Definitions; *Dictionaries; *Earth Science; Geology; *Natural Resources; Reference Books; Resource Materials

ABSTRACT

This dictionary contains about 55,000 terms with approximately 150,000 definitions. These terms are of both a technical and local nature and apply to metal mining, coal mining, quarrying, geology, metallurgy, ceramics and clays, glassmaking, minerals and mineralogy, and general terminology. Petroleum, natural gas, and legal mining terminology, unless of a general nature, has been excluded, as has been foreign terminology where there is an English equivalent. Those Spanish-American and Mexican terms still used in the Southwestern United States have been retained. Many terms are identified by the country or area of origin. Others can be identified by examining the source following each definition. These sources are completely identified, with full bibliographical information, in the list of authorities and sources in the back of the dictionary. A consultation of this list can also aid in establishing the recency of the definition. (Author/PR)
A Dictionary of Mining, Mineral, and Related Terms

Compiled and edited by Paul W. Thrush and the Staff of the Bureau of Mines

U.S. Department of the Interior

1968
Created in 1849, the Department of the Interior—America's Department of Natural Resources—is concerned with the management, conservation, and development of the Nation's water, fish, wildlife, mineral, forest, and park and recreational resources. It also has major responsibilities for Indian and Territorial affairs.

As the Nation's principal conservation agency, the Department works to assure that nonrenewable resources are developed and used wisely, that park and recreational resources are conserved for the future, and that renewable resources make their full contribution to the progress, prosperity, and security of the United States—now and in the future.

UNITED STATES DEPARTMENT OF THE INTERIOR
STEWART L. UDALL, Secretary

BUREAU OF MINES
WALTER R. HIBBARD, JR., Director

This publication has been cataloged as follows:

Thrash, Paul W. comp.
1269 p. (U.S. Bureau of Mines. Special publication.) Includes about 55,000 individual term entries with about 150,000 definitions under these terms.
1. Mineral industries—Dict. 2. Mining engineering—Dict. I. Title. (Series.)
TN9.T53 622.03
U.S. Dept. of the Int. Library.

This Dictionary of Mining, Mineral, and Related Terms is the result of an effort by the Bureau of Mines extending over many years. The work began as a revision of Bureau of Mines Bulletin 95, A Glossary of the Mining and Mineral Industry, by Albert H. Fay, first published in 1918, and reprinted in 1947. Fay's Glossary, as it came to be known, has long been the standard authoritative reference work for technical and specialized terms related to mining and the mineral industries.

In the nearly 50 years that have elapsed since the first publication of Fay's Glossary, the expansion of the minerals industries and the development of new mining and related technologies have resulted in considerable extension of the vocabulary of mining and minerals. Hence, the need has grown for an up-to-date, comprehensive, and authoritative reference work. The increased scope and detailed treatment of the work justify its identification as A Dictionary of Mining, Mineral, and Related Terms.

Many individuals, especially those comprising the Bureau's staff of engineers, scientists, and technologists, contributed to the preparation of this comprehensive publication. Much of the credit for the direction and professional conduct of the task is due to Paul W. Thrush, who has served effectively as Editor in Chief.

The Bureau of Mines has prepared and published this dictionary in the expectation that it will be a useful tool in pursuing modern applications of one of the oldest industries in the world.

Walter R. Hibbard, Jr.
Director
June 20, 1967
preface

This dictionary is published by the Bureau of Mines as a contribution to the mining and mineral literature in the belief that it will fill a recognized need.

Several attempts have been made over the years to revise Albert Fay's *Glossary of the Mining and Mineral Industry* which first appeared in December of 1918. Frank L. Hess of the Bureau of Mines worked on a revision, but his untimely death prevented its completion. Subsequently, the writer was employed to compile and edit this dictionary in cooperation with the technical staff of the Bureau of Mines.

Fay's glossary contained about 18,000 terms with 27,000 definitions; the present compilation contains about 55,000 terms with approximately 150,000 definitions. These terms are of both a technical and local nature, and they apply to metal mining, coal mining, quarrying, geology, metallurgy, ceramics and clays, glassmaking, minerals and mineralogy, and general terminology. Petroleum, natural gas, and legal mining terminology, unless of a general nature, has been excluded, as has been foreign terminology where there is an English equivalent.

Several thousand Spanish-American mining terms that appeared in Fay's compilation have been removed to make way for the thousands of new English terms that have evolved over the years. Those Spanish-American and Mexican terms still used in the Southwestern United States have been retained.

Fay's compilation included terminology from the entire English-speaking world. This objective has been maintained in this dictionary. Many terms are identified by the country or region of origin. Others can be identified by examining the source following each definition. These sources are completely identified, with full bibliographical information, in the list of authorities and sources in the back of the dictionary. A consultation of this list can also aid in establishing the recency of the definition. Several thousand terms from Fay that might be considered obsolete were retained because it was felt that we had an obligation to preserve the historical record.

The list of authorities and sources in the back of the dictionary is only a partial listing of the sources consulted in compiling this dictionary. The items in this list are for the most part dictionaries, glossaries, or other tools that were found to be fruitful sources of information. Abbreviations of sources and references and other symbols used in the dictionary are identified in alphabetical sequence in the list of authorities and sources. Many additional citations from textbooks, research reports, and periodicals are given individually throughout the body of the dictionary following each definition. Geographical abbreviations are also listed in the back of the dictionary.

It is too much to hope that the first edition of a volume such as this will be free from error. The Bureau of Mines will appreciate having errors pointed out, and will welcome suggestions for the inclusion of additional terms that may appear to be desirable. Communications should be addressed to the Office of Mineral Information, Bureau of Mines, U.S. Department of the Interior, Washington, D.C. 20240.

Paul W. Thrush
Pittsburgh, Pa.
June 20, 1967
In the compilation of this dictionary, the Bureau of Mines gives credit for each definition as indicated in the list of authorities and sources quoted. Definitions credited Webster 3d in the text have been reproduced by special permission from Webster's Third New International Dictionary, copyright 1966 by the G. & C. Merriam Co., publishers of the Merriam-Webster Dictionaries. Reprinting of these definitions herein in truncated form is not to affect in any way the validity of the proprietary rights of the G. & C. Merriam Co. to the reprinted definitions. Definitions credited Webster 2d in the text have been reproduced by special permission from Webster's New International Dictionary, Second Edition, copyright 1959 by G. & C. Merriam Co., publishers of the Merriam-Webster Dictionaries, and their reprinting herein in truncated form is not to affect in any way the validity of the proprietary right of G. & C. Merriam Co. to the reprinted definitions. Material quoted from Webster's 2d Edition is of historical importance or is material not retained in Webster's 3d Edition.

In all, several hundred specialists of the Bureau of Mines read various sections of this dictionary or technical review. No section was read by fewer than two specialists. Since a listing of individual names would be extensive, grateful acknowledgment is here made for their efforts and for the suggestions and changes recommended by them. James E. Hill and Dr. C. Meade Patterson reviewed the mineral list; Taber de Polo and the late Howard P. Hamlin reviewed the ceramics list; and Dr. Patterson reviewed the general list and part of the geology list, and compiled a list of single-letter abbreviations that has been incorporated in the dictionary. Other Bureau personnel whose services deserve special acknowledgment include Earle P. Shoub, who reactivated the project after Hess' death; A. L. Julian, Jr., whose enthusiastic support reinforced my efforts over the past 6 years; Carl Rampack and Robert P. Willing, both of whom gave valuable assistance and administrative counsel; Hazel J. Stratton, who gave valuable advice on editorial style; and Marion Hatch, whose unexcelled proficiency in library services helped to make the task easier. Special acknowledgment is due Charles W. Merrill, whose continuing interest and professional counsel played a major role in insuring the final completion of the project. In the final phase of the project, Dr. Miles J. Martin of Washington and Meyer Reiness of Pittsburgh provided the administrative authority and guidance needed to bring this long-standing project to a conclusion.

Finally, several people outside the Bureau deserve recognition for their help. I am indebted to Mr. Daniel R. Pfouts, Head of the Science and Technology Department of Carnegie Library of Pittsburgh, Pa., who relaxed the rules and permitted me to use many noncirculating reference tools outside the library for this project; and to Mrs. Virginia R. Fischel, retired professor of library science at the Carnegie Institute of Technology, whose suggestions of sources led to the inclusion of several thousand terms in this compilation.

The contributions of three persons deserve special recognition. Mrs. David Mishkelevich, formerly with the Bureau of Mines and now with the U.S. Geological Survey, made many significant contributions in the early stages of this project. To Marilyn Pantone and Pauline Mekon I owe my deepest gratitude and enduring regard for their cooperation and superior performance. Both of them started with me in 1961 and have remained loyal and dedicated through many vicissitudes. Without their invaluable assistance, this seemingly endless task could not have been completed.

a dictionary of mining, mineral, and related terms
a dictionary of mining, mineral, and related terms

Alloy

A-11

abalone pearl. A colored pearl from the abalone. A prefix added to the names of the a-axis. In structural petrology, the direction of movement or transport in a tectonic. This may be parallel to lineation, as in many shear zones (slickensides); or normal thereto, as in regionally folded metamorphic terranes. A.G.I.

ab- A prefix added to the names of the practical electrical units to indicate the corresponding unit in the cgs (centimeter-gram-second) electromagnetic system, or the electromagnetic unit (emu); for example, abampere; abouombul; abvolt. Handbook of Chemistry and Physics, 45th ed., 1964, p. 29.

abalone. The mollusk Haliotis, also known as an ormer or ear shell. From the Pacific waters of California; Mexico; Japan; and New Zealand. See also Haliotis. Shiplay.

abalone pearl. A colored pearl from the Pacific usually a blister pearl although a true pearl is found occasionally, especially in Mexico and in California. Usually pronounced green, pale green, or pink cinnabar.

abampere. The centimeter-gram-second (cgs) electrical unit of current; that is, current which, in a one-turn circular conductor of 1 centimeter radius in a vacuum, produces a magnetic intensity of 1 oersteds at the center of the circuit. Equals 10 absolute amperes. Hess.

abandon. To stop drilling and remove the drill rig from the site of a borehole before the intended depth or target is reached. Long.

abandoned cliff; ancient cliff. Cliff abandoned in consequence of differential movement or transport in a tectonic. Many shear zones (slickensides), or normal to a. A.G.I.

abandon. To stop drilling and remove the drill rig from the site of a borehole before the intended depth or target is reached. Long.

abandoned areas. The Persian weight for pearls, about 2.66 troy grains. Shipley.

abeat. The petting weight for pearls, about 2.66 troy grains. Shipley.

abatis; abattis. In structural petrology, the surface along which differential movement takes place. A.G.I.

ab-plane. In structural petrology, the surface of movement or transport in a tectonic. The ab-plane is perpendicular to a. A.G.I.

ab-andes. A method of seismic surveying involving the use of alum, blood, charcoal, and clay. Ham.

abbe value. See Abbe number. Dodd.

abbcite. Ammonia dynamite containing a percentage of ammonium nitrate and trinitrotoluene composition used as an explosive. Pryor, 3.

abbe number. See Abbe value. Dodd.

abberlite. An abrading substance, as emery, and is perpendicular to a. A.G.I.

abberlite. Ammonium nitrate and trinitrotoluene composition used as an explosive. Pryor, 3.

abrasion

men and exert a combined abrasive, compressive, and twisting action twice in each revolution of the specimen holder. Osborne.

abrasion. The wearing away by friction, A.G.I. b. The act of wearing or rubbing off, A.G.I. c. Wearing away by rubbing or friction on the part being cut through water laden with sand and other rock debris and by glaciers. A.G.I. d. The operation of wearing away by aqueous or glacial action. A.G.I.

abrasion hardness. Hardness expressed in quantitative terms or numbers indicating the degree to which a substance resists being worn away by friction contact with an abrasive material, such as silica or carbonaceous grits. Also called abrasion resistance; wear resistance. Compare scratch hardness. Long.

abrasion index. The percentage of a specially prepared 3 in.-2 in. sample of coke retained on a 1/8-inch mesh B.S. test sieve after the sample of coke has been subjected to a standardized abrasion procedure in a rotating drum. B.S. 1016, 1961, Pt. 16.

abrasion of refractories. Wearing away of the surfaces of refractory bodies in service by the abrading action of moving solids. HW.

abrasion plates. A flat surfaced plat-form of large areal extent is a marine peneplain or a marine plane, according to the smoothness of the surface produced by wave erosion. A.G.I.

abrasion resistance. The degree to which a porcelain enamel will resist attack by abrasive materials. ASTM C286-65. See also abrasion hardness.

abrasion shoreline. See shoreline of retrogradation. Schieferdecker.

abrasive. A substance used for grinding, honing, lapping, superfinishing, polishing, pressure blasting, or barrel finishing. It includes natural materials such as garnet, emery, corundum, and diamond, and electric-furnace products like aluminum oxide, silicon carbide, and boron carbide. ASTM Gloss. Natural abrasives in order of hardness include diamond, corundum, emery, garnet, and pumice. Artificial abrasives include borazon, carborundum, corundum (sold as alumund, aloxite, etc.), boron carbide. For preparing polished surfaces on mineral specimens, carborundum, levi-gated alums, jeweler's rouge, and magnesium oxide which used, diamond-impreg-nated paste being employed at final stage. Pryor, 3.

abrasive belt. A coated abrasive product, in the form of a belt, used in production grinding and polishing, ASM Gloss.

abrasive disk. a. A grinding wheel which is mounted on a steel plate, with the exposed flat side being used for grinding, ASM Gloss. b. A disk-shaped, coated abrasive product. ASM Gloss.

abrasive drilling. A rotary drilling method in which drilling is effected by the abrasive action of the abrasive medium which rotates while being pressed against the rock. Franekel, v. 1, Art. 8:30, p. 21.

abrasive finishing. The final cuts taken with a grinding wheel to obtain the accuracy and surface desired. ACSG, 1963.

abrasive formation. A rock consisting of small, sharp, angular fragments or lumps, or a rock, the cuttings from which, produced by the action of a drill bit, are hard, sharp, angular grains, which grind away or abrade the metal on bits and drill-steel equipment at a rapid rate.

Also called abrasive ground. Long.

abrasive ground. Synonym for abrasive formation. Long.

abrasive hardness test. This test employs a rotating abrasive wheel or plate against which specimens are held. The specimens are abraded over a given number of revolu-tions and the weight of material lost is a measure of the abrasive hardness. Lewis, p. 374.

abrasive salts. See abrasiasalz.

absarokite. An alkalic basalt consisting of about equal amounts of olivine, augite, labradorite, and sanidine, with accessory biotite, epidote, and opaque oxides. Leucite is sometimes present in small amounts. Absarokite forms a series with shoshonite with decreasing amounts of olivine and increasing amounts of plagioclase and sanidine. A.G.I.

abrasiva. The axis at right angles to the axis of ordinates. Crispin.

absolute. a. In chemistry, free from impurity or admixture. Hess. b. In physics, not dependent on any arbitrary standard. Hess. c. Frequently used in the trades to indicate a thing as being perfect or exact. Abbreviation, abs. Crispin.

absorbent. A substance that absorbs. Crispin.

absorbed dose. Usually expressed as rads, which represents the energy absorbed from the radiation per gram of specified body tissue. BuMines Bull. 630, 1965, p. 247.

absorber. A rock or rock material, which, by virtue of its dryness, porosity, or permeability, has the ability to drink in or suck up a drilling liquid, as a sponge absorbs water. Also called absorber ground. Long.

absolute potential. True potential difference between a metal and the solution in which it is immersed. Pryor, 3.

absolute pressure. Total pressure at a point in a fluid equaling the sum of the gage pressure and the atmospheric pressure. Webster 3d.

absolute scale. See Kelvin temperature scale.

absolute time. Geologic time measured in terms of years. Compare relative time. Late.

absorbents. Substances, such as wood meal, which are forms of absorbent formation. Also called absorbens. Nelson. 2. The entire mass of superjacent rocks. Briggs, p. 61, c. The entire mass of strata overlying a coal seam. See also neither roof, a. Nelson. b. In mine subidence, the entire mass of superjacent rocks. Briggs, p. 61, c. The entire mass of strata overlying a subsurface point of reference. Bureau of Mines Staff.

absorptance. See Kelvin temperature scale.

absolute zero. The temperature at which all gas would show no pressure if the general law for gases would hold for all temperatures. It is equal to 273.16° C or 459.69° F. Handbook of Chemistry and Physics, 45th ed., 1964, p. F-29.

absorb. To drink in or to suck up as a liquid by a solid like a sponge or fuller's earth. Pryor, 3.

absorbed dose. Usually expressed as rads, which represents the energy absorbed from the radiation per gram of specified body tissue. BuMines Bull. 630, 1965, p. 247.

absorber. A rock or rock material, which, by virtue of its dryness, porosity, or permeability, has the ability to drink in or suck up a drilling liquid, as a sponge absorbs water. Also called absorber ground. Long.
absorptiometer. A device for measuring the absorption. *Heat.* b. The resistance and condenser in series which is placed across a barometer circuit in order to damp any possible oscillatory circuit, which would tend to maintain an arc or spark when a current is interrupted. Also called a spark absorber. C.T.D. c. Any material that absorbs or stops ionizing radiation. Strong neutron absorbers like boron, hafnium, and cadmium are used in control rods. Lead, concrete, and steel attenuate gamma rays and neutrons in nuclear reactor shields. A thin sheet of paper or metal will stop or absorb alpha particles and all but very energetic beta particles. See also poison. L.47.

**absorber** plant. A plant that has the ability to absorb a gas. Bureau of Mines Staff. 1962.

**absorber**. Trade name for activated carbon. *Heat.*

**absorptiometer.** A device for measuring the solubility of a gas in a liquid. *Bennett 2d, 1962.*

**absorption.** Measurement of the loss through absorption by homogeneously colored solution of photosynthetic light. Absorption (Beer’s Law) is proportional to the number of molecules through which the light passes. The Bougner-Beer law is $I = I_0 e^{-kx}$, where $I$ is intensity; $I_0$ is original intensity; $k$ is an extinction coefficient; and $x$ is concentration (grams per liter). Measuring instruments are called absorptiometers or spectrophotometers; much used types being the Bumetron and the Spectro. The method is used where light (including ultraviolet) can be analyzed as an analytical or metric medium. It is much used in mineral dressing control analysis and research.

**absorption.** a. Taking up, assimilation, or incorporation; as, the absorption of gases in liquids, as distinguished from adsorption. Sometimes losing strength in place of adsorption. A.G.I. b. The act or process of absorbing, imbibing, swallowing, or engulfing mechanically. *Fay.* c. A taking in or reception by molecular or chemical action. *Fay.* d. The phenomenon observed when a pleochroic mineral is rotated in plane polarized light. In certain positions, the mineral is darker than in others, owing to the absorption of light. *Fay.* e. In hydrology, a term applied to the entrance of surface water into the lithosphere by all methods. A.G.I. f. As applied to ceramic products, the quantity of water which can be absorbed by the ware, expressed as a percentage of the weight of the dry ware. *Hw.* g. The process in which a solution is drawn into and tends to fill permeable pores in a porous solid body; also, the increase in weight of a body resulting from the penetration of a liquid into its permeable pores. *ASTM C125-66.*

**absorption** hygrometer. A type of hygrometer which measures the moisture content of the atmosphere by means of the absorption of vapor by a hygroscopic chemical. The amount of vapor absorbed may be determined in an absolute manner by weighing the hygroscopic material, or in a non-absolute manner by measuring the physical property of the substance that varies with the amount of water vapor absorbed. The hygroscopic material is suspended in a strip and carbon-film hygrometer element are examples of the latter. *H.G.*

**absorption** loss. a. The loss of water occurring during initial filling of a reservoir in wetting rocks and soil. *Ham.* b. That part of the transmission loss which is due to distortion or the conversion of sound energy into some other form of energy, usually heat. This conversion may take place within the medium itself or upon a reflection at one of its boundaries. This loss is a critical factor in the effectiveness of sonar equipment. *Hy.*

**absorption** of gases. The solution of gases in liquids or the absorption of gases by solids. *Bennett 2d, 1962.*

**absorption** spectrum. The series of dark bands crossing a continuous spectrum, seen when white light has been transmitted through a colored vapor, liquid, or solid. *Anderson,* p. 354. When white light passes through a colored stone, light of certain wavelengths is absorbed more strongly than others, the colors that are absorbed combining to produce the color of the stone. When viewed through a spectroscope, the colors most strongly absorbed may show as dark bands crossing the spectrum in characteristic positions. Such a spectrum is known as an absorption spectrum, and provides a useful means of identification. *Anderson.*

**absorption** tower. A tower in which a liquid absorbs a gas. *Bureau of Mines Staff.*

**absorptivity.** The ability of a substance to absorb radiant energy absorbed by a body to that falling upon it. It is equal to the emissivity for radiation of the same wavelength. *Stock.*

**abstract.** To absorb the waters of a neighborhood stream by abstraction; said of water excepting rain or run-off. *Stock.*

**abstraction.** In geology, the draining of water from a stream by another having more affinity for the streams in which it flows. *Stock.*

**abundant vitrain.** A field term denoting, in accord with the arbitrary scale established for use in describing banded coal, a frequency of occurrence of vitrain bands comprising 30 to 60 percent of the total coal layer. Compare dominant vitrain; moderate vitrain; sparse vitrain. *A.G.I.*

**abutment.** a. A surface or mass provided to withstand thrust, for example, the end supports of an arch or bridge. In coal mining, (1) the weight of the rocks above a narrow roadway is transferred to the solid coal along the sides, which act as abutments of the arch of strata spanning the roadway; and (2) the weight of the rocks over a longwall face is transferred to the front abutment, that is, the solid coal ahead of the face and the back abutment, that is, the settled packs behind the face. See also pressure arch. *Nelson.* b. The structural portion of a furnace that withstands the thrust of an arch. *D.R.*

**abutment load.** In underground mining, the weight of rock above an excavation which has been transferred to the adjoining walls. *Pryor.*

**abyssal.** See abyssal.

**abyssal sea.** That part of the sea which occupies the ocean basins. *Fay.*

**abyssal.** a. Very deep, unfathomable place. *Fay.*

**abyssal**. The term is used to refer to a particularly deep part of the ocean, or to any part below 3,000 fathoms. *H.G.* b. Synonym for pit; pit; pothole; chasm; shaft. *Schieler-decker.*

**abyssal assimilation.** See assimilation. *H.G.*

**abyssalbenthic.** A zone comprising all of the deep-sea benthic system below the archibenthic zone, or below 800 to 110 meters. *A.G.I.*

**abyssal deposit.** A deposit of the deep sea, accumulating in depths of more than 1,500 fathoms of water; these deposits comprise the organic zones, various muddy and red clay of the deepest regions. *C.T.D.*

**abyssal injection.** The process by which magmas, originating at considerable depths, are considered to have been driven up through deep-seated contraction fissures in the margins of the earth. *Anderson.*

**abyssal intrusion.** An alternative name for a plutonic intrusion. *C.T.D.*

**abyssal plain.** a. An area of the ocean floor with a slope of less than 1 in 1,000. *Schleider-decker.* b. Flat, nearly level areas which occupy the deepest portions of many ocean basins. *A.G.I.*

**abyssal realm.** The deep waters of the ocean below 1,000 fathoms, or 2,000 meters, or
abyssal realm

6,000 feet. Bureau of Mines Staff.

abyssal rock. A plutonic or deep-seated igneous rock. The word was suggested and used by Brearly. Fayer.

abyssal theory. A theory of the origin of ores involving the separation of ore from silicates during the cooling of the earth from the liquid stage. A.G.I.

abyssal zone. The marine-life zone of the deep sea embracing the water and bottom below a depth of 6,000 feet. Stokes and Varnes, 1955.

Abyssinian well. Pointed and perforated tube driven into the ground by a light pilehammer. Water is extracted by pumping.

abyssobenthic. Relating to that part of the abyssal realm which includes the ocean floor; peering down to the ocean floor from the ocean floor at great depths. C.T.D.

abyssolith. Literally, a bottomless body of rock material, a molten mass of eruptive material passing up without a break from the zone of permanently molten rock within the earth. A.G.I.

abyssopelagic. Relating to that part of the abyssal realm which excludes the ocean floor; floating in the depths of the ocean. C.T.D.

access point. One to which access is given. C.T.D.

accident. A sudden, unexpected, and unfortunate event. Gr. Brit. An iocident or event at which the man sustains a bodily injury which causes the injured person to be away from work for more than three days A certain degree of harm to an individual is the criterion. The event is usually classified as fatal, a serious nonfatal, or a minor or plus 3-day accident. See also accidental. Hess.

accessory. a. A machine that accelerates electrically charged atomic particles to high velocities. Electrons, protons, deuterons, and alpha particles can be accelerated to nearly the speed of light for use in nuclear research. Types of accelerators include the betatron, cyclotron, linear accelerator, and synchrotron. Familiarly known as atom smasher. L.BJ. b. In the case of stucco, plaster, mortar, concrete, etc., a substance which will hasten the set. ASTM C11-50. c. A device controlling the rate at which fuel is injected into a combustion-type engine and hence controlling its speed. Also called throttle. Long. d. A substance added to increase the rate of a chemical reaction. See also catalyst.

accelerometer. An instrument used to measure acceleration; specifically, a seismic design which measures particle accelerations. A.G.I.

acceptance operations. In mineral processing, rejection of material held as run-of-mine ore because of inferior quality. Bureau of Mines Staff.

accelerator. a. A machine that accelerates electrically charged atomic particles to high velocities. Electrons, protons, deuterons, and alpha particles can be accelerated to nearly the speed of light for use in nuclear research. Types of accelerators include the betatron, cyclotron, linear accelerator, and synchrotron. Familiarly known as atom smasher. L.BJ. b. In the case of stucco, plaster, mortar, concrete, etc., a substance which will hasten the set. ASTM C11-50. c. A device controlling the rate at which fuel is injected into a combustion-type engine and hence controlling its speed. Also called throttle. Long. d. A substance added to increase the rate of a chemical reaction. See also catalyst.

acceleration. That due to the gravitational attraction of the earth is 980.665 centimeters per second square (32.174 feet per second square). Standard value for use in vacuum. International Committee on Weights and Measures. True value varies slightly with isotopic effect, latitude, longitude, and the departure of the planet from a truly spherical shape. Pryor, 3.

accelerator. a. A machine that accelerates electrically charged atomic particles to high velocities. Electrons, protons, deuterons, and alpha particles can be accelerated to nearly the speed of light for use in nuclear research. Types of accelerators include the betatron, cyclotron, linear accelerator, and synchrotron. Familiarly known as atom smasher. L.BJ. b. In the case of stucco, plaster, mortar, concrete, etc., a substance which will hasten the set. ASTM C11-50. c. A device controlling the rate at which fuel is injected into a combustion-type engine and hence controlling its speed. Also called throttle. Long. d. A substance added to increase the rate of a chemical reaction. See also catalyst.

accessor plate. a. The quartz plate which gives the sensitive tilt of a specimen between crossed nicks. It is the mica plate which retains yellow light. Pryor, 3. b. The selenite plate which gives the sensitive tilt of a specimen between crossed nicks. It is the mica plate which retains yellow light. Pryor, 3.

access test. A route constructed to enable plant, supplies, and vehicles to reach a mine, quarry, or open cast pit. In remote and isolated regions, the provision of an access road may be very costly. Nelson.

access time. That required to locate data in the memory. Pryor, 3, p. 31.

accidental. Gr. Brit. An incident or event at work in which some-one sustains a bodily injury which causes the injured person to be away from work for more than three days A certain degree of harm to an individual is the criterion. The event is usually classified as fatal, a serious nonfatal, or a minor or plus 3-day accident. See also accidental. Hess.

accidental block. A solid chip of igneous, metamorphic, or sedimentary rock torn from the subvolcanic basement and ejected from a volcano. Synonym for noncognate block. A.G.I.

accidental error. Unpredictable, arising from a cause or cause. Pryor, 3, p. 139.

accidental inclusion. An enclosed crystal or fragment having no genetic connection with the igneous rocks which it occurs. See also accidental. Hess.

accidental pearl. Genuine natural pearl as distinguished from (artificially cultured pearl. A term not used in the trade as it is of questionable meaning.

Shipley.

accidental cause code. A system sponsored by the American Standards Association. Under this code accidents are classified under eight disabling working conditions and nine improper working practices. Nelson.

accident frequency rate. The number of all disabling injuries (fatal, permanent-total, permanent-partial, and temporary lost-time injuries) per million man-hours of exposure. Hess.

accident-prone. Accident statistics reveal that certain individuals have a predisposition to sustain more accidents than others exposed to the same hazard. This suggests that there is a certain defect or propensity in some miners which makes them accident-prone cases. It is also suggested that such cases tend to sustain an undue number of injuries even at home or at sports.

Nelson.

accident severity rate. The number of days of disability resulting from all accidents (fatal, permanent-total, permanent-partial, and temporary lost-time injuries) per thousand man-hours of exposure. Hess.

acclimatization. A man completely new to a hot mine will find great difficulty in doing any appreciable amount of work. Within a short period, his body will have improved its mechanism for heat loss, the rate at which the man can sweat will be much increased, pulse rate decreased, and body temperature falls, and the man is then said to be "acclimatized" to hot working conditions. A minority never become acclimatized and are said to be "heat intolerant." Roberts, l, p. 132.

acclival valleys. Those that run in the direct-
tion of the dip. A.G.I.

accompan. a. (Corn.) Account day; the usual settling day. Fay. b. The place of meeting, council house. Fay.

accordant tributary. A tributary that enters the main trunk stream at grade, that is, at the same elevation as the main stream. Stokes and Varney, 1955.

accordion roll conveyor. A roller conveyor with a flexible latticed frame which permits variation in length. ASA MH4-1938.

account. The record of the transactions affecting one party; as any one party may be the receiver or debtor in one transaction and the giver or creditor in another, an account has two sides, a debtor and a creditor side. Truscott, p. 280.

accountancy. The continuous recording of transactions on a money basis as a means to show clearly at any time the financial position of a business, what profit or loss has been made over any period, and where that profit or loss was made. Truscott, p. 280.

account day. See bill day. Nelson.

accretion. a. The process by which inorganic bodies increase in size by the addition of fresh particles to the outside of the body. Fay. b. The gradual addition of new land to old by the deposition of sediment carried by the water of a stream. A.G.I. c. May be either natural or artificial. Natural accretion is the gradual buildup of land over a long period of time solely by the action of the forces of nature, on a beach by deposition of waterborne or airborne material. Artificial accretion is a similar buildup of land by reason of an act of man, such as the accretion formed by the groin, breakwater, or beach fill deposited by mechanical means. H.B.G.

accretionary lapillus. A pellet, often exhibiting concentric structure owing to the accretion of fine ash or dust around raindrops falling through an explosion cloud, or to similar accretion around a nucleus fragment which rolls along the ground. Accretionary lapilli are also called mud pellets; pisoliths. A.G.I.

accretionary lava balls. Rounded balls of lava several inches in diameter formed by many small flows, formed by the rolling up and adhesion of viscous lava around some fragment of solidified lava as a center. A.G.I.

accretion. A limekiln which has formed in place by slow accretion of organic remains. Many such deposits belong to the reef or bioherm subclass. A.G.I.

accretion coast. See shoreline of progradation. Schierradenk.

accretion hypothesis. Any hypothesis of the origin of the earth which assumes that it has grown from a small nucleus by the gradual addition of solid bodies, such as meteorites, asteroids, or planetesimals, formerly revolving about the sun in independent orbits, but eventually drawn by gravitation to the earth and incorporated in it. Fay.

accretion vein. A vein formed by the repeated filling of a channelway and its reoccupying by the development of fracturess in the granite during subjacent mineralization. Forrester, p. 115.

accumulation. a. In coal mining, bodies of coal or anthracite collected in higher parts of mine workings and at the edge of goaves and waste. They are found in cavities, at rippling, at other sheltered places protected from the ventilating current, and at the higher sides of rise faces. Mason, 1. p. 262. b. The concentration or gathering of oil or gas in some form of trap. Commercial accumulation is a volume or quantity sufficient for profitable exploitation. A.G.I. c. A collected mass of material. Jones.

accumulator. a. A cylinder containing water or oil under pressure of a weighted piston for hydraulic presses, hoists, etc. It is between the pumps and the presses, keeps a constant pressure on the system, and absorbs shocks. Bureau of Mines Staff. b. A storage battery. Bureau of Mines Staff. c. In oceanography, a spring of rubber or steel attached to a trawling warp, to lessen any sudden strain due to the trawl catching C.T.D.

cumulative conveyor. Any conveyor designed to permit accumulation of packages or objects. Usually roller, live roller conveyor, roller flat conveyor, or belt conveyors. ASA MH4-1958.

accumulator metal. An alloy of 90 percent lead, 9.25 percent tin, and 0.75 percent antimony; condenser tellol. Campbell.

accumulator plant. In geobotanical prospecting, a plant is grown in a pot that maintains an normal content of a metal where growing in metal-bearing soil. A.G.I.

accuracy. a. The practical limit of accuracy in building work is about one-eighth of an inch for placing of walls and floors, and about 1 inch for a long tunnel driven through a mountain. A modern air survey, plotted to a scale of 1 in 500, can give an accuracy of plus or minus 3 inches vertically or horizontally. Ham. b. The closeness of approach to a measurement of the true value of the quantity measured. Since the true value cannot actually be measured, the most probable value from the available data, critically considered for sources of error, is used as the truth. Compare precision. A.S.M. Glaz. accuracy of a method. A measure of the ability of a method to provide accurate results, that is, results which are precise and free from bias. The accuracy of a method must not be confused with its precision. A determination may be made with great precision, and the standard deviation of a number of determinations on the same congnmment may be kept very low, but the results will only be accurate if they are free from bias. B.S. 1017, 1960, Pt. 1.

accuracy of a result. The closeness of agreement between an experimental result and the true value. B.S. 1017, 1960, Pt. 1.

acetamide; acetic acid amide; acetic acid amine; ethanamide. Colorless, deliquescent crystals; mousy odor; CHCONH2. Used in explosives and as a soldering flux. CD 64, 1961.

acetate; ethanolic acid. Produced during the dry distillation of wood followed by ash, and subjected to further distillation by the oxidation of dilute alcohol (HCO3H); specific gravity, 1.0942 (at 20° C). Vitamin C, a precursor of acetic acid and it contain a legal minimum of 4 percent of acetic acid. Used in the porcelain enameling industry to prepare grain-decorating and metal-cutting flame torches. Long.

acetate black. Graphite type of carbon black obtained by incomplete combustion of acetylene; apparent density, 0.21. Ben.

acetate lamp. See carbide lamp. Zern.

acetic acid tetrahydrone; symmetrical tetrahydrone. Mutthmann's liquid. Yellowish-irid liquid; CH3CHOHCH3; specific gravity, 2.98 to 3.00; boiling point, 259° to 247° C with decomposition; density, 1.0002 to 1.0005; boiling point, 151° C (at 54 mm); melting point, 0.1° C; and refractive index, 1.368. Used for separating minerals by specific gravity; a solvent for fats, oils, and waxes; a fluid in liquid gases; and a solvent in microscopy. CD 64, 1961.

acetylene lamp. See carbide lamp. Zern.

acetylene tetrahydronitrose; symmetrical tetrahydronitrose. Mutthmann's liquid. Yellow-irid liquid; CH3CHOHCH3; specific gravity, 2.98 to 3.00; boiling point, 259° to 247° C with decomposition; density, 1.0002 to 1.0005; boiling point, 151° C (at 54 mm); melting point, 0.1° C; and refractive index, 1.368. Used for separating minerals by specific gravity; a solvent for fats, oils, and waxes; a fluid in liquid gases; and a solvent in microscopy. CD 64, 1961.

acetylene. A preventable occurrence in coal mining which causes the production of silicon carbide and synthetic graphite. Henderson.

acetylene graphite. Artificial graphite made from coke by electric furnace heating. Bennett 2d, 1962.

acetylene process. A process for the production of artificial or synthetic graphite. It consists of simultaneously coked in the Acheson furnace at 5,000° to 6,000° F. Henderson.

acrimarlite. A pale sulfur-yellow to orange and red arsenochlromolybdate of lead, 33Pb3S33Se33Mo133O1333; Mohs' hardness, 3 to 4; specific gravity, 5.956. From the mines of Guanacare, Chihuahua, Mexico. Hess.

acrylic. A colorless variety of tourmaline. Fay.

acromatic. Free from hue. See also achromatic. Shipley.

acromatic color. White, black, or any tone of neutral gray, that is, gray containing no tint of any hue. See also chromatic color. Shipley.

acromatic loupe. Any loupe containing an achromatic lens. Shipley.

acromatic triple. A loupe corrected for chromatic aberration. See also loupe. Shipley.

acrylic. A Chilean term for a small earthenware dish used in making tests in the patio process. Hess.

acicular. A mineral consisting of fine needle-
acid clay. A naturally occurring clay.

acid bottle. Acid-dip bottle used in survey of Bessemer converter. One liner with acid. In another bit or reused in some other manner. May be fitted in a clinometer. Staff.

acid carbonator. One liner with acid.

acid chloride. A byproduct obtained in treating acid calcium phosphate. See calcium phosphate. A.G.I.

acid chlorination. The process of forcing acid into the borehole and left for 20 to 30 minutes to measure inclination. May be fitted in a clinometer. Pryor, 3.

acid coloring. The determination of the color. A.G.I.

acid desulfurization. The process of removing sulfur from coal by sulfuric acid. See desulfurization. A.G.I.

acid dip. A form of gold decoration for pottery introduced in 1863 by Minton's Ltd., Stoke-on-Trent, England. The glazed surface is etched with dilute HF prior to application of the gold; the decoration only of ware of the highest class. A.G.I.

acid gold. A form of gold decoration for glassware by immersing the surface is etched with dilute HF prior to application of the gold. Long.

acid mine drainage. Acidic drainage from ferrous ore. A.G.I.

acid mine water. Mine water which contains free sulfuric acid, mainly due to the weathering of iron pyrites. A pit water, which corrodes iron pipes and pumps, usually contains a high proportion of solids per gallon, principally the sulfates of iron, chiefly ferrous and alumina. Nelson. See also acid drainage. A.G.I.

acid open-hearth steel. Low-phosphorus pig iron treated in an acid (silica or sand) refractory steel furnace. Dobb.

acid open-hearth furnace. An open-hearth furnace used in the refining of hematite iron; little such iron is now made. The particular feature is that the hearth is made of acid-resistant bricks covered with a fritted layer of silica sand. Dobb.

acid polishing. A method of polishing cut decorations on glassware by immerse the base of known strength (standard solution) and an indicator is used to establish the end point. See also pH. C.C.D. 64, 1961.

acid resistant. A glass to which acid has been added. C.C.D. 64, 1961.

acid resisting. A glass which can be etched with concentrated sulfuric acid. A.G.I.

acid right. The determination of the angle of inclination of a borehole which is used to determine the quantity of acid in a solution. Hauzen.

acid salt. One which forms an acid molecule through combination with one or more protons. Pryor, 3.

acidity. The extent to which a solution is acid. See also pH. C.C.D.

acidity coefficient. See coefficient of acidity.

acidization. The process of forcing acid into a limestone, dolomite, or sandstone in order to increase permeability and porosity by dissolving and removing a part of the rock constituents. It is also used to remove mud injected during drilling. The general objective of acidization is to increase productivity. A.G.I.

acid mine drainage. Acidic drainage from ferrous ore containing acid. See also acid drainage. A.G.I.

acid mine water. Mine water which contains free sulfuric acid, mainly due to the weathering of iron pyrites. A pit water, which corrodes iron pipes and pumps, usually contains a high proportion of solids per gallon, principally the sulfates of iron, chiefly ferrous and alumina. Nelson. See also acid drainage. A.G.I.

acid mine water. Mine water which contains free sulfuric acid, mainly due to the weathering of iron pyrites. A pit water, which corrodes iron pipes and pumps, usually contains a high proportion of solids per gallon, principally the sulfates of iron, chiefly ferrous and alumina. Nelson. See also acid drainage. A.G.I.

acid mine water. Mine water which contains free sulfuric acid, mainly due to the weathering of iron pyrites. A pit water, which corrodes iron pipes and pumps, usually contains a high proportion of solids per gallon, principally the sulfates of iron, chiefly ferrous and alumina. Nelson. See also acid drainage. A.G.I.
acid polishing

article in an acid bath for a few minutes, rinsing in water and brushing out the cut parts. C.T.D.

acid proofing. A steelmaking process, either Bessemer, open-hearth, or electric, in which the furnace is lined with a siliceous refractory and the pig iron low in phosphorus is required, as this element is not removed. See also basic process. C.T.D. b. One which employs an acid slag. Bureau of Mines Staff.

acidproof brick. Brick having low porosity and permeability, and high resistance to chemical attack or penetration by most commercial acids and some other corrosive chemicals. H.W.

acid radical. That part of the acid which cannot be replaced by a metal; for example, SO₄ in sulfuric acid (H₂SO₄). Cooper.

acid-recovery operator. In the coke products industry, one who recovers sulfuric acid used in processing coke-gas byproducts by cooking sludge with steam in acid regenerator pans. Also called acid regenerator. D.O.T. Supp.

acid refractories. Refractories containing a substantial amount of silica that may react chemically with basic refractories, basic slags, or basic fluxes at high temperatures. ASTM C71-64.

acid refractory material. A general term for those types of refractory material that contain a high proportion of silica, for example, silica refractories (greater than 92 percent SiO₂) siliceous refractories (78 to 92 percent SiO₂). The name derives from the fact that silica behaves chemically as an acid and at high temperatures reacts with bases such as lime or alkalis. Dodd.

acid refractory products. Forming those made of clay-silica mixtures or pure silica. Rosenthal.

acid resistance. The degree of resistance of the ceramic surface to attack by acids, (that is, porcelains enamels, chemical stoneware, glazes, etc.). Bureau of Mines Staff.

acid resistance of vitreous enamels. In the United States the acid resistance of vitreous enamels at (nominal) room temperature was determined by exposing the enamelled surface to 10 percent citric acid for 15 minutes at 80°F ASTM C282. Five classes of enamels are distinguished according to their frequent appearance: AA: no visible stain and passes dry-rubbing test; A: passes blurring-highlight test and wet-rubbing test; B: passes blurring-highlight test; fails wet-rubbing test; C: fails blurring-highlight test; passes disappearing highlight test; D: fails disappearings highlight test. Dodd.

acid-resistant brick. Brick suitable for use in contact with chemicals usually in conjunction with acid-resistant mortars. ASTM C43-65T.

acid rock. Loosely used in petrology, genera lly defined as one of the following: (1) An igneous rock containing 66 percent or more of silica, free or combined, in this sense quartz, feldspar, mica; (2) an igneous rock in which minerals high in silica, such as quartz, alkaline felds par are dominant; and (3) very loosely, an igneous rock composed dominantly of light-colored minerals. In all three senses contrasted with the term misleading, undesirable, and becoming obsolete. As used in the first sense, it is being replaced by felsic or peraluminous; as used in the second sense, it should be replaced by felsic or a term denoting the dominant mineral, and as used in the third sense, it has been replaced by leukocratic. See also acidic, a. Fay.

acid salt. A salt containing hydrogen, (for example, KH₂SO₄). A.G.I. b. A salt which dissolves to yield a solution containing an excess of H⁺ ions over OH⁻ ions, whether or not it contains hydrogen in its formulas, (for example, FeCl₃). A.G.I.

acid scaling. Raw shapes dipped in acid or sprinkled with acid and annealed. Bryant.

acid slag. One which contains substantial amounts of active silica. Bureau of Mines Staff.

acid sludge. Products of refining of tar, shale oil, petroleum in which sulfuric acid reacts to form a sulfonic acid mixture, green acids, and sulfuric acid. Used in the flotation process, and in proprietary collector agents for flotation of iron ores. Pryor.

acid soil. A soil deficient in available bases, particularly calcium, and gives an acid reaction when tested with standard methods. Stokes and Varrone, 1955.

acid steel. Steel melted in a furnace with an acid bottom and lining and under a slag containing an excess of an acid substance, such as silica. ASM Gloss. See also acid process.

acid strength of. Related to ability to liberate hydrogen ions from solution, and hence-to-electrical conductivity of equivalent aqueous solutions of acids. Pryor. 3.

acid sulfate. Compound containing or dissociating to give the ion, HSO₄. Pryor. 3.

test. a. Synonym for acid-dip survey. Long. b. A severe or decisive trial, as of usability or authenticity. Long.

acid tube. Synonym for acid bottle. Long.

acid treatment. The process of agitating petroleum products with sulfuric acid to remove undesirable compounds. Hess.

acid tube. Synonym for acid bottle. Long.

acidulose. Cold mineral waters, especially those impregnated with carbonic acid. Fay. Pay.

acid-vial culture tube. Synonym for acid bottle. Long.

acid water. Water charged naturally with carbon dioxide. Also applied to natural waters containing sulfur compounds, especially sulfates. Bureau of Mines Staff.

acicular. An alloy containing 92 to 97 percent aluminum and offered as a metal of strength and lightness and noncorrosive suitable for use in the construction of automobiles, aircraft, military equipment, railroad cars, valves, hardware, and for the manufacture of helmets. It is silver white, and has a specific gravity of 2.82 and a melting point of 1,382°F. Its tensile strength in 1/16 inch rod given as 10,000 pounds per square inch, and in rods and sheets as 28,000 to 64,000 pounds and heat-treated as upwards of 70,000 pounds per square inch. Fay.

aciform. From the Latin acinus, meaning date-grape or the cluster of grapes or a cluster of berries. Included are clusters of grapes, clusters like grapes. Also, full-leaved leaves or any leaves like a grape. Bureau of Mines Staff.

acinos. Synonym for aciniform; acinos. Bureau of Mines Staff.

acidic acid. Having no inclination or dip; situated where a magnetic needle if suspended freely has no dip or inclination and assumes a horizontal position, as the acinic line or magnetic equator. Webster, 3d.

acinic line; dip equator; magnetic equator. The line through those points on the earth's surface at which the magnetic inclination is zero. The acinic line is a particular case of an isoclinic line. HGÖ.

ACL kiln; Lepol kiln. ACL is a trademark of the Allia-Chalmers Manufacturing Company in the United States. Lepol is a trademark of Polyiusia Company, Germany. Both terms refer to a traveling grate preheater for a portland cement batch prior to its being fed to a rotary cement kiln; with this attachment, the length of a rotary cement kiln can be halved. Dodd.

acme thread. A screw thread, the section of which is between the square threads and the V threads. Used extensively for feed screws. Citrin.

acmite. A brown or green silicate of sodium and iron, essentially NaFe₅O₉·(Si₂O₅)₃, belonging to the pyroxene group and often found in long prismatic crystals characteristically pointed. The variety aegirine is common in certain igneous rocks, occurs in blunted terminated crystals and also in capillary and fibrous forms. Webster 2d. Monocline; Mohs' hardness, 6 to 6.5; specific gravity, 3.5. Dana 17.

acme trachyte. A trachyte in which the pyroxene is acmite or aegirine and the feldspar is anorthoclase. It differs from normal trachyte in that its predominant alkali is soda instead of potash. Acmite trachyte is intermediate between true trachyte and phonolite. First described from the Azores and also found in the Crazy Mountains. Mont. Fay.

acoustic. Used when it modifies designates something which has the properties, dimensions, or physical characteristic which is intimately associated with sound. Hy.

acoustic axis. See axis of acoustic symmetry. HGÖ.
acoustic dispersion. Acoustic dispersion is the change of speed of sound with frequency. H&G.

acoustic impedance. The acoustic impedance is the quotient obtained by dividing the power of the acoustic energy being transmitted at a given time through a given area by the magnitude of this area as the unidirectional steady-state force. H&G.

acoustic interferometer. An instrument designed for measuring strains, for example, to provide a continuous vertical profile of the change of speed of sound with frequency, and by the motion of which sound energy is transmitted in air, in water, or in the earth. The wave may be described in terms of change of pressure, of particle displacement, or of density. A.G.I. b. Used increasingly to study the physical properties of rocks, and composition of gases. Investigations may be made both in situ and in the laboratory. Nelson.

acoustic theodolite. An instrument designed to provide a continuous vertical profile of ocean currents from the bottom to the surface in a specific location. H&G.

acoustic waves. a. The waves which contain sound energy and by the motion of which sound energy is transmitted in air, in water, or in the earth. The wave may be described in terms of change of pressure, of particle displacement, or of density. A.G.I. b. Used increasingly to study the physical properties of rocks, and composition of gases. Investigations may be made both in situ and in the laboratory. Nelson.

Ac-plane. In structural petrology, a plane at right angles to the surface of movement. The ac-plane is the direction of eutectic transport, and c, the axis perpendicular to the surface of movement.

acre. a. A measure of surficial area, usually of land. The statute acre of the United States and England contains 4,836 square feet (43,560 square yards) = 0.4047 hectares = 4,047 square meters, or 1/640 of a square mile. Standard, 1964, b. Can. In Quebec, a linear measure that equals the square of 13.2 feet or approximately 20.7 feet. Fay. c. For the calculation of coal reserves, a convenient rule is to allow 1,200 tons per foot of strike length, 1,500 tons per foot of dip length. A.C.I.

d. May be used, for example, to measure vegetation, such as height, absorption, or impedance. H&G.

acoustic log. A continuous record made in a wellbore showing the velocity of sound waves over short distances in adjacent rock; velocity is related to porosity and the liquid occupying pores. A.G.I. A.C.I.

acoustic methanometer. An instrument to determine the concentrations of methane at points in the underground fire damp drainage pipes. It is based on the principle that sound travels much more rapidly in methane than in air and the intermediate velocity in a simple mixture can be used as a measure of the proportion of the two gases. A range of 40 to 90 percent methane is usually covered. New regulations which became effective in July 1961 call for automatic shutdown of methane drainage plants if the drained gas falls below 40 percent methane. Nelson.

acoustic radiation pressure. The acoustic radiation pressure is a unit directional steady-state force exerted upon a surface exposed to an acoustic wave. Such a steady radiation force is quite small in magnitude and is really observable only in the presence of very intense sound waves. H&G.

acoustic radionuclide. An instrument for measuring acoustic radiation pressure by determining the unidirectional steady-state force resulting from reflection or absorption of a sound wave at its boundaries. H&G.

acoustic resistance. Product of longitudinal wave velocity and density, being the property that controls the reflective power at a boundary plane. Schlierflecker.

acoustics. The science of sound, including its production, transmission, and effects. Hg. acoustic scattering. The irregular reflection, reflection, or diffusion of sound waves in many directions. Hg.

acoustic sounding. The indirect evaluation of the properties of the sea by measuring the length of time necessary for a sound wave to travel to the bottom, reflect and return back to the water surface. H&G.

acoustic strain gage; sonic gage. An instrument for measuring strain, for example, it can be attached to shafts or rotating gears. It contains a length of fine wire under tension, the tension being varied by the strain to which the gage is subjected. The measurement is made that is of the frequency of vibration of the wire when it is plucked by means of a current of magnetic impulse and this measurement can be made with great accuracy. The gage is highly stable and readings can be made over a period of years without any fear of zero drift. See also electrical resistance strain gage; mechanical extensometer. Nelson.

acoustic theodolite. An instrument designed to provide a continuous vertical profile of ocean currents from the bottom to the surface in a specific location. H&G.

acoustic waves. a. The waves which contain sound energy and by the motion of which sound energy is transmitted in air, in water, or in the earth. The wave may be described in terms of change of pressure, of particle displacement, or of density. A.G.I. b. Used increasingly to study the physical properties of rocks, and composition of gases. Investigations may be made both in situ and in the laboratory. Nelson.

Ac-plane. In structural petrology, a plane at right angles to the surface of movement. The ac-plane is the direction of eutectic transport, and c, the axis perpendicular to the surface of movement.

actinium. Actinium is located in the actinide series; symbol, Ac; emits alpha and beta rays; half-life, 22.2 minutes; and degrades to AcB (bismuth 211). A-C-B; atomic number, 89; atomic weight, 227; isotopic with RaB (lead 214). RaD (lead 210), ThB (lead 212), and lead; emits beta rays; half-life, 2.6 minutes; and degrades to AcB (bismuth 211). H&G.

actinium. A radioactive element found in nature as a constituent of all uranium ores. A ton of pure pitchblende contains 0.15 milligram of actinium. Actinium has an atomic number of 89 and is the first member of the actinium series. C.C.D. 64, 1961, b. The elements with atomic numbers above 88. According to many authorities, these elements occupy one single place in the extended periodic table. In the same group into which the rare earth elements (lanthanides) are classified. G. Nay, c. Radioactive elements, atomic numbers 89 to 103. HURD.

actinium. A radioactive element found in nature as a constituent of all uranium ores. A ton of pure pitchblende contains 0.15 milligram of actinium. Actinium has an atomic number of 89 and is the first member of the actinium series. C.C.D. 64, 1961, b. The elements with atomic numbers above 88. According to many authorities, these elements occupy one single place in the extended periodic table. In the same group into which the rare earth elements (lanthanides) are classified. G. Nay, c. Radioactive elements, atomic numbers 89 to 103. HURD.
actinium C'. a. A name for polonium 211, a member of the actinium disintegration series. NRC-ASA N1.1-1957. b. A name for thallium 207, a member of the actinium disintegration series. See actinium emanation. Hess.

actinium disintegration series. a. A series of radioactive elements formed by the degradation of AcC (bismuth 211); symbol, AcC"; atomic number, 88; atomic weight, 223 (radium 223); isotopic with radium, thorium, and thorium (radium 224; symbol, ThX); emits alpha rays; half-life, 11.7 days; and degrades to AcD (actinium 219; actinon emanation; symbol, Ac or AcEm). Hess; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-82; Glasstone, 2, p. 135.

actinium emanation. See actinium disintegration series. CCD 6d, 1964, p. 63.

actinium X. The daughter of actinium C" formed by the degradation of RaDc (radioactinium; thorium 227) and of AcE (actinium C; francium 223); symbol, AcX; atomic number, 88; atomic weight, 223 (radium 223); isotopic with radium, thorium, and thorium (radium 224; symbol, ThX). Hess, Glasstone, 2, p. 135.

actinium actinon. a. A gaseous, inert, very short-lived radioactive element of the actinium disintegration series and formed by the degradation of AcX (actinium X; radium 223); symbol, An or AcEm; atomic number, 86; atomic weight, 219 (radon 219); isotopic with radon and thoron (radon 220; symbol, Tn); emits alpha particles; half-life non; and degrades into AcA (actinium 215). Hess; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-81.

actinoform. Having a radiate form. Rice.

actinolite. A natural hydroxy-calcium-magnesium-iron silicate Ca(Mg,Fe)2SiO(Si,OH); green color; monoclinic; luster vitreous to silky; floures to granular; fibers brittle; Mohs' hardness, 5.6; specific gravity, 2.9 to 3.2. Found in the United States, Canada, and Europe. Used as a minor asbestos mineral in building material. An amphibole. CCD 6d, 1961.

actinohydrolytic. Pertaining to the action of an actinomorphic enzyme. Glu.

actinohydrolysis. a. The changing of the passive surface of a metal to a chemically active state. Contrast with passivation. ASM Gloss. b. In the flotation process of ore dressing, the process of altering the surface of specific mineral particles in an ore pulp to promote adherence of certain reagents. Also called activation. B.F. 255. c. The process of adding a catalyst or catalyst carrier. CCD 6d, 1961.

catalyst. A substance which when added to a mineral pulp promotes flotation in the presence of a collecting agent. Also called activator. B.F. 255. CO2 is an element used particularly in differential mineral flotation to help clean the mineral surface so that a collector may adhere and permit or aid its floatability. Frequently used to permit floating minerals that had been previously depressed. Mitch.

catalyzed. a. The changing of the passive surface of a metal to a chemically active state. Contrast with passivation. ASM Gloss. b. In the flotation process of ore dressing, the process of altering the surface of specific mineral particles in an ore pulp to promote adherence of certain reagents. Also called activation. B.F. 255. c. The process of adding a catalyst or catalyst carrier. CCD 6d, 1961.

activation analysis. a. The process of making a material radioactive by bombardment with neutrons, protons, or other nuclear particles. See also activation energy; activator; activation. Pryor, 3. d. The process of adding a catalyst or catalyst carrier. CCD 6d, 1961.
activation analysis

nuclear radiation. The newly radioactive atoms in the sample give off characteristic nuclear radiations that can identify the atoms and indicate their quantity. Activation analysis gives more specific information than chemical analysis. It is being used more and more in research, industry, and criminal investigation, and other areas. L.O.I.

activation energy. The energy required for initiating a physical or chemical transformation, in particular a metallurgical reaction; for example, plastic flow, diffusion, or chemical reaction. The activation energy may be calculated from the slope of the line obtained by plotting the natural log of the reaction rate versus the reciprocal of the absolute temperature. A.M. Gold.

activator. a. In flotation, a chemical added to the pulp to increase the floatability of a mineral in a froth, or to refloat a depressed (sunk) mineral. Also called activating reagent. C.T.D. b. A reagent that affects the surface of minerals in such a way that it is easy for the collector atoms to attach themselves to the mineral surface. E.R.I.

active agents. Surface-active substances which impart reactivity on minerals. Fay.

active lime. That portion of total lime which is available for external attraction, for example, plastic flow, diffusion, or chemical reaction. The active lime permits the application of the law of mass action. C.T.D.

actual age. In geology, the age of a given feature or event expressed in years or centuries. This can seldom be ascertained accurately, and most geologic estimates are subject to wide margins of error. Stokes and Varnes, 1955.

actual aggregate breaking strength. The sum total of the actual tensile tests which have been made on wires before manufacture into wire rope. Ham.

actual breaking strength. The breaking load obtained from a tensile test to destruction on a sample of rope. Ham.

actual horsepower. The horsepower really obtained from a tensile test to destruction on a sample of rope. Ham.

actual performance curve. A performance curve showing the results actually obtained in a tensile test to destruction on a sample of rope. Ham.

actual size. The size to which a rock core is reduced to obtain satisfactory cores and samples of rock. Originally used to mount wheels in which the holes are larger than the machine arbors. See also conditioner. L.E.

actual size. The size to which a rock core is reduced to obtain satisfactory cores and samples of rock. Originally used to mount wheels in which the holes are larger than the machine arbors. See also conditioner. L.E.

actual tensile strength. The true tensile strength of a given mineral specimen. Fay.

actual aggregate breaking strength. The sum total of the actual tensile tests which have been made on wires before manufacture into wire rope. Ham.

actual breaking strength. The breaking load obtained from a tensile test to destruction on a sample of rope. Ham.

actual horsepower. The horsepower really obtained from a tensile test to destruction on a sample of rope. Ham.

actual horsepower. The horsepower really obtained from a tensile test to destruction on a sample of rope. Ham.

actual performance curve. A performance curve showing the results actually obtained in a tensile test to destruction on a sample of rope. Ham.
gent evoluition. A.G.I.
adptive metallurgy. Branch of metallurgy that deals with use of metals and alloys. Fay. 

added elements. Any elements added in relatively small amounts to an alloy for scavenging or modifying its properties. Bennett, 2d, 1962. 

additive. A correction applied to times of seismic reflections measured from an arbitrary time origin. The additive is normally applied for the purpose of translating the time origin chosen for computation, and it is usually in the same units as shot time. A.G.I. 

additional constant. The length, which must be added to the product of the intercept, on the staff in stadia work and the multiplying constant, to give the true distance from the center of the telescope to the staff. The length is often less than 1 foot. Ham. 

add; ad. N. of Eng. To earn by labor. Fay. 

addings. A term used in the northern and parts of other coalfields in Great Britain to denote the miner’s wages. Nelson. 

adder muscles. A muscle passing across from one valve of a bivalve to the other, for the purpose of closing the shell. Shipley. 

adhesion. 1. The cohesion of a gearwheel. Crispin. 

adhesion-type ceramic veneer. Ceramic slabs approximately 1/8 thick, held in place by the adhesion of the mortar to the ceramic veneer and the backing wall. No metal anchors are required. See also ceramic veneer. ACG. 

adhesive. A substance capable of holding materials together by surface attachment. CDD 6d, p. 218. 

adhesive force. The frictional grip between two surfaces in contact, for example, between the tire of a locomotive and the rail; the product of the weight on the wheel and the friction coefficient between the wheel and the rail. Nelson. 

adhesive state. A very absorbent state that adheres to the tongue if touched by it. Standard, 1964. 

adiabatic. A change at constant total heat. An action or a process during which no heat is added or subtracted. Strock, 12. 

adiabatic calorimeter. A calorimeter which measures adiabatic temperature changes. The theoretical maximum temperature that would be attained if no heat were lost to the surroundings. Newton, p. 125. 

adiabatic compression. Compression in which no heat is added or subtracted from the air, which cools during the expansion because of the work done by the air. Lewis, p. 665. 

adiabatic efficiency. This is obtained by dividing the power, theoretically necessary to compress the air and deliver it without loss of heat, by the power supplied to the fan shaft. Roberts, 1, p. 186. 

adiabatic expansion. Expansion in which no heat is added to or subtracted from the air, which cools during the expansion because of the work done by the air. Lewis, p. 663. 

adiabatic phenomena. Those which occur without a gain or loss of heat. Hy. 

adiabatic reaction. A reaction which takes place without transfer of heat to or from the body concerned. Hess. 

adiabatic temperature changes. The compression of a fluid without gain or loss to the surroundings is work performed on the system and produces a rise of temperature. In very deep water such a rise of temperature occurs and must be considered in the vertical temperature distribution. Hy. 

adiagnostic. Proposed by Zirkel and applied to mineral constituents of a rock that cannot be distinguished even with the aid of a microscope. Johannsen, v. 1, 2d, 1939, p. 164. 

adiosine. A dense, felsitic, contact-metamorphic rock composed chiefly of exceedingly fine-grained quartz and albite; the soda may reach 10 percent. From the fact that certain minerals are in smaller quantities. Ainosine are formed by reactions following the intrusion of mafic-ultramafic magma (spilitic; desmitite). They also make up beds in metamorphic rocks (Compare porphyroid; halleflinta). Hess. 

adiosine. A dense, felsitic, contact-metamorphic rock composed chiefly of exceedingly fine-grained quartz and albite; the soda may reach 10 percent. From the fact that certain minerals are in smaller quantities. Ainosine are formed by reactions following the intrusion of mafic-ultramafic magma (spilitic; desmitite). They also make up beds in metamorphic rocks (Compare porphyroid; halleflinta). Hess.

From the fact that certain minerals are in smaller quantities. Ainosine are formed by reactions following the intrusion of mafic-ultramafic magma (spilitic; desmitite). They also make up beds in metamorphic rocks (Compare porphyroid; halleflinta). Hess. 

a-dipping. Scot. Toward the dip. Fay. 

d. A horizontal or nearly horizontal passage driven from the surface for the working or unwatering of a mine. If driven through the hill or mountain to the surface on the opposite side it would be a tunnel. Lewis, p. 21. Also called drift; adit level. 

adit. An adit. A horizontal or nearly horizontal passage driven from the surface for the working or unwatering of a mine. If driven through the hill or mountain to the surface on the opposite side it would be a tunnel. Lewis, p. 21. Also called drift; adit level. 

a-dipping. Scot. Toward the dip. Fay. 

d. A horizontal or nearly horizontal passage driven from the surface for the working or unwatering of a mine. If driven through the hill or mountain to the surface on the opposite side it would be a tunnel. Lewis, p. 21. Also called drift; adit level. 

a-dipping. Scot. Toward the dip. Fay. 

a-dipping. Scot. Toward the dip. Fay. 

adit end. The furthest end or part of an adit from its beginning, or the very place where the miners are working underground towards the mine. Hess.

adit level. Mine workings on a level with an adit. Hess.

adjacent. As generally defined and understood, means, by or near, and close, but not actually touching; nonadjacent, representing the opposite situation, means not near, and not close. Ricketts, I.

adjacent sea. Semienclosed sea adjacent to and connected with the oceans. The North Polar, Mediterranean, and Caribbean Seas are examples. Synonym for marginal sea. A.G.I.

adjoining. To be in contact; to lie next to. Jones.

adjutable bed. Bed of a press designed so that the die space height can be varied conveniently. ASM Glass.

adjusting screw. An accurately machined adjustable bed. Bed of a press designed so that the adhesives are calcareous. Similar deposits are found in other desert basins. The agent of deposition seems to be mainly water and the places of deposition are more or less flat areas in the central and lower parts of desert basins. The materials, in part at least, have been produced from the rocks of the desert slopes through both decomposition and disintegration. A.G.I. b. The mixed earth or clay of which such bricks are made. Standard, 1964, c. In mining, a brick of pulverized ore mixed with clay, as in quicksilver metallurgy. Fay. d. Synonym for mandrel. Long. e. A firm sticky clay. Long.

adobe brick. A large clay brick, of varying size, roughly molded and sun-dried. ACGS.

adobe flat. A broad flat formed by deposition from sheetfloods and floor with sandy clay or adobe. The surface, when dry, is normally hard, smooth, and somewhat streaked in appearance due to the presence of fine crenulations in the direction of flow. USGS Bull. 730, 1923. pp. 69-70.

adoberia. An adobe kiln or yard. Hess.

adobe shot. Ordinarily referred to as a dobe shot. A stick or part of a stick of dynamite is laid on the rock, is broken and covered with mud to add to the force of the explosion. A mudcap shot. Hess.

adolescent river. In physical geology, a river in the stage where it has acquired a well-cut channel, sometimes reaching baselevel at its mouth, and a graded bed. Standard, 1964.

A drill rod. A former standard diamond-drill rod superseded in 1954 by the DCDMA standard AW drill rod. Long.

adhesion. A. The work of excavating as mining advances. A.G.I. b. Substitution of a common element by a trace element or water) which is added in small quantity adsorbed and that not adsorbed at a constant temperature. Pryor, 3.

adsorption. A solution of dissolved substances, or of liquids by the surface of a solid, particularly clay or adobe. The surface, when dry, is normally hard, smooth, and somewhat streaked in appearance due to the presence of fine crenulations in the direction of flow. USGS Bull. 730, 1923. pp. 69-70.

adsorb. To condense and to hold a gas on the surface of a solid, particularly clay or adobe. The surface, when dry, is normally hard, smooth, and somewhat streaked in appearance due to the presence of fine crenulations in the direction of flow. USGS Bull. 730, 1923. pp. 69-70.

adsorbate. That which is adsorbed by an adsorbent. Pryor, 3.

adsorption. Proximate. The two histogram classes adjacent to the maximum class in the graphic representation of particle size analysis. A.G.I.

adsorbs. Materials added to mortar as water-repellent or coloring agents or to retard or speedup setting. ACGS.

adolescent river. A river in the stage where it has acquired a well-cut channel, sometimes reaching baselevel at its mouth, and a graded bed. Standard, 1964.

adularization. The introduction of or placement by adularia, as in the potash flotation process. Bureau of Mines Staff.

advanced, advance. The work of excavating as mining goes forward in an entry and in driving a cut channel, sometimes reaching baselevel at its mouth, and a graded bed. Standard, 1964.

advanced gallery. A small heading driven in advance of the main tunnel in tunnel excavation. Fay.

advanced gates. Gate roads that are driven simultaneously with the longwall entry but which are not advanced more than 10, 20, or more yards in advance of the face. The area immediately ahead of the coal face

adverse claim. A claim made to prevent the patenting of part of the ground within the area in question; for example, an adverse claim of ground located under a house would include the part of his claim that is overlapped by the interest of his coowner to be forfeited upon death of the joint tenant, if the coowner has transferred his interest in the property. The term is used in a legal sense to mean nothing more than the intention of the dissessor to appropriate and use the property, whether in fact it is so used or not. See also adverse intent. Nov. 3. c. The process of relieving the effects of caviation by admitting air to the section affected. Seelye, 1. d. The process of mixing air or other gases with water, sewage, etc. Seelye, 1.

adverb. A term used to express the result of the action of a joint owner of a mining claim who by proper notices causes the intention to acquire by purchase for failure to perform his share of the assessment work. Fay.

adz. A cutting tool with the blade set at right angles to the handle; used for rough dressing timber. Crispin. Also spelled advr. Webster 3d.

dead-eye hammer. Usually the claw-type nail hammer in which the eye is extended to give a longer bearing on the handle than is the case with other hammers. Crispin. AEC Abbreviation for Atomic Energy Commission. GPO Style Manual, p. 155.

adze. A device used to measure the effect of the atmosphere on Portland cement during storage. Air dry has no effect, but if it is exposed to moist air both moisture and carbon dioxide are absorbed with erratic effects on the setting behavior. See also air entraining. Dodd.

aeration, zone of. The zone in which the interstitial fluid of the parent rock minerals are not (except temporarily) filled with water under hydrostatic pressure; the interstitial fluid is either air or are filled with water that is held by capillarity. Rice.

Aereos apparatus. A liquid-air type of breathing apparatus which is smaller and lighter than the Aerophor apparatus. The entire apparatus is carried on the wearer's back and has a weight of only 32 pounds, which is 8 pounds lighter than the Aerophor breathing apparatus. The mouthpiece of the Aereos apparatus has been specially designed to prevent the involuntary inhalation of the outside atmosphere should the mouth or nose muscles become slack. McAdam, pp. 32-44.

Aerex fan. Trade name for an axial-flow type of mine fan. It has the advantages of high efficiency, small size, and high operating speeds. See also fan, 1. Nelson.

aerial. Relating to the air or atmosphere. Subaerial is used to denote land occurring under the atmosphere as subaqueous. See also air entraining. Webster 3d.
aerial magnetometer

ure variations in the earth's magnetic field while being transported by an aircraft. Same as airborne magnetometer. A.G.I.

aerial tramway. A system for the transport of continuous vertical photographs from an airplane for geophysical and other purposes. One such method employs a steel cable, usually mounted 35-foot, millimeter positioning camera, which photographs continuously the track of the aircraft. From the prints obtained, a mosaic map is closely examined through double-eye pie viewers, etc., and the possible nature of the geology and subsurface structure can be inferred by trained geologists. See also profile flying; radio altimeter. Nelson.

aerial railroad. A system of wires from which to suspend cars or baskets, as in hoisting ore. Standard, 1964. See also aerial tramway. Fay.

aerial rope way. System of ore transport used in rough or mountainous country. A cable is carried on pylons, and loaded buckets are (1) towed from loading point to discharge; (2) suspended from a carriage running on this cable, and then returned empty along a second cable; or (3) the whole cable moves continuously carrying buckets which hang from saddle clips and are loaded and discharged automatically or by hand control. Pryor, 3. See also bicable; jig-back; monocable; aerial tramway. Standard, 1964. "A Offices. Synthetic water-soluble polymers used as flocculating agents. Bennett 2d, 1962. 44.

aerofall. A short, cylindrical grinding mill with a large diameter used dry, with either coarse lumps of ore, pebbles, or steel balls as crushing bodies. The mill load is air-sewn to remove finish mesh material. Pryor, 3. 1961.

aerograph. A device for spraying powdered glass or mineral on the surface of pottery by means of compressed air. Dodd.

aerodynamic. 1. Pertaining to or affecting the motion of gases in the body. The disease is characterized principally by urticarial pain, cramps, and swelling, and sometimes results in death. Also known as decompression sickness. H.O.G.

aerodynamic instability. Flutter which may occur in a structure exposed in wind forces. This form of instability can be guarded against by suitable design. Ham.

aeronautical. The science or liberation of gases in the blood vessels of the body, as brought on by a change from a high, or relatively high, atmospheric pressure to a lower one. H.O.G. b. The disease or condition caused by the formation or liberation of gases in the body. The disease is characterized principally by urticarial pain, cramps, and swelling, and sometimes results in death. Also known as decompression sickness. H.O.G.数组.

aerofall mill. A short, cylindrical grinding mill with a large diameter used dry, with either coarse lumps of ore, pebbles, or steel balls as crushing bodies. The mill load is air-sewn to remove finish mesh material. Pryor, 3. 1961.

aerofocls. An apparatus containing a supply of compressed air for respiration, as for a miner. Webster 3d.

aerofolic. An obsolete term for siderolite. A.G.I.

aerosol. A suspension of ultramicron size or liquid particles in air or gas, as smoke, fog, or mist. Webster 3d.

aerosol. Trade name of strong wetting agent based on sulfonated bi-carboxylic esters. Hest.数组.

aerugite. A green to brown nickel arsenate, perhaps SnNiOAsO; an analysis gave 48.77 percent nickel. It is an oxidized ulvöspinel mineral. Hest.

aerug. a. Copper rust; verdisol; especially, green copper rust adhering to old bronzes. Standard, 1964. b. Copper carbones, due to weathering of the metal; especially, the patina adhering to old bronzes. Hest.数组.

aeruginite. A black to transparent yellowish-brown, complex orthorhombic titanocolumbium of thorium and the cerium metals with some iron, calcium, etc.; 32 to 37 percent, CbO2; 21 to 42 percent, TIO2; 19 to 24 percent, cerium earths; 1 to 3 percent, rare earth oxides. Specific gravity, 4.93-5.17; in pegmatites. Hest.数组.

aeruit. Basalt; Metarciamic Harbite, an isometric HgS. Dana 6d, p. 63.

aetite. A nodule consisting of a hard shell of hydrated oxide of iron within which the yellow oxide becomes progressively softer toward the center which is sometimes empty. Fay. b. Synonym for eagletone. Standard, 1964.

AFA rammer. Apparatus designed by the American Foundrymen's Association for the preparation of test pieces of foundry sand; it has also been applied as a method for the preparation of test pieces of particulate refractory materials. The rammer operates by a 14-pound weight falling through a height of 2 inches on the plunger of a 2-inch diameter mold; normally, the weight is allowed to fall on the mold three times. Dodd.

A-frame headgear. A steel headgear consisting of two heavy plate A-frames, set fit for breathing. Fay. b. A portable apparatus containing a supply of compressed air for respiration, as for a miner. Webster 3d.

A-frame headgear. A steel headgear consisting of two heavy plate A-frames, set fit for breathing. Fay. b. A portable apparatus containing a supply of compressed air for respiration, as for a miner. Webster 3d.

aerolite. A stony meteorite in which silica and silicates. CCD 6d, 1961.

aerology. A science dealing with the study of the composition of gases in the body. The disease is characterized principally by urticarial pain, cramps, and swelling, and sometimes results in death. Also known as decompression sickness. H.O.G.数组.

aerole. A stony meteorite in which silica and silicates. CCD 6d, 1961.

aeromagnetic prospecting. A technique of exploration of an area using an aerial magnetic meter to survey that area. A.G.I.

aerometer. An instrument for ascertaining the weight or the density of air or other gases. Pryor, 3.

Aeromine Promoters. Trademark for a group of cationic flotation reagents. Used in the flotation of ores and minerals, primarily silica and silicates. CCD 6d, 1961.

aeropone. A respirator in the form of a tank which contains, in one or more compartments from the lungs, and containing chemicals designed to revive the air to render the air fit for breathing. Fay. b. A portable apparatus containing a supply of compressed air for respiration, as for a miner. Webster 3d.
A-frame headgear

east: the shaft mouth. They are braced together and carry the heavy girders which support the diaphragm plate. It is a completely self-supporting and rigid structure and leaves more usable space around the collar. It includes a guide-tower structure built over the shaft collar. A number of these headgears have been erected in the Republic of South Africa. Nelson.

African nephrite. Same as Transvaal nephrite. afterburst. a. A rock burst is sometimes followed by an afterblast. Continued blowing of air through a fissure subsequent to a rock burst. Pryor, 3.

aftercooling. The cooling of a reactor after the principal reaction has ceased. Most of the afterheat is due to the decay of fission products. D.L.

aftergases. Gases produced by mine explo- sions or mine fires. Fay.

afterheat. The heat produced by the continuing decay of radioactive atoms in a nuclear reactor after the fission chain reaction has ceased. D.L.

agglomerate. 16

agate. Aagate consisting of Jasper, containing veins of chalcedony. Dana.

agate opal. Optalized agate. Fay.

agate shell. Same as agate snail, a large land snail with a shell of pure agate. Shipley.

agate ware. A. An enameled iron or steel ware used for household utensils. Used exclusively as table equipment in miners' camps and boarding houses. Fay. b. Pottery, veined and motled to resemble agate. Standard, 1964. c. Bodies formed by blending differently colored clays (known as solid agate), or by covering surfaces with differently colored slips. C.T.D.

agateous. Producing or containing agate. Shipley.

ag大涨. Like or pertaining to agate. Shipley.

agateite. To change into, or cause to resemble an agate. Shipley.

agatized wood. A variety of silicified wood which resembles any variety of agate. Shipley.

AGC Automatic gain control. An electronic device used in television and radio amplifiers to keep the overall recording level from varying more than a controlled amount.

agatification. The ratio of daughter to parent isotope; the term is often used to indicate a ratio that is perturbed by some factor and, therefore, not indicative of the absolute age of the mineral. A.G.I.

agglomerate. A brecia composed largely of angular volcanic clasts. More specifically, a heterogeneous mixture of fragments of volcanic and other rocks.
agglomerate
filling the funnel or throat of an extinct or quiescent volcano. Fay, b. To collect into a ball, heap, or mass; hence, to gather into a heap or mass; as to agglomerate coal. Webster 3d. c. Contem- poraneous pyroclastic rock containing a predominance of round or subangular frag- ments larger than 32 millimeters in diam- eter. A.G.I.

agglomerate belt flotation. A coarse-fraction concentration method used in milling pep- ble phosphate in which conditioned feed at 70 to 75 percent solids is placed on a flat, vibrating belt traveling at a rate of about 75 feet per minute. Water sprayed on the surface of the pulp aerates the pulp causing agglomerates of phosphate particles to float to the side of the belt for removal. The silica fraction travels the length of the belt and is permitted to flow off the opposite end. Baffles are positioned at approp- riate points along the belt to stir the material so that trapped phosphate par- ticles are given an opportunity to float. Concentrate from the first belts or rougher operation, is cleaned on a second belt for further silica removal. Tailings from the cleaning operation are recycled to the rougher circuit. Arberit, p. 536.

agglomerated. Bonded aggregate. V.V.

agglomerating value. A measure of the bind- ing qualities of coal but restricted to describe spalled-off scoria in the interstices between the blocks, and by the general absence of an ash or tuff matrix. A.G.I.

agglutinating power. See caking index. Nelson.

agglutinating value. A measure of the binding qualities of a coal and an indication of its caking or coking characteristics. Applicable with reference to the ability of fused iron to precipitate an inert material as sand. Compare agglomerating value. A.G.I.

agglutinating-value test. A laboratory test of the coking properties of coal, in which a determination is made of the strength of buttons made by mixing powdered coal and 15 to 30 times its weight of sand. Bureau of Mines Staff.

aggradation. a. The natural filling up of the bed of a watercourse at any point of weakening of the current, by deposition of detritus. Standard, 1964. b. Specifically, the building up of fanlike graded plains by streams in arid regions by the shifting of the streams and the loss of the water in the soils. Contrast ed with degradation. Standard, 1964. c. The process of building up a surface by deposition. A.G.I. d. The growth of a permafrost area. A.G.I. e. See also aggradation plain.

aggradation plain. A topographic plain built up by aggradation in arid districts. It is began by the building up of the bed of a stream, at the foot of a decivility, forming a plain with a nearly straight longitudinal profile, which may become a very broad plain of deposition. Standard, 1964.

aggrading stream. Synonym for upgrading stream. A.G.I.

aggregate. a. Sand, gravel, or any clastic material in a bedded iron ore, sometimes so abundant as to make it resemble a puddinngstone. Uncrushed or crushed gravel, crushed stone or rock, sand, or artificially produced inorganic materials, which form the major part of concrete. Taylor, c. To bring together; to collect or to gather into a mass. Webster 3d. d. Composed of mineral or rock frag- ments; composed of mineral crystals of one or more kinds. Webster 3d. e. See concrete aggregate; lightweight expanded clay aggregate. A.G.I.

aggregated. Packed particles. V.V.

aggregated ore; aggregated sulfide. Massive sulfide in which the sulfide constitutes 20 percent or more of the total volume. A.G.I.

aggregated sulfide. See aggregated ore. A.G.I.

aggregate polarization. Polarization in a rock thin section in which the constituent min- erals cannot be individually recognized. Webster 3d.

aggregate structure. A randomly oriented mass of separate little crystals, scales, or gains that extinguish under the polarizing microscope at different times. Fay.

aggressive magma. A magma that forces its way into place. Synonym for invasive magma. A.G.I.

aging. a. The storing of ceramic raw ma- terials (glazes, slips, glasses, etc.) before processing. Bu- reau of Mines Staff. b. The change occur- ring in plagioclase feldspars in the lapse of time. ASTM C286-65. c. Curing of pre-}
Agnite. A. Migmatite containing xenoliths. A.C.I. Supp. b. Fragmental plutonic rock with more or less granitic cement. A.G.I. Sandstone. c.開放岩 in which pegmatite has filled the cracks and formed a three-dimensional network. Heti.

agnostic line. One of several lines on the earth's surface, on which the direction of the magnetic needle is truly north and south; a line of no magnetic declination. Standard, 1964.

agpaitic. Applied to the process of mineral formation distinguished from an ordinary granite process by an excess of alkali (especially sodium) as a result of which the amount of alumina is insufficient for the formation of aluminum silicates. Heti.

agreement. The written document by which the contractor and the authority mutually agree to comply with the requirements of the tender. Fay.

agricultural drain. Earthenware or porous concrete pipes of about 3 inch internal diameter, laid end to end below ground with open joints in order to drain the subsoil. Synonym for land drain. Ham.

agricultural geology. Applied to soil improvement. Schoeller.

agricultural hydrate. A relatively coarse, unrefined form of hydrated lime that is mainly used for neutralizing soil acidity and for purposes where high purity and uniformity are not necessary. Bennett 2d, 1961.

agricultural line. A. A lime whose calcium and magnesium content is capable of neutralizing soil acidity. ASTM C51-47. B. Lime containing a minimum amount of water to form calcium hydroxide. CDD 64, 1961.

agricultural pipe. See field-drain pipe. Dodd.

agriculture stone. A finely ground limestone or a mixture containing considerable riebeckite. Fay.

agrolite. A. An instrument for boring holes in stone or other masonry or holes used in blasting. Webster 3d. B. An instrument for explosive work in mining. Webster 3d. C. A bubble of irregular shape formed generally by volume of 21 percent oxygen and 79 percent nitrogen. It also contains about 0.003 percent carbon dioxide, some aqueous vapor, and some argon. Fay. a. To ventilate a mine. Fay. Long. b. A bubble which is forced into the furnace. Henderson.

agriculture. Fr. An instrument for boring holes in stone or other masonry or holes used in blasting. Webster 3d.

agricultural pipes. See field-drain pipe. Dodd.

air. a. The mixture of gases that surrounds the earth and forms its atmosphere; composed by volume of 21 percent oxygen and 78 percent nitrogen; by weight about 23 percent oxygen and 77 percent nitrogen. It also contains about 0.003 percent carbon dioxide, some aqueous vapor, and some argon. Fay. b. The current of atmospheric air circulating through and ventilating the workings of a mine. Fay. C. To ventilate any portion of the workings of a mine. Fay. d. A bubble of irregular shape formed generally by volume of 21 percent oxygen and 79 percent nitrogen. It also contains about 0.003 percent carbon dioxide, some aqueous vapor, and some argon. Fay. a. To ventilate a mine. Fay. Long. e. Air piped under compression to bottom of drill hole through the drill stem and used in place of water to clear the bit of soil and to blow them out of the borehole. See also air circulation. Long. f. Air piped under compression to bottom of drill hole through the drill stem and used in place of water to clear the bit of soil and to blow them out of the borehole. See also air circulation. Long. g. Air piped under compression to bottom of drill hole through the drill stem and used in place of water to clear the bit of soil and to blow them out of the borehole. See also air circulation. Long.

air adit. An adit driven for the purpose of ventilating a mine. Fay.

air-avid surface. A surface that seems to prefer contact with air to contact with water. A particle (or mineral) of this sort will adhere to an air bubble and float out of a flotation pulp; otherwise, the particle will not float. Also called water-repellent surface. Compare water-avid surface. Hanon, p. 98.

air barricade. The division of a ventilation gallery in a mine when a wall is thrown into two parts; the air is led in through the one part and back through the other part. Stock, v. 1, p. 534.

air base. In photography, the distance between the exposure stations of two overlapping aerial photographs. See also base line. Seelye, 2.

air bell. a. In flotation, the small air pocket or bubble which forms after emergence from pulp into froth have different characteristics, hence the distinction. These bubbles vary in attractive and retaining power for aerophilic mineral grains, and are a critical component of the flotation process. Also called air bubble. Pryor, 3. b. A bubble of irregular shape formed generally by the electrospinning or melting operations in the manufacture of optical glass. ASTM C162-66.

air belt. In a cupola furnace, an annular air space around the furnace, from which air is forced into the furnace. Henderson.

air blast. a. A term improperly used by some diamond drillers as a synonym for air circulation. See also air circulation. Lang. b. A disturbance in underground workings accompanied by a strong rush of air. Fay. c. A strong rush of air, as by the explosion force, is caused by the ejection of air from large underground openings, the sudden fall of large masses of rock, the collapse of pillars, slippage along a fault, or a strong current of air pushed outward from the source of the explosion force. Standard, 1964.

airbreakers. A device of bluiting in which compressed air at very high pressure is piped to a shot shell in a short hole and discharged. B.S. 3618, 1964, sec. 6.

air block. Air trapped in the upper end of an unvented inlet pipe. Air trapped in the core barrel, which, when sufficiently compressed, acts like a solid and stops further advance of core into the inner tube. Also referred to as air cushion. Fay.

airborne electromagnetic prospecting. Electromagnetic surveys carried out with airborne equipment. Since 1950, an increasing proportion of such surveys have been carried out in this manner since advantages in cost reduction and speed are great. Debra, p. 369.

airborne geophysical anomaly. A geophysical anomaly related to geologic formations that can be detected by airborne equipment. Hawkes, 2, p. 320.

airborne magnetometer. A device used to measure variation in the earth's magnetic field while being transported by an aircraft. Same as aerial magnetometer. A.G.I.

airborne radiation thermometer. A device for measuring the intensity of gamma radiation by employing a phosphor which emits a minute flash of light on absorbing a gamma ray. A photograph multiplier tube converts the light flash into an electrical current or voltage variation which is proportional to the intensity of gamma radiation. A.G.I.

airborne scintillation counter. Any scintillation counter especially designed to measure the ambient radioactivity from an aircraft in flight. The instrument must be mounted in the field while being transported by an aircraft. Same as aerial scintillation. A.G.I.

airborne seaming. A process for the general, as opposed to local, repair of a gas retort by blowing refractory powder into the sealed retort, while it is hot; the powder builds up within any cracks in the refractory, brickwork and seals them against gas leakage. Compare spray welding. Dood.

airbound. The condition of a pipeline where the gas entrained prevents the free flow of water through it. Sellew, 1.

air box. a. A rectangular wooden pipe or tube made in lengths from 9 to 15 feet for ventilating a heading or a sinking shaft. Fay. b. A rectangular wooden pipe or tube made in lengths from 3 to 15 feet for ventilating a heading or a sinking shaft. Fay. c. A rectangular wooden pipe or tube made in lengths from 9 to 15 feet for ventilating a heading or a sinking shaft. Fay.

air breakers. A method of breaking down coal by the use of high-pressure compressed air. The method was first introduced in the United States about 1947. As used today, the power unit is normally an electrically driven air compressor operating at pressures of 10,000 to 12,000 pounds per square inch. The high-pressure air is conducted through a steel pipeline to the working face, and copper tubing or wire-braded rubber hose is used to connect the supply pipeline to the air-breaker shell which discharges the air in the shothole. Normally, one or two shells are in use in a working place at any one time, and the simplicity of the operation is such that the
air chamber. A vessel installed on piston pumps to minimize the pulsating discharge of the liquid pumped. The chamber contains air under pressure and is fitted with an opening on its underside into which some of the liquid from the pump is forced upon the delivery stroke of the piston. The air acts as a cushion to lessen the fluctuation of the suction strokes. According to S. K. McAdam, pp. 91-92.

air channels. In a reverberatory furnace, air channels are usually squared to a square meter. Air is blown through these channels to prevent the oxygen from coming in contact with the coal while it is being burned. It is the practice to make recirculation possible. Lewis, p. 671-672.

air changes. The simultaneous control, within prescribed limits, of the quality, quantity, and temperature-humidity of the air in a designated space. It is essentially atmospheric environmental control. Control of only one or two of these properties of the atmosphere does not constitute air conditioning. To make sure of correct usage, a series of ventilation tables of the recommended number of such changes for various-type rooms are used for ventilation design. Crispin.

air clamp. Any type of clamping device operated by pneumatic pressure. Crispin.

air classifier. An appliance for separating or sizing granular or powdered materials such as clay, edges of mica sheets and penetrating along the edges of sheets and along the edges of mica. Pryor, 3. See also infrasizer.

air crossing. A bridge where a return airway through the face crosses the forward airway and is forced to avoid overheating the surrounding atmosphere. B.S. 3323, 1960.

air curing. The process by which pigments are brought to a state of equilibrium with the surrounding atmosphere. B.S. 3323, 1960.

air current. A. The flow of air ventilating the workings of a mine. Also called airflow. air quantity, B.S. 3618, 1963, sec. 2. B. A body of air moving continuously in one direction. Jones.

air development. A stoppage of airflow due to air or other gas crowding the face ahead of the advancing mine. Jones.

air displacement pump. A pump consisting of a closed vessel from which water is expelled through a delivery valve and pipe by means of compressed air admitted to the top of the vessel. Also called displacement pump. B.S. 3618, 1963, sec. 4.

air distribution. Supplying air in the desired amounts to the various working places in a mine. Hartman, p. 250.

air dome. A cylindrical air-sealed container closed at the upper end and attached in an upright position above and to the discharge of a piston-type pump. Air trapped inside the closed cylinder acts as a compressible medium, whose expansion and contraction trends to reduce the severity of the pulsations imparted to the liquid discharged by each stroke of a pump piston. Also called bonnet; pressure dome. Lewis.

air door. A door erected in a roadway to prevent the passage of air. When doors are erected between an intake and an exhaust they may be known as separation doors. Also called door; separation door; trapdoor. B.S. 3618, 1963, sec. 2. A door in a ventilation network that may be used with safety in gaseous and dusty mines. See also compressed-air blast.

air drier. A. A device for drying down coal by which compressed air, generated locally by a portable compressor at 10,000 pounds per square inch, is blown through a cooling cylinder, which is placed in a hole drilled in the coal. Thus, slow breaking results, with no flame, in producing a larger percentage of lump coal than is made by using explosives. Its principal advantage is that it may be used with safety in gaseous and dusty mines. See also compressed-air blast. Lewis, p. 114.

air drain. A passage for the escape of gases from a mold while the molten metal is being poured. Standard, 1964.

air dried. Of minerals, naturally dried to equilibrium with the prevailing atmosphere. Pryor, 3.

air dried basis. An analysis expressed on the basis of a coal sample with moisture content determined at the moisture equilibrium with the surrounding atmosphere. B.S. 3323, 1960.

air drill. A. A small diamond drill driven by compressed air. Long. B. A small rotary-type rock drill driven by compressed air. Long.

air drive. See jackhammer operator. D.O.T.

air bearing. A. Dry, if dry to such a degree that no further moisture is supplied on exposure to air. Webster 3d. Most air-dry substances contain moisture that can be expelled by heating them or placing them in a vacuum. Fay. B. Said of timber, the moisture content of which is in approximate equilibrium with the surrounding atmosphere. Jones.

air drier. Drying to such a degree that no further moisture is given up on exposure to air. Webster 3d. Most air-dry substances contain moisture that can be expelled by heating them or placing them in a vacuum. Fay. B. Said of timber, the moisture content of which is in approximate equilibrium with the surrounding atmosphere. Jones.

air duct. A. Tubing which conducts air, usually from an air compressor to a point as required in the mine. B.S. 3618, 1963, sec. 2. B. An air box, canvas pipe, or other air carrier for delivering compressed air. Foster.

air elutriator. See air classifier; air classifier. Enam.

air elutriation. A method of separating or sizing granular or powdered materials such as clay, through deposition in air currents of various speeds. This principle is widely used in continuous pulverizing of dry materials, such as grit, feldspar, limestone, and clay. See also air classifier; air elutriator. Enam. Dic.

air filter. A device for filtering out impurities from the air breathed by human beings. Such devices are used on the coal face to prevent and control the spread of tuberculosis. C.T.D.

air flush. Stain formed by air entering at an air in a designated space. It is essentially atmospheric environmental control. Control of only one or two of these properties of the atmosphere does not constitute air conditioning. To make sure of correct usage, a series of ventilation tables of the recommended number of such changes for various-type rooms are used for ventilation design. Crispin.

air drive. See jackhammer operator. D.O.T.

air driven. A. Dry to such a degree that no further moisture is given up on exposure to air. Webster 3d. Most air-dry substances contain moisture that can be expelled by heating them or placing them in a vacuum. Fay. B. Said of timber, the moisture content of which is in approximate equilibrium with the surrounding atmosphere. Jones.
of the glaze constituents. The term was used particularly when ware was fired in saggers in coal-fired kilns, air escaping from a faulty sagger into the kiln with the same time that the gases were treated into the sagger. The term is also sometimes applied to a glaze that has partially devitrified and is then a result of cooling slowly between 900° and 700° C.

Dodd. air elutriation. Method of dividing a substance into various particle sizes by means of an air process, after grinding. See also air classifier. C.T.D. air embolism. See caisson disease. Ham. air endway. A narrow roadway driven in the coal seam parallel and close to a winning headway chiefly for ventilation. The air endway usually acts as a return and is connected at intervals of 10 yards or so to the headway spout. Fay. See companion heading, Nelson.

Hansen. air entrained concrete. Concrete used for road construction in the United States, having about 5 percent of air in its composition. Although less dense than ordinary concrete, it has very high resistance to frost. The strength loss as compared with ordinary concrete is about 5 percent for each 1 percent of air entrained. Ham.

Hansen. air emulsion. The addition of a material to Portland cement clinker during grinding, or to concrete during mixing, for the purpose of reducing the surface tension of the water so that 0.5 to 1 percent (by volume) of minute air bubbles become trapped in the concrete. This improves workability and frost resistance and decreases segregation and bleeding. The agents used as additions include: 0.025 to 0.1 percent of alkali salts of wood resins, sulfonate detergents, alkali naphthenate, or triethanolamine salts; or 0.25 to 0.5 percent of the Ca (calcium) salts of glues (from hides); or 0.25 to 1.0 percent of Ca (calcium) lignosulfonate (from papermaking). Dodd. air entrained-agitating core. A concrete mixture that contains usually a resin which entrains the air in very fine bubbles. Its purpose is to increase both workability of the wet concrete and its frost resistance when hardened. Ham.

Hansen. airfield soil classification. Classification published in Casagrande in the United States in 1946, based on sieve analyses and consistency limits. Cohesive soils can be divided into those with a liquid limit above or below 30 percent. The former are, in general, clays and the latter, silts. Ham. air filter. A device for cleaning compressed air. Hansen.

Ham. air float. A device which is fitted to tube breathing apparatus. There are two kinds in general use, one consisting of a flexible corrugated rubber tube and the other a canvas fabric bag. On inspiration, air is drawn partly from the equalizer, which is reduced in volume and finally from the tube. On expiration, the equalizer restores itself to its original volume and in doing so draws air through the tube. Thus the air is kept flowing very nearly in a continuous stream, and the wearer, without the aid of bellows or rotary blower, experiences very little resistance to breathing. Mason, s. 1, p. 327.

Hansen. airflow meter. An instrument which measures and shows directly on a scale the flow of air in a pipe or hose in cubic feet per minute. Nelson.

Ham. air flush. Synonym for air circulation. Long.

Ham. air flushing. The circulation of air through the drilling apparatus during drilling to cool the bit and to remove the cuttings from the hole. B.S. 3610, 1963, sec. 2.

Hansen. air foam extinguisher. An extinguisher which produces a foam somewhat similar to that produced by a chemical foam extinguisher, therefore, it can be used for the same purposes. However, unlike the chemical foam type, this extinguisher can be recharged underground by simply replacing the container with water and inserting a scaled metal charge holding foam concentrate and a proper gaseous charge of carbon dioxide. McAdam, p. 112.

Ham. air foil. A fan with an airfoil-shaped blade which moves the air in the general direction of the axis about which it rotates. Strack, 10.

Ham. air gap. a. The distance between the surface of the electrode and the oscillator plate. It is usually necessary to avoid particular gap dimensions in which resonance damping occurs with acoustic waves generated by the oscillator plate. Am, 1, b. The distance between passing material and tip of attracting magnetic pole, in a magnetic separator. Pryor, 3, c. The gap between rotor and stator of a dynamo or an electric motor. Fay.

Ham. air gas. a. A combustible gas made by charging air with the vapor of some volatile hydrocarbon mixture (as gasoline) and using a pyrolyzing torch. Webster, 3d.

Ham. air gas. b. A producer gas consisting chiefly of carbon monoxide and nitrogen and made by blowing air into a producer. Webster 3d.

Ham. air gate. a. Mid. An underground roadway used principally for ventilation. Fay. b. An air regulator. Fay. c. In molding, an orifice through which the displaced air and gases escape from the mold while the molten metal is filling it. Fay.

Ham. air hammer. a. Sharp, vibratory impacts in a liquid pump or piping system caused by entrapped air. Long. b. Reciprocating motion induced in a drill string by excessive air pressure at face of drill bit when air is used in lieu of a liquid as a bit coolant and cuttings removal agent. Long. c. A pneumatically actuated hammer. Long. d. A tool in which a hammerhead is activated by means of compressed air. The air is conducted to the tool through a hose. A trigger starts or stops the admission of air to the hammerhead. Fay. e. An airhammer operator. One who breaks asphalt, concrete, stone, or other pavement, who loosens earth, digs clay, breaks rocks in trimming bottom or sides of trenches or other excavations, or who reduces the size of large stones, using an airhammer. D.O.T. Supp.

Ham. air hardening. See air hardening refractory cement.

Ham. air hammer. Steel containing sufficient carbon and other alloying elements to harden fully during cooling in air or other gaseous mediums from a temperature above its transformation range. The term should be restricted to steels that are capable of being hardened by cooling in air in fairly large sections, about 2 inches or more in diameter. Same as self-hardening steel. ASM Gloss.

Ham. airhead; airheading. S. Staff. A smaller drift driven parallel to the main haulageway for an air course. A connecting crosscut is called a spigot. Long.

Ham. air intake. An appliance to warm the air as it enters the downcast shaft or intake drift. In countries where the winter is very cold, such as Poland and Russia, nearly all mines are equipped with air heaters. A few British mines have oil-fired air heaters, mainly to prevent the accumulation of ice in wet downcast shafts or on winding ropes. Nelson.

Ham. air-heating furnace. A furnace used for heating air to warm a room or building. Hess.

Ham. air heave. Structure. Small crumplings, which die out downward, found in laminated sands of the United States. These sands are usually made up of fine grains of quartz or feldspar coarser than 0.002 mm in diameter, which are presumed to be formed by rise of air trapped in sand at low tide. Pettijohn.

Ham. air hold. a. Hoisting machinery operated by compressed air. Fay. b. A small portable hoisting machine usually mounted on a column and powered by a compressed air motor. Also called tugger. Long.

Ham. airhole. a. A small excavation or hole made to improve ventilation by communication with other workings or with the surface. See also cundy. B.S. 3618, 1963, sec. 2. b. A venthole in the upper end of the inner tube of a double-tube, core barrel to allow air and/or water entrapped by the advancing core to escape. Long. c. A void, cavity, or flaw in a casting or bit crown. Fay.

Ham. air horsepower. a. The rate at which energy is used in horsepower units, in moving air between two points. B.S. 3610, 1963, sec. 2. b. The horsepower in an air current is usually expressed in the form: Horsepower = \( \frac{P \times Q}{100} \) where \( P \) equals ventilating pressure in pounds per square feet and \( Q \) equals quantity of air in cubic feet per minute. Nelson.

Ham. air intake. Blowing operation in which air is blown through molten copper in a wire bar or anode furnace. Fuel is removed as SOx and impurities are slugged off. Fay.

Ham. air intake. A device for supplying a compressor with clean air at the lowest possible temperature by air cooling under controlled conditions. By rise of air trapped in sand at low tide. The air is conducted into the airway usually for the return and is connected at intervals of 10 yards or so to the headway spout. Fay. See also companion heading, Nelson.

Ham. air float. B.S. 3618, 1963, sec. 2. a. A B.S. 3618, 1963, sec. 2. b. The horsepower in an air current is usually expressed in the form: Horsepower = \( \frac{P \times Q}{100} \) where \( P \) equals ventilating pressure in pounds per square feet and \( Q \) equals quantity of air in cubic feet per minute. Nelson.
intake air, the greater is the capacity of the compressor; a drop of 5° in temperature represents a gain in capacity of approximately 1 percent. In hot climates the intake should be placed on the coolest side of the compressor house. Lewis, p. 671.

air leg. A cylinder in which the feed is supported by air pressure acting on the cylinder and air-operated piston, the rod of which descends or ascends in order to give the hammer. B.S. 3618, 1964, sec. 6.

air lift. a. An apparatus used for pumping water from wells either temporarily or for permanent water supply; for moving or removing liquids such as sulfuric acid; for unwatering flooded mines; for elevating mill tailings, sands, and slimes in cyanide plants; and for handling the feed to ball mills. In operation, compressed air enters the suction pipe and mixes with the water. As the water is agitated by the air, pulp elements and, if practically at atmospheric pressure at the top of the discharge pipe. The efficiency of the air lift is calculated on the basis of the foot-pounds of work done in lifting the water, divided by the isothermal work required to compress the air. Lewis, pp. 686-689. b. A method used in petroleum exploitation in which gas pressure is increased artificially or by natural gas into the deposit under pressure from a neighboring borehole, thereby forcing the petroleum out. Standing, p. 261.

air-lift dredges. Dredges in which solids suspended in a fluid are lifted. By injecting air into a submerged pipe at about 60 percent of that passing through the surface, the density of the fluid column inside the pipe can be lessened, forcing the fluid column down reduced to cubic feet of free air, and calculating the amount of air in the system at time of shutting down reduced to cubic feet per minute of free air at time of that the valves are tight and all loss in valves on both ends of the line. Assuming that the valves are tight and all loss in pressure due to leakage, the cubic feet of free air lost per minute through leakage is:

\[ Q = \frac{2T}{5V} \]

where \( Q \) equals leakage in cubic feet per minute of free air at time of shutting down, \( V \) equals total volume of air in the system at time of shutting down reduced to cubic feet of free air, and \( T \) equals time in minutes from shutting down until the gage has dropped to zero. Lewis, p. 679.

air leak. a. The short-circuiting of air from intake to return airways (through doors, stoppings, wastes, and old workings) without doing useful work in flowing around the faces. The total air leakage is usually within the range of 35 to 55 percent of that passing through the surface fan. Nelson. b. The leakage of air in the transmission lines may be determined by filling the entire system with air at normal operating pressure and then closing the valves on both ends of the line. Assuming that the valves are tight and all loss in pressure due to leakage, the cubic feet of free air lost per minute through leakage is:

\[ Q = \frac{5V}{2T} \]

air lock. a. A casing at the top of an upcast boring borehole, thereby forcing the petroleum out. See also anemometer. Nelson. b. An air pocket or bubble in a pipeline moving, and caused by the expansion of air. Nelson. c. A system of doors arranged to allow the airway where the volume of air passing is measured periodically. The station should be straight, smooth and of uniform section to obtain as near as possible, streamline flow. Permanent air-maltering stations are usually constructed in concrete or brickwork. See also anemometer. Nelson.

air motor. A motor driven by compressed air; it may be either a vane- or gear-type rotary or a reciprocating piston-type motor. Long.

air mover. A portable compressed-air appliance, which may be used as a blower or exhaustor. It converts the compressed air into a large induced volume of moving air. The compressed air is fed through a side inlet and is expanded at a high velocity through an annular orifice. It is useful for emergency ventilation in workings where auxiliary fans cannot be installed. Nelson.

air receiver. The air receiver is required to but 1 pound of a combustible substance. Hess.

air receiver, a. A heated chamber for drying samples of ore, coals, etc. Zen.

air permeability. See permeability. Dodd.

air pressure. a. Pipes for conveying air for ventilation or for other purposes. Fay. b. See ventilation tubing. Nelson.

air pl. See air shaft. B.S. 3618, 1963, sec. 2.

airplane strand wire rope. A small 7- or 19-wire galvanized strand made from plow steel or crucible steel wire. H&S, p. 129.

air pockets. Pockets of air sometimes found in clay during wedging or throwing. J.C.S., 1963.

air pollution recorder. Instrument collects atmospheric samples of particulate matter and aerosols on the continuous filter tape. Sampling is performed at a uniform rate by means of a motor-driven pump or other vacuum system. Suitable values of R for different types and sizes of airways are obtained by reference to tables in which the resistance in Atkinsons, per 100 yards of airway, is given. See also ventilation. Nelson. 5.

air pressure. For rock drills, the air pressure ranges from 70 to 90 pounds per square inch, the most economical pressure for such machines being from 90 to 95 pounds per square inch, when high drilling speed is attained. Ham.

air-pressure drop. The pressure lost or consumed in overcoming friction along an airway. It can be calculated from the formula

\[ P = \frac{Q^2}{R^2} \]

where \( P \) equals pressure drop in inches water gauge, \( R \) equals resistance in Atkinsons, and \( Q \) equals air quantity in thousands of cubic feet per second. Suitable values of \( R \) for different types and sizes of airways are obtained by reference to tables in which the resistance in Atkinsons, per 100 yards of airway, is given. See also ventilation. Nelson. 5.

air propeller. A rotary fan for circulating air. Webster 3d.

air pump. A pump for exhausting air from a closed space or for compressed air or for forcing it through other apparatus. Compare vacuum pump. Webster 3d.

air puncher. A machine introduced in 1904 to the mining industry that consisted essentially of a reciprocating chisel or pick, driven by air. A compressor plant, usually located outside the mine near the boilers of the air for the puncher. Kentucky, p. 340.

air quantity. The amount of air flowing through a mine shaft or through one or more fans in cubic feet per minute. Air quantity is the product of the air velocity times the cross-sectional area of the airway. Bull. Miner. Bull. 589, 1960, p. 2. See also air volume; air current, a.

air ramming. A method of forming refractory shapes, furnace hearths, or other furnace parts by means of pneumatic hammers. HW.

air receiver. A vessel into which compressed air is discharged to be stored until re-
air receiver
quired.
C.T.D.
air-deduction process. See roasting and reaction process. Fay.
air-regulating dampers. Shutters fitted to the isolating doors in the sandstr. Plastic refractories to reduce or regulate the underground air-flow in an emergency. Such an emergency would be a large open fire in the workings and it is decided to reduce the flow of air past the fire. Nelson.
air regulator. An adjustable door installed in permanent air stoppings to control ventilating current. Bureau of Mines Staff.
air requirements. The quantity of air required to maintain adequate ventilation of the mine. This quantity will depend on (1) the length of face room in production; (2) the average distance from the shafts to the faces; (3) the gas emission rate; (4) the depth of the workings; and (5) the volatile. China clay; the velocity of an air ventilation. Nelson.
air-cooled blast furnace slag. The material resulting from solidification of molten blast furnace slag under atmospheric conditions. Subsequent cooling may be accelerated by applying water to the solidified surface. ASTM C125-66.
air rod puller. See rod puller. Long.
air sampling. The taking of air samples in mine workings for analysis in the laboratory. The usual method is by air pump and bottle. The air in the bottle is replaced by a sample of mine air by means of the hand pump and then closed tightly by a rubber cork. See also sampling instrument. Nelson.
air sampling pump. A pump, designed to collect air samples in laboratory or field, and may be used in conjunction with filters, impactors, impingers, and bubblers, depending on the model. Operating principle may depend on graphite ringed pistons activated by a split phase motor, on the movement of air by a rotating vane blower, or on other vacuum induction apparatus. Beits, p. 378.
air-sand process. See Fraser's air-sand process. Mitchell, p. 529.
air seal. A method for the prevention of the escape of gases from the entrance or exit of a continuous furnace, or tunnel kiln, by blowing air across the opening. Dodd.
air separation. In powder metallurgy, the classification of metal powders into particle size ranges by means of a controlled air jet. Beits, p. 378.
air separator. A machine for the size classification of the fine ceramic powders, for example, fine refractories, from the entrained air or current controls the size of particles classified. Dodd.
air stack. The property of a material to develop high strength when dried, an example being air-setting mortars. A.R.I. in a material such as a castable refractory, refractory mortar, or plastic refractory, the ability to harden without the application of heat. A.R.I. Long.
air-setting refractories. Compositions of ground refractory materials which develop a strong bond upon drying. These refractories are used in the manufacture of mortars, plasters, refractories, ramming mixes, and gunning mixes. They are marketed in both wet and dry condition. The dry compositions require tempering with water to develop the necessary consistency. Hills.
air-setting refractory mortars. A composition of finely ground materials, marketed in either a wet or dry condition, which may require tempering with water to attain the desired consistency and which is suitable for laying refractory brick and bonding them strongly together. Hills.
air-shaft. A shaft used wholly or mainly for ventilating mines, for bringing fresh air to places where men are working, or for exhausting used air. It may either receive or discharge the circulating current. See also downcast, a; upcast. Fay; B.C.I.
air shooting. This ventilation of a, a seismc wave in crustal rocks by explosion in the air above the area. In rock shattering, an air shot is one in which pockets of air are left when charges are filled, to reduce shatter. Pryor, 3. See also compressed-air blasting.
air shot. A shot prepared by loading (charging) in such a way that an air space is purposely left in contact with the explosive for the purpose of lessening its shattering effect. Fay.
air shrinkage. The volume decrease that a clay undergoes in drying at room temperature. Fay.
air-slaked lime. Contains various proportions of the oxides, hydroxides, and carbonates of calcium and magnesium, which result from excessive exposure of quicklime to air that vitiates its quality. It is partially or largely decomposed quicklime that has been exposed to the atmosphere to give slow hydration. Fay.
air slitting. a. York. A short heading driven more or less at right angles to and between two headings, or levels, for ventilation. Fay. b. See stenton. B.S. 3618, 1963, sec. 2.
air slug. A mass of air under compression entrapped in the air that vitiates its quality. It is partially or largely decomposed quicklime that has been exposed to the atmosphere to give slow hydration. Fay.
air survey. a. A map production from an air-streak; chain. In mica, a series of air inclusions connected (or nearly connected) to form a relatively long, thin air streak. Also known as silver streak. Skow.
air survey, a. A map production from an interconnected series (mosaic) of aerial photographs made in conjunction with fixes by a theodolite of locating points on the ground. Pryor, 3. b. In mining, a check on ventilation, gas, and dust in a mine. Pryor, 3.
air-swept ball mill. See ball mill. Dodd.
air-swept mill. A tumbling mill used in dry grinding, from which finished material is removed by means of regulated air currents which can be so controlled as to produce a closed circuit. Pryor, 3.
air swivel. A device similar to a water swivel but designed to conduct air under compression into a rotating drill stem when air instead of a liquid is used as an agent to flush drill cuttings out of a borehole. Compare water swivel. Long.
air-stowing machine. The machine used for blowing the shatter chippings into the waste area in pneumatic stowing. It consists of a steel paddle wheel revolving in an adjustable casing. Stowing water is fed continuously from a hopper to the machine which in turn blows the material through 5- to 6-inch-diameter pipes into the waste area. See also pneumatic stowing. Nelson.
air table; pneumatic table. A shaking table used when water is scarce to effect gravity concentration of sands. Air is blown upward through a porous deck, over which a layer of finely crushed ore passes. The heavy and light minerals stratify and gravitate to separate discharge zones. Pryor, 3.
airtight. So constructed or sealed as to prevent any inlet or outlet of air. Cuspin.
air tong. Air-actuated breakout tong. See also breakout tong. Long.
air-track drill. A heavy drilling machine for quarry or opencast blasting. It has caterpillar tracks and is operated by independent motors which drive its own portable rotary compressor and drills 3- or 4-inch-diameter holes at any angle but is chiefly used for vertical holes up to 80 feet in depth. Nelson.
air transport. A method employed in some mines in which the filling material is transported and stowed in a special hopper by pipelines. Stoces, v. 1, p. 190.
air trap. a. A device for shutting off foul air or gas from drains or sewers. Webster 3d; b. An air pocket. Webster 3d.
air trunk. A large pipe or shaft for conducting air, as for ventilation, or to a furnace. Fay.
air turbolamp. A lamp coupled to the compressed air mains, which may be at any pressure above 40 pounds per square inch. It consumes from 5 to 6 cubic feet per minute of free air. The elec-
air turbolamp

23

alaskite

akori. A porous coral which, previous to the
beginning of the 18th century, was fished,
fashioned, and prized by the Negroes of
West African Coast. It is a red, blue, or
violet-colored stone, has also been fished in
Samoa; probably still used as a gem by the natives.
The name has more recently been applied
to substitutes such as rock, glass, and pearl
with little nacre. Shipley.

akrochondrite. A yellowish red-brown hydrous
silicate of the cyclosilicate group. Found in the
MnsAsO4MnO4MnsH2O. Minute, spherical
crystal aggregates. Monoclinic.

From Langban, Sweden, Engländer.

akosite. A euhedral chordite in impure ha-
lite, Mg0B04H2O from Ak-sui, Kazak
stan, U.S.S.R. Named from locality. locality.

akosphore. Introduced by Barrell for that
outer part of the centrosphere which theo
retically stores up the stress during the
progressive changes toward contraction
in the inner earth (the barysphere). Hess.

Al Chemical symbol for aluminum. Hand
book of Chemistry and Physics, 45th ed.,
1964, p. 81.

Alabandine ruby. Originally, alabandine
garnet from ancient Babylon. Sometimes
applied to violet-red spinel. Shipley.

Alabandite. A massive, granular sulfide of
manganese, occurring in veins in Romania.
Also called mangambende. C.T.D. A vein
mineral, MnS; isometric; black; Mohs' hardness
3.5 to 4; specific gravity, 4.0. Dana 17.

Widely used for ornamental purposes.

Alabandrite. A light-green variety of diopside from
Alaka, Japan. Named from locality. Hess; English.

Alabandite. A light-green variety of diopside from
Alaka, Japan. Named from locality. Hess; English.

Alachment. A name given to the cellulosic group. Found
as a vein mineral of the oxidized zone
of Alamos, Sonora, Mexico. Closely related to
wellastonite; monoclinic. E.G.T. u. 12, pp.
277, 301; Hess; English.

Alambre. Fr. A special fireplace at the base of
a porcelain kiln, fed from the outside.

Widely used for ornamental purposes.

Alabandite. A light-green variety of diopside from
Alaka, Japan. Named from locality. Hess; English.

Albrecht. Rock crystal. Shipley.

Alaskite. a. A plutonic rock containing ortho-
clase, microcline, and subordinate quartz,
with a few or no mafic constituents.
Plagioclase may or may not be present.

Alaskite. b. A rock in the feldspar group, the former
being defined specifically as a granite mass
found near Spruce Pine, N.C., from which the feldspar is
alaskite. A quartz-feldspar rock containing so much quartz, that it is a transitional phase between typical alaskite and typical quartz. Hess.

albite. A hard, greenish to yellowish, although other colors are possible, feldspar. From Pennsylvania; New York; and Canada. See also peristerite. Shipley.

Alexandrite. A sapphire; blue in daylight, changing to violet, purple, or reddish under most artificial light. So named because alexandrite also changes color under similar conditions. Also called alexandrite sapphire. Shipley.

algae. A single-celled or multicellular plant, similar to those of terrestrial plants, but differing in that they have no gametophytes, no sporophytes, and their sporangia are not shed. Shipsley.

aleurite. A variety of aleurite, exhibiting adulteresence, which is more pale greenish to yellowish, although other colors are possible. From Pennsylvania; New York; and Canada. See also peristerite. Shipley.

aletheopteris-like andalusite. Andalusite of various colors which become reddish under lamplight and most other artificial light. Shipley.

alexandrite-like tourmaline. Same as chameleonite. Shipley.

alexeyevite; see alexeyevite.

alexeyevite. Having pheneocrysts containing aluminum and ferric iron. C.I.P.W.

alexjejevite. See alexeyevite.

alexandrite-like sapphire. A sapphire; blue in daylight, changing to violet, purple, or reddish under most artificial light. So named because alexandrite also changes color under similar conditions. Also called alexandrite sapphire. Shipley.

alexandrite-like tourmaline. Same as chameleonite. Shipley.

alexeyevite; see alexeyevite.

alexeyevite. Having pheneocrysts containing aluminum and ferric iron. C.I.P.W.

alexjejevite. See alexeyevite.

alexeyevite; see alexeyevite.

alexeyevite. Having pheneocrysts containing aluminum and ferric iron. C.I.P.W.

alexjejevite. See alexeyevite.

alexeyevite. Having pheneocrysts containing aluminum and ferric iron. C.I.P.W.

alexjejevite. See alexeyevite.

alexeyevite. Having pheneocrysts containing aluminum and ferric iron. C.I.P.W.

alexjejevite. See alexeyevite.

alexeyevite. Having pheneocrysts containing aluminum and ferric iron. C.I.P.W.

alexjejevite. See alexeyevite.

aleurite. A single-celled or multicellular plant, similar to those of terrestrial plants, but differing in that they have no gametophytes, no sporophytes, and their sporangia are not shed. Shipsley.

alginate. The salts of alginic acid are hydrophilic colloids derived from certain marine algae, such as the giant kelp of the Pacific Coast. Sodium alginate is the most common form, but ammonium alginate is usually preferred in the ceramic industry, due to its lower ash content. Alginate solutions possess marked suspending, thickening, emulsifying, stabilizing, and water-holding properties. In addition, they act as binders in ceramic processing, either in the body or the glaze. They can be used as a replacement for the various water-soluble gums used in the industry. Some forms of alginites have been used as a flotation agent for enamels.
alginates. Another name for oriental alga sapropel. Equivalent to peat of the algarite. A general term for a bitumen derived from algae. The salts of alginic acid are hydroalgodonite. Arsenide of copper occurring as silver blue, yellow to orange. Alginite is best recognized by an incrustation in the Algodona silver mines in the form of sporinite in coals of low rank. In transmitted light, alginite sometimes shows structure (of colonies of algae). The color is generally due to the presence of metallic iron in the maceral. More specifically only that from the coast of Algeria. Shiapley.
Algerian onyx. Another name for oriental alga sapropel. Equivalent to peat of the algarite. A general term for a bitumen derived from algae. The salts of alginic acid are hydroalgodonite. Arsenide of copper occurring as silver blue, yellow to orange. Alginite is best recognized by an incrustation in the Algodona silver mines in the form of sporinite in coals of low rank. In transmitted light, alginite sometimes shows structure (of colonies of algae). The color is generally due to the presence of metallic iron in the maceral. More specifically only that from the coast of Algeria. Shiapley.
Algerian oxyz. Another name for oriental alga sapropel. Equivalent to peat of the algarite. A general term for a bitumen derived from algae. The salts of alginic acid are hydroalgodonite. Arsenide of copper occurring as silver blue, yellow to orange. Alginite is best recognized by an incrustation in the Algodona silver mines in the form of sporinite in coals of low rank. In transmitted light, alginite sometimes shows structure (of colonies of algae). The color is generally due to the presence of metallic iron in the maceral. More specifically only that from the coast of Algeria. Shiapley.

alkali feldspar or Cornish stone, and are used in the preparation of frits for glasses. They decrease the vitrification and melting points of ceramic mixtures and are also used in the preparation of casting slips. The oxides of calcium, strontium, and barium are called alkaline earths. 

Rosenthal.

alkaline igneous rock. A rock with more of the alkali elements than are contained in the feldspars, therefore, such minerals in feldspathoids are present; an igneous rock with more of the alkali elements than the average for its clan; an igneous rock with an alkali-lime index less than 51; and igneous rocks of the Atlantic series, obsides, A.G.I. Supp.

alkaline-earth subbentonite. A bentonite containing alkali-earth metals that can be replaced by hydrogen and in which the positive plates consist of finely divided iron. A concen- trated solution of potassium hydroxide acts as electrolyte. The normal voltage varies between 1.0 and 1.5 volts per cell. Bennett, 1962.

alkaline water. A water having a bitter or soda-like taste. If strongly alkaline, the water is unfit to drink or use in mixing cements. Long.

alkane. A member of the paraffin series as methane, ethane, etc. Fry, 193.

alkane. A compound of lead, copper, bis- muth, and sulfur occurring in lead-gray, needle-shaped crystals; also massive. Fay.

alkaline test. A process by which a solution is treated with a solution of caustic soda, making it purer and more suitable for cementing. The kerosines are divided into classes according to the results given by this test and a fixed scale constructed. Fay.

alkaline storage battery. Analogous to a voltaic cell except that the positive plates are of ceramic or glass, and the electrolyte is a solution of a salt of an alkali metal. See also battery. 

alkaline weathering. The degree of resistance of a ceramic surface to attack by aqueous alkaline solutions (that is, enamel glazes, stoneware, chemical stoneware, etc.). Bureau of Mines Staff.

alkalinity, protective. Lime added to auriferous pools to insure alkalinity, without which gold precipitation cannot be successful. Fry, 193.

alkalinity, protective. Lime added to auriferous pools to insure alkalinity, without which gold precipitation cannot be successful. Fry, 193.

alkaline water. A water having a bitter or soda-like taste. If strongly alkaline, the water is unfit to drink or use in mixing cements. Long.

alkane. A member of the paraffin series as methlane, ethane, etc. Fry, 193.

alkene. A compound of lead, copper, bis- muth, and sulfur occurring in lead-gray, needle-shaped crystals; also massive. Fay.

alkyls. A chemical group that possesses the power of neutralizing acids, and turns red litmus blue. Gordon.

alkali feldspar. An alkali-bearing feldspar carrying free quartz and alkali feldspar. C.M.D.

alkali-lime series. Igneous rocks which contain soda-lime (plagioclase) feldspars. Hess.

alkali metal. A metal in group IA of the periodic system; namely, lithium, sodium, potassium, rubidium, caesium, and francium. They form strong alkaline hydroxides; hence, the name. A.G.I. Supp.

alkali metal. A metal in group IA of the periodic system; namely, lithium, sodium, potassium, rubidium, caesium, and francium. They form strong alkaline hydroxides; hence, the name. A.G.I. Supp.

alkalimetry. The determination of the amount of alkali contained in a solution by titration with a standard acid solution. Coop.

alkaline. A term rather loosely used to mean one of the following: (1) more than average alkali (K_2O + Na_2O) for the clan in which they occur; (2) containing feldspathoids or other materials, such as acmite, so that the molecular ratio of alkali to silica is higher than 1 to 6; or (3) embracing those rock series having a combined content of alkali oxides less than 51. A.G.I. Supp.

alkaline-series. One of the four chemical classes of igneous rocks distinguished by Peacock based on the alkali-lime index. This term comprises those rock series with alkali-lime indexes less than 51. Schieffelbeer.

alkali polishing. A term used to denote the polishing of elements (group II) forming bivalent cations, including calcium, strontium, and barium. Hess.

alkali-earth subbentonite. A bentonite containing calcium, strontium, or barium; and sometimes containing a small percentage of radium. A.G.I.

alkali flotation. An alkali-bearing feldspar carrying free quartz and alkali feldspar. C.M.D.

alkali water. A water having a bitter or soda-like taste. If strongly alkaline, the water is unfit to drink or use in mixing cements. Long.

alkane. A member of the paraffin series as methane, ethane, etc. Fry, 193.

alkene. A compound of lead, copper, bis- muth, and sulfur occurring in lead-gray, needle-shaped crystals; also massive. Fay.

alkylene. A member of the hydrocarbon group series, C_2H_4, for example, ethylene, propylene, etc. Fry, 193.

alkalic igneous rock. See alkalic igneous rock. A.G.I.

alkaline metal. See alkali metal.

alkaline storage battery. Electric storage battery in which the positive plates consist of nickel and nickel peroxide, and the negative plates of finely divided iron. A concentrated solution of potassium hydroxide acts as electrolyte. The normal voltage varies between 1.0 and 1.5 volts per cell. Bennett, 1962.

alkali neutralizer. See neutralizer. Dodd.

alkalinity. A. The combining power of a base as measured by the maximum number of equivalents of an acid which it can react to form a salt. Brantly, 1. b. The extent to which a solution is alkaline. See also pH. C.T.D. c. In sea water, the excess of hydroxyl ions over hydrogen ions, generally expressed as milliequivalents per liter. HBG.

alkalinity, protective. Lime added to auriferous pools to insure alkalinity, without which gold precipitation cannot be successful. Fry, 193.

alkaline pyroxenes. Sodium iron silicates with some calcium, magnesium, and potassium; NaFe_2 O_6 (SiO_4); transparent; color, brown or green; Mohs hardness, 6.0 to 6.5; easily, replaceable; specific gravity of igneous soda-rich rocks, for example, nepheline syenite. Fry, 193.

alkali water. A water having a bitter or soda-like taste. If strongly alkaline, the water is unfit to drink or use in mixing cements. Long.

alkane. A member of the paraffin series as methane, ethane, etc. Fry, 193.

alkene. A compound of lead, copper, bis- muth, and sulfur occurring in lead-gray, needle-shaped crystals; also massive. Fay.

alkylene. A member of the hydrocarbon group series, C_2H_4, for example, ethylene, propylene, etc. Fry, 193.

alkalic; alkali. A vitreous brownish-red hydro- magnesium arsenate; MnO_2.AS_2O_3; melting point, 652°C, As_2O_3 28.8; Mohs hardness, 4.5; specific gravity, 3.04; apparently a metamorphic mineral. It is monoclinic and resembles asinite. Larsen, p. 129.
27

Allarguent. A name given to the hexagonal phase know in the synthetic system silver antimonide. Silver containing less than 10% antimony. Found associated with pyrargyrite and cubic antimonial silver from Cobalt, Ontario. American Mineralogist, v. 39, July-August, p. 1941.

all-basal furnace. Abbreviation for all-basal open-hearth steel furnace. The whole of the superstructure of such a furnace, hearth, walls, roofs, ports, ends is built of basic refractories. These furnaces were introduced in Europe in 1933, the object being to make it possible to operate at a higher temperature than that possible with basic open-hearth, furnaces having a silica roof. Doddd.

alligator bide. A defect characterized by an extreme roughness of the porcelain enamel surface; a severe case of orange peel. ASTM C286-65.

alligatoring. The longitudinal splitting of flat slabs of metal in a plane parallel to the rolled surface. Also called fishmouthing. ASM Gloss.

alligator wrench. A wrench having a fixed flaring jaw with teeth on one side. Webster 3d.

allignite. A fossil resin related to amber from the Baltic region; derived from plant debris. English.

alligatoring. A completely altered gabbro with aplitic texture. Commonly contains a little thorium and may be metasomatic. A.G.I. This is weakly to moderately radioactive; black to dark brown but commonly greenish, grayish, yellowish, or even white due to alteration. Typically an accessory mineral in granites, syenites, diorites, and pegmatites; also in gneisses and amphibolites and as a contact metasomatic mineral in limestones; found associated with magnetite, biotite, epidote, carbonatite, and amphibolite. Commonly contains a little thorium and may be amorphous; hexagonal; tin white or reddish-brown in thin sections; granular or massive; nonsilicic; vitreous; and yellowish. A.G.I. From Alligator, North Carolina. American Mineralogist, v. 19, 1934.

alligator wrench. A wrench having a fixed flaring jaw with teeth on one side. Webster 3d.

all-geared drive. The transmission of power for feeds and speeds on a machine by means of gears instead of by belts and pulleys. Crispin.

alliancous. Applied to minerals having the odor of garlic; for example, arsical minerals. Fay.

alliance coupling. A coupling designed for a maximum drawbar pull of 5 tons or, in special alloy steels, up to 10 tons. Its horizontal gathering range is 18°. The coupling is provided with a swing knuckle and a forged steel pin. Fay.

alligatoring. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

alliance; allilace. A steel-gray cobalt-arcesenic-bismuth sulfitic, CO(AsBi)S, usually with part of the cobalt replaced by iron; crystallizes in the orthorhombic system. Fay.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.

allilacite; allilacose. A mineral or rock which has been transported to the site of deposition. A.G.I.

allilacose. A completely altered gabbro with aplitic texture. It is subdivided into Gyttja type and Drift type. Tomkiewicz, 1954.
allomorphism

limonite. Johannsen, v. 1, 2d, 1899, pp. 165, 190.

allomorphite. J. T. K. L.

allophane. A yellowish-green to greenish-yellow, hydrous aluminum silicate, found near Salt Lake City, Utah. English.

allophanoa. Clays of the allophane, halloysite, and montmorillonite groups. English.

allophane. See alligene. A.G.I.

allophane. See alligene. A.G.I.

allophane. A constituent of a metamorphic rock which, in the new rock, has not had its original crystal outlines changed. Johansson, v. 1, 2d, 1899, p. 163.

allophane. Proposed by Rosenbusch and applied to those minerals of igneous rocks which are not bounded by their own crystal faces, but which have their outlines impressed on them by the adjacent minerals. Rocks that consist predominantly of an allophane mineral assemblage are said to have an allophane-granular (xenomorphic-granular) texture. Contrasted with autolithomorphic; idiomorphic; euhedral. Synonym for xenomorphic; anhedral. A.G.I.

allophane-granular. Used to indicate the texture of igneous rocks if almost all the constituents are xenomorphic and of the same size. Synonym for xenomorphic-granular. Schieferdecker.

allopotite. One of the forms assumed by an allotriomorphic substance; for example, diamond is an allotriomorphic diamond. Standard, 1964.

allopotite. Applied by Berzelius to those substances which exist in two or more forms, as diamond and graphite. A.G.I. See also allotriomorphic.

alloptope; allotropism. The existence of a substance, especially an element, in two or more different modifications usually in the same phase, as different crystalline forms of carbon, iron, plasphor, and sulfur. Weber 26.

all over. End of a shift; when the breaker at a colliery shuts down for the day it is said to be "all over." English.

allowable bearing value. The maximum pressure that can be permitted on foundation soil giving consideration to all pertinent factors and with adequate safety against rupture of the soil mass or movement of the foundation of such magnitude that the structure or subsurface works will be endangered. Also called allowable soil pressure. ASCE P1826.

allowable pile-bearing load. The maximum load that can be applied on a pile with adequate safety against movement of such magnitude that the structure is endangered. SOM.

allowable stress; working stress. If a member is so designed that the maximum stress as calculated for the expected conditions of service is less than some certain value, the member will have a proper margin of safety against damage or failure. This margin of safety is, of course, dependent on many factors, the kind, and for the material and condition of service in question. The allowable stress is less than the working stress because of the uncertainty as to the conditions of service, nonuniformity of material and inaccuracy of stress analysis. The margin between the allowable stress and the damaging stress may be reduced in proportion to the certainty with which the conditions of service are known, the intrinsic reliability of the material, the accuracy with which the stress produced by the loading can be calculated, and the degree to which failure is unattended by danger or loss. Compare damaging stress; factor of safety; factor of utilization; margin of safety.

allowance. a. Eng. Refinement of bread, cheese, and beer supplied by the lessee or owners of a mine to surveyors. Fay. b. Eng. A.I. given to workmen on having to work under unusual conditions, for example, when they are wet through. Fay. c. The calculated difference between the volume occupied by a cement slurry when mixed and the volume it will occupy on setting, due to change in volume and material price paid to drill-crew members working in remote areas under rigorous conditions; e.g., a specified difference in weights exactly calculated, as a synonym for tolerance. See also tolerance. Long. f. The specified difference in limiting stress (minimum clearance or maximum interference) between mating parts, as computed arithmetically from the specified dimensions and tolerances of each part. ASM Gloss.

alloy. A substance having metallic properties and being composed of one or more chemical elements of which at least one is an elemental metal. ASM Gloss.

alloyage. The act or process of alloying; specifically, in minting, of alloying the precious metals with base ones to harden forming an alloy. Standard, 1964.

alloy balance. An adjustable balance that is in equilibrium when the weights in the scalpens are in proper proportion for forming an alloy. Standard, 1964.

alloy cast iron. Cast iron containing alloying elements. It may be: (1) a combination of nickel, chromium, copper, and molybdenum. These elements may be added to increase the strength of ordinary iron, to facilitate heat treatment, or to obtain martensitic, austenitic, or ferritic irons. C.T.D. alloy elements. Chromium, tungsten, iron, molybdenum, and other elements which aid in making alloys heat resistant and corrosion resistant. Bennett 24, 1962.

alloying. The addition of one metal to another or the introduction of one or more different elements to form an alloy. Standard, 1964.

alloying elements. An element added to a metal to effect changes in properties, and which remains within the metal. ASM Gloss.

alloy, monoferron. Any alloy based on metals other than iron, that is, usually a copper, aluminum, lead, zinc, tin, nickel or magnesium. C.T.D.

alloy plating. The codeposition of two or more metallic elements. See also alloy. ASM Gloss.

alloy powder. In powder metallurgy, a powder of which each particle is composed of the same alloy or two or more metals. ASM Gloss.
alluvial cone

29

in the gravel along the courses of valleys and rivers on the bedrock. Generally, the purest tin ore. Fay.

alluvial diamond. A diamond found in river gravels; also, loosely used for a diamond found in beach and desert gravels. A.G.I.

alluvial fan. A. The outspread sloping deposit of boulders, gravel, and sand left by a stream where it leaves a gorge to enter upon a plain or an open valley bottom. Fay. b. The land counterpart of a delta. An assemblage of sediments marking the place where the larger streams from a steep gradient to a flatter gradient and suddenly loses its transporting power. Typical of arid and semiarid climates, but not confined to them. Lett.

alluvial flat. A generally narrow plain, having a slope of 3 to 20 feet to the mile, built of fine sandy clay or adobe brought down by an ephemeral stream, having a smooth surface that is usually unmarked by streams but where so marked the channels are insignificant. USGS Bull. 730, 1923, p. 86.

alluvial gold. Gold found associated with waterworn (water-transported) material. Schielerdecker.

alluvial mining. The exploitation of alluvial deposits by dredging, hydraulic mining, and drift mining. See also placer mining. Nelson.

alluvial ore deposit. An ore deposit in which the recoverable mineral particles have been transported and deposited by a stream. Schiederdecker.

alluvial plains. a. If a stream is swift in one part of its course and slow in another, the swifter part may carry a load which the slower cannot carry. Deposits made then be made in the valley where the current is sluggish. In this way, floodplains are constructed. Floodplains produced by the filling of a valley are alluvial plains. We commonly think of alluvial plains as made of fine mud, but alluvial plains may be made of fine sand, silt, or pebbles, under special circumstances. A.G.I. b. A plain resulting from the deposition of alluvium by water. In the southwestern United States, most alluvial plains are formed by streams having a considerable grade, and therefore, they are generally referred to as alluvial slopes. USGS Bull. 730, 1923, p. 86.

alluvial-poor shoreline; alluvial coast. Shoreline or coast formed by a plain composed of fluviatile, fluviolacustrine or marine alluvial material. Schiederdecker.

alluvial slope. A surface composed of alluvium that slopes away from the sides of mountains and merges with the plain or broad valley floor upon which it rests. The alluvial slope near the mountains may be as much as 300 feet per mile. The plain is built by the union of the alluvial fans of tributary streams, which are common intermittent, and it is sometimes called a fan apron, debris apron, or piedmont plain or slope. USGS Bull. 730, 1923.

alluvial stone. A mineral that has been transported and deposited by water. See also alluvial deposit. Shipley.

alluvial tin. Stream tin, or cassiterite pebbles used as an ornamental stone. Also called princess blue. Shipley.

alluvial values. In placer mining, the minerals recoverable from the alluvium. These include cassiterite, gold, diamond, and gem stones, zirconia, rutile, monazite, and platinum. Pryor, 3.

alluviation. a. The process of building alluvial cones and deltas. Standard, 1964. b. A hydraulic effect on solids suspended in a current of water, whereby the coarsest and heaviest particles are the first to settle out on diminution of slope or velocity of the stream, and the finest muds the last. Pryor, 3.

alluvium. a. Clay silt, sand, gravel, or other rock materials transported by flowing water and deposited in comparatively recent geologic time as sorted or semi-sorted sediments in riverbeds, estuaries, and flood plains, on lakes, shores, and in fans at the base of mountain slopes, and estuaries. The term is not applied to subaqueous sediments deposited in seas or lakes or to non-sorted sediment carried or deposited by glacial. Compare Bull. of Mines Staff. a. As incorrectly used by some drillers to designate earthy clay material directly below the soil layer and above the solid, unbroken bed or ledge rock. Long.

alnugmide. alnugmide. A variety of garnet, Fe₃Al₂(SiO₄)₃, sometimes referred to as precious garnet. Its color is a fine deep red, it often shows a violet tinge, and it resembles rubies in most properties. Used as a gem. Also called alnugmoh stone. Mohs' hardness: 7; specific gravity: 4.25; isometric. Fay; Dana 17, p. 597.

alnugmide spinel. A violet-colored type of ruby spinel. C.M.D.

alnugmide. See alnugmide.

alpha. The first letter (a) of the Greek alphabet. Commonly used as a prefix to show that a mineral, the condition of a metal, or other thing or property is one of several closely related species, or one of a series: beta (b) the second letter, and gamma (γ), the third letter are used likewise, for example, alpha rays, beta rays, and gamma rays and alpha quartz and beta quartz. Hett.

alpha alumina. A white, a-hydrous, non-hygroscopic substance. If precipitated from an acid solution, it is known as aluminum hydroxide (Al(OH)), which is calcium (Al₂O₃). It is the natural product of the Bayer process and other processes used (or proposed) to treat bauxite, clay, or other aluminum-bearing materials. Newton, pp. 470-477.

alpha-beta brass. An alloy of 57 to 63 percent copper and 37 to 43 percent zinc, with a possible small addition of lead. Used in hot working. Pryor, 3.

alpha brass. An alloy of 70 percent copper and 30 percent zinc, perhaps with a small addition of lead. Used in heavy cold working. Pryor, 3.

alpha-carneolite. A sodium anorthite, NaAl₅SiO₅, produced by heating nepheline to 1,468° C. It can be preserved by quenching at temperatures above 690° C, at which point it passes into beta carnegolite. Isometric; rounded grains. English.

alpha compounds. The ash-free portion of coal. Not strucrurally designed. English.

alpha hydrite. A porcelain-white, hydrous asic sulfosilicate of thorium with some uranium, iron, and lead; isotropic. An aluminum boride. From Hylia, Ontario, Canada. English.

alpha iron. The body-centered cubic form of pure iron, stable below 1,870° F. ASM Gloss.

alpha particle. alpha radiation; alpha ray. A positively charged particle emitted by certain radioactive materials. It is composed of two protons and two neutrons; hence, it is identical with the nucleus of a helium atom. It is the least penetrating of the three types of radiation (alpha, beta, and gamma), being stopped by a sheet of paper. It is not dangerous to living things unless the emitting substance is inhaled or ingested. Ley.
alpha quartz. A form of quartz, apparently hexagonal, trapezohedral, tetrahedral, formed at temperatures below 750° C; occurring in irregular, large, and aggregate masses. English. Also called low quartz.

alpha rays. A. One of the three types of rays (alpha, beta, and gamma), emitted by radioactive sources. Crispin. B. Streams of alpha particles. C.T.D.

alpha uranium. The allosopic modification of uranium metal which is stable below 667° C. It is orthorhombic. NRC-AS I 11-1957; Handbook of Chemistry and Physics, 45th ed., 1964, p. 163.

alpha zircon. A mineralogical name for any zircon with properties about specific gravity 4.7; refractive index, 1.92 to 1.98. Strongly birefringent, 0.059. Almost no other type is used in jewelry. See also beta zircon; gamma zircon. Shipley.

alpha proton. Proposed by Salomon for clays and silts consisting largely of rock flour, such as the fine material produced by glaciers. There is little reason for the term, and extreme difficulty in its application because of inability to differentiate that a clay is of glacial origin and not composed of particles of many origins brought together by wind or water. A.G.I.

alpine. Great east-west structural belt including the Alps of Europe and the Himalayas and related mountains of Asia, folded mostly in the Tertiary period. A.G.I. Supp. 37

alpine revolution. That period of earth movement in the Tertiary period (mainly in the Miocene) when the Alps and other mountain chains came into existence. C.T.D.

aluminum. Crispin. Crystalline alumina

aluminum. Crispin. Crystalline alumina

ammonium chloride. The salt of ammonia and hydrochloric acid, usually obtained by electrolysis. See sodium chloride.

ammonium carbonate. Anhydrous carbonic acid ammonium salt, used in perfumery and in the manufacture of ammonia. See ammonium nitrate.

ammonium nitrate. A salt of the nitric and ammonium acids used in fertilizers and explosives. See ammonium carbonate.

ammonium hydroxide. A base obtained by neutralizing nitric acid with ammonia. See ammonium carbonate.

ammonium nitrite. A salt of nitrous and ammonium acids, used as a oxidizer in pyrotechnics and explosives. See ammonium carbonate.

ammonium perchlorate. Ammonium salt of perchloric acid, used in the manufacture of explosives. See ammonium carbonate.

ammonium sulfate. A salt of sulfurous and ammonium acids, used in fertilizers and as a mordant. See ammonium carbonate.

ammonium hydroxide. An alkaline solution of ammonia, used in the manufacture of ammonia and in the treatment of wool. See ammonium carbonate.

alpine revolution. That period of earth movement in the Tertiary period (mainly in the Miocene) when the Alps and other mountain chains came into existence. C.T.D.

alumina ceramic

which alumina, (Al₂O₃), is the essential crystal phase. ACSB-4.

alumina crucible. A crucible made from alumina mixed with highly heated calcium aluminate. Such crucibles are said to withstand temperatures of 2500° C. Bauxite has been used to replace the alumina, H. L.

alumina, natural abrasive. See corundum; emery, AGSC, 1963.

alumina-corundum. A vitreous ceramic white refractory material for technical applications, (Al₂O₃), is the essential crystal phase. H.TDM 2C42-60.

alumina-silica refractories. Refractories consisting essentially of alumina and silica, and including high-alumina fire clay, and kaolin refractories. H.W.

alumina, sintered. Alumina, sometimes containing an amount of clay or of a mineralizer, and fired at a high temperature to form a dense ceramic. Sintered alumina has great mechanical strength and abrasion resistance, high dielectric strength, and low power factor. Because of these properties, sintered alumina is used in thread guides, tool tips, and grinding media; as the ceramic component of spark plugs, electronic tubes, ceramic-to-metal seals, etc. Sintered alumina coatings can be applied to metals by flame-spray method.

aluminia. A. A compound having the general formula, MAO₃ or MA₂O₅, in which M indicates a monovalent metal. Bennett 2d, 1962. B. A salt of alumic acid. Sodium aluminate is a common one, used to good advantage as a mill addition, to set up acid-resisting enamels and certain cast-iron ground coats. Mineral aluminas, like Mg₃Al₂O₅, are termed spinels. Enam. Dict.

alumina trisilicate; aluminum hydrate; alumina hydrate; hydrated alumina; hydrated aluminum oxide; hydrated aluminum oxysulfate, Al₂O₅·3H₂O or Al₂O₃·H₂O; monoclinc; white; crystalline powder, balls, or granules; specific gravity, 2.42; insoluble in water; and soluble in mineral acids and caustic soda. Obtained from bauxite. Used in glass and ceramics as a source of aluminum. CCD 6d, 1961. Sometimes used in sinted bodies because of possible high reactivity. Used in the placing and firing of various ceramic products to prevent sticking of the ware and the setter. L. L.

alumnum. A hydrous sulfate of aluminum, Al₂(SO₄)·9H₂O, usually occurring in white reniform masses. Fay.

alumnum, British spelling of aluminum. See also aluminum.

aluminizing. Forming an aluminum or aluminum alloy coating on a metal by hot dipping, hot spraying, or diffusion. ASM 3.

aluminum-cobalt. A variety of copiapite in which X in the formula, X(OH)₃·Fe⁺⁺,

(50%,1,3H₂O), is mainly Al[Al₁₀₁·7₂-4.43 percent]. Compare ferritcopiapite. Spencer 18, M.M., 1949.

alumunisilicate refractory. A general term that includes all refractories of the fire clay, silitamite, mullite, diopside, and bauxite types. Dodd.

aluminisilicate bricks. Various kinds of alumina silicon refractories with metal oxides or other radicals. Used as catalytic in refining petroleum and to soften water. See also seals. CCD 6d, 1961.

aluminothermic reaction. In thermit welding, the chemical reaction which occurs when powdered aluminum is ignited with the oxides of other metals. The aluminum extracts the oxygen from these metals and burns fiercely, melting them and forming the weld. Ham.

aluminothermy. A process of producing great heat and strong chemical reduction by oxidizing finely divided aluminum with oxygen taken from another metal, this metal being thus reduced from its oxide (as molten iron is obtained from iron oxide in welding by the thermit process). Webster 3d.

aluminous. Of the nature of alumina or clay. Fay.

aluminous fire clay refractory. This type of refractory material is defined in British Standard 1902 as an aluminosilicate refractory containing 38 to 45 percent Al₂O₃. Dodd, C.T.D.

aluminous ores. Iron ores in which the gangue consists principally of alumina.

aluminous refractory goods. Those which contain more than 45 percent alumina. Roush.

aluminum. A light, silver-white, ductile metal with high electrical conductivity and good resistance to corrosion. Obtained from bauxite. It has numerous uses and is the basis of many light alloys. Symbol, Al; valences, 3; atomic weight, 26.98; atomic number, 13; isometric; specific gravity, 2.705 (at 20° C); specific electrical resistance, 3.80 microhms per cubic centimeter (at 20° C); mass conductivity, 212.9 percent of standard aluminum. Mersereau, 4th, p. 27.9. After magnesium, it is the lightest of the metals. Used in the manufacture of glassware and in the production of white enamel. CCD 6d, 1961.

aluminum bronze. An alloy of aluminum and copper resembling pale gold; used in cheap jewelry, etc. Standard, 1964. As a powder, used in glazing. Fay.

aluminum deuteron. See Briska detonator. Higham, p. 61.

aluminum fluoride; aluminum fluorides; aluminum fluoride. AlF₃; molecular weight, 40.03; triclinic; colorless, transparent; specific gravity, 3.07; melting point, 1,040° C; and soluble in water. Used in the production of white enamel. CCD 6d, 1961.

aluminum hexafluoride; aluminum hexafluorides. A white powder; Al(F)₃. Used in artificial gems, enamels, and glass. CCD 6d, 1961.

aluminum gold. An alloy said to be ruby red containing 22 percent aluminum and 78 percent gold; melting point, 1,080° C. Camm.

aluminum hydroxide, gelatinous; hydrous aluminum oxide; aluminum gel. A white, gelatinous precipitate; Al₂O₃·2H₂O. Used in the manufacture of glassware and in ceramic glaze. CCD 6d, 1961.

aluminum metaphosphate. Al₅(PO₄)₃; molecular weight, 263.91; white crystalline powder; melting point, 1,700° C; and insoluble in water. Used in glass, china, and enamels. Fay.

aluminum minerals. Alunite, albunite, andalusite, bauxite, corundum, cryolite, cyanite, diopside, eucryptite, gillette, garnet, jade, kaolin, micas, mullite, nepheline, nephrite, quartz, spodumene, tourmaline, wavellite, and many silicates. The commercial ores of aluminum are cryolite, a fluoride of sodium and aluminum, found in Greenland; and bauxite, a hydrous compound of alumina, ferric oxide, and silica, found in Arkansas, Georgia, and Tennessee. Fay.

aluminum nitride. AlN; hexagonal; and clear white crystals. Used to make crucibles for melting aluminum by reacting aluminum powder with nitrogen. Lee.

aluminum orthophosphate. a. AlPO₃; molecular weight, 123.1; orthorhombic plates; specific gravity, 2.556; melting point, above 1,500° C; insoluble in water; and soluble in acids. Used in ceramics. Bennett 2d, 1962. b. White crystals; insoluble in alcohol; and soluble in alkalies. CCD 6d, 1961.

aluminum oxide. See aluminum. Fay.

aluminum phosphate. a. Phosphorus acid; phos- phosphorus acid. A white, granular powder; approximately 2Al₂O₃·3B₂O₃·3H₂O. Used in the glass and ceramics industries. CCD 6d, 1961.

aluminum boride. The usual compound is AlB₁₂, this dissociates above 980° C to form Al₂B₁₀ and Al₁₃Dodd.

aluminum brass. Brass to which aluminum has been added to increase its resistance to corrosion. It contains 24 to 42 percent zinc, 55 to 71 percent copper, 1 to 6 percent aluminum. Used for condenser tubes, etc. Nelson.

aluminum bronze. An alloy of aluminum and copper resembling pale gold; used in cheap jewelry, etc. Standard, 1964. As a powder, used in glazing. Fay.

amagrosite. A hydrous silicate of magnesium and aluminum, Mg(OAlO2SiO2)7H2O. It is commonly known as natural soap or soaprock. A trade name for a Bentonite from the Amargosa River, Calif. The same as montmorillonite. English.

amal. Eng. With great force or speed. Wagons or tubs are said to run amain, if by accident they go over an incline, bank, or dump, without the rope being attached; or through the rope becoming detached or broken. Fay.

amalgame. A mineral, (Fe,Mg)O(OH); rhombohedral; oxidizes rapidly in air; occurs as thin veins in kimberlite; U.S.S.R. Hey, M.M., 1964; Fleischer.

amakusa. The Japanese equivalent of china stone. See also china stone. Dodd.

amalgamation. a. The production of an amalgam by which mercury is alloyed with some other metal to produce an amalgam. It is generally done through suitable doors. Fay.
b. To amalgamate gold. Fay.
c. Amalgamates gold. Fay.

d. Amalgamating battery accumulations and other materials. It is run with intermittent charges, and consists of a lead of steel balls or pebbles to effect continuation and to bring the mercury into contact with the metal to be amalgamated. Charging and discharging are done through suitable doors. Fay.

amalgamating barrel. A short, cylindrical vessel or barrel with solid ends turned to the plates in a mill treating gold ores. Fay.

amalgamating table. A sloping wooden table covered with a copper plate on which the amalgamating battery accumulations and other material. It is run with intermittent charges, and consists of a lead of steel balls or pebbles to effect continuation and to bring the mercury into contact with the metal to be amalgamated. Charging and discharging are done through suitable doors. Fay.

c. Native amalgamated gold 39 to 42.6 percent gold has also been found. Sanford.

d. Amalgamated ore. An ore in a vacuum tube having electrodes of mercury amalgamated with zinc, cadmium, or other metal. The spectra of such ores contain the bright lines of the metals in the electrodes. Webster 2d.

amalgam. a. An alloy of mercury with one or more other metals in ASM Glass. b. A styptic of gold and mercury, about one-third gold by weight, obtained from the plates in a mill treating gold ore. C.T.D. c. A native compound of silver and mercury, in which the percentage of silver ranges from 2.7 to 9.5. Native amalgam gold carrying 39 to 42.6 percent gold has also been found. Sanford.

amalgamite. A trade name for a bentonite from the Amargosa River, Calif. The same as montmorillonite. English.

c. Native amalgamated gold 39 to 42.6 percent gold has also been found. Sanford.

d. Amalgamated ore. An ore in a vacuum tube having electrodes of mercury amalgamated with zinc, cadmium, or other metal. The spectra of such ores contain the bright lines of the metals in the electrodes. Webster 2d.

amalgamation. a. The production of an amalgam by which mercury is alloyed with some other metal to produce an amalgam. It is generally done through suitable doors. Fay.
b. To amalgamate gold. Fay.
c. Amalgamates gold. Fay.

d. Amalgamating battery accumulations and other materials. It is run with intermittent charges, and consists of a lead of steel balls or pebbles to effect continuation and to bring the mercury into contact with the metal to be amalgamated. Charging and discharging are done through suitable doors. Fay.

amalgamating table. A sloping wooden table covered with a copper plate on which the amalgamating battery accumulations and other material. It is run with intermittent charges, and consists of a lead of steel balls or pebbles to effect continuation and to bring the mercury into contact with the metal to be amalgamated. Charging and discharging are done through suitable doors. Fay.

c. Native amalgamated gold 39 to 42.6 percent gold has also been found. Sanford.

d. Amalgamated ore. An ore in a vacuum tube having electrodes of mercury amalgamated with zinc, cadmium, or other metal. The spectra of such ores contain the bright lines of the metals in the electrodes. Webster 2d.

amalgamation. a. The production of an amalgam by which mercury is alloyed with some other metal to produce an amalgam. It is generally done through suitable doors. Fay.
b. To amalgamate gold. Fay.
c. Amalgamates gold. Fay.

d. Amalgamating battery accumulations and other materials. It is run with intermittent charges, and consists of a lead of steel balls or pebbles to effect continuation and to bring the mercury into contact with the metal to be amalgamated. Charging and discharging are done through suitable doors. Fay.

amalgamating table. A sloping wooden table covered with a copper plate on which the amalgamating battery accumulations and other material. It is run with intermittent charges, and consists of a lead of steel balls or pebbles to effect continuation and to bring the mercury into contact with the metal to be amalgamated. Charging and discharging are done through suitable doors. Fay.
mated with mercury added to the pan.  C.T.D.

amalgamation process. A process of gold or silver recovery in which the ore, finely divided and suspended in water, is passed over a surface of liquid mercury to form an amalgam. The amalgam is subjected to fire-refining processes for the recovery of its gold, silver, and copper content. See D.O.T. 1.

amalgamation. a. An apparatus used in mining for bringing pulverized ore into close contact with mercury. The ore is then ground to a fine pulp from which it may be separated. See by heat. D.O.T. 1.

amalgamation pan; amalgamating barrel. A small cylinder batching amalgam slivering. A process of silvering amalgamation process. A process of gold or silver treatment. See amalgamation. See C.T.D.

amalgamation table. A table used in the amalgamation process. A small cylinder batching amalgam barrel. A small cylinder batching amalgam plate. A sheet of metal (copper, muntz, etc.) with an adherent film of mercury that seizes gold or silver from the mixture of ore and mercury, thus causing particles of free gold to amalgamate with mercury. See D.O.T. 1.

amalgamation gilding. A process of gilding in which the metal is coated with gold amalgam and the mercury driven off by heat. Standard, 1964.

amber. amber drop. A term describing a shape in which amber occurs. Webster 3d.

amber kaolin. A white-firing micaceous kaolin from Hirschau, Oberpfalz, Germany. It takes a fine polish and is used chiefly in making ornamental objects (as beads and mouthpieces). Webster 3d. See also kaolin.

amber color. amber color plate. A term describing a shape in which amber occurs. Webster 3d.

amber kaolin. A white-firing micaceous kaolin from Hirschau, Oberpfalz, Germany. It takes a fine polish and is used chiefly in making ornamental objects (as beads and mouthpieces). Webster 3d. See also kaolin.

amber colophony. amber varnish. Same as amber pitch. Webster 3d.

ambers. See amber lac. Webster 3d.

amberfish. amber fish. A name for amber. Webster 3d.

amber, oil of. A reddish brown distillation of amber. Webster 3d.

ambers. See amber lac. Webster 3d.

amber, oil, amber. oil. A reddish brown distillation of amber. Webster 3d.

amber, oil, amber. oil. A reddish brown distillation of amber. Webster 3d.

amber, oil, amber. oil. A reddish brown distillation of amber. Webster 3d.

American American disk filter. A continuous rotary filter in which the separating membranes are washed with water. American pigments. See pigment, American. 1940.

American pigment. A type of pigment that is used in the production of American pigments. American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.

American pigments. See pigment, American. 1940.
American disk filter

American gold. See coi gold.

American green jade. A Chinese trade name for a variety of green jade, which occurs in foliated quartzite and is very popular with American tourists and exporters in China. The name was unheard of before World War I. Shipley.

American gold. See coin gold.

American gold. See coin gold.

American jade. A Chinese trade name for pale reddish-purple jade, occurring in amygdaloidal geodes. Usually pale to dark green or bluish green. Also used for the pigment amorphous of this color.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A pigment usually composed of a lead molybdate or a basic lead sulphate, known as Mexican turquoise. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.

American amethystine. A color designation meaning violet to purplish, used as in amethystine glass and amethystine sapphire. Shipley.
ammonium alamgal

ammonium bicarbonate; ammonium-hydro-
gen carbonate; ammonium acid carbonate.
NH₄HCO₃. Used in conjunction with fluo-
rates as a refrigerant for selecting certain
types of glassware, as in producing
frosted surfaces on electric light bulbs.
ammonium bifluoride; ammonium acid flu-
ride; ammonium-hydrogen fluoride. White;
orthern or tetragonal; deliquescent;
(NH₄)HF. Used for processing beryl-
ium; in electropolishing; as a chemical re-
agent; in etching glass (white acid); and
in ceramics. C.D, 6d, 1961.
ammonium carbonate; ammonium sesqui-
carbonate. A mixture of ammonium acid car-
bonate and ammonium carbonate; (NH₄)
HCO₃, (NH₄)(NH₄)CO₃; colorless crystal-
plates or acicular powdcr; and unstable in
air, being converted into the carbonate.
Used in ceramics. C.D, 6d, 1961.
ammonium chloride; am ammoniae. NH₄Cl;
isometric; and colorless. When dissolved
in water, it is used as an electrolyte for
some primary cells. Obtained as a by-
product in gas manufacture. Used as a
flux in soldering. Crispin.
ammonium fluoride. NH₄F; monoclinic;
white and specific gravity, 1.31. Used in
glass etching. C.D, 6d, 1961.
ammonium fluoroborate; ammonium al-
oxalate. Colorless; orthorhombic;
(NH₄)H(C₂O₄). Used in integral worlds of
cements, concrete, and stucco. C.D, 6d,
1961. Molecular
weight, 301; melting point, 74° C; and
ammonium fluoride. (NH₄)F; orthorhomb-
ic; and colorless. Sometimes added as a
minor agent in glass batches since it is
claimed to shorten the melting time and to
be more effective than salt cake as an
accelerating agent, both of melting and
refining. Lee. Obtained as a byproduct of
the distillation of oil shales, lignite, and
bituminous coals. Used widely as a fertil-
izer. Hess.
ammonium hydroxide. See ammonium
hydroxide. C.D, 6d, 1961.
ammonium hydroxide. A solution of ammonia
in water. NH₄OH. C.D, 1961.
ammonium nitratevanadate. NH₄VO₃. Used in
certain ceramic glasses, especially in the
trivaniumodium yellow glasses, and as a base
for ceramic glazes. Can be combined with
tin to produce tin-vanadium yellow. Les.
ammonium nitrate. NH₄NO₃; molecular
weight, 80.04; colorless; monoclinic;
specific gravity, 1.725 (at 25° C); melt-
ing point, 186.9° C; soluble in water;
and stable in dry alcohol. Used in explosives
and as a fertilizer. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. (NH₄)NO₃; molecular
weight, 62.04; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
(NH₄)NO₃; molecular weight, 64.07; reddish-yellow powder;
insoluble in water; and soluble in acid. Used for painting on porcelain. Bennett 2d, 1962.
ammonium nitrate. A white crystalline powdcr,
ampelitis

city of bituminous earth used as an insecticide sprirkled on vines. Tomkiewicz, 1954.

amperage. The strength of a current of electricity acquired in an ammeter.

amperes. The practical unit of electric current. The current produced by 1 volt acting through a resistance of 1 ohm. Abbreviation, amp. Webster 3d.

amper-turn. The meter-kilogram-second (mks) unit of magnetomotive force equal to the magnetomotive force around a path that links one turn of wire carrying an electric current of 1 ampere; 1 amper-turn is equal to 0.4 x 1.257 gilberts. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

amper-turn. The meter-kilogram-second (mks) unit of magnetomotive force equal to the magnetomotive force around a path that links one turn of wire carrying an electric current of 1 ampere; 1 amper-turn is equal to 0.4 x 1.257 gilberts. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-turn. The meter-kilogram-second (mks) unit of magnetomotive force equal to the magnetomotive force around a path that links one turn of wire carrying an electric current of 1 ampere; 1 amper-turn is equal to 0.4 x 1.257 gilberts. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.

ampere-hour. The quantity of electricity carried past any point of a circuit in 1 hour by a steady current of 1 ampere; 1 ampere-hour equals 3,600 coulombs. Abbreviation, amp hr. Webster 3d.
analcite (analcime). Webster 3d. b. The same as analcite. Webster 3d.

analcimization. The replacement of feldspars or feldspathoid by analcite (analcime), usually in igneous rocks and the result of late-magnetic or post-magnetic reactions. A.G.I.

analcitholith. An igneous rock composed of analcite (analcime), either primary or secondary. Hess.

analcite. See analcite.

analcite basalt. An olivine-bearing basaltic rock, in which the predominant felsic mineral is analcite (analcime). See analcite.

analkite essexite. A gray to almost black, fine-grained analcite diabase. A diabase, containing analcite, usually as an interstitial constituent. Holmes, 1928.

analcitite. See analcite.

analog indicator. A device which translates a measured variable to a readable form. Pryor, 3, p. 31.

analog computer. One which works by creating an analogy of the problem, mathematically. Pryor, 3, p. 31.

analogous. a. Corresponding to or resembling something else in some way; as in form, proportion, etc. Bureau of Mines Staff. b. Designating that pole (end) of a pyroelectric crystal to which heating gives a positive charge. Compare analogous. Bureau of Mines Staff.

analogy. Comparison between two effects. Alternating current is used as an analogy in the study of tides. Electrical analogies are also applicable to such studies as seepage of water through sand, and to the solution of structural problems. A.S.M.E.

analysis. a. A quantitative statement of the experimentally determined physical and chemical characteristics of a substance. See also air-dried basis; dry ash-free basis; dry mineral matter basis. B.S. 3373, 1960. b. The determination of the chemical composition of the constituents of a coal, rock, or mineral. See also assay; chemical constitution of coal. Nelson. c. The process of reducing a problem to its primary components; the assessment of causes or faults from survey data, etc. Nelson. d. The separation of combined substances into their constituent chemical processes. Webster 3d. e. The determination, which may or may not involve actual separation, of one or more ingredients of a substance either as to kind or amount. Also, the result of such a determination. Webster 3d.

analytical chemistry. Qualitative or quantitative composition of materials. Pryor, 3, p. 80.

analyze. To separate into constituent parts or elements for study. Merriam, 4th, p. 413.

analyser. a. One of two nicol prisms or polaroid discs in the petrological microscope, between which the thin rock sections are studied with transmitted polarized light. Pryor, 3, b. The part of a polaroscope that receives the light after polarization and exerts a magnetic or post-magnetic force on the processes are constructive. See also katamorphic zones.

anamorph. a. Metamorphism; anamorphism. Metamorphism at considerable depths in the earth's crust and under great pressure, resulting in the formation of complex minerals from simpler ones. Fay. The term contrasts with kathamorphism, which designates the breaking-down processes that take place at or near the surface of the earth. See also kathamorphism. 

anamorphic. a. Designating that pole (end) of a pyroelectric crystal to which heating gives a positive charge. Compare analogous. Bureau of Mines Staff.

anchor. a. To fasten down or hold in place. Long. b. A heavy object buried in ground to which a guy or drain line may be attached. Also called put- or deadman. Long. c. A lag screw used to anchor the drill base to a platform or sill. Long. d. An anchor-shaped rabble used in drawing coke from a coke oven. Hess. e. An anchor-shaped rabble used in drawing coke from a coke oven. Hess.

anchor charge. Means of fastening an explosive charge to a seismic shot hole to allow several charges to be preloaded. At each stage, the bottom charges are fired first, the upper charges being held down by anchors. A.G.I.

anchor derrick. A steel, towerlike derrick designed to serve as a drill platform and as support for drive pipe or casing in drilling boreholes in formations under very high water. The tower is held upright by anchors in the water by lines fastened to anchors. Long.

anchor charge. Means of fastening an explosive charge to a seismic shot hole to allow several charges to be preloaded. At each stage, the bottom charges are fired first, the upper charges being held down by anchors. A.G.I.

anchor derrick. A steel, towerlike derrick designed to serve as a drill platform and as support for drive pipe or casing in drilling boreholes in formations under very high water. The tower is held upright by anchors in the water by lines fastened to anchors. Long.

anchor-type ceramic veneer. Ceramic slabs approximately 2 to 2 1/2 inches thick, held per minute with a cutting depth from 1/2 to 3 inches and the broken coal is loaded by a plough-shaped body on to an armored conveyor. The machine can be operated independently of the face conveyor. See also Renshaw-Kennedy conveyor.

anchorage distance. That distance behind a quay wall at which a deadman must be fixed to insure that it will not slip with the wall but will provide an efficient anchorage for it. Ham.

anchoring bolt. A bolt or other device used to secure a diamond-drill core to a solid foundation. It may or may not be threaded. Long. c. A lag screw used to anchor the drill base to a platform or sill. Long. d. A bolt or other device used to anchor the drill base to a solid foundation. It may or may not be threaded. Long. e. A lag screw used to anchor the drill base to a platform or sill. Long.

anchorage. That portion of any beam or structure designed to resist pulling out or slipping of the beam or structure when subjected to stress. Nelson.

anchorage distance. That distance behind a quay wall at which a deadman must be fixed to insure that it will not slip with the wall but will provide an efficient anchorage for it. Ham.

anchoring bolt. A bolt or other device used to secure a diamond-drill core to a solid foundation. It may or may not be threaded. Long. c. A lag screw used to anchor the drill base to a platform or sill. Long. d. A bolt or other device used to anchor the drill base to a solid foundation. It may or may not be threaded. Long. e. A lag screw used to anchor the drill base to a platform or sill. Long.
anchor line. Cable connecting anchor with anchor jack. See jack.

ancylite. A very rare, weakly radioactive, ancient beach placer. Deposits found on the anchor plates. Plates attached to a drill base.

anchor ice. Ice formed below the surface of the water or to submerged objects. Also called ground ice; bottom ice. Webster 3d; Fay.

anchorite. A nodular and veined variety of diorite, the normal facies of the rock being variegated with dark mafic segregation patches and light felsic contemporaneous veins. From Anchor Inn, Caldecote, Nuneaton, England. Holmes, 1929.

anchor jack. See jack.

anchor plate. Cable connecting anchor with drill barge, float, other vessel, or drilling tower. Long.

anchor oven. An oven from which coke is removed with an anchor. Standard 366.

anchor plates. Plates attached to a drill base used to anchor or fasten the drill to the drill platform or platform sills with anchor bolts. Long.

ancpylosynt. To unite solidly; to grow together into one. Rice.

ancient cliff. See abandoned cliff. Schiessl.

ancolysis. A very rare, weakly radioactive, amphibolitic hornblende.

ancolyte. A direction of coal face roughly half-way between the main (bord) and secondary (end) cleavages; on the cross. Mason.

Anderseni. One of the plagiolase feldpars, AbAs-Abs-Abs; a mineral between albite and andorite.

andesine. A volcanic rock composed essentially of andesine and diorite. Usually, the plagiolase is strongly zoned and may range in composition from about An 50 to An 75, but the average composition usually falls within the range of andesine. When the rock is porphyritic, the plagiolase phenocrysts are usually more calcic than the plagiolase in the groundmass, and in addition, the groundmass may contain small amounts of microcrystalline or occulit psamitic feldspar and cristobalite. Pyroxene, hornblende, or biotite, or all three in various proportions, may constitute the mafic constituents. A.G.I. Also called leucotroite.

Andesite line. A map line designating the petrographic boundary of the Pacific Ocean. Extrusive rocks on the Pacific side of the line are basaltic and on the other side andesite. Lees.

Andesite. A dark, steel-gray sulfantimonite of the line. Fay.

andersonite. A very rare, strongly radioactive, secondary mineral, NaCa(UCO3)(OH). It is bright yellow-green and occurs as a lussore line with gypsum, schroekeringite, bayleisite, and schwartzite. Crosby, p. 6.

Anderton shearer loader. A widely used cut-and-tuck loader in which the ordinary jib of the longwall coal cutter is replaced by a shearing drum which cuts a web from 16 to 22 inches depending on its width. The machine travels on an armored conveyor and requires a pit-free-front for working. It shears the coal in one direction and the front coal is loaded by a plough deflector, and then returns along the face without cutting and loads the remainder of the broken coal. The ordinary Anderton is suitable for coal seams above 6 inches thick. See also shearer loader. Nelson.

andesite. One of the plagiolase feldpars, AbAs-Abs-Abs; a mineral between albite and andorite.

andesite. A volcanic rock composed essentially of andesine and diorite. Usually, the plagiolase is strongly zoned and may range in composition from about An 50 to An 75, but the average composition usually falls within the range of andesine. When the rock is porphyritic, the plagiolase phenocrysts are usually more calcic than the plagiolase in the groundmass, and in addition, the groundmass may contain small amounts of microcrystalline or occulit psamitic feldspar and cristobalite. Pyroxene, hornblende, or biotite, or all three in various proportions, may constitute the mafic constituents. A.G.I. Also called leucotroite.

andesite. A volcanic rock composed essentially of andesine and diorite. Usually, the plagiolase is strongly zoned and may range in composition from about An 50 to An 75, but the average composition usually falls within the range of andesine. When the rock is porphyritic, the plagiolase phenocrysts are usually more calcic than the plagiolase in the groundmass, and in addition, the groundmass may contain small amounts of microcrystalline or occulit psamitic feldspar and cristobalite. Pyroxene, hornblende, or biotite, or all three in various proportions, may constitute the mafic constituents. A.G.I. Also called leucotroite.
The speed of the decomposition reaction is double that obtained with dry additions. *See also* blasting; molasses/A.N. explosive.

**angelardite.** The corrected form of angelarite, so named after the locality Angelard (not Angel) in France. It is a massive, blue-green, and crystalline incrustation on andesite from the Cerrro Pululon tin mine, northwestern Argentina; adamantine to semimetallic lustre; conchoidal fracture. *American Mineralogist,* 44, No. 11-12, November-December 1959, p. 1222-1223.

**angle.** A free or given erroneous, first in 1837 to vivianite, and again in 1848 to berthierite. *Dana 6d,* p. 115. *See* angelardite.

**angle of a surface**. The angle formed by two meeting planes (line angle), two meeting planes (dihedral angle), or three or more planes meeting in one point (trigonal angle). *Webster 3d.* b. The difference in direction of two lines. *Webster 3d,* c. A projecting corner; a pointed form or sharp fragment. *Webster 3d.*

**angle beam.** A two-limbed beam. *ACS Gloss.*

**angle of dip.** The angle at which strata or mineral deposits are inclined to the horizontal plane. In most instances subsequent to the deposition of the strata have caused them to be inclined or tilted. *See also* apparent dip; true dip. *Nelson.* Synonym for dip. *Fay.*

**angle of draft.** Approach to perpendicular of a surface necessary for satisfactory draining purposes. *ACS 1226.*

**angle of draw.** a. In coal mine subidence, this angle is assumed to bisect the angle between the vertical and angle of repose of the coal surface, which is 20° for flat seams. For dipping seams, the angle of increase, being 35.8° from the vertical for a 46° dip. The main break occurs over the seam at the vertical, equal to half the dip. *Lewis,* pp. 618-619. b. The angle between the limit line and the vertical. *Nelson.*

**angle of external friction; angle of wall friction.** The angle between the abscissa and the tangent of which is the index of anisotropic minerals are rotated between crossed nicols for flat mineral planes. *ACS 1226.*

**angle of extinction.** When transparent or translucent thin sections of anisotropic minerals are rotated between crossed nicols in a polarizing microscope light ceases to be transmitted when the mineral's planes of vibration are parallel to the nicol plane. The angle between the two vibration. *Fay.*

**angle of external friction.** The angle between the vertical and the tangent of which is the index of anisotropic minerals are rotated between crossed nicols in a polarizing microscope light ceases to be transmitted when the mineral's planes of vibration are parallel to the nicol plane. The angle between the two vibration. *Fay.*

**angle of friction.** The angle between the perpendicular to a surface and the resultant force acting on a body resting on the surface, at which the body begins to slide. *Ham.*

**angle of incidence.** The angle formed by the line of incidence and a line drawn from the point of contact perpendicular to the plane of the surface on which the incident ray or body impinges. *Fay.*

**angle of inclination.** The angle of slope from the horizontal. *Bureau of Mines Staff.*

**angle of internal friction.** The angle between the abscissa and the tangent of which is the index of anisotropic minerals are rotated between crossed nicols in a polarizing microscope light ceases to be transmitted when the mineral's planes of vibration are parallel to the nicol plane. The angle between the two vibration. *Fay.*

**angle of repose.** The maximum slope to which a heap of any loose or fragmented solid material will stand without sliding, or come to rest when poured or dumped in a pile or on a slope. *Bureau of Mines Staff.*

**angle of shear.** The angle between the planes of maximum height which is bisected by the axis of greatest compression. *Rice.*

**angle of sliding resistance.** The value of sin θ in Coulomb's expression for the frictional force acting on a given plane and the normal to that plane. *ACS P1826.*

**angle of static friction.** a. That angle, the tangent of which is the index of a reflecting substance. *Fay.* b. The angle of refraction from a plane surface at which light is polarized. *Hers.*

**angle of pull.** The angle between the vertical and an inclined plane bounding a deflection surface exceeding the vertical. *Fay.*

**angle of reflection.** The angle which a reflected ray of light, upon leaving the surface of an object, makes with the normal to that surface. *Shipley.*

**angle of refraction.** The angle which a refracted ray of light makes with the normal to the surface on which it entered, or interior surface of an object, such as a transparent stone or crystal, makes with the normal to that surface. *Shipley.*

**angle of repose.** See angle of rest. *Bureau of Mines Staff.*

**angle of rest; angle of repose.** The maximum angle to which a heap of any loose or fragmented solid material will stand without sliding. If the angle of rest may be varied, the angle of repose is determined by experiment. It is zero for a saturated clay sheared without variation of moisture content, but for silts and clays in different conditions the value differs. *Ham.*

**angle of slide.** The slope, measured in degrees of deviation from the horizontal, on which loose or fragmented solid materials will start to slide; it is a slightly greater angle than the angle of rest. *Bureau of Mines Staff.*

**angle of swing.** The number of degrees through which the dipper moves horizontally from the filled position to the dump position to that surface. *Shipley.*

**angle of thread.** The angle included between the sides of the thread, that is, the spread of the thread from the screw to the major or minor diameter. *Bureau of Mines Staff.*

**angle of total reflection.** Same as critical angle. *Shipley.*

**angle of wall friction.** See angle of external friction. *ACS P1826.*

**angle plate.** Used in setting up work, generally for machinery; made of cast iron, being formed of two plates of metal at right angles with each other, and pierced with holes or slots for the reception of bolts. *Gates.*

**angle rule.** Synonym for clinometer rule. *Long.*

**angle base.** A special type of wall tile. *Dodd.*

**angle beam.** a. A two-limbed beam used for fixing a piece of timber to another, as in shafts, etc. *Zern.* b. See angle iron. *Hers.*

**angle brace.** A brace used to prevent sliding or overturning of a piece of timber, when used parallel to or perpendicular to the surface. *Ham.*

**angle rod.** A kind of bar with a pointed end inserted in the soil to form an angle or right angle with the earth's surface. *ASTM.*

**angle plate.** Used in setting up work, generally for machinery; made of cast iron, being formed of two plates of metal at right angles with each other, and pierced with holes or slots for the reception of bolts. *Gates.*

**angle rule.** Synonym for clinometer rule. *Long.*

**angled.** A brittle, lustrous lead sulfate, PbSO₄; orthorhombic; color transparent to opaque; Mohs' hardness, 2.5 to 3; specific gravity, 6.3. Valuable lead is oxidized and concentrated by gravity and/or flotation. *Pryor, 3; Dana 17.*

**angled.** A purpose-made clay or concrete tile for use in an angle in vertical exterior tiling. *Dodd.*

**angle to the right.** Horizontal angle measured clockwise from the preceding line to the
angle to the right

following one. Svercle, 2.

angle trough. A short curved section of a shaker or sorter trough mounted on a trough line to change the angle of direction. Up to 15° of turn the angle trough does not affect the face of the shaker or sorter other than connection to adjacent troughs. For a greater degree of turn, a shaker belt and a swivel device are employed with the trough action joint.

angular furnace. A furnace for the distillation

angular. -ing -ed. Willims.

angular shear. An inclination between two cutting edges to reduce the amount of pressure on the material cut. See 1. G.1. and C.1., 4.

angular inconsistency. An unconformity in which the lower underlying strata dip at a different angle than the overlying strata. A.G.I. See also conformities. A.G.I. Supp.

angular velocity. The time rate of angular displacement usually expressed in radians per second, or in revolutions per seconds, or per minute being a vector, the direction and sense of which are such that the motion appears clockwise to one looking in the direction of the vector. Webster 3d.

Anisou-Smith compound. A proteogenic ceat-

angular for valves, fittnes, and pipes used for underound work, composed of coal tar, tallow, resin, and quicklime B.S. 3618.

Annamite. A rock composed chiefly of anhy-

angularly. -ing. -ed. Macalister. A bulldozer with a blade that can be pivoted on a support center pin, so as to cast its load to either side. Nichol.

Anise. A trade name for cast tungsten car-

anglemeter. angledean. Angstrom. A roundness grade showing very

anglemeter. -ing. -ed. As a unit, the initial letter a of angstrom

anglemeter. -ing. -ed. As a unit, the initial letter a of angstrom

anglemeter. -ing. -ed. As a unit, the initial letter a of angstrom

anhydrous. a. Without water, especially water of crystallization. Webster 3d. b. An oxide of a nonmetallic element or an organic radical, capable of forming an acid by the abstraction of one element of water, or of being formed from an acid by the abstraction of the water, or of uniting with basic oxides to form salts. Webster 3d. c. A compound formed from another or others by the abstraction of water. See also acid anhydride. Webster 2d.

anhydrite. Calcium sulfate. CasO\textsubscript{2}. ortho-

anhydrite. a. A compound derived from another compound (as an acid) by the removal of the elements of water. Webster 3d. b. A residue of a nonmetallic element or an organic radical, capable of forming an acid by the abstraction of one element of water, or of being formed from an acid by the abstraction of the water, or of uniting with basic oxides to form salts. Webster 3d. c. A compound formed from another or others by the abstraction of water. See also acid anhydride. Webster 2d.

anhydrite. a. A compound derived from another compound (as an acid) by the removal of the elements of water. Webster 3d. b. A residue of a nonmetallic element or an organic radical, capable of forming an acid by the abstraction of one element of water, or of being formed from an acid by the abstraction of the water, or of uniting with basic oxides to form salts. Webster 3d. c. A compound formed from another or others by the abstraction of water. See also acid anhydride. Webster 2d.
anionic flotation

Staff. 2. A flotation process in which the undissolved ions of heavy minerals instead of the metal ores are floated. It is used with some success in the treatment of low-grade sources. A.G.I. Supp.

anisometric compound. A compound in which the bonds joining different metallic cations have an average of different relative strengths. A.G.I. Supp.

anisometric structure. In a crystal, a bond-line orientation that there is pronounced quantitative difference between the bond strengths. Prior. 3.

anisometric. A rock of porphyritic texture in which the chief minerals are embedded in a matrix or groundmass Obsolete. A.G.I.

anisometric. A rock of porphyritic texture in which the chief minerals are embedded in a matrix or groundmass Obsolete. A.G.I.

anisometric. A Happening asymmetrical. Not isometric. Applied to crystals with three unequal axes Webster 3d. b. Or relating to a rock of granular texture but having mineral constituents of unequal size Webster 3d. c. A textual term applied to granular rocks in which the grains are of different sizes. Webster 3d. d. A rock of different sizes. Webster 3d. e. A rock of different sizes. Webster 3d.

anisotropic. Having physical properties that vary in different directions. Specifically of optical crystallography showing double refraction. Characteristic of all crystalline substances, including minerals, except those belonging in the hexagonal system, which are isotropic. Opposite of isotropic. Fay. A.G.I.

anisotropic fabric. One in which there is preferred orientation in space of the elements of which the rock is composed. A.G.I.

anisotropic mass. A mass having different properties in different directions at any given point. ASCE P1826.

anisotropy; anisotropic. a. The property of being anisotropic, or exhibiting properties (such as velocity of light transmission, conductivity of heat or electricity, or compressibility) with different values when measured along axes in different directions Webster 3d. b. The condition of having different properties in different directions. For example, the state of geologic strata of transmitting sound waves with different velocities in the vertical and in the horizontal directions. A.G.I.

anisomorphite. A mafic olivine basalt composed mainly of pyroxene, with lesser amounts of olivine and plagioclase, and accessory olivine, apatite, and opaque oxides. A.G.I.

anisophyle. A white, red, or grayish calcium-magnesium-iron carbonate, CaCO₃(Mg,Fe,Mn)CO₃; commonly occurring in the partings of coal; thombohedral Dana 17; R.S. 3723, 1960.

anhydrometeors. See anecystosomiation. Webster 3d.

anhydrosilicate. A mineral, Ni₃(AsO₄)₆·8H₂O. Usually found as green incrustations as an alteration product of nickel ore. Monche, Min. Soc. called nickel bloom. A.G.I. Dana 17.

anhydrous. a. To heat, fire, bake, or fuse, as glass, asphalt, salt, clay, etc. Fig. b. To heat, as glass, earthenware, or metals in order to fix colors. c. To heat, as glass, earthenware, or metals, by heating and gradually cooling, so as to toughen them and remove brittleness. d. To prevent or remove objectionable stresses in glass by continuous cooling from a suitable temperature. ASTM C162-66.

annealed steel. Steel that has been softened or had strains removed by heating followed by slow cooling. [Rm.

annealed wire. Wire that has been softened or annealed Zen.

annealing. 1. A HEATING and holding at a suitable temperature and then cooling at a suitable rate for such purposes as reducing hardness, improving machinability, facilitating cold working, producing a desired microstructure, or obtaining desired mechanical, physical, or other properties. When applied to ferrous alloys, the term annealing without qualification, implies full annealing. When applied to nonferrous alloys, the term annealing implies a heat treatment designed to soften a cold-worked structure by recrystallization or subsequent grain growth or to soften an air-hardened alloy by causing a nearly complete precipitation of the second phase in a relatively coarse form. ASM Gloss. b. The transformation of the cooling rate at different temperatures of porcelains, glass, and other ceramic ware containing large quantities of vitreous material to prevent defects such as dunting, crazing, cracking, crystallization, etc. Bureau of Mines Staff. c. The process by which glass and certain metals are heated and then slowly cooled to make them more tenacious and less brittle. Important in connection with the manufacture of steel castings, forgings, etc. F any. d. See malleable castings. e. The process of heating metal shapes in a red heat or above, prior to cleaning. See also fine annealing. ASTM C286-65.

annealing arch. The oven in which glass is annealed. Fay.

annealing but. A box in which articles to be annealed are enclosed while in the furnace Standard, 1964. Also called annealing pot.

annealing color. The hue taken by steel in an annealing process. Fay.

annealing furnace. See annealing oven. Fay.

annealing oven. An oven for heating and gradually cooling metals or glass to remove stresses. Standard, 1964. Also called annealing furnace. Fay.

annealing point. The temperature at which the viscosity of glass is 10⁶ poises. Formerly defined as 10⁶ poises. The internal stresses are substantially relieved in 15 minutes at this temperature. ASTM C286-65.

annealing pot; annealing but. A pot in which articles are placed to be annealed. It is closed to prevent oxidation. Fay.

annealing range. The range of glass temperature in which stresses in glass articles can be relieved at a commensurable desirable rate. For purposes of comparing glasses, the annealing range is assumed to correspond with the temperatures between the annealing point and the strain point. ASTM C162-66.

annealed. annealed. a. A submetallic black, iron-black, or slate-gray color, crystallizing in the orthorhombic system. An intergrowth of samarskite and columbite. Fay; Crosby, p. 4.

annealed lamp. a. Lepidomelane; (H,K)₆Fe₆(FeAl)₄(SiO₄)₃, Mohs' hardness 3. Specific gravity, 5.0 to 5.2. A black, rather brittle mica characterized by the large content of ferric iron. Dana 6d, p. 634, b. Synonym for hydroxylmica. Hyd 2d, 1955.

annealed. Tennellite, Cu₆S₄As₄, in which part of the arsenic is replaced by bismuth. Dana 64, p. 138-140.

annual labor. Same as assessment work, on mining claims Fay.

annual layer. A sedimentary layer deposited, or presumed to have been deposited, during the course of a year; for example, a glacial layer. A.G.I. Super. A dark layer in a stratified salt deposit containing disseminated anhydrite A.G.I. Supp.

annual value. The annual value of a property is the estimated annual surplus of revenue over expenditure in process of liquidating the mineral reserves. In the usual case, that of a property owned by a company, it is the dividend estimated maintainable annually over the whole computed life, the regular distribution of ultimate profit Truscott, p. 234.

annealed. Recap. The space between casing and the wall of the hole or between drill pipe and casing and is an annular space. Fay.

annealed. Recap. A ring gear with teeth fused to its internal circumference. Also called internal gear. Crispin.

annealed. a. The electropositive pole. A.G.I., Supp. b. The positive terminal of an electrolytic cell. Webster 3d. c. The electrode at which electrons leave a device of an electrolytic cell. Webster 3d. d. The negative terminal of a primary cell or of a storage battery that is delivering current. Webster 3d. e. The electron-collecting electrode of an electron tube. Webster 3d.

annealed. Recap. An anodic cell in an electrolytic cell the enclosure formed by a diaphragm around the anodes. ASM Gloss.

annealed. Copper. Special-shaped copper slabs, resulting from the refine of blister copper in a reverberatory furnace, used as anodes in electrolytic refinement. ASM Gloss.

annealed. Copper. The dissolution of a metal acting as an anode. ASM Gloss.

anode fall. The effect produced by polarization of the anode in the electrolysis of fused salts. It is characterized by a sudden increase in voltage and a corresponding decrease in amperage due to the anode's being virtually separated from the electrolyte by gas bubbles. Fay; Crosby, p. 4.

anode efficiency. Current efficiency at the anode. ASM Gloss.

anode fall. A very thin space-charging layer in a gas discharge tube, placed on the anode surface, characterized by a steep potential gradient through the region. BoMines Bull. 625, 1965, p. 781.
anode film

anode film, a. The portion of solution in immediate contact with the anode, especially if the concentration gradient is steep. (Gloss. b. The inner layer of the anode itself. ASM Gloss.

anode furnace. A copper or nickel refining furnace, in which copper or impure nickel is refined. Bureau of Mines Staff.

anode metals. Metals used for electroplating. They are as pure as commercially possible, uniform in texture and composition, and have the skin removed by machining. In addition to pure single metals, various alloys are produced in anode form, such as... standard.

anode mud. anode slime. A deposit of insoluble residue formed from the dissolution of the anode in commercial electrolysis. Sometimes called anode slime. ASM Gloss.

anode picking. See electrolytic picking. Dodd.

anode scrap. Remnants of anode copper retrieved from electrolytic refining of the metal. H. P.

anode slime. See anode mud.

anode cleaning. Electrolytic cleaning where the work is the anode. It is also called reverse-current cleaning. ASM Gloss.

anodic coating. A film on work resulting from an electrolytic treatment at the anode. ASM Gloss.

anodic picking. Electrolytic picking where the work is the anode. ASM Gloss.

anodic painting. In the electrical self-potential method of geophysical prospecting, if the chemical composition of the soil or subsoil is such as to give electrical polarization, the zone of electropotential potential is the anodic zone. A.G.I.

anodized aluminum. Aluminum which has been made the anode or positive electrode of an electrolytic chemical bath containing sodium phosphate or other solution. On passing a current through the bath, the aluminum is chemically oxidized on the surface, giving it a fine matte appearance.

anodizing. Forming a conversion coating on a metal surface by anodic oxidation; most frequently applied to aluminum. ASM Gloss.

anorgan. An obsolete term for rocks that have risen from below; that is, eruptive rocks. Fay.

anolyte. The electrolyte adjacent to the anode in an electrolytic cell. ASM Gloss.

ammonia. A lightweight alteration product of jaspermorite; a pyroxene, (Mn,Zn,Fe,Mg)(Ca,Na,Fe)2SiO,; blood red in thin section, containing 30 percent MnAs, with copper and nickel. Hess.

ammonious double refraction. Double refraction in a chemically slightly refractive substance. Caused by internal strain. Seen by irregular extinction when substance is observed between crossed nicols as in symmetrical prism and sometimes in garnet. Skipper.

ammonious magma type. An unusual magma type that is generated by or affected by assimilation. It is to be distinguished from magma types formed by differentiation alone. A.G.I.

anomaly. A. Any deviation from uniformity. A distinctive local feature in a geophysical survey, such as an anomaly of over a large area. An area or a restricted portion of a geophysical survey, such as a magnetic survey of the earth, that differs significantly from the rest of the survey in general. The anomaly might be associated with petroleum, natural gas, or mineral deposits, or provide a key to interpreting the underlying rock structure. Drilling for economic mineral deposits might be conducted in the area of a geophysical anomaly. In seismic usage, anomaly is generally synonymous with structure, but it is also used for spurious or unexplainable seismic events or for local deviations of potential functions which cannot be conclusively attributed to a unique cause. A.G.I. b. Any departure from the normal maeristic field of the earth is a magnetic anomaly. It may be a higher or a lower, subcontinuous, ridgelike or valleylike, or linear and dikelike. A.G.I. c. A gravity anomaly is the difference between the theoretical calculated gravity and the observed terrestrial gravity. In comparing any set of observed data with a computed theoretical curve, the difference can be observed value and the corresponding computed value, or the observed minus the computed value. Excess observed gravity is a positive anomaly, and a deficiency is a negative anomaly. See also Bouguer anomaly; free-air anomaly; normal gravity; A.G.I. Supp. d. A crystallographic anomaly is the lack of agreement between the apparent external symmetry of a crystal and the observed optical properties. Schueller-decker.

anomaly drilling. Boreholes drilled to explore the formations in or adjacent to an anomaly. Long.

anomalite. Applied to a geologic feature that formed during a period of tectonic quiescence between orogenetic periods. A.G.I.

anomalite granite. A granite, the replacement of which is not connected with an orogen. Schueller-decker.

anomalite complex. A geologic time when significant deformation of the earth's crust did not occur. A.G.I.

anomalite. An end-member of the plagioclase I-feldspar series, Ab-An=CaAl2SiO6, consisting of calcium-aluminum silicate and containing no sodium. The intermediate plagioclases may be regarded as mixtures of anorthite with the other end-member, albite. Treml. Compare albite. Fay. Done 17.

anomalite. a. Proposed by Turner for a granular igneous rock composed almost wholly of anorthite. Hess. b. A coarse-grained granito-granitic rock that consists almost entirely of anorthite. The rock is a feldspathic extreme of the gabbro group, an anorthosite formed of anorthite. Hess.

anomalite schist. A trichassic feldspar closely related to the orthoclase group. Chiefly a soda potash feldspar. (K(AlSi3O8)).NaAl(AlSi3O8).

anthonyite. A plutonic rock composed almost entirely of plagioclase, which is usually lathrodite. It is a monomineralic equiaxed aggregate of plagioclase that is frequently seen in thin sections. Bureau of Mines Staff.

anthonyite. The process of formation of anorthosite by replacement of metamorphism. A.G.I.

anthos. Oxygen deficiencies in the blood cell, or tissues of the body in such degree as to cause psychological and physiological disturbances. Anoxia may result from a scarcity of oxygen in the air breathed or from an inability of the body tissues to absorb oxygen under conditions of low ambient pressure. Also called hypoxia. HOG.

anthropoid. A.N.S. amphibolite skarn. An underwater breathing apparatus consisting essentially of a breathing bag worn around the neck, and an oxygen cylinder, reducing valve, and carbon dioxide absorbent canister worn at the left side. A counterbalance weight is worn on the right side. When the cylinder is fully charged with pure oxygen, this apparatus can be used up to 40 minutes at depth down to 30 feet. Mr.Adam, pp. 163-164.

antagonizing screws. On a theodolite, clip screws used to eliminate index error of a vertical circle. Prior, J.

antecedent. Pertaining to streams, valleys, or complete drainage systems that were established before upwars, faulting, or folding, and that maintained their original courses despite subsequent deformation. A slow rate of uplift is implied. The term contrasts with consequent and superimposed (or superposed). Stoles and Varnes, 1955. b. Pertaining to or characterizing the internal movements of the earth concerned in the elevation of continental masses and their exposure to degradation. Contrasted with consequent. Standard, 1964.

antecedent stream. A stream that retained its early course and remains unaltered since its course was assumed. Fay.

antecedent valley. A stream valley that existed before uplifts, faulting, or folding occurred and which maintained itself during and after the uplifts, faulting, or folding. Bureau of Mines Staff.

antecedent stream. a. In a deformed region may be found, therefore, true antecedent streams, and streams that were consequent upon the form of the surface assumed as the result of early movement but are antecedent to later movements of the same series. Such a stream might be termed antecedent, consequent, or antecedent-sequent. A.G.I. b. A stream that is consequent on some earlier stage of the warping and antecedent to the rest. A.G.I.

antelope aquamarine. See Colorado aquamarine.

antil. In blast-hole drilling, the cuttings around the hole collar. Kramanhøj, p. 50.

antilite. Gypsum or rock salt of the radiating clusters of long needle or hairlike crystals on the roof or wall of a cave. A.G.I.

antimony. A hydrous aluminum tungstate, AI02WO4, 3H2O, as white chalky material. Used as a rouge of the Congo. Spencer and Mau, 1949.

antimony. A mineral, Cu(OH)2, 3H2O; monomelane; lavender-colored pleochroic crystals; unaltered biotite, or Centennial mine, Calumet, Mich. Compare calomite. Hay, MM, 1964; Flitner.

1964.
anthophyllite. A close-brown orthorhombic amphibole, (Mg,Fe)₃Si₆O₁₈(OH), usually massive, and of a color due to oxidation of the magnesium, a metallicate of magnesium and iron. It is a variety of asbestes. 

C.M.D. Dana 17.

anthophyllite. From Greek anthrax, coal, also, a precious stone; combing forms used commonly to denote substances resembling or derived from coal or fossils found in the coal measures.

anthophyllite. Obtained by the distillation of coal tar. Used in the manufacture of dye-stuffs Crayon.

anthracene oil. A heavy green oil that distills over from coal tar above 270° C and is the principal source of anthracene, phenanthrene, and carbazole. Webster 3d.

anthracene. An old name for coal tar later transferred to mineral coal. Tomkeieff, 1954. See also anthrax.

anthracite. A grouping name for coal, anthracite, peat, etc. Tomkeieff, 1954.

anthracite. Containing or yielding anthracite. Webster 3d.

anthracite. A brownish resin found in the coal measures; also, a precious stone; combinings used commonly to denote substances resembling or derived from coal or fossils found in the coal measures.

Tomkeieff, 1954.

anthracite. a. A hard, black lustrous coal containing a high percentage of fixed carbon and a low percentage of volatile matter. Commonly referred to as hard coal, it is mined in the United States, mainly in eastern Pennsylvania, although in small quantities in other states. B.C.I. 1947. Probable identical with attrite. Webster 3d.

b. Nonagglomerating anthracite coal having 92 percent or more, and less than 7 percent of ash, dry-matter-free) and 8 percent or less, and more than 2 percent of volatile matter. (Dry, mineral-matter-free). A.S.T.M. D388-38 c. A black coal with semimetallic luster, semiconchoidal fracture, and volatile-matter content usually less than 7 percent. Carbon content is 80 to 85 percent in France, 85 to 93 percent in Pennsylvania, and 85 to 95 percent in Wales compared to 70 to 85 percent carbon in bituminous or soft coal. Anthracite ignites with difficulty, produces no smoke, burns at first with a very short black flame; that disappears after the coal is thoroughly ignited, and produces an intensely hot fire. Also called hard coal.

Kilkenny coal; stonelump.

anthracite. a. Having a greater hardness than the anthracites.

b. See large-diameter bore machine.

anthracite coal. Used refractory. A manufactured refractory comprised substantially of calcined anthracite coal.

ASTM C71-64

anthracite coal. Massive fibrous of the lungs marked by a tumidity, consisting of breath from inhalation of carbon and quartz dusts. Also called miner's phthisis. Webster 3d.

anthracite. A coal-black bituminous marble or limestone usually emitting a foul smell when rubbed. Webster 3d. Also called stinkstone; stone coal.

anthracite. A short form of anthracite.

anthracite. A brownish resin found in coal and partly soluble in ether, the remaining insoluble black powder is called anthracene. Webster 3d.

anthracite. A dense black powder obtained from a resin in the coalbeds of Brandrlil, near Schlak in Bohemia, after the resin is treated with nitric acid which dissolves the schlanie, leaving the insoluble portion, anthracene. Webster 3d.

anthracite. Sizes of anthracite smaller than barley. Jones.

anthracite. Variant of anthracocilikis. Webster 3d.

anthracite. A highly graphitic coal. One specimen contained 97.1 percent fixed carbon. A.G.I. Supp. b. Anthracite material occurring in veins in Precambrian slate of the Sudbury district, Ontario, Canada. A.G.I. Supp. b. Introduced by R. Thiesen in 1920. Used microscopically, anthracite generally reveals some of the original plant structure. Cellular inclusions indigenous to the original plant structure. Cellular inclusions indigenous to the original plant tissue are assigned to the anthracite when present. Conventionally, anthracite must be more than 14 microns thick perpendicular to the bedding plane. Microscopic material resembling anthracite in color and transmissibility but less than 14 microns wide is included with translucent humic degradation matter. Color is orange to red brownish-red; the depth of color increasing with rank and the thickness of the thin section. Cellular inclusions may vary in color from reddish-brown to light yellow. In general, plant structure is revealed by slight differences in the tint of cell walls and cell fillings. Anthracite that is transitional into the and is tint than normal anthracite of the same rank, and cell structure is more clearly shown. It is present in quantities of carbon in structure. It is present in quantities of carbon in structure. Anthracite is a black, bituminous coal containing 50 to 70 percent of anthracite, b. By the physical variations in coal that make it possible to classify coal material by type. A.G.I.

Anthracocilikis. A synonym of anthracocilikis. See also Molucca.

anthracocilikis. A coal-black bituminous marble or limestone usually emitting a foul smell when rubbed. Webster 3d. Also called stinkstone; stone coal.

anthracocilikis. A coal-black bituminous marble or limestone usually emitting a foul smell when rubbed. Webster 3d. Also called stinkstone; stone coal.

anthracocilikis. A brownish resin found in coal and partly soluble in ether, the remaining insoluble black powder is called anthracene. Webster 3d.
antiphlogistic device. A cushioning device to prevent the breakage of fragile or delicate objects.

antikline. A fold which is convex downward, having the same general form as a syncline, but the two sides dip in opposite directions, and the limbs generally form a more nearly parallel alignment.

anticlinal. Relating to or denoting an anticline.

anticline. A fold which is convex downward, having the same general form as a syncline, but the two sides dip in opposite directions, and the limbs generally form a more nearly parallel alignment.

anticline, a. Inclining in opposite directions. Having or relating to a fold in which the sides dip from a common line or crest. Of or pertaining to an anticline. The opposite of synclinal.

anticline axis. The medial line of a folded structure from which the strata dip in either direction. Fay. b. A line of hills, or a valley, is composed of strata, which on the two sides dip in opposite directions, the imaginary line that lies between them and towards which the strata on each side rise, called an anticlinal axis.

anticline bend. An upwardly convex flexure in which one limb dips gently towards the apex and the other limb dips more steeply away from it. Compare syncline, monocline.

anticline. A fold or range of hills, or an arch-shaped form. Gordon.

anticline mountain. Using the terms anticlinal and synclinal in their commonly accepted sense, we propose to apply the phrases anticlinal or synclinal mountain or range to designate ridges formed respectively by a convex and concave flexure of the strata.

anticline theory. The theory that water, oil, and gas accumulate in the order named in upwarped strata, provided such a structure contains reservoir rocks in proper relation to source rocks and an impervious barrier. A.G.I.

anticline valley. A valley which follows an anticlinal axis. The term was used as early as 1862 by C. H. Hitchcock. A.G.I.

anticline, a. A fold or range of hills, or an arch-shaped form. Gordon.

anterior. Relating to the part of an organism on the side opposite the posterior or hind part.

anterior or anterior. Of or relating to the part of an organism on the side opposite the posterior or hind part.

anterior. Of or relating to the part of an organism on the side opposite the posterior or hind part.

anterior. A. Trivalent and pentavalent antimony forms a comparatively small part. Pettijohn.

anterior. Antimonious. A salt or ester of antimonious acid; a compound containing the radical SbO⁺₄, Sb₄O⁻₇, or Sb₂O⁻₆ (diantimonate) in which antimony has a +5 valence. A.G.I. b. A salt contains pentavalent antimony and oxygen in the anion.

anterior. Antimonial arsenic. A native compound of arsenic and antimony of which the antimony forms a comparatively small part. Members of this series with antimony greater than arsenic dimorphous with polybasite, which has a unit-cell 8 times as large.

anterior. Antimonial arsenic. A native compound of arsenic and antimony of which the antimony forms a comparatively small part. Members of this series with antimony greater than arsenic dimorphous with polybasite, which has a unit-cell 8 times as large.

antimony. A. Trivalent and pentavalent metalloid element that is commonly metallic silver white, crystalline, and brittle yet rather soft but is known also in black amorphous, unstable yellow, and explosive forms, that occurs in the free state but more often combined in minerals (as stibnite, kermesite, valentine, and ceylanite) and in ores of other minerals (as lead), that is prepared chiefly from sanite storage battery plates (4 to 12 percent), in lead for shrapnel (10 percent), and in various nonferrous alloys. Symbol, Sb; atomic weight, 120.2; specific gravity, 6.7; thombohedral.

anticline. Antimony. a. A trivalent and pentavalent metalloid element that is commonly metallic silver white, crystalline, and brittle yet rather soft but is known also in black amorphous, unstable yellow, and explosive forms, that occurs in the free state but more often combined in minerals (as stibnite, kermesite, valentine, and ceylanite) and in ores of other minerals (as lead), that is prepared chiefly from sanite storage battery plates (4 to 12 percent), in lead for shrapnel (10 percent), and in various nonferrous alloys. Symbol, Sb; atomic weight, 120.2; specific gravity, 6.7; thombohedral.

anticline. Antimony. a. A trivalent and pentavalent metalloid element that is commonly metallic silver white, crystalline, and brittle yet rather soft but is known also in black amorphous, unstable yellow, and explosive forms, that occurs in the free state but more often combined in minerals (as stibnite, kermesite, valentine, and ceylanite) and in ores of other minerals (as lead), that is prepared chiefly from sanite storage battery plates (4 to 12 percent), in lead for shrapnel (10 percent), and in various nonferrous alloys. Symbol, Sb; atomic weight, 120.2; specific gravity, 6.7; thombohedral.

Symbol, Sb; atomic weight, 120.2; specific gravity, 6.7; thombohedral.
antimony crucud

antimony crucud. The name given to the molten, high-grade sulfide that drains away from the metal (antimony metal) when it is poured. It is also known as antimony vitreous or antimony glass. It is used as a flux in the manufacture of lead glass and as a source of antimony trisulfide.

antimony glass. A glass obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of lead glass and as a source of antimony trisulfide.

antimony glass, antimony vitreous, antimony white, antimony yellow, antimony orange, antimony red. A variety of antimony compounds that are used in the production of glass and as a flux in the manufacture of lead glass.

antimony ocher. An impure product of the antimony ore, native antimony. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony ore. The mineral from which antimony is obtained. It is a sulfide, antimony(III) sulfide, or antimony(II) sulfide.

antimony oxide; antimony trioxide; antimony dioxide. A compound of antimony and oxygen. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony trisulfide. A compound of antimony and sulfur. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony yellow. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony red. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony orange. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony glass, antimony yellow, antimony red, antimony orange. A variety of antimony compounds that are used in the production of glass and as a flux in the manufacture of lead glass.

antimony trisulfide. A compound of antimony and sulfur. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony yellow. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony red. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony orange. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony trisulfide. A compound of antimony and sulfur. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony yellow. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony red. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony orange. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony trisulfide. A compound of antimony and sulfur. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony yellow. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony red. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony orange. A color obtained by the fusion of antimony metal with fluorine in a crucible. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.

antimony trisulfide. A compound of antimony and sulfur. It is used as a flux in the manufacture of glass and as a source of antimony trisulfide.
anvil block. A massive block of cast iron which rests in a bed of steam and other heavy hammers, for the absorption of the vibration due to the blows struck into it by the iron anvils embedded in it. May be concrete. *Crispin.*

anvil jaw. See anvil. *Long.*

apachite. Suggested by U.S., from the Apache or Davis Mountains of western Texas. For a variety of phoniolite, that differs from typical phonolites. It has almost as much amphibole as pyroxene, whereas amphibole is rare in normal phonolite. The feldspar of the groundmass is generally microperthite. *Fay.*

apatic. A hydrous ferric sulfate, found in yellow nodules in clay. *Fay.*

apatic, a. Flanupatite, CaF(PO₄)₂; and 3Ca·PO₄·CaF₂; hexagonal; transparent to opaque; low gray polarization colors; Mohs' hardness; 5; specific gravity, 3.2. Rock phosphates ex guano deposits and beds of bone have not been defined by an optical composition. *Prior,* 3; Chlapartite, CaCl(PO₄)₂; and 3CaF·PO₄·CaCl₂; hexagonal; transparent to opaque; low gray polarization colors; Mohs' hardness; 5; specific gravity, 3.2. Phosphate content less than 90 percent. Rock phosphates ex guano deposits and beds of bone have no definite chemical composition. *Prior,* 3.

aperiodal damping. Case whereby damping is carried to the extreme so that the mass returns into the position of equilibrium without oscillating. *Prior,* 3; *American Petroleum Institute.*
apex a. The highest or uppermost point; the summit; the top; the peak. For example, the apex of a mountain. The end, edge, or crest of a mineral vein nearest the surface. *Webster* 3d b. The highest point of a stratum. *American Petroleum* 1964 c. The top of an anticlinal fold of strata. *Fay.* d. The point of highest elevation on an alluvial fan, usually at the point where the stream emerges from the mountain. *A.G.I.* e. In United States mining law used to designate the highest limit of a vein defined. *Fay.* f. The top of an inclined section. *Pryor,* 3.
apex angle. A right angle included angle measured between the slopes of the inside faces of a concave, nonconning bit, which may range from as small an angle as 70° to a maximum of about 120°. *Long.*
apex law. a. This law gives the owner of a properly located claim on a vein the right to an indefeasible right on the whole length of the vein beyond the vertical planes through the side lines of his claim. In order to secure the claim owner must clearly set off the ends of the claim parallel and of substantial length. A triangular claim would have no apex right and cannot be patented. A similar law of extralateral rights. *Levis,* p. 32 b. Obsolete mining law allowing the owner of a lode to follow it for a distance of 1000 feet on the vertical, the tension of the legal surface boundaries.

Apold-Fleissner process. An aplanate lens composed of three portions cemented together to eliminate spherical aberration. A more popular name for the aplanat. *Shipley.*
apoldite. See a. *A.G.I.*
apoplinite. A rock texture showing two generations of the same mineral but having no phenocrysts, Roosenbusch's incorrect porphyritic. *Fay.*
apo-plagioclase. See *felsite.*
apolymorphite. A rock containing phenocrysts in an aphanitic groundmass; some porphyric igneous rocks. *Fay.*
apoplasmonic. A lens free from both spherical and chromatic aberration. A more correct term for an aplanatic lens. *Shipley.*
apolytriplite. An aplanate lens composed of three portions cemented together to eliminate spherical aberration. A more popular name for the aplanat. *Shipley.*
apoplinite. See a. *A.G.I.*
apoplasmonic. A lens free from both spherical and chromatic aberration. A more correct term for an aplanatic lens. *Shipley.*
apolytriplite. An aplanate lens composed of three portions cemented together to eliminate spherical aberration. A more popular name for the aplanat. *Shipley.*
apoldite. See a. *A.G.I.*

Apollon-Fleissner process

47

ore and as a preheating flue for the air, which rapidly oxidizes the ferrous oxide in the upper regions of the furnace. The quantity and temperature of the hot gases and cold air are carefully regulated, so as to keep the carbon dioxide constant, and so to ensure thorough roasting of the ore at the lowest possible temperature. A furnace roasting 200 to 450 tons per day requires about 160,000 to 200,000 kilogram-calories per ton, giving a heat efficiency of 71 per cent Osborn.

apophasitic. a. Applied to mineral deposit of magmatic origin developed in surroundings which do not reveal its immediate relationship to a body of parental eruptive rock: the existence of the latter may, however, still be determined from the occurrence of dikes, the phenomena of con act metamorphism, etc. Schielecker. b. Applied to deposit in the area surrounding the intrusive center at a moderate distance. A.G.I.

apophite. Calcium potassium silicate with water, color white to pink with strong pearly lustre on the face parallel to the cleavage plane; common in cavities in talc bodies. A.G.I.

apophysis. A branch from a vein or a dike to which it is attached. An epiphysis is the same, but it is not attached. Fay. A small dike is injected from a larger intrusive body into adjacent rocks. A.G.I.

apophyllite. A former felsite, the groundmass of which was once glassy but is now devitrified. A.G.I.

apulite. One of the gneis that were sometimes used to symbolize the apophyses in the Middle ages: Jasper, Petr.obsolete, St. Andrew; chalcedony, St. James; emerald, St. John; sardonyx, St. Philip; carnelian, St. Bartholomew; chrysolite, St. Matthew; beryl, St. Thomas; chrysoprase, St. Thaddeus; topaz, St. James the Less; hyacinth, St. Simeon; and amethyst, St. Matthias, Hess.

Apperson, see also. A large group of methods used to determine the density of a porous solid, particularly a refractory brick. It is defined as the volume of the solid material plus the volume of any sealed pores and also of the open pores. Dodd.

apparent specific gravity. a. The ratio of the weight in air of a given volume of the impermeable portion of a permeable material (for example, with all capillary pores and voids) at a stated temperature to the weight in air of an equal volume of distilled water at a stated temperature. ASCE P1826, b. This property is determined by the standard method of dividing the weight of a rock by the weight of an equal volume of water. The term apparent specific gravity is used because water cannot penetrate the closed pore spaces inside the rock, and hence the specific gravity measured by water displacement methods includes the effect of internal pore spaces as well as that of the constituent minerals. Lewis, p. 575.

apparent strain. The stress corresponding to a given unit strain on the assumption of uniaxial stress. It is calculated by multiplying the unit strain by the modulus of elasticity, and may differ from the true stress because the effect of transverse stresses is not taken into account. Re, apparent superposition. The actual or visible order in which strata lie in any locality. Standard, 1964.

apparent strain. The differential quotient of the distance along a line on the surface over the increase in time of arrival of a wave. Schielecker.

apparent volume. True volume plus closed-pore volume. FF.

apple coal. Scott. Soft or loose coal which is easily mined and breaks into small pieces. Lewis, p. 574.

applied pressure. Without a stated time, the pressure applied to the material (for example, the solid matter inside the rock, and hence the specific gravity measured by water displacement methods includes the effect of internal pore spaces as well as that of the constituent minerals. Lewis, p. 575.

apparent specific gravity. a. The ratio of the weight in air of a given volume of the impermeable portion of a permeable material (for example, with all capillary pores and voids) at a stated temperature to the weight in air of an equal volume of distilled water at a stated temperature. ASCE P1826, b. This property is determined by the standard method of dividing the weight of a rock by the weight of an equal volume of water. The term apparent specific gravity is used because water cannot penetrate the closed pore spaces inside the rock, and hence the specific gravity measured by water displacement methods includes the effect of internal pore spaces as well as that of the constituent minerals. Lewis, p. 575.

applied pressure. The apparent force of a surface or material divided by its exterior volume or apparent volume. A.S.M. Gloss.

apparent strength. The stress corresponding to a given unit strain on the assumption of uniaxial stress. It is calculated by multiplying the unit strain by the modulus of elasticity, and may differ from the true stress because the effect of transverse stresses is not taken into account. Re, apparent superposition. The actual or visible order in which strata lie in any locality. Standard, 1964.

aquamarine emerald. Trade name for a
genuine-blue or aquamarine triplet. See
also emerald triplet. Shipley.

aquamarine glass. A term loosely used for
any light-blue or greenish-blue glass, regard-
less of its chemical composition or physical
properties. Shipley.

aquamarine sphalite. Pale blue sphalire.
Shipley.

aqueous homogeneous reactor

aquapling. A lightweight apparatus used for
underwater exploration. It consists of tans
of air or oxygen carried on

the back of a diver, a breathing tube, and
a face mask for breathing that per-

mits underwater observations to depths of
about 300 feet uncomplicated by an air

how leading to the surface. Also called
scuba or SCUBA, the letters of which
stand for self-contained underwater breath-

aq uamarine. Pale blue (green) variety of
beryl (BeAlSi3O6). Pryor 3.

aquamarine chrysolite. Greenish-yellow beryl
Shipley.
aquamarine triplet. A genuine triplet which
is used to simulate emerald, and often
incorrectly called an emerald triplet. It
consists of two portions of aquamarine with
a crinkled layer of green coloring matter
between them. Shipley.
aquarOMETRY. Analytical procedures used in
mineralogic or inorganic analysis. Fay.

1962 Add.

aqurose; nitrohydrochloric acid; nitrom-
plastic acid. A very corrosive, fuming yellow
liquid made by mixing nitric and
hydrochloric acids. Used in dissolving met-
tals and in etching. Webster 3d. It dissolves

aquaduct. A conduit for conveying water
over long distances; a bridge supporting
such a conduit. Hem.
aquadra. A combining form for aqueous,
denoting aqueous. And for example, aque-
ojenous meaning of water and heat. Web-
ster 2d.
aquadration. Of, pertaining to, or resulting
from the combined action of ice and
water. Webster 2d.
aquadraugmentation. Of, pertaining to or result-
ning from the joint influence of heat and
water. Webster 2d.
aquadraugmentation. Of, pertaining to or hav-
ing the characteristics of water: watery. Made
from, with, or by means of water. Pro-
duced by, with, or by means of water. Webster 3d.
b. Pertaining to water; also, to sediment
deposited by water. A.G.I.
aquadraugment. A Cf., relating to, or having the
characteristics of water; watery. Made
from, with, or by means of water. Pro-
duced by, with, or by means of water. Webster 3d.
b. Pertaining to water; also, to sediment
deposited by water. A.G.I.
aquadraugment. A combining form for aqueous,
denoting aqueous and. For example, aque-
ous cesium carbonate. Shipley.
aquadraugmented. Of, pertaining to, or result-
ning from the combined action of ice and
water. Webster 2d.
aquadraugmentation. Of, pertaining to or result-
ning from the joint influence of heat and
water. Webster 2d.
acquous homogeneous reactor

aquiclude. A formation which, although porous and capable of absorbing water slowly, will transmit it fast enough to furnish an appreciable supply for a well or spring.

Aquifer. A well, or a group of wells, that are so connected with a water-bearing stratum that they will yield water in sufficient quantity to be of value as a source of supply.

Aquifer. A stratum or bed of permeable rock or sediment, beneath the water table, through which a well may be drilled to obtain water. See Water table.

Aquifer. A rock or stratum that is capable of producing water, from which water may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well.

Aquifer. A rock or stratum that is capable of producing water, which may be supplied through a well. arch girder
arch girder

architectural term castas. Plain or ornamented (machine-extruded or handmolded) hard fired clay building units, generally larger in size than brick and most facing tile, and having a crazed or unglazed ceramic finish in an unlimited variety of colors. See also ceramic veneer. AGSG.

arch kilns. Alternative name for muffle. See also muffle.

arch rib. The main load-bearing member of a ribbed arch. Ham.

arch steel. Steels and steels used to support mine workings. Pryor, 3.

arch structure. See abutment, a; pressure arch, N.B. See also arches a.

arch furnace. See imber furnace. Dodd.

arch melting. Melting metal in an electric arc furnace. AGSG.

arch welding. A group of welding processes wherein coalescence is produced by heating one or more parts, or without the application of pressure and with or without the use of filler metal. Coal Age, 3, May 1961, p. 91.

arc welding electrode. See electrode. AGSG.

arc welding. A group of processes wherein the arc is used to melt metal in the normal way. AGSG.

arc welding. A white or light yellow hydrous silicate of calcium, magnesium, and aluminum, possibly 11,(Ca,Mg)O·Al2O3·3SiO2. Dana. 6th ed., p. 713.

arc welding. The method by which the arc is used to melt metal in the normal way. AGSG.

arc welding. The space between arc terminals in which vapor is formed by the arc. AGSG.

arc welding. The space between arc terminals in which the arc is sustained. AGSG.

arc welding. A group of processes wherein coalescence is produced by heating one or more parts, or without the application of pressure and with or without the use of filler metal. Coal Age, 3, May 1961, p. 91.

area. The area of a surface or the area of a curved surface is the number of square units contained by the surface. AGSG.

area. A plane region bounded by a finite number of curves. AGSG.

area. Same as arc. Standard, 1954.

area 2. A word used in certain expressions. See also metal stock, wood stilt.

area of contact. The total area of the surface of a rock or rock unit in contact with the wall of the tunnel. AGSG.

area of settlement. The surface area affected by subsidence. Bridge, 23. p. 5.

area of a new. The area which it area. 2.

area. The area of a surface or the area of a curved surface is the number of square units contained by the surface. AGSG.

area. A plane region bounded by a finite number of curves. AGSG.

area. A word used in certain expressions. See also metal stock, wood stilt.

area of a new. The area which it area. 2.

area. The area of a surface or the area of a curved surface is the number of square units contained by the surface. AGSG.

area. A plane region bounded by a finite number of curves. AGSG.

area. A word used in certain expressions. See also metal stock, wood stilt.
arenaceous

angered. Reduced to or mixed with sand. Standard, 1964.

argentic. Of, pertaining to, or containing silver. A.G.I.

argentiferous. Containing silver. A.G.I.

argent aim. A yellow, brownish hydrous basic sulfate of iron and silver, AgFe(SO4)2. Small scales. Hexagonal. From Divad, Utah. English.

argentopigrite. A questionable silver iron sulfide said to occur in small six-sided twin crystals. Fay. argentous. Of, pertaining to, or containing silver. Used especially for compounds in which silver is in the univalent state; for example, argentous oxide (AgO). Webster 3d; CCD 6d, 1961.

argentile. Full of grit or fine sand; gritty. Standard, 1964.

arenaceous. Resembling sandstone; having the texture of sandstone; composed of sandstone. A.G.I.

arenite. A consolidated rock having the texture of sand regardless of its composition. A.G.I.

arenolite. An artificial siliceous-argillaceous calcareous stone. CCD 3d, 1942.

arenose. Full of grit or fine sand; gritty. Standard, 1964.

argal. See argol. Fay.

argin. Referring to movement whereby the ore is caused to move forward by the action of rabbles extending across the hearth. Fay.

argal. A variety of asphaltic sandstone. Fay.

argonite. A clayey sandstone containing a considerable proportion of clay. Fay.

argonite. a. A clayey limestone. A limestone with appreciable clay or sand as impurity. Certain varieties are useful as a material for cement manufacture and are called cement rock. CCD 6d, 1961.

argonite. a. Inorganic oxides. Iron oxides. In the chemical composition of pigments, the iron oxides are usually the principal constituents. Fay.

argonite. a. A silicate of calcium, iron, and magnesium, FeO, 0.02; MgO, 0.02. Monoclinic. One of the amphibole group. American Mineralogist, v. 43, No. 7-8, July-August, 1958, pp. 797- 798; Dan. 17.

argonite. A rock alteration in which certain primary and/or secondary minerals are converted to clay minerals. A.G.I. Supp.

argonite. Clay minerals. Minerals occurring in sulfide ore and that are characterized by a later formation than sericite. Chemical data indicates that calcium and sodium are generally removed from the rock to a significant degree. Water and silica remain constant or increase slightly. Leoni, p. 506.

arginite. A rock formed either from siltstone, claystone, or shale, that has undergone a somewhat higher degree of induration than exists in those rocks. Arginite is intermediate in composition between the rocks named and shale. Its cleavage is approximately parallel to its bedding, thereby differing from slate. An argilite may be argillaceous, bituminous, calcareous, carbonateous, ferruginous, siliceous, etc. A.G.I.

argonification. The replacement or alteration of feldspars to form clay minerals, especially in wall rocks adjacent to mineral veins. A.G.I.

argyrode. A double sulfide of germanium and silver, Ag2GeS4. Fay.

argyrargyrite. A clayey lime, clayey. Fay.

argyrargyrite. A clayey lime, clayey. Fay.

argyroplatiniferous. Composed of or containing germanium and silver. Fay.

aryodianized plaster. Plaster that has been treated, which being heated in the kiln, with deliquescent salt, for example, CaCl2; it is
claimed that this produces a strong plaster having more uniform properties. Dodd.
arithmetic mean. In statistical methods, the
average of a number of observations. pryer, 3.
arithmetic mean particle diameter. A measure
of the average particle size obtained by
summing the products of the size-grade
midpoint times the mass of particles in
each class, and dividing by the total
frequency. A.G.I.
Arizona perlite. Peridot from Arizona, usu-
ally found in small sizes and light tones.
Shipley.
Arkansas ruby. A pyrope from Arizona.
C.M.D.
Arkansas spinel. See Arkansas ruby. Hess.
arizolite. A name for a type of ore. The
principal vein mineral is micaceous iron,
iodide of silver, gold, sulfures of iron, and
antimony. Hey, M.M., 1961. A dike rock,
composed mostly of quartz, some ortho-
class, and with accessory mica and apatite.
Obsolete. A.G.I.
arkose. A rock in which coal was floated
down the rivers to tidewater. It made one
trip and was broken up at its destination,
the timber sold, and the hardware returned
to the point of origin. Korsen. A large
vat used in the pottery industry for the
mixing or storage of clay slip. Dodd.
Arkansas diamond. A rock crystal from Ar-
kansas. Shipley. A diamond from a mine
near Murfreesboro, Arkansas. Shipley.
Arkansas pearl. Freshwater pearls from rivers
in Arkansas, once a larger producer of
 pearls than any other state. Shipley.
Arkansas stone. A true novaculite used as
an oilstone for sharpening tools or instru-
ments. Found in the Ozark Mountains,
Ark. See also Novaculite, Fay.
arkansite. A brilliant, iron-black variety of
brookite from Magnet Cove, Ark. Fay.
arosite. The cubic phase of ZrO2. Hey, M.M.,
1964.
arosite. A rock of granular texture formed
largely of pseudoojite and nepheline, with sub-
ordinate melanite and pyroxene, and acces-
sory orthoclase, apatite, and sphenite.
The pseudoojite usually occurs as phenocrysts.
A.G.I.
arosite. A rock of granular texture formed
largely of pseudoojite and nepheline, with sub-
ordinate melanite and pyroxene, and acces-
sory orthoclase, apatite, and sphenite.
The pseudoojite usually occurs as phenocrysts.
A.G.I.
arosite. A rock of granular texture formed
largely of pseudoojite and nepheline, with sub-
ordinate melanite and pyroxene, and acces-
sory orthoclase, apatite, and sphenite.
The pseudoojite usually occurs as phenocrysts.
A.G.I.
arosite. A rock of granular texture formed
largely of pseudoojite and nepheline, with sub-
ordinate melanite and pyroxene, and acces-
sory orthoclase, apatite, and sphenite.
The pseudoojite usually occurs as phenocrysts.
A.G.I.

largely of pseudoojite and nepheline, with sub-
ordinate melanite and pyroxene, and acces-
sory orthoclase, apatite, and sphenite.
The pseudoojite usually occurs as phenocrysts.
A.G.I.
arosite. A rock of granular texture formed
largely of pseudoojite and nepheline, with sub-
ordinate melanite and pyroxene, and acces-
sory orthoclase, apatite, and sphenite.
The pseudoojite usually occurs as phenocrysts.
A.G.I.
aromatic hydrocarbon

1 to 2 feet long with a ring at the other end and used in surveying; a thin metal pg. Mason.

1. Indian arrowheads mostly made of quartzite, more rarely of obsidian or other fine-grained rock. Schaller, arroyo. a. The channel of an ephemeral stream or an intermittent stream, usually with vertical banks of unconsolidated material 2 feet high, or higher. USGS Bull. 73, 1921; p. 82. b. Vertically-walled, flat-footed channel of an ephemeral stream in the semiarid southwestern United States. A.G.I. c. Sp. A small stream; a gutter. Usage varies and in some Latin-American countries arrow includes gorges of major proportions. McKinstry.

arsenagrite. Possibly a silver arsenide, AgAs. Dana 6d, p. 63.

arsenic, salt or ester of an arsenic acid; a compound containing one of the three radials in which arsenic has a +5 valence: AsO3 (orthoaesnate), AsO5 (metaaensate), or AsO5 (pyrosenate). A.G.I.; Handbook of Chemistry & Physics, 42 ed. 1964, p. B-100. b. An industrial term for an oxide of arsenic. ASTM C162-66.

arsenical copper. Copper containing up to about 0.6 percent arsenic. This element slightly increases the hardness and strength and raises the recrystallization temperature. Used for firebox stays, etc. C.T.D.

arseniochloride. See arseniochloride.

arsenokinetic. See arsenokinetic. Hay, 1925.

arsenolinite. A white, odorous, tasteless powder; AsO, Used in ceramics. C.C.D 6d, 1961.

arseniochlorido; arseno chlorido. A colorless or pale yellow, oily acid; AsCl3. Used in ceramics. C.C.D 6d, 1961.

arsenio trisulfido; white arsenic; arsénico trisulfuro. A white, odorous, tasteless powder; AsS3. Used in the manufacture of pigments, glass, and other arsenic compounds; ceramic enamels, aniline colors; and in the manufacture of. C.C.D 6d, 1961. b. Isometric and monoclinic crystals. Handbook of Chemistry & Physics, 45th ed., 1954, p. 51-3.

arsenio trisulfido: orpimento. AsS3; molecular weight, 246.04; yellow or red; monoclinc; specific gravity, 3.43; melting point, 300° C; boiling point, 707° C; and soluble in water and in ethyl alcohol. Bennett 2d, 1950.

arsenio, white. See arsenio trisulfido.

arsenio. A compound in which arsenic is the negative element; for example, cobalt arsenide (CoAs). Standard, 1964. Arsenic unites with most metals to form arsenides; for example, with iron to form diarsenic, FeAs. Arsenides are decomposed by water or by dilute acids with the formation of arsenic. C.T.D.

arsenious. Of, relating to, or containing arsenic. Used especially in compounds in which arsenic is trivalent. C.T.D.

arsenic. A salt or ester of the acid arsenious, AsO3 (OH)2; a compound containing the radical AsO3 or AsO55. A.G.I.

arsenio, orpimento. A white crystalline compound; AgAs. Standard, 1964.

arsenio, orpimento. A compound consisting of a certain oxide of mercury, mercury arsenide, AgAs. Standard, 1964. Arsenic unites with most metals to form arsenides; for example, with iron to form diarsenic, FeAs. Arsenides are decomposed by water or by dilute acids with the formation of arsenic. C.T.D.

arsenio, yellow. A yellow, strongly aromatic hydrocarbon; As(C2H5)3. Standard, 1964. Spectrographic analysis showed a mixture of tert. and secondary arsines. Standard, 1964. Arsenic unites with most metals to form arsenides; for example, with iron to form diarsenic, FeAs. Arsenides are decomposed by water or by dilute acids with the formation of arsenic. C.T.D.

arsenio trisulfurido. Orpimento. AsS3; molecular weight, 246.04; yellow or red; mono-clinic; specific gravity, 3.43; melting point, 300° C; boiling point, 707° C; and soluble in water and in ethyl alcohol. Bennett 2d, 1950.

arsenio, white. See arsenio trisulfuro.

arsenio. A compound in which arsenic is the negative element; for example, cobalt arsenide (CoAs). Standard, 1964. Arsenic unites with most metals to form arsenides; for example, with iron to form diarsenic, FeAs. Arsenides are decomposed by water or by dilute acids with the formation of arsenic. C.T.D.

arsenious. Of, relating to, or containing arsenic. Used especially in compounds in which arsenic is trivalent. C.T.D.

arsenic. A salt or ester of the acid arsenious, AsO3 (OH)2; a compound containing the radical AsO3 or AsO55. A.G.I.

arsenio, yellow. A yellow, strongly aromatic hydrocarbon; As(C2H5)3. Standard, 1964. Spectrographic analysis showed a mixture of tert. and secondary arsines. Standard, 1964. Arsenic unites with most metals to form arsenides; for example, with iron to form diarsenic, FeAs. Arsenides are decomposed by water or by dilute acids with the formation of arsenic. C.T.D.

arsenio trisulfurido. Orpimento. AsS3; molecular weight, 246.04; yellow or red; monoclinc; specific gravity, 3.43; melting point, 300° C; boiling point, 707° C; and soluble in water and in ethyl alcohol. Bennett 2d, 1950.

arsenio, white. See arsenio trisulfuro.

arsenio. A compound in which arsenic is the negative element; for example, cobalt arsenide (CoAs). Standard, 1964. Arsenic unites with most metals to form arsenides; for example, with iron to form diarsenic, FeAs. Arsenides are decomposed by water or by dilute acids with the formation of arsenic. C.T.D.

arsenious. Of, relating to, or containing arsenic. Used especially in compounds in which arsenic is trivalent. C.T.D.

arsenic. A salt or ester of the acid arsenious, AsO3 (OH)2; a compound containing the radical AsO3 or AsO55. A.G.I.
arsenurancorite. Synonym for heinrichite; it is not clear which name has priority as applied to a natural mineral. Hey, M.M., 1955.

arsenurane. The arsenate analogue of phosphurane, which it closely resembles except for some minor color differences. Coll. 1910.

arthritis. A Russian measure of volme equal to 12.7 cubic feet. Fay.

arsotracehyte. An olivine trachyandesite containing phenocrysts of sanidine, oligoclase, augite, and olivine in a trachytic groundmass containing interstitial glass. The lava of Ischia Island Italy. Holmes, 1928.

art. See airborne radiation thermometer. Hy.

arterial road. A main road with secondary roads joining it. Ham.

arterite. a. A migmatite that was produced by regional contact metamorphism in the course of which residual magmas were injected into the rock. See also migma-
tite; venite. A.G.I. b. A gneiss containing veins formed from the solutions rising from a deep-seated magma. A.G.I. c. A veined gneiss in which the vein material was injected from a magma. Venite is a veined gneiss of similar aspect and composition, but differs from arterite in that the vein material was derived by secretion from the rock itself. When it is impossible to distinguish between arterite and venite, the term phlebithe is used. A.G.I.

arterite migmatite. Injection gneiss supposed to be produced by the introduction of peg-matite, granite, or aplite into schist parallel to the foliation. A.G.I.

artesian. a. Refers to ground water under sufficient hydrostatic head to rise above the aquifer. a. Ground water that is under sufficient pressure to rise above the level at which it is confined by a well, but which does not necessarily rise to or above the surface of the ground. A.G.I. b. Ground water that rises in a permeable bed and that rises under pressure to ap-
proximately the height of the intake. If the point of intake is appreciably below the height of the intake, the water will flow out under pressure. If even with or above the height of the intake the water will rise in the well but it will not flow out. Bateman, 1964, sec. 2.

artesian well. a. A well in which the water level rises above the top of the aquifer, whether or not the water flows at the land surface. A.G.I. b. Formed, only applied to a well drilled to a depth where, owing to the structure of the strata, the water pressure is high enough to raise the water to the surface. Standard, 1964. c. Often applied to any deep well, even where pumping is necessary in an ordinary driven well. Standard, 1964.

arthropoda. Consist of animals divided into a number of parts in series, each equipped with a pair of legs. Crustaceans resemble lobsters and crabs, spiders and insects. The most important fossil type is the trilobite which has been variously lived in Paleozoic times only. It consisted of seg-
ments divided into three portions, the seg-
ments are joined to the head with jaws and antennae and the tail and chest portion have feet for swimming and gills for breathing. Fay.

arthritine. Thin apple-green crusts on quartz consisting of an intimate mixture of pharo-

artilaculine. Synonym for italcumite. A.G.I.

artificial. Aging above room temperature. See also aging; precipitation heat treatment. Compare natural aging. ASM Gloss.

artificial cementing. Consolidation of loose soils for which three methods are generally used: (1) cementation, (2) the Jooston process of chemical consolidation, and (3) freezing. Ham. See also soil stabilization. artificial earthquake. Resulting from indus-
trial or traffic commotion, explosions, etc. Schieferdecker.

artificial hatching. A harbor constructed by building breakwaters around an area of sea to provide protection for shipping. Ham.

artificial heavy spar. Sphalerite.

artificial horizon. In surveying, a surface of liquid mercury used in connection with measurement of height of run by means of sextant. Pryor 3.

artificial liquid fuels. Fuels created by the hydrogenation of coal, the destructive dis-
tillation of coal, lignite, or shale at low temperature, and by a recombination of the constituents in the presence of a suitable catalytic Bureau of Mines Staff.

artificial mineral; synthetic mineral. A min-
eral formed artificially (synthetically) in the lab-topasy, as distinguished from a

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

arsenic containing. a. A univalent aromatic radical of aryl. A.G.I.

fibrous serpentine; amosite is fibrous antho- groups. The two main varieties are amosite and crocidolite, which have a fibrous structure, are heat resistant, and are used in the manufacture of asbestos cement and asbestos linings for furnaces.

asbestos minerals. Certain minerals which have a fibrous structure, are heat resistant, chemically inert and possess high electrical insulating qualities, and are of sufficient strength to be handled with ease. The asbestos minerals are serpentine and amphiboles.

Asbestos proper is actinolite. Chrysolite is fibrous serpentine; amosite is fibrous antho- phylite; crocidolite is fibrous soda-amphi- bole. Used in fireproof buildings, insulating, paint materials, rubber, plastics, clutches, in- solution against heat, electricity, and acid.

Asbestos is a yarn consisting of either asbestos fiber, asbestos and vegetable fibers; asbestos and vegetable fibers with an insert of asbestos fiber yarn reinforcement. Metallic asbestos yarn is yarn consisting of plain asbestos yarn twisted with brass, copper, or other wire. It is also called wire inlaid yarn. Plain asbestos yarn is

asbestos. a. A soft, earthy manganese dioxide, containing up to about 32 percent cobalt oxide. C.M.D. Some time, termed as earthy cobalt. Asbestos. See asbestine.

ascendant. The vector representing the rate of increase of a property. See also gradient.

ascensional ventilation; antidotal ventila- tion. A mine ventilation system in which the fresh intake air flows into the bot- tom end of the workings and then ascends along the faces to the main return. The air is heated as it travels along the face which assists its uphill flow. The system is advantageous in gassy mines as the fire- damp also tends to flow upwards. See also descensional ventilation. Nelson.

classy tumble. A mixture of small fragments of greenish clay quartz, etc. Fay.

ash bed. A deposit or a bed of volcanic ash. Ash bed. A deposit of volcanic ash forming the cone of a volcanic eruption. USGS Bull., 524, 1933, p. 68.

ash content. The percentage of incombustible material in a fuel; that portion of a laboratory sample remaining after heating under standard conditions to constant weight, that is, until all the combustible material has been burned away. See also ash yield. Nelson.

ash curve. A graph that shows a relation be- between the specific gravity of fractions of a coal sample floated in liquids of step-by- step increased density, and the percentage of ash in each such fraction. Pryor, 3.

ash drawers. Early name applied to tournai- line because of its electrical property. Ship- ley.

ash error. The difference between the per- centage ash of a product of a separation and that shown by the washability curve (based on the reconstituted feed) of a product with the same properties (usually percentage of ash). B.S. 3552, 1962.

ashes. The residue left after the fuel has been burned. Also called cinder. Muirton, P. 746.

ash fall. a. A rain of airborne volcanic ash falling from an eruption cloud. It is characteristic of explosive eruptions. A.C.I. b. A deposit of volcanic ash resulting from such a fall and lying on the surface of the earth. A.C.I. Supp. d. Tuff that, in color, texture, and general appearance resembles ashes. Also called volcanic ash.

ash field clay. A clay of Yorkshire, Eng- land. The raw clay contains approximately

be those prescribed in the Standard Meth- ods of Laboratory Sampling and Analysis of Coal and Coke (American Society for Testing and Materials. ASTM D212-62, b. The physical resistance to removal of coal to constant weight under standa- conditions. In general, it differs in weight and composition from the origi- nal mineral matter. B.S. 3618, 1964, sec. 5.

c. Volcanic dust and particles less than 4 millimeters in diameter. A.C.I. Supp.
ash field clay

57 per cent, SiO₂, 27 percent Al₂O₃, 1.7 per cent Fe₂O₃, and 1.3 percent alkalies. Dodd.

ash into a blob. Below.

ash, volcanic. An admixture of volatile ash. Generally, a highly heated mixture of volcanic gases and ash traveling down the flanks of a volcano or along the surface of the ground and produced by the explosive disintegration of viscous lava in a volcanic crater or by the explosive ejection of gas-charged ash from a fissure or a group of fissures. The solid materials contained in a typical ash flow are generally unsorted and ordinarily include volcanic dust, pumice, scoria, and blocks in addition to ash. A.G.I. In a deposit of volcanic ash and other debris resulting from such a flow and lying on the ground surface. A.G.I. c. Synonym for ignimbrite. A.G.I. Supp.

ash furnace. A furnace or oven for fritting materials for glassmaking. Also called ash oven. Webster 3d.

ash fusibility. A measure, in terms of temperature, of the ease of fusion of coal ash prepared and tested under standard conditions. B.S. 3552, 1962.

ash fusion temperature. Indicates the temperature at which a special test cone made from a known ash obtained from the coal will (1) begin to deform, that is, soften, or (2) completely deform or fuse according to the time of deformation. A.G.I.

Ashgillian. Upper Ordovician. A.G.I.

ashlar. a. A block of stone, as brought from ordinary sand and volcanic ash. A.G.I. Supp.

ashlar masonry. Masonry composed of rectangular units of ashlar clay or slate, or stone, generally larger in size than brick and properly bonded, having sawed, dressed, or rough-faced surfaces. BuMines Bull. 630, 1965, p. 877.

ashlar masonry. Masonry composed of rectangular units of ashlar clay or slate, or stone, generally larger in size than brick and properly bonded, having sawed, dressed, or rough-faced surfaces. BuMines Bull. 630, 1965, p. 877.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.

asphalt. a. A bitumen of variable hardness and viscosity or solid, low gravity hydrocarbon. Fay.
asphaltic pyrobiteumen

asphaltically hard, and nonvolatilizable solids, sub- 
stantially free from oxygenated bodies, in-
fusible and insoluble in carbon disulfide. It 
includes clasticite, wurtzilite, albrite, impomise, and asphaltic pyro-
bitumen. See pyrobiteumen. Shell Oil Co.

asphaltic sand. One of the solid hydrocarbons that differ 
from asphalt in being insulable and gen-
erally insoluble in carbon disulfide. A.G.I.

asphaltic sandstone. See sandstone; asphalt 
rock; asphalt stone. Limestone im-

asphaltite. a. Black to dark brown naphtha 
material; asphaltum. See asphalt, c. Fay.

asphalt mastic. The mixture of asphalt ce-
ment and mineral material which on heat-
ing becomes a thick mass and may be 
poured and troweled. Shell Oil Co.

asphaltness. The quantity of asphalt con-
tained in petroleums expressed as a per-
centage of the total mass. Petroleum Age, 
v. 1, February 1, 1923, p. 37.

asphalt oil. a. Containing asphalt or having an 
asphalt base, as distinguished from oil 
having a paraffin base. Crispin.

asphalt rock; asphalt stone. Limestone im-

asphalt snal. The creation of a trap by the 
decrease in permeability of a reservoir as 
the result of the transformation of petro-
leum into asphalt. A.G.I.

asphalt stone. See asphalt rock. Webber 3d.

asphaltum. See asphalt, c. Fay.

asphyxiate. To suffocate; to choke. Massa.

aspirate. a. An appliance, such as a suction 
pump, exhaust fan, or the friction of a 
water jet, for causing a movement of gases 
or liquids by suction. Hess. b. A device 
made of wire gauze, cloth, or of a fibrous 
material held between pieces of mesh 
metal; a filter used to filter the lungs or 
or having a canister of activated charcoal 
or other substances through which the air 
breathes must pass to prevent the passage 
of noxious gases into the lungs. Also 
called inhaler; muzzle. Hess.

assay, a. To test ores or minerals by chemical 
or blowpipe examination; to determine 
the proportion of metals in dust by smel-
ning in the way appropriate to each. Gold 
and silver require an additional process 
called cupellation, for the purpose of sepa-
rating them from the base metals. See also 
fire assay. Fay. b. An examination of a 
mineral, an ore, or an alloy differing from 
a complete analysis in that it deter-
mines only certain ingredients in the sub-
stance examined, whereas an analysis de-
termines everything it containing. Fay. c. A 
means of ascertaining the commercial value 
of a mineral substance, as, for example, 
ore or black sand, or the product of a 
mill or smelter, either by a fire or a wet 
process, and it is termed ordinary assays, 
commercial assays, specimen assays, control 
assays, and umpire assays. See also crucible 
assay; dry assay; scorification; wet assay. 
Ricketts.

assay balance. A very sensitive balance used 
in the assaying of gold, silver, etc., for 
weighting the breccias; usually has magnifi-

ing lenses for reading the graduations. 
Webster 3d.

assay, complete. One sufficiently detailed to 
show structural associations of required 
elements, or to account adequately for all 
the constituents of the ore. Pryor, 3.

assayer. One who analyzes ores and alloys, 
especially bullion, to determine the value and 
properties of their precious metals; 
separates precious metals from dross ma-
terials by solution, flotation, or other li-
quid processes, or by dry methods, such 
as the application of heat to form slugs of 
lead, borax, and other impurities; weighs 
residues on calibrated balances to deter-
mine the proportion of pure gold, silver, 
platinum, or other metals in the 

assay limit. The limit of an ore body estab-
lished by the low cost of valuable 
mineral as determined by assays. A.G.I.

assay master. A chief or official assayer. 

assay office. A laboratory for examining ores, 
usually gold and silver ores, in order to 
determine their economic value. Standard, 
1964.

assay plan. Map of a mine showing the assay 
stop, width, etc., of samples taken from 
positions marked. Used to control grade 
quality of ore mined and milled. Pryor, 3.

assay plan factor; correction factor. In 
sampling, a term used to describe the 
rate which the head value bears to the 
mass sampling. This percentage figure is 
useful in reducing any extant or frequent 
mine-scale variations in the mass sampling 
which, if in actual production it will likely prove 
to be. In South Africa this is generally known as 
the "mine call factor." Truscott, pp. 
98-99.

assay pound. A varying weight, sometimes 

half a gram, used by assayers as propor-
tionately representing a pound. Standard, 
1964.

assay split. Agreed average value between 
the buyer's and seller's assayers, used as a 
price-fixing valuation of mine products. 

assay ton. For a long ton (2,240 pounds 
avoidopus) 32,667 grams, and for a 
short ton (2,000 pounds avoidopus) 
29,166 grams. The number of milligrams 
of bullion obtained from one assay ton 
equals determined from assays. Hess.

assey. a. The amount of the gold or 
silver, in ounces per ton of ore, as shown 
by assay of any given sample. An average 
assay value is the weighted result obtained 
from a number of samples, by multiplying 
the assay value of each sample by the 
width or thickness of the ore face over 
which it is taken, and then dividing the 
totals of these products by the total width 
of cross section sampled. The result ob-
tained would represent an average face 
value sample. Fay. b. The average value of gold 
everywhere. An average assay value of 
several samples cannot be taken as an 
absolute mathematical demonstration of the 
value of an ore body nor is the assay 
return necessarily conclusive of the value 
of the thing assayed; it may, however, tend 
to prove discovery. Ricketts, i. e. The per-
centage of a specified element or compound 
in a given sample. Trace values may be 
reported in other ratios, for example, parts 
per million. Pryor, 3.

assessable. That ore to which an ore body 
can be profitably mined, the limiting fac-
tors being the metal content of the country 
and determined from assays. Hess.

ASSE Abbreviation for the American Society 
of Safety Engineers, Williams.

assemblage zone. A stratigraphic unit de-

nominated and identified by a group of associ-
ated fossils rather than by a single index 
faunal. Synonym for cenozo. Compare 
range zone; faunzone; florzone. A.G.I.

assay split. See dry assay; scorification; wet assay.

assay walls. The planes to which an ore body 

is taken, and then dividing the 

assay value of each sample by the 

a number of samples, by multiplying 

assay value is the weighted result obtained 

as the application of heat to form slags 

of pure gold, silver, platinum, or other metals in 

the laboratory sample. D.O.T. 1.

assay foot. The area multiplied by the 

number of feet across which the sample 

is taken. Fay. Compare assay inch. 

assay grade. The percentage of an element 
or compound in a representative sample, 
as found by analytical test (assay). Pryor, 3.

assay inch. In valuation of an ore body, the 

assay value multiplied by the number of 

inches along which a sample of ore has 

been cut by grooving or channeling. The 

distance is normal to enclosing rocks so 
as to refer the sample to true width of 

the assay value of each sample by the 

sum of these products by the total width 

of cross section sampled. The result ob-
tained would represent an average face 

value sample. Fay. b. The average value of gold 
everywhere. An average assay value of 
several samples cannot be taken as an 
absolute mathematical demonstration of the 
value of an ore body nor is the assay 
return necessarily conclusive of the value 
of the thing assayed; it may, however, tend 
to prove discovery. Ricketts, i. e. The per-
centage of a specified element or compound 
in a given sample. Trace values may be 
reported in other ratios, for example, parts 
per million. Pryor, 3.

assessable. That ore to which an ore body 
can be profitably mined, the limiting fac-
tors being the metal content of the country 
and determined from assays. Hess.

assessment work. a. The sum that the officers 
of a mining company levy on the stock held 
by shareholders. Fay. b. See assessment 
work, Fay.

assessment drilling. Drilling done to fulfill 
the requirement that a proscribed amount 
of work be done on an unpatented mining 
claim to retain title. Long.

assessment labor. Refers to the annual labor 
required of the locator of a mining claim 
after discovery and not to work before 
discovery. Ricketts, 1.

assessment work. The annual work upon an 
unpatented mining claim on the public 
domain necessary under the United States 
low to maintain the maintenance of the 
title thereto. Same as annual labor. Fay. 
After filing location notice and performing the 
required discovery work within a few months 
from the date of discovery, the locator must 
perform two more years of work to prove that he has the 
right to a mining claim. The land must be 
it. In the first year, the locator is 
required to bring in per ton of ore. Pryor, 4.

assessment value. a. The amount of the gold 
or silver, in ounces per ton of ore, as shown 
by assay of any given sample. An average 
assay value is the weighted result obtained 
from a number of samples, by multiplying 
the assay value of each sample by the 
width or thickness of the ore face over 
which it is taken, and then dividing the 
totals of these products by the total width 
of cross section sampled. The result ob-
tained would represent an average face 
value sample. Fay. b. The average value of gold 
everywhere. An average assay value of 
several samples cannot be taken as an 
absolute mathematical demonstration of the 
value of an ore body nor is the assay 
return necessarily conclusive of the value 
of the thing assayed; it may, however, tend 
to prove discovery. Ricketts, i. e. The per-
centage of a specified element or compound 
in a given sample. Trace values may be 
reported in other ratios, for example, parts 
per million. Pryor, 3.

assessment. The value to which an ore body 
can be profitably mined, the limiting fac-
tors being the metal content of the country 
and determined from assays. Hess.
must be done each year if the claim is to be held without patenting. Lewis, p. 27.

asbestos. A mineral with high tensile strength and very low friction. It is used in building materials and as a fireproofing material. See also asbestos cement.

asset. Property with cash sale value. In mining, the dominant asset is the proved ore reserve. Pryor, 3.

assignment. Transfer by deed of asset from one person to another. See also assignment.

assimilation. a. The process by which rock from the containing walls of an intrusion is absorbed by solution in the invading magma, either in situ (or nearly so) at the contacts; or in depth, by the sinking into the magma of blocks or fragments of country rock stopped from the roof above the intrusion. Hess. b. The incorporation of a magma of material originally present in the wall rock. The term does not specify the exact mechanism or the results. The assimilated material may be present as crystals from the original wall rocks, newly formed crystals including wall-rock elements, or as a solution in the liquid phase of the magma. The resulting rock is called a hybrid. Also, the process is termed magmatic assimilation. A.G.I.

assistant mine foreman. An official appointed at many large collieries in Great Britain with a status between the undermanager and manager. The assistant mine foreman is not a foreman, although he has no legal authority over the undermanager. He is often delegated to give concentrated supervision to any special operations, thus allowing the undermanager to carry on with his routine duties. He is often a graduate with a first-class certificate of competency who may be in need of managerial experience. Nelson.

asthenosphere. The hypothetical, concentric, spherical shell within the earth, tens of kilometers below the surface and of undefined thickness, which is a shield of weakness where plastic movements take place to permit isostatic adjustments. Asthenosphere.

astic. Not taking a fixed or definite position or direction; as, an instrument in which a negative restoring force has been applied so as to aid any deflecting force, thereby rendering the instrument more sensitive and/or less stable. A.G.I.

astic gravimeter. A gravity meter or gravimeter constructed so that a high sensitivity is achieved at the positions of the elements of the system employed, that is, the equilibrium becomes neutral at such positions. See also gravimeter. A.G.I.

astic pendulum. Having almost no tendency to take a definite position of equilibrium. Schieferdecker.

astatic. A rare radioactive element in group VII (halogens) of the periodic table. atomic number 85, first announced by Allison and Murphy as alabamine in 1929. Renamed astatine by Segre, McKenzie, and Corson who produced astatine 211 in 1940 by a bombardment of bismuth with high-energy (32 mev) alpha particles. Symbol, At; valences, 1, 3, 5, and 7; and the mass number of the most stable isotope, 210. Gaynor.

astatization. The application of a negative restoring force to a moving element of a physical system in such a manner as to drive the moving element away from its rest position and to deflecting force, so as to increase sensitivity. A.G.I.

astatum; ostatil. A Russian name for a petro- leum rock. Until about 1870 it was considered a useless article, and was disposed of by burning in open pits near the refineries. Gaynor.

aster. A precious stone which, when cut en cabochon, displays a 6- or 12-rayed star due to asterism. Star sapphire and star ruby display this character. C.T.D.

asteriated. Like a star, with rays diverging from a center. Shipley.

asteriated beryl. A variety of beryl which in thin sections exhibits asterism. As yet of no geological importance. Shipley.

asteriated quartz. Quarts having whitish or colored radiations within the crystals. Standard, 1964.

asteriated stone. A stone, such as asteriated ruby, sapphire, etc., exhibiting a star by either reflected or transmitted light. See also star stone. Shipley.

asteriated topaz. A yellow topaz, usually yellow cornudum, called Oriental topaz. Schaller.

asterism. a. Starlike rays of light observed in some minerals when viewed from certain directions. Often the mineral is cut en cabochon. Minerals having this feature are called asteriated or star. Asteri- ated or star beryl, chrysoberyl, crocidolite, emerald, quartz, ruby, and topaz are known. Hess. b. A starlike effect observed in certain minerals either by transmitted or reflected light.

asthenosphere. The hypothetical, concentric, spherical shell within the earth, tens of kilometers below the surface and of undefined thickness, which is a shield of weakness where plastic movements take place to permit isostatic adjustments. Asthenosphere.

astic. Not taking a fixed or definite position or direction; as, an instrument in which a negative restoring force has been applied so as to aid any deflecting force, thereby rendering the instrument more sensitive and/or less stable. A.G.I.

astic gravimeter. A gravity meter or gravimeter constructed so that a high sensitivity is achieved at the positions of the elements of the system employed, that is, the equilibrium becomes neutral at such positions. See also gravimeter. A.G.I.

astic pendulum. Having almost no tendency to take a definite position of equilibrium. Schieferdecker.

astatic. A rare radioactive element in group VII (halogens) of the periodic table. atomic number 85, first announced by Allison and Murphy as alabamine in 1929. Renamed astatine by Segre, McKenzie, and Corson who produced astatine 211 in 1940 by a bombardment of bismuth with high-energy (32 mev) alpha particles. Symbol, At; valences, 1, 3, 5, and 7; and the mass number of the most stable isotope, 210. Gaynor.

astatization. The application of a negative restoring force to a moving element of a physical system in such a manner as to drive the moving element away from its rest position and to deflecting force, so as to increase sensitivity. A.G.I.

astatik; ostatil. A Russian name for a photo- leum rock. Until about 1870 it was considered a useless article, and was disposed of by burning in open pits near the refineries. Gaynor.

aster. A precious stone which, when cut en cabochon, displays a 6- or 12-rayed star due to asterism. Star sapphire and star ruby display this character. C.T.D.

asteriated. Like a star, with rays diverging from a center. Shipley.

asteriated beryl. A variety of beryl which in thin sections exhibits asterism. As yet of no geological importance. Shipley.

asteriated quartz. Quarts having whitish or colored radiations within the crystals. Standard, 1964.

asteriated stone. A stone, such as asteriated ruby, sapphire, etc., exhibiting a star by either reflected or transmitted light. See also star stone. Shipley.

asteriated topaz. A yellow topaz, usually yellow cornudum, called Oriental topaz. Schaller.

asterism. a. Starlike rays of light observed in some minerals when viewed from cer- tain directions. Often the mineral is cut en cabochon. Minerals having this feature are called asteriated or star. Asteri-
astral. Applied to the stage in the formation of the earth when it glowed with incandescent light like a molten globe.

Astrall, an. A noun of astrally.

Astrallite. A mineral, CuCl(OH),; blackish-green color, orthorhombic. A.G.I.; Dana 17. Also called green sand of Peru. Fay.

Astrallite. An igneous rock with a glassy base; containing small quantities of sillimanite, and locally cordierite. Orthoclase, augite, and biotite occur as microscopic crystals; from the Monashee Mountains, southern British Columbia. U.S.S.R. Holmes, 1928.

Atactic. Proposed by Keyes (1901) to be applied to unstratified ore deposits, as contrasted with ore deposits that are stratified, or eutaxic. Holmes, 1920.

Ataxite. A brecciated, or irregularly mot ted, composite volcanic rock in which the broken fragments of one lava flow are irregularly distributed in another. A similar term may also be applied to occur in certain minor intrusions. Holmes, 1928. b. A general term for varieties of igneous rocks which contain less nickel than hexahedrites or more nickel than octohedrites, and in which the structure of the lamellae is interrupted. Holmes, 1928.

Atectonic. Applied to a geologic event that occurs when orogeny is not taking place. Synonym for nontectonic. A.G.I.

Atectonic pluton. A pluton that is emplaced after orogeny is not occurring. A.G.I.

Atlas. A general term for varieties of igneous rocks which contain less nickel than hexahedrites or more nickel than octohedrites, and in which the structure of the lamellae is interrupted. Holmes, 1928.

Atlas spar. Same as satin spar. Shipley.

Atlasses. A. Malachite. Shipley.

Atlantic type of coastline. The trend of the folded mountains before the appearance of the mid ocean. Compare Pacific type of coastline. A.G.I.

Atlantic type of coastline. The trend of the folded mountains before the appearance of the mid ocean. Compare Pacific type of coastline. A.G.I.

Aquatic. Proposed by Grabau for a rock fragment broken in situ either by chemical or mechanical means. A.G.I.

Atmospheric rock. A rock fragment broken in situ by chemical or mechanical atmospheric influences. Synonym for atmolastic. Schieferdecker.

Atmospheric. Applied to rocks of atmospheric origin, whether derived by condensation (as snow, névé, and glacier ice), by wind action, or by deposition by volcanic vapors; used chiefly for rocks and minerals. Stokes and Vernes, 1925.

Atmosphere. A rock precipitated from the atmosphere; for example, snow, névé or frrn, and snow ice. A.G.I.

Atmosphere. An instrument for measuring the evaporation of water, ice, and snow. Oberson.

Atmosphere. Proposed by Grabau for a rock fragment broken in situ either by chemical or mechanical means. A.G.I.

Atmospheric. Proposed by Grabau for a rock fragment broken in situ either by chemical or mechanical means. A.G.I.
atmosphere. a. The gaseous envelope surrounding the earth. The atmosphere is odorless, colorless, tasteless; very mobile, flowing readily under even a slight pressure gradient; elastic, compressible, capable of unlimited expansion, a poor conductor of heat, but able to transmit vibrations with considerable velocity. Its weight has been calculated at 5.9 x 10^14 tons. One-half the mass of the atmosphere lies below 3.46 miles above sea level. The ordinary term for the mixture of gases comprising the atmosphere is air, which also includes water vapor and solid liquid particles. A.G.I. b. A unit of pressure. A normal atmospheric pressure is equal to the pressure exerted by a vertical column of mercury 760 millimeters in height at 0° C, and with gravity taken as 980.665 centimeters per second squared. 1 torr equals 14.696 pounds per square inch. A.G.I. c. The entire continuous spherical layer of air surrounding the earth. The atmosphere contains the earth's waters in the gaseous, liquid, or solid state. A.G.I. d. In a furnace, the mixture of gases resulting from combustion. Kinney.

atmospheric water. Water which exists in the atmosphere in the gaseous, liquid, or solid state. A.G.I.

atomic mass unit. A unit of mass for expressing the mass of an atom. A.G.I.

atomic number. The number of particles in an atom's nucleus. Pryor, 3. A total of 100 elements is known. Each element is designated with its atomic number, which is equal to the number of protons in its nucleus. A.G.I. Supp.

atomic orbit. A region in space where the probability of finding an electron is high. A.G.I.

atomic plane. Any one of the layers into which the atomic structure of a crystal may be divided. A.G.I.

atomic radius. The distance from the center of an atom to the surface of the atom. A.G.I. Supp.

atomicity. A. Of an element or compound, the number of atoms contained in its molecules. Cooper.

atmospheric pressure. a. The force per unit area exerted by the atmosphere in any part of the earth's atmosphere. Some of the expressions for the normal value of the atmospheric pressure at sea level are: 76.0 centimeters of mercury; 29.92 inches of mercury; 760 millimeters of mercury; 1,013.25 millibars for the weight of a vertical column of air, corrected back to a detector tube, thus providing a continuous measure of moisture content. This meter will permit the moisture content of coal to be measured instantaneously, continuously, and automatically. Bureau of Mines Staff.

atomic number. A. The number of protons in the nucleus of an atom. Each chemical element has its own atomic number and together the atomic numbers form a complete series from 1 (hydrogen) to 103 (lawrencium) in order of increasing atomic weight. There are several exceptions. See atomic power. L&L. b. The number of an element which when arranged with others forms a periodic table. See atomic number. Pryor, 3. A total of 100 elements is known. Each element is designated with its atomic number, which is equal to the number of protons in its nucleus. A.G.I. Supp.

atomic orbit. A region in space where the probability of finding an electron is high. A.G.I.

atomic power. The thermal capacity of an atom, that is, the product of the atomic weight and specific heat of an element. Cooper

atomic hydrogen welding. An arc-welding process wherein coalescence is produced by heating with an electric arc are maintained between two metal electrodes in an atmosphere of hydrogen. Shielding is obtained from a gas mixture of 75% hydrogen and 25% carbon dioxide. Pressure may not be used and filler metal may or may not be used. Coal Age, v. 66, No. 3, Mar. 1961, pp. 91-92.

atomic mass. The mass of any species of atom usually expressed in atomic mass units. Webster 3d.

atomic mass unit. A unit of mass for expressing the mass of an atom. A.G.I.

atomic moisture meter. A device designed by the U.S. Bureau of Mines to monitor the moisture in coal passing through a preparation plant, by using radiation that is sensitive to hydrogen atoms. The coal is bombarded with neutrons, some of which strike hydrogen atoms and bounce back to a detector tube, thus providing a continuous measure of moisture content. This meter will permit the moisture content of coal to be measured instantaneously, continuously, and automatically. Bureau of Mines Staff.

atomic number. The number of protons in the nucleus of an atom. Each chemical element has its own atomic number and together the atomic numbers form a complete series from 1 (hydrogen) to 103 (lawrencium) in order of increasing atomic weight. There are several exceptions. See also atomic weight. L&L. b. The number of an element when arranged with others forms a periodic table. See atomic number. Pryor, 3. A total of 100 elements is known. Each element is designated with its atomic number, which is equal to the number of protons in its nucleus. A.G.I. Supp.

atomic orbit. A region in space where the probability of finding an electron is high. A.G.I.

atomic power. The thermal capacity of an atom, that is, the product of the atomic weight and specific heat of an element. Cooper

atomic hydrogen welding. An arc-welding process wherein coalescence is produced by heating with an electric arc are maintained between two metal electrodes in an atmosphere of hydrogen. Shielding is obtained from a gas mixture of 75% hydrogen and 25% carbon dioxide. Pressure may not be used and filler metal may or may not be used. Coal Age, v. 66, No. 3, Mar. 1961, pp. 91-92.

atomic mass. The mass of any species of atom usually expressed in atomic mass units. Webster 3d.

atomic mass unit. A unit of mass for expressing the mass of an atom. A.G.I.

atomic moisture meter. A device designed by the U.S. Bureau of Mines to monitor the moisture in coal passing through a preparation plant, by using radiation that is sensitive to hydrogen atoms. The coal is bombarded with neutrons, some of which strike hydrogen atoms and bounce back to a detector tube, thus providing a continuous measure of moisture content. This meter will permit the moisture content of coal to be measured instantaneously, continuously, and automatically. Bureau of Mines Staff.
atomic power

clear power. See also nuclear energy. NRC-ASA No. 1-1957.

atomic proportions; atomic ratios. The proportions or ratios in which the various atomic species occur in a substance. It is obtained by dividing the total weight of each substance by the atomic weight of that substance. When recalculated to atoms per 100 atoms total, the values are atom-percent. A.G.I.

atomic radius. The radius of an atom or the average distance from the center to the outermost electrons of the neutral atom. It is commonly expressed in angstrom units (10^-10 centimeters). A.G.I.

atomic scattering factor. Mean amplitude of wave of X-rays scattered by atoms in a crystal lattice plane. Fryer, J.

atomic structure. The arrangement of atoms in a substance. Shipley

atomic theory. The theory that all substances are composed of infinitesimally small particles or atoms. Crispin

atomic volume. a. The space occupied by a quantity of an element as compared with its atomic weight. Obtained by dividing the specific gravity of the element by its atomic weight; also called specific volume. Standard, 1964. b. The volume occupied by 1 gram atom of an element. C.T.D.

atomic weight. a. The average relative weight of an element as it occurs in nature referred to some element taken as a standard. Hydrogen is sometimes assigned an atomic weight of 1 but oxygen with an atomic weight of 16 is usually taken as a basis. Houtermans 2d, 1954.

The average relative weight of the atoms of an element referred to an atomic weight of 16.0000 is usually taken as a basis. Hydrogen is sometimes assigned an atomic weight of 1.

atomic weight or the most abundant oxygen isotopic factor ascribed by A. Atterberg. Dodd.

attached carbon dioxide. Carbon dioxide dissolved in water and in equilibrium with the dissolved carbon dioxide not contained in carbonate ions. A.G.I. Supp.

attached crystal. One which is attached to the mother rock, usually singly terminated. Shipley

attached dune. A drift of sand which the wind adds or attaches to an obstacle in its path to make the shape of the obstacle less resistant to the wind. Such a dune, which may occur on the windward and/or leeward sides of the obstacle, may range widely in size and form. A.G.I.

attached ground water. That portion of the subsurface water adhering to the pore walls. It is assumed to be equal in quantity to the pellicular water, and it is measured by specific retention. A.G.I.

attached island; land-locked island. An island which has become attached to the mainland by temporary connections or by sediments filled with water. A.G.I.

attack rate. Planned rate of ore extraction from mineral deposit. Fryor. 3.

attial. See ial

attapulgite. A light green, magnesium-rich clay mineral, named from its occurrence at Attapulgus, Ga., where it is quarried as fuller’s earth. Crystallizes in the monoclinic system. Also called palgorskite. A.G.I.

attitude. The angle of inclination of a bed of strata or of the surface of a rock or other planar feature with respect to the horizontal plane. The attitude of planar features (bedding, foliations, joints, etc.) is described by the strike of the horizontal projection of the plane and the dip. The attitude of a linear feature (fold axis, lineation, etc.) is described by the strike of the horizontal projection of the linear feature and its plunge. A.G.I.

attitude. a. Point that revolves. Denny.

attenuation. a. The fractional decrease of the intensity of an energy flux, including the reduction of intensity resulting from geometrical spreading, absorption, and scattering. ASTM Gloss. b. All losses in sound intensity of an energy flux, including the energy absorbed or scattered by a material. A.G.I.

attrition. The relation of some directional feature in a rock to the horizontal plane. The attitude of planar features (bedding, foliations, joints, etc.) is described by the strike of the horizontal projection of the linear feature and its plunge. A.G.I.

attenuation. a. The fractional decrease of the intensity of an energy flux, including the reduction of intensity resulting from geometrical spreading, absorption, and scattering. ASTM Gloss. b. All losses in sound intensity of an energy flux, including the energy absorbed or scattered by a material. A.G.I.

attrition. The relation of some directional feature in a rock to the horizontal plane. The attitude of planar features (bedding, foliations, joints, etc.) is described by the strike of the horizontal projection of the linear feature and its plunge. A.G.I.

attrition. A method for determining the plasticity of clay in terms of the difference between the plastic limit and the liquid limit. See A. Atterberg test. Dodd.

Atterberg test. A method for determining the plasticity of clay in terms of the difference between the plastic limit and the liquid limit. The test was first proposed by A. Atterberg. Dodd.

Atterberg scale. A proposed particle-size scale or grade classification for the sediments based on a decimal system beginning with 2 millimeters. The limits of the subclans are obtained by taking the square root of the product of the upper and lower grade limits. The subdivision thus made follows the logarithmic rule. This is the accepted European standard for classification of sediments. A.G.I.

Atterberg test. A method for determining the plasticity of clay in terms of the difference between the plastic limit and the liquid limit. The test was first proposed by A. Atterberg. Dodd.

Atterberg scale. A proposed particle-size scale or grade classification for the sediments based on a decimal system beginning with 2 millimeters. The limits of the subclans are obtained by taking the square root of the product of the upper and lower grade limits. The subdivision thus made follows the logarithmic rule. This is the accepted European standard for classification of sediments. A.G.I.

attritional coal. A bright coal (composed of anthracites and of anthracite) in which the translucent cell-wall degradation matter or translucent humic matter predominates) in which the ratio of anthracene to attritus is less than 1:3. Compare anthracite-coal. A.G.I.

attrition. a. The act of wearing down together or of wearing down. The condition of being worn down or of being ground down by friction. The wear of the solid surface of a particle moving along the boundary between the solid and liquid state. Also, the removal of ice from a glacier by melting or evap-
attrition. *Webster* 3d. b. The act of wearing and smoothing of rock surfaces by the passage of sand drifts, the descent of glaciers, etc. See also corrosion. A.G.I. c. The wear and tear that rock particles in transit undergo through mutual rubbing, grinding, knocking, scraping, and bumping with resulting comminution in size. Compare abrasion. A.G.I.

attrition mill. a. One which grinds abrasively, using rubbing action to disintegrate material, not impact battering. Pryor, J. A. A disintegrator depending chiefly on impact to reduce the particle size of the charge. Attrition mills are sometimes used in the clay building materials industry to deal with the tailings from the edge-runner disintegrator. Dodd.

attrition milling. Milling which reduces the gangue, including a large percentage of heavy minerals present in disseminated concentrates, to slimes or sizes smaller than the diamond particles to be recovered. As much as 90 percent of the gangue can be removed as slime by attrition milling without any noticeable loss of diamond due to comminution. Attrition milling is also reported to clean the diamond and make it easier to recover in subsequent steps. The mills are run at about one-third to one-half the critical speed to avoid cascading of the grinding media. A.G.I.

Auger. A general term for enditic achondrites (meteorites) consisting almost wholly of crystalline glassy enstatite (and diopside) low in calcium and practically free from ferrous oxide, with accessory diopside. A.G.I.

Auger. a. A drill for seismic shotholes or geophone holes modeled after the conventional carpenter's screw auger. Hence, any seismic shothole or geophone hole in which the cuttings are mechanically continuously removed from the bottom of the bore during the drilling operation without the use of fluids. A rotary drilling device used to drill shotholes or geophone holes in which the cuttings are mechanically removed without the use of fluids. A.G.I. b. Any of various augerlike tools designed for boring holes in wood or for boring into soil. Hard steel or tungsten-carbide-tipped cutting teeth used in an auger run in a torque box or backhoe. An auger head run on a continuous-flight auger. Long.

Auger. b. Boring. The hole and/or the process of drilling a hole using auger equipment. Long.

Auger-drill head. Tool that holds the auger bits (cutting teeth), run on continuous-flight auger. Long.

Auger fork. A tool used to span the top of an auger-drill hole and engage and support the weight of a string of continuous-flight augers. Long.

Auger hole. A hole drilled with powered-auger equipment. Long.

Auger mining. a. A machine for the manufacture of xicodistillation retorts. Similar to machines used for manufacturing drain pipes. Fay. b. In ceramics, a machine for extruding plastic clay through a die by means of a revolving auger or screw to form clay products such as brick, sewer pipes, drain tile, etc. *Bureau of Mines Staff*.

Auger tasting. A mining method often used by the mining operator when the burden gets too thick to be removed economically. Large-diameter, spaced holes are drilled up to 200 feet into the coal bed by an auger. Like a bit used for boring holes in wood, this consists of a cutting head with screw-like extensions. As the auger turns the head breaks the coal and the screw carries it back into the open and turns the coal into fine particles. This, in turn, carries the coal to an overhand bin or loads it directly into a truck.
auger mining

Auger mining is relatively inexpensive, and it is reported to recover 60 to 65 percent of the bed of the coal. See also auger, borehole. Bureau of Mines Staff.

auger-nose tool. Eng. A clearing tool used in boring for coal, etc., having an auger or tube which is wobble. Fay.

auger stem. The iron rod to which the bit is attached in rope drilling. Standard, 1964.

aura. A solid-white solution of gold and osmium in cubic iridium (as distinct from a solid solution of iridium, etc., in hexagonal osmium). Isometric. Grains. From the Uralis, U.S.S.R. English.

auriferous. Of, pertaining to, or containing gold in the univalent state; for example, aurous chloride (AuCl). Standard, 1964.

aurum. The element, atomic number 79, with an atomic weight of 196.9665. It is regarded as the precious metal and is symbolized Au. Institute of Metals.

aurichalcite. A carbonate of zinc and copper in the hexagonal system. It is normally of a yellowish green and contains zinc and copper up to 20 percent nickel. Bolivian origin. Holmes, 1928, b. Applied to a mineral formed by a sedimentary process as a crystallographic unit at the place of its occurrence. A.G.I. c. Applied to a mineral which originated in sediments at the time of, or after, their deposition. The term indicates local derivation rather than from transported matter. A.G.I. d. Applied to growth in the place of occurrence. Secondary enlargement is included. A.G.I. e. Pertaining to a mineral that was formed, at the location where it now occurs, before the burial and consolidation of the containing sediment. An authigenic mineral is the product of chemical and biochemical action. A.G.I. f. The original mineral in which the mineral now occurring was formed prior to its burial by another material. A.G.I.

auriferous pyrite. Iron sulfide in the form of pyrite, containing gold, probably in solid solution. C.T.D.

aurigean. Gold-bearing; auriferous.

authigenic. a. Generated on the spot. Authigenic minerals are those that are generated on the spot, and which were formed in situ. Liddell 2d, p. 493.

aurorubidite. A. A zone in the country rock surrounding an igneous intrusion, and in which zone, contact metamorphism of the country rock has taken place. Also called a contact aureole or a contact zone. A.G.I. b. In some thin sections of rocks, an outer zone of a mineral or of minerals that surrounds another mineral. Bureau of Mines Staff.

auric. Of, pertaining to, or containing gold in the univalent state; for example, auric chloride (AuCl). Standard, 1964.

aurichalcite. A basic carbonate of zinc and copper in the hexagonal system. It contains CO3-3 (Zn, Cu) (OH); monocline; green to blue color. Danz 17.

auriferous. Containing gold. Fay.

auriferous deposits. Gold-bearing deposits; localities, grades, and their oil saturated equivalents, which contain gold in detrital grains or nuggets. See also banket; placer deposit; saddle reef. Nelson.

authigenous; authigenic

ed with that of some other minerals which may have been brought from a distance. Part of the mineral constituents of any rock that have formed in place, as in an igneous rock. Compare allochogenic. Johannesen, n. 1, 2d, 1939, p. 167.

autoclaviform. A constituent of a metamorphic rock which, in the formation of the new rock, had its crystal outlines or boundaries altered. Johannesen, n. 1, 2d, 1939, p. 167.

authorized. In Great Britain, the regulations made by the Minister (Smoke Control Areas) for authorized Fuel-Consumptions, 1956, authorized fuels include coke of all kinds, anthracite, low volatile steam coals, bituminous, coalled, R exco, etc., as well as oil, gas, and electricity. Nelson. 

authorized person. An authorized person is either one appointed or permitted by the official designated by State mining laws to be in charge of the operation of the mine or one appointed to perform certain duties incident to generation, transformation, and distribution of electricity in the mine. This person shall be familiar with construction and operation of the apparatus and with hazards involved. A.J.A. M.1-1963.

to. A combining form meaning self, from the Greek auto. Webster 2d.

autoclave. A closed strong vessel for conducting chemical reactions or sterilization under high pressures. Benett 2d, 1962.

autoclad. A special form of highly hydrated dolomite, largely utilized for structural purposes, that has been hydrated under pressure in an autoclave. Boynton.

autoclastic. a. In Alpine geology, a succession of beds which was moved comparatively little from the original site of formation. A.G.I. Supp.

autoclastic schist. A schist that was formed in place from massive rocks by crushing and squeezing. Automatic describes a rock which has been brecciated in place by mechanical processes. See also augen gneiss; augen schist; cataclasite; crushed breccia; crushed conglomerate; mylonite; phylolite; protoelastics. A.G.I.

autoclar. A cleared strong vessel for conducting chemical reactions or sterilization under high pressures. Benett 2d, 1962.

autoklava. A revolving cylinder with no balls or bars for the crushing of rocks or clays. See also kulikov. Letouzey. 1956.

autochthon. Applied to a rock that has been brecciated in place from massive rocks by crushing and squeezing. Automatic describes a rock which has been brecciated in place by mechanical processes. See also augen gneiss; augen schist; cataclasite; crushed breccia; crushed conglomerate; mylonite; phylolite; protoelastics. A.G.I.

autochthony. a. In the dense-media separation process, the term itself can be distinguished between terrestrial and aquatic. Also called indigeneous; authigenic; authigenous. a. In Alpine geology, a succession of beds which was moved comparatively little from the original site of formation. A.G.I. Supp.

autogenous. a. In the dense-media separation process, the term itself can be distinguished between terrestrial and aquatic. Also called indigeneous; authigenic; authigenous. a. In Alpine geology, a succession of beds which was moved comparatively little from the original site of formation. A.G.I. Supp.

authogenic; authigenic

autochthonous. Applied to a rock that has been brecciated in place from massive rocks by crushing and squeezing. Automatic describes a rock which has been brecciated in place by mechanical processes. See also augen gneiss; augen schist; cataclasite; crushed breccia; crushed conglomerate; mylonite; phylolite; protoelastics. A.G.I.

automaton. A case which is constantly changing because its course is dependent upon the slopes of the alluvium the stream deposits itself as fans or alluvial plains, for example. A.G.I.

autoregressive. Pertaining to a rock metal cylinder by the use of momentary internal pressure exceeding the yield strength. ASM Gloss.

autogenetic. a. Drainage by streams the courses of which have been determined solely by the conditions of the land surface over which they flow rather than their earliest late stream. Webster 2d. A self-established drainage system developed solely by headwater erosion. A.G.I.

autogenous. a. In the dense-media separation process, the term itself can be distinguished between terrestrial and aquatic. Also called indigeneous; authigenic; authigenous. a. In Alpine geology, a succession of beds which was moved comparatively little from the original site of formation. A.G.I. Supp.

auxiliary controller. A device used with certain types of belt conveyors for the taking up or storage of belt during reversible operation. Jones.

automotive. a. A device other than a manually operated device other than a manually operated device other than a manually operated device other than a manually operated device other than a manually operated device other than a manually operated device other than a manually operated device other than a manually operated device other than a manually operated device other than a manually operated device. Nelson. 1928.

automotive anal. A. A. L. a. An automobile analysis which is primarily intended for the analysis of X-rays by the combustible and noncombustible components of the sample. The reflection is compared photoelectrically with a reference sample. Nelson.

automotive belt takeup. A device used with certain types of belt conveyors for the taking up or storage of belt during reversible operation. Jones.

automotive clip; automatic coupling. An appliance for attaching and detaching mine cars or cars without manual effort. They are generally attached at inbye cleating stations and detached at the shaft bottom. See also haulage clip. Nelson.

automotive-closing door. A wooden separation door arranged to close automatically when released by setting the hanging post with a slight pull of the rope. Nelson.

automotive clutch. A clutch whose engagement is controlled by centrifugal force, vacuum, or other power without attention by the operator. Nicholls.

automotive controller. In flotation, a device which operates automatically to regulate a current of water on the basis of some command and a feedback signal. Fuerstenau, p. 541.
automatic control system

automatic counter. A device that automatically couples cars when they bump together. Zern, See also Alliance coupling; Wilson coupling; A.S.F. coupler. Sinclair, V, pp. 278-279.

automatic cutting table. A table upon which a column of clay travels and is cut automatically into bricks by descending wires. Mersereau, 4th, p. 260.

automatic cycle winding. A system of automatic winding in which the complete installation operates without human aid and winding is automatically started by a preset signal. Long. A. automatic dam. In placer mining, a dam that operates automatically to retain water after the trip has passed. These dams are automatically operated by a pass-through mechanism. Nelson.

automatic dryer. A dryer that automatically sets in and forwards through the ore stream at predetermined interval. The time interval is controlled by an electronic timer, and the amount of ore loaded on each cut is governed by the speed of the cut which is controlled by restricter valves. Nelson.

automatic door. A mechanism which maintains a predetermined tension in a conveyor belt. The most common type is the gravity takeup in which a weight acts upon a takeup pulley. NEMA MB1-1956.

automatic press. A press in which the work is fed mechanically through the press in synchronism with the press section. An automatic press is an automatic press which, in addition, is provided with built-in electrical and pneumatic control equipment. ASM Gloss.

automatic pump control. The starting and stopping of a pump, a mechanism actuated by the level of water in the suction well or pump, or by the level or pressure of water in a discharge tank. B.S. 3618, 1963, sec. 4.

automatic reclosing relays. These are used to automatically close circuit breakers. The time interval between reclosures is predetermined. Locked-in means that after the third attempt fails to keep the breaker in, the relay will not function until it is reset manually. Such relays can be designed to operate more than three times before locking out, with the number of reclosures depending on the requirements and design of the system. Coal Age, v. 66, No. 3, Mar. 1961, p. 91.

automatic sampling. Removal from a passing stream of ore, pulp, or solution of a sample at timed intervals and under controlled conditions by means of automatically operated devices. Pryor, 3.

automatic sampling. Snagging by use of semiautomatic grinders where pressure between wheel and work and traverse over work is controlled. One such wheel is hydraulic in action and is actuated from a station removed from the wheel. See also snagging. A.C.S.G., 1963.

automatic splicer. This type is actuated by hydraulically actuated drill-rod clamping device similar to a Wommer safety clamp. See also Wommer clamp. Nelson.

automatic sparkle. A foot and/or hydraulically actuated feed mechanism. Long, b. A pneumatic device used at mill feeds and other operations where pressure between the machine and the work is controlled. Nelson, b.

automatic strake. Sloping deck, around which timbered bottoms, sometimes by legal requirements. Zern.

automatic strake. Sloping deck, around which an endless band of corduroy is moved, the concentrate being washed off as the corduroy is moved around. Words are at the departure end. Pryor, 3, p. 109.

automatic takeup. Any mechanism which maintains a predeter-
autometasomatism

b. The process of alteration in a newly crystallized igneous rock by its own last, water-enriched, liquid fraction which is trapped in the rock, or in an impervious chilled border zone. A.G.I. Supp.

auxetic. A dark green to nearly black zinc spinel. Schaller.

automorphic. Applied to those minerals of igneous rocks that are bounded by their own crystal faces. Rocks that are composed predominantly of an automorphic mineral assemblage have an automorphic-granular or panidiomorphic-granular texture. Contrasted with allotriomorphic, xenomorphic, and ashedral. Synonym for idiomorphic; euhedral. A.G.I.

autometasomatized. Applied to a solidified igneous rock that is metamorphosed by solutions from its own hot interior. A contraction of automatismophen. Huit.

auto-oxidation. Oxidation of minerals on exposure to atmosphere without use of auxiliary reagents. Pryor, 3.

autopinacoid. Stream capture that only involves the parts of a single stream which generally shortens its course, as in the cutting off of a meander. A.G.I. Supp.

autopneumatolysis. A subdivision of the term autometamorphism. It probably should be restricted to metamorphic changes occurring in the pneumatolytic stage of a cooling magma, when the temperatures are approximately 400° to 600° C. A.G.I. A. The development of late minerals in an igneous rock by the action of its own gaseous mineralizing agents; for example, the formation of sanidine, soda-lime, biotite, etc., in the leucite tephrites of Mount Vesuvius, Italy. Halmay, 1920.

autoradiography. An inspection technique in which the radiation spontaneously emitted by a material is recorded pictographically. The radiation is emitted by radioisotopes that are produced in or added to a material. The technique is used to locate the position of the radioactive element or compound. ASM Gloss. See also radiography.

autosite. A rock similar to kersantite (a dark plagioclase-biotite rock) but without feldspar.

autospary. A device for spraying dust carried by loaded conveyors. A liquid medium is sprayed on the conveyor load only when moving and not when stationary, or when the belt is running unloaded. The spray control is placed centrally beneath the conveyer belt and a load causes the belt to deflect and rotate the driving pulley which causes the controller valve to open. A belt stoppage or no load causes the valve to deflect and rotate the driving pulley which causes the controller valve to open. Available Energy. That part of the total energy which can be usefully employed. In a perfect engine, that part which is converted to work. Strock, 10.

available lime. a. Those constituents of a lime which are made available for reaction under the conditions of a specific method or process. ASTM C51-47. b. Represents the total free lime (CaO) content in a quicklime or hydrate and is the active constituent of a lime. It provides a mean of evaluating the concentration of lime. Boynton.

available lime index. The calcium-oxide fraction that is available for immediate chemical reactivity, as in a neutralization reaction. Bennett 2d, 1962 Add.

available moisture. The moisture in soil that is available for use by plants. A.G.I. Supp.

available nitrogen. Water-soluble nitrogen compounds plus that which is rendered soluble or convected to free ammonia. Bennett 2d, 1962 Add.

available nutrients. Consist of ions that are either dissolved in the soil moisture or that are absorbed on the clay minerals of the soil in readily exchangeable form. These nutrients constitute the mineral content of the soil that is immediately available for uptake by the plant. Hawkes, 2, p. 291.

available power. The rate at which a given source would deliver energy to a load if there were no impediment which is the conjugate of the source impedance is designated as the available source power. Horig.

available power for. The available power loss of a transferer connecting an energy source and an energy load is the transmission loss measured by the ratio of the source power to the output power of the transferer. HBG.

available relief. a. The vertical distance between the altitude of the original surface and the flat upland. Bennett, 257. b. The relief that is first attained. A.G.I. The relief that is available for erosion. Bureau of Mines 57.

available silica. Refers to the amount of silica present in a flux which is not slagged by
avalanche. a. A falling mass of snow which, having been detached from a great height in the mountains, acquires enormous bulk by fresh accumulations of snow as it descends. When it falls into the valleys below, it often causes great destruction. Fay, b. An accumulation of snow or of snow and ice, which descends from precipitous mountains like the Alps into the valleys below. An avalanche originates in the higher regions of a mountain and begins to descend when the gravity of its mass becomes too great for the slope on which it rests, or when thawing destroys its adhesion to the surface. A.G.I. c. A large mass of snow or ice, sometimes accompanied by other material, that moves rapidly down a mountain. Avalanche protector. Guardplates that prevent loose material from sliding into contact with the wheels or tracks of a digging machine. Nicholson.

avalanching. In ball avalanches, a falling mass of snow which, having been detached from a great height in the mountains, acquires enormous bulk by fresh accumulations of snow as it descends. When it falls into the valleys below, it often causes great destruction. Fay.
axes

crystal; used as lines of reference. *Huribut.*

*axes, fabric.* In structural petrology, three mutually perpendicular directions in the rock that are the axes of reference in determining the position and symbols of the crystal planes.

*axes of reference.* The coordinate axes to which crystal faces are referred. *Fay.*

*axes, reference.* In structural petrology, three mutually perpendicular axes to which structural measurements are referred. The a axis is the direction of tectonic transport, the b axis is perpendicular to the plane along which the differential movement takes place, and the c axis lies in this plane but is perpendicular to a.* *A.G.I.*

*axes elements.* The a, b, and c fabric axes or coordinates used by structural geologists and petrologists. *A.G.I.*

*axis.* a. The acute angle between the two optic axes of a biaxial crystal; its symbol is ZV. *A.G.I.* b. The angle in a given system between two lines which are, in general, the optic axes; also the angle between the two sets of principal planes. *A.G.I.*

*axis compression.* f. Experimental work with cylinders; a compression applied parallel with the cylinder axis. It should be used in an appropriate sense only in the interpretation of deformed rocks. *A.G.I.*

*axis cut in.* The distortion of a fold axis upward in a form similar to an anticline. *A.G.I.*

*axis elements.* The axis ratio and the angles between the axes of a crystal. *Fay.*

*axis figure.* The interference figure that is obtained in convergent light when an optic axis of the mineral b is observed in thin section or as a fragment coincides with the axis of the polarizing microscope. When a thin section of a uniaxial mineral that was cut at right angles to an optic axis is examined between crossed nicols (that is, between two polarizers, the polarization planes of which are at right angles to each other) as seen in a thin section and as seen in a shadowy cross and a set of spectrally colored, circular bands are seen. If the mineral is biaxial, two shadowy prisms are called isogyres and opening away from each other in a set of spectrally colored, oval bands appear. *Hess; Bureau of Mines Staff.*

*axis flow.* In pummeling or in ventilation, the use of a propeller or impeller to accelerate the load (as against displacement pumps). *Pror.*

*axis-flow compressor.* One in which air is compressed in a series of stages as it flows axially through a decreasing tubular area. *Pror.*

*axis-flow fan.* a. A modern type of mine fan in which the mine air enters along the axis and continues in this direction outward to the atmosphere. The axis-flow fan may have fixed blades (fixed pitch fan) or adjustable blades (variable pitch fan). Two, four, or six axial section blades (like an airplane wing) are usually employed. Also called screw fan. *Compare radial-flow fan.* See also *Axen fan; fan, a.*

*axis-flow turbine.* A modern type of mine turbine in which the auxiliary fan consists essentially of a single-stage axis-flow fan in which the rotor also forms the stator of a compressor-turbine combination. The exhaust of the turbine is added to the ventilating air. The result is a light and very compact ma-

*axonometric projection.* A method of projecting a three-dimensional figure onto a two-dimensional plane. The angles are chosen so that the projected figure is a true scale projection of the original figure. It is often used in engineering and architecture to show the true size and shape of objects. The method is also known as isometric projection.

*axes, fabric.* In structural petrology, three axes of reference in a crystal which are used as coordinate axes in determining the position and symbols of the crystal planes. *Fay.*

*axes, of symmetry.* a. An imaginary line in a crystal about which it may be supposed to rotate; a straight line with respect to which a body, figure, or system of points is either radially or bilaterally symmetrical. *Webber 3d.* b. In crystallography, one of the imaginary planes in a crystal which are used alongside the coordinate axes of reference in determining the positions and symbols of the crystal planes. *Fay.* c. Often used synonymously with anticlinal; thus, the Brady's bend axis for Brady's bend anticlinal. *See also, anticlinal axis.*

*axis, of vibration.* The imaginary line about which all the parts of a rotating body turn. *Fay.*

*axis, of weld.* A line through the length of a wheel perpendicular to the cross section at its center of gravity. *ASM Gloss.*

*axis, of symmetry.* a. An imaginary line in a crystal about which it may be supposed to rotate; a straight line with respect to which a body, figure, or system of points is either radially or bilaterally symmetrical. *Webber 3d.* b. In crystallography, one of the imaginary planes in a crystal which are used alongside the coordinate axes of reference in determining the positions and symbols of the crystal planes. *Fay.*

*axis, of rotation.* The imaginary line about which all the parts of a rotating body turn. *Fay.*

*axis, of weld.* A line through the length of a wheel perpendicular to the cross section at its center of gravity. *ASM Gloss.*

*axis, of symmetry.* A direction through a crystal about which the crystal is symmetric. *Huribut.*

*axis, a.* A transverse bar or shaft connecting the body of the vehicle to the chassis; a line along which the body of the vehicle is supported and moved. Also called axle-tree arm. *Hess.*

*axetrite arm.* See axle, b.* Hess; Hess.*

*axzone; axstone.* A species of jade. It is a sialite of magnesia and alumina. *Fay.*

*axonometric projection.* A method of projecting a three-dimensional figure onto a two-dimensional plane. The angles are chosen so that the projected figure is a true scale projection of the original figure. The method is also known as isometric projection.

*axes.* a. A straight line about which a body or a three-dimensional figure rotates or a three-dimensional figure rotates about a line.
atomoxenous. In crytallography, having clean-
gle, or pependicular to an axis; said of min-

Ayrshire bauxite clay. A nonplastic fire clay
formed by laterization of basalt and occu-
pied in the Millstone grit of Ayrshire,
Scotland; there are two types, the one
formed in situ, and the other being a see-
mentary deposit. Chemical analysis (aw): 42
percent SiO₂, 38 percent Al₂O₃, 3 to 4
percent Fe₂O₃, 0.5 percent FeO, and 0.2
percent alkali. Dodd.

Ayr stone. A fine-grained stone used in pol-
ishing marble and giving a fine surface to
metalwork, particularly iron and steel, also
as a whetstone. Also called Scotch stone.

azotobacter. Mexican name for pitch
coal or jet. Tomkjeff, 1954.

azimuth a. The azimuth of a body is that arc
of the horizon that is included in the me-
ridian circle at the given place, and a ver-
tical plane passing through the body.
It is measured (in surveying) from north
to north or from the horizontal plane
through an heavenly body, or from the
direction of the magnetic meridian. Stand-
ard, 1964.

azimuth b. A horizontal circle divided
into 360, or 4 sets of 90, major divisions,
due of distillation; distillation waste. Zim-
merman, p. 189. f. Symbol for r: or rect-
barometer reading; barometer.

azimuth c. As a subscript, a or b, the sym-
bol for the direction of the axes; (a, b, c).
Bureau of Mines Staff. c. Symbol for the
minimum axis of an ellipse.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.

azimuth circle. An instrument for mea-
suring azimuth, having for its chief characteris-
tic a graduated horizontal circle. Standard,
1964.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.

azimuth b. A horizontal circle divided
into 360, or 4 sets of 90, major divisions,
due of distillation; distillation waste. Zim-
merman, p. 189. f. Symbol for r: or rect-
barometer reading; barometer.

azimuth c. As a subscript, a or b, the sym-
bol for the direction of the axes; (a, b, c).
Bureau of Mines Staff. c. Symbol for the
minimum axis of an ellipse.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.

azimuth b. A horizontal circle divided
into 360, or 4 sets of 90, major divisions,
due of distillation; distillation waste. Zim-
merman, p. 189. f. Symbol for r: or rect-
barometer reading; barometer.

azimuth c. As a subscript, a or b, the sym-
bol for the direction of the axes; (a, b, c).
Bureau of Mines Staff. c. Symbol for the
minimum axis of an ellipse.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.

azimuth b. A horizontal circle divided
into 360, or 4 sets of 90, major divisions,
due of distillation; distillation waste. Zim-
merman, p. 189. f. Symbol for r: or rect-
barometer reading; barometer.

azimuth c. As a subscript, a or b, the sym-
bol for the direction of the axes; (a, b, c).
Bureau of Mines Staff. c. Symbol for the
minimum axis of an ellipse.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.

azimuth b. A horizontal circle divided
into 360, or 4 sets of 90, major divisions,
due of distillation; distillation waste. Zim-
merman, p. 189. f. Symbol for r: or rect-
barometer reading; barometer.

azimuth c. As a subscript, a or b, the sym-
bol for the direction of the axes; (a, b, c).
Bureau of Mines Staff. c. Symbol for the
minimum axis of an ellipse.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.

azimuth b. A horizontal circle divided
into 360, or 4 sets of 90, major divisions,
due of distillation; distillation waste. Zim-
merman, p. 189. f. Symbol for r: or rect-
barometer reading; barometer.

azimuth c. As a subscript, a or b, the sym-
bol for the direction of the axes; (a, b, c).
Bureau of Mines Staff. c. Symbol for the
minimum axis of an ellipse.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.

azimuth b. A horizontal circle divided
into 360, or 4 sets of 90, major divisions,
due of distillation; distillation waste. Zim-
merman, p. 189. f. Symbol for r: or rect-
barometer reading; barometer.

azimuth c. As a subscript, a or b, the sym-
bol for the direction of the axes; (a, b, c).
Bureau of Mines Staff. c. Symbol for the
minimum axis of an ellipse.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.

azimuth b. A horizontal circle divided
into 360, or 4 sets of 90, major divisions,
due of distillation; distillation waste. Zim-
merman, p. 189. f. Symbol for r: or rect-
barometer reading; barometer.

azimuth c. As a subscript, a or b, the sym-
bol for the direction of the axes; (a, b, c).
Bureau of Mines Staff. c. Symbol for the
minimum axis of an ellipse.

azimuth compass. A magnetic compass sup-
plied with sights, for measuring the angle
between a known direction and a line on
a magnetic profile of the earth's surface.
Dodd.
bacca

bacina

cal basin. Fay.

bacine. A basin or deep dish of or resembling Italian breadcrasted, lustered pottery. Standard, 1964.

bacil. A rodlike crystalline made up of a number of parallel longitudinal. Johannisen, 1, 24, 1939, p. 168.

bacillus coll. An organism found in potable water, originating from sewage pollution. Hen. 55.

back. a. The rod or upper part in any under-ground mining cavity. Fromkel, b. The ore body between a level and the surface, or between two levels. Higham, p. 35. c. A system of joiins in coal oblique to the bed-ding at an angle from 35° to 70°. They are usually perfectly tight and close and have polished cheeks which suggests a cer-tain amount of friction. The term back is sometimes also applied to the principal cleat. Arkell, d. That part of a lode which is situated on the side nearest in relation to any portion of the workings of the mine; thus the back of the level or stop is that part of the unstoped lode which is above, Fay. e. A stoped back. Nichols. f. A plane of cleavage in coal, frequently a smooth parting and some sooty coal included in it. Fay. h. Back of a heading. Fay. i. Leic. To throw back into the gob, or waste, the slack, dirt, etc., made in holling. Fay. j. Leic. To roll large coal out of waste for loading into trimmers. Also called bact-
n. K. Applied to an arch, in the interior or upper surface, A.G.I. l. The pav-
vion of a gem stone. Shipler, m. To drive, force, or cause to move or act backward; to cause to retreat, or recede. Webster 2nd.

back act. Front-end equipment fitted to an excavator, comprising a jib with an arm and bucket. Although designed primarily for vertically sided trenching, it is also useful for bulk excavation below treck level. Nelson.

back amcrate turns. Those in the armature of a motor which exercise demagnetizing action on the field poles. Prior, 3.

back and underhand stoping milling system. See combined overhand and underhand stoping milling. Fay.

back arch. A concealed arch carrying the backing or inn. r part of a wall where the exterior facing material is carried by a lintel. ACSG.

back balance. a. A kind of self-acting incline of a thin high, wall well lined with Bobbitt. The bronze shell is called the backing of the backing, and the Bobbitt is thus said to be a bronze backed. Petroleum Age, v. 1, 1920, p. 39.

back electromotive force. Sometimes used for counter electromotive force. It refers to that electromotive force which opposes or tends to set up a current in the reverse direction to the impressed current. Critchin.

backen. S. Staff. See back, j and m. Fay.

back end. a. Newer. The part of a judd remaining after the stump has been removed. See also sump, g. Fay. b. Synonym for barrel head. Long, c. Synonym for thrust yoke. Long. d. Eng. The coal in a place remaining to be worked after stuffing in. SMRD, Paper No. 61.

back-end man. A man who works behind the coal-cutter as it moves along the face. His duties include maintaining the stuffing from behind the machine and setting props to support the roof or overhang of coal. See also stuffing.

back entry. The air course parallel to and below an entry or the entry used for sec-ondary purposes in two-entry system of stoping. Locally, any entry not having crack in it. B.C.I.

backhaul cable

in a cable excavator, the line that pulls the bucket from the dumping point back to the digging. Nichola.

backhaul cable. A companion place to a main winning. SMRB, Paper No. 61.

back leads. Applied to black sand leads on coastlines which are above high-water mark. Fay.

backing strip. A strip of metal welded to the back of a metal panel prior to its being enamelled; the purpose is to prevent warping. Dodd.

backing-out switch. A switch applied to windsers and man-riding haulages which allows the control circuit to be energized, in order to move the conveyance out of an occupied point, provided that the winder control lever or other operating mechanism is moved in the appropriate direction. See also overwind, B.S. 3618, 1954, sec. 71.

backing sand; filler sand. Reconditioned sand used for supporting the facing sand, and forming the main part of the mold. Osborne.

backing-up switch. A switch applied to the taking down of a thick-walled pipe, or to unscrew or disconnect.

backing deal. A joint plane more or less parallel to the strike of the cleavage, and frequently vertical. Zero. A rabble or chase left to receive a permanent slab or other filling. Webster 3d.

backjoint. a. A joint plane more or less parallel to the strike of the cleavage, and frequently vertical. Zero. A rabble or chase left to receive a permanent slab or other filling. Webster 3d.

backing-up switch. A switch applied to windsers and man-riding haulages which allows the control circuit to be energized, in order to move the conveyance out of an occupied point, provided that the winder control lever or other operating mechanism is moved in the appropriate direction. See also overwind, B.S. 3618, 1954, sec. 71.

backbone. See also backset.

backs. The seaward return of the water following the uprush of waves. For any given tide stage, the point of farthest return seaward of the backwash is known as the limit of backwash or limit of non-wash. A.G.I.

backs. The seaward return of the water following the uprush of waves. For any given tide stage, the point of farthest return seaward of the backwash is known as the limit of backwash or limit of non-wash. A.G.I.

backs. The seaward return of the water following the uprush of waves. For any given tide stage, the point of farthest return seaward of the backwash is known as the limit of backwash or limit of non-wash. A.G.I.

backs. The seaward return of the water following the uprush of waves. For any given tide stage, the point of farthest return seaward of the backwash is known as the limit of backwash or limit of non-wash. A.G.I.

backs. The seaward return of the water following the uprush of waves. For any given tide stage, the point of farthest return seaward of the backwash is known as the limit of backwash or limit of non-wash. A.G.I.
backs and cutters. Jointed rock structures, the backs (joints) of which run in line parallel to the strike of the strata, the cutters (cross joints) crossing them at about right angles. Standard, 1964.

back. The emergence of radiation from that surface of a material through which it entered. Also used to denote the actual backscattered radiation. NCB.

backset bedding. Inclined bedding that dips into the current. Said to occur at the front of an anticline. Also used for the beds deposited on the windward side of a transverse dune. Pettijohn.

backset beds. Inclined layers of sand developed on the gentler dune slope to the windward. These beds may constitute a large part of the total volume of a dune, especially if there is enough vegetation to trap most of the sand before it can cross over the slip face. Leith.

backshod. Black corrugated sheets sometimes placed behind the skeleton tubing to conduct water leakages down to the shaft bottom and prevent it running to conduct water leakages at all times with the dense-medium process, since none of the lumps of mined coal and fills the tubs at the coal face. C.T.D.

backstop. To mine a stope from below. Fay.

back stopes. Overhead stopes; stopes worked by putting in overhead holes at blasting down the ore body. Nelson.

back stoping; back stopes. See overhand stoping. Fay.

back stroke. A weld deposited at the back of the belt and the belt support between the belt and its backup. Johnson.

backwash ripple marks. Ripple mark on the back of the belt and the belt support. Fay.

backwash ripple marks. Ripple mark on the back of the belt and the belt support between the belt and its backup. Pettijohn.

backwash ripple marks. Ripple mark on the back of the belt and the belt support between the belt and its backup. Johnson.

badenite. A worn condition on the back of an abrasive belt due to high speed and/or high pressure, both of which cause friction between the belt and its backup. Wear may be reduced by the use of graphite or by using the friction between the back of the belt and the belt support at the point of contact with the workpiece. ACSG, 1965.

back weld. A weld deposited at the back of a single-groove weld. ASM Gloss.

back work. a. Any kind of operation in a mine not immediately concerned with production or transport; literally work behind the face; repairs to roads. Macon, b. Scot. See back coming; back splinter. Fay.

back working. Scot. Working a coaled back or toward a shaft. Johnson.

backwash. Eng. Fibre of carbonite, also known as beef and horseflesh; Isle of Portland. Arkell.

backstop. Eng. Hard, creamy, and flabby limestone above the Ash; Lower Purbeck beds, Isle of Portland. Either so called from sometimes containing bacon, or because of a streaky appearance, as in the striped Purbeck Cliffs of Bacon Hole near Lulworth. Arkell.

backtan. bakor. A Russian corundum-zirconia refractory for use more particularly in the glass industry. The name is derived from bakelite and corundum. There are various grades, for example, bakor-20 (62 percent Al₂O₃; 18 percent SiO₂); and bakor-33 (50 percent Al₂O₃; 30 percent ZrO₂; 15 percent SiO₂). Dodd.

bacula bed. A bed of filter media such as rock or clinker which will expose effluent from the sewage to the air and thus to the action of micro-organisms which oxidize it. Johnson.

baculite. Crystals appearing as dark rods. Hess.

bad air. A, vitiated by powder fumes, noxious gases, or insufficient ventilation. Weed, 1922.

baddeleyite. A weakly radioactive, colorless, yellow, brown, or black zirconium dioxide, ZrO₂, with some hafnium oxide. Monoclinic: tabular crystals, also nodules with perfect cleavage. Found in Bakwans, Minas Gerais and San Paulo, Brazil; Alno, Sweden; and near Bozeman, Mont. U.S. See also English. Monocl. 8075, p. 117.

baffling

baffle. The application, usually by transfer or silk-screen, of crests, trademarks, etc., to a bottle or glassware. See also back-stamp. Dodd.

bad. a. Soft, highly fractured, or cav-

cous; a borehole is a slow procedure involving

time-consuming cementing or caising opera-

tions. Long. b. Rock formations in which

monitor breakouts are usually not safes maintained

unless heavily timbered or supported in

some manner. Long.

badland. A region nearly devoid of vegeta-

tion where erosion, instead of cutting hills and

canyons, has cut into an inclined mass of narrow

ravines and sharp crests and pinnacles. Traveling across such a region is almost impossible, heavy in name. Specifically, the badlands of the Dakotas. Fay.

bad place. Within the meaning of a contract

between the United Mine Workers and an

Employers' Association, a place in which

the roof cannot be made reasonably safe by

the ordinary procedures usually done by

the miner. Fay.

bad top. A coal mining term indicating a

weak roof. Bad top sometimes develops from

breaks in the overburden of Kentucky, p. 185.

baeumlerite. A colorless chloride of potassium and

calcium, KCl·CaCl₂. Intergron with baeumlerite and itanoboric.

Identical with chlorocalcite or hydrophil-

ite. From Leintal, Germany. English.

baft. a. Mid. To brush out- or mix fire-

damp with air. Fay. b. In a hydraulic or a

rake classifier, a vertical plate set across and

dipping into the pool of pulpored ore, to

prevent it from streaming along the

to the flame from striking

and tripping the lever. D.0.7' ..1.

and tripping the lever.

bail. a. Mid. To brush out- or mix fire-

damp with air. Fay. b. In a hydraulic or a

rake classifier, a vertical plate set across and

dipping into the pool of pulpored ore, to

prevent it from streaming along the

to the flame from striking

a baffle plate. Fay.

baffle tube. A pipe of sufficient length to

lower the temperature of hot gases before

they enter a furnace. C.T.D.

baffled wall. A refractory wall used to deflect

gases or flames from the ware and to pro-

tect the flame from striking

the side of a water swivel, or. (2) a U-shaped

open-sided, latch-tquipped, circular

sides of a water swivel. Both types of

bails are designed to permit circulation of

gas or water. Tomkeieff, 1954. c. A

bail of gas. Eng. A gas-filled cavity found

in seams of coal. See also bag, b. Fay.

bail filter. An apparatus for removing dust

from dust-laden air, employing cylinders of

closely woven material which permit

passage of air but retain solid particles. B.S. 3552, 1962. See also filter, b.

bail of foulness. N. of Eng. A cavity in a coal

seam filled with gas or coal, and sometimes

of liquid or gas, formed by a pressure

which, when cut, is

given off with much force. See also bag, b. Fay.

bail of gas. Eng. A gas-filled cavity found

in seams of coal. See also bag, b. Fay.

bail powder. Originally applied to black pow-

der loaded in bags, but now applied to

a number of explosives to pack them.

the bags are long, cylindrical units about 6

inches in diameter and weighing 121/4

bail process. A method of recovering flue

dust and also sublimed lead whereby fur-

nace gases and fumes are passed through

bags suspended in a baghouse. The fur-

nace gases are thus filtered and the parti-

cles in suspension collected. Fay.

baggroon. A dust chamber in which bags are

suspended for filtering the furnace gases in

the bag process. See also baghouse. Fay.

bagnet. A vessel or tank used for holding

liquids and also sublimed lead whereby fur-

nace gases and fumes are passed through

bags suspended in a baghouse. The fur-

nace gases are thus filtered and the parti-

cles in suspension collected. Fay.

bag. a. A paper container

baggroon. A dust chamber in which bags are

suspended for filtering the furnace gases in

the bag process. See also baghouse. Fay.

bagement. One type of revetment. It consists

of closely woven material which, permit-

ing the passage of air but retains solid par-

ticles. The bags are usually made of

domestic or foreign cloth, or paper, single or double, depend-

ing on the local conditions, and are constructed

for placing an inert material, such as sand,

clay, etc., into a borehole for stemming or

tamping. Also called a tamping bag. Fay.

b. S. Staff. A quantity of findrnd reduced
depently given off by the coke seam. Fay. or

Scot. To swell or bulge. Also called baggit. Fay. d. A cavity in coal containing

gas or water. Tomkeiif, 1954. e. York.

bail of foulness. N. of Eng. A cavity in a coal

seam filled with gas or coal, and sometimes

of liquid or gas, formed by a pressure

which, when cut, is

given off with much force. See also bag, b. Fay.

bail of gas. Eng. A gas-filled cavity found

in seams of coal. See also bag, b. Fay.
or while the rods are being raised or lowered a few feet with the hoisting cable.  
Long.  b. As used by the churn drillers, to remove the cuttings from a borehole by use of a tubular container attached to a wire line.  See also bailer, a. Long.  c. The handle on or skip by which withdrawal of which may be lifted or lowered.  Long.  d. A large elevus.  Long.  e. To unwater a mine with a skip or bailer.  Bureau of Mines Staff, 1. Hoop or arched connection between the crane hook and lade or between crane hook and mold foundations.

**ASM Gloss.**

**bailiff.** Eng. A name formerly used for man-

**bain.** Scot. Old form of ben, a. Fay.

**balling reel.** Synonym for bailing drum. Long.

**balling.** a. Removal of the cuttings from a bailing tub. A container into which the contents of a bailer are emptied. Long.  

**bailing tub.** A container into which the contents of a bailer are emptied. Long.

**bailing machine operator.** See bailer, d. D.O.T.

**bailing reel.** Synonym for bailing drum. Long.

**bailing rope.** A bailing line constructed of fine wire also sandline. Fay.

**bailing tub.** A container into which the contents of a bailer are emptied. Long.

**bail.** a. Eng. A bag for carrying a miner's lunch. Fay.

**bait.** b. N. of Eng. Mealtime during a shift. First.

**bajada.** A. ladderway. Fay. b. A broad alluvial slope extending from the base of a mountain range out into a basin and formed by coalescence of separate fluvial fans. Webster 3d, c. Compound alluvial fans. A.G.I.

**baja de metales.** Peru. Unwatering of ores from mine to mill. Fay.

**bal.** a. Eng. A Cornish name for a mine; a cluster of mines. Fay.  

**bal.** b. A metal tank, or skip, with a valve in the bottom, used for unwatering a mine. Fay.  

**bal.** c. See sludger, c. Nelson.  

**bal.** d. A laborer who scoops water from drainage ditches in a mine with a bucket and empties it into a water car, a ditch flowing to a natural outlet, or to a pumping station. Also called water bailer. D.O.T. 1.

**bailer line.** Wire, rope or line attached to a bailer and only used to raise and lower a bailer in a borehole. Long.

**bailer shop.** A term used in all Russian oilfields, for a shop in which bailers are made and kept in repair for use at oil wells. Fay.

**bailiff.** Eng. A name formerly used for manager of a mine. Fay.

**bail.** a. Removal of the cuttings from a well during cable-tool drilling or liquid from a well by means of a bailer. Institute of Petroleum, 1961. b. Unwatering a mine. See also bailer, b and e. Fay.  

**bailing.** a. A stage in the heating of a clay to a low temperature in order to remove gases. ASM Gloss.  

**bakerite.** A white, compact, nodular, hydrous solid, tenacious, and heavy peat forming a body coincides with its rotational axis. ASM Gloss.  

**bake.** To dry, harden, or vitrify by exposure to heat, as in a furnace or kiln; as, to bake pottery or bricks. Standard, 1964.

**bakedclay.** A form of clay made from sand pump or an American pump. Loy.

**baked tonge valve at closing end of the bailing line, and downhill. Fay. b. A small weighted truck mounted upon a short inclined track, and carrying a sheave around which the rope of an endless haulage system passes as it winds off the drum. Zern.

**balanced core.** A core which is supported only at one end. Gristin.

**balanced cutter chain.** A cutter chain which has the same number of bottom and top picks. It usually cuts more freely in hard material and is often used for cutting at higher than floor level. See also unbalanced cutter chain. Nelson.

**balanced direct-rope haulage.** A modified form of direct-rope haulage. C.T.D. A power-driven reversible pulley (surge pulley) is used instead of a drum. The full trams are hauled up on one end of the rope while the empties go down on the other end. It involves a double track or conveyor with the haulage plane. The descent of the empty tram lasts in balancing the load being hauled upwards. Nelson.

**balanced draught.** Applied to combustion units in which forced and induced draughts are adjusted to give atmospheric pressure in the combustion chamber to avoid the infiltration of unwanted cold air. Nelson.

**balanced earthworks.** The ideal in excavation and filling work. In order to achieve maximum economy of construction, the excavation should as far as possible be equal to the embankment. Ham.

**balanced holding.** Arrangement of cages or skips in mine shaft in which the winding drum is raised or lowered at the same time lowers the other, thus reducing power consumption. Pryor, S.

**balanced ventilation.** A system of ventilation in which the districts (each with its separate split) are so arranged with regard to length and resistance, that the use of ventilation regulators is unnecessary. Regulators, although sometimes unavoidable, reduce the efficiency and increase wear required to ventilate the mine. Nelson.
balanced vibrating conveyor. A vibrating conveyor in which the center of gravity of the complete assembly is held constant by balance plate movement of the end offset by opposite movement of some other element. ASHA V.1-1958.

balanced winding. The conventional method of winding in a mine shaft. As the cage containing the loaded cars ascends, the other cage containing the empty descends; and thus the cages and cars are balanced. Balanced winding also implies the use of a balance rope, and thus, ignoring friction, the only load to be hoisted is the coal or mineral. See also winding. Nelson.

balance sheet. A record showing the present value of all assets and the liability to creditors of a company, in terms of cost or book value. Hooe. p. 448.

balance shot. In coal mining, a shot for which the drill hole is parallel to the face of the coal that is to be broken by it. Fay. balancing. a. A term used in surveying for leveling adjustment. Ham. b. Testing for balance; adding or subtracting weight to a grinding wheel to bring it into balance. Fay.

balancing a traverse. Adjusting the observed measurements to conform to the geometrical requirements of the traverse. Syllye, 2.

balanzon. Mex. Main beam or balance bob. Fay.

balance plate. Eng. A pit or shaft in which a balance (counterweight) rises and falls. Fay.

balance plane. An inclined plane up which empty cars are hoisted by the weight of descending loaded cars. Also called balance brow. Fay.

balance rope. A steel wire rope, generally of the weight per foot as the main winding rope, which is attached to the bottom of the cages, and extends down to form a loop in the shaft bottom or sump. Its function is to balance out the difference in weight of the upgoing or downgoing mine ropes during the wind. See also winding. Nelson.

balance sheet. A record showing the present financial obligations and resources of the company, in terms of cost or book value. Hooe. p. 448.

ball coal. A variety of coal made of spherical masses, which were probably formed by later deposition. Same as scalped anticline. A.G.I.

ballast. A very dark grayish or black, dense, igneous rock consisting essentially of pyroxene in a groundmass of anakrite, augite, and iron oxide. Johanssen. v. 4, p. 637.

ballastite. See ballastite. Fay.

ball. a. Eng. A more or less rounded mass of spongy iron, prepared in a puddling furnace; a lump. Also called balsite. Fay.

ball-and-socket reamer. A borehole-reaming device consisting of a bit attached to a ball-and-socket or a knuckle-joint member, which in turn is connected to the drill rods and used in borehole-deviation drilling. Also called arc cutter. Long.

ball and seat. a. A hard, spherical aggregate of many very small diamond crystals, usually cryptocrystalline in structure, relatively and more or less concentrically, around a central point. Because of their structure, balls are classified as polycrystalline. They are occasionally used in diamond-drill bits and other diamond tools. Also incorrectly used as a name applied to rounded, single-crystal forms of diamond. Also called shot bort. Long.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast car. A freight car (as for carrying ballast) that may be unloaded from the side or bottom. Webster 3d.

ballast engine. A steam engine used in excavating and for digging and raising stones and gravel for ballast. Webster 3d.

ballast hammer. A hammer with a long handle and two faces, used to break stone ballast. Fay.

ball bearing. A friction-reducing device consisting of hard steel balls in a circular race; also applied to some pieces of equipment, such as a swivel-type double-tube core barrel, using ball bearings as load-bearing members on rotating parts. Long.

ball breaker. a. A steel or iron ball that is hollowed by a chisel or drilled. Fay. Also called ballat. Fay.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.

ballast. a. Heavy material, such as water, sand, or iron, which has no function in a railroad, except increase of weight. Nichols. b. A very long piece of gravel as used to form the bed of a railway or as substructure for new roads. Artell.
ball coal

some process of joining. Perhaps the same as coal apple. Tomskia, 1954.

ballcoater. See battery-coater II. D.O.T. 1.

ballers. White sand with large spheroidal masses of calcareous sandstone known as sandballer-out. See battery-coater II. D.O.T. 1. The operation of forming balls in a puddy furnace. C.T.D.

balling. a. A process that occurs in the cementation of steel on prolonged annealing at 650° to 700° C. C.T.D. b. The operation of forming balls in a puddy furnace. C.T.D.

balling formation. Rock or formations that, when drilled, produce cuttings and sludge, which tend to collect on, and adhere to, borehole wall or drilling equipment in sticky or gummy masses. Compare gummy; sticky; long.

balling furnace, a. A kind of reverberatory furnace used in alkali works. Fay. b. A furnace in which piles or fagots of wrought iron are placed to be heated preparatory to rolling. Fay.

balling tool. A tool used in collecting the iron in the direction of one member, partly spherical and fits to taking it to the hammer or squeezer; a rabble. Fay.

ballistic test. The throwing of rock to a distance from the exploded charge, a thing to be avoided in rock blasting. Stauffer.

ballistic mortar. Heavy pebble mortar in which a standard explosive charge is fired and the angle of recoil is measured; testing device for explosive power. Bennett 24, 1962. 

ballistic pendulum test. A test for measuring the strength of explosives. It consists of measuring the energy of a pendulum, produced by the explosion of a weighed charge of material. Higham, p. 36.

ballinette; ballisite. A rockless powder consisting essentially of soluble cellulose nitrate and nitroglycerin approximately in equal parts. Webster 3d.

ball jasper. Jasper showing a concentric banding of red and yellow. C.M.D.

ball joint. A connection in which the end of one member partly spherical and fits into a corresponding spherical cavity in the other, thus permitting relative angular movement.

ball mill. A rotating horizontal cylinder with a diameter almost equal to the length supported by a frame or shaft in which non-metallic materials are ground using various types of grinding media such as quartz pebbles, porcelain balls, etc. Ball mill is used for grinding materials for whiteware, electrical insulation, etc., has a suitable cement to produce containers consisting of hardened cement and the material may be ground wet or dry. Bureau of Mines Staff.

ball mill grindability test. A test in which a crushed specimen of a given size range of particles is placed in a ball mill, and the reduction in size of particles for a given number of revolutions of the mill is interpreted in terms of a grindability index. Lewis, p. 574.

ball milling. A method of grinding and mixing material, with or without liquid, in a rotating cylinder, the material partially filled with grinding media such as balls or pebbles. ASTM C242-60T.

ball mill method. A grindability method based on the principle that all coals are ground to the same fineness, about that required for pulverized fuel, and then using the relative amounts of energy required for this reduction in size as a measure of grindability. Mitchell, p. 62.

ball mine. Same as ball ironstone. b. Fay.

Ball-Norton magnetic separator. Dry separator for coarse ore, in which one or two magnetic drums rotate in a series of fixed magnetic circuits, alternating in polarity. Pryor, 3.

ballooch being. A ball with about 15 percent larger than standard bricks but perforated to reduce their weight. Meritense, 4th, p. 260.

ballotini. Transparent glass spheres less than about 1.5 millimeter diameter; presumably a derivative of the Italian ballotta, a small ball used for balloting. Dodd.

ball phyllos. A variety of quartz phyllites in which all of felsicale are developed. Fay.

balls. a. Common name for nodules, especially of ironstone. Arkell. b. In fine grinding, crushing bodies used in a ball mill. Cast or forged iron or steel, or alloys of iron with molybdenum or nickel, are used. Spherical balls are mainly used, but various shapes are favored locally, for example, concaved. Pryor, 3.

ball sizing. Sizes and finishing a hole by forcing a ball of suitable size, finish, and hardness through the hole or by using a burning bush, or broach consisting of a series of spherical bands of gradually increasing size coaxially arranged. Also called ball burnishing, and sometimes ball broaching. ASM Gloss.

ball stamp. A stamp for crushing rock, operated directly by steampower, the stem of the stamp being at the same time the piston rod of a steam cylinder. Fay.

ball structure. A primary structure characteristic of some limestones and sandstones; also applied to the ball structure of coal, called ball coal. See also ball-and-sillow structure; armored mud balls; lake balls; sea balls. Pettijohn.

ball test. See Kelly ball test. Dodd.

balliff. See tiff, b. Fay.

ball valve. A device allowing liquids to flow unimpeded in a direction opposite to the direction of the ball toward the opening, the ball is pushed against the seat and seals the opening. If flow is from the opening toward the sphere, the ball is pushed away from the opening allowing the liquid to pass. Long.

ballast. a. A stratum in which siderite concretions occur; also, the ore itself. Hess.

bally seating. Underlay with nodular concretions. Arkell.

banakite. A variety of alkalic andesite consisting of plagioclase, sanidine, and biotite with minor olivine and calcic. Small amounts of other plagioclase or leucite may be present, and anatekite is also a common accessory. Banakite, in a series with shoshonite and abarokite, is transitional into shoshonite with decreasing amounts of sanidine and biotite, and increasing amounts of olivine and augite. A.G.I.

banasite. A bariumfeldspar with sodium, BaNaAlSiO6, as orthorhombic crystals from Benallt mine, Wales. Named from the chemical formula. Spenser 17, M.M., 1946.

banartite. A name describing the dioritic rocks connected with a series of ore deposits in the Austrian Province of the Banat. Accurate microscopical study has shown them to be of such varying mineralogy, that the name has now slight definition. The rocks are largely quartz-diorites. Fay.

bansal. A sandbank, bed, terrace, or stratum. Mex.

banco. a. Sp. B. de piedra, any one bed or stratum of stone in a quarry. Fay. b. Mex. A hard rock which narrows a vein or makes it change its course. Fay.

band. a. Slate or other rock interstratified with coal. Commonly called middle band in Arkansas; also, dirt band, sulfur band, or other band, as the case may be. Fay. b. Applied to a stratum or lamina consisting of a zone consisting of different and adjacent layers; a group of layers displaying color differences is described as being banded. A.G.I. c. Corn. A bed or seam of coal. Fay. d. Staff. A winding rope or chain. Fay. e. Any well-defined and widespread thin rock deposit which may or may not be fossiliferous, and is of value in correlation. Nelson f. Synonym for band. Long. g. A flexible ribbon of steel. Long.

bandaiite. A fine-grained goethitic rock with microcrystalline, labradorite, dacites, that is, for quartz basalts which in texture, resemble dacites or andesites; from Bandai San, Japan. Holmes, 1928.
band brake

A flexible, circular ribbon of steel lined with wooden blocks or asbestos-impregnated material that, through a band brake, is band or mechanically actuated lever, can be brought to bear on the surface of a projecting flange on a hoisting drum. A band brake is the drum, and, through friction, control the rotation of the drum, capstan, or wheel. Long.

band conveyor. A belt conveyor. See also steel conveyor band. Nelson.

banded. The property of rocks having thin and nearly parallel bands of different textures, colors, or minerals. Johannsen, 1, 2, 1912, p. 263. Banded coal has alternating bands of different types. Pryor, 3.

banded agate. Agate with colors usually disposed in parallel bands, which are more or less wavy. Mook agate in the trade is dyed and bands are of differing tones due to their coloring action on the silica sol or dye. See also agate; onyx. Chalcédon onyx. Shipley.

banded coal. a. The common variety of bituminous and subbituminous coal. It consists of a sequence of irregularly alternating layers or lenses of homogeneous black material having a brilliant vitreous luster, grayish-black, less brilliant, striated material usually of silty luster, and generally, thinner bands or lenses of soft, powdery, and fibrous particles of mineral charcoal. The difference in luster of the bands is greater in bituminous than in subbituminous coal. Common-banded coal.

banded quartz-hematite ore. Banded hematite of the Italica Region of Minas Geraes, Minas, specular hematite forming alternate bands with sugary quartz. Some of the bands are auriferous and contain gold-palladium alloys with manganese oxides, native copper, and talc. Writers have given the rocks various names, such as iron-glance schist, quartz, quartz itabirite, and banderita. Hess.

banded structure. a. A term applied to veins having distinct layers or bands. This may be due to successive periods of deposition or replacement of some earlier rock. Fay.
b. A structure developed in many igneous and metamorphic rocks owing to layers which differ noticeably in mineral composition or texture. Tomkeieff. c. A segregated structure of nearly parallel bands aligned in the direction of working. A.G.I.

banded texture. See banded ore. A.G.I.

banded vein. A vein made up of layers of different minerals parallel with the walls. Also called ribbon vein. Fay.

bандиул. Staff. A cage, or strictly speaking, a rope load; for example, bandiul of men. Compare band. Fay.

banding. The application, by hand or machine, of a band of color to the edge of a plate or cup. Dodd.

banded saw. An endless saw running on revolving pulleys, used for cutting wood in the lumber industry. Dobbs.

banded scale. An arrangement under which coils are placed an agreed sum for removing a dirt band, in addition to the usual tonnage rate. The payment varies with the thickness of the band. Nelson.

banded screen. In hydraulics, an endless band of wire mesh. Its purpose is to remove solids from the water at the intake point in hydroelectric generating schemes. Hess.

banded wonder. In concentration on shaking a dirt band, in addition to the usual tonnage rate. The payment varies with the thickness of the band. Nelson.

banded ironstones. Ironstones which are made up of bands of different composition, frequently alternating between two varieties. They have been attributed to crystal settling during convection, with rhythmic effects due to cooling and injection. A.G.I.

banded ingredients. a. The four distinctive and visibly differing portions forming the mass of an ordinary bituminous coal which can be readily separated macroscopically by hand, and microscopically in thin section, and which are not, in themselves, chemical entities that is, vitrain, chert, shale, and durain. See also rock type; primary type; variety. A.G.I. b. The same as banded coal. Tomkeieff, 1954.

banded ironstone. S. Afr. A rock consisting essentially of iron oxides and cherty silica, but possessing a prominent layered or banded appearance in shades of brown or red and black. Beerman.

banded ore. Ore composed of bands that may range from the same minerals differing in color, textures, or proportions, or they may be composed of different minerals. Synonym for banded texture. A.G.I.

banded quartz-hematite ore. Banded hematite of the Italica Region of Minas Geraes, Minas, specular hematite forming alternate bands with sugary quartz. Some of the bands are auriferous and contain gold-palladium alloys with manganese oxides, native copper, and talc. Writers have given the rocks various names, such as iron-glance schist, quartz, quartz itabirite, and banderita. Hess.

banded ore. Ore composed of bands that may range from the same minerals differing in color, textures, or proportions, or they may be composed of different minerals. Synonym for banded texture. A.G.I.

banded quartz-hematite ore. Banded hematite of the Italica Region of Minas Geraes, Minas, specular hematite forming alternate bands with sugary quartz. Some of the bands are auriferous and contain gold-palladium alloys with manganese oxides, native copper, and talc. Writers have given the rocks various names, such as iron-glance schist, quartz, quartz itabirite, and banderita. Hess.

banded texture. See banded ore. A.G.I.

banded vein. A vein made up of layers of different minerals parallel with the walls. Also called ribbon vein. Fay.

banded saw. An endless saw running on revolving pulleys, used for cutting wood in the lumber industry. Dobbs.

banded scale. An arrangement under which coils are placed an agreed sum for removing a dirt band, in addition to the usual tonnage rate. The payment varies with the thickness of the band. Nelson.

banded screen. In hydraulics, an endless band of wire mesh. Its purpose is to remove solids from the water at the intake point in hydroelectric generating schemes. Hess.

bank boss. Arkell.

bang-bang control. A method of operating a control system in such a way that correcting signals always provide actuation of the servomechanism to the full extent. N.C.R.

banging piece. Eng. A catch or rest to hold a cage when stopped at any landing. Hess. See also catches, s.

banjo. Scot. An iron frame for carrying a false clerk or Vive. Fay.

bank. a. The top of the shaft, or out of the shaft. Zern. b. The surface around the mouth of a shaft Zern. c. To manipulate coals, etc., on the bank. Zern. d. The whole or sometimes only one side of one entire face of a working place underground. Zern. e. A large heap of mineral on the surface. Zern. f. Derb. The face of the coal at which minerizing were working. Fay.

banded coal. A large heap of mineral on the surface. Zern. f. Derb. The face of the coal at which minerizing were working. Fay.

bank boss. Arkell.

bang-bang control. A method of operating a control system in such a way that correcting signals always provide actuation of the servomechanism to the full extent. N.C.R.

banging piece. Eng. A catch or rest to hold a cage when stopped at any landing. Hess. See also catches, s.

bank. a. The top of the shaft, or out of the shaft. Zern. b. The surface around the mouth of a shaft Zern. c. To manipulate coals, etc., on the bank. Zern. d. The whole or sometimes only one side of one entire face of a working place underground. Zern. e. A large heap of mineral on the surface. Zern. f. Derb. The face of the coal at which minerizing were working. Fay.

banded coal. A large heap of mineral on the surface. Zern. f. Derb. The face of the coal at which minerizing were working. Fay.

banded coal. A large heap of mineral on the surface. Zern. f. Derb. The face of the coal at which minerizing were working. Fay.
bank boss

face or underground operations at a mine.

D.O.T. 1. See also foreman; mine foreman.

bank chain. A chain that includes the bank of a stream. Fay.

bank coal. Coal contained in and sometimes salvaged from the bank. B.C.I.

banker off. Aust. The man who attends to taking skips off the cage. Fay.

bank a. Originally applied by the Dutch settlers to the gold-bearing conglomerates of the Witwatersrand. It is now used more widely for conglomerates and conglomeratic quartzites. C.T.D. b. Eng. A stonemasons' or bricklayers' bench, on which to trim stone or brick. Standard, 1964.

bank gravel. Gravel found in natural deposits, usually more or less intermixed with fine material, such as sand or clay, or combinations thereof; gravelly clay, gravelly sand, clayey gravel, and sandy gravel, indicate the varying proportions of the materials in the mixture. Stokes and 3d.

bank head. a. The upper end of an inclined plane, next to the engine or drum, made nearly level. Zern. b. The mouth and immediate environs of a coal mine. See also bank or island shelves or offshore island, situated on locally unrimmed continental shelf or rise.

c. Mid. Sorting and loading coal on the bank of a stream or a lake and used to pump water to a distant drill. Also called bankings, by growth of vegetation, and by changes in particle size and composition.

d. The vertical height of a bank as measured from the ground water which tend to cause sliding or caving.

bank level; pit bank. The angle, measured in degrees of deviation from the horizontal, at which the earthy or rocky material will stand in an excavated, terrace cut in an open pit mine or quarry. Bureau of Mines Staff.

bank slope; bench slope. The angle between the base of an open-hearth steel furnace and the bank and front walls. They are constructed of refractory bricks covered with fritted sand (acid open-hearth furnace) or burned-in magnesite or dolomite (basic open-hearth furnace). See also benches.

bank slope stability. A slope is subject to the influence of gravity and possible pressure of ground water which tend to cause sliding or caving. It is also subject to surface erosion from running water, wind, and alternate freezing or thawing, or wetting and drying. Weathering causes changes in particle size and composition. Bank slope stability can be attained by benching, by growth of vegetation, and by artificial protections, such as masonry walls, drainage systems to intercept or remove ground water, and fences to catch rolling pieces. See also slope failure; stability.

bank water. In placer mining, applied to water at the surface when short of wagons, or cars. Fay.

banking. a. The bringing of a cage to a banking transformers. The grouping of transformers in one horizontal plane and will in consequence carry the load of superimposed sagger uniformly. Dodd.

banking yards. Yards of soil or rock measured in its original position, before digging.

bank yards. See also bank, or island shelves or offshore island, situated on locally unrimmed continental shelf or rise.

bank boar. See tail. Schieferdecker.

banking. Doubling the rim of a sagger (before it is fired) by means of flat metal or a wooden board, to ensure that the rim lies in one horizontal plane and will in consequence carry the load of superimposed sagger uniformly. Dodd.

bankax. An amorphous metasuphosphate compound, used as a preliminary treatment before wire drawing. It is found to have excellent rust-resisting properties, and to act as a lubricant when wire is coated, by dipping with baxox before liming, it is found that the amount of lime applied is not critical. It can also be used with wire flash-coated with copper, where it assists rust proofing. Ochone.

banking rolls. A roll or bundle, a thick bed of blocks of granite, schists, and quartz. Fay.

bank. A certain number of men, usually three or four, who, prior to the introduction of cages, use: to ride up and down a shaft sitting h. u., to load loose pieces of chain attached to a hemp rope, with their knees pointing inward toward the center of the shaft. There were usually two bantz, the lower or bottom bant which was composed of men, and the upper or foaky bant which was made up of lads a few feet ahead of the men. Compare bont, a; tacklers. Fay.

bantams. Small pebbles of a banded garnet-quartz rock, which usually are associated with diamond in the concentrate obtained when washing the diamond-bearing gravels from the Vaal River in the Republic of South Africa. The occurrence of bantams in a gravel deposit is considered a good indicator of diamond. I.C. 8200, 1964, p. 45.

bar a. A drilling or tamping rod. Fay. b.
A vein or dike crossing a lode. Fay. c. A bank of sand, gravel, or other matter, especially near a river or harbor, often obstructing navigation. Webster 2d. d. A placer deposit, generally submerged, in the slack portion of a stream. Accumulation of gold along the banks of a stream, and, which, when worked by the miners for gold, are called bar diggings. Fay. e. A length of timber placed horizontally for supporting the roof. Fay. i. See sinker bar. Fay. g. Any band of hard rock crossing a lode. Bar of ground, and intersecting vein. See also cross course. Arkell. h. A strap or beam used to support the roof between two props or other supports. Mason. i. A length of steel pipe equipped with a flat cap at one end and a jack screw on the opposite end, by means of which the pipe may be wedged securely in a vertical or horizontal position across an underground workplace to serve as a base on which a small diamond or rock drill may be mounted. Also called drifter bar; drill bar; drill column. Long. j. A heavy used with either pointed or flattened ends used as a pry or as a tool by miners to dislodge loose rock in roof or sidewalls of an underground workplace. Long. k. A piece of material thicker than sheet, long in proportion to its width or thickness, and whose width-thickness ratio is much smaller than sheet or plate, as low as unity for squares and rounds. ASM Gloss. l. An offshore ridge or mound of consolidated material submerged at least at high tide, especially at the mouth of a river or harbor, or lying a short distance from and usually parallel to, the beach. HBG. m. A unit of pressure equal to 1,000,000 dynes per square centimeter, 1,000 millibars, or 29.33 inches of mercury. HBG. barbacoa. A monadnock which has been buried by a series of strata and subsequently re-exposed by the partial erosion of these younger strata. Fay. barbed wire. A piece of wire making up a continuous coiled wire consisting of a blended mixture of barium octohydrate and calcium hydroxide. It is used as a carbon dioxide extinguishing method in rebreathing (diving) systems. HBG. barlithe. A hexagonal fluorosilicate of ammonium, (NH4)12SiF6, occurring with cryptocrystalline, barabite. A discredited term for a type material from Kragelod, Norway, that has been shown to be finely twinned microcline with about 20 percent of unmixed albite. The name monolist is suggested for the high-temperature monoclinic modification of NaAlSiO4, not yet found in nature. American Mineralogist, v. 60, No. 2, October-December, 1975, p. 105. barbou quartzite. A quartzite of the Devil's Lake region of Wisconsin, used in silica brick manufacture. A quoted analysis: 98.2 percent SiO2, 1.1 percent Al2O3, 0.2 percent Fe2O3, and 0.1 percent Na2O + KO2. Dodd. barbotinite. a. A thin clay paste used in low relief ornamentation of pottery. Standard, 1964. b. A term applied to vases and other pieces decorated with flowers, leaves, etc., in high relief and colored in different enamels. C.T.D. barboun. A disc-shaped quartz crystal of low cinnabar. Fay. h. A term applied to vases and other undecorated pieces used at the bottom of a clay body in the drawing of the wire. Coal Age, v. 66, No. 3, March 1961, p. 91. barcart. A motor without a pulley, belt, tightening base, or slide rails. NEMA MB1-1961. barcree. Colom. In placer mining, to extract much of the gravel as possible, without method, leaving the underlying untouched. Fay. barcroqu. Colom. Extracting the rich ore by side methods. Fay. barrero. Colom. A placer miner who uses crude methods of sluical washing. A spiller. Fay. barr. A workman who removes surface soil or overburdens in a quarry. Arkell. barge Saturday. N. of Eng. The Saturday on which wages are not paid. Fay. barge. v. Flight conveyor. See draw-crest conveyor; flight conveyor. ASA MH41-1958. barge. A machine in which a folding bar or wing is used to bend a metal sheet whose edge is clamped between the upper folding leaf and the lower stationary jaw into a narrow, sharp, close, and accurate fold along the edge. It is also capable of making rounded folds such as those used in wiring. A universal folder is more versatile in that it is limited to width only by the dimensions of the sheet. ASM Gloss. bargain. a. Portion of a mine worked by a gang on contract. Zern. b. N. of Eng. An inclusive agreement made between a set of men and the management to complete a specified job; for example, removing a small area of coal, driving a new roadway, winning out a new face, or taking a newing. Bargains are not subject to caviling. Trist. bargain work. v. To cut coal by hand; to hole by hand. Mason. b. The unceded portion of borehole. Also called barefoot; blank; naked; open. Lang. c. To remove overburden. Arkell. d. Eng. To strip or cut by the side of a fault, boundary, etc.; to make a horizontal cut. Fay. e. A wire or conductor not covered with insulating material. Also called bare wire. Nelson. bare electrode. A filler-metal electrode, used in arc welding, consisting of a metal wire with no coating other than that incidental to the drawing of the wire. Coal Age, v. 66, No. 3, March 1961, p. 91. barefoot. Said of an oil well without a liner in a well. N. of Eng. bare golven. One. A term applied to vases and other undecorated pieces used at the bottom of a clay body in the drawing of the wire. Coal Age, v. 66, No. 3, March 1961, p. 91.
barghe loader

barghe loader. In the quarry industry, a laborer who controls the movement of a barge in a river as it is loaded with crushed stone. 421-1. 1

barges. Scot. Sheets of iron, zinc, or wood, used in wet shafts or workings for diverting water to one side. 2

bar grizzly. A series of spaced bars, rails, pipes, or other members used for rough sizing of bulk material passed across it to allow smaller pieces to drop through the spaces. ASA MH4.1-1958.

bar-heating furnace. A furnace to heat iron bars preparatory to rolling. Hess.

bar-heating furnace. A furnace to heat iron bars preparatory to rolling. Hess.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.

barium. An impure sodium carbonate and sulfate obtained by burning various species of land or marine plants; soda ash. Used in making glass, soap, etc. Standard, 1964.
England, where J. Y. M. Halsall was General Manager and which was at the time associated with the Purrit pottery. Dodd.

barrel. a. A piece of small pipe inserted in a barrel. The removal of surface excrescences on pieces of a product to be sorted out by hand in sufficient purity for smelting without mechanical concentration. Also called barrel copper. Fay.

barrel finkhing. Improving the surface finish of a product to be sorted out by hand in sufficient purity for smelting without mechanical concentration. Also called barrel copper. Fay.

barrel vault. A plain arch of semicircular cross section which is generally much longer than its height. Reinforced concrete barrel vaults are used for shell roofs of factories where open floor space is essential. Traditional barrel vaults are also constructed in both masonry or as reinforced concrete. Ham.

barrel washer. A washer comprising a cylinder rotating slowly about an axis which is fixed in the horizontal. A continuous stream of water, into which the raw coal, with a current of water or of a suspension, is fed near its upper end. The current of water or suspension to the lower end of the cylinder over a scroll which conveys the reject to the upper end of the cylinder. B.S. 3552, 1962.

barrel work. Biscuit-fired ceramic ware. Dodd.

barrenar. Mex. To drill; to fire a round of powder. Fay. Compare barren ground.

barrenf. Mex. To drill; to fire a round of holes. Fay.

barrenar. Mex. To connect with each other (as two mines or workings). Fay.

barren block. The block bounded by the vertical planes passing through the traces of the fault planes. Fay. Am. oilfield such a block is barren of oil, the oil sand being faulted out. Schieffelen.

barren contact. A contact vein, or a place in the contact vein, which has no mineral. Fay.

barren ground. Strata containing seams of coal that are not of a workable thickness. In metal mining, ground that does not contain ore. Fay. Compare dead ground. See also disturbed ground.

barren hole. Synonym for blank hole. Long.

barren measures. Materials such as lead and concrete which are used for protection from X-rays or gamma rays in radiographic installations. Osborne.

barren reef. a. A coral reef which extends above high water. K.G.

barren pillar. a. A solid block or rib of coal, etc., left unworked between two collieries or mines for security against accidents arising from an influx of water. Zern. b. Any large piece of a vein which has not been broken by roadways or airways that is left around a property to protect it against water or airways which subsequently may be develop ed or to protect the latter property in a similar manner. Zern. c. Incorrectly used for a similar pillar left to protect a body of water or airway, or group of roadways or airways, or a panel of rooms from a squeeze. Zern.

barren reef. a. The term barrier reef has been generally applied to that vast reef which fronts the northeastern shore of Australia, and by most voyagers likewise to that on the western coast of New Caledonia. At one time, it was thought convenient to restrict the term to the reefs which are in structure and position relative to the land, like a wall with a deep moist within, enclosed by many smaller islands which have been classed together. A.G.I. c. The name given to those coral reefs that run parallel to the shores of the islands and which are separated from the coastal reef by a lagoon channel, more or less extensive. A.G.I. c. A reef which runs more or less parallel with the coast but at some distance from it, so as to leave a broad channel between the two. A.G.I. d. A coral
barium zirconate. BaZrO₃; melting point, above 1,500° C. Used as an additive to barium uranophane. A silicate of barium and zirconium. BaZrSiO₂; white; used in the production of electrical resistor ceramics; glaze opacifiers; and as a stabilizer for colored ground coat enamels. 

Baroid. Brand name for a weighting material used in drilling muds to increase the unit weight of the mud. It is a complex of Ba₀₂, Zr₀₂, and S₁₀. Used to prevent the walls of the well from collapsing. 

Barolite. Wadsworth’s name for rocks composed of amphibole near arvedsonite in composition. Fay.

Baroque. Any pearl of very irregular form. Shipley.

Barometer. A measuring instrument for atmospheric pressure. There are two general types: (1) mercury barometer, and (2) aneroid barometer. 

Barometer holiday. Derb. Any day on which no work is carried on underground, owing to the very low state of the barometer. 

Barometric leg. In filtering system, use of a vacuum box sensitive to external pressure whose expansion or contraction is indicated on a graduated dial by means of an inclined plane. Also called bullfrog; groundhog; larry; ram; mute; truck. Fay.

Barometric leveling. The density of the atmosphere varies with altitude, hence by suitable graduation of barometer can be used to record difference in height. Two instruments should be used to record the change in pressure at the datum point and the other taking levels at the required positions. These levels are later corrected by comparison with the first barometer. The barometer cannot be used directly for the determination of levels underground owing to the artificially reduced air pressure. The readings taken with a barometer when used underground for ventilation surveys must be corrected for differences in level. These have to be taken with a level or theodolite. G. J. Barker and E. Traog for the treatment. 

Barratt-Halsall firemouth. A design for a stoker-fired firemouth for a pottery bottle oven; a subsidiary flue system links all the flues to the curved around the oven wall to assist in temperature equalization. The design was patented by W. G. Barratt and J. Y. M. Halsall (British patent 566,838; 16-1-45). Also known as the Gatter Hall device because it was first used at the factory of Gater Hall & Company, Stoke-on-Trent.
barrier reef

reef separated from the coast by a lagoon that is too deep for coral growth. Generally, barrier reefs follow the coasts for long distances with only short interruptions termed passes. A.G.I.

barrilla. Colom. In gold mining, wooden bar rig.

barrowman. In mining, one who pushes shal-

barrow. Webster 2d.

basaltic ware

(Often called Egyptian black or balalite ware). Bureau of Mines Staff.

basaluminite. Hydrous basic aluminum sulfate, 2Al₂O₃·SO₄·10H₂O, as white compact ratarial lining crevices in ironstone from Orchester, Northamptonshire. This material with the same formula has a different X-ray pattern. So named because more basic than alunite. See also hydrobasaluminite, Elephant 19, M.M., 1949.

basanite. An extrusive base charge. a. The charge or tariff made by base bullion. Crude lead containing recoverable base metal. b. Inferiority, due to alloy. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock. Standard, 1964. See also base.

base. a. Foundation or supporting structure on which a drill or other tool rests. b. Inferiority, due to alloy. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base charge. a. Foundation or supporting structure on which a drill or other tool rests. b. Inferiority, due to alloy. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base charge. a. Foundation or supporting structure on which a drill or other tool rests. b. Inferiority, due to alloy. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base charge. a. Foundation or supporting structure on which a drill or other tool rests. b. Inferiority, due to alloy. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base charge. a. Foundation or supporting structure on which a drill or other tool rests. b. Inferiority, due to alloy. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base charge. a. Foundation or supporting structure on which a drill or other tool rests. b. Inferiority, due to alloy. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base charge. a. Foundation or supporting structure on which a drill or other tool rests. b. Inferiority, due to alloy. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base exchange. a. The clay particle with its cations may be regarded as a kind of salt in which the colloidal clay particle is the anion. Certain cations may replace others, making the clay more flocculent. The cation replacement is known as the base exchange. Synonym for ion exchange. A.G.I. f. The physicochemical reactions by which one species of ions adsorbed on soil particles is replaced by another species. ASCE 1926.

base exchange capacity. The number of milliequivalents of NaOH required to neutralize the exchangeable cations adsorbed onto 100 gms of dry material. VV.

base fracture. In quarrying, used to describe the condition of the base after a blast. It may be a good or bad base fracture. A.G.I. c. A metal more precious than gold and silver (commonly restricted to gold and silver, and more particularly to gold) as used by householders, absent owners, and in industry. A.G.I. d. A metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base goods. Generally used to denote a material made by treating phosphate rock of underground sources. Pryor. 3.

base level. a. The lowest level to which a land surface can be eroded by running water. Mather. b. To reduce by erosion to or toward a base level. Standard, 1964.

base line. A line taken as the foundation of operations in trigonometrical and geological surveys. See also base, g. Fay.

base line. A line taken as the foundation of operations in trigonometrical and geological surveys. See also base, g. Fay.

base line. A line taken as the foundation of operations in trigonometrical and geological surveys. See also base, g. Fay.

base line. A line taken as the foundation of operations in trigonometrical and geological surveys. See also base, g. Fay.

base line. A line taken as the foundation of operations in trigonometrical and geological surveys. See also base, g. Fay.

base line. A line taken as the foundation of operations in trigonometrical and geological surveys. See also base, g. Fay.

base line. A line taken as the foundation of operations in trigonometrical and geological surveys. See also base, g. Fay.

base metal. a. Any of the nonprecious metals. Mather, 1922. b. A metal inferior in value to gold and silver (commonly restricted to the ore metals). A.G.I. c. A metal more precious than gold and silver, and more particularly to gold) as used by householders, absent owners, and in industry. A.G.I. d. A metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

base metal. a. Any of the nonprecious metals. Mather, 1922. b. A metal inferior in value to gold and silver (commonly restricted to the ore metals). A.G.I. c. A metal more precious than gold and silver, and more particularly to gold) as used by householders, absent owners, and in industry. A.G.I. d. A metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.

A metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. g. A base metal or alloy (as zinc, lead, or brass) of which was not melted. ASM Gloss. f. The groundmass or magma of a rock.
base price

base price (of pearls). The price of a single pearl is computed by squaring its weight in grains and multiplying the result by the base rate. This scheme of establishing the price of a pearl takes into consideration the fact that the pearls which are many times more common than large ones and that their value therefore increases as the square of their weight. Expressed as a formula, it is the average size, times the total weight, times the base rate equals the price of a group of pearls. Skiplay.

base rock. a. As used by some drillers, the solid rock immediately underlying the overburden material. Long. b. As used by drillers in the Midwestern United States, the igneous rock formations underlying the sedimentary rocks. Also called basement; parent rock; pavement. Long.

base station. Station belonging to the wide-meshed net of stations whereby the acceleration of gravity is determined with particular care and to which the field stations are tied in. Schiefler-decker.

basin. 1. A hollow which is expected to fill with rubbish the spaces from which the coal has been mined. Fay.

basin. To build walls and nonporous stoppings for the complete isolation of a district of a mine in which a fire has occurred; the complete stowing of old workings or roadways after all equipment has been removed. Nelson.

basic. a. In furnace practice, a slag in which the basic constituents are present in the amount required to form a neutral slag with the silica present. Fay. b. In geology, a general descriptive term for those igneous rocks that are comparatively low in silica. About 50 or 50 percent in the sub ogólny meaning one of the (1) an igneous rock containing calcium, magnesium, bronze or iron oxide. Cooper.

basic refractory lining. A furnace lining, especially for a copper converter or for an open-hearth steel furnace, which is composed of material low in such acid minerals as silica and high in such basic minerals as lime, magnesite, or magnesia. Bureau of Mines Staff.

basic rock. a term rather loosely used in lithology generally meaning one of the following: (1) an igneous rock containing less than 55 percent of silica, free or combined; (2) an igneous rock in which minerals comparatively low in silica and rich in the metallic bases, such as the amphiboles, the pyroxenes, biotite, and olivine, are dominant; or (3) an igneous rock composed chiefly of dark-colored minerals. In all three senses contrasted with acid. The term is misleading, undesirable, and becoming obsolete. As used in the first sense above, it is being replaced by sub-silicic and as used in the second sense, it should be replaced by mafic or by some term denoting the dominant mineral or minerals. See also basicity.

basalt. a salt in which the acid part of the compound is not sufficient to satisfy all the bonds of the base. Fay.

basalt. See Thomas steel.

basin. See bismuth nitrate. See bismuth subnitrate.

basin. See basic refractory lining.

basin. See basic refractory lining.

basin. See basic refractory lining.

basic. a. In process of smelting, the pig iron and keep it out of the hearth steel processes, and, from the quantity of phosphorus contained in it, valuable as an artificial fertilizer. Standard, 1964.

basin. One which accepts protons from solute. Pryor, 3.

basin. Steel melted in a furnace with a basic bottom and lining and containing an excess of a basic substance, such as magnesia or lime. *A.S.M. Gloss.*

basalt. The beveled edge of a drill or chisel. *Crispin.*

basalt. In diabase, the partial or entire enclosure by augite of plagioclase crystals. *Johnston*, 1. 1. 2. 1939, p. 168.

basal. a. The lowest part of a mine or area of coal lands. *Hudson*. b. A general region with an overall history of subsidence and thick sedimentary section. *Wheeler*. c. A large or small depression in the surface of the land, the lowest part often being occupied by a lake or pond. *Webster*. d. A broad area of the earth beneath which the strata dip usually from the sides toward the center. *Webster*. e. A natural depression of strata containing a coalbed or other stratified deposit. *Fay*. f. The deposit itself. *Fay*. g. A depression of the sea floor more or less edimentional in form. When the length is much greater than the width, the feature is a trough. *H.W.G*. h. An area in a tidal region in which water can be kept at a desired level by means of a gate. Also called tidal basin. *H.W.G*. i. A relative or small cavity in a rock mass usually created or enlarged by excavation, large enough to receive one or more vessels for a specific purpose. *H.W.G*. j. Same as pouring basin. *A.S.M. Gloss.*

basin. In geology, a settlement of the
basin

ground in the form of basins, usually due to the removal by water of soluble, underlying strata; also, deformation of strata into a fold or flexion in which the bed- 
dip from all sides toward the center; opposite of doming. Standard, 1964.

basin plot. Same as local plot. Tomkeieff, 1954.

basin range. A kind of mountain range character- 
ing the Grand Basin province and formed by a faulted and tilted block of strata. Standard, 1-64.

basin base. A term used to describe that part of a failed rock magma that in cooling fails to crystallize as recognizable minerals, but chills as a glass or, related amorphous 
eggerate. It differs from groundmass, which is the relatively fine portion of a porphy- 
ritic rock, as distinguished from the pheno-
crysts. Fay.

basin metal. The original metal to which one or more coatings are applied. ASM Glass.

basket. Synonymous with basic rock. Bureau 6, Mines Staff.

basket. Eng. Old cloth used to cover wet holes to prevent splashing while drilling. Fay.

basket. a. A type of single-tube core barrel made from thin wall tubing with the bore-
end notched into points, which are intended to pick up a sample of granular or plastic rock material by bending in on striking the bottom of the borehole or a solid layer. Also used as a fishing tool to recover an article lost or dropped into a borehole. Also called basket barrel; basket tube; saw-
tooth barrel. Long. b. Wire-mesh strainer in the top of a core barrel to strain out bits of debris, which might clog up the water ports in the core barrelhead. Long. c. Syn-
onym for basket core lifter. Long. d. S. Staff. A shallow part into which small coal is raked for loading into cans. Fay, e. Leic. A measure of weight (2 hundredweight) occasionally used in east Lancashire. f. A group of several wooden stakes placed in the form of a small circle to mark and protect an inside diameter slightly larger than 
the core size being cut. Also called basket ; 
basket core lifter. Long. g. A hole made in the 
core barrel for work in clay. ACSG, 1963. h. A plate 
used for drying clay or as a platform for work in clay. HPH. b. A broken, burned brick or shape. A.R.I. c. A slab or disk of plaster or fired clay used for drying clay or as a platform for work in clay. A.S.G. 1963. d. A plate of gelatin used in printing on pottery or porcelain over the glaze. Webster 3d. e. Any part of a brick intentionally or accidentally broken off; a piece of broken brick. A.I.S.I. No. 24. f. E. Leic.; S. Staff.) Batting out gas was formerly a regular though unsafe thing to do. See also bafile, a. Fay, g. Eng. A contact black, butuminous shale which splits into fine laminae. It is often inter-
stratified in layers with coal. Also spelled blank; Fay.

basinweave. A hydraulic silicate of magnesium and 
aluminum, approximately 4H2O·4MgO· 
Al2O3·4SiO2. Micaceous scales of hexagonal outline. A decomposition product perhaps related to the micas or chlorites. From Pas-

cuá, Bavaria, Germany, English.

batch. a. Corn. The quantity of ore sent to the surface by a pair of men. Also called batch of ore. Fay. b. A quantity of material described for the refining; Webster 2d. c. A quantity of material produced at one operation. Webster 3d. d. The mixture of raw materials from which glass is produced in the furnace. A proportion of cullet is either added to the mixture or placed in the furnace previous to the charge. C.T.D.

batch charger. A mechanical device for introdu-
ing batch to the furnace. ASTM C102-66.

batch distillation. A distillation in which a given quantity of material is charged into a still, and the distillation is conducted without additional charge to the still. N.R.C.-A.S.A. N-1.1-1957.
batch feeder. See batch charger. ASTM C162-66.
batch force. One in which each charge is placed, heated and withdrawn on completion of work. Pryor, 3.
batch grinding. In laboratory, paint, and ceramic work and in other special applications, the grinding of a charge of mineral (dry or wet) in a closed ball mill. Pryor, 3.
batch house. The place where batch materials are received, weighed, and mixed for delivery to melting units. ASTM C162-66.
batching plant. A concrete mixing plant which measures accurately the different ingredients in a concrete mix. ASTM C236-65.
batch mill. A grinding mill, usually cylindrical, in which the feed is processed to completion of the required comminution. Pryor, 3.
batch mixer. One who mixes various kinds of dry clay, according to formula, into a tank which mixes clay before addition of water. Nelson. Also called clay pddlder; mixer man. See also mixer. D.O.T. 1.
batch of ores. The quantity of ore sent to bank, by any pair of workmen. Nelson.
batch oil. A pale, lemon-colored neutral oil having a viscosity of about 80 Saybolt at 71°F. Used to keep molded materials from sticking to the molds and as a lubricant in cordage manufacture. Porter.
batch process. A process in which the feed is introduced as discrete charges, each of which is processed to completion separately. N.R.C.-A.S.A. W.1-1.577.
batch sintering. Preparing or sintering in such a manner that the products are furnace treated in individual batches. Osborne.
batch smelter. A smelter that operates as a periodic unit being charged, fired, and processed in such a manner that the products are sent to the melting units. Osborne.
bath. a. A medium as water, air, sand, or oil for treating or otherwise processing of products or batches. Pryor, 3.
bath. a. To enlarge a colliery road by lowering a drift or road. See bating.
batical variation. One found when examining the bottoms of the oceans. Webster 3d.
batholith. A huge, domed, intrusive igneous body of at least 40 square miles in extent whose sides are so closely cored as to render it undivided by fluvial erosion. See also batholith.
batholith. A drier in which ware remains until ware becomes heated. AIME, p. 17.
batholite. A term applied by Suess to an older division of magmas solidified as coarse crystalline rock in the deep horizons of the crust. See also batholith.
bathomile. A gelatinous substance precipitated from mud dredged from various depths from a moving ship. Applied in oceanography, of, relating to, or living in the deeper waters of the sea, especially those parts between 100 and 1,000 fathoms deep. Webster 3d.
bathymetric chart. Chart showing depths of water by means of contour lines or by color shading. Hy.
bathymetry. In oceanography, the measurement of depths of water, especially those several hundred feet below the surface. DAC, 1964. Webster 3d.
bathygraphic. In oceanography, or relating to ocean depths and mountain heights. Webster 3d.
bathylogie. In oceanography, of, relating to, or living in the deeper waters of the ocean, especially those several hundred feet below the surface distinguished from the surface and pelagic. Webster 3d.
bathyphotometer. In oceanography, an instrument designed to record the current velocity and water temperature at indicated depths below the surface of a sea or lake. Compare bathythermograph. Webster 3d.
bathyphotograph. An underwater photograph of a submersible ship that is used for deep-sea exploration, has a spherical watertight cabin attached to its underside, and uses gasoline and shot for ballast. Webster 3d.
bathyseism. In oceanography, an earthquake of deep origin recordable at seismographic stations on the earth's surface. Webster 3d.
bathyseism. In oceanography, or relating to the bottom of the deeper parts of the sea, especially those parts between 100 and 1,000 fathoms deep. Webster 3d.
bathysonic. In oceanography, or relating to a knowledge of the depths of the sea or of the things found there. Webster 3d.
bathythermograph. In oceanography, a spherical diving apparatus, made large enough to contain two men and instruments; capable of resisting tremendous pressure, and therefore of descending to great depths; it is used in oceanography for the investigation of deepwater fauna. C.T.D.
bathythermograph. In oceanography, a coin for a permanent sea floor installation. HBG.
bathythermograph. In oceanography, a record obtained with a bathythermograph. Webster 3d.
bathythermograph. An instrument, which may be lowered into the sea on a vessel at anchor or underway, to record temperature as a function of depth. The temperature sensing device is a Bourdon tube, the depth finder is a bellows system. Accuracy of temperature is ±0.1°F; depth ±10 feet. Abbreviation, bt. Hy.
bathythermograph. In oceanography, or relating to oceanography. Webster 3d.
bathythermograph. In oceanography, a ship (as a submarine or bathysphere) designed for exploration or navigation in water far below the surface of a sea or lake. Webster 3d.
batter. A company of miners working a set of products or batches. Pryor, 3.
batter. A. To enlarge a colliery road by lowering a drift or road. See bating.
batter. A medium as water, air, sand, or oil for regulating the temperature of something or of the atmosphere around it; also, a vessel containing such a medium. Webster 3d.
batter. B. The molten material in a reverberatory furnace. Standard, 1964. c. Any solution, or the vessel containing it, in which articles of any kind are immersed to expose them to its effects; as, the baths used in the concrete industry. Standard, 1964.
bathtub. An abrasive made from a very fine-ground, quartz-rose clay found along the banks of the Mohawk River in South- west England. Used for scouring steel utensils. AIME, p. 17.
bathtub. A term applied by Suess to an older division of magmas solidified as coarse crystalline rock in the deep horizons of the crust. See also batholith.
bathymeter. This instrument measures temperature, pressure, and sound velocity to depths up to 200,000 feet. In oceanography, the device is completely transistorized and uses frequency modulation for telemetering HBG.
bathymeter. A device used in oceanography for the measurement of depths of water in oceans, seas, and lakes. Webster 3d.
bathyscape. In oceanography, a ship (as a submarine or bathysphere) designed for exploration or navigation in water far below the surface of a sea or lake. Webster 3d.
bathos. A. A deep sea. Webster 3d. A. A deep sea. Webster 3d.
bathyseism. In oceanography, or relating to oceanography. Webster 3d.
bathyseism. In oceanography, or relating to oceanography. Webster 3d.
bathyseism. In oceanography, or relating to oceanography. Webster 3d.
battens. A strip of wood used for nailing or tying together or to cover a crack. Webster 3d.

batter boards. Horizontal boards placed to widen the area of support and to resist sinking or sloping a wall back in succession. Fay.

battery assay. An assay of samples taken from a battery wall. The wall between two furnaces, built across the chute to hold back blasted coal. Hess.

battery locomotive. A locomotive powered by a storage battery. The term comprises all electric motive power by conducted electricity. It may be used for a considerable time as a source of similar machines or similar pieces of equipment. Pryor, 3.

battery ore. See manganese dioxide. Bennett.

battery ore storage. A series of stamps, usually five, operated in a groundmass of augite, magnetite, and ironstone. Hess.

battery wall. The wall between two furnaces, built across the chute to hold back blasted coal. Hess.

battery starter. In anthracite and bituminous coal mining, one who charges and sets off explosive charges. Hess.

battery type. A number or group of ovens for making coke from coal. See also bank of ovens. Bureau of Mines Staff.

battened. A set of mine timbers in which the posts are inclined. Fay.

batter-out I. One who prepares bat (flat piece of pliable clay) to be formed into dish, plate, or similar ware by jiggerman. Also called batterer. D.O.T. 1.

batter-out II. One who prepares web of clay for forming in molds of wares, such as bowls and cups. Also called baller; bailer-out; ballemaker; batter; cup bailer. D.O.T. 2.

batter pile. A pile driven at an angle to the vertical. Ham.

batter printed. A former method of decorating pottery; it was first used in Stoke-on-Trent, England, in 1810, when W. Wedgwood patented it in 1817. A bat of solid glue or gelatin was used to transfer the pattern, in oil, from an engraved copper plate to the glazed ware, colorless then bluing doped on. The process was still in use in 1890 and has now been developed into the Murray-Curves machine. Dodd.

batter printing. A method of decorating pottery; it was first used in Stoke-on-Trent, England, in 1810, when W. Wedgwood patented it in 1817. A bat of solid glue or gelatin was used to transfer the pattern, in oil, from an engraved copper plate to the glazed ware, colorless then bluing doped on. The process was still in use in 1890 and has now been developed into the Murray-Curves machine. Dodd.

battend. a. Thin partings of clay such as used in laying bricks, between 2 and 4 inches in thickness and from 5 to 8 inches in width. Used for flooring or as a support for laths. C.T.D. c. A bar fastened across a door, or anything composed of parallel boards, to secure them and to add strength and/or to reduce warping. C.T.D.

batterer. a. To reduce the width of brickwork with horizontal courses. ARJ. b. Receiving or sloping a wall back in successive courses; opposite of corbel. ACIG. c. A piece of pliable clay) to be formed into slips. Thom.

battery. a. A network of cells; storage battery. Long. b. A battery of solid glue or gelatin was used to transfer the pattern, in oil, from an engraved copper plate to the glazed ware, colorless then bluing doped on. The process was still in use in 1890 and has now been developed into the Murray-Curves machine. Dodd.

battery rule. An instrument consisting of a rule or frame and a plumbline and bob and used to regulate the batter of a wall in building. Webster 3d.

battersea. Brand of cups, scoops, crucibles, muffin sleeves, and similar assay equipment. Prype, 3.

battery, s. a. A bulkhead or structure of timber for keeping coal. Hess. b. A wooden platform for masons to stand upon while at work, especially in steeply dipping coalbeds. The plank closed at the bottom of a coal chute. Fay. d. In steeply pitching seams, a wooden structure built across the chute to hold back blasted coal. Korson. e. A blasting machine or exploder. Nelson. f. A number of stamps for crushing and pulverizing ores. Nelson. g. A series of stamps, usually five, found in one box or mortar, for crushing ores; also, the base on which they are operated. Hess. h. A Stamper mill for pulverizing stone. Gordon. i. A series or row of coke ovens. Mercereau, 4th, p. 552. Section of ore dressing (reduction) plant. Pryn. j. k. Timbering in which the stanchions are placed from foot to hanging, touching each other, in a solid mass of from three to twelve or more. The battery may be further strengthened by binding around with wire. Spalding, 3rd. l. A number of similar machines or similar pieces of equipment placed side by side on a single or separate base and operated by means of common connections as a unit. Long. m. A combination of chemically activated accumulators, which, after charging, may be used for a considerable time as a source of direct-current electricity. Also called storage battery. Long.

battling block. A plaster slab on which plastic modeling is done. Bureau of Mines Staff.

battered. a. A dark leucite basalt containing phenocrysts of augite and fewer of olivine in a groundmass of augite, magnetite, and olivine; from Batuku, Celebes, Indonesia. Holmes, 1928.

baudolier cooler. An arrangement of pipes one above another through which refrigerant flows and is vaporized as it absorbs heat from the water being cooled by trickling over the tubes. Stock, 10.

bauman print. Sulfur print, made to test concentration of sulfur on metal surfaces. The metal is dampened with dilute sulfuric acid, and pressed against photographic bromide paper. A staining of silver sulfide is produced by H2S liberated from the metal. Nelson.

baunehuerite. A lead- to steel-gray sulfarsenide of lead, 4PbS.3As3S; complex crystal systems: monoclinic; metallic luster; perfect cleavage; conchoidal fracture. From Binnewalz, Switzerland. English.

bauschinger effect. Usually refers to the phenomenon by which plastic deformation of a polycrystalline metal, caused by stress applied in one direction, reduces the yield strength where the stress is applied in the opposite direction. Sometimes used in a broad sense to include all changes in the structure of a polycrystalline or single crystal metal, whether or not the polycrystalline or single crystal and polycrystalline metals that may be ascribed to changes in the microscopic stress distribution within the metals as distinguished from those caused by strain hardening. ASM Gloss.
bauxite. a. A rock composed of aluminum hydroxides. Especially, Al₂O₃·2H₂O. The principal ore of aluminum; also used collectively for similar aluminium ores. Fay. Composed of aluminum hydroxides and impurities in the form of free silica, clay, tilt, and iron oxides. A.G.I. A nearly horizontal portion of the uprush and backwash of waves where the waves play only at high stages of the tide. Among the minor forms of the shore zone none has proved more popular in puzzling out the origin of beach material built by wave action along the shore. Sand, gravel, or coarse cobbles or pebbles may be scattered uniformly spaced ridges which trend at right angles to the sea margin, tapering out to a point near the water's edge. These beach cusps have attracted the attention of many students. A.G.I. Beach deposits. Alluvial concentrations of mineral formed by the grinding action of natural forces (wind, wave, or frost) and the selective transporting action of tides and winds. Fryar. Beach drift. drift. Beach drifting. See beach 

bauxite brick. A firebrick composed essentially of hydrated alumina and ferric oxide. Such bricks are used for the lining of furnaces where a neutral material is required. Osborne.

bauxite cement. A cement made from bauxite and lime in an electric furnace; hardens rapidly. Sometimes called cement foun, Nelson.

bauxite clay. a. A clay consisting of a mixture of bauxitic minerals, such as gibbsite and diaspor, with clay minerals, the former constituting not over 50 percent of the total. The opposite of this would be an aglaioclase bauxite, A.C.S.E. b. A natural mixture of bauxite and clay, containing not less than 47 percent nor more than 5 percent alumina on a calcined basis. H.W.

bauxitland cement. See Kühl cement. Dodd.

Bavarian cat's eye. Quartz cat's eye, from bauxitic clay. a. A clay consisting of a mixture of bauxitic minerals, such as gibbsite and diaspor, with clay minerals, the former constituting not over 50 percent of the total. The opposite of this would be an aglaioclase bauxite, A.C.S.E. b. A natural mixture of bauxite and clay, containing not less than 47 percent nor more than 5 percent alumina on a calcined basis. H.W.

bay. a. An open space for waste between two bodies of water partly surrounded by land. It may be shallow or deep, the resulting form having a nearly square cross section. Standard, 1964.

bay bar. A bar extending partially or entirely across the mouth of a bay. A.G.I.

bay mouth bar. See baymouth bar. Schiedercker.

bayou. a. A sluggish or stagnant inlet or outlet from a lake or bay, or one connecting two bodies of water; also, a branch of the stream flowing through a delta; a gut. Standard, 1964. b. See oxbow. Fay.

bay salt. A coarse-grained variety of common salt obtained by evaporating seawater in shallow bays or pools by the heat of the sun. Standard, 1964.

bayshon. Som. An air stopping, Fay.

B. bit. A nonstandard core bit no longer in common use except in drilling longwall working. See also BuMin Style Guide, p. 58.

Be Chemical symbol for beryllium. Hand.
beach mining
beaches, coastal plain, and deposits located inland from the shoreline. High-grade con-
centrates is usually obtained from low-grade material by the use of suction dredges and spiral concentrators. Nelson.

beach ore. A concentration of heavy minerals on a beach by selective action of the surf. See also black sands. A.G.I.

beach placers. Placer deposits either on a present or ancient sea beach. There are three series of these at Nome, Alaska, known as first, second, or third beach, etc., due to change of shoreline. Fay. See also black sand; placer deposit.

beach profile. The intersection of the ground surface with a vertical plane; may extend from the top of the dune line to the seaward limit of sand movement. H&G.

beach ridge. An essentially continuous mound of beach material behind the beach that has been heaped up by wave or other action. Ridges may occur singly or as a series of approximately parallel deposits. In England, they are called fulls. A.G.I.

beach scarp. An almost vertical slope along the beach. See also beach ridge. H&G.

beach width. The horizontal dimension of the point measured normal to the shoreline. H&G.

bead. a. The globule of precious metal obtained by the crystallization process in pouring. Webster 3d. b. A glassy drop of flux (as borax) used as a solvent and a color test for metallic salts (as of iron or manganese) that is formed by fusion in the loop of a usually platinum wire. Webster 3d. c. Prill. Pryor, J. d. An enlarged, rounded edge of a tumbler or other glass article, or any raised section extending around the article. ASTM C162-66. e. A piece of glass tubing used around a lead wire. ASTM C162-66.

bead enamel. A special type of porcelain enamel used for building purposes. Hansen.

beading. Off. Wiping off enamel on head preparatory to applying beading. Bryant.

beads. a. In ion-exchange, sized resin spheres, usually + 20 mesh so constituted as to capture ions from pregnant solutions under loading conditions, and to retain them under other (eluting) conditions. Two types are anionic and cationic. See also permutes; resin. Pryor, J. b. Test in mineral identification, borax is fused to a transparent bead by heating in a blowpipe flame in a small loop formed by platinum wire. When suitable minerals are melted in this bead, characteristic glassy colors are produced in an oxidizing or reducing flame, and serve to identify elements. Pryor, J. c. Weld. A weld composed of one or more string or weave beads deposited on an unbroken surface. ASM Gloss.

beader. a. A glass container for chemical work. It is generally round, flat-bottomed, with parallel sides, somewhat taller than wide, has a flared rim and a pouring lip, and ranges in capacity from a few milliliters (cubic centimeters) to 4 liters. Hess.

beaker. a. A vessel having a short cylindrical form, with a long neck, or with a short neck and a flared rim. Fay. b. A cleaned and screened anthracite coal or series of anthracite coals that will pass through a 1/2-inch screen or mesh. Fay. c. A cleaned and screened anthracite about 1/2 by 1 inch. Walker.

beaker septum. A small rubber loop used to support a stopper in a round-bottom flask. Ginn.

beaker stopper. A rubber or plastic ring used to support a stopper in a round-bottom flask. Ginn.

beaker test. A method of measuring the modulus of rupture of concrete or mortar by casting a standard beam, without reinforcement. The beam is supported and loaded in a standard way, the bending moment at the point of failure being recorded; from this the maximum tensile stress is calculated. It is a cheap and efficient test for concrete and mortar. Hess.

beak. a. A straight or curved point. Ast. b. A beak-like part of a bird. Ast. c. A lifting device, used to lift the pump rods or sacked rods. Hess.

beaker and bar. A special type of porcelain bead used for building purposes. Hansen.

beak. a. A species of small bee that constructs a beehive resembling a beehive. b. A beak-like part of a bird. Ast.
beche; biche

grate bars in a furnace. Fay.
bearers. a. S. Staff. Women formerly em-
ployed to carry coal out of the mines.
Fay. b. Slimmers, fat men, placed in a shaft
at intervals of 30 to 100 feet to support
shaft sets. They are usually put beneath
the end plates and dividers, and carry the
hit-and-miss charge. Also used to sup-
port pumping gear. Fay. c. Porters, such as
those used on prospecting trips in many
countries.
bearers' way. Scot. An underground load
bearing-in shots. Borcholes tending to meet
bearing-in. The depth of an undercut, or
bearing road. Scot. See bearers' way. Fay.
bearing pit. Scot. A shaft up which coal was
bearing piles. Piles to transmit the load of a
bearing metal. Metal employed for axle bear-
bearing seal. A device on the *outer side of
bearing pressure. The load on a bearing sur-
facing which has been selected as the most suitable to
support a given load. Hem.
bearing strength. In a mine shaft, a specially
substantial set of timbers used at intervals to
support the linings and ordinary bearers.
They are tied into the surrounding rock to
give extra strength. Pryor, 3.
bearing stake. A pole or a line in indi-
cate the horizontal direction an inclined
boorehole is to be drilled. Long.
bearing stratum. The earth formation which
bearings. a. Eng. The surface outcrop of a lode
bearing test. Same as azimuth test. Long.
bearing-up pufuhy. A pulley wheel fixed in a
frame and arranged to tighten or take up
the slack rope in endless-rope haulage. Fay.
bearing-up stops. a. Partitions or brattices of
blank that serve to conduct air to a face.
Fay. b. Keps or catches used to support
a cage at the end of a hoist during load-
ing or unloading. C.T.D.
bearing wall. A wall which supports a vertical
load in addition to its own weight. ACSG.
bear. Derb. Calcareous nodules of clay iron-
bearing strata. a. Scot. A mine with hard rock
bearsite. The arsenic analogue of mornesite,
bearing strata. a. Scot. A mine with hard rock
bears. Derb. Calcareous nodules of clay iron-
bearers' way. Scot. An underground load
bearing-in shots. Borcholes tending to meet
bearing-in. The depth of an undercut, or
bearing road. Scot. See bearers' way. Fay.
bearing pit. Scot. A shaft up which coal was
bearing piles. Piles to transmit the load of a
bearing metal. Metal employed for axle bear-
bearing seal. A device on the *outer side of
bearing pressure. The load on a bearing sur-
facing which has been selected as the most suitable to
support a given load. Hem.
bearing strength. In a mine shaft, a specially
substantial set of timbers used at intervals to
support the linings and ordinary bearers.
They are tied into the surrounding rock to
give extra strength. Pryor, 3.
bearing stake. A pole or a line in indi-
cate the horizontal direction an inclined
boorehole is to be drilled. Long.
bearing stratum. The earth formation which
bearings. a. Eng. The surface outcrop of a lode
bearing test. Same as azimuth test. Long.
bearing-up pufuhy. A pulley wheel fixed in a
frame and arranged to tighten or take up
the slack rope in endless-rope haulage. Fay.
bearing-up stops. a. Partitions or brattices of
blank that serve to conduct air to a face.
Fay. b. Keps or catches used to support
a cage at the end of a hoist during load-
ing or unloading. C.T.D.
bearing wall. A wall which supports a vertical
load in addition to its own weight. ACSG.
bear. Derb. Calcareous nodules of clay iron-
bearing strata. a. Scot. A mine with hard rock
bearsite. The arsenic analogue of mornesite,
bearing strata. a. Scot. A mine with hard rock
bears. Derb. Calcareous nodules of clay iron-
bearers' way. Scot. An underground load
bearing-in shots. Borcholes tending to meet
bearing-in. The depth of an undercut, or
bearing road. Scot. See bearers' way. Fay.
bearing pit. Scot. A shaft up which coal was
bearing piles. Piles to transmit the load of a
bearing metal. Metal employed for axle bear-
bearing seal. A device on the *outer side of
bearing pressure. The load on a bearing sur-
facing which has been selected as the most suitable to
support a given load. Hem.
bearing strength. In a mine shaft, a specially
substantial set of timbers used at intervals to
support the linings and ordinary bearers.
They are tied into the surrounding rock to
give extra strength. Pryor, 3.
bearing stake. A pole or a line in indi-
cate the horizontal direction an inclined
boorehole is to be drilled. Long.
bearing stratum. The earth formation which
bearings. a. Eng. The surface outcrop of a lode
bearing test. Same as azimuth test. Long.
bearing-up pufuhy. A pulley wheel fixed in a
frame and arranged to tighten or take up
the slack rope in endless-rope haulage. Fay.
bearing-up stops. a. Partitions or brattices of
blank that serve to conduct air to a face.
Fay. b. Keps or catches used to support
a cage at the end of a hoist during load-
ing or unloading. C.T.D.
bearing wall. A wall which supports a vertical
load in addition to its own weight. ACSG.
bear. Derb. Calcareous nodules of clay iron-
bearing strata. a. Scot. A mine with hard rock
bearsite. The arsenic analogue of mornesite,
bearing strata. a. Scot. A mine with hard rock
bears. Derb. Calcareous nodules of clay iron-
bearers' way. Scot. An underground load
bearing-in shots. Borcholes tending to meet
bearing-in. The depth of an undercut, or
bearing road. Scot. See bearers' way. Fay.
bearing pit. Scot. A shaft up which coal was
bearing piles. Piles to transmit the load of a
bearing metal. Metal employed for axle bear-
bearing seal. A device on the *outer side of
bearing pressure. The load on a bearing sur-
facing which has been selected as the most suitable to
support a given load. Hem.
bearing strength. In a mine shaft, a specially
substantial set of timbers used at intervals to
support the linings and ordinary bearers.
They are tied into the surrounding rock to
give extra strength. Pryor, 3.
bearing stake. A pole or a line in indi-
cate the horizontal direction an inclined
boorehole is to be drilled. Long.
bearing stratum. The earth formation which
bearings. a. Eng. The surface outcrop of a lode
bearing test. Same as azimuth test. Long.
bearing-up pufuhy. A pulley wheel fixed in a
frame and arranged to tighten or take up
the slack rope in endless-rope haulage. Fay.
bearing-up stops. a. Partitions or brattices of
blank that serve to conduct air to a face.
Fay. b. Keps or catches used to support
a cage at the end of a hoist during load-
ing or unloading. C.T.D.
bearing wall. A wall which supports a vertical
load in addition to its own weight. ACSG.
bear. Derb. Calcareous nodules of clay iron-
bearing strata. a. Scot. A mine with hard rock
bearsite. The arsenic analogue of mornesite,
bearing strata. a. Scot. A mine with hard rock
bears. Derb. Calcareous nodules of clay iron-
bearers' way. Scot. An underground load
bearing-in shots. Borcholes tending to meet
bearing-in. The depth of an undercut, or
bearing road. Scot. See bearers' way. Fay.
bearing pit. Scot. A shaft up which coal was
bearing piles. Piles to transmit the load of a
bearing metal. Metal employed for axle bear-
bearing seal. A device on the *outer side of
bearing pressure. The load on a bearing sur-
facing which has been selected as the most suitable to
support a given load. Hem.
bearing strength. In a mine shaft, a specially
substantial set of timbers used at intervals to
support the linings and ordinary bearers.
They are tied into the surrounding rock to
give extra strength. Pryor, 3.
bearing stake. A pole or a line in indi-
cate the horizontal direction an inclined
boorehole is to be drilled. Long.
bearing stratum. The earth formation which
bearings. a. Eng. The surface outcrop of a lode
bearing test. Same as azimuth test. Long.
6 pounds. The hollow part extends to five-eighths of an inch at the upper end and tapers to three-eighths of an inch at the lower end and tapers to five-eighths of an inch at the upper end. It is used for extracting the bottom portion of broken sets of rods from a borhole, Fay.

beckite. A brown resin, found at the boric acid lagoons of Tuscany, Italy. Standard, 1964.

Becke method. Becke. In optical mineralogy, a method or test for determining relative indices of refraction. The Becke method determines microscopically the index of refraction of a mineral compared with that of an oil or another substance, such as Carbon tetrachloride, in which it is immersed, or of two adjacent minerals in a microscopic thin section. If the mineral grain under investigation has an index of refraction lower than that of the enclosing medium or that of an adjacent mineral grain with which it has a nearly vertical contact, a line of light (called the Becke line) will move outward into the medium or into the adjacent mineral grain of higher refractive index as the barrel of the microscope is moved upward from the position where it first moves inward from the mineral being investigated if the barrel of the microscope is moved downward. If the mineral grain under investigation has an index of refraction that is higher than that of the enclosing medium or that of the adjacent mineral grain with which it has a nearly vertical contact, the Becke line will move inward into the mineral grain under investigation from the boundary with the enclosing medium or inward from its nearly vertical contact with the adjacent mineral grain of lower refractive index as the barrel of the microscope is moved upward from the position of focus, and it will move outward from the microscope until it reaches the mineral grain under investigation if the barrel of the microscope is moved downward. Bureau of Mines Staff.

beckite. A brown resin, occurring with amber. English.

Becket loop. A loop of small rope fastened to the end of a large wire rope to facilitate installation. Ham.

beckite. See becket. C.T.D.

beckite. A brown resin, occurring with amber. English.

1. A passage usually wide and high and used for traveling from one side of a cave to the other. Necle.

2. The solidified core of a kettle at the bottom of a cupula. The first charge of iron is also called a bed charge. Origin. British. Fay.

bed. a. The smallest division of a stratified series and marked by a more or less well-defined upward and downward trend, and may be regarded as a local plane in its neighbors above and below. Fay. b. A deposit, as of ore, parallel to the stratification, later in origin than the rock below, and older than the rock above, thus constituting a regular member of the series of formations, and not an intrusion. Standard, 1964. c. The portion of an outcrop or face of a quarry which occurs between two bedding planes. Fay. d. The level surface of rock upon which a curb or crib is laid. Fay. e. The bottom of a watercourse or of any body of water. Webster 3d. f. A mass or heap of anything (as ore), arranged in layers. Webster 3d. g. All the coal, partings, and seams which lie between a distinct roof and floor. Bed is preferred by the U.S. Geological Survey, state geologists, coal authorities, and the U.S. Bureau of Mines. Seam or vein should be used instead of bed if the coal bed is worked in benches, use the term bench (upper, middle, or lower), not seam, or bed. Webster 3d. h. S. Afr. The hard solid rock underlying alluvial deposits. Also called bedrock. Waller. i. Perhaps the most common term in geology meaning layer or stratum. Quarrymen usually mean by bed not the strata beds in the geologist's sense but the partings between Arkell. j. A stockpile, as of ores, concentrates, and fluxes, built up of successive longitudinal layers so that transverse cutting yields a uniform mixture for furnace feed until the material is all consumed. Bureau of Mines Staff. k. The stationary portion of a press structure which usually rests on the floor or foundation, forming its base. Webster 3d. l. Moisture that is small compared with the mass or heap of anything (as ore), arid, consisting a regular member of the series of deposits. Schieferdecker.

bed. a. The layer of heavy and oversize material placed between the corrugated loading to the stream of ore being treated, for example, between bottom of thickener and its rakes. Fay.

bed. Applied to rocks resulting from consolidated sediments and accordingly exhibiting planes of separation designated bedding planes. Fay.

bed. A term usually applied to mineral deposits that are found parallel with the stratification of sedimentary rocks and usually of contemporaneous origin. The term is used by some writers to describe layer-like deposits of replace- ment origin. Steckel and Vane 1955. See also bedded formation. Fay. b. In economic geology, a synonym for blanket deposit. Nichols.

bed. A formation which shows successive beds, layers, or strata due to the manner in which it was formed. A bedded deposit. Fay.

bed. Ore aggregates occurring between beds or in sedimentary rocks. Schieferdecker.

bed. Ore which occurs as beds or layers. The ironbearing ore in Great Britain are the iron ores of the Jurassic. Another bedded ore is that of manganese, found in the Cambrian and Ordovician rocks of North Wales. See also Frodingham ore; manganese ore; Northampton sand ironstone. Nelson.

bed. One of the two subdivisions of the period named for the rocks within each bed, in addition to being elastically perfect, isotropic, and homogeneous, must have a thickness large enough for the stress that is applied on the bed to be significant compared with the effective stress across the bed. See also bedded volcanos. Webster 3d.

bed. A thin layer differing in composition with the beds between which it occurs. Schieferdecker. b. A joint paral-
bedding joint

lel to the bedding plans formed by tection processes. Schieredercker.

bedding plans a. In sedimentary or stratified rocks, the division planes that separate the individual layers, beds, or strata. A.O.G.I. b. A rock-bedding forming mineral has been deposited. Pryor, 3. c. A separation or weakness between two layers of rock, caused by changes during the building up of the rock-forming material. Nichols. 

bedford limestone. One of the finest and best known building stones to be found in the United States. It gets its name from its shipping point, Bedford, Ind. Crispin.

bed joint a. A horizontal crack or fissure in massive rock. Webster 3d. See also bedding plane. Fay b. One of a set of tracing fissesures parallel with the bedding of a rock. Webster 3d. c. A horizontal joint between courses of brick. A.R.I. d. The horizontal of mortar on (or in) which a masonry unit is laid. ASCG. 

bedfoid. Sediment that moves on or very near the bottom and in almost continuous contact with the bed. It moves by skipping, sliding, and rolling. Motion is derived from gravitational and gravitational forces. USGS Prof. Paper 462-F. 

bed material. The material composing the channel bed. USGS Prof. Paper 462-F. 

bedplate. A plate of iron, copper, or other metal, fastened to the bottom of a furnace. Webster 2d. 

bedrock. a. Any solid rock exposed at the surface of the earth or over lain by unconsolidated material. A.G.I. Supp. b. In Australia, the stratum upon which the wash dirt rests is usually called bedrock. It usually consists of granite or boulder clay (or pebbles in a stratum), and more rarely, basalt. When the strata consists of slates or sandstones (Silurian or Ordovician), it is usually called reef strata. Engineering and Mining Journal, v. 139, No. 4, April 1938, p. 55. 

bedrock (ledge). Rock of relatively great thickness and extent in its native location. ASCE P1826. 

bedrock test. A borehole drilled to determine the character of bedrock, and separate the char-acter and depth of overburden overlying such bedrock. Long. 

bed rubber. In the concrete products and stonework industry, one who rubs down and finishes stone, sandstone, or rough stonework. Shell Oil Co. 

bed separation. The thin processes. Schieferdecker. 

bed stone. In milling, the lower or stationary beds of passage. Beds in which the fossils or rock below, indicate the transition character of the deposit. Standard, 1964. 

bed stone. In milling, the lower or stationary millstone. Fay. 

bed vein. a. Following the bedding planes in sedimentary rocks or a mineralized permeable stratigraphic horizon developed below an impervious bed. Synonym for blanket vein; mant as; sheet ground. Schieredercker. 

beech coal. Charcoal made from beechwood. Fay. 

beef. Eng. Fibrous carbonate of lime, so called by the Purbeck quarrymen and now in general use. It is called on the continent bacon and homeflesh. Arkell. 

beehive coke. Coke manufactured in beehive rectangular, or similar forms of ovens in a horizontal bed, where heat for the coking process is securd by combustion within the oven chamber. ASTM D121-62. 

beehive coke oven. Oven, brick, brick bottom, side walls, and a domed roof. Bureau of Mines Staff. 

beehive kiln. See round kiln. Dodd. 

beekmantown limestone. A magnesian lime- stone, 1,800 feet in thickness and charac-terized by curved nautiloid cephalopods, occurring in the Canadian series of North America; of Arenig age; equivalent to part of the Durness limestone of the Highlands of Scotland. C.T.D. 

beerkhuite. This rock was originally de-scribed as a basic igneous rock but it is now known to be a hornfels with a layer of olivine. See also hornfels. A.G.I. 

beer stone. Eng. An agglutinated and sili-cous material obtained from quarries at Beer, 10 miles west of Lyme Regis, at the pass-ing of the chalk into the greensand. Fay. 

beerstone. A sedimentary rock containing connected nes-sicators in tunneling and quarrying. See also exploder. Nelson. 

beetle. a. A powerful rope-hauled propulsion unit, operated under remote control, for moving a train of wagons at the mine surface. A beetle runs on a narrow-gage track set within the main track, and moves wagons by passing with them and exerting pressure with idler rollers on arms which are extended by a forward motion of the tongs to engage the trolley treads. See also charger. Nelson. b. Eng. A small compressed-air locomotive. Fay. 

beetlestone. A nodular, dense, ironstone, so named from the resemblance of the en-closed coprolite to the body and limbs of the beetle. Beet. 

bedding stones. Flat stones on which clothes were beaten. Arkell. 

before breast. Rock or vein, which still lies ahead. Zern. 

beginners. Points (and, may be, crossings) in a roof or roadway. 

behead. In geology, to cut off and capture by erosion an upper portion of (a watercourse); see the development of a higher stream upon a weaker one. Standard, 1964. 

beheaded stream. The lower section of a stream that has lost its upper portion through stream piracy. Leet. 

beidellite. A white, reddish, or brownish-gray component of bentonite, an aluminum montmorillonite clay, Al2(Si205)OH2·12H20. Minute plates, probably orthorhombic. Previously described as purekaite. Found in Beidell, Colo., and Owhey County, Idaho. English; Dana 17; A.G.I. 

beige. A color. An oil well is said to "be in" when it is in. Shell. 

bein. An oil well is said to be "in" when it begins to produce. Heiss. 

Bel. A unit of level when the base of the logarithm is 10. Use of the bel is restricted to levels of quantities proportional to powers of 10.

Belinite. An extinct type of cephalopod known from cigar-shaped fossils. A.G.I. Staff.

Belinite marls. Calcareous clays characterized by the occurrence of plentiful belemnites, occurring in the English Chalk. See also Flints. Pet.

Belfast truss. A bowstring design of girder fabricated entirely from timber components. Ham.

Belgian kiln. A type of annular kiln patented by D. Enghiens. It is a longi-
tudinal arch kiln with grates at regular intervals in the kiln bottom; it is side-fired on the grates. Sigillaria, or the roots of trees. See also Belemnites. C.T.D.

Belgian sliez. A very hard, tough, more or less shaped to fit the curve of a coal seam. See also Belemnites. Arkell. b. A form of lead poisoning to which miners are subject. Fay. c. A gong used as a signal at mine shafts. Fay. d. An expanded part at one end of a pipe section, into which the next pipe is inserted when laying. The shaft is made of lead, rubber, or other suitable substance other than iron. Fay. e. A gong used as a signal at mine shafts. Fay. f. A gong with a bell-like flaring mouth. Fay. pearl. A bell or pear-shaped pearl. Shipley.

Belgian zinc furnace. A furnace in which zinc ore, mixed with a reducing material, is placed in retorts which consist of cylindrical pipes of refractory material closed at one end, of a length and diameter convenient for charging and cleaning them. A number of these retorts are placed slightly inclined in a properly constructed furnace. The open ends of these retorts are covered with a sheet-iron hood to which are connected short, conical, sheet-iron pipes discharging the molten zinc downward. Fay.

Belgian slite. A very hard, tough, more or less shaped to fit the curve of a coal seam. See also Belemnites. Fay.

Belgian process. A process most commonly employed in the smelting of zinc. Roasted zinc ore, mixed with a reducing material, as coal, coke, is placed in retorts which contain of phosphorus from molten pig iron in a puddling furnace, lined with a caldron bottom. Fay.

Belgian zinc furnace. A furnace in which zinc ore is reduced and distilled from calcined ores in tubular retorts. These furnaces may be classified as direct-fired and gas-fired, but there is no sharp division between these systems, which merge into one another by difficulty definable gradations. Each class of furnace may be subdivided into recuperative and non-recuperative, but heat recuperation in connection with direct firing is rare. Fay.

Bell damper. A damper of the sand-seal type, originally made from Belleek, Ireland. ASTM C242-60T.

Bell jar. Synonym for jar collar. Long.

Bell jar. See bell jar. Long.

Bell jars. Trays, used in connection with the miner's lamp, for holding the powder used in the lamp. Long.

Bell's dephosphorizing process. The removal of phosphorus from molten pig iron in a puddling furnace, lined with a sheet-iron bottom and fitted with a mechanical rabble to agitate the bath. Red-hot iron ore is added. See also Kropp's washing process. Fay.

Bell's dephosphorizing process. The removal of phosphorus from molten pig iron in a puddling furnace, lined with a sheet-iron bottom and fitted with a mechanical rabble to agitate the bath. Red-hot iron ore is added. See also Kropp's washing process. Fay.

Bell's dephosphorizing process. The removal of phosphorus from molten pig iron in a puddling furnace, lined with a sheet-iron bottom and fitted with a mechanical rabble to agitate the bath. Red-hot iron ore is added. See also Kropp's washing process. Fay.

Bell's dephosphorizing process. The removal of phosphorus from molten pig iron in a puddling furnace, lined with a sheet-iron bottom and fitted with a mechanical rabble to agitate the bath. Red-hot iron ore is added. See also Kropp's washing process. Fay.
bell tap
the upper end of lost, cylindrical, downhole drilling equipment and turned, the telescope of a bell tap cuts into and grips the outside surface of the lost equipment. Also called bell; bell screw; belt; box bell; die; die collar; die nipple. Long.
bell top. Term used to describe a good roof that has a clear ringing sound. Kentucky, p. 133.
bellwork. A system of working bell helve. Eng. A forge hammer, lifted by a bellboy in a forge and used to drive the bell. Long.
bell top. Term used to describe a good roof that has a clear ringing sound. Kentucky, p. 133.
belly helve. Eng. A forge hammer, lifted by a bellboy in a forge and used to drive the bell. Long.
belly pipe. A flaring-mouthed blast pipe in a drill tripod or derrick. Long.
belongs. A white transparent magnesium molybdate, MgMoO₄, crystallizing in a tetragonal system. Fay.
belonesite. A white, transparent magnesium nodule, Mg₂Co₄, crystallizing in the tetragonal system. Fay.
belote. A red- or club-shaped microscopic embryonic crystal in a glassy rock. Fay. Longitudinal, clavilites, and spiculites are included under this term. A.G.I.
belotite. A nodule; a globular nodule. Fay. A globule of coals or peat, consisting of a mixture of peat and dust, which lies on the surface. Fay.
belphosphate. The mineral reported by E. I. Nefedov, 1953, with the formula, Ca₃(Ca₃Mg)(AsO₄)·2H₂O. Near moselite, Nevada, 20, M.M., 1953; Spencer 17, M.M., 1946.
belonite. A white, transparent magnesium molybdate, MgMoO₄, crystallizing in the tetragonal system. Fay.
belonite. A red- or club-shaped microscopic embryonic crystal in a glassy rock. Fay. Longitudinal, clavilites, and spiculites are included under this term. A.G.I.
belrade. The difference in speed between the inner and outer drums of a belt conveyor. Fay. Bell alip. The difference in speed between the terminal drums and the intermediate drums. Fay.
the driving drum and the belt conveyor. Belt slip at the drivehead can cause heating of the driving drum. Devices are available which measure the belt slip and which cut off the power when a predetermined amount of slip takes place. See also slip.

devices. A device fitted to a belt conveyor to give an alarm or to cause the conveyor to stop if the amount of belt slip exceeds a predetermined amount. B.S. 3618, 1965, sec. 7.

device. An assembly which causes the power to be disconnected if the belt slips excessively on the drive pulley. NEMA MB1-1961.

table. A table incorporating a belt-slip device. A table designed for measuring the belt slip and which provide working space on one or both sides of the belt. ASA MAH-1-1958.

takeup. A mechanism which operates and includes a takeup pulley carrying one end of a belt loop in such a way as to provide suitable operating tension. It may also serve as a means for storing extra belt.

tensioning. A mechanism which operates on a takeup pulley carrying one end of a belt loop in such a way as to provide suitable operating tension. It is commonly known as a belt takeup. NEMA MB1-1956.

trainer. A device used for training a belt or to assist it in running in a central position. It consists of a roller, either of metal or hard wood, supported at one of the frames which likewise supports the tugging idler, or idlers. Jones.

tipper. A device or mechanism which causes the conveyor belt to pass around pulleys for the purpose of discharging material from it. ASA MAH-1-1958.

geologic classification. A name based upon the Beluga River, Alaska, and suggested by J. E. Spurr for a transition group of plagioclase rocks between his diorites and diaspars. Spurr restricts the name dionic to those plagioclase rocks (without regard to the dark silicate) whose plagioclase belongs in the andesine-oligoclase series. The diabase group, on the other hand, contains those whose plagioclase belongs in the labrador-ite-anorthite series. Belugites with a porphyritic texture and a fine-grained or aphanitic groundmass are called aleutites. Fay.

m. A salmon-colored feldspar from Denis, Me. Schaller.

. Inward toward the workings; the workman's right to enter the pit. Fay. b. The day's work of a youth, indicating the proportion of a man's task which he is able or allowed to put out, is called quarter-man, half-man, three-quarter man. Fay. c. The live or productive part of a lode. Arkell. d. A mountain peak; a word occurring chiefly in the names of many of the highest summits of the mountains of Scotland, as Ben Nevis. Fay.

b. A finely ground plastic clay prepared from a deposit in Essex, England, used as a bond in foundry sand mixtures. Osborne.

d. One of two or more divisions of a coal seam, separated by slate, etc., or simply separated by the process of cutting the coal, one bench being cut before the adjacent one. Fay. b. To cut the coal in benches. Fay. c. A terrace on the side of a river or stream formed at one time by a river which has since been abandoned. B.S. 3618, 1965, sec. 7.

d. A group of retorts in an oven or furnace; also, the complete oven or furnace containing a set or group of retorts for generating coal gas. Webster 3d. h. Eng. A ledge left in tunnel construction work, on the edge of a cutting in earth or in rock. Fay. i. Scot. A landing place. Fay. j. The horizontal step or floor along which coal, ore, stone, or overburden is worked or quarried. See also benches; opencast. Nelson. k. A stratum of coal forming a part of the seam; also, a flat place on a hillside indicating the outcrop of a coal seam. B.C.I. A tunnel excavation, where a top heading is driven, the bench is the mass of rock left, extending from about the spring line to the bottom of the tunnel. Steauffer. m. Any coal mine, a long horizontal face or ledge of ore in a stope or working place. C.D. A ledge, which in open-cut work forms a step from which excavation will take place at constant level. Austin. n. A part of the face of a large excavation which is not advanced as part of the round but as a separate operation. B.S. 3618, 1964, sec. 6.

m. A ledge, which, in open-cut mines and quarries, forms a single level of operation above which mineral or waste materials are excavated from a contiguous bank or bench face. The mineral or waste is removed in successive layers, each of which is a bench, several of which may be in operation simultaneously in different parts of, and at different elevations in an open-cut mine or quary. Compare bench, a. A level or gently marked by a characteristic mineralogy or structure. A.G.I. u. A level or gently sloped erosion plane inclined seaward. "Arc. v. A nearly horizontal zone, at about the level of maximum high water or the seaward side of a dike. H.O.G. w. See see. ASTM C-1166.

Ark. That plan of mining coal in a room which requires the blasting of the bench before any, of coal alternately, each a little beyond the other. Also called bench working. Fay.

Ark. A mining system used either underground or in open pit, whereby a thick ore or waste zone is removed by blasting a series of successive horizontal layers called benches. Bureau of Mines Staff.

a placer claim located on a bench above the present level of a stream. Hess.

b. A coal seam cut in benches or by benches. Fay.

cut. a. In vertical shaft sinking, blasting of drill holes so as to keep one end of a drill string open at the beginning (leading), thus facilitating drainage and removal of blasted rock. Pryor. b. Benches in tunnel driving are often drilled from the top downward. The vertical shotholes are generally spaced 4 feet apart in both directions, fired by electric detonators, one row at a time. When bench shot holes are drilled horizontally, with the drifter drills mounted on a bar, the charges are fired in rotation, starting from the upper center. In some cases a bench may be drilled both vertically and horizontally, particularly where the benches are exceptionally high or when the headroom above the bench is inadequate for handling drill stuffs. Fay. c. A series of horizontal levels in a mine or mine tunnel. Fay. d. The day's work of a youth, indicating the proportion of a man's task which he is able or allowed to put out, is called quarter-man, half-man, three-quarter man. Fay. e. A long horizontal face or ledge of ore in a stope or working place. C.D. a. A ledge, which in open-cut work forms a step from which excavation will take place at constant level. Austin.
bending iron. An item of surveying equipment, comprising a triangular steel plate with printed studs at the corners. These studs are driven into the ground in the desired position. The plate is used either as a temporary bench mark or as a change point in running a line of levels. Ham.

bending shot. Scot. A shot placed in a hole bored vertically downward in an open face of work. Fay.

bench mark. a. permanently fixed point of known elevation used as a reference for elevations. A primary bench mark is one chosen as a tide station to which the tide staff and tidal datum originally are referred. Hy, b. A permanent mark or a suitable character for preserving and transferring vertical elevations in a tunnel. Stuffle.

bench of timbers. A term used to describe the header when it is complete with legs. Also called a set. Kentucky, p. 140.

bench placed. A tin- or gold-bearing terrace of gravel on one or both sides of a river valley. Nelson.

bench placer. Placers in ancient stream deposits. Fay.

bench stones are made circular for those who prefer the rotary motion in sharpening chisels and similar instruments. Fay.

bench stone. A rectangular stone measuring from 4 to 8 or 9 inches long by approximately 2 inches wide and varying in thickness, with 1 inch generally rests on the artist's bench, whence its name. Some bench stones are made circular for those who prefer the rotary motion in sharpening chisels and similar instruments. Fay.

bench terrace. A more or less level step between steep riers, graded into a hillside. Nichols.

bench vise. The ordinary machinist's vise, either plain or swivel. Crispin.

bench working. The system of working one or more seams or beds of mineral by open or under pressure. Crispin.

bend. Corn. Indurated clay; applied by the Bendelari jig. A jig fitted with a flexible rubbing element by which the bending operation is performed. ASM Gloss.

bend away. See away.

bend, bending. A diaphragm which is worked by an eccentric motion, thus producing a jigging cycle (pulsion suction). Pryor, 3.

bending brake. A press brake used in bending. ASM Gloss.

bending formula. The formula used to calculate the bending of beams, made of any homogeneous material, under load, $M = \frac{t}{2} \times I$, where $M$ equals bending moment, $t$ equals stress, and $z$ equals modulus of section, from which, for a beam where $I$ is the moment of inertia of the section and $y$ is one-half its depth. Ham.

bending moment. The algebraic sum of the couples or the moments of the external forces, or both, to the left or to the right of any section on a member subjected to bending by couples or transverse forces, or both. ASM Gloss.

bending moment diagram. A diagram showing the amount of bending moment at any point along a beam, for one loading. The position and amount of the maximum bending moment is clearly revealed by this diagram. Ham.

bending moment envelope. A diagram showing the worst bending moment at any point for all possible loadings on a beam, consisting of several bending moment diagrams superimposed one upon another. Ham.

bending of strata. See folding. C.T.D.

bending rolls. Two or three rolls with an adjustment for imparting a desired curvature in sheet metal. ASM Gloss.

bending schedule. A list of steel reinforcement prepared by the designer of a reinforced concrete structure, showing the shapes and dimensions of every bar and the number of bars required. The bar bender prepares the bars in accordance with this schedule. Ham.

bending stress. The stress produced in the outer fibers of a rope by bending over a sheave or drum. Zorn.

bend radius. The inside radius of a bent section. ASM Gloss.

bend pulley. An idler pulley which is used solely for the purpose of changing the direction of motion; or, other than at the terminals of the conveyor. NEMA MBI-1961.

benda. Caisson diease, brought on by too sudden return to normal pressure after working in a pressurized shaft or tunnel. Pryor, 3.

bend shaft. A shaft which supports a bend wheel or pulley. ASA MH4-1958.

bend tangent. A tangent point where a bending arc ceases or changes. ASM Gloss.

bending test. A test for determining relative ductility of metal that is to be formed, usually shearing, bending, or, for and, for determining soundness and toughness of metal. The specimen is usually bent over a specified diameter through a specified angle for a specified number of cycles. ASM Gloss.

bend-up, bend up a bit. Eng. An order to raise the cage slowly, so that it may be instantly stopped on the order "hold" or "stop".

bend wheel. A wheel used to interrupt and change the normal path of travel of the conveying or driving medium. Most generally used to change the direction of a conveyor travel from inclined to horizontal or a similar change. ASA MH4-1964.

beneficiate. a. To improve the grade by removing unwanted constituents, and (3) improving the quality, purity, or assay grade of a desired product. Pryor, 2. b. Concentration or other preparation of ore for smelting by drying, flotation, or magnetic separation. ASM Gloss.

beneficio. a. Sp. The working of mines. Fay. b. Sp. Profit derived from working a mine. Fay. c. Sp. Metallurgical processes: B. de caliza, to the caldron or hot amalgamation process; b. de hierro, amalgamation reduction with the addition of fragments of iron; b. de colo, the colo or cold amalgamation process; b. de patio, the patio or cold amalgamation process; b. de tonelos, the Freiberg or barrel amalgamation process; b. por cianura, the cyanide process; b. por corloración, the chlorination process; and b. por fuego, reduction by smelting. Fay. d. Sp. B. de metales, mechanical preparation of ores; ore dressing. Fay.

bench press. Any small press that can be placed in a pressurized shaft or tunnel. Fay.

bench placer. A tin- or gold-bearing terrace of gravel on one or both sides of a river valley. Nelson.

bench stones are made circular for those who prefer the rotary motion in sharpening chisels and similar instruments. Fay.

bench terrace. A more or less level step between steep riers, graded into a hillside. Nichols.

bench vise. The ordinary machinist's vise, either plain or swivel. Crispin.

bench working. The system of working one or more seams or beds of mineral by open working or stripping; in stages or steps. Zorn. Also called bench-and-bench Fay.

bend. Corn. Indurated clay; applied by the miner to any hardened argillaceous substance. Fay.

bend allowance. The length of the arc of the neutral axis between the tangent points of a bend. ASM Gloss.

bend angle. The angle by which a bending operation is performed. ASM Gloss.

bend away. See away.

bend, bending. A diaphragm which is worked by an eccentric motion, thus producing a jigging cycle (pulsion suction). Pryor, 3.
a fixed elevation. ASA MH4-1.1–1938. c. In tunnel timbering, two posts and a roof timber. Nichols.

bent. Pl. Elas that has been shaped while hot into cylindrical or other curved shapes. ASTM C162-66.

bent Lac. A primary division of the sea which includes all of the ocean floor. The Benthi Division is subdivided into the Littoral Sea (the ocean floor lying in water depths ranging from the high markwater to a depth of 200 meters or the edge of the continental shelf), and the Deep-Sea System (ocean floor lying in water deeper than 200 meters). The systems are further subdivided into the Tertiary Zone (0 to 30 meters), Subtropical Zone (30 to 200 meters), Archibenthic Zone (200 to 1,000 meters), and the Abyssal Zone (1,000 meters and greater). Hy.

bentonite. All plants and animals living on the ocean bottom. A.G.I.

bentonite. A montmorillonite-type clay formed by the alteration of volcanic ash. It varies in composition and is usually high in montmorillonite and diatomaceous earth.
beryllium oxide; beryllia

Beryllium oxide is a metal oxide with the formula BeO, a compound of beryllium and oxygen. It is a white, crystalline solid that is extremely hard and is used as a ceramic packing.

The compound is known for its high thermal and electrical conductivity, making it useful in electronic and electrical applications. It is also used in the production of gemstones, such as beryl, and in the manufacturing of high-strength alloys.
beryllium oxide; beryllia
cific gravity, 3.02. Bodies high in BeO have extremely high thermal conductivity (for a range of metal ranges) and also possess high mechanical strength. Used in nuclear reactors because of its refractoriness, high thermal conductivity, and its ability to act as a moderator for fast neu-
trons, reducing them to thermal speeds. BeO is widely used for electronic components and for crucibles for melting uranium and thorium. See beryl, beryl oxide. A rare mineral, found at Stone-
ham, Maine, in decomposed granite, oc-
curring as orthorhombic crystals. Phosphate of beryllium and sodium. C.T.D.
berylmometer. An instrument, often portable, that measures the presence of beryllium in any mixture or mineral. The device con-
tains radioactive antimony, which pro-
duces a beta phase of a single beryl into a lighter isotope, releasing neutrons which are counted by a scin-
berylstone. A color filter, same as the Emer-
el glass. Shipley.
beryl whirlpool process. A quick, simple method developed by the U.S. Bu-
reau of Mines for determining the amount of beryl in a mineral sample. Pre-
ts are placed in a hot solution of sodium hydroxide; this etches the beryl grains in the sample, which then are stained an in-
tense blue with another chemical, so they can be easily counted under a microscope. Bureau of Mines Staff.
berylite. A mineral, Cu2O, consisting of copper selenide, having a silver-white color when freshly broken; specific gravity, 6.7. Basset.
berylzircon. A mineral, (Ca,Al(C03)2(OH)4)n·3H2O, but the fibers give straight extinction. From the shales at Nowa Ruda, Dolny Slask, Poland. Hey, M.M., 1964; Fleischer.
beryllite. A massive, bright, yellow, brittle, 
calcium-magnesium-manganese arsenate, 
(Ca,Mg,Mn)3AsO4·2H2O. Fay.
berusite. A soda-rich variety of quartz 
that is stable between approximately 667° 
and 775° C; it is tetragonal. Lea.
berutile. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium. Iron ore very low in phospho-
rus and thus suitable for use in the Besse-
beryllium gamma ray. A gamma ray emitted by 
beryllium into a lighter isotope, releasing 
neutrons which are counted by a scin-
tigraphy detector. LBIL.
beryllium hydride. Metallic tin in its common, massive 
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium radiation. Metallic tin in its common, massive 
beryllium target. A target at high-tempera-
ture phases of a compound, adopted by most min-
eralogists and X-ray workers, is exactly re-
crystallized at room temperature. In the lattices of beryllium hydride, the fibers give straight extinction. From the shales at Nowa Ruda, Dolny Slask, Poland. Hey, M.M., 1964; Fleischer.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beryllium oxide. A soda-rich variety of quartz 
that contains over 99.75 percent copper. 
Bennett 2d, 1962.
beta zircon

Shippel, beta.

Bethell's process. A process for creosoting betelnut. Bethel. Orthorhombic nee-

Bettendorf-Kroll process. A process for obtaining betrothed. Deprived of its trunk or main

bettunked. Deposition of its trunk or main body; said of certain river systems, whose

bettered valley. A valley that has lost its

hoodoo. A ferric lead sulfate or arsenate

bailee's-laboratory tolerance. The maximum

bevel 2d. The abbreviation for bevel-wall bit.

bevel angle. The angle formed between the

prepared edge of a member and a plane

bevel cut. Applied to any style of cutting with a very large table, joined to the

girdle by one or sometimes two bevels, and a

pavilion which may be steep cut, brilliant cut, or any style. Used mostly for

opaque gems. Also known as table cut. Shipley.

beveled end. In concrete and similar pipe,

terminal surface inclined at such an angle

with the axis of the pipe that the end of one pipe will closely fit in the alternate

der end of another. Hem.

beveled joint. In sewer or drain pipe, a joint

formed between pipes with beveled ends.

beveler. In the stonework industry, one who

bevels slabs of slate for building purposes

by beveling with a beveling edge. D.O.T. 1.

bevel flanging. Same as flaring. A.S.M. Glot.

bevel gear. a. A cone-shaped gear encircling the
drive rolls in a diamond-drill swivel head, which meshes with a matching gear attached to the drive shaft from the drill motor. By means of these gears the drill-string equipment can be made to rotate. Also called miter gear. Long. b. Any gear, the teeth of which are inclined to the shaft axis of the gear. Long. c. A gearwheel that transmits power between two shafts which meet at an angle. If at a right angle, and the wheel is of the same size, it is called a miter gear. Grispin.

beveling. The process of edge finishing flat glass to a bevel angle. ASTM C166-62.

beveminent. The replacement of an edge of a crystal by two planes equally inclined to the adjacent faces. Standard, 1964.

bevel-wall bit. A core bit having the inside

section of a gem stone. Shipley.

d. The groove made in a setting to receive the girdle and the immediately adjacent section of a gem stone. Shipley.

bezel facets. The eight facets on the crown of a round brilliant-cut gem, the upper points of which join the table and the lower points, the girdle. If the stone is a cushion-shaped brilliant, four of these bezel facets are called corner facets. Shipley.

bezel. a. All that part of a faceted gem stone lying above the girdle. Shipley. b. The sloping surface of the crown between the table and the girdle. Shipley.

c. A small part of that sloping surface just above the girdle; the so-called setting edge. Shipley.

d. The groove made in a setting to receive the girdle and the immediately adjacent section of a gem stone. Shipley.

beveling. A process for creosoting

betelnut; betechtinit. Orthorhombic nee-

A.1.1-1957.

bettenhorst Bed. A siliceous fireclay occurring under the Better Bed coal of the

BD. Following for Birmingham gauge; hoop and sheet. Handbook of Chemistry and

bina. A Malaysian unit of weight equal to

400 pounds avoirdupois. Hect.

B.H. Abbreviation for bottom-hole tempera-

Bi Chemical symbol for bismuth. Handbook

blanchite. A white hydrous double sulfate of

zinc and iron, FeZn(SO4)2.8H20. Later shown to be an isomorphous mixture of zinc and iron sulfates, (Zn,Fe)SO4.6H2O, belonging to the hexahydrate series of salts of Zn,Ni, Co and Mg. Crystalline crusts. Probably monoclinic. English.

bias. The tendency to obtain a value that is either persistently higher or persistently lower than the correct value. Alternatively, the numerical value of the difference between the true value and the average result obtained from a large number of determinations using a biased method. B.S. 1017, 1960, Pt. 1.

biased error; constant error; systematic error. Series which are always wrong in the same direction, producing cumulative distortion. Pyor, 3, p. 159.

biased results. In sampling, survey measurement, etc., systematic errors due to a fault in technique or in the instrument. Such errors are cumulative (anomyn random error). Pyor, 3, p. 159.

bismuth. The optical character of crystals belonging to the rhombic, monoclinic, and triclinic system, which exhibit double refraction, but have two sets of directions, that is, two optic axes. Anderson.

bistability. In a biaxial stress state, the ratio of the uniaxial to the larger principal stress. A.S.M. Glot.
bicarbonate. A salt of carbonic acid in which only one of its hydrogen atoms is replaced by a base; for example, bicarbonate of sodium, NaHCO₃, also called monobasic carbonic acid. Standard, 1964.

bicarbonate. A salt containing two chlorine atoms; for example, bicloride of mercury, HgCl₂. Standard, 1964.

biclitr. To make a price on anything; a proposition. Bid. A. To make a price on anything; a proposition. Bid.

bimetal. Refers to the concurrent use of both gold and silver as money at a fixed relative value, established by law. Also, the doctrine advocating such use. Standard, 1964. f.

bimetal. A strip consisting of two metals which have different coefficients of expansion, one metal forming each side of the strip. The strip will curl, with change of temperature, one way or the other by an amount which can be calculated. This device is widely employed in thermometers and relays.

bimetal. A strip consisting of one or two such metals; thus, NaCl, NaO, NaSO4, and (NH)4SO4, are all binary compounds. Webster 3d; A.G.I.

bimetal. An alloy consisting of two elements. A.G.I.

bimetal system. A system consisting of two or more metals. Webster 3d; A.G.I.

bimetal diagrams. Phase diagrams of two component systems. VV.

bimetal machine. A machine which can be quickly broken down by the bacteria used for this purpose at sewage disposal plants. Bureau of Mines Staff.

bimetallic. The concurrent use of both gold and silver as money at a fixed relative value, established by law. Also, the doctrine advocating such use. Standard, 1964. f.

binder. A. In mining, an iron piece attached to a drift. Standard, 1964. i.

binder. A. Shale or mudstone occurring in coal rests. Fay.

binder. A. To make cohesive or to give consistency to by means of a binder. Standard, 1964. a.

binder. A. A rock unit composed of one or more biotopes differing in biologic aspects from the immediately surrounding biotopes. C.S.A. Memo. 39, 1949, p. 96. b.

binder. A. A rock unit composed of one or more biotopes differing in biologic aspects from the immediately surrounding biotopes. C.S.A. Memo. 39, 1949, p. 96. b.

binder. A. In ceramic mixes to increase the wet and dry strengths of the compact. Bureau of Mines Staff.

binder. A. A place for storing ore coal, etc. Compare bing, a and e. Fay.

binder. A. The place where lead ore is buckered or broken small for the hodding tubs. Arkell.

binder. A. The best quality coal, the small of which will bind or cake. Tomkies, 1954.

binder. A. The place where lead ore is buckered or broken small for the hodding tubs. Arkell.

binder. A. A rock unit composed of one or more biotopes differing in biologic aspects from the immediately surrounding biotopes. C.S.A. Memo. 39, 1949, p. 96. b.

binder. A. In mining, an iron piece attached to a drift. Standard, 1964. f.

binder. A. A rock unit composed of one or more biotopes differing in biologic aspects from the immediately surrounding biotopes. C.S.A. Memo. 39, 1949, p. 96. b.

binder. A. The best quality coal, the small of which will bind or cake. Tomkies, 1954.

binder. A. The place where lead ore is buckered or broken small for the hodding tubs. Arkell.

binder. A. The place where lead ore is buckered or broken small for the hodding tubs. Arkell.

biological prospecting. The chemical analysis of plants as a prospecting method. measured to a large amount of solutions from a large volume of earth. Most of the mineral content from these solutions is found in the leaves. Analysis of leaves may serve as a guide to prospecting. Standard, 1964. a.

bioclast. Refers to rocks consisting of fragment organic remains. A.G.I. supp.

biodegradable. Used in sewage disposal and water pollution to describe these substances that can be quickly broken down by the bacteria used for this purpose at sewage disposal plants. Bureau of Mines Staff.

biochemical prospecting. Prospecting by means of vegetation. The rock systems of trees are actually powerful sampling mechanisms which bring representative samples of solutions from a large volume of earth. Most of the mineral content from these solutions is found in the leaves. Analysis of leaves may serve as a guide to prospecting. Standard, 1964. a.

biogeochemistry. A. Pertaining to a deposit resulting from the physiological activities of organisms. The rock thus formed is designated a bio lith. A.G.I.

biogenous deposits. Deposits having more than 30 percent material derived from biogenous sources. Standard, 1964. a.

biogeochemical anomaly. An area where the vegetation contains an abnormally high concentration of metals. Hanek, 2, p. 296.

biogeochemical prospecting. The chemical analysis of plants as a prospecting method. Hanek, 2, p. 296. b.

biophenyl. A. A petrographic shatter or shatter of a crystal that is broken by the pressure exerted on it during the cycle of the other. Strock, 10.

bimetal strip. A strip consisting of two metals. Webster 3d; A.G.I.

bimetallic. The concurrent use of both gold and silver as money at a fixed relative value, established by law. Also, the doctrine advocating such use. Standard, 1964. f.

biogeochemistry

bloberm. a. A moundlike or circumscribed mass built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, algae, etc., and enclosed in normal rock of different lithological character. A.G.I. b. An organic reef or mound built by corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

biopelmicrite. Limestone similar to biopelmicrite.

biology. The science of life; the branch of biological shield. A man of absorbing knowledge which treats of organisms; in- cluding knowledge which treats of organisms; includes fishes and pebbles. Shipley.

bioluminescence. The emission of visible light by bioluminescent algae. Messer.

biomass. A mass of absorbing material placed around a reactor or a radio-active source to reduce ionizing radiation to a level that are not hazardous to personnel. See also thermal shield. LBL.

biology. The science of life; the branch of knowledge which treats of organisms; includes fishes and pebbles. Shipley.

biomass. A mass of absorbing material placed around a reactor or a radio-active source to reduce ionizing radiation to a level that are not hazardous to personnel. See also thermal shield. LBL.

biowall. A magnesium-iron mica, K(Mg,Fe)3 (AlSiO6)(OH), widely distributed in igneous rocks. Monoclinic; perfect basal cleavage; dark brown to grey. Often used as a prefix to many names of rocks that contain it, such as biorite andesite. Fay.

bird-eye coal. Sometimes applied to anthracite coal when it has numerous and freshly broken surfaces displays round or oval eyelike forms, many of which have convex surfaces. A.G.I. See also anthracite coal sizes.

bird-eye limestone. A very fine-grained limestone containing spots or tubes of crystalline calcite. A.G.I. Supp.

bird-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye coal. A name given by prospectors and miners to a fine-grained igneous rock having small phenocrysts, particularly if they are quartz, from a fancied resemblance to bird's-eyes. Hess.

bird's-eye quartz. Jasper containing minute spherulites of usually colorless quartz.

bird's-foot delta. A delta formed by the outwash of a stream. Subsequent action by wave and storm may fail to remove all the impure material. Hess.

bird's-eye coal. A term applied by fishermen to pebbles which have slight imperfection on the best surface. Shipley.

bird's-eye slate. A quarryman's term for slate containing abundant deformed or squeezed quartz. Hess.

bird's-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye quartz. Jasper containing minute spherulites of usually colorless quartz.

bird's-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye coal. A name given by prospectors and miners to a fine-grained igneous rock having small phenocrysts, particularly if they are quartz, from a fancied resemblance to bird's-eyes. Hess.

bird's-eye quartz. Jasper containing minute spherulites of usually colorless quartz.

bird's-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye coal. A term applied by fishermen to pebbles which have slight imperfection on the best surface. Shipley.

bird's-eye slate. A quarryman's term for slate containing abundant deformed or squeezed quartz. Hess.

bird's-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye quartz. Jasper containing minute spherulites of usually colorless quartz.

bird's-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye coal. A term applied by fishermen to pebbles which have slight imperfection on the best surface. Shipley.

bird's-eye slate. A quarryman's term for slate containing abundant deformed or squeezed quartz. Hess.

bird's-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye quartz. Jasper containing minute spherulites of usually colorless quartz.

bird's-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye coal. A term applied by fishermen to pebbles which have slight imperfection on the best surface. Shipley.

bird's-eye slate. A quarryman's term for slate containing abundant deformed or squeezed quartz. Hess.

bird's-eye marble. A local name given to several varieties of marble in which the masses built exclusively or mainly by sedentary organisms, such as corals, stromatoporoids, gastropods, echinoderms, foraminifera, mollusks, and other organisms. A.G.I.

bird's-eye quartz. Jasper containing minute spherulites of usually colorless quartz.

bit core

place a portion or pilot of a noncoring or other type of bit. Compare core, x and y. Long.

bit cost. Bit-use cost generally expressed in monetary units per foot or per hundred feet of borehole drilled. For a specific diam- eter of bit, this cost per foot drilled usually is calculated in the manner shown as follows:

\[(R - S)Z + (CO + BL + ST - SC) = X,\]

where R equals diamonds in original bit, in carats; S equals resettable diamond salvaged, in carats; Z equals diamond cost per carat, in dollars; CO equals cutout charge, in dollars; BL equals cost of bit blank in dollars; ST equals setting charge in dollars; SC equals credit value of scrap diamonds in dollars; Y equals number of feet bit drilled; and X equals bit costs in dollars, per foot drilled. Long.

bit die. Synonym for bit mold. Long.

bit disc. A bit with two or more rolling discs which are used in rotary cutting. Used in rotary drilling through certain formations. Porter.

bit drag; drag bit. A bit with serrated teeth for cutting rock and for metal and wood. See also bit grinding machine that shapes and sharpens the teeth of a bit. Long. bit drilling. The cutting device at the lower end of a cable drilling tools or rotary drill pipe, the function of which is to accomplish the actual boring or cutting. A.G.I. bit end. The end of a reaming shell to which the bit is attached. Long. bit face. That part of the bit crown that comes in contact with the bottom of a borehole. It does not include that part of the bit crown that consists of the walls of the borehole. Long.

bit fed. See feed rate. Long.

bit fixed in and/or outside diameter of a set bit; also, a tool or device used to measure such diameters. Compare gage radius. Long.

bit gage. The man whose job is to gather small quantities of glass for use in decorating and inlaying glassware. Dodd. bit grinding. In metal mining, one who operates a bit grinding machine that shapes and sharpens the cutting edges of detachable drilling bits by abrasive action of grinding wheels. Also called bit sharpener operator. D.O.T.

bit handle. A tool for straightening a lost bit in the hole. Porter.

bit insert. A shaped hard-metal piece, which is inserted in a slot or hole in a bit by brazing or peening to serve as a cutting edge or abrasion-resistant point or plane. Compare insert bit. Long.

bit life. The average number of feet of borehole a bit may be expected to drill in a specific type of rock under normal operating or specified conditions. Long.

bit load. The weight or pressure applied to a bit in drilling operations as expressed as the number of pounds or tons of weight applied. Also called bit pressure; bit weight; drilling pressure; drill weight; drill pressure. Long.

bit matrix. Synonym for diamond matrix. See also matrix. Long.

bit mold. A steel, carbon, or ceramic die in which the shape of a bit crown is incised and pressed. Also called a pipe; gage. Long. bit mold. A matrix alloy by a casting or a powder metal-sintering process affixes the shank to a diamond-insert which can have a shape conforming to that incised in the die. Also called bit die; crown die; crown mold. Long.

bit performance. The achievement of a bit as gauged by the overall cost of using a specific bit per a unit measure of borehole drilled or by the total number of feet of borehole drilled per bit. Long.

bit pilot. The small cylindrical portion that is of smaller diameter and projects beyond the main body of a pilot-type noncoring bit. Long.

bit setter. Formerly an individual skilled in the art of setting diamonds in a bit blank by a hand-peeking and calling technique to produce a complete bit; currently an individual who places diamonds in pipe provided in a bit die or mold used in producing a diamond bit by mechanical method. See also core bit. Long.

bit speed. a. The number of revolutions a bit is rotated per minute. Long. b. Sometimes incorrectly used to express the number of bit revolutions required to advance the bit 1 inch, or by the total number of feet of borehole drilled. Long.

bitstone. In ceramics, carefully sized fragments of a core of a bit that is rotated in a glass grinding machine. See also core stone. Long.

bitumens. a. A general name for various solid hydrocarbons. In 1912, the term was used by the American Society for Testing Materials to include all those substances derived from bituminous coal that contain 50 per- cent hydrocarbon. Standard, 1964. b. A general term descriptive of coal or coal products. Standard, 1964. c. A coal that is rich in carbonaceous matter. Nelson.

bituminous. a. Native of mineral pitch, tar, or asphalt. The term is generally applied to any of the flammable viscous, liquid, or solid hydrocarbons, such as oil in carbon disulfide; often used interchangeably with hydrocarbons. A.G.I.

bituminous cable. A cable notable for its resistance to moisture, but not suitable for high temperatures. The wires are tinined to prevent reaction with the sulfur in the bitu- men. Outside the bitumen are layers of tape, jute, and one or two layers of steel armoring; outside each layer of steel armoring are layers of serving compound. Mason, V. 2, p. 433.

bituminous emulsion. a. A suspension of mi-
bismuth. I. A mixture of 1 part potassium bromide. An alloy of bismuth with tin. 

bismuth glance. See bismuthinithe.

bismuthinithe. Bismuth triulfuride, BiS3, commonly occurring in shapeless, lead-gray masses with a yellowish tarnish. Also called bismuth glance. C.T.D.

bismuth calomel. Bismuth occurs free, in association with gold, silver, or copper. Main sources are native bismuth and bismuthinite. Used, especially, in the glass industry, and for fusible alloys. Pryor, 3.

bismuth oxide; bismuth trioxide. a. BiO; melting point, 820° to 860° C, and is derived from the ignition of bismuth nitrate. A constituent of optical glasses, providing greater durability and higher refractive indices than corresponding lead glasses. Used as an ingredient in fluxes for fired-on conductive silver paints. The calcined material can be used to bond metallic silver flake to ceramic bodies. Lee. b. A heavy, yellow powder; orthorhombic; and specific heat, 3.7. Used in ceramic colors and in producing bismuth salts. CCD 6d, 1961.

bismuth oxychloride; pearl white. BiOCI; molecular weight, 260.46; crystals or white powder; specific gravity, 7.72; insoluble in water; soluble in acid. Also called basic bismuth chloride; bismuthyl chloride; bismuth subchloride; blanc d'Espagne. Bennett 24, 1962.

bismuth tribromide; bismuth tribromide; BiBr3; black; orthorhombic; and melting point, 706° C. Of some interest for thermoelectric applications. Lee.

bismuth subnitrate. A light-colored crystalline powder; Bi(NO3)3 · 5H2O. CCD 6d, 1961. Melting point, above 1,300° C. Used as an additive to barium tetraborate ceramic capacitor conductive bodies with an intermediate level of dielectric constants which show little variation with temperature. CCD 6d, 1961.

bismuth tribromide; bismuth trifluoride; tetrafluoride. BiF3; hexagonal rhombohedral; gray; and a thermoelectric material. Because it loses its semiconducting properties above 100° C, it is of value chiefly in copling devices. Lee.

bismuth tribromide; bismuth trifluoride; tetrafluoride. BiF3; hexagonal rhombohedral; and a thermoelectric material. Because it loses its semiconducting properties above 100° C, it is of value chiefly in coupling devices. Lee.

bismuthite. An amorphous form of bismuth carbonate, occurring as a rare natural mineral. C.T.D.

bismotostannite. A black bismuth tantslate oxide, 1 part acid potassium sulfate, and 2 parts sulfur. Also, a mixture of equal parts of potassium oxide and sulfur. Fay.

bit core. A coating of wet-process porcelain enamel that has been dried, but not fired. ASTM C286-65. b. Biscuit, biscuit ware, as in statuettes, dolls, etc.; ware baked once but not glazed. Standard, 1964. c. Ceramic ware that is fired to a temperature which is adequate to produce the necessary strength for glazing and decorating. Bureau of Mines Staff.

biscuit kiln drawer. One who removes saggers from kiln after ware has been fired and has cooled, and removes ware from saggers. When removing glazed ware from kiln, known as glost-kiln drawer. Also called kiln drawer; round-kiln drawer. D.O.T. 1.

biscuit kils. Acid sulfate, containing the monovalent radical HS04, for example, NaHSO4. Pryor, 3.

biscuit oven. The same as biscuit oven. C.T.D.

bismuth. Acid sulfate, containing monovalent radical HSO4, for example, NaHSO4. Pryor, 3.

bisselite. Acid sulfate, containing monovalent radical HSO4, for example, NaHSO4. Pryor, 3.

bit. a. Any device that may be attached to, or is, an integral part of a drill string and is used as a cutting tool to bore into or penetrate rock or other materials by utilizing power applied to the bit percussively or by rotation. Long. See also deraschable bit; drag bit. b. A pointed hammer for dressing hard stone. Webster 2d. c. The outside set diameter of the reaming bit. Lee.

bismuth telluride; bismuth trkelluride; tetra-telluride. Bi2Te4; orthorhombic; and 706° C. Of some interest for thermoelectric applications. Lee.

bismuth glance. C.T.D.

bismuth glance. See bismuthinithe.

bismuthinithe. Bismuth triulfuride, BiS3, commonly occurring in shapeless, lead-gray masses with a yellowish tarnish. Also called bismuth glance. C.T.D.

bismuth calomel. Bismuth occurs free, in association with gold, silver, or copper. Main sources are native bismuth and bismuthinite. Used, especially, in the glass industry, and for fusible alloys. Pryor, 3.

bismuth oxide; bismuth trioxide. a. BiO; melting point, 820° to 860° C, and is derived from the ignition of bismuth nitrate. A constituent of optical glasses, providing greater durability and higher refractive indices than corresponding lead glasses. Used as an ingredient in fluxes for fired-on conductive silver paints. The calcined material can be used to bond metallic silver flake to ceramic bodies. Lee. b. A heavy, yellow powder; orthorhombic; and specific heat, 3.7. Used in ceramic colors and in producing bismuth salts. CCD 6d, 1961.

bismuth oxychloride; pearl white. BiOCI; molecular weight, 260.46; crystals or white powder; specific gravity, 7.72; insoluble in water; soluble in acid. Also called basic bismuth chloride; bismuthyl chloride; bismuth subchloride; blanc d'Espagne. Bennett 24, 1962.

bismuth tribromide; bismuth tribromide; BiBr3; black; orthorhombic; and melting point, 706° C. Of some interest for thermoelectric applications. Lee.

bismuth subnitrate. A light-colored crystalline powder; Bi(NO3)3 · 5H2O. CCD 6d, 1961. Melting point, above 1,300° C. Used as an additive to barium tetraborate ceramic capacitor conductive bodies with an intermediate level of dielectric constants which show little variation with temperature. CCD 6d, 1961.

bismuth tribromide; bismuth trifluoride; tetrafluoride. BiF3; hexagonal rhombohedral; gray; and a thermoelectric material. Because it loses its semiconducting properties above 100° C, it is of value chiefly in coupling devices. Lee.

bismuth tribromide; bismuth trifluoride; tetrafluoride. BiF3; hexagonal rhombohedral; and a thermoelectric material. Because it loses its semiconducting properties above 100° C, it is of value chiefly in coupling devices. Lee.

bismuthite. An amorphous form of bismuth carbonate, occurring as a rare natural mineral. C.T.D.

bituminous emulsion

- globules of bituminous material in water or in an aqueous solution. Urquhart, Sec. 2, p. 81. B. A suspension of minute globules of bituminous material in a liquid bituminous material. Urquhart, Sec. 2, p. 81.

bituminous fermentation. A fermentation peculiar to vegetable matter placed in such situations, as not only to exclude the external air and to secure the presence of moisture, but to prevent the escape of the more volatile principles; and which terminates in the formation of those substances termed bitumens, which in this case includes peat and coal. Tomkiewicz, 1954.

bituminous grout. A mixture of bituminous material and sand finer than one-fourth inch, which, when heated, will flow into place without mechanical manipulation. ASTM 1079-54.

bituminous lignite. a. Term used in coal literature to apply to a certain kind of lignite. A.G.I. b. Lignite of a pitch black color with a conchoidal fracture. It is sometimes known as pitch coal. Nelson.

bituminous macadam. Asphalt made artificially from crushed stone and bitumen with bitumen. See also tar macadam; asphalt, b. Nelson.

bituminous marl. A bituminous material mixed with a very fine aggregate. Petroleum Age, v. 11, April 15, 1923, p. 37.

bituminous materials. Materials containing bitumen as an essential constituent. In a broad sense, the term applies to materials containing mixtures of native or pyrogenous hydrocarbons and their nonmetallic derivatives, which may be gases, liquids, viscous liquids, or solids, and which are soluble in benzol or chloroform. This definition is still a matter of controversy, but has the sanction of technical use. Hess.

bituminous pavements. A pavement composed of stone, gravel, sand, shell, or slag, or combinations thereof, and bituminous material thoroughly incorporated. Fay.

bituminous rock. Natural or rock asphalt, but the term is sometimes used to describe a rock in which the percentage of impregnation is comparatively low. See also artificial rock asphalt. Nelson.

bituminous sand. A sand naturally impregnated with bitumen or petroleum residue. Petroleum Age, v. 11, April 15, 1923, p. 37.

bituminous shale. A shale containing hydrocarbons or bituminous material; when rich in such substances, it yields oil or gas on distillation (for example, oil shale). Standard, 1964. b. Shaly sandstone or shale. C.T.D.

bituminous stabilization. The mixing of a bituminous material with soil to act either as a binder or as a waterproofing agent. The type and quantity of bituminous material depend on its reaction with the soil type and the climatic conditions. The bituminous material increases the effective fluid content of the soil and the plastic limit is particularly efficient with soils whose natural moisture content is below that needed for compaction. See also soil stabilization. Nelson.

blowout. Surface. In paving, a superficial coat of bituminous material, with or without the addition of stone or slag chips, gravel, sand, or material of similar character. Fay.

blowout. A variety of brown coal resembling wood. Fay.

black. b. Some bituminous matter of low rank found in oil shales, shales, marls, and limestones; derived from waxes, fats, and resins. Tomkiewicz, 1954.

blowout. Organic matter, soluble in organic solvents, and present in various types of little altered or unaltered sedimentary rocks, including coal, peat, etc. Tomkiewicz, 1954.

black. b. That portion of the bit between the crown and the shank of the bit. Long.

black. a. Total weight in carats, of the diamonds set in a diamond bit. Long. b. Weight or load applied to a diamond bit during drilling operation. See also bit load.

black. A yellowish-white hydrous orthosilicate of aluminum and calcium, with small amounts of chlorite, etc., 10.8SiO₂·6Al₂O₃·5½(Ca,Be,Mg)O·1·5(Al,-Na,K)O·7H₂O. Minute hexagonal plates. Pseudohexagonal prism. Mt. Bity, Malaya Republic. English.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found to the southwest of Simpson Spring, Utah. English.

black. a. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.

black. A geometry-red beryl found in the southwest of Simpson Spring, Utah. English.

black. A black oxide of iron and magnesium. Fay.

black. c. bivalent; divalent. a. Having a valence of 2. Webster 3d.

black. b. Having two valences; for example, cobalt which has values of 2 and 3. Handbook of Chemistry and Physics, 43d ed., B-107.

black. A mullusc having two shells. See also univalve. Shipley.
black chondrite

is a black chondrite, veined. Hess.

black cement. The mixture of amalagam gold and magnetic obtained; from behind the riddles in a gold sluice. C.T.D.

black core. A name given to the more or less impure metallic copper produced in blast furnaces when running on oxide ores or roasted sulfide material. It is always an alloy of copper with one or more other metals generally containing several percent of iron, often lead, and sometimes other impurities; it contains from 1 to 3 percent sulfur. Fay.

black core. The interior of a ceramic shape which is black in color, (that is, in most cases the part of the interior surface of a ceramic surface of carbonaceous material, sulfur, etc. In general, accompanied by bloating or expanding). Also called black heart. Bureau of Mines Staff.

black coreing. A condition usually resulting from the premature vitrification of a high silica iron ore. It is a mixture of a porosity or void which prevents the oxidation of carbonate material, sulfur compounds, etc., and the interior remains a reduced state; hence the black core. Bureau of Mines Staff.

black cotton. black cotton soil. In India, soil from 10 feet to 30 feet in thickness overlying the coal measures, which 'r dry weather, shrings and produces mud cracks. Fay.

black cottons. Generally applied to coal carbon dioxide. Strictly speaking, a mixture of nitrogen and carbon dioxide. The average black damp contains 20 to 75 percent of carbon dioxide and 85 to 90 percent nitrogen. It is formed by mine fires and the explosion of firedamp in mines, and hence forms a part of the afterdamp. An atmosphere depleted of oxygen rather than containing an excess of carbon dioxide. Fay. Being heavier than air it is always found in a layer along the floor of a mine. It extinguishes light and suffocates its victims. Hence, it is sometimes known as choke-damp. Kerton.

black diamond. a. A variety of crystalline carbon, appearing black in diamond, but showing no crystal form. Highly prized as an abrasive because of its hardness. Occurs only in alluvial carbonado. C.T.D. b. A term frequently applied to coal. Fay.

black Diamond Na-Cel. Permissable explo-

black earth. a. A general term including chernozem and dark plastic clays of tropics. Schieferdecker. b. A kind of coal which is pulverized and used by printers in fresco. Fay.

black edge. The dark enamel exposed at the edge of a light enamel. Fay. The enamel used to produce the black. Bryant.

black edging. A black porcelain enamel applied over the ground coat and exposed in specified areas by brushing the cover coat bisque prior to firing. See also edging. ASTM C286-65.

black Egyptian ware. See basaltic. C.T.D.

blackening. In foundry, the process of coating the faces of a mold with graphite or powdered carbon, still used in naming lead pencils, which are really made of graphite. Also called plumbago. Tomkeieff, 1954. b. Graphite, in impure crystalline form. Pryor, 3. c. Used for coating patterns and the faces of cast-iron chillings. Grupp.

blacklead ore. An early name for the black variety of cersitude. Fay.

blackleg. a. A worker hostile to trade unionism or acting in opposition to union policies; a strikebreaker. Webster 3d. b. A swindler; a professional gambler. Webster 3d.

black light. a. Used by miners and prospectors for ultraviolet light. See also fluorescence. Ballard, b. Electromagnetic radiation not visible to the human eye. The portion of the spectrum generally used in fluorescence is found in the ultraviolet region between 3,300 and 4,000 angstroms with the peak at 3,650 angstroms. ASTM Gloss.

black lignite. Lignite higher in rank than brown lignite. Defined by Grout as having a fixed carbon content ranging from 35 to 60 percent and a total carbon content of from 73.6 to 76.2 percent. A.G.I.

black liquor. a. A residue from the digesters in the manufacture of sulfate or soda pulp. Bureau of Mines Staff.

black magnetite. a. Coating of black iron ore or recovery furnaces in which evaporated black liquor is burned to a molten chemical. Bureau of Mines Staff.

black list. a. Any list of persons who are for any reason deemed objectionable by the makers or users of the list, such as for political or social misconduct, for joining in or assisting a strike, etc. Fay. b. (York.) Miners' term for impure fusain bands in the Barnsley or Mexborough, etc. Tomkeieff, 1954.

black mica. a. A colorless variety of mica. See anorthosites. Fay. b. A magnesium ore. A polishing material containing 93 percent FeO or Osborne.

black magnesite. See hausmannite. Osborne.

black men's buttons. Small pieces of rounded glass found in various parts of Australia and Tasmania; thought to be probably of meteoric origin. Hess.

black metal. See black shale, b. Tomkeieff, 1954.

black moh. Eng. Slang for workmen who refuse to join a trade union. Fay.

blackmornite; black moh. Lanc. A dark-brown powdery substance, consisting of silica, alumina, and iron; found in iron mines.

black mud. A mud formed in lagoons, sounds, or bays, in which there is poor circulation or weak tides. The color is black because of the presence of iron sulfides and organic matter. A.G.I.

black oil. See black brass as used by braziers and wire drawers. Standard, 1964.

black lava glass. See obsidian. C.M.D.

black lead. a. An old and obsolete name for graphite, still used in naming lead pencils, which are really made of graphite. Also called plumago. Tomkeieff, 1954. b. Graphite, in impure crystalline form. Pryor, 3. c. Used for coating patterns and the faces of cast-iron chillings. Grupp.

blacklead ore. An early name for the black variety of cersitude. Fay.

blackleg. a. A worker hostile to trade unionism or acting in opposition to union policies; a strikebreaker. Webster 3d. b. A swindler; a professional gambler. Webster 3d.

black light. a. Used by miners and prospectors for ultraviolet light. See also fluorescence. Ballard, b. Electromagnetic radiation not visible to the human eye. The portion of the spectrum generally used in fluorescence is found in the ultraviolet region between 3,300 and 4,000 angstroms with the peak at 3,650 angstroms. ASTM Gloss.

black lignite. Lignite higher in rank than brown lignite. Defined by Grout as having a fixed carbon content ranging from 35 to 60 percent and a total carbon content of from 73.6 to 76.2 percent. A.G.I.

black liquor. a. A residue from the digesters in the manufacture of sulfate or soda pulp. Bureau of Mines Staff.

black magnetite. a. Coating of black iron ore or recovery furnaces in which evaporated black liquor is burned to a molten chemical. Bureau of Mines Staff.

black list. a. Any list of persons who are for any reason deemed objectionable by the makers or users of the list, such as for political or social misconduct, for joining in or assisting a strike, etc. Fay. b. (York.) Miners' term for impure fusain bands in the Barnsley or Mexborough, etc. Tomkeieff, 1954.

black mica. a. A colorless variety of mica. See anorthosites. Fay. b. A magnesium ore. A polishing material containing 93 percent FeO or Osborne.

blackmornite; black moh. Lanc. A dark- brown powdery substance, consisting of silica, alumina, and iron; found in iron mines.

black mud. A mud formed in lagoons, sounds, or bays, in which there is poor circulation or weak tides. The color is black because of the presence of iron sulfides and organic matter. A.G.I.

black oil. a. A residue from petroleum or from
black oil

its distillates. It varies widely in character and is used as a cheap lubricant. Fay.

black oil shale. Oil shale in the Eastern U. S., particularly common around the bituminous coal and petroleum regions. Bureau of Mines Staff.

black opal. Incorrect name for black- colored opal or chalcedony which is usually colored artificially. Properly called black chalcedony. See also onyx. Shipley.

black opal. An opal of dark tints is so called, though it is rarely black; the fine Australian blue opal, with flame-colored glazes, is typical. C.M.D.

black oxide of cobalt. See earthy cobalt.

black oxide of manganese. See pyrolusite. Fay.

black pearl. A trade name which in the narrowest usage refers to a black or almost black pearl, or sometimes to a gray pearl; in its broadest sense, it refers to a brown or a dark blue, blue-green, or green pearl which is veiled or a pearl which shimmers. Shipley.

black pot. Eng. A variety of coarse unglazed earthenware. Fay.

black pot. Eng. A variety of coarse unglazed earthenware. Fay.

black pete. Sheet iron before tinning. Fay.

black post. Impure earthy limestone. Atwell.

black spot. A defect that appears in the black oil.

black solder. An alloy for brazing black iron, sometimes known as a leaden alloy. Fay.

black speck. A defect that appears in the black oil.

black speck. A defect that appears in the black oil.

black strap. A black heavy oil sometimes used in plate printing.

black stratigraphic section. (adjacent to the gray zone) of used silica brick from steel furnace roofs, composed largely of tridymite and magnetite. Bureau of Mines Staff.

black tellurites. Accessory sulfotelluride of gold and lead with some antimony. C.T.D.

black turpentine. A typical black section (adjacent to the gray zone) of used silica brick from steel furnace roofs, composed largely of tridymite and magnetite. Bureau of Mines Staff.

black wart. An early name for several minerals, including graphite and the softer magnetite oxides. Fay.

black work. A term wrought by blacksmiths. Fay. b. Metal products (as forgings or rolled work) that have not undergone a finish (as pickling or machining) that gives a bright finish. Webster 3d.

black-zone. A typical black section (adjacent to the gray zone) of used silica brick from steel furnace roofs, composed largely of tridymite and magnetite. Bureau of Mines Staff.

black. a. Usually, a part of an excavator which digs and pushes dirt but does not carry it. Nelson. b. The shape of a solid, defined by Zingg as one in which the ratio of breadth to length is less than 2 to 3. C.G.1. c. A shape in which the ratio of breadth to length is less than two-thirds. A.G.1. d. A shape in which the ratio of breadth to length is less than 2 to 3. C.G.1. e. A shape in which the ratio of breadth to length is less than 2 to 3. C.G.1. f. A shape in which the ratio of breadth to length is less than 2 to 3. C.G.1. g. Having the appearance of blades; mineral crystals that are strongly elongated in one direction. A.G.1.

bladed. Decidedly elongated and flattened; descriptive of some minerals. Fay.

bladed structure. Consisting predominantly of individual minerals flattened like a knife blade. Hess.

bladed mill. Trommel washer with lifting blade which acts as a conveyor and scrubbing of passing feed. Pryor, 3.

bladed mica. A Scottish name for carbonaceous shales, of a blue-gray color, associated in the Lothians with oil shales, but differing from these in having a much lower proportion of bituminous matter, in being brittle rather than tough, and in producing when weathered a crumbling mass which, when wetted, is plastic. Dodd.

bladegrate. See also bind. Also called blade; blaise. Fay. b. A soft shale or slate of black and white bands. See also kingstone.

blades. A Scottish name for carbonaceous shales, of a blue-gray color, associated in the Lothians with oil shales, but differing from these in having a much lower proportion of bituminous matter, in being brittle rather than tough, and in producing when weathered a crumbling mass which, when wetted, is plastic. Dodd.

black turf. An Irish name for the lowest layer of peat deposit which is a well-matured compact organic mass. Also called stone turf and sodium turf. Fay.

black truck. H. Aust. A box-shaped truck or car with an end door, so called because it is made black with tar. Fay.
Blaidsell loading machinery

tank center and the sand dropped on the disk is distributed over the entire tank or of the entire area. Blaisdell sand distributor. An apparatus for loading sand tanks. It consists of a rapidly revolving disk radially. The disk is hung on a shaft in the center of the tank, and as sand is dropped on the disk it is distributed over the entire area.

blay. Scot. See black. Fay.

blake breaker. A jaw breaker or particular kind of jaw crushing. Nelson.

Blake furnace. A furnace, the hearth of which consists of terraces rising from, the outer edge to the center. The hearth is circular and revolves when in operation.

blanket. a. Anhydrous ferric tellurite as red-brown microcrystalline (cubic?) crusts from Goldfield, Nev. Spencer 17, M.M., 1952. It is distributed over the entire area.

blanket of black deposit. A flat deposit of ore, the minket sand. A body of sand or sandstone where all the holes on one side are parallel to the long axis of the cross section.

blanket deposit. A flat deposit of ore, the length and breadth of which are relatively great compared with the thickness. More or less synonymous flat sheets, bedded veins, beds, or flat masses. See also blanket vein. Fay.

blanket feed. A method for charging batch designed to produce an even distribution of batch across the width of the furnace. ASTM C162-66.

blanket deposit. A flat deposit of ore, the length and breadth of which are relatively great compared with the thickness. More or less synonymous flat sheets, bedded veins, beds, or flat masses. See also blanket vein. Fay.

blanket sand. A body of sand or sandstone that covers a considerable two-dimensional area. Often called a sheet sand. A.G.I.

blanket shooting. Applied to a method of blasting on a face not exceeding 30 or 35 feet in height. It involves leaving at the quarry face a mass of shattered rock several feet in thickness that serves as a buffer, preventing the rock from being thrown far from its source, and also rendering the hole more effective. Also called buffer shooting. Fay.

blanket slack. A sluice in which coarse blankets are laid, to catch the fine but heavy particles of gold, amalgamates, etc., in, the slime passing over the blank. The blanks are removed and washed from time to time, to obtain the precious metal. Fay.

blanket strata. A strata over which gold pays. It is limited in width for the purpose of finding coarse gold and associated minerals. Nelson.

blanket vein. A horizontal vein or deposit. A sheet deposit. A vein in which the ore body covers the entire area within the limits of the surface lines of a mining location. The apex of a blanket vein is coextensive with the space between the sidelines of a mining location. See also blanket deposit. Fay.

blanket washing. In ore dressing, sizing, and refining, one who cleans flannel blankets over which a mixture of finely ground gold ore and cyanide solution from Chilean mills is passed to collect free particles of gold not dissolved by the cyanide. D.O.T. I.

blanket flange. A flange which has not been drilled for bolts. Ham.

blanket of a drawing or forming die that holds the workpiece against the drawing to control metal flow. ASM Glou.

blanket hole. A borehole in which no minerals or other substance of value were penetrating. Also called cased hole. Fay.

blanket deposit. A deposit of which first shapes the glass in the manufacture of hollowware. ASM C162-66.

blanket mold. The metal mold which first shapes the object in the nitriding operation without introducing nitrogen. This is usually accomplished by using an inert material in place of the nitriding agent or by applying a suitable protective coating to the ferrous alloy. ASM Glou.

blanket. To line a specific portion of a borehole with casing or pipe for the purpose of supporting the sidewalls or to prevent ingress of unwanted liquids or gas. Also called case; case off; seal off; Long.

blanket pipe. Unperforated pipe or casing set in a borehole. Long.

blanket trench. A trench in which no reaming diamonds or other cutting media are inset on the outside surface. Long.

blanked, pressing. Optical glass formed by pressing into the rough shape and size required in the finished article. ASTM C162-66.

blanket car. A device used for locking the cam on the camshaft in a stamp mill. A wedging action is inducted by means of a brass taper bushing. Fay.

blanked cut. This is a cut with a single V where all the holes on one side are parallel and meet the holes from the other side at an angle that may be as low as 30°. Longfett, p. 194.

blanket. The ignition of a heavy explosive charge, particularly a large one in open-cast or quarry work. See also blasting. A Nelson. b A miner's term for compressed air underground. Nelson. c. The operation of igniting both air and gas, the latter is ignited by means of explosives. Fay. d. An explosion of gas or dust in a mine. Webster 3d. e. Sadness, S. G. The operation of increasing the dis-
blast mon exposure on a bit face by removing some of the matrix metal through the abrasive action of grains of sand carried in a blast. Also, the process of crystallization during the recrystallization of rocks. It is used as a suffix in idiom and porphyroblast to indicate the process of recrystallization during the metamorphism of rocks. It is used as a suffix in idiom and porphyroblast to indicate the extent of the rocks produced by metamorphism and recrystallization. The two-syllable term blast is used in words like granoblastic and porphyroblastic to denote the extent of the rocks produced by metamorphism and recrystallization. The two-syllable prefix blasto appears in words such as blastogranitic, blastophytic, and blastoporphyritic to denote a relict structure, veiled but not obliterated. Holmes, 1920. An increase in firing temperature of a kiln immediately before ending the firing operation. Bureau of Mines Staff. The period during which a blast furnace is in blast, that is, in operation. 

blasting box. A chamber into or through which the air of a blowing engine passes. Fay. 

blasting cell. Heat transfer surface, most frequently of an extended surface arrangement, over which air is blown to be heated or cooled, depending from the temperature of the fluid within the pipe-like surface. Strock, 10. 

blasting draft. The draft produced by a blower, as by blowing in air beneath a fire or drawing out the gases from above it. A forced draft. Fay. 

blasting cap. A term applied to a miner who has been injured by an explosion of dynamite or gunpowder. Weed, 1922. B. Rent by an explosive and kiln. 2d. 

blaster. A device for detonating an explosive charge. The blaster usually consists of a main explosive, an igniting mechanism, and an electric blasting cap. Also called blasting machine. A.C.G.I. B. One who sets off blasting caps. Fay. A blast of a charge of explosive, to permit introducing a blasting cap into a hole detonating the charge. Fay. A blast hole, a. A tightly woven covering of asbestos, linen, or cotton. b. A plug. Fay. 

blasting charge. A portable unit consisting of a drilled explosive charge tank feeding into an air-activated loading tube. The equipment should be grounded to guard against buildup of static electricity and possible accidental explosive detonation. The blasting charge permits rapid loading of drilled explosives into blastholes drilled in any direction. Bureau of Mines Staff. 

blasting drill. Any rotary, percussive, fusion-piercing, churn, or other type of drilling machine used to produce holes in which an explosive charge is placed. Also called shotdrill. Long. 

blasting machine. Synonym for blasthole drill. Long. 

blasting. a. The operation of breaking coal, ore, or rock by boring a hole in it, inserting an explosive charge, and detonating or firing it. Also called blasting. See also explosive, b. Napoleon. c. Cleaning or finishing metals by impingement with abrasive particles at high velocity, and usually carried by gas or liquid, or thrown from a centrifugal wheel. ASM Gloss. 

blasting agent. A commercial blasting agent is a cap of chemical composition or mixture which contains no explosive ingredients and which can be made to detonate when initiated with a high strength explosive primer. DuPont, 1966, p. 47. 

blasting barricade. A piece of iron pipe, usually about one-half inch in diameter, used to provide a smooth passageway through the stemming for the miner's egress. It is recovered after each blast and used until destroyed. Fay. 

blasting cap. a. A copper shell closed at one end and containing a charge of detonating compound, which is ignited by electric current or the spark of a fuse. Used for detonating high explosives. Fay. b. A small sensitive charge placed in the larger explosive charge by which the larger charge is detonated. B.C. 1. See also electric detonator. 

blasting cap, waterproof electric. See water-proof electric blasting cap. 

blasting cap, waterproof electric. See water-proof electric blasting cap. 

blasting circuit. A circuit consisting of a horizontal wire or cable and electric blasting caps used in the firing of a blast in mines, quarries and tunnels. ASA C42.85: 1956. 

blasting compound. Explosive substances other than dynamite, gunpowder, blasting caps, and air-shot firing blasting cord. See also explosive, blasting cap, shot-firing blasting cord. 

blasting curtain. A screen erected to prevent damage to equipment and supports in the vicinity of the blasting point. It consists of round timbers about 6 inches in diameter and suspended from a cable or chain across the roof. The curtain is erected a short distance from the shothole. See also shot-firing curtain. Nelson. 

blasting fuse. a. A slow-burning fuse used in blasting operations. Standard, 1964. b. A fine core of gunpowder enclosed in the center of a fuse, yarn, etc., for igniting an explosive charge in a shothole. See also safety fuse. Nelson. 

blasting galvanometer. An instrument that provides a simple means for testing electric blasting circuits, enabling the blaster to locate breaks, short circuits, or faulty connections before an attempt is made to fire the shot. With its use, misfires may be prevented to a great extent. To test a circuit one wire should be placed on one terminal of the instrument and the other wire on the other terminal. If the needle is not deflected, it indicates the circuit is broken; if it is electric blasting cap that is being tested, this should be discarded. Pit and Quarry, 53rd, sec. A, p. 85. 

blasting galvanist. A high explosive, consisting of nitroglycerin and nitrocellulose. It is a strong explosive, and a rubberlike, elastic substance, unaffected by water. Fay. Taken as a standard of explosive power. BS 3618, 1964, sec. 6. 

blasting machine. A portable dynamo that generates enough electric current to detonate electric blasting caps. It drives the machine rack bar or handle, which is given a quick, downward push. Also called battery. Long. 

blasting machine, dynamo type. A.M.E. 6 75 147, 1964. 

blasting machine, electric. A high explosive, consisting of nitroglycerin and nitrocellulose. It is a strong explosive, and a rubberlike, elastic substance, unaffected by water. Fay. Taken as a standard of explosive power. BS 3618, 1964, sec. 6. 

blasting machine, v. a. A tightly woven covering of heavy fabric such as wool, hemp, or cotton, made in various sizes, for spreading over material to be blasted for preventing blasted fragments from falling on the miners as they work. A commonly used mat that consists of discarded heavy-duty tire casings cut into pieces which are then laced together with discarded wire cable. Bureau of Mines Staff. 

blasting neck. A pointed instrument for piercing the wad or tamp of a charge of explosive, to permit introducing a blasting fuse. Standard, 1964. 

blasting powder. a. A powder containing less nitrate, and in its place more charcoal than blackpowder. Its composition is 65 to 75 percent potassium nitrate, 10 to 13 percent sulfur, and 13 to 20 percent charcoal. In the United States, sodium nitrate is used largely in place of potassium nitrate. Compare blackpowder. Fay. b. A low explosive. See also gunpowder, black. Nelson. 

blasting refire. A mechanism, blasting. Lewis, p. 146. 

blasting stick. A simple form of fuse. Fay. 

blasting supplies. A term applied to electric blasting caps, ordinary blasting caps, fuse, blasting machines, galvanometers, etc., used in blasting. See blasting used in blasting, except explosives. Fay. 

blasting switch. A switch used to connect a
blasting switch

The power source to a blasting circuit. It is sometimes used to short-circuit the leading wire to the primer to ensure safety against premature firing. 

A.S.A. C42.45-1956.

blasting timer

An instrument that utilizes a powerline and an electronic control to close the circuits for successsive blasting caps with a delay time interval. The timer provides for the circuits of 15 charges to all offices positive control of the duration of intervals. Strevlerkter, pp. 46-47.

blasting tube

A tube of explosives, as nitroglycerin, for blasting. Standard, 1964.

blasting unit

A portable device including a battery or a hand-operated generator designed to supply electric energy for firing explosive charges in mines, quarries, and tunnels. Also called blaster; explode; shot-firing unit. A.S.A. C42.85: 1956.

blasting unit, single-shot

See single-shot blasting unit.

blasting unit, multiple-shot

See multiple-shot blasting unit.

blast meter

An instrument to show the velocity of discharge from the nozzle of a blasting engine. Standard, 1964.

blast nozzle

A fixed or variable sized outlet for releasing gases. A.S.A. C42.51-1956.

blasting pipe

A pipe for supplying air to furnaces. They are employed. Hartman, p. 33. They are

blasting smit, nsultiple-shot

See multiple-shot blasting smit.

Manfred med. Sand that has become pale yellow because of bleaching. Schieferdecker, v. 1, 2d, 1939, p. 204.

blasting unit

An instrument that utilizes blasting powder, nitroglycerin, or electric current to fire the explosive. A.S.A. C109.1-1958.

blasting unit, single-shot

See single-shot blasting unit.

blasting unit, multiple-shot

See multiple-shot blasting unit.

blast stoporpkyritic

blast made.

A fixed or variable sized outlet for releasing gases. A.S.A. C42.51-1956.

blast pipe. A pipe for supplying air to furnaces. They are employed. Hartman, p. 33. They are

bleeding

a. To drain off water or entrapped air from a piping system or container. Compare bleeder, a. Lang. b. To give off or exude small amounts of droplets of water or gas, such as from a stratum of rock or coal. Long. c. To remove unwanted air or fluid from a confined space. Fay.

bleeder. a. A connection located at a low place in an airline or gasoline or container so that by means of a small valve the condensed water, or other liquid, can be drained or bled off from the line or container without discharging the air or gas. Lawe, b. A fine adjustment valve (needle valve) connected to the bottom end of a hydraulic feed cylinder in order to control the speed at which the hydraulic piston travels can be minutely controlled. Long. c. A pipe on top of an iron blast furnace through which gas escapes. Bureau of Mines Staff.

bleeder bench

Widely used for draining methane in coal mines in the United States where the room-and-pillar method is employed. Huthman, p. 32. They are panel entries driven on a perimeter of a coal face and are driven to the face or in the main intake airways. They are maintained, after mining is completed, as exhaust airways. Bureau of Mines Staff.

bleeder pipe. A pipe inserted in a seal to relieve gas pressure from a sealed area. Coal. The exudation of bituminous material on the roadway surface after construction. Fay. d. The exudation of water or gas from passages. Nichol.

bleeder. a. A connection located at a low place in an airline or gasoline or container so that by means of a small valve the condensed water, or other liquid, can be drained or bled off from the line or container without discharging the air or gas. Lawe, b. A fine adjustment valve (needle valve) connected to the bottom end of a hydraulic feed cylinder in order to control the speed at which the hydraulic piston travels can be minutely controlled. Long. c. A pipe on top of an iron blast furnace through which gas escapes. Bureau of Mines Staff.

bleeder bench

Widely used for draining methane in coal mines in the United States where the room-and-pillar method is employed. Huthman, p. 32. They are panel entries driven on a perimeter of a coal face and are driven to the face or in the main intake airways. They are maintained, after mining is completed, as exhaust airways. Bureau of Mines Staff.

bleeder pipe. A pipe inserted in a seal to relieve gas pressure from a sealed area. Bureau of Mines Staff.

bleeder turbine. A steam turbine arranged so that low-pressure steam for heating purposes can be taken out between intermittent stages. Thus, the high-pressure boiler steam does some work before it is taken out for low-pressure heating service. Petroleum Age, v. 11, April 15, 1923, p. 39.

bleeding

bleeding rock. Sandstone containing water. T.I.M.E.

bleeding surface. Any face, such as the walls of a well or borehole or the sides of a fracture, that traverses a reservoir rock or aquifer permitting the stored liquid or gas to seep (or to bleed) into the opening. A.S.A. C109.1-1958.

bleeding valve. A cock, as in an airbrake mechanism, the opening of which releases air. Standard, 1964. See also bleeder. Fay.

bleeding. a. A coal, when blown, that feeds or blows act as the means by which gas is "bled off" or dissipated to the adjacent strata or to the surface. Kentucky, p. 24.

Bleiberg furnace

See Carinthian furnace. Fay.

blende. Without specific qualification, it means zincblende or the sulfide of zinc (sphalerite), which has the luster and often the color of common resin and yields a white streak and powder. The darker varieties are called blackby the English miners. Other minerals having this luster are also called blende, such as antimony blende, ruby blende, pitchblende, and hornblende. Sphalerite (blende) is often found in banded iron formations, the name of which is derived from the word blende, meaning to dazzle. Fay.

bleending and mixing, the process of intermixing powders of the same nominal composition so that each bin or stockpile can be individually controlled. Bureau of Mines Staff. See also paddle-type mixing conveyor; screw-type mixing conveyor. A.S.A. M14.1-1958.

bleending system. A coordinated system of conveyors and allied equipment for the purpose of blending bulk materials to obtain a product which will be uniform and homogeneous having physical and chemical properties very near the average of the entire raw input. A.S.A. M14.1-1958.

bleen persian. A form of pottery decoration in which a white pattern was painted or over a dark blue background; the same derives from the fact that the pattern generally had a Persian flavor. Dodd.

belle. A fault, in glacial rock, in the form of an elongated bubble intermediate in size between a seam and a blister. Gray bille contains undissolved sodium sulfide. Dodd.

blick. Ger. Bright glow or flash, on gold color or gold sheen. R.C.M. C66-62.

blin. a. Not appearing in an outcrop at the
surface, such as a blind veneer. Webster 3d.
blind. a. Forest of Dean. See after-damp. Fay.
c. The overburden is moved in front of the cutting to create a cut or other underground roadway. Fay.
d. To drill with the circulation medium (water or drill mud) escaping into the sidewalks of the borehole and not overflowing the collar of the drill hole. Long. c. An underground opening not connected with other workings nearby and at about the same level. Long.
blind space. See subcutoff. The upper edge of a lode or vein near the surface but covered by superficial deposits. Nelson.
blind borehole process. A new method in the underground gasification of coal. A borehole is drilled to a blind end having no outside connection. A tube of smaller diameter is inserted nearly the full length through which air is passed to supply a gasification reaction at the far end of the hole. The hot gases return around the outside of the tube. Nelson.
blind coal. a. Eng. A seam covered by the heat of a trap dike so as to resemble anthracite. Fay. b. Eng. Anthracite and other kinds of coal that are covered by the overburden. See also black coal; natural coke. A.G.I.
blind drift. a. Horizontal passage, in a blind deposit. A deposit that does not extend downward into a coal seam to another below. Hess. See also blind road; blind way. Mid. Any underground roadway not in use, having stoppings placed across it. Fay.
blind end. One not yet holed through to connect with other passars. Fay.
blind level. a. One not yet holed through to connect with other passars. Pryor, 3. b. A level that does not extend downward into the sand or to the surface of bedrock. Hawkes.
blind lead; blind lode. A. vein having no outcrop. Fay. b. A lead showing no surface outcrop, and one that cannot be found by any surface indication. c. Also lead. Fay. c. An obscure bedding plane. Zern.
blind lode. An obtur. A channel having no surface outcrop or indication of lode or vein reef, near the surface but covered by superfi- cial deposits. Nelson.
blind ore. A. A vein that does not continue to the surface. Also blind, a; blind lode; blind lead. Fay.
blind shaft. A sublevel shaft, connected to the surface by a transfer shaft. A wine. Pryor, 3.
blind splicing. Joining ropes or cables by laying out alternate strands of one and laying in the corresponding kinds of the other, so that the splice is smooth and of the same size as other sections. Hess.
blind stopes. Secret workings underground, not marked on plans. Pryor, 3.
blind vein. A vein that does not continue to the surface. See also blind, a; blind lode; blind lead. Fay.
blinds. Echo trace on radar or sonar indicator screen. Hy.
blister. a. A closed or broken bubble. Bureau of Mines during vitrification appearing as an enclosed or broken bubble. Bureau of Mines. b. A small blisters are called pinheads or pepper blisters. A.G.I. c. A defect in metal, etc., by rapid heating to produce a light- tering. See also secondary expansion. Staff. b. Expanding nonmetallic raw materials such as clays, shales, perlite, slates, etc., by rapid heating to produce a light- ttering. See also secondary expansion. Staff. c. Compacting soil immediately over reinforcement. Ham. e. A glaze fault revealed to provide a base on which to place rein-
siing, blocking of screen spertures by particles. Pryor, 3. b. A matting of, or stoppage by, fine materials during screening which interferes with or blinks the screen mesh. Bureau of Mines Staff. c. Compactaing soil immediately over a tile drain to reduce its tendency to move into the tile. Nicholls. d. A layer of lean mix concrete from 2 to 4 inches thick, laid on soil in the bottom of a foundation to provide a base on which to place reinforce- ment. Ham. e. A glaze fault revealed by a reduction in gloss, and caud by surface devitrification. Dodd. 
blind lead; blind lode. A. A vein having no outcrop. Fay. b. One not yet holed through to connect with other passars. Pryor, 2. b. A lead showing no surface outcrop, and one that cannot be found by any surface indication. c. Also lead. Fay. c. An obscure bedding plane. Zern.
blind lode. A. A lead showing no surface outcrop, and one that cannot be found by any surface indication. c. Also lead. Fay. c. An obscure bedding plane. Zern.
blind ore. A. A vein that does not continue to the surface. Also blind, a; blind lode; blind lead. Fay.
blind splicing. Joining ropes or cables by laying out alternate strands of one and laying in the corresponding kinds of the other, so that the splice is smooth and of the same size as other sections. Hess.
blind stopes. Secret workings underground, not marked on plans. Pryor, 3.
blind vein. A vein that does not continue to the surface. See also blind, a; blind lode; blind lead. Fay.
blister copper. An impure intermediate product in the refining of copper, produced by blowing copper matte in a converter, the name being derived from the large blisters on the cast surface that result from the liberation of SO2 and other gases. ASTM. Glow.
blister furnace. A furnace for smelting ore to blister copper. Hess.
blister hypotheses. A hypothesis proposed by J. L. Rich (1951) as an explanation of compressional mountains. Radiogenic heat expands and melts a limited portion of the crust and subcrust causing a domed regional uplift (or blister) on a foundation of molten material having no permanent strength. Erosion and isostatic transfer initiates a marginal downwarp which is gradually filled with sediments (a geosyncline). Sliding of the crust away from the center of the dome causes crumpling and thrusting of the marginal geosynclinal sediments. Repeated isostatic tension across the top of the dome and block faulting and copious emissions of lavas result. Finally, as the dome cools and congeals, sliding of the crust ceases and the upwarped area subsides. A.G.I.
blistering. a. The development during firing of enclosed or broken macroscopic vesicles or bubbles in a body in a glaze or other coating. ASTM C242-60T. b. See secondary blistering; mudcap. Fay.
blister pearl. Pearly concretion attached to the shell and therefore not true pearl. Flattened, irregular, and sometimes contains clay, water, etc., and occasionally a small bladder. Shipley.
blister rubber. One who removes blisters (air pockets) from inside of green sewer pipes by cutting them with knife. D.O.T. 1.
blister steel. Raw steel which has been cooled very slowly and which has a blistered appearance. The blisters have been formed by the efforts of gas to escape from within the metal. Cinnam.
blister wax. Same as blowax wax. Tomkeieff, 1954.
blitzrohr. Ger. A fulgurite; a mass of sand or rock, usually tubular, melted by lightning. Hess.
blitzschiene. A. Basic lead chloride, PbCl2O or PbCl(OH)2; with x about 2.6, occurring as a fissure mineral at Langban, Sweden. Hey, M.M., 1961.
blasto. A hammer swelled at the eye. Fay.
blasting. a. The expanding or swelling of a ceramic shape during firing. Results in defective ware and is generally caused by overfiring or black coring. Bureau of Mines Staff. b. Expanding nonmetallic raw materials such as clays, shales, perlite, slates, etc., by rapid heating to produce a light- weight vesicular structure. Bureau of Mines Staff. c. Swelling of a refractory when in the thermoplastic state caused by a temperature in excess of that for which the material is intended, an exception being the use of this property in one type of laminate brick. See also secondary expansion. A.R.I.
blasting of refractories. Substantial swelling produced by a heat treatment that causes the formation of a vesicular structure. ASTM C71-64.
bleating phenomena. The expansion of cer-
block diagram. A view of an imaginary rectangular block of the earth's crust. It is, as if, upon a rectangular block of wood—two geologic sections had been drawn on two adjoining sides and a map on the top face. While the block itself had been sketched in a position, such that these three faces were visible. Stokes and Varnes, 1955.

blocked ore a. Ore, the amount, content, and mineability of which have been proven by development work or by drilling developed ore. A.G.I. b. A body of ore exposed, explored, and sampled for valutative purposes and which represents a side of the panel formed by driving, winning, and raising. Pryor, 3.

blocker. In bituminous coal mining, a laborer who places wooden blocks under the wheels of mine cars to prevent their movement at the tipple or the opening of a shaft or an incline before they are run onto the cage or attached to the haulage cable.

D.O.T. 1.

block faulting. See fault block. A.G.I.

blockfield. See felsenmeer. A.G.I.

block furnace. Same as bloomery. Fay.

block grease. Moderately stiff grease, prepared in block form. It is used as a lubricant for the belts, above bearings (tunnel lubrication). Pryor, 3.

block handle. A cup handle of the type that is attached to the cup by a solid bar of clay (which is, of course, integral) with the handle. See also open handle. Dodd.

block in large course. Large stone blocks laid in courses in dock wells. Having bush-hammered faces and smooth beds; such stones are generally of varied lengths but constant depth, often 12 inches. Ham.

blocking. a. The process of shaping a gather of glass in a cavity of wood or metal. ASTM C162–66. b. The process of stirring and fusing glass by immersion of a wooden block, or other sort of bubble, in the molten mass. ASTM C162–66. c. The process of reprocessing to remove surface imperfections. ASTM C162–66. d. The process of cutting edge, or other, mass blanks in a shell for grinding and polishing operations. ASTM C162–66. e. The process of setting refractory blocks in a furnace. ASTM C162–66. g. A method of cutting edge, or other, mass blanks, not built at the same time, by means of offsets and overhanging blocks. ACSG. h. Obstruction of crushing zone by clayey material or rock which refuses to break down and pass to discharge. Pryor, 4, i. In forging, a preliminary operation performed in closed dies, usually hot, to position metal properly so that in the finish operation the dies will be filled correctly. ASTM Glott. j. In radiography, using diaphragms made of lead or other dense material to limit the cross section of the X-ray beam so as to prevent excessive fogging of the film because of secondary or scattered radiation. MAE. k. An opening or around the object being radiographed are sometimes employed. A.S.M.

blocking and wedging. A method of holding mine timber sets in place. Blocks of stone or boulders, or bolters, or small pieces of rock have been blown down by the miners. Fay. b. See machine operation.

blocking. See fault block. A.G.I.

blocking. a. A person whose duty it is to break up and reduce to safe and convenient size, by blasting or otherwise, any large blocks or pieces of rock that have been blown down by the miners. Fay. b. See machine operation.

blocking. See fault block. A.G.I.

blocking. See fault block. A.G.I.

blocking. a. A small hole drilled into a rock or boulder into which a metal bolt or a small charge or explosive may be placed. Long. b. Used by drillers, miners, and quarrymen for a method of breaking undeniably large blocks of stone or boulders by the discharge of an explosive loaded into shallow holes drilled into the blocks or boulders. Long. c. A relief hole, designed to remove part of the burden from a subsequent shot, used in coal mining. Fay.

blocking. See fault block. A.G.I.

blocking. a. A person whose duty it is to break up and reduce to safe and convenient size, by blasting or otherwise, any large blocks or pieces of rock that have been blown down by the miners. Fay. b. See machine operation.

blocking. See fault block. A.G.I.

blocking. See fault block. A.G.I.

blocking. See fault block. A.G.I.

blocking. See fault block. A.G.I.

blocking. See fault block. A.G.I.
least three sides, in preparation for continuous extraction; the opening of a deep lead deposit. Nelson. b. As applied to coal re- st ore, to acquire coal and mining rights in contiguous areas to form a continuous area and in a desirable shape for planned future mining. Bureau of Mines Staff, c. Aust. Laying or staking out gold-bearing gravel deposits in square blocks in order to facilitate systematic washing. Fay.

blocking out. Insulating black composed of mineral wool, fiber; asbestos, and a high temperature binder. Bureau of Mines Staff.

block lava. Lava flows occurring as a tumultuous assemblage of angular blocks. Contrasted with palahoehoe, a lava with a comparatively smooth orropy surface. Also called aphrolithic lava; aa. Holmes, 1928.

block layer; madman; platelayer. A man employed on the maintenance of tracks underground. He is also responsible for the laying of turnouts and junctions. Nelson.

blockmaking. Applied to the various processes involved in roofing slate manufacture which include the stripping, dressing, and splitting, cutting, sawing, etc. AIME, p. 796.

block mica. Mica with a minimum thickness of 0.007 inch and a minimum usable area of 1 square inch, fully-trimmed unless otherwise specified. Skow.

block mill. See pan mill. Dodd.

block mountain. A mountain carved by erosion from a large, uplifted earth block bounded on one side or both sides by fault scarps. AGI.

block movement. A general failure of the hanging wall. In the gold mines of the Union of South Africa and the Michigan copper domain, block movements have been experienced. Nelson.

block off. a. To fill and seal undesirable openings. Too, or caving zonis in a borehole by cementation or by lining the borehole with pipe or casing. Also called blank off; cased off; seal off. Long. b. To stop movement against the flow or escape of gas, air, or liquid by erecting rock, concrete, steel, or cloth barriers, or erecting barriers to prevent men from entering unsafe areas in underground workings. Long.

block ore. A local term in Wisconsin for large, cubical crystals of galena. Fay.

block out. To delineate the area in which a desirable mineral occurs by systematic core drilling or by underground openings. Long.

block pavement. The wearing surface of a road formed of rectangular blocks of stone or wood. Ham.

block rake. A surface blemish, having the appearance of a chain, sometimes occurring on plate glass. Dodd.

block reef (rake). A scratch imperfection caused by clogged tools, or the felt in the paving operation. ASTM C162-66.

block rilles. These consist of timber blocks, 8 to 12 inches square, set in transverse rows along the entire length of a structure and it is usual to separate the rows by means of a strip of ordinary rifle scantling. Griffith, S. V., p. 62.

Block's alloy. A high cobalt alloy containing 9.4 percent cobalt, 45 percent nickel, and 0.9 percent silicon. Campbell.

block sequence. A longitudinal welding sequence. For iron and steel, the width is not more than twice the thickness, and the cross-sectional area is usually not less than 36 square inches. Iron and steel blooms are sometimes made by forging. AIME Glass.

block test. A shop giving power output, effi- ciency, and fuel consumption of a motor. Fay.

block-tin lining. Copper vessels are lined or blocked with hot-rolled product, rectangular in shape and having the core produced tends to break and block or jam around the drill dust free. Long.

blood agate. a. Flesh-red, pink, or salmon-colored agate from Utah, Shipley, b. Hem- schie, Shipley.

blood coral. A name sometimes applied to iron-stained coral. Shipley.

blood poisoning. A morbid state of the blood caused by the introduction of poisonous or infective matter from without, or the absorption or retention of such matter pro- duced in the body itself. Occasionally caused by injuries, particularly in dirty mines or mills. Fay; Hess.

bloodstone. A variety of chalcedony or jasper, dark green in color, interspersed with small red spots. Used as a gem. Sanford. Also called heliotrope.

bloodwipes. Deb. To draw blood, at a mine, by any act of violence that one man can inflict upon another. Fay.

bloody line. A pipe or flexible tube conducting cutting-laden air or gas from the collar of a borehole to a point far enough removed from drill rig to keep the air around the drill dust free. Long.

bloom. a. A mineral that is frequently found as an efflorescence, cobalt bloom, for ex- ample. Also called blossom. Webster 3d. b. To form an efflorescence; as, salts with alkali salts are incorporated, bloom out, on the surface of the earth in dry weather following rain or irrigation. Webster 3d.

bloomery. e. The reduction of petroleum, or its products. Webster 3d. f. A semifin- ished hot-rolled product, rectangular in cross section, produced on a blooming mill. For iron and steel, the width is not more than twice the thickness, and the cross- sectional area is usually not less than 36 square inches. Iron and steel blooms are sometimes made by forging. AIME Glass.

bloodyrock. Rock ore that breaks in thick blocks from the roof of a mine working. Long.

boulevard. An area on a construction site set apart for carrying present concrete components, which are then allowed to mature and harden before use. Ham.

blocky rock. Rock ore that breaks into large blocks. Sandstrom.

blodite. See blodite.

blodite. A colorless, water-soluble, magnesi- um-sodium hydroxyurate, Na₂O·3MgO·3H₂O; no cleavage; occurs in saline deposits Also called blodite; astrakanite; achat. Fay; Webster 3d.

blomford. Shipley.

bloomer. The mill or equipment used in reducing steel ingots to blooms. AIME Glass.

blonde. A name applied to iron-stained iron, making wrought iron, usually direct from the ore. The sides are iron plates; the hair plate at the back, the boney plate at the front, the tuyere plate (through which the tuyere passes) at one side (its upper part being called the tuyere plate), the forespout plate opposite the tuyere plate (its upper part being the skew plate) and the back boney plate. For iron and steel blooms are sometimes made by forging. AIME Glass.

blooming. See blooming.

blooming mill. A device formed by a vertical or horizontal device which enables the wearer to continue breathing comfortably, even should the normal blower stop. Mclennan, s. i, pp. 326-327.

blown. A to-and-fro aerial ropeway, perhaps spanning an excavation. May be equipped with rope system which allows leads to be lifted from quarry and then carried to side for discharge, the ropeway then reversing its motion and returning the carrier to the loading point. Pryor, 3.

bloody metal. Staff. A variety of blood, light-colored clay ironstone from the Coal Measures. Arkell.

bog coal. A name sometimes applied to iron-stained coal. Shipley.

bog iron ore. Hematite. Shipley.

bogus. A name sometimes applied to iron-stained coal. Shipley.

borehole. The mill or equipment used in reducing steel ingots to blooms. AIME Glass.

borel. To draw blood, at a mine, by any act of violence that one man can inflict upon another. Fay.

borel. A mouthpiece having an inhalation valve, an exhalation valve, and a rotary blower. A mouthpiece for coating lead sheet or lining lead pipe, called hot dippings. Tin is sometimes used to absorb the impact of waves. Fay; Hess.

borelli. See iron-borelli.

boreling. The mill or equipment used in reducing steel ingots to blooms. AIME Glass.

boreno. A mill or equipment used in reducing steel ingots to blooms. AIME Glass.

boreoxide. A device formed by a vertical or horizon- tal device which enables the wearer to continue breathing comfortably, even should the normal blower stop. Mclennan, s. i, pp. 326-327.

boreostone. Staff.

borestone. A variety of chalcedony or jasper, dark green in color, interspersed with small red spots. Used as a gem. Sanford. Also called heliotrope.

borewipe. Deb. To draw blood, at a mine, by any act of violence that one man can inflict upon another. Fay.

bog iron ore. Hematite. Shipley.

bogus. A name sometimes applied to iron-stained coal. Shipley.

bog iron ore. Hematite. Shipley.

bogus. A name sometimes applied to iron-stained coal. Shipley.

borel. A mouthpiece having an inhalation valve, an exhalation valve, and a rotary blower. A mouthpiece for coating lead sheet or lining lead pipe, called hot dippings. Tin is sometimes used to absorb the impact of waves. Fay; Hess.

borelli. See iron-borelli.

boreling. The mill or equipment used in reducing steel ingots to blooms. AIME Glass.

blowing. The process of manufacturing blooms of iron from the ore or from puddle balls. Standard, 1964.

blossom of coal. See coal smut. Fay.

bloom. 1. The natural rolling mill used to make blooms. ASM Gloss.

blossom. The oxidized or decomposed outcrop of a vein or coal bed, or any indicating traces of a coal bed or a mineral deposit, visible at the surface. Fay. B.C.I.

blossom of coal. See coal smut. Fay.

bloomer. Rock detached from a vein but which has not been transported. Fay.

bloated. Spotted effects, especially on stone and other marble. Kuba, Curtis, 4th. p. 301.

blower. a. A fan employed in foreign air. Mason.

c. Eng. A man who blasts or fires shots down a mine. Zern.

blower fan. a. A fan which compres a stream of air through a tubing to a particular working face. Bureau of Mines Staff.

blower system. A system in which the pressure generating source is located at the entrance and raises the pressure of the air about atmospheric. Hartman, p. 80.

blower wax. A pale yellow soft variety of ozokerite which is squeezed out of the veins under the influence of pressure of the surrounding rocks. Tomkiewicz, 1954.

Blow-George. Eng. A small hand-driven fan operating in an iron case, introduced in the Midlands Counties about 1850. It was used for auxiliary ventilation. Nelson.

blow head. Part of a forming machine serving to introduce air under pressure to blow any hollow glass article. ASTM C162-66.

blow hole. a. An air bubble or void in a bit crown or casing. See also airhole. Long. b. A minute crater formed on the surface of thick lava flows. Fay. c. A hole in a casting or a well caused by gas entrapped during solidification. ASM Gloss.

blow in. To put a blast furnace in operation. See also blowing.

blowing cavity. A cave from which air is blown out at the entrance. Scharereder, Fay.

blowing engine. A machine for forcing air into blast furnaces under pressure, often about 1 pound avoiduoop per square inch. Hear. D. C. T. D. B. Fay.

blowing fan. A fan which forces or blows air into the mine workings either through the airways (a main fan) or through inbye air pipes (an auxiliary fan). Nelson.

blowing furnace. A furnace in which glassware is heated so that it becomes stiff in working. Also called glory hole. Webster 2d.

blowing house. Eng. An establishment in which blast furnaces are operated. Used specifically for smelting tin ore. Fay.

blowing in. To start a blast furnace. Bureau of Mines Staff.

blowing out. a. A valve or drain connection on which the water flows from Lie fan at the portal towards the working face. Frankel, 3, Art. 18:01, p. 1.

blind blast. A port is made in the stem and cinder, for carrying the air. Fay. c. A sudden explosion of uncontrolled explosion due to insufficient stemming, and cinder. Fay.

blow mold. The metal mold in which a blown glass article is finally condensed. ASTM C162-66.

blown. a. A large outcrop beneath which the air flows from Lie fan at the portal towards the working face. Frankel, 3, Art. 18:01, p. 1.

blown glass. Glassware shaped by air pressure, as by mouth blowing or by compressed air. ASTM C162-66.

blown metal. Pig iron purified by blowing air through it. Bureau of Mines Staff.

blown-out shot. A shot which dissipates the explosive force by blowing out the stemming instead of breaking down the coal. It may be caused by insufficient stemming, overcharging with explosive or a burden which is too much for the charge to dislodge. Nelson.

blown Petroleum. In roadbuilding, the semi-solids or solids produced by blowing air through heated native liquid bitumens. Ferri.

blow-off. a. A valve or drain in which the rocks beneath it becomes so hot that it is finally squeezed out of the rocks. Fay. b. The sudden escape of gas from the strata or the coal into mine workings. See also outburst, nelson. c. Eng. Man who blasts or fires shots into a mine, or who drills the holes and charges them, ready for firing. Fay. d. One who forms glass by blowing. ASTM C162-66. See also glassblowing; gaffer, D.O.T.

blowing pipe. A glassblower's pipe. Fay.

blowing of furnace. A furnace used for firing ore or for the voltaic lead and zinc. Fay.

blowing ventilation. Mine ventilation in which the air flows from Lie fan at the portal towards the working face. Frankel, 3, Art. 18:01, p. 1.

blowpipe. A portable apparatus for applying intense local heat, used by painters, electricians, and plumbers. Also called blowtorch. C.T. D.

blow molding. The metal mold in which a blown glass article is finally shaped. ASTM C162-66.

blown asphalt. A hard friable solid obtained by blowing air at high temperature through natural or residual oils. Also known as distilled asphalt, condensed asphalt, and mineral rubber. C.C.D, 66, 1961.

blown away. Sey holes blown. Dodd.

blown bitumen. A special type of bitumen produced by blowing air, under controlled conditions, through hot bitumen. Ham.

blown glass. A glassware shaped by air pressure, as by mouth blowing or by compressed air. ASTM C162-66.

blown metal. Pig iron purified by blowing air through it. Bureau of Mines Staff.

blown-out shot. A shot which dissipates the explosive force by blowing out the stemming instead of breaking down the coal. It may be caused by insufficient stemming, overcharging with explosive or a burden which is too much for the charge to dislodge. Nelson.

blown petroleum. In roadbuilding, the semi-solids or solids produced by blowing air through heated native liquid bitumens. Ferri.

blow off. a. A valve or drain connection on a steam or hot-water boiler so arranged to drain off water and steam with any accumulated oil, grease, and dirt. Crispin. b. Removal of dust and dirt from the surface of dry (biscue) enamel, prior to firing. Bryant.

blowout. a. A large outcrop beneath which the air is smaller is called a blowout. Fay. b. A shot or blast is said to blowout when it goes off like a gun and does not shatter the rock. A blow-out or windy shot. Fay. c. A sudden violent, uncontrolled escape of gas, oil, or water from the well due to (1) the formation pressure being greater than the hydrostatic head of the fluid in the hole, and (2) the failure or lack of mechanical means, such as blowout preventers, to control such an occurrence. Brantly, 1, d. A great mass of quarts found in gold quartz veins that may show as a yellow or orange rock. Perhaps a trap or porphyry, or some similar development may reveal a vein only a few feet wide. How, p. 101, c. The high points of cementitious rock, and uncontrolled ejection of water, gas, or oil from a borehole. Long. 1. Used by prospectors
blowout and miners for any surface exposure of strongly altered discolored rock associated, or thought to be associated, with a mineral deposit. Blowing equipment is used in the application of the rotary method, an unexpected volume of gas under pressure sometimes "blows" the mud-laden drilling fluid from the hole, thus putting an end to drilling until controlled. The term is also used in standard tool drilling when the flow of gas is sufficient to interfere with the drilling operation. A.G.I. b. Used by miners and prospectors for a large, more or less isolated, usually barren quartz outcrop. Known in Australia as blow. Hess. i. A basin, scooped out of soft, unconsolidated deposits by the process of deflation. It ranges from a few feet to several miles in diameter. Lest. j. The cleaning of boiler flues by a blast of steam. Fay. The rupture of a boiler tube, steampipe, pneumatic tire, or other container through faulty construction, excessive pressure, or other cause. Fay. l. To put a blast furnace out of blast, by ceasing to charge fresh materials, and continuing the blast until the contents of the furnace have been smelted. Fay. m. To smelt the iron-bearing materials in the furnace, adding domestic coke so that the products charged about normal. Camp. 6th ed., 1931, p. 336. blowout plug. A sub (adapter) by means of which the upper end of an inner tube of a double-tube core barrel can be coupled to the fluid-circulation system of a drill. Long. blowout preventer. A rotary or stationary device attached to drivepipe or casing at the collar of a borehole, consisting of an assemblage of bypass and gate or disk valves which may be closed around the drill rods, or which can be closed completely if the drill rods are withdrawn from the borehole. Used to contain and control the flow of liquids or gases under high pressure encountered while drilling a borehole. Long. blowout shot. An improperly placed or overcharged load of black blasting powder in coal (where used) which frequently results in a mine explosion. von Bennewitz. blowover, blow. The sudden, high head-on damage done above a blow-out in a hand shop operation to facilitate bursting off. ASTM C162-66. blowout, a. Welding or cutting torch. A.S.M. Gloss. b. A small laboratory apparatus using a mixture of air under pressure and utility gas in order to give a hot localized flame. Used in the blowpipe analysis of minerals and in laboratory glass-blowing and glass bending. C.T.D. See also blowpipe reaction. c. A metal tube, some 4 to 5 feet long, with a bore of 1/4 to 3/4 inch and a thickened nose which is dipped into molten glass and withdrawn from the furnace. The glass is subsequently manipulated on the end of the blowpipe and blowout to shape. Also called blowing iron. C.T.D. blowpipe furnace. A furnace fired by having a blowpipe blown through a pipe. Hess. blowpipe reaction. a. The decomposition of a compound or mineral when heated by the use of a blowpipe in some characteristic reaction, as a coloring of the flame or a colored crust on a piece of charcoal. See also blowpipe. b. A method of analysis in mineralogy, Fay. blowpipe spray welding. See spray welding. blowpipe tubing. A rapid method for the determin-
blue malachite. Same as azurite. Standard.

blue marl. Lower Lias clays. Arkell.

blue material. A name commonly applied to the common fine-grained, bluish-gray mudstone which forms the roots of many of the exposures in England. A.G.I. b. A copper matte containing approximately 60 percent copper. See also bind; bluestone. Fay. c. See blue powder.

blue moonstone. A bluish chalcedony. Shipley. b. A term frequently applied to fine quality previous moonstone of bluish tinge; also incorrectly applied to chalcedony artificially colored blue. Shipley.

blue mud. a. An ocean-bottom deposit containing up to 75 percent terrigenous materials of dimensions below 0.003 millimeter. The depth range occurrence is about 750 to 16,000 feet. Colors range from reddish to brownish at the surface, but beneath the surface, the colors of the wet muds are gray to blue. A.G.I. d. A common variety of deep-sea mud having a bluish-gray color due to presence of organic matter and finely divided iron sulfides. Calcium carbonate is present in amounts up to 35 percent. A.G.I.

blue needles. Applied in the grading of quartz crystals to needlelike imperfections, often due to presence of organic matter and finely divided iron sulfides. Calcium carbonate is present in amounts up to 35 percent. A.G.I.

blue onyx. Incorrect name for single-colored zephyrite. Fay. b. Also called blue agate or blue jade. See also bind. Fay. c. Same as copper vitriol; copper sulfate. Fay. c. Also called Amherst stone because it is quarried near Amherst, A.G.I. d. A dense, hard, indurated, fine-grained feldspathic sandstone, most of which splits easily into thin, smooth, bluish-gray sheets. A term is applied to all slate-gray, but the term is applied to all varieties irrespective of color. A.S.T.M. C-465. See also bind, b. See above. SMTR. Paper No. 61. f. Synonym for chalcanthite. Hey 24, 1955.

blue take. Synonym for cyanite. Fay.

blue tops. Grade stage whose tops indicate finish grade level. Nicholas.

blue vitreous wollastonite or chalcanthite. Also called copper vitriol. Fay.

blue water gas. Obtained by passing steam over red-hot coke, in a cycle process comprising two main stages: (1) gasmaking, which reduces the temperature of the coke; and (2) blowing with air, which raises the temperature of the coke. It is called blue water gas because of its blue flame, a characteristic of the combustion of carbon dioxide. Francis, 1965, v. 2, pp. 386-387.

blue whistler. Ark. A local term for a very hard, dark-gray siderite rock, so tough that when stray pieces reach the rolls of the bauhite-chalcopyrite mill, it is reduced to powder. Fay. d. Synonym for chalcanthite. C.T.D.

blue whinstone. A term frequently applied to fine quality previous moonstone of bluish tinge; also incorrectly applied to chalcedony artificially colored blue. Shipley.

blue pebble. Synonym for lazulite. Fay.

blue peach. Corn. A slate-blue, very fine-grained tourmaline. Fay.

blue needles. Applied in the grading of quartz crystals to needlelike imperfections, often due to presence of organic matter and finely divided iron sulfides. Calcium carbonate is present in amounts up to 35 percent. A.G.I.

blue rock. Lapis lazuli from California.
**Bohemia** gem stones. Includes the following: garnet, jadeite, pyrope, astrophyllite, pyrite, quartz (gem-cut), and yellow quartz (gem cut). Pryor, 3.

Bohemian ruby. A jeweler's name for rose quartz when cut as a gem. Fay.

Bohey boiler. The net magetic moment arising from the dipole moment of the atom. Toms, 1924, p. 453.

Bohemia's clerystone. Moldasite. Shipley.

Bogwood. A spongy variety of hydrated oxide bog ore. Bohey boiler. An engine having its cylinders and driving wheels on a pivoted truck bogie engine. An engine having its cylinders and driving wheels on a pivoted truck.

Bogie; bogi, bog. A rail truck or trolley of low height, used for conveying timber or machine parts underground, or for conveying the dirt hoppit from a smoking pit to the dirt heap. It may also be used as a wagon spotter. Nelson, b. York. A small truck or trolley upon which a bucket is carried from the shaft to the spoil bank. Fay. c. A weighted truck run fore and aft or next to the rope in a train or trip. Fay. d. A two-axle driving unit in a truck. Also called tandem driving unit; tandem. Nickels.

Bogie engine. An engine having its cylinders and driving wheels on a pivoted truck.

Bogie kiln; truck chamber kiln. An intermittent kiln of the box kiln type distinguished by the fact that the ware to be fired is set down in a house. Each is then pushed into the kiln; the bogie has a deck made of refractory material. See also box kiln; shuttle kiln.

Bog iron ore. Loose, porous form of limonite occurring in wet ground, often mixed with vegetable matter, Fe₃O₄·nH₂O. Fay. b. A deposit of hydrated iron oxides found in swamps and peat mosses. Schiefer. c. A deposit of iron oxides in a peat bog. Prayor, 3. b. A deposit of hydrated iron oxides found in wet ground and used in Portland cement manufacture. It is often erroneously called marl, a term which properly belongs to a calcareous clay. Fay. b. See lake marl. Nelson.

Bogey, a. A notions in the Carnarvon name for peat. Tompkev, 12.7

Bog oak. Oak immersed in peat bogs, semifossilized and blackened to resemble ebony by water distilling with the tannin of the oak. C. M. D.

Bog ore. A spongy variety of hydrated mode of iron and limonite. Found in layers and fossilized and blackened to resemble ebony. Medical: John; 3. b. A deposit of hydrated iron oxides found in swamps and peat mosses. Schiefer.

Bogus. a. A white powder, calcareous deposit, precipitated through plant action on the bottom of many ponds and used in Portland cement manufacture. It is often erroneously called marl, a term which properly belongs to a calcareous clay. Fay. b. See lake marl. Nelson.

Bogus-carbonate. Chryssocolla; carrying carbon dioxide as an impurity; from the Bogo- selski mine, Perm, Russia. Weed, 1918.

Boguel. Same as zemora. A.G.I.

Bogumil. A grayish, fine, granular to porphyritic intrusive rock containing plagioclase, augite, more or less hornblende, a little biotite; interstitial and skeletal. Jahnke. c. 4, 1938, pp. 220-222.

Bogwood. Eng. The trunks and larger branches of trees dug up from peat bogs. See also bog oak.

Bohemia's diamond. Rock crystal. Shipley.

Bohemia's garnet. Yellowish-red variety of the garnet pyrope. Occurs in large numbers in the Mittelgebirge, in Bohemia, Czechoslovakia. C.T.D.

Bohemia's gem stones. Includes the following: garnet, jadeite, pyrope, astrophyllite, pyrite, quartz (gem-cut), and yellow quartz (gem cut). Pryor, 3.

Bohemian ruby. A jeweler's name for rose quartz when cut as a gem. Fay.

Bohey boiler. The net magnetic moment arising from the dipole moment of the atom. Toms, 1924, p. 453.
boke. a. Derb. A small stringer of ore which soon dwindles out. Fay. b. Derb. A break or division between the outcrops of two rocks.

d. bold coast. A prominent land mass that rises steeply from the sea. H.G.

Bolderberg beds. Belg. The sands and gravels of the Bolderberg Hill, representative of the middle or Eocene Tertiaries, and often referred to by geologists. Fay.

boli. a. Any of several varieties of friable earthy clay usually colored red by iron oxide and consisting essentially of hydrous silicates of aluminum and less often of magnesia. Webster 3d. b. Claylike minerals used in medicine; some have been identified as halloysite. Holmes, 1928. c. A bright red, water-stained, decomposed product of basaltic rocks, having the variable composition of lateritic clays. Holmes, 1928. d. Any cylindrically shaped object or mass. Webster 3d.

bolomagnetometer. Lindblad-Malmqvist gravity meter, for measuring variations in gravity; used in prospecting for ore deposits. Fay.

bollard. A cast-iron post anchored securely into the masonry or concrete of a guay wall as a mooring for vessel, or bolted into a curb as a protection against traffic. Ham.

Boley's gold purple. A color that has been used on porcelain. A solution of stannic ammonium chloride is left for some days in contact with granulated tin and is then treated with dilute gold chloride solution. The gold purple is precipitated. Dodd.

bolitto. It. The frit or calcined ingredients from which glass is made. Standard, 1964. A unit of measure.

Bologna stone; Bolognian stone. The mineral Bologna spar. See Bologna stone.

bolster. A plate to which dies may be fastened, the work being secured to the top surface of a press bed. In mechanical forging, such a plate is also attached to the ram. ASM Gloss.

bolter. A nearly horizontal cylinder or prismatic frame, usually rotating, covered with silk or other fabric with very regular meshes, for sitting and separating flour of which the shaft has been covered by extending the fabric over the whole length of the machine. Usually different sections of its length are covered with gradually decreasing sizes of mesh. Standard, 1964. b. To tilt or separate by passing through a bolster. Standard, 1964. c. In glassblowing, a cylindrical mass, as a bolt of melted glass. Standard, 1964. d. S. Staff. A short narrow heading connecting two objects. Also called boltbole. Fay. e. A mild steel rod, used in roof bolting. See also slot-and-wedge bolt; wedge-and-sleeve bolt. Nelson.

bolted cable coupler. Two cable coupling parts, with connecting pins, bolted together to form a straight through connecting box. B.S. 3618, 1965, sec. 7.

bolted cable plug and socket. A plug and socket designed to be held together by one or more bolts or screws, or studs and nuts, in such a way that they cannot be disengaged without the use of a tool. B.S. 3618, 1965, sec. 7.

bolthole. S. Staff. A short narrow opening if , through a pipe at the top of the chamber removed and hauled away in metal containers for disposal. Bureau of Mines Staff.

bomber. 4. Large rounded mass of lava from a few inches to several feet in diameter, generally vesicular, at least inside, through which escaping gas and ash are forcing an explosive eruption. Fay. b. An elipsoïdal, discordal, or irregularly rounded mass of lava ejected at a high temperature during a volcanic eruption. Bombs range upwards in size from the largest lapilli. They are characterized by a well-defined crust and are often cellular or even hollow internally. Holmes, 1928. e. The combustion chamber of a bomb calorimeter. Webster 3d. d. A missile containing an explosive, as dynamite. Fay. e. A heavy-walled reaction vessel or autoclave. Used to carry out reactions at high pressure and high temperature. Hurbut.

bomb calibrometer. A long steel vessel used for determining the heat produced during combustion, for example, for determining the calorific value of fuels. Standard, 1964. d. S. Staff. A short narrow heading connecting two objects. Also called boltbole. Fay. e. A mild steel rod, used in roof bolting. See also slot-and-wedge bolt; wedge-and-sleeve bolt. Nelson.

bomb calorimeter. A strong steel vessel used to determine the heat produced during combustion, for example, for determining the calorific value of fuels. Standard, 1964. d. A transparent, colorless mineral, found in lignite in Tuscany, Italy; it fuses at 75°C, volatilizes at a higher temperature. Ben. Also known as bomb.

bonamite. A jeweler's trade name for an apple-green smithsonite, resembling chrysoprase in color, from Kelly, New Mexico. Shipley.

bonanza. a. In miners' phrase, good luck, or a body of rich ore. A mine is in bonanza when it is profitably producing ore. Fay. b. Part of a precious mineral deposit that is especially rich. Baturin.

bond. a. The cohesion or adhesion that develops between particles of ceramic materials in the unfired or fired state. Bureau of Mines Staff, 1965, sec. 7. The bond is the junction of the various parts of a masonry wall by lapping one unit over another; the pattern formed by the exposed faces of the unit. The adhesion of the mortar to the units is also referred to as the bond. ACG. d. See adhesion. ASTM C286-62. e. In grinding wheels and other relatively rigid abrasive products, the material that holds the abrasive grains together. ASTM Gloss. f. In welding, the junction of joined parts. Where two atoms due to an electron pair resonating or rotating between them. If each atom contributes an electron the bond is atomic, and also homopolar (nonpolar). If held unequally, it is heteropolar (polara), for example, H:O. If only one of the two electrons, the bond is molecular. In a coordinate bond each of two atoms contributes one electron to form a coordinate bond, or to a shared pair (covalent). In a dative bond, one atom supplies both electrons of bonding pair (also called a
bond

The term bond is used in various contexts, including in chemistry, engineering, and geology. For example, in chemistry, it refers to the attraction between atoms in molecules or ions that holds them together. In engineering, it is often used in the context of bonding materials like concrete, metals, and ceramics. In geology, it can refer to the connection between layers of rock or the bonds that form minerals. This page seems to cover multiple topics related to bonds, such as bond strength, bonding systems, and bond failure, but it is not entirely clear due to the fragmented nature of the text. It appears to be a compilation of various definitions and explanations, possibly from different sources. Without additional context, it's challenging to provide a coherent summary.
boninite. Mex. First-class silver ore, that is, bonnet. A. A covering over a mine cage which acts as a roof to shield it from objects falling down the shaft, thereby protecting the riders. Also called cage cover. Fay. B.C.I. b. A gasket for firetight timber. Zinn. c. See bell mold. Fay. Scot. Gas coal or shale overlying and working along with a coal seam. E. Scot. A portion of a coal seam left for a roof. Fay. d. The metal casing of a miner's flame safety lamp, with openings at the top and a hook for carrying the lamp. The bonnet protects the inner gauze from damage and from the impact of high-velocity air. See also safety lamp. Nelson. g. Synonym for air dome. Long. h. The access cover for the steam chest of a pumping boiler. Also called pressure dome. Long. j. A cover used to guide and inclose the tail end of a valve spindle. Strock. k. A cap over the borehole arranged as one would read a book, also bottle oven. Dodd.

bonnet hip. See hip tile. Dodd.

bonney. Corn. An isolated body of ore. See also bonnet roller.

bontle. Mid. A hoisting stage full of men. See also bottle oven.

bonnie; bonney; bunny. Corn. A mass of clay in order to increase strength, or the steam chest on a steam engine. Long. g. Synonym for air dome. Long. h. The gate in a dam that holds the water until it is released. See also gate in a dam; flop gate. Hess. b. A device, usually a pole resting on a fulcrum, used to tighten a chain or line about a loaded truck or wagon to hold the load in place. Hess.

boomer. a. An explosive of special character mainly used in booming. Fay. b. A slight channel cut into which is let a sudden heap of water (in placer mining, where water is scarce). In California, the contrivances for collecting and dumping water are termed "self-shooters," an idea suggested by the sudden and violent manner in which the water makes its return to the surface for retrieval. It is designed for nighttime recovery. HBG.

booming. The accumulation and sudden discharge of a quantity of water (in placer mining, where water is scarce). In California, the contrivances for collecting and dumping water are termed "self-shooters," an idea suggested by the sudden and violent manner in which the water makes its return to the surface for retrieval. It is designed for nighttime recovery. HBG.

boomerang sediment corer. This (free-instrument type) device can be dropped over the side of a moving ship where it will sink rapidly to the ocean floor, take a core of sediment, release itself, and automatically return to the surface for retrieval. It is designed for nighttime recovery. HBG.

booster. a. An explosive of special character used in booming. Fay. b. A straight channel cut down a declivity into which is let a sudden heap of water. Hess. c. A pump or compressor inserted to pump water in place. Hess. b. A pump or compressor inserted in the column near the outbye end to increase the pressure. Nelson. c. Any device used to tighten a chain or line about a loaded truck or wagon to hold the load in place. Long. e. A new sonar transducer, expected to be especially helpful in the exploration of bottom substrata. Hy.

boom cutter. See boom operator.

boom drifter. a. The device used in booming. Fay. b. A slight channel cut down a declivity into which is let a sudden heap of water. Hess.

boom machine. a. In placer mining, an automatic gate in a dam that holds the water until the reservoir is filled, then opens automatically and allows the escape of such a volume of water that the soil and upper gravel of the placer are washed away. When the reservoir is emptied the gate closes and the operation is repeated. On a smaller scale it may be used merely to furnish water periodically in small quantities. Also called automatic dam; flop gate. Hess. b. A device, usually a pole resting on a fulcrum, used to tighten a chain or line about a loaded truck or wagon to hold the load in place, while being hauled over rough roads. Hess. c. Originally, an oilfield worker who migrates from one boom drifter to another; now, commonly, a member of a drill crew who works on one job a short time, quits, and moves on to another locality to seek employment. Also called drifter. Long. d. A combination ratchet and lever device used to tighten a chain or line about a loaded truck or wagon to hold the load in place. Long. e. A new sonar transducer, expected to be especially helpful in the exploration of bottom substrata. Hy.

boom ram. See boom operator.

book. a. See book form. b. See book value. c. The sum at which the total assets of a company stand in the books, less the sum of the external liabilities. Truex.

book form. book-packed splittings. Splittings arranged and supplied in the form of individual bunches, each book containing consecutive splittings obtained from the same piece of block mica or thins. Book form splittings are generally dusted with mica powder to offset residual cohesive forces. Strock.

book mica. Crystals of crude mica obtained from the mine in various shapes and sizes. Also called books. Strock.

book value. The sum of the external assets of a company stand in the books, less the sum of the external liabilities. Truex.

bookee. See book form. b. See book value. c. The sum at which the total assets of a company stand in the books, less the sum of the external liabilities. Truex.

book form. book-packed splittings. Splittings arranged and supplied in the form of individual bunches, each book containing consecutive splittings obtained from the same piece of block mica or thins. Book form splittings are generally dusted with mica powder to offset residual cohesive forces. Strock.

book mica. Crystals of crude mica obtained from the mine in various shapes and sizes. Also called books. Strock.
booster
y substance to augment or improve performance, volume, or force. See also booster fan.

booster conveyor. Any type of powered conveyor used to regain elevation lost in gravity rolling. A slope conveyor. AMR 1956.

booster fan. A fan installed underground to improve or augment the ventilation in a district. A booster fan is installed when other means of improving the ventilation would be very costly, or too slow or perhaps ineffective. A ventilation survey is a legal obligation in Great Britain before installing a booster fan. See also fan.

booster pump. A. A pump used to increase the pressure of fluids, such as to increase the pressure of water delivered to a drill. ASTM C162-66. B. A pump that operates in the discharge line of another pump, either to increase pressure, or to restore pressure lost by friction in the line or by lift. Nichols.

boosters. Those people who, as local property owners, have a stake in the prosperity of their town. Legends grow rapidly on mining properties.

boothite. A blue, lighter than chalcanthite, monoclinic crystal occurring in hard glassy crystals, and soft white masses. It is strongly pyroelectric. Found in beds of gypsum and anhydrite at Stassfurt, Germany. C.T.D.; Dana 17; A.G.I.; Fay.

boor. A sandwich of boron carbide crystals in aluminum, with a layer of cellophane pure aluminum. Concentrations of up to 50 percent boron carbide can be obtained. Used as a shielding material against the passage of thermal neutrons, as in reactor shields; neutron curtains; shutters for thermal curtains; safety rods; and containing for fissile material. CCD 6d, 1961.

boresor. A salt or ester of boric acid; a compound containing the radical BO\(_2^–\). A.G.I.

boresor glass. A glass in which the essential glass former is boron oxide instead of silica. ASTM C162-66.

borates. See boron minerals.

borax. A mineral deposited by evaporation of the waters of alkaline lakes, notably in California, Nevada, and Tibet, China. A hydrated sodium borate, Na\(_2\)B\(_4\)O\(_7\)·10H\(_2\)O, occurring as a surface alunite, or as monoclinic crystals embedded in the lacustrine mud. Dana 17; A.G.I.; Pryor 3.

bore day. The day the drills are withdrawn. Pryor, 3.

bore hole. A joint in a coal. See also borehole.

borehole. A. A hole, shaped somewhat like the leg of a boot, caused by a blast that has failed to reach the rock properly. See also gun, b. A hole to be carried through the face of the coal with the large end of the cone turned upward. The long end caving off of the walls above catches on it and forms a packer. Porter.

boresor. Abbreviation for barrels of oil per day. Also abbreviated BOBD. Bulfin Style Guide, 58.

boron. Boron oxide used to any great extent. Boron has been applied to this method, such as checkerboard system; Brown panel system; following up the whole with the broken; Lancahshire bord-and-pillar method; modified room-and-pillar method; narrow working; North Staffordshire method; rearer method of working inclined seams; rock-chute mining; room system; room system with caving; Warwickshire method of working contiguous seams; wide or square work; bord-and-pillar method.
and pillar-and-breast. Fay.

bord-and-pillar working. N. of Eng. A system of mining in which interlacing rows of bord and pillar workings are driven at right angles into the seam, leaving small square or rectangular pillars of coal of from 30 to 50 yards side length, either wholly or partly extracted by a small group. Also called room-and-pillar; tab-and-stall; bord-and-wall.

bord cleat. a. Eng. The main cleavage planes of a seam. Lons. b. In coal mining, the main cleats. Also called bord on face.

bord cleat. a face being taken at right angles to the main cleat or facing, that is, the length of a bord. Fay.

bord facies. The outer or border zone of an igneous rock mass that has a different texture or composition from the interior owing to more rapid cooling and possibly to assimilation of substances from the enclosing rock. Hess.

bord gate. a. A main heading generally to the main cleats. Also called bord on face. c. Eng. A coal face having a bearing coal cut, the bord line. TM. b. The bord gate is also bordways.

bord gate. a. A main gate leading and at right angles to a coal bed. SMRB, Paper No. 61. b. See main cleat. Mason, V. 1, p. 8.

bord course. Aust. A direction at right angles to the bord course or facing, that is, the length of a bord. Fay.

bord round. A headings driven at right angles into the coal between the levels is removed. Fay.

bord. a. To cut a circular hole by the rotary motion of a cutting tool. Long. b. In rock drilling, a circular hole made by boring. Long. c. A tunnel, especially during the time it is being excavated. Nelson. d. The inside diameter of a cylinder, such as the inside diameter of piston cylinders on a pump or reciprocating engine. Pryor. e. A hole or cavity produced by a single-point or multipoint tool other than a drill. ASM Gloss. f. A tidal flood that regularly or occasionally fills a strata with drifting fluid. Quick-acting syrinx cement, with a 30-60 minute set time. See also mud flush, b. Nelson. c. The complete filling of a borehole with cement to prevent the entry of water into mine workings. Nelson.

borehole spacing. The distance between boreholes drilled for drilling, ion or sampling purposes. With bedded minerals, the holes may be positioned at the intersection points of co-mine and sub-mine lateral triangles with sides from 100 to 500 feet apart. The spacing is closer with patchy deposits. With metallic ores following belts across country, the holes are spaced along lines crossing the ore body in order to yield correct information about the ore at definite intervals. In the case of known and semiproved coalfields, boreholes at 1/4-mile intervals may suffice. Nelson.

borehole survey. A process of determining the course of, and the target point reached by, a borehole, using one of several different azimuth and dip recording apparatus small enough to be lowered into a borehole; also, the record of information thereby obtained. Also called drillhole survey. Long. b. The process of determining the mineralogical, structural, or physical characteristics of the formations penetrated by a borehole using electrical logging apparatus small enough to be lowered into a borehole; also, the record of the information thereby obtained. Long. c. Measurement of deviation from straight line by a diametrical borehole surveying instrument by observing each pattern of glass bottle containing hydrofluoric acid or consolidation angle of cooling liquid wax, more accurately, by a photographic record of plumb-lines, magnets, or by a gyroscope. Pryor, 3. d. A survey to determine the precise position of various points on the central axis of a borehole. B.S. 3618, 1963, sec. 1. e. A survey to obtain information about the sites intersected by a borehole. B.S. 3618, 1963, sec. 1.

borehole sampling. Instrumental tests to determine the amount and direction of deflection of a borehole from vertical and horizontal planes. The instrument is lowered into the borehole and tends approximately every 100 feet or so of depth. The data obtained may be used to construct a scale model showing the actual course taken by the hole. See also crooked hole; Oehman and Payne-Galloway instrument; oriented core. Nelson.

borehole. A tabular record of the characteristics and thicknesses of strata intersected by a borehole. B.S. 3618, 1963, sec. 1. e. See also drill, Fay.

borehole. A long hole in a strata used for the purpose of blasting. See also drill, Fay.

bore. a. A rod (as a drill) used for boring. Webster 3d. b. Eng. A piece of round iron with a steel point, which is driven into the rock to make holes for the purpose of drilling. See also drill, Fay.

bore rod; boring rod. Term used primarily by soil and foundation testing engineers for the equipment customarily called a drill rod by drillers and miners. Long.

borehole. A simple vertical hole in the earth's crust by means of boreholes and suction pumps. Boreholes are used for mining, and for the extraction of liquid solutions of salt, sulfur, etc. Nelson.

borehole pump. a. Strictly, any pump which can be suspended in a borehole; usually a centrifugal pump suspended in a borehole by its pipe range and driven by a shaft inside of the pipe. B.S. 3618, 1963, sec. 4. b. A centrifugal pump, electrically driven, and designed in the form of a vertical narrow chamber. It may be used to provide water, for dewatering purposes; or for borehole mining. See also sinking pump; submersible pump. Nelson.

borehole samples. The samples of the rocks obtained during boring. The diamond and shot drill yield cores, while percussive drills yield flute and chips which are examined to determine the nature of the rocks passed through. Borehole samples may also be required during site investigations. See also exploratory drilling; soil core. Nelson.

borehole sealing. a. The sealing or closing of borehole walls where drilling fluid is lost. Quick-acting syrinx cement, with a 30-60 minute set time. See also mud flush, b. Nelson. c. The complete filling of a borehole with cement to prevent the entry of water into mine workings. Nelson.

boric acid; orthoboric acid. White; trilinec; H2BO3; and very soluble in water. Used as a flux in the manufacture of cast-iron and sheet-steel porcelain.
boric acid; orthoboric acid
cornel f. r., hanssen. on heating it loses water and forms metabolic acid, H₂BO₂; or on fusion it forms basic acid, HB₂O₃ or the so-called pyrophoric acid, H₂BO₃; on heating at a still higher temperature, it forms the third compound, called boric oxide or boric acid. It occurs as tabular triclinic crystals deposited near fumeroles, and it also occurs in solution in the hot lakes of tuolumne, italy. c.t.d.
boric oxide glass; boron oxide glass. A colorless, transparent glass or noncrystalline powder; somewhat brittle; B₂O₃; specific gravity, 1.85 to 1.88; boiling point, above 1,500° C; soluble in alcohol and in acids; slightly soluble in cold water with decomposition; and soluble in hot water. Used in the production of boron; in the chemical analysis of silicates; in heat-resistant glassware; and as a fire-resistant additive for paints. ccd 6d, 1961.
boron. A group of special ceramic materials. Typical properties are great hardness and mechanical strength, high melting point; low thermal shock resistance; and high thermal conductivity; impact resistance is low but the thermal-shock resistance is generally good. The density of specific borides see under the borides of the following elements: aluminum borides; bainium borides; calcium borides; chromium borides; hafnium borides; molybdenum borides; niobium borides; silicon borides; strontium borides; tantalum borides; thorium borides; titanium borides; zirconium borides; vanadium borides; tungsten borides; zirconium borides. dod.
borer. corn. a. tool for boring. An instrument of iron and brittleness; slightly bitter; B₂O₃; specific gravity, 1.85 to 1.88; boiling point, above 1,500° C; soluble in alcohol and in acids; slightly soluble in cold water with decomposition; and soluble in hot water. Used in the production of boron; in the chemical analysis of silicates; in heat-resistant glassware; and as a fire-resistant additive for paints. ccd 6d, 1961.
borer. a. rod, made in various lengths, for water or firedamp drainage. a., a glass in which boric oxide, silica and boric acid are used as a constituent of a ceramic body that fires to a translucent porcelain at 1,000° C. dod.
boring. a. drilling or cutting of a hole for blasting, water infusion, exploration, or water or firedamp drainage. see also percussion boring; rotary boring. nelson. b. the drilling of deep holes for the exploitation of deep mutuals. The latter is used similarly in connection with metalliferous deposits. c.t.d., ma., materials, standard, 1964. c. a machining method using single-point tool on internal surfaces of revolution. asm.
boring bar. a. a rod, made in various lengths, usually with a single chisel cutting edge, for hand drilling in rock. the blows are given by a sledge hammer. nelson. b. a revolving or stationary bar carrying one or more cutters or drills for boring. fay.
boring bit. derb. a. sharp piece of steel at the end of an auger stem or drill for cutting rock or other material by rotation of the auger. see also bit, a; b. derb. fay.
boring contract. an agreement entered into between a producer and a contractor for the sinking of oil or gas wells on a property. fay. see also drill contract.
boring contractor. synonym for drill contractor.
boring head. a. the part of a drill machine more commonly called swivel head by persons associated with the diamond-drilling industry. see also swivel head, a; long. b. synonym for drill bit. long. c. the cutting end of a boring tool, especially the cutting end of an auger drill. web. 3d. d. see drill head, a. b.s. 3618, 1963, sect.
boring journal. a book which contains an accurate record of the progress of the boring work, day by day. it is usually kept by the drilling master. see also log, c. fay.
boring log. synonym for drill log. long.
boring machine. the tool used in charge of a well-boring outfit. fay.
boring rod. a rod made up of segments, carrying at its lower end a tool for earth boring or rock drilling. webster 3d.
borings. used by the soil and foundation testing profession as a synonym for boring holes and/or the materials removed from a borehole. compare cuttings, a; sample, b. long.
boron equation. the free energy of solvation of an ion is

\[ \Delta G = \frac{N_{\text{Av}} e^2}{2r} \]

N is the Avogadro number, z the ionic valency, e its electronic charge, D the dielectric constant of the electrolyte and r the ionic radius. pryor, 3.
bornhardsite. a cobalt selinite, Co₂Se₄ cubic to hexagonal rhombohedral crystals; ranking 6d. 1961; handbook of chemistry and physics, 1964.
bornite. a valuable copper ore; a sulfide of copper and iron, CuF₅S₄, crystallizing in the cubic system. also called erubescite; horseflesh ore; rock copper ore; variegated copper ore; purple copper ore. sanford; dana 17.
bornoludate. see aluminum borate. dod.
borolite. a hypabyssal rock, having a granitoid texture and consisting essentially of orthoclase and melanite with subordinate nepheline, biotite and pyroxene. a variety of melanite-nepheline pyroxenite found at Loch Borolan, Scotland. a.g.i.
borolon. alumina, Al₂O₃, prepared by fus- ing bauxite; specific gravity 4; used as an abrasive and refractory. nelson.
boron. element of atomic number 5, of group III in the periodic system. a very soft, brown, amorphous powder or yellow crystals; insoluble in water, alcohol, or in concentrated sulfuric acid; and soluble in concentrated hydrochloric acid, hydrobromic acid, and hydrofluoric acid. used as a constituent of a ceramic body that fires to a translucent porcelain at 1,000° C. dod.
boron-edenite. a mineral, artificial NaCa₂Mg₅(Si₄B₄O₁₀)F₉, containing 91 percent B₂O₃. sperling, 21, 1958.
boron hydride indicator. unit tests for up to 0.1 parts per million (ppm) of pentavalent boron or deaborane in air and 0.1 parts per million (ppm) of diborane. detector comprises a potentiostat, a burette and a burette pump, reagent solution, a dry reagent, color or comparison card and a calibration chart. the number of parts per million produced on filter paper a color to match a reference standard is the index of borane concentration.
boron metasomatism. the replacement of minerals, as of a granite, by boron-bearing minerals, such as orthoclase and rarely, datolite and danburite. a.g.i.
boron minerals. many known minerals contain boron, but only a few are commercially valuable as a source of boron. the principal boron minerals are borax (tincal), Na₂B₄O₇·10H₂O; kernite (zarorite), Na₂B₄O₇·4H₂O; colemanite (boracite), Ca₂B₆O₁₀·5H₂O; ulexite (boronatrocalcite), CaNa₂B₁₀O₂·9H₂O; priceite (pamphphile), Na₂B₁₀O₂·9H₂O; carborborite (stassfurtite), Mg₂B₂O₇·9H₂O; and sassoite (natural boric acid), H₂BO₃. today the united states furnishes the bulk of the boron introduction from deposits of sodium boron. boron and boron compounds have numerous uses, including applications in glass, ceramics, welding compounds, soaps and detergents, plasters and paints, starches, fertilizers, steels, nonferrous metals, atomic reactors, radio tubes, solar batteries, abrasives, refractories, chemicals, plastics, motor fuels, antifreeze, insulation materials, adhesives, drugs, and cosmetics. bu mines bull, 630, 1965, pp. 149, 151.
boron nitride. white, p. 594. hexagonal rhombohedral, crystals or powder; the powder has a hardness of 2, Mohs' scale; sublimes, about 3,000° C; and is insoluble and some properties vary accordingly to the method of preparation and the crystal form. used as a refractory; a high-temperature lubricant, as in glass molds; in furnace insulation; and in molten-metal pump parts. ccd 6d, 1961; handbook of chemistry and physics, 45th ed., 1964, p. b-138.
boron oxide. see boric oxide. ccd 6d, 1961.
boron-phosphate. a. a％material, K₂B₂O₅.Fe₂O₃. spencer 21, m.M., 1958.
boron phosphate. BPO₃; specific gravity, 2.80; melting point 1,000° C. used in the production of high-cristobalite. it has been used as a constituent of a ceramic body that fires to a translucent porcelain at 1,000° C. dod.
boron phosphide. symbol, BP; melting point, greater than 2,000° C but readily oxidizes, which limits its potential use dod.
boron silicides. see silicon borides. dod.
boron steel. the addition of about 0.003 percent of boron confers increased hardness and ability to steels in the quenched and tempered condition. the addition of this percentage of boron to low carbon, 0.50 to 0.60 percent molybdenum steel in the normalized condition gives double yield strength and a 30 percent increase in tensile strength, but boron has only a very slight advantage when molybdenum is less than 1.00 percent.
boronate. see ulexite, fay.
boron carbide; tetrahedron carbide. probably not a true compound, but instead a solution of varying amounts of carbon in a slightly distorted boron lattice; B₄C; black; hexagonal rhombohedral crystals; ranking next to diamond in hardness, 9.3 Mohs' scale; and melting point, 2,350° C. used in powder form as an abrasive and in molded form as an abrasion resist. ccd 6d, 1961; handbook of chemistry and physics, 45th ed., 1964, p. b-158.
boronatrocalcite. see ulexite, fay.
boron carbide; tetrahedron carbide. probably not a true compound, but instead a solution of varying amounts of carbon in a slightly distorted boron lattice; B₄C; black; hexagonal rhombohedral crystals; ranking next to diamond in hardness, 9.3 Mohs' scale; and melting point, 2,350° C. used in powder form as an abrasive and in molded form as an abrasion resist. ccd 6d, 1961; handbook of chemistry and physics, 45th ed., 1964, p. b-158.
boronatedite. a mineral, artificial NaCa₂Mg₅(Si₄B₄O₁₀)F₉, containing 91 percent B₂O₃. sperling, 21, 1958.
boron hydride indicator. unit tests for up to 0.1 parts per million (ppm) of pentavalent boron or deaborane in air and 0.1 parts per million (ppm) of diborane. detector comprises a potentiostat, a burette and a burette pump, reagent solution, a dry reagent, color or comparison card and a calibration chart. the number of parts per million produced on filter paper a color to match a reference standard is the index of borane concentration.
borsella. An instrument for stretching or con-

bosh. a. A tank or tub from which horses 

glasscutting. Gordon. g. S. Afr. Rounded 

crystalline diamonds not usable as gems; 

standard, cost than ordinary excavation. Hess.

vation it also often requires the construction of a 

the land, where the borrow pit is located; 

tracts.

form the embankment. Borrow-pit excava-

near an embankment when there is 

therefore 

usually runs higher in 

classification, 

boreal. A.d. Formerly used to 

beryll in spherical form, and said to 

bort somewhat more granular than com-

crystalline diamond; (3) framesite bort 

picked up by a magnetic separator and 

tain black carbon or other minerals; used 

use in a fragmented form. See also frag-

Currently the term commonly is applied 

low-grade industrials suitable only for 

American mineralogic assays. CCD 6d, 1961, 

Handbook of Chemistry and Physics, 45th 

borrow pit. A special classification usually 

plied to material taken from some pit 

near an embankment when there is in-

sufficient excavation nearby on the job to 

form the embankment. Borrow-pit excava-

ation is therefore a special classification, 

usually bid upon as a special item in con-

tracts. It frequently involves the cost 

land, or a royalty on material taken from the 

land, where the borrow pit is located; 

it also often requires the construction of a 

suitable road to the pit. This type of exca-

vation therefore usually runs higher in 

cost than ordinary excavation. Hess.

borsella. A. Formerly used for stretching or con-

tracting glass in its manufacture. Standard, 

1964, p. 301.

boss. a. In immediate charge of a 

piece of work, as a mine foreman. Fay. 

b. A master workman, a foreman, a 

director or manager. Ricketti, 1. c. Ark. 

A coal mine employee not under the juris-

diction of the miner's union. Fay. d. 

the enlarged part of a cast iron on which a wheel 

is keyed. Webster 3d. e. A cast-iron plate 

secured to the back of a traveling forge 

hearth. Fay. (2) A wag or die used for 

shaping metals. Webster 2d. g. A heavy 

cylindrical piece of iron (usually cast or 

steel) inside the top of the stamp. 

stems into and into the bottom of which the 

shoer is inserted. It is the body of the 

hammer into which the handle fits and which 

also gives height to the blow. Also called 

top head. Fay. h. Scott. Hollow. The 

or engraved marking on any 

metal. To hole or uncover. Fay. i. A 

pierced, and often dome-shaped mass 

of igneous rock congealed in the surface 

of the earth and laid bare by erosion. 

Webster 3d.

boss driver. One in charge of men or boys 

who are driving horses or mules for haul-

ing coal, rock, or ore at mines. Fay.

bossing. a. Scott. The holing or undercut-

ting of a thick seam, as of limestone, the 

height of the undercutting being sufficient 

for a man to work in. Fay. b. In ceramics, 

the projection of a cast-iron forma-

columnar in clusters on 

botryolite. A radiated, 

bott. A plug of clay for closing the taphole 

of a cupola or a blast furnace. Bureau of 

Mines Staff.

Böttger ware. Dark red stoneware. ACSG, 

1963.

botting. Thrusting a bot into the taphole to 

stop a run of slag or metal. Fay.

bottle. a. A vessel or receptacle 

having a neck. Fay. b. Glass, earthen 

ware. See glass. c. A plug of clay 

incorporated. Used as a Jeff-lubricating 

bottle brick. A hollow clay building unit 

shaped like a bottomless bottle 12 inches 

long, 3 inches outside diameter (o.d.), 2 

inches inside diameter (i.d.), and 

weighting 21/2 pounds. The neck of one unit 

is placed in the end of another to build 

beams, arches, or flat slabs; steel reinforce-

ment can be used. Bottle bricks have been 

used in France (where they are known as 

 Fusées Céramiques'), in Switzerland, the 

Netherlands, and in South America. Dodd.

bottle chuck. A pulley with a wide-grooved 

face for guiding a cable around a turn in 

the track, an angle sheave. Zurn.

bottled gases. The liquefied petroleum gases 

propylene and butane. These gases are 

liquefied at normal atmospheric temperature 

(70° F) at pressures of 125 pounds per 
square inch and 38 pounds per square inch 

respectively and the are used in cylinders or 
tank cars in liquid form at about these 

pressures. Liquid propane is sold mainly 

for industrial use, because of its 

pressure, and butane mainly for domestic 

bottles. A gas consisting of volatile hydro-

carbons, from propane to pentane, mixed 

with hydrogen and methane under pres-

sure. It withstands pressures that may be 

transported in steel tanks under 

pressure in liquefied form. May be used as 

species. Its major constituents are copper, 

carbon, and hydrogen oxygen. Its for-
mula is Cu(2H2)3(2C3H8). American 

Mineralogist, v. 30, no. 1, march-april 

29, no. 211, December 1950, p. 260.

botanical prospecting. Prospecting in which 

differing plants. Prepared plastic or factory plant 

serve as a clue to the presence of metals 

beneath barren rock or a covering of sand 

botryogen. A vitreous hyacinth-red, translu-

cent, hydrous magnesium ferromagnesio-

lite, crystallizing in the monoclinic system. Fay.

botryoid. A form in the shape of grapes. 

A.G.I.

botryoidal. Having the form of a bunch of 

grapes; usually applied to mineral aggre-

mates. Webster 3d. Fay.

botryoidal stalactite. Round or semispherical 

smooth nodular growths of calcium carbo-

nate, usually occurring as cavern walls. Synonym for botryoid; clus-

terite; grape formation. Schützackerterite.

botryolite. A red, columnar dolomite 

bott. A plug of clay for closing the taphole 

of a cupola or an blast furnace. Bureau of 

Mines Staff.

botryolite. A radiated, 

bottle-glass machine operator. See bottle-

boss driver. One in charge of men or boys 

who are driving horses or mules for haul-

ing coal, rock, or ore at mines. Fay.

bossing. a. Scott. The holing or undercut-

ting of a thick seam, as of limestone, the 

height of the undercutting being sufficient 

for a man to work in. Fay. b. In ceramics, 

the projection of a cast-iron forma-

bosilicate glass

ASTM C162-66.

bottle gas
**bottle gas**

A fuel to operate combustion-type engines in lieu of gasoline. Sold under various trade names but most commonly known as L.P. gas, L.P., L.P. gas, or bottled gas (or blue gas). Long.

**bottle glass.** Glass used for the manufacture of bottles. Made from a batch comprising essentially sand, lime, and alkali. A typical glass composition may contain the following: such a glass was 0.6 percent Al₂O₃, 9.0 percent CaO, and 16.3 percent Na₂O; C.T.D.

**bottle jack.** Eng. An appliance for raising heavy objects, with a pump; the screw is operated so as to cause the pump to push the loaded jack up. Also called bottle pumping jack. Eng. A bottle being formed in an intermittent kiln, usually by the use of suction feeding, blowing, and forming.

**bottle machine operator.** One who tends automatic machines which forms bottles from molten glass. Also called bottle-making machine operator; forming-machine operator; press-and-blow-machine operator.

**bottle-making machines.** These may operate in various ways, but the bottle being formed in two stages, that is, the parison and the flashed bottle. Widemouth ware may be formed by pressing the parison and then blowing, narrow-mouthed bottles by blowing a wall of glass after pressing and blowing. In the last method, the glass is gathered by suction into the parison mold, in the other two it is dropped by hand or more probably by a feeding device, hence the term suction-fed, suction-fed, feeder-fed.

**bottle oven.** A type of kiln used for melting glass, and often used where height is limited. Nelson.

**bottle oven.** The method by which the bottomeh is removed from below as with a power shovel. American Institute of Mining and Metallurgical Engineers Bulletin No. 604, 1935, p. 7.

**bottleneck.** Eng. The bottom of a wagon or truck which is unfastened by knocking off a catch when the wagon is required to be discharged. Fay. A flat base for holding the flask in making sand molds. ASM Natl. c. Also placed on the underside of a mold during ramming. C.T.D.

**bottle oven.** The technique by which soap impurities are reflected off the bottom one or more times before reaching the target. Ha.

**bottom break.** The break or crack that separates a block of stone from a quarry floor. Hein.

**bottom cager.** A man at the bottom of a stope or shaft in a mine to superintend the operation of the raising and lowering of the cage. See also cage. Fay.

**bottom cutter.** A dinter; a coal cutter for making floorcuts. Nelson.

**bottom equipment.** a. The tools or equipment attached to the lower end of a drill string and normally used at or near the bottom of a borehole. Also, the drilling equipment placed and operated at or near the bottom of a borehole, such as a pump unit or strainer. Long. b. Mine equipment used solely for work at the mine bottom, such as rotary dump and switch motor (i.e. used to spot cars in rotary dump). Bureau of Mines Staff.

**bottom filler.** A man who fills a barrel with ore, coke, or stone, places it on the cage or elevator so that it is hoisted to the top of the furnace. Fay.

**bottom-filler conveyor buckets are attached continuously.** ASA M141-1.958.

**bottom-discharge conveyor buckets are essentially generally rectangular in shape in plan and having a bottom consisting of an undercut gate.** ASA M141-1.952.

**bottom-discharge conveyor.** A conveyor used to convert a cone at the bottom of a drilled hole into a cylinder. ASM Natl.

**bottom-dump car.** See mine cars. Lewis. p. 222.

**bottom-dump scraper.** A carrying scraper that dumps or ejects its load over the cut.
bottom floor. Eng. The lowest bed of Lias limestone in the quarry, Barlaston, lime works, also at Stanford quarries, North- west Derbyshire. Zorn.

bottom gate. The gate road at the lower end of an inclined coalface. See also main gate, tailgate, top gate. Nelson.

bottom heading (overhand bench). Method of excavating tunnels, drifts, or other mine openings. Bottom heading, which may either be driven in successive stages or holed through, is subsequently enlarged by excavating at the top section. Frendel.

bottom hole. A point at, or near, the bottom of a borehole. Long.

bottoming. a. The thinning out or ending of the rock and/or other media encountered or near the bottom of a borehole. Long.

bottom joint. A joint or bedding plane, horizontal or nearly so. Zorn.

bottom-lift. a. The deepest column of a pump. Zorn. b. The lowest or deepest lift or level of a sugar mill. Manufactures.

crater. The deepest lift of a mining pump, or the lowest pump. Fay.

crater. One who digs up the bottom of a drift, entry, or other haulageway to gain headroom. Also called brusher; dirt scraper; groundman; ripper; stoneman. Fay.

bottom loading belt. A belt conveyor.

bottom maker. A laborer who retines bottoms of ingot sooking pits with coke dust to retard formation of oxide scale on hot ingots. DOT: T. 1.

bottom man. See bottomer, a and b. DOT: T. 1.

bottom pillow. Peat found near lakes, rivers, and smaller forms consisting of hypnum and similar plants. Tomkeieff, 1954.

bottom pillar. A large block of solid coal left unworked around the shaft. See also shaft pillar, a. Fay.

bottom plate. A plate supporting a foundry mold. Webster.

bottom pouring; uphill teeming. A method of teeming molten steel from a ladle into ingot molds. The steel passes through a system of refractory fireclay tubes and enters the molds at the bottom; the refractory tubes are of various shapes—trumpet, guide-tube, center brick, and runner brick. See also trumpet; guide tube; center brick; runner brick. Dudd.

bottom pour ingot assembly. One comprising hot tops, wood blocks, ingot mold, mold stool, lateral outlet bricks, lateral bricks, king brick, foundation bricks, funnel brick and suitable metal supporting devices. Bureau of Mines Staff.

bottom-pour ladle. One poured through a refractory nozzle in the bottom. Bureau of Mines Staff.

bottom reverberation. See reverberation. Hy.

bottom rock. Bedrock. Austin.

bottom roller. See return roller. Nelson.

bottom set bed. A layer of finer material carried out farther south so deposited on the bottom of the sea or lake in front of a delta. As the delta grows forward, the bottomset beds are covered by the foreset beds. See also foreset bed; topset Led. Fay.

bottom settling. Earthy matter, inert organic matter, or, in the case of Pennsylvania petroleum, manifacatured of amorphous paraffin wax and water, which accompanies crude oil. Fay.

bottoms. a. The steel plates forming the bottom of an oil still or a steam boiler. Fay. b. Steel sheets about three-eighths of an inch thick formerly used on small mines on wood beams spanning a vump where a floor was not desired. Zorn.

boulder. A large gray and white mottled marble with streaks and clouds of yellow, brown, and pink; from Nassau, Germany. Fay.

bouger anomaly. The gravity value existing after the Bouguer corrections to a level datum have been applied. A.G.I.

bouger correction. The correction made in a gravity survey to take account of the altitude of the station and the rock between the station and sea level. A.G.I.

bouging. a. Scot. Segments of wood or other material used for increasing the diameter of a pipe from a distance is not always in- fers, et al. 1954. Fay. b. Scot. To coil unevenly on a drum; at, the rope or cable is not buoing well. Fay.

bouling. a. Metal, metallic, bluish-gray, lead-sulfur-antimony mineral, PbSnSb; orthorhombic. Dana 17.

bouler. The word connotes a sense of size and boulders probably may be considered to be, in general, worn rocks and the latter in diameter. Hes. b. A fragment of rock brought by natural means from a distance (this concept of transpor- tation from a distance is not always involved in later usage) and usually large and rounded in shape. Fay. c. A detached
boulder; bouldering

- Boulder: A large rock that is too heavy to be lifted readily by hand, Nickoli.
- Boulder belt: A belt of glacial boulders ranging from boulders to clay sizes, ASCE.
- Boulder clay: A stiff, hard, and usually rounded, Webster 3d.
- Boulder cracker: A heavy iron rod from 8 to 10 inches to 10 or more, and rounded or much-worn mass, Fay.
- Boulder flat: A level tract strewn with smaller pieces (secondary blasting), Fay.
- Boulder pavement: A surface of rock units, Webster 3d.
- Boulder pop: An alarm given when a boulder is to be broken up by a pop shot, Fay.
- Boulder strata: A stratified deposit of boulders on a beach or on the thickest set with boulders released by glacier move-
- Boulder clay: A stiff, hard, and usually rounded, Webster 3d.
- Boulder cracked: A strand thickly set with boulders released from the till by wave erosion, Fay.
- Boulder on a beach or on the bottom of shallow water; derived from deposits of boulder clay, destroyed by the waves.
- Boulder pop: An alarm given when a boulder is to be broken up by a pop shot, Fay.
- Boulder reef: A beach ridge composed of boulders, A.G.I.
- Boulder stratification: A term used by miners for many purposes, in the direction the ice moved, Fay.
- Boulder hinge: A fault with fixed ends, Fay.
- Boulder point: A strand of boulders of the same sort of rock, extending from the source or parent ledge, perhaps for many miles, in the direction the ice moved, Fay.

Bourdon pressure gage

- Bourdon pressure gage: A tube, oval in cross section, which tends to straighten as the pressure inside is increased. In civil engi-

boundary conditions: As used in strength of materials, the term usually refers to the condition of stress, displacement or slope at the ends or edges of a member, where these conditions are apparent from the circumstances of the problem. Thus for a beam with fixed ends, the ends are considered as boundary conditions. For a pierced circular plate with freely supported edges, the zero radial stress at each edge is a boundary condition. Re.

boundary layer: The velocity of the fluid at the surface of a solid boundary is zero. There is, therefore, a region adjacent to the boundary in the fluid across which the velocity of flow will vary from zero to maximum stream velocity. This region is termed the boundary layer, the thickness of which depends upon the viscosity and velocity of the fluid. Roberts, I, p. 2.

boundary map: A map for the purpose of delineating a boundary line and the adja-

boundary plane: Interface. Plane separating two media with different elastic properties, Schieferdecker.

bound charge: An induced electrostatic charge, held by attraction of inducing charge, which has opposite polarity, Pryor, 3.

boundary pillar: A pillar left in mines by adjoining mining of a member, where these conditions are apparent from the circumstances of the problem. Thus for a beam with fixed ends, the ends are considered as boundary conditions. For a pierced circular plate with freely supported edges, the zero radial stress at each edge is a boundary condition. Re.

boundary pillar: A pillar left in mines by adjoining mining of a member, where these conditions are apparent from the circumstances of the problem. Thus for a beam with fixed ends, the ends are considered as boundary conditions. For a pierced circular plate with freely supported edges, the zero radial stress at each edge is a boundary condition. Re.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.

boundary points: Points on the map showing the location of the points of some friendly or neutral country, on a boundary.
Bourdon pressure gage

Ham.

Bourdon tube. Pressure gage, made from elliptical curved tube which straightens under pressure, and is made to move a measuring needle over a dial.

Pryor, S. 'bourn.' Springs which only flow at certain times of the year, or only after a prolonged spell of rainy weather, form temporary streams, which are known as bournes, nal-bournes, winter-bournes, dep-wou-bournes, levants, and gypsies. Some of them break out every year at the same spot; these may be called regular bournes, and are generally winterbournes. Others only come into existence after a season of great and prolonged rainfall, and these may be termed occasional bournes. Challinor.

Bournouille. A sulfide of lead, antimony, and copper, approximately PbSbSbS; orthorhombic. Also called wheel ore. Dana 17.

Bournstone. Mid. A coil of rope upon a drum.

Bowenite. A fine-grained massive variety of serpentinite resembling nephrite (jade); in appearance and sometimes sold as such; hardness, 5 to 5.5; specific gravity, 2.6 to 2.8; mean refractive index varies from 1.50 to 1.55. From New Zealand; India; and Rhode Island. Shipley.

Bowenite Jade. Same as Bowenite. Shipley.

Bowen's reaction series. A discontinuous reaction series. A.G.I.

Bowing. a. Distortion of a structure. ASM Glass. b. A tendency in a length of coated abrasive to curve, caused by excess moisture (expanding) or lack of moisture (shrinking) on one side of the strip. Usually prevented by proper storage conditions. ACSG, 1963.

Box. a. Mid. A coil of rope upon a drum. Fay. b. (Leic.) A dinner or other jollification.

Bowl and slips. Synonym for bowl and bowl. Fay. b. (Aust.) An iron bucket used for carrying rock or shale, Fay. b. Scot. A projecting horizontal portion of the Syrions crusher, which carries ore, bowse, or booze, Yorkshire lead mines. See also bowser, Arkell.

Bowl mill. Grinding unit for soft material, such as coal. A bowl rotates about its vertical axis, the feed being crushed between its wearing rings and spring-loaded rollers. Products are air-classified. Pryor, S.

Bowl scraper. A steel bowl hung within a fabricated steel frame, running on four or two wheels. In its bottom edge digs into the ground, the bowl being filled as it is drawn forward by a tractor, soil is ejected at the dump by a tailgate, moved by wire ropes or hydraulically. Towed scrapers transport soil, in addition to spreading and leveling it. Hamm.

Bowl scraping. A method of forecasting the durability of refractory glass tank blocks proposed by E. J. C. Bowmster. The loss in weight of a sample cut from the tank block is determined after the sample has been immersed for 3 hours in HF/H_2SO_4 at 100° C; the acid mixture is 3 parts by volume HF commercial 50 to 50 percent HF and 2 parts by volume pure concentrated H_2SO_4. The test is no longer considered valid. Dodd.

Bowellite. A pegmatoid rock consisting of crystals of sandine with subordinate soda amphiболite (anorthosite), and aggregate from Bowral, Wales. Hess.

Bowser. a. Lead ore as extracted from the vein. Nelson, b. Eng. Medium-quality lead ore, Staffordshire. Vein matter v nickel has been worked out or wrought and which carries some lead, bowse, or booze, Staffordshire lead mines. See also bowser, Arkell.

Bowstring girder. A girder shaped in the form of a bow and string, which may be held between the arches of a bridge, and is made to take the strain by a bowstring. C.T.D.

Bowl and slips. Synonym for slip and slip. Long.

Bowl centring. A centrifugal device for de-watering, usually conical or bowl-shaped, in which the containing surface is imperforated. The greater density of the particles causes them to collect preferentially in contact with the inside of the containing surface where they are discharged mechanically. Water usually overflows from a position nearer to the axis. B.S. 3525, 1962.

Bowl classifier. A machine for dressing, a hydraulic classifier similar to a thickener, but different in that the current carries the fine material to the top of the machine, where it is made separations at very fine particle size. Neuston, b. 81.

Bowditch's rule. Used in surveying to adjust a closed traverse, which has been made by compass. Angles and sides are assumed to be equally liable to error. The correction applicable to any line for an error in latitude is, __________ x total error in latitude. Correction for errors in departure is made in the same way. Ham.

Bow drill. A small drill operated by twisting a bowstring around it and pushing the bow back and forth. Used for perforating glass and gems. Hess.

Bowen's name for large, coarsely botryoidal concretions in the Lower Cretaceous sands at Stone, near Aylesbury. Also called doctor's bowls, deadmen's bowls, Arkell.

Bowels. a. The common paving stones. The expression paving stones here clearly means cobbles. Arkell. b. Large stones scattered over the heaths. Arkell.

Bow or bower. Variant and archaic spelling of boulder. Long.

Bow. a. The common paving stones. The expression paving stones here clearly means cobbles. Arkell. b. Large stones scattered over the heaths. Arkell.

Bow metal. The impure Anthony obtained from coal, that is, from the fusion of anthracite ore with iron or other anthracite containing carbon. Also known as iron sulfide, the removal of which eliminates both iron and sulfur. Hess.

Bowels. b. Eng. A core box; core tray. Gong. k. To drill borehole. Nichols. l. To extract samples from a core barrel. Nichols. m. To install female thread. Nichols. n. A transmission. Nichols. o. A dump body. Nichols. p. The internal threaded portion of a coupling or connector. The DCDMA accepted standard system for female thread. Long. q. To place core samples in a lidded, traylike, partitioned container for safekeeping after they have been removed from the core barrel; also, the container in which core samples are placed after they have been removed from a core barrel. Also called core box; core tray. Long. k. To drill bore-
holes at the four corners of a square area at equal distances from a centrally located and already completed borehole. Long. 1. A unit in a sluice for washing gravel; a succeptor. "Box", mer. Eng. See also into. SMIR, Paper No. 61.

box and pin. The female and the male members of a tool joint, or a wood dowel joint, which form a screwed coupling. Porter.

box annealing. Annealing a metal or alloy in a box for accelerated cooling and to minimize oxidation. In box annealing a ferrous alloy, the charge is usually heated slowly to a temperature below the transformation range, but sometimes above or within it, and then cooled slowly; this process is also called close annealing or pot annealing. See also black annealing. ASM Gloss.

box barrow. A large wheelbarrow with up-right sides. Webster 2d.

box bell. See bell screw. Hess.

box bill. a. A tool used in deep boring for punching a female and the male members of a tool joint, or a wood dowel joint, which form a screwed coupling. Porter.

box canyon. A canyon from the bottom of which a nearly vertical wall ascends all four sides. Hess.

box canyons. a. Any of several types of canyons cut by a river or stream. Fay.

box cask. A large box of steel or concrete with an open top, built on shore and launched into a river or sea to be floated and towed to the site chosen for its foundation. This box will form an integral part of the permanent structure; it is used for bridge piers, because it enables them to be driven down under reasonably dry conditions. Ham.

box canyon. A canyon from the bottom of which a nearly vertical wall ascends all four sides, as the result of the zigzag course of the canyon. Fay.

box cutting. Any of several types of conveyors adapted by portable or hinged mounting for use in loading bulk materials into boxcars. Some types are designed to have their material fed into the ends of the car. ASA MHA-1-1938. b. In anthracite and bituminous coal mining, one who loads coal into railroad boxcars by means of shovels, for hand filling coal into trams. The collar scooped the lumped coal into the box and discarded the small material which had little market value. The use of this box was compulsory at many collieries until a few decades ago. See also fork-filled. Nelson.

box frame construction. A modern method of building flats, offices, and similar structures, using concrete or steel supports supported by load-bearing walls across the shortest span of the building. It has been developed to economize in steel or reinforced concrete framework. Ham.

box furnace. a. A furnace in which, periodically, a load of ware is introduced, fired, and removed. ASTM C286-65. b. The term refers to the batch-type furnace for firing enamelware, or smelting enamel metal. Enam. Dist. Gym.

box girder. A hollow steel beam with a square or rectangular cross section. Nichols.

box groove. A closed groove between two rolls, formed by a collar on one roll, fitting between collars on another. Fay.

box hardening. A process of hardening by cementation in an iron box. Webster 2d.

box heading. A heading driven through very soft ground with close timbering. Nelson.

boxing. a. A method of securing shafts solidly by slots and thinning out, Zern. b. Continuing a fillet weld around a corner as an extension of the principal weld. Also called end return. ASM Gloss.

boxing in. A method of setting in a kiln so that, for example, special refractory shapes can be fired without being stressed and deformed; also known as pocket setting. Dodd.

boxing up. Packing ballast under sleepers to raise a track which has subsided. Ham.

box kilns. A relatively small industrial kiln of boxlike shape and intermittent in operation. Dodd.

box loader. In the quarry industry, one who loads broken rock into a large box, placed on a small track running on a narrow gauge track, to be hoisted out of the quarry pit. Also called grouter; rock load. D.O.T. 1.

box metal. A brass, bronze, or antifouling alloy used in the journal boxes of sails or shafing. Long.

box metal. A steel pipe made fr.m a pair of steel sheets in single sections, or rolled steel joists welded along their lines of contact. Ham.

box section. A compact type of section contained in a small metal box. Ham.

box shear test. See shear box test. Ham.

box sluice. An open wooden channel or flume for conveying placer sand. The gold or heavy minerals settle at the bottom. The method is cleaner and requires less water than ground sluicing. Nelson.

box stones. Eng. Masses of brown ferruginous or phosphatic sandstone, rounded or flattened in form and generally a little larger than the flat. Some enclose fossil remains; hence the name. Holmes, 1928.

box tap. See bell tap. Long.

box thread. The thread on the inside surface of a coupling or tubular connector. Accepted by the DCDMA as the standard term to be used in lieu of female thread.

box-thread bit. A bit having threads on the inside of the upper end or shank of the bit by means of which the bit may be coupled to a running shell, core barrel, or drill rod. Long.

box timbering. Plank timbering. Use of rectangular close frame for lining shafts or drives. Pryor, 3.

box to box. The two internal-threaded ends of a coupling, or tubular connector piece. See also box b. Long.

box to pin. The internal and external-threaded ends of a tubular coupling, or tubular connector piece. Long.

boxwork. The series of rock, or the general rock structure of a deposit. Fay.

box-work texture. A texture showing a porous aggregate with plates or septa along their cleavage or fracture planes and its density varies inversely as the absolute pressure. Schieferdecker, 3.

boy's law. States that at a constant temperature, the volume of a gas varies inversely as the absolute pressure while the density varies directly as the pressure. (That is, if the pressure on a gas is doubled the density is also doubled, but the volume is decreased to one-half of the original volume.) HBG.

boyon. Staff. A bluish iron ore. See also bolun. Arkell.

boyson's reagent. A 5 percent solution of nitric acid in absolute ethyl or methyl alcohol, used for the general etching of normal carbon steels. Olsborn.

box to box. A box, with a heat-insulated walls, containing a temperature recorder; it was designed by M. Boyson to travel with the law through a vitrorespiring furnace. Dodd.

bd Abbreviation for barrels per day. BuMin Style Guide, p. 38.

BPL Abbreviation for bone phosphate of lime, the anhydrous calcium phosphate or tricalcium orthophosphate, Ca3(PO4)2, in
which form are calculated most determina-
tions of phosphorus in rocks to be used for
mades of PAO and multiplied by the factor
2.184 to convert it to the equivalent BPL.

Br Chemical symbol for bromine. Handbook

Brachian Plastography. Brabender Plastifi-
Corder. Trade names; instruments designed
in the United States to assess the plasticity
of clays and other materials on the basis of
stress measurement during a continuous
shearing process. Dodd.

Brachy SAIL The shorter lateral axis in the
form or landing at the top of a shaft. The
focal distance is equal to 4 hundredweight. Fay. d. A plat-
measure of weight. The Hurlet brace was
firmly in place; especially, (1) a framed
for giving the blows to the chisel in
bracing. a. Long.

Brace head. a. A cross handle attached at
the top of a column of drill rods by means
of which the rods and attached bit are
turned after each drop in chop-and-dash
operations while sinking a borehole arough
a derrick, which properly should be called
a platform or landing at the top of a shaft. The
upper brace is the platform built in the head of the shaft collar. Nelson.
e. A timber member in square-set stopes.
Nelson. 1. A stiffening member running at
an angle, in the vertical plane, between two legs of a drill tripod or
derrick. Sometimes improperly used to designate a stiff-
ening member or run in a horizontal plane between two legs of a drill tripod or
derrick, which properly should be called a
brace head. 2. A small hand tool to which
may be attached a metal- or wood-boring
bit and by means of which the attached bit
may be rotated. Nelson. b. A member to which
or to strengthen with planks or heavy tim-
ber. Long.

Bracing. a. A cross handle attached at
the top of a column of drill rods by means
of which the rods and attached bit are
turned after each drop in chop-and-dash
operations while sinking a borehole arough
a derrick, which properly should be called a
brace head. 2. A small hand tool to which
may be attached a metal- or wood-boring
bit and by means of which the attached bit
may be rotated. Nelson.

Bracklessam beds. Pale-colored clays inter-
mingled with black shales occurring in
parts of Southern England and worked
for brickmaking to the Southwest of Lon-
edon and near Southampton. Dodd.

Bracklesham beds. Pale-colored clays inter-
mingled with black shales occurring in
parts of Southern England and worked
for brickmaking to the Southwest of Lon-
edon and near Southampton. Dodd.

Bradford Waken A machine which combines
coal crushing and screening. It consists of
two or more men holding a block or band
and through which the drill must go to
reach the lower and more profitable oil
balls. Fay.

Bradford brakes. A machine which combines coal crushing and screening. It consists of
a revolving cylindrical screen 8 to 14 feet in
diameter and 15 to 22 feet in length. It breaks the coal by gravity impact, which
turns the block upon the screen and the
coal which accumulates around the fur-
ces of coal works; coal dust; coke dust.

Brake. a. A device, either hand- or power-
operated, for applying resistance to the
drum or pulley and thus controls the move-
ment of mine cars or cages. A common
form is a brakehoe, lined with friction
material, which is applied to the surface of
a wheel or drum, and thus retards or even
stops its movement. See also winder brake.

Brake band. The flexible steel-ribbon part of
the salt causes the zinc sulfide to be wetted
while the lead sulfide and pyrite float. The
separation of the zinc from the metal from
the gangue is effected later. Fay.

Bradykrite. A double salt of potassium
and magnesium carbonate, K2O·MgCO3,
as very fine-grained material in saline oil
shale from Wyoming. Spencer 16, M.M.,
1943.

Bradyseism. Slow movement of the ground
especially recognizable by an upheaval,
subsidence, or a shifting of shoreline.

Brace. a. Scot. A hillside, a slope, a bank,
a hill. Fay. b. Scot. An inclined roadway,
more commonly used in the compound
form, for example, pulley brac, cuddy brac.
Fay. c. Insufficiently charred wood, as in

Bragg angle. In crystallography, an identi-
yzing angle measured by placing crystals in
narrow X-ray beam, when its lattice layers
reflect the incident ray on to photographic
plate. This produces series of lines NA=2d
sin θ = nλ, where d is the lattice spacing,
and λ the wavelength, n the integer reflection. Pryor, J.

Brackebuschite. A black to reddish hydrated
iron-manganese vanadinite, (Pb,Fe,Mn)
4VaO2(OH)2, crystallizing in the mono-

Brackelsberg process. A process by which fine
ores are moistened with water to which a
binding medium is added and the wet
mass, without any heating, is rotated in a
drum till it forms into spherical lumps of
varying size. The moisture is then dried out
by evaporation and the product contains
in its form or landing at the top of a shaft.

Brachypinacoid. A pinacoid parallel to the
shorter lateral axis and 40% of the inter-

Brachyaxis. A variety of leucite tephrite,
having the chemical composition of certain
leucitites. Holmes, 1928. b. A dense basaltic
rock with rare phenocrysts and composed
of nearly 50 percent leucite, 8 percent
augite and nepheline, olivine, 4 percent
andesite, and plagioclase. Belle.

Brake and-stope feeder. One that utilizes a
brake-and-stope mechanism to 4ead, trans-
port and deliver objects. ASA MH41.1-
1958.

Brake band. The flexible steel-ribbon part of

Brachypinacoid. A pinacoid parallel to the
shorter lateral axis and the brachyaxial.

Brachypyramid. A pyramid, the intercept of
which on the brachyaxial is more than 1.

Brachytypus. In crystallography, comparati-

Bracing. a. One that utilizes a brake-and-stope
mechanism to transport and deliver objects.
ASA MH41.1-1958.
brake beam. A horizontal beam or rod on a wagon or railroad car that operates the brake shoes. Webster 3d.

brake beam. A device for checking by friction the speed of a rope (as in a hoist). Webster 3d. b. The part of a brake that holds the shoe. Webster 3d.

brakedrum. A rotating cylinder with a milled inner or outer surface upon which a brake band or brake shoes press. Nichols.

brake hanger. One of the bars or links suspending a brake wheel. Webster 3d.

brake horsepower. a. The power of an engine or other motor as measured by a dynamometer applied to the flywheel or the shaft. Webster 3d. b. Actual power output put delivered by the crankshaft of an engine. It is equal to the theoretical or indicated horsepower multiplied by the mechanical efficiency. Abbreviation, bhp. Brantly, 2.

brake incline. a. An incline in which the full trucks descend by gravity and pull up the empty ones. C.T.D. See also gravity haulage. Webster 3d.

brake-lining finisher. In the asbestos products industry, one who performs the finishing operation on asbestos lining stock. D.T.O. 1.

brake limiters. Friction elements. Dodd.

brake magnet. One that (1) induces eddy currents in a rotating drum, and (2) magnetically applies a friction load. Pryor. 3.

brakeman. a. One who attends to a brake or brakes, as on a railroad car. Standard, 1964. b. Eng. The man in charge of a winding (hoisting) engine for a mine. Brakeman is usually used in the United States; brakesman is the British usage. The man in charge of hoisting engines, especially in the United States, is usually called a hoisting engineer. Fay. c. In mining, a laborer on trains of cars hauled by locomotive or hoisting cable or chain, and controlling their transportation. D.T.O. 1.

brakesman. a. A stationary portion of the brake capable of being pressed against the brake drum for stopping the wheel. Shell Oil Co.

brake stick. A lever, operated by a hand lever. Fay.

brakesman. Eng. See brakeman, b. Fay.

brake staff. Eng. See brake, b. brake staff. Fay.

brake stick. A stick of wood to provide leverage in operating the brake wheel of a railroad car. Bureau of Mines Staff.
manganese, nickel, tin, and lead are frequently added. C.T.D. See also brasses.

brassage. The mixing ice for coinage; now commonly a term used for brasses.

brass; brassi; brazil; brazile. Miners' term for iron pyrites; applied to coal seams containing pyrites. Also used for hard nodules elsewhere, as at the base of the Totternhoe stone, and sometimes applied to the Totternhoe stone itself or other hard rocks. Compare rattle; raddle; raddle; Arkel.

brasses. a. Term used among British miners for iron pyrites; now also used in place of hard ore; sometimes used in place of iron. Fay. b. Term used among British miners for iron pyrites; applied to coal seams containing pyrites. Also used for hard nodules elsewhere, as at the base of the Totternhoe stone, and sometimes applied to the Totternhoe stone itself or other hard rocks. Compare rattle; raddle; raddle; Arkel.

brassing. The minting fee for coining; now a. Term used among British miners for iron pyrites; applied to coal seams containing pyrites. Also used for hard nodules elsewhere, as at the base of the Totternhoe stone, and sometimes applied to the Totternhoe stone itself or other hard rocks. Compare rattle; raddle; raddle; Arkel.

brass powder. a. A pulverized mixture of metallic phosphorus and antimony for diminishing the friction of revolving journals that rest upon them. Fay.

brass furnace. One of two kinds of furnaces for the making and founding of brass such as (1) a reverberatory furnace for large quantities of the alloy, or (2) a crucible furnace for small quantities of the alloy. Fay.

brass rod. A drill rod made entirely of a nonmagnetic alloy consisting essentially of copper and zinc in variable proportions. See also nonmagnetic rod. Lang.

brassy top. Aust. The top part of the Greta coal seam, in which there are large quantities of iron pyrites. Fay.

brassy, brass. See brassy. Tomkeiff, 1954.

brat coal. Thin seam of impure coal usually containing a small amount of pyritic material and frequently found at the roof of a seam of coal, Scotland and North England. Probable origin, Brazil.

brattie. a. A board of planking, or other partition, in any mine passage to confine the air and force it into the working places. Its object is to keep the intake air from finding its way by a short route into the return airway. Temporary bratties are often made of cloth. Also spelled brettie; bretti; brat; brattie. See also brattie cloth. Fay.

brattie road. A road through the goaf supported by checks or timber packs. Fay.

brattie trick. Aust. A trick played on inspectors when measuring the air in a mine, the quantity of air passing a particular district below its normal amount, in order to increase it in the district being tested. Usually effected by: (a) the fitting of a plate of brass cloth across one of the return airways. Fay.

brattice man. In mining, one who builds brattices, &c. b. A heavy canvas, often covered with some water-proofing material, for temporarily forcing the air into the face of a breast or heading; also used in place of hard ore; sometimes used in place of iron. Fay. c. Fitting! of brass in bearing blocks. etc.
Brazil twin

rivable from the other by any rotation, here is the twin.

brazing. Joining metals by flowing a thin layer, capillary thickness, of nonferrous filler metal into the space between them. Brazing results from the intimate contact produced by the dissolution of a small amount of base metal in the molten filler metal, without fusion of the base metal. Sometimes the filler metal is put in place as a thin solid sheet or as a clad layer, and the joint zone is heated as in furnace brazing. The term brazing is used where the temperature exceeds some arbitrary value, such as 800° F, the term soldering is used for temperatures lower than the arbitrary values. ASM Gloss.

brazing alloy. The same as brazing filler metal. ASM Gloss.

brazing filler metal. A nonferrous filler metal used in brazing and braze welding. ASM Gloss.

brazing sheet. Brazing filler metal in sheet form or flat-rolled metal edgings. Brazing filler metal on one or both sides. ASM Gloss.

brazing solders. Alloys used for brazing. They include copper zinc (50 to 55 percent copper), copper-zinc-silver (16 to 52 percent copper, 4 to 50 percent zinc, 10 to 80 percent silver) and also nickel-silver alloys. C.T.D.

brea. A viscous asphalt formed by the evaporation of petroleum from oil seeps; moltha, or mineral tar. Webster 2d.

break. a. An opening made by breaking down a portion of a solid body, as a wall, a dike, or a riverbank; a break; a gap. Fay. b. The face of a level or drift. Fay. c. A fracture or crack in the roof beds as a result of mining operations, for the purpose of inducing fractures. Nelson. d. To split into pieces or smash into parts or fragments typically by a blow or stress and with suddenness or violence; to separate; to burst. Webster 3d. d. Scot. A reduction of the day's wage. Fay. e. Can. Local shear zone within which mines arc induced to break circulation. To resume the movement of drilling fluid down the drill pipe through the eyes of the bit, and upward through the annulus. Brantly, 1.

breakdown. a. Of an emulsion, the reunion of the finely dispersed particles and their separation from the medium which they form an emulsion. C.T.D. Supp. b. The sudden passage of current through an insulating material, as soon as the voltage exceeds a certain definite value called the breakdown voltage. C.T.D. c. An initial rolling or forging operation, or a series of such operations, for the purpose of reducing a casting or extruded shape prior to forging. ASM Gloss. d. A preliminary press forging operation. ASM Gloss. e. Mechanical failure. Pryer. f. An opening on the side of a vessel through which ore is crushed, sieved, or washed. From this term are derived such terms as breakage, break-in, breakage, etc. g. A fracture formed in the roof next to the goaf. Fay. h. A coal miner or hewer. Fay. i. To commence to twist open or break; to twist or break; to open; to break; to crack; to dash; to shatter. Som. To commence to break. Webster 2d.

breakdown voltage. The voltage at which an insulator or dielectric ruptures; or the voltage at which ionization and conduction begin in a gas or vapor. HOG.

breaker. a. In anthracite mining, the stricture in which the coal is broken, sized, and cleaned for market. Also known as coalbreaker. Fay. b. N. of Eng. A large crack formed in the roof next to the goaf. Fay. c. Som. A coal miner or hewer. Fay. d. In Italy, a collier who wedges down coal and hammers it into coal. Fay. e. A small narrow across a road for drainage. Webster 3d. f. In the quarry industry, one who operates a crane to load freight (wedges and two metal strips on each tapering side) in each hole drilled in stone, or along a channel. Also called crane. D.O.T. 1. g. A machine used for the primary reduction of coal, ore, or rock. Crushing generally refers to the finer reduction of the material. Nelson. h. A wave breaking into beam against the shore. Synonym for breaking wave. Schiferdecker.

breaker boss. A foreman who is in charge of operations in an anthracite breaker where coal is washed, sized and cleaned for market. D.O.T. 1.

breaker chain; breaker; break-off man; breaker of slate. See slate picker. D.O.T. 1.

breaker engine. In anthracite coal mining, the coal which operates and maintains a power unit and machinery for crushing, sizing, and cleaning coal in a breaker. D.O.T. 1.

breaker props. Strong rigid props set along the edges of roadways, in longwall mining, to cause the explosives to shear the rock square with the roadway sides, rather than allow the force to spread over the waste area. See also waste edge support. Nelson.

breaker repairman. In anthracite coal mining, a maintenance mechanic who adjusts and repairs machinery in a breaker where coal is crushed, sized, and cleaned for market. D.O.T. 1.

breakers. a. The face of a level or drift. Fay. b. A fracture in the strata. Eng. For the purpose of mining operations, for the purpose of inducing fractures. Nelson. c. To split into pieces or smash into parts or fragments typically by a blow or stress and with suddenness or violence; to separate; to burst. Webster 3d. d. Scot. A reduction of the day's wage. Fay. e. Can. Local shear zone within which mines arc induced to break circulation. To resume the movement of drilling fluid down the drill pipe through the eyes of the bit, and upward through the annulus. Brantly, 1.

breast wall. Eng. Fissures in old coal workings. Also called crack-off man; knocker-off; D.O.T. 1.

breast zone. See surf zone. Schiferdecker.

breakage. a. Voluntary or involuntary division of a solid. B.S. 3552, 1962. b. Small material produced by involuntary breakage during mechanical handling or processing. ASM Gloss.

breakage clause. Eng. A clause inserted in some mining leases providing for an abatement of royalty or allowance on weight for certain weight of small coal or breakage sent out in every ton of large coal, for example, 120 pounds in every culler's ton of 2,640 pounds. Fay.

breakage of coal. See degradation. Nelson.

breakaway chain. A chain that holds a tractor and a towed unit together if the regular fastening opens or breaks. Also called safety chain. Nichols.

breakback. The fractures caused by the shattering of solid rock ledge back of the drill holes in which the charge is placed. Fay.

break circulation. To resume the movement of drilling fluid down the drill pipe through the eyes of the bit, and upward through the annulus. Brantly, 1.

breakdown. a. Of an emulsion, the reunion of the finely dispersed particles and their separation from the medium which they form an emulsion. C.T.D. Supp. b. The sudden passage of current through an insulating material, as soon as the voltage exceeds a certain definite value called the breakdown voltage. C.T.D. c. An initial rolling or forging operation, or a series of such operations, for the purpose of reducing a casting or extruded shape prior to forging. ASM Gloss. d. A preliminary press forging operation. ASM Gloss. e. Mechanical failure. Pryer.

breakdown of emulsion. The separation of an emulsion into its constituents; in a bituminous emulsion, these are bitumen and water. Hem.

breakdown voltage. The voltage at which an insulator or dielectric ruptures; or the voltage at which ionization and conduction begin in a gas or vapor. HOG.

breaker. a. In anthracite mining, the structure in which the coal is broken, sized, and cleaned for market. Also known as coalbreaker. Fay. b. N. of Eng. A large crack formed in the roof next to the goaf. Fay. c. Som. A coal miner or hewer. Fay. d. In Italy, a collier who wedges down coal and hammers it into coal. Fay. e. A small narrow across a road for drainage. Webster 3d. f. In the quarry industry, one who operates a crane to load freight (wedges and two metal strips on each tapering side) in each hole drilled in stone, or along a channel. Also called crane. D.O.T. 1. g. A machine used for the primary reduction of coal, ore, or rock. Crushing generally refers to the finer reduction of the material. Nelson. h. A wave breaking into beam against the shore. Synonym for breaking wave. Schiferdecker.

breaker boss. A foreman who is in charge of operations in an anthracite breaker where coal is washed, sized and cleaned for market. D.O.T. 1.

breaker chain; breaker; break-off man; breaker of slate. See slate picker. D.O.T. 1.

breaker engine. In anthracite coal mining, the coal which operates and maintains a power unit and machinery for crushing, sizing, and cleaning coal in a breaker. D.O.T. 1.

breaker props. Strong rigid props set along the edges of roadways, in longwall mining, to cause the explosives to shear the rock square with the roadway sides, rather than allow the force to spread over the waste area. See also waste edge support. Nelson.

breaker repairman. In anthracite coal mining, a maintenance mechanic who adjusts and repairs machinery in a breaker where coal is crushed, sized, and cleaned for market. D.O.T. 1.

breakers. a. The face of a level or drift. Fay. b. A fracture in the strata. Eng. For the purpose of mining operations, for the purpose of inducing fractures. Nelson. c. To split into pieces or smash into parts or fragments typically by a blow or stress and with suddenness or violence; to separate; to burst. Webster 3d. d. Scot. A reduction of the day's wage. Fay. e. Can. Local shear zone within which mines arc induced to break circulation. To resume the movement of drilling fluid down the drill pipe through the eyes of the bit, and upward through the annulus. Brantly, 1.

breakdown. a. Of an emulsion, the reunion of the finely dispersed particles and their separation from the medium which they form an emulsion. C.T.D. Supp. b. The sudden passage of current through an insulating material, as soon as the voltage exceeds a certain definite value called the breakdown voltage. C.T.D. c. An initial rolling or forging operation, or a series of such operations, for the purpose of reducing a casting or extruded shape prior to forging. ASM Gloss. d. A preliminary press forging operation. ASM Gloss. e. Mechanical failure. Pryer.

breakdown of emulsion. The separation of an emulsion into its components; in a bituminous emulsion, these are bitumen and water. Hem.
breaking-down machine

breaking-down mill. Engine. A mechanical appliance, worked by compressed air or by hydraulic power, for breaking down coal after hoisting. Fay.

breaking-down mill rolls. A rolling mill unit used for breaking-down operations; a rolling mill used for modifying the sectional dimensions, mainly the thickness of ingots, billets, and other rough, semifinished products, as a preliminary step to subsequent rolling operations. Henderson, p. 273.

breaking ground. a. The breaking and loosen-
ing of rock, as a preparatory step to its loading and removal. See also excavation. Nelson.
b. Attrition of ore by hand, explosive, or mechanical breaking methods to reduce it to pieces of ore suitable for transport and treatment. Pryor.

c. break in. Trist.

breaking joints. Unscrewing drill

breaking bad. Stress or tension

breaking point. In rock crushers, a

breaking piece. Part of a machine designed to fail in overload, thus providing easy

breaking strain; breaking strength. The least load that will cause a rupture, as in crushing, breaking, etc.

beak. a. A short narrow heading driven from one road to another; a breakthrough. Fay. b. Dog. An alteration in the vein due to an intrusion of barren rock, or to a fault. Fay.

breakout. a. To pull drill rods or casing from a borehole and unscrew them at points where they are joined by threaded couplings to form lengths that can be stacked in the drill tripped or derrick. Compare breaking joints. Long. b. An accidental flow of metal through a hole in a furnace lining. Bureau of Mines, Staff. c. In dry process enameling, a defect characterized by an arc of well-defined boundaries. ASTM C286-65.

breakout block. A block of steel made to fit the square section of a drill bit and to hold it with the greatest possible while breaking the joint. Porter.

breakout gun. A hydraulic or compressed-air actuated device attached to breakout tongs used to couple or uncouple drill rods, drill pipe, casing, or drive pipe. Also called makeup gun.

breakout tongs. A heavy wrench, usually mechanical arrangements, used to couple or uncouple drill rods, drill pipe, casing, or drive pipe. Also called makeup tongs.

break up. Clev. A system of employing unskilled men, the former paying the

latter a mere laborer's wage until he becomes an experienced miner. Fay.

breakup. a. On exhaustion of an ore deposit or exhaustion of the exploitable value on site of buildings, equipment, stockpiles, untouched remnants of ore, concentrates, etc., in foundations of plant and any other assets still having value apart from their original use. Pryor.

breakwater. A structure or contrivance, as a mole, mound, or wall serving to break the force of waves and protect a harbor or anything exposed to the force of the waves. Fay.

breakway. The running back downhill of a tram or tramway (usually loaded) on an inclined haulage plane, due to the break-

break of the circuit. Fraenkel, v. Wire receiving the firing impulse and caps, the time elapsing between the bridge and the main pre.sure on the main. Fay.

break of ice on a river or other

break in the reef. Aust. A fault in a

break line. a. The line in which the roof of a coal mine is expected to break. Fay. b. The line of complete extraction of coal. Fay. c. A line roughly following the rear edges of the pillars that are being drawn concurrently. Fay.

breast beads. Natural joints in rock, coal, etc. Fay.
breast holes. In driving a tunnel, holes blasted after the bottom cut. Pryor, 2.
breasting. a. N. Staff. A short leading stall, weight to and forming the face of the main levels. Fay. b. A wide heading or level. Fay. c. Eng. Taking ore from the face or head of a drift. Fay. d. In drift mining, breaking down the gravel underground, and retreating towards the crosscut from which the drift was worked. Berntsen. e. Eng. In Cumberland, a place driven to open out a longwall face. SMiRB, Paper No. 61.
breast machine. A machine used for underground cutting coal in which the main frame and carriage are held stationary by roof jacks while the cutters advance into the face during the cutting operation. Since cuts do not exceed 44 inches along the face, it is necessary to rebate the machine several times before the entire face can be cut. Jones.
breast plate. A slightly curved iron plate fastened to the end of a coal auger to enable the miner to press the auger forward with his body to work against a known size of rock. Fay.
breasts. The sloping parts joining the hearth of an open-hearth furnace to the furnace end, below the ports and adjoining brickwork. See also doors. Banks.
breast stopping. A method of stopping employed on veins where the dip is not sufficient to keep the ore to be removed by gravity. The ore remains close to the working face and must be loaded into cars at that point. See also overhand stopping. Fay.
breast timber. A leaning brace from the floor of an excavation or a wall supported by a breast wall. Fay. breast wall. a. Eng. A wall built to prevent the falling of a vertical face cut into the natural soil. Zern. b. The sidestraight of a glass tank furnace above the tank blocks. Also called caving wall; casement wall; jamb wall. Dodd. c. The bearing wall between the pillars of a glassmaking pot furnace and in front of the pot. Dodd.
breast wheel. A waterwheel onto which the water is led at about axle height and which acts both as a support of the drying house, the windows of which are arranged along the inner edge of the drying house, and in front of the pot. Dodd.
breath. a. Eng. The word used to denote any wind or air, not necessarily clean. Also the word used to denote the act of inhaling or breathing. c. The reference is to how the water wheel acts on the vessel. Compare overshot wheel; undershot wheel. Webster 3d.
breathwork. In the construction industry, one who works in a tunnel heading. D.O.T. 1.
breather. a. Eng. An apparatus enabling a man to enter and explore underground workings filled with noxious gases. Fay. b. A device fitted in the wall of an explosion-proof compartment, or connected by piping thereto, which permits relatively free passage of air through it, but which will not permit the passage of incendiary soot or flames in the event of gas ignition inside the compartment. ASA C42.35: 1956.
breathing. Alternate expansion and contraction of air in bransch which allows fresh oxygen to be drawn in and oxidation to proceed. Sinclair, I., p. 286.
breathing apparatus. An apparatus that enables a person to work in an explosive or poisonous gas. It contains a supply of oxygen and a regenerator which removes the carbon dioxide exhausted from the supply. See also Gibbs apparatus; Proto apparatus; Simbal breathing apparatus; W'g rescue apparatus. Nelson.
breathing cave. A cave in which air is alternately blown out and sucked in at the entrance. Conway, p. 18. b. A narrow part in a passage through which air blows. Schieferdecker.
breccia. a. A. A fragmental rock, the components of which are angular, and therefore, it is distinguished from a conglomerate in that its components are not water-worn. There are friction or fault breccias, talus breccias, and eruptive breccias. Fay. b. Any rock formation essentially composed of unconsolidated, or loosely consolidated, angular-shaped fragments. Compare broken ground. Long.
brecciated. Any marble composed of angular fragments. Fay.
brecciated structure. Characterized by agglomeration of angular fragments. May be a primary sedimentary structure related to desiccation, slump, etc., also produced by tectonic movement and other causes. Pettijohn.
brecciated vein. A fissure filled with fragments of rock and in the interstices of which vein matter is deposited. Fay.
bredge. The form of calcium orthosilicate is stable up to 1,477°C on heating, persisting down to 670°C on cooling. See also calcium orthosilicate. Dodd.
breeching. a. Mid. Drawing loaded trams downhill underground. Fay. b. The part of a harness that passes around the breech of a draft animal and enables him to support by brattices built on each side. Fay. c. The part of a harness that passes around the breech of a draft animal and enables him to support by brattices built on each side. Fay.
breech hole. In driving a tunnel, a hole blasted in the face of the tunnel and then filled with noxious gases. Fay.
breeching fire. a. A smolder, or an old variant described from the word burn; a burn. Fay.
breeder. a. A reactor that produces additional fissionable material. In some usages, a reactor that produces energy, regardless of the amount. The reactor that produces energy, regardless of the amount. The breeding gain when neutrons are absorbed in the reactor. See also conversion ratio. LBL.
breeding gain. See breeding ratio. LBL.
breeding ratio. The ratio of the number of fissionable atoms produced in a breeder reactor to the number of fissionable atoms consumed in the reactor. Breeding gain is the breeding ratio minus 1. See also conversion ratio. LBL.
breezy. a. A thin deposit of metal is incorporated with the reducing agent necessary to form the metal. The usual procedure is to apply the metal as its anode dissolved in an organic solvent. Although the easiest heater to apply, it is less durable means clinker, but it may refer to coke breeze. Taylor.
breeze case. A concrete made of 3 parts coke breeze, 1 part sand, and 1 part portland cement. It has poor fire-resistant qualities and is cheap and nails can be driven into it. Nelson.
breeze oven. A oven for the manufacture of small coke. Fay. b. A furnace designed to consume breeze or coal dust. Fay.
breezing. Buckwheat anthracite coal or coarse sand spread on seage before setting of pota. ASTM C162-66.
breithauptite. Nickel antimonide, NiSb. See also nicalcite. Fay.
breithauptite. Nickel antimonide, NiSb. See also nicalcite. Fay.
brick. a. A molded block of clay or other material, usually fired and sintered together to form a coherent mass. The standard size of building brick unit is 8 1/2" X 4 1/2" X 2 1/4" inch, while the standard size firebrick unit is 2 1/4" X 2 1/4" X 3 1/2" inch. However, many firebrick consumers now prefer to use a 9 X 4 1/2" X 3 1/4" inch brick as the standard unit. A.S.I. No. 24, b. A solid masonry unit, such as clay or shale, usually formed while plastic into a rectangular prism and burned or fired in a kiln. ASTM C43-65T.

brickbat. A piece, usually half, of a brick. See head brickbat.

brick coal. Eng. Small, dirty coal used to fire brick kilns as well as in the firing zone of rotary lime, cement, or dolomite kilns. ACSG.

brick coalty. a. A variable color averaging a moderate reddish-brown that is redder, lighter, and stronger than mahogany, ox-blood, or rustic brown, paler than Tuscan red, yellower, lighter, and stronger than roan. Webster 3d. b. A moderate brown that is redder, lighter, and stronger than chestnut brown, bay, coffee, or auburn, and deeper and slightly redder than toast brown. Webster 3d.

brick saw. A mechanically driven abrasive disk used for cutting brick. ACSG, 1963. See chemical brick saw.

brick settings. A wire or cable used with carbide brick as they are extruded in a column. ACSG, 1963.

brick setting. A permanent support for circular shafts. On reaching the rockhead, a firm ledge is prepared to receive the first bricking curb or ring. The curb is fixed correctly with reference to the center-line of the shaft. The bricks are then built upwards from the curb, the space behind being firmly packed with bricks on the sides with bricks and mortar. Concrete is replacing brickwork as a shaft lining.

brickcutter. A wire or cable used with carbide brick in the manufacture of refractories. CCD 6d, 1963.

brick cutting. a. A trade, in the manufacture of bricks or tile. See also brickcutting.

brick cutting. a. An oven for drying green bricks, so as to prepare them for burning. C.T.D.

brick cutting machine. a. A device to measure the resistance of a wire or other conductor forming a part of an electric circuit. Fay. b. A piece of timber held above the cap of a set of bricks and used to convey fuel or ore to the mouth of a shaft when landing coal, rock, or men at the surface. Fay. c. A brick furnace. Webster 3d.

brick machine. A permanent support for circular shafts. C.T.D.

brick machinery. A variable color averaging a moderate reddish-brown that is redder, lighter, and stronger than mahogany, ox-blood, or rustic brown, paler than Tuscan red, yellower, lighter, and stronger than roan. Webster 3d. b. A moderate brown that is redder, lighter, and stronger than chestnut brown, bay, coffee, or auburn, and deeper and slightly redder than toast brown. Webster 3d.

brick saw. A mechanically driven abrasive disk used for cutting brick. ACSG, 1963. See chemical brick saw.

brick setting. A wire or cable used with carbide brick as they are extruded in a column. ACSG, 1963.

brick walling. A permanent support for circular shafts. On reaching the rockhead, a firm ledge is prepared to receive the first bricking curb or ring. The curb is fixed correctly with reference to the center-line of the shaft. The bricks are then built upwards from the curb, the space behind being firmly packed with bricks on the sides with bricks and mortar. Concrete is replacing brickwork as a shaft lining.

brick yard. A place where bricks are made and stored. Standard, 1964.

bridgel. A conveyance used in coal mining to prevent cars from overturning upon steep inclined planes having a rise of over 3 or 4 feet. Hess.

bridge. a. A device to measure the resistance of a wire or other conductor forming a part of an electric circuit. Fay. b. A piece of timber held above the cap of a set of bricks and used to convey fuel or ore to the mouth of a shaft when landing coal, rock, or men at the surface. Fay. c. A brick furnace. Webster 3d.

brick machine. A permanent support for circular shafts. C.T.D.

brick machinery. A variable color averaging a moderate reddish-brown that is redder, lighter, and stronger than mahogany, ox-blood, or rustic brown, paler than Tuscan red, yellower, lighter, and stronger than roan. Webster 3d. b. A moderate brown that is redder, lighter, and stronger than chestnut brown, bay, coffee, or auburn, and deeper and slightly redder than toast brown. Webster 3d.

brick saw. A mechanically driven abrasive disk used for cutting brick. ACSG, 1963. See chemical brick saw.

brick setting. A wire or cable used with carbide brick as they are extruded in a column. ACSG, 1963.

brick walling. A permanent support for circular shafts. On reaching the rockhead, a firm ledge is prepared to receive the first bricking curb or ring. The curb is fixed correctly with reference to the center-line of the shaft. The bricks are then built upwards from the curb, the space behind being firmly packed with bricks on the sides with bricks and mortar. Concrete is replacing brickwork as a shaft lining.

brick yard. A place where bricks are made and stored. Standard, 1964.

bridge. a. A device to measure the resistance of a wire or other conductor forming a part of an electric circuit. Fay. b. A piece of timber held above the cap of a set of bricks and used to convey fuel or ore to the mouth of a shaft when landing coal, rock, or men at the surface. Fay. c. A brick furnace. Webster 3d.
bridge break. The time which elapses between the application of current and the fusion of the bridge wire when using instantaneous blasting caps. Streetler, p. 44.

bridge cup. The highest portion of a bridge pier, on which the bridge bearing is seated. Ham.

bridge conveyor. A conveyor which is supported at one or both ends by a loading unit and at the other end by a receiving unit in such a way as to permit changes in the position of either end without interrupting the operation of the loading unit. NEMA MBI-1961.

bridge deck. See bridge wall cover. ASTM C162-66.

bridged. A borehole plugged by debris lodged at some point above the bottom of a hole. The hole may be bridged deliberately by introducing foreign material into the hole or by rock fragments sloughing off the sidewalls of the borehole. Lord.

bridge deck. The load-bearing floor of a bridge, carrying and distributing the loads to the main beams. The present trend is to form such decks in prestressed concrete, welded steel, or aluminum alloy. Ham.

bridge operator. One who operates an ore bridge of the gantry crane type. Fay.

bridge over. Collapse of well bore around the drill stem. Williams.

bridge pier. The support for a bridge, which may be of masonry, concrete, steel, or timber; it must be erected on a firm bearing stratum so as to provide the necessary stability, and therefore sometimes entails excavation. Ham.

bridge rails. Aust. Rails made in the form of an inverted U, generally in short lengths, which are light to handle, and can be brought within easy shoveling distance of the face. Fay.

bridge rock. Delicate plugging of a borehole at a point some distance above the bottom by introduction of some type of foreign material or a plug. See also e and f. Long.

bridge thrust. The horizontal force exerted by the arch of an arch bridge under load. This force is resisted by a horizontal reaction at the abutment, or in a bowstring girder by reaction in the tie beam. Ham.

bridge tramway. Consists of two steel bridge trusses braced together so as to form between them a trestle on which to carry trolley runs. The bridge is carried at or near the ends on steel towers supported which are wheeled rails running lengthwise of the storage. The bridge thus spans the area over which material may be piled, and the length of this area is limited only by the length of the track. Either of each end of the bridge may be fixed or seated on expansion rollers. Fay.

bridge truss. A truss designed to carry bridge loads, which differ from those in building structures. Ham.

bridge wall. A low separating wall usually of firebrick which forms the back of such a wall in a reverberatory furnace. Webster 3d.

bridge wall cover. Refractory blocks spanning the space between the bridge walls. ASTM C162-66.

bridge wire. The fine platinum wire which is heated by the passage of an electric current to ignite the priming charge of an electric blasting cap, an electric squib, or similar device. Fay.

bridging. a. In crushing practice, the obstruction of the receiving opening by two or more pieces wedged together, each of which could easily pass through. Nelson. b. Formation of arches of keyed or jammed particles across the bottom of a hole through aperture or of small particles through filter pores. Fryor, s. e. Arching of the charge across the shaft in a blast furnace or cupola. Bureau of Mines Staff. d. Premature solidification of metal across a mould section before the metal below or beyond solidifies. ASTM Gloss. e. Solidification of slag within the cupola at or just above the tuyeres. ASTM Gloss. f. Welding or mechanical locking of the change in a downdraft melting or smelting furnace. ASTM Gloss. g. Preclude metallurgy, the formaed, or rafted cavities in a powder mass. ASTM Gloss. h. Closing of a section of a drill hole by debris of rock material or by squeezing of plastic shale etc. Bureau of Mines Staff.

bridging oxygen. An oxygen ion placed between two silicon ions, for example, in the structure of a silicate glass. Dodd.

bridgeman sample. A mechanical device that automatically selects two samples as the ore passes through. Fay.

bridle bar. See bridle rod. Fay.

bridle cable. An anchor cable that is at right angles to the line of pull. Nichol.

briddle chains. a. The chains used for supporting the cage from the winding rope. Usually four chains are used, one for each corner, and are gathered together at their upper ends to be connected to a attaching hook by a spreader plate. The plate is made large enough to receive the four D links to which the respective chains are attached. Nelson. b. Safety chains to support the cage if the shackles should break, or to protect a train of cars on a slope should the shackle or drawbar fail. Fay.

bridle hitch. A connection between a bridle cable and a cable or sheave block. Nichol.

briddle iron. A strong, flat iron bar 90 bent as to support, as in a stirrup, one end of a derrick, where no sufficient bearing can be had. Webster 2d.

briddle rod; bridle bar. A steel tie bar used to join the ends of sections of a drawbar to hold them to gage in the proper position. Webster 3d.

bridle rope. A fixed rope supporting a jib or boom. Ham.

brider. N. of Eng. A beam or girder fixed across a shaft, etc. Ham.

bridesman. Member of a Rand mine rescue team equipped with Proto breathing apparatus. Bruggs.

briggs climophones. An instrument used in measuring borehole deviation which transmits electrical signals, communicating to the surface the position of a plum bob fitted with a needle relative to four electrodes arranged laterally, and W, the needle and electrodes being immersed in the electrolyte. Signals are matched with a similar arrangement of needle and electrodes at the surface and the deviation is then read off on a deviation and the direction of deviation. Sinclair, 11, p. 243.

briggs equalizer. This consists of a head hammer for firing a charge of up to 30 pounds of nonexplosive, corrugated breathing tube, Briggs equalizing device, 120 feet of reinforced air tubes, and a strainer and spike. It has neither bellows nor rotary blower but depends entirely on the action of the equalizer for comfortable respiration. The resistance to breathing is so low that reasonably hard work can be done by the wearer over a period of 2 hours or more. The supply tubing is attached to the waist by a strong leather belt. Mason, v. 1, pp. 237-259.

briggs stretcher carriage. A stretcher used as an ambulance trolley in transporting casualties from underground workings. The stretcher has rests which are supported by coil and tension springs to protect the patient from bumps, and also an adjustable wheel base which allows the carriage to be maneuvered around sharp corners or to be raised or lowered to correspond to the mine haulage system. McAdam, pp 105-106.

bright annealing. Annealing in a protective medium to prevent discoloration of the bright surface. ASTM Gloss.

bright attrition. A field term to denote the degree of luster of attritol coal compared to the brilliant luster of associated vitrain. Compare moderately bright attritium; crudely dull attritu; dull attritur. A.G.I.

bright-banded coal. Coal consisting of vitrain and clarain, more or less durain and minor fusain. See also banded coal. Compare dull-banded coal. A.G.I.

bright-cherry-red heat. Division of the color scale generally given as about 815° C (1,490° F). Bureau of Mines Staff.

bright coal. a. The constituent of banded coal which is of a jet black, pitchy appearance, more or less brightly attritum, and breaking with a conchoidal fracture when viewed macroscopically, and which in thin section always shows preserved cell structure of woody plant tissue, either of stem branch, or root. Same as anthraxylum. A.G.I. b. A constituent of anthraxylum and attritum, in which the translucent cell-wall degradation matter or transversely cut hemic matter predominates. Compare semiplate coal; intermediate coal; semidull coal; dull coal. A.G.I. c. A banded coal containing less than 20 percent opaque attritium and more than 5 percent anthraxylum. Compare semiplate coal; splint coal. A.G.I. d. A type of banded coal containing from 100 percent to 81 percent pure bright ingredients (vitrain, clarain, and fusain), the remaining consisting of clarodurain and durain. Compare semiplate coal; intermediate coal; semidull coal; dull coal. A.G.I. e. An old mining term for lustrous coal. In 1931, R. Thompson defined this coal as being composed of anthraxylum and attritium in which the translucent matter predominates and thereby established the concept of remaining coal as a piece of anthraxylum. In 1948, B. C. Parks and H. J. O'Donnell provided a quantitative definition based on the macroscopic appearance of the coal to a person with normal vision. According to their definition, bright coal is a type of banded coal composed macroscopically of at least 81 percent anthraxylum and less than 20 percent opaque matter, the measurements being made perpendicular
bright coal
to the bedding across the entire thin section (2 to 3 centimeters in width). This coal can be entirely or in greater part of anthracitoly; it can also be attirial providing the content of opaque ataraxic remains or gangue from the external surfaces of the table and other faces of a gemstone. See also total reflection; luster; brillitation (of a gemstone). The amount of light reaching the eye as a result of (1) reflections from the internal surfaces of facets (called total internal reflection); and (2) transmission from the external surfaes of the table and other faces of a gemstone. See also total reflection; luster; brillitation.

brilliation of diamond. The most effective form of cutting for diamond, and so usual for this microscopic, and determines hardness number of sample from chart that expresses hardness in terms of diameter of impressions produced under standard test conditions. Also called Brinell operator. D.O.T. 1.
bright. A smooth parting or separation. A. York. A smooth parting or joint in coal; a plane of cleavage. Fay.
bright. b. The principal cleat in coal. Arkel.

brilliance: brilliancy (ok a gemstone). The amount of light reaching the eye as a result of (1) reflections from the internal surfaces of facets (called total internal reflection); and (2) transmission from the external surfaes of the table and other faces of a gemstone. See also total reflection; luster; brillitation.

brilliant-cut. The most popular cut for most stones; with round girdle outline and usually 58 facets, sometimes or combination of these facets are.

brilliant-cut. A cut used for diamonds and certain other gemstones, characterized by a large number of facets and a high degree of brilliance. The brilliance of a brilliant-cut diamond is increased by the use of a good girdle, which helps to reduce internal reflection and glare.

brilliant-cut. The most popular cut for most stones; with round girdle outline and usually 58 facets, sometimes or combination of these facets are.

brilliant-cut. A cut used for diamonds and certain other gemstones, characterized by a large number of facets and a high degree of brilliance. The brilliance of a brilliant-cut diamond is increased by the use of a good girdle, which helps to reduce internal reflection and glare.
Bristol recorder

equation, it will indicate when a support is operating with a faulty valve. Nelson.

Britannia cell. In mineral processing, a pneumatic flotation cell 7 to 9 feet deep. See also flotation cell. Fryer, 3.

Britannia metal. Alloy of from 80 to 90 percent tin with antimony, copper, lead, or zinc or a mixture of these. Fryer, 3.

britching. See also breeching, b. Fay.

brittle crack propagation. A very sudden brittle fracture that occurs without appreciable plastic deformation. ASM Gloss.

brittle-ring test. A test to determine the behavior of a ceramic material under tensile stress; a test piece in the form of an annulus is loaded along a diameter so that maximum tensile stresses develop on the inner periphery of the annulus in the plane of loading. Compare Brauns test. Dodd.

brittle substance. A substance for which the yield point and the point of rupture lie close together. Brigg, p. 189.

broach. a. To restore the diameter of a borehole by reaming. Long, b. To break down the walls between two contiguous drill holes. Long, c. A bar-shaped cutting tool provided with a series of cutting edges or teeth that increase in size or diameter in shape from the starting to the finishing end. The tool cuts in the axial direction when pushed or pulled and is used to enlarge bores or outside surfaces. ASM Gloss. e. A sharp-pointed chisel, used especially for rough-dressing stone. Winser 2 to 3 feet. Fay, g. To shape (a block of stone) roughly by chiseling with a coarse tool. Webster 3d.

broaching. a. Trimming or straightening a mine workroom of rock excavation employed where it is important that the adjacent rock formation should not be shattered by explosive. A line of closely spaced holes is drilled along the required line of breakage. The rock between the holes is kept out with a broach and removed with the aid of wedges. Ham. See also channeler, a. c. Removing metal stock from a workpiece with a broach. ASM Gloss.

broadside shooting. A refraction type of seismic shooting used to determine the structure across a strike. The broadside lines are ordinarily laid out in conjunction with the standard-type profiles that run along the strike. The shot points and detector spreads are laid out along parallel lines which are generally across the strike. The distance between each line of shots and the receiving line is chosen so that it will always be greater than the double offset distance for the primary refracted event will be received as a second arrival. When this spacing is used, the refracting point associated with the shot will be very close to that associated with the detector and each of the further shots will be at an intercept time. A single depth point (based on half the intercept time) is then plotted midway between shot and receiver. The depth points are thus placed along the "control lines" which are located halfway between the shooting line and the receiving line. Dobrin, pp. 96-97.

broadside. A paving slab, so called because it is broad and thin, and cut from out of the quarries, not above 2 or 3 inches in thickness. Arkell.

breadstone bind. Eng. Shale or clay that breaks up into large blocks or slabs. Fay.

broad veins. Where a broad vein apexes so that the boundary splits the apex, the extralateral rights go to the senior locator, who takes the entire width of the vein on the dip; that is, a broad lode that is bisected by the division sideline between two mining claims belongs to the claim having the prior location. Lewis, p. 34.

broad. a. A heavy spike, driven alongside the end of an abutting timber to prevent its slipping. Fay, b. Mid. A short, thick timber, proper or sprag for supporting the coal while it is being hauled. Fay. c. An English term for a wrought-iron spike driven into bars and stiles to steady the head or foot of a prop. Stauffer.

brocadel. A type of bronze powder consisting of coarse metal flakes prepared from the waste of metal-leaf factories. Camm.

Brocatelle marble. A variety of marble from the French Revens. The body of the stone is fine, compact, and of light yellow color traversed by veins and dull red blotches. The name being that of a coarse kind of tapestry, which the marble somewhat resembles. Fay.

bronzite. A mineral, Cu(OH)2SO4, common in the oxidation zone of copper sulfide deposits; monoclinic; emerald-green to dark green color; formed by the decomposition of chalcopyrite. A.G.I.; Dana 17.

B rod. A former standard diamond drill rod having an outside diameter of 14Inches. p. 328.
Brod

Superseded in 1954 by a new standard drill rod designated by the letter name BW. Long.

Broil. A collection of loose rock fragments usually closely spaced, and indicating the presence of a mineral vein beneath; outcrop; gossan. Also spelled bryle; broyl. Fay.

Broken. a. Eng. That part of a mine where the mineral has already been partly worked away, and where the remainder is in course of being extracted. Fay. b. The dislocation of a vein by faulting. Weed, 1922. c. Term used to denote a mixed succession of depositions; a broken sand usually has shaly layers in it. Wheeler. c. See broken coal.

Broken. a. Ashlar in which the stones are rectangular, but of different sizes and shapes Webster 3d.

Broken charge. A charge of explosive in a broken ground.

Broken coal. In anthracite only; coal that has been rounded through use and repeated forcing the diamonds to seat themselves. Gradually removing the excess matrix and rotated slowly under a light load for a length of time.

Broken coal. a. A newly set bit, which has been worked away, and where the remainder is in course of being extracted. Fay. b. A newly set bit, which has been worked off in transit leaving only some part of a skip load. Fay. c. Shattered rock that has been shattered in use. Long. d. A diamond that, in use, has lost a portion of its mass by cleaving action. Long. e. A diamond, the size and shape of which have been changed by deliberate cleaving. Long. d. See crushed stone. Mined coal, 630, 1965, p. 685.

Broken working. The working away or removal of blocks or pillars of coal formed by whole workings. Fay.

Brokens; robbery; robbing pillars. Eng. The removal or extraction of pillars previously formed in bord and pillar working. Brokens usually is preceded by its principal alloying element as, for example, aluminum bronze, silicon bronze, tin bronze, etc. Henderson. a. Any of the copper-base alloys including all copper alloys other than zinc and in sufficient amounts to be predominant over the zinc in the alloy. Henderson. d. An alloy composed mainly of copper and tin. Various other elements may be added in small amounts for certain specific purposes. A number of copper alloys are referred to as bronzes although they contain no tin. The American Society for Testing Materials has classified all copper-base alloys on a basis of composition ranges of the principal alloying elements. Henderson.

Bronze mica. Synonym for phlogopite. Fay.

Bronze pearls. The variety of so-called black pearls with a bronze-like color and sheen. Shipley.

Bronze tubes. Tubes of bronze or copper embossed with a ridge at the outer (principally) for the circulation of water to counteract the intense heat. Mersereau, 4th, p. 19.

Bronze welding. Gas welding of copper, steel, or other metals using a filler rod of silicon brass alloy. This process is easier than fusion welding because the temperature is lower, yet it generally exceeds 850° C, and the joint is therefore usually unnecessary and can be carefully controlled in a factory.

Bronzite. A mineral consisting of a ferriferous variety of enstatite often having a luster like that of bronze, (Mg,Fe)SiO3; orthorhombic. Webster 3d; Dana 17. b. It is often used as a prefix to the names of rocks containing the mineral. Rocks of the gabbro family are the most common ones having the prefix. Fay.

Brooking. See broaching. Fay.

Brooking. See broaching. Fay.

Brookfield viscometer. An electrically operated rotating cylinder viscometer in which the drag is recorded directly on a dial; it has been used in the testing of vitreous-cast alloy. Dodd.

Brookhill wafer. A coal cutter with the ordinary horizontal jib and also a shearing or mowing jib. In some cases, a flight loader follows it along the face to load the cut coal onto the face conveyor (named after Brookhill-collie.)

Brookite. Titanium dioxide, TiO2. Identical in composition with rutile, but occurs in

with a hammer or a gend in rock that is loose and liable to fall. Fay.

Bronze. a. Any of the many copper-base alloys in which tin is the principal alloying element, with or without other alloying elements. Also called tin bronze. Henderson. b. Any of the many copper-base alloys having, as the principal alloying element, any element other than zinc. The term usually is preceded by its principal alloying element as, for example, aluminum bronze, silicon bronze, tin bronze, etc. Henderson. c. All copper-base alloys containing all copper alloys other than zinc and in sufficient amounts to be predominant over the zinc in the alloy. Henderson. d. An alloy composed mainly of copper and tin. Various other elements may be added in small amounts for certain specific purposes. A number of copper alloys are referred to as bronzes although they contain no tin. The American Society for Testing Materials has classified all copper-base alloys on a basis of composition ranges of the principal alloying elements. Henderson.

Bronze mica. Synonym for phlogopite. Fay.

Bronze pearls. The variety of so-called black pearls with a bronze-like color and sheen. Shipley.

Bronze tubes. Tubes of bronze or copper embossed with a ridge at the outer (principally) for the circulation of water to counteract the intense heat. Mersereau, 4th, p. 19.

Bronze welding. Gas welding of copper, steel, or other metals using a filler rod of silicon brass alloy. This process is easier than fusion welding because the temperature is lower, yet it generally exceeds 850° C, and the joint is therefore usually unnecessary and can be carefully controlled in a factory.

Bronzite. A mineral consisting of a ferriferous variety of enstatite often having a luster like that of bronze, (Mg,Fe)SiO3; orthorhombic. Webster 3d; Dana 17. b. It is often used as a prefix to the names of rocks containing the mineral. Rocks of the gabbro family are the most common ones having the prefix. Fay.

brown translucent orthorhombic crystals. Fay.

brouse. The crushing and spreading of the head of a timber pile not fitted with a driving band when driven into ground. Fay.

bros. Eng. In Sutherland, the imperfect coal in the lower part of the oolite formation. Fay.

Broseley tile. An old name for a plain clay roofing tile; such tiles were made in the Broseley area of Shropshire, England. Dodd.

browning; broom time. Scot. Mealtime. Fay.

browser. A rope or chain sling, the term applying to both two- or four-leg types. Fay.

browse. A sort of coarse stopping, made of small boughs of trees, and placed in back of shaft timbers to prevent rock from falling. Fay.

brown bar. Mid. A massive curb or beam of timber fixed in the wall of the shaft. Fay.

brown COAL a. A low-rank coal which is containing 20 or more percent water, brown coal between 10 and 20 percent water, and bituminous coal less than 10 percent water. Hess. b. A type of low-rank coal that is isolated from the bituminous and semianthracite coals by differences in ash content. Brown coal contains 20 or more percent water. A.G.I. Used as a building stone. Fay. c. A coal with a moisture content ranging from 30 to 55 percent and a total carbon content ranging from 65 to 75 percent. A.G.I. b. Same as brown coal. Tomkiewicz, 1954.

brown metal coal. Eng. Term used among Yorkshire miners for bituminous coal which when brown gives much brown or red dust. Tomkiewicz, 1954.

Brown muffle furnace. A mechanically raked roofed furnace of the straight-line type, with a series of longitudinal combustion flues placed under the hearth. Fay.

Brown panel system. a. Same as pillar-and-breeze. Fay. b. Coal mining by long rooms opened on the upper side of the gangway. The breasts are usually from 5 to 12 yards wide and are separated by pillars (solid walls of coal broken by crossheadings for ventilation) 5 to 12 yards thick. The pillars are robbed by mining from them until the roof comes down and prevents further working. Hess.

brown petroleum. A natural solid or semi-solid product produced by the action of air upon fluid bitumens. Fay.

brown soil. A zonal group of soils having a lower horizon which grades downwards into lighter colored soil and finally into a layer of carbonate accumulation. It is developed under shrub forests, bunch grasses, and shrubs in a temperate to cool, semiarid climate. A.G.I.

brown spar. Any light carbonate that is colored brown by the presence of iron carbonate, as ankerite, dolomite, magnesite, or siderite. Fay. Standard, 1964.

brownstone. A ferruginous sandstone, the grains of which are generally coated with iron oxide, whereas true hematite is an oxide of iron. Applied to a dark brown sandstone derived from the Triassic formations of the Connecticut River Valley. A.G.I. Used as a building stone. See also sandstone. Fay. b. Eng. Toadstone. Arkell.

brown turby furnace. A cylindrical tank or vat, tall in proportion to its diameter, with the bottom ending in a 60° cone. Within the tank is a hollow column extending from the bottom to within about 8 inches from the top. The apparatus works on the air-lift principle, the aerated pulp in the tube flowing upward, and discharging at the top while more pulp flows in at the bottom to take its place. It is in reality a pulp agitator. Also called Pachuca tank. Liddell 24, p. 390.

brown tum. A long-handled, pierlike device similar to a certain type of blacksmith tongs used to handle wash or drill rods in place of a safety clamp in shallow borehole drilling. Also called adjustable pipe tongs; extension tongs; lowering tongs. Long.

brown turpentine. An Irish name for the layer of bituminous coal that is situated between the white turf and the black turf and in composition intermediate between these two. Tomkiewicz, 1954.

brown umber. A brown earthy variety of limonite. Fay.

brownpiece. A heavy upright timber used for underpinning in opening a station for a level in a mine. Webster 3d. See also brown piece. Fay.

brown. Ore imperfectly smelted, mixed with cinder and clay. Fay.

Broxburn oil shale

33 to 40 pounds of ammonium sulfate per ton. Fay.

broyl. Corn. See broil. Fay.

Brunswick. A nearly colorless mineral, CaHPO$_4$. 2H$_2$O, consisting of calcium hydrogen phosphate in slender crystal or massive. Webster 3d.

Brunswick. A nearly colorless mineral, CaHPO$_4$. 2H$_2$O, consisting of calcium hydrogen phosphate in slender crystal or massive. Webster 3d.

Brunson, cosmet. A. An impure system of oil firing, particularly for the top-firing of annular kils, developed by A. A. Niesper in Switzerland, in 1864. Dodd.

broling man. A. A terns used in Arkansas and Missouri for one who removes fine ore from a working place, especially when the work is done with the hands. See also broining. Fay. b. In metal mining, one who loosens ore, blasted from the working face, with a pick or bar and pushes it down from a pile into contact with the scoop of a mechanical shovel or within reach of other muckers, to assist in loading cars. Also called brush hand. D.O.T. 1.

brushvigne. An olive-green to yellowish-green hydrous magnesium-iron, and magnesium, 9[Fe,Mg]O2Al$_2$O$_3$SiO$_2$OH. O. A chlorite near the metachlorite of the Buchholzite. Fine scale masses. From Rudaushal, Harz, Germany. English.

Brunswick. A small pocket compass with sights and a reflector attached, used in sketching mine workings, as in mine examinations, or in preliminarily surveys. Fay.

Brunswick compass. Synonym for Brunton. Long.
b. s. gang. The production crew, which, by
B-scope. A cathode ray oscilloscope indicator
Btu Abbreviation for British thermal unit.
B to B Abbreviation for back to back. Zim-
bubble. a. Air bubble in spirit level mounted
bu Abbrevation for
bubble hoick. A lightweight brick developed
bubble cap. A small, hollow, chemical stone-
bubble bear & peace. A process in which
bubble imp/endo. Small depressions, not
bubbles. Air introduced near bottom of flota-
tion cell containing pulped ore forms cour-
bubbles, which rise through the liquid and
bubbles; superficially resembling raindrop im-
bubbles sized and arranged to produce a dec-
bubbles; the train of bubbles they produce as
bushel. BuMtn Style
buck. a. A typically round and wooden
bucket. a. A round and wooden vessel for
drawiing up water from a well.
bucket. b. A vessel (as a tub or scoop)
bucket. c. A laborer who breaks ore.
bucket drill; bucket drilling. Originally de-
veloped as an aid in making excavations for
civil works and septic tanks; now used
mostly in drilling holes for
bucket. d. A small auger incorporat-
ing a steel tube to help hold
the bit. It is
bucket elevator. A conveyor consisting of a con-
tinuous line of buckets attached by pi-
nels to two endless roller chains running on
tracks and driven by sprockets. The buckets
are so pivoted that they remain in an
upright position and the soil is
absorbed by the filter. When tilted
into a dumping position by a
charger, the soil is
poured out of the bucket.
bucket conveyor. A conveyor consisting of a con-
tinuous line of buckets attached by pi-
nels to two endless roller chains running on
tracks and driven by sprockets. The buckets
are so pivoted that they remain in an
upright position and the soil is
absorbed by the filter. When tilted
into a dumping position by a
charger, the soil is
poured out of the bucket.
bucket drill. A drill having two pon-
toons, between which passes a
chain of digging buckets. These buckets
excavate material at the bottom of the
pond (pump) in which the dredge floats, and
deposit it in concentrating devices on
the decks. Pryor, 3.
bucket elevator. b. A typical round and wooden
vessel for drawing up water from a well.
bucket 3d. b. A vessel for hoisting and conveying
material (as coal, ore, grain, gravel, mud, or concrete).
bucket 3d. c. The device for the end of the arm of a
bucket dredge. Webster 3d. d. One of the receptacles on
the rim of a water wheel such as by which the water
rushed causing the wheel to revolve. Webster
3d. e. A float or paddle of a water
wheel or of a boat’s side wheel or stem
window.
bucket 4d. a. A large vessel or vessel for
hoisting and conveying material (as coal, ore, grain, gravel, mud, or concrete.
bucket 4d. b. A vessel for
hoisting and conveying material (as coal, ore, grain, gravel, mud, or concrete.
bucket 4d. c. The device for the end of the arm of a
bucket dredge. Webster 3d. d. One of the receptacles on
the rim of a water wheel such as by which the water
rushed causing the wheel to revolve. Webster
3d. e. A float or paddle of a water
wheel or of a boat’s side wheel or stem
window.
buck. b. A vessel (as a tub or scoop)
buck. c. A laborer who breaks ore.
buck. d. A small auger incorporat-
ing a steel tube to help hold
the bit. It is
buck. e. A vessel (as a tub or scoop)
bucket. a. A round and wooden vessel for
drawiing up water from a well.
bucket. b. A vessel (as a tub or scoop)
bucket. c. A laborer who breaks ore.
bucket drill drill. A drill having two pon-
toons, between which passes a
chain of digging buckets. These buckets
excavate material at the bottom of the
pond (pump) in which the dredge floats, and
deposit it in concentrating devices on
the decks. Pryor, 3.
buck. b. A vessel (as a tub or scoop)
buck. c. A laborer who breaks ore.
buck. d. A small auger incorporat-
ing a steel tube to help hold
the bit. It is
buck. e. A vessel (as a tub or scoop)
bucket. a. A round and wooden vessel for
drawiing up water from a well.
bucket. b. A vessel (as a tub or scoop)
bucket. c. A laborer who breaks ore.
bucket drill; bucket drilling. Originally de-
veloped as an aid in making excavations for
civil works and septic tanks; now used
mostly in drilling holes for
bucket elevator. A conveyor consisting of a con-
tinuous line of buckets attached by pi-
nels to two endless roller chains running on
tracks and driven by sprockets. The buckets
are so pivoted that they remain in an
upright position and the soil is
absorbed by the filter. When tilted
into a dumping position by a
charger, the soil is
poured out of the bucket.
bucket conveyor. A conveyor consisting of a con-
tinuous line of buckets attached by pi-
nels to two endless roller chains running on
tracks and driven by sprockets. The buckets
are so pivoted that they remain in an
upright position and the soil is
absorbed by the filter. When tilted
into a dumping position by a
charger, the soil is
poured out of the bucket.
bucket drill. A drill having two pon-
toons, between which passes a
chain of digging buckets. These buckets
excavate material at the bottom of the
pond (pump) in which the dredge floats, and
deposit it in concentrating devices on
the decks. Pryor, 3.
bucket elevator. A conveyor consisting of a con-
tinuous line of buckets attached by pi-
nels to two endless roller chains running on
tracks and driven by sprockets. The buckets
are so pivoted that they remain in an
upright position and the soil is
absorbed by the filter. When tilted
into a dumping position by a
charger, the soil is
poured out of the bucket.
bucket conveyor. A conveyor consisting of a con-
tinuous line of buckets attached by pi-
nels to two endless roller chains running on
tracks and driven by sprockets. The buckets
are so pivoted that they remain in an
upright position and the soil is
absorbed by the filter. When tilted
into a dumping position by a
charger, the soil is
poured out of the bucket.
bucket drill. A drill having two pon-
toons, between which passes a
chain of digging buckets. These buckets
excavate material at the bottom of the
pond (pump) in which the dredge floats, and
deposit it in concentrating devices on
the decks. Pryor, 3.
bucket elevator 2 inches in size. Nelson.
bucket elevator belt. A belt fabricated for bucket elevator use, to which elevator buckets are attached. ASA MH4.1-1958.
bucket elevator, perfect discharge. See positive discharge bucket elevator. ASA MH4.1-1958.
bucket elevator, positive discharge. See positive discharge bucket elevator. ASA MH4.1-1958.
bucket hooker. See can hooker. Q.T. 1.
bucketing. Eng. The operation of removing a wornout pump bucket or clack, and replacing it with a new one. Fay.
bucket-ladder dredge; bucket-ladder dredge. A dredge whose digging mechanism consists of a ladderlike frame on which is attached an endless chain which rides on sprocket wheels and on which buckets are attached. Bureau of Mines Staff.
bucket-ladder excavator. A mechanical excavator working on the same principle as a bucket-ladder dredge, but adapted for use on land. C.T.D. See also trench excavator.
bucket line. An endless line of digging buckets of a derrick, or on a bucket elevator. Pryor, 3.
bucket loader. a. A form of portable, self-feeding, inclined bucket elevator for loading bulk materials into cars, trucks, or other conveyors. See also bucket elevator; portable conveyor, b. ASA MH4.1-1958.
b. A machine having a digging and gathering rotor, and a set of chain-mounted buckets to elevate the material to a dumping point. Nichols.
bucket machine. See elevator pump. Fay.
bucket mounting. Scot. Leather or gutta percha packing of a pump bucket. Fay.
bucket piece. Scot. The pipe carrying the bucket door of a pump. Fay.
bucket pump. a. An iron or wooden receptacle for holding ore, or for raising rock in shaft sinking. Fay. b. A reciprocating lift pump formerly much used in shafts in this country. Nelson.
bucket rig. Synonym for rotary bucket drill. Long.
bucket rods. Eng. Wooden rods to which a pump piston is attached. Fay.
bucket sheave. A pulley attached to a shoveling bucket in order to prevent the rope from slipping off the sheave, or the point or drag cable is reeved. Nichols, 2.
bucket shell. Scot. The cast-iron or brass frame of a pump bucket. Fay.
bucket sword. Eng. A wrought-iron rod to which a pump bucket is attached, having at its upper end a knocking-off joint. Fay.
bucket temperature. The surface temperature of the bucket, as measured by a bucket thermometer or by immersing a surface thermometer in a freshly drawn bucket of water.
bucket thermometer. A water-temperature thermometer provided with an insulated container around the bulb. It is lowered into the sea until it has had time to reach the temperature of the surface water, then withdrawn and read. The insulated water surrounding the bulb preserves the temperature reading and is available as a salinity sample. HBG.
bucket tree. Eng. The pipe between the working barrel and the windbore of a pump. Fay.
bucket tripper. A device that tilts or turns the buckets of a pivoted bucket conveyor causing them to discharge. It may be fixed or movable. ASA MH4.1-1958.
bucket wheel excavator; BWE. A continuous digging machine originally designed and used in large-scale stripping and mining of East German brown coal deposits. Its digging mechanism is essentially a boom on which is mounted a rotating vertical wheel having buckets on its periphery. As the rotating wheel is pressed into the material to be dug, the buckets cut, gather, and discharge the material onto a conveyor belt where it is moved to the mined materials transport system. Bureau of Mines Staff.
buckling. a. Derb. The act of breaking or pulverizing ore. The bucking hammer or bucking pin is a broad-headed hammer used for this purpose, and the ore is broken on a flat piece of iron (bucking plate). Fay. b. Sawing a long log into shorter pieces. Nichols.
buckling load. The maximum load expressed in tons which will cause a structure to buckle. Fay.
buckling length. The length of drill rod that will subject the material to a specified feed pressure or compressional load. Long.
buckling stress. See buckling load.
buckling strength. See buckling load.
buckshot land; buckshot soil. a. Land or soil filled with rounded lumps of the size of buckshot, or which, by centrifuging, could be made into such lumps. Standard, 1964. b. Land or soil containing many limonitic nodules, Standard, 1964.
buckshot land; buckshot soil. a. Land or soil filled with rounded lumps of the size of buckshot, or which, by centrifuging, could be made into such lumps. Standard, 1964. b. Land or soil containing many limonitic nodules, Standard, 1964.
buddy. A shortwall coal cutter designed for
buffer. a. Any of various devices, apparatus,
buffed top. A term used for any stone which
buff brick. A light-colored brick usually light
buff wheel. A buffing wheel. Webster 2d.
buff bar. The heavy iron bar of a railroad
bung. A partner; each of two men who
bug dust. A. The fine coal or other materials
buhrmill. a. A stone disk mill, with an upper
buhrer. a. A fire clay brick used for
buhrstone. A type of sandstone used because of
buhrstone mill. A grinding mill with two
buhrer kiln. The zigzag kiln invented by J.
bugger. Braz. Pockets of yellow clay, r.:ch
bug hole. a. A small cavity, in a rock, usually
buffing oil. A viscous oil used with polishing
bug hole. A small cavity, in a rock, usually
buck. a. A mine car of small dimensions,
bug light. Slang for a miner’s electric cap
bugger. N. Wales. A dolomite bed in the
buhrstone mill. A grinding mill with two
buhrmill. a. A stone disk mill, with an upper
buhrstone. A type of sandstone used because of
bug hole. A small cavity, in a rock, usually
buck. a. A mine car of small dimensions,
bug dust. An attachment used on shortwall
bugger. A. A mine car of small dimensions,
bulking agent. Chemically inert materials for increasing the volume of a composition, for example, clay. Bureau of Mines, p. 124, 1962. Also called a filler. See also filler. Bureau of Mines Staff.

bulk measurement. A method of mining in which large quantities of low-grade ore are mined without attempt to segregate the high-grade portions. Nelson, p. 6. Compare selective mining, a.

bulk modulus. a. The number that expresses a material's resistance to elastic changes in volume; for example, the number of pounds per square inch necessary to cause a specified change in volume. Laid. b. Under increasing force per unit area a body will decrease in size but increase in density.

bulk modulus of elasticity. The ratio of a tensile or compressive stress, triaxial and equal in all directions (e.g., a vacuum pressure), to the relative change it produces in volume. Ro.

bulk oil flotation. a. A flotation process in which large amounts of oil are used. Fay. b. In this process the separation of mineral from gangue is accomplished by virtue of the fact that mineral is hydrophobic while gangue such as sulfides, or hydrocarbons, as coal and graphite, are wetted preferentially by oil in the presence of water and consequently pass into the interface between oil and water; while gangue or rock is wetted by water and remains in the medium. Mitchell, p. 570.

bulk oil separation. A concentration process based on selective wetting of minerals by oil in the presence of water and in the absence of air. E.C.T., v. 8, p. 955.

bulk pit excavation. Primarily the excavation of considerable length as well as of substantial volume or bulk that must be hauled from the site of operations. Also called embankment digging. Caron, pp. 29, 30.

bulk samples. Large samples of a few hundredweight or more taken at regular though widely spaced intervals. In the case of coal, a car load may be taken at intervals for size analysis and dirt content. See also grab sample. Nelson.

bulk specific gravity (specific mass gravity). Ratio of the weight of a given volume of permeable material, including both permeable and impermeable voids normal to the material at a stated temperature to the weight in air of an equal volume of distilled water at a stated temperature. ASCE P1826.

bulk spreader. A machine for carrying and spreading cement or other material in soil stabilization. Nelson.

bulk strength. The strength per unit volume of an explosive and depends upon the weight strength and density. Nelson. It is obtained by multiplying the weight strength of an explosive by its density and dividing by the density of the blasting gelatin, which is 1.55 McAdam II, p. 17.

bulk volume. A term used relative to the density and volume of a porous solid, for example, a refractory brick. It is defined as the volume of the solid material plus the volume of the sealed and open pores present. Dodd.

bulk wide-area excavation. In this kind of excavation, there is complete access to the site from many directions, and the excavation banks can be shaped or modified. Usually shallower in depth than bulk pit excavations but larger in area. Compare bulk pit excavation. Car-
bull. a. An iron rod used in ramming clay to line a shothole. Staufer, b. A rod for drilling members, such as bent bars, in a shothole. C.E. N.S.W. To enlarge the bottom of a drilled hole to increase the explosive charge. New South Wales. To break up large stones with a sledge hammer. C.E. N.S.W. To emphasize the hope that their price will rise. Hoo. p. 285.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.

bull block. A machine with a power-driven revolving drum for cold drawing wire through a drawing die as the wire winds around the drum. ASM Gloss.

bull clam. A bulldozer fitted with a curved face with protective layer of tin. Pryor, 3.
bull plugs. Plugs that are screwed into the end of an unfinished pipeline to keep out debris and small animals; made of soft pipe material or pipe nipples having one end closed by welding or pressed in oval form and the other end threaded.

bull pump. Corn. A direct single-acting pump, the steam cylinder of which is placed over the top of a shaft or slope, and the piston rod attached to the pump rods. The steam lifts the piston end pump rods and the weight of these produces the downstroke.

bull pup. A worthless mining claim. Fay.

bull quartz. A miner’s or prospector’s term for a quartz deposit.

bull’s-eye. Labradorite with a dark sheen.

bull’s-eyes. Nodules of pyrite in roofing slate.

bull’s-eye. a. A pattern of miners’ hammer, varying in size and shape, used for banding. b. A metal point driven into the ground. c. A man who pushes loaded cars.

bull’s-kiln. A clamp of a type designed by W. Bull in which the bricks to be fired are set in a trench below the floor or walk of a mine opening, generally accompanied by a loud report and a sharp shock. Long. e. The earth tremor occasioned by a rock failure, when that failure causes no damage to the workings. Fay. f. A noise caused by a break in the roof underground. The actual movement due to the break. A sudden floor uplift due to a break in the floor. Mason. g. In coal mining, shock due to the movement of coal, floor, or roof strata, with sufficient violence to be heard and to shake the workings. Pryor, 3.

bumped heads. Convex or concave. Heads that have been bumped. Fay.

bumped heads. a. A man who pushes loaded cars. b. A man who handles loaded cars or cans into the station for the hooker and other moving equipment. c. A man who sorts and shifts cars in a rail yard. d. A machine-mined coal which has been moved, moved, or churned up and down, generally accompanied by a loud report and a sharp shock. Long. e. The earth movement due to the break. A sudden floor uplift due to a break in the floor. Mason. f. The actual movement due to the break. A sudden floor uplift due to a break in the floor. Mason. g. In coal mining, shock due to the movement of coal, floor, or roof strata, with sufficient violence to be heard and to shake the workings. Pryor, 3.

bump knocker. Ark. Local term used at mines for a person who drives dark clogs into portions of machine-mined coal which have not been shot down by blasting. Fay.

bumps. Sudden, violent explosions as coal from the seam is mined cause violent bumps and the crushing and bursting of pillars left for support. There are two distinctive types of bumps: (1) pressure bumps, which appear to be due to the unit loading of a pillar being too great for its bearing strength and where the coal roof and floor are strong, the pillar is ruptured suddenly and with violence; and (2) shock bumps, which are thought to be the result of the impact of thick, massive, rigid strata somewhere above the coalbed which causes a great hammerlike blow to be sent to the immediate roof which it transmits as a shock wave to the coal pillar or pillar. Kentucky, 1924, 237; Lewis, pp. 99, 151.

buna. A synthetic rubber based on butadiene and acrylonitrile; butadiene and styrene. Fay, 3.

bunch of ore. Corn. An ore body, usually a small one. Fay.

bunch of veins. A group of parallel or almost parallel veins, usually they will be fairly close together. Hok.

bunchy. a. An ore body containing small scattered masses or bunches of ore. Weed, 1924. b. A mine that sometimes rich and other times poor. Hess.

bunch reef. S. Afr. A succession of blows, or outcrops, following a certain course. See also blow, a. Penny, 1924.

bund. An earth retaining wall. Austin.

bundling. A staging of boards on stools or stemples, to carry dead. See also still covering, a. Fay.

bung. a. A small column of saggers, one placed on another. The bung rests on the stemples, to carry dead. See also still covering, a. Fay. b. A stack or column of saggers, one placed on another. The bung rests on the stemples, to carry dead. See also still covering, a. Fay.

c. A stag or column of saggers, one placed on another. The bung rests on the stemples, to carry dead. See also still covering, a. Fay.

c. A stag or column of saggers, one placed on another. The bung rests on the stemples, to carry dead. See also still covering, a. Fay.

c. A stag or column of saggers, one placed on another. The bung rests on the stemples, to carry dead. See also still covering, a. Fay.

bung arch, 9-inch. A special bung brick with an arch 9 inches across the top. Bureau of Mines Staff.

bung brick. A special type (quality, size, and shape) of five clay brick, used in roofs of air furnaces. Bureau of Mines Staff.

bung. a. A built-in frame that usually has low sides and a canvas, mesh, or spring bottom, and that serves as a bed or sleeping place. Webster 3d. Common in mining and lumber camps. Fay.

bung. A vessel for the storage of materials; the lowermost portion is usually constructed in the form of a hopper. Also called bin. B.S. 35, 1962. See also hopper, a. Bureau of Mines Staff.

bunker coal. Applied to coal consumed by ocean steamers, tug, ferries, or other vessels.
bunker coal

steam watercraft. Also called bunkers. Fay.

bunker conveyor. A high-capacity conveyor which takes peaks of production from another conveyor and discharges the material when production drops. Such a conveyor may be built under or alongside a trunk belt near its discharge end. The floor of the bunker comprises a slow-moving steel plate conveyor operated by hydraulic or other power. A movable plough gate situated over the trunk belt diverts the material sideways into the bunker conveyor. Nelson.

bunker plate. An iron plate covering a hole in a ship's deck leading to the coal bunker. Nelson.

bunker, surface. A large capacity hopper or staiki in mines and used to store coal or other material coming from the winding shaft. The provision tends to equalize the run of mine going to the preparation plant and smooth out any minor breakdown in the plant. Nelson.

bunker, underground. Arrangements, such as high capacity supplementary conveyors, staple pits, hoppers, or standage room for coal or other material stored below the crackling of crude petroleum. HW.

bunker plate. An iron plate covering a hole in a ship's deck leading to the coal bunker. Nelson.

bunkers, surface. A large capacity hopper or staiki used to store coal or other material coming from the winding shaft. The provision tends to equalize the run of mine going to the preparation plant and smooth out any minor breakdown in the plant. Nelson.

bunky. Shrop. The basalts on Clee Hill. Arkell.

burette. A laboratory apparatus consisting of a long tube with a small aperture and stopcock, that is used for delivering measured quantities of liquid or for measuring volumetrically the liquid or gas received or discharged. Webster 3d.

burial. Engl. In lead mining, a floor or staging of wood built across the lode over the miners' heads, and on which the refuse was thrown, so that the mine, originally begun as an open work, became covered over for its whole length except the windlass opening. Also spelled chaldron. Fay.

bunny. Corn. An isolated body of ore. Hess. See also bonny.

bureaucracy. Eng. In lead mining, a floor or staging of wood built across the lode over the miners' heads, and on which the refuse was thrown, so that the mine, originally begun as an open work, became covered over for its whole length except the windlass opening. Also spelled chaldron. Fay.

bus. Narrow, or small coal. Fay. See also burgy.

Burgos luster. A red luster for porcelain made by suitably diluting a gold luster with a bismuth luster; some tin may also be present. Ford comes from Burgos, Spain.
Burn of or to permit a bit to become overheated.

Burial ground. A place for burying unwanted bodies or objects to prevent escape. A burial is the act of interring a dead person in a grave, vault, or other receptacle set in or under the earth. Burying objects such as radioactive materials in a burial ground is a common practice to prevent them from spreading harmful substances or causing radiation exposure to the environment or people.

Buried hill. A hill of resistant older rock overburden. The hill is formed from a natural or artificial deposit of earth and rock material that has been accumulated on top of another layer or a series of layers. Blind apex. Buried rivers. Riverbeds which have been covered by other layers of soil or rock materials.

Buried outcrop. A resistant rock layer that is covered by younger deposits of soil or rock. Buried water. Water that is confined to a layer of permeable rock or sediment that lies below the land surface.

Buried clay. A clay containing burls, okilites, and other minerals that have been covered by younger deposits of soil or rock. Burial hill. A hill formed from a natural or artificial deposit of earth and rock material that has been accumulated on top of another layer or a series of layers. Blind apex. Buried rivers. Riverbeds which have been covered by other layers of soil or rock materials.

Burial mounds. A mound or heap of earth or other material that has been deposited on top of a natural or artificial deposit of earth and rock material. Burial mound. A mound or heap of earth or other material that has been deposited on top of a natural or artificial deposit of earth and rock material.

Burial or to permit a bit to become overheated. Burial of or to permit a bit to become overheated.
burnishing. A method applied to artificially colored yellow transparent quartz (topaz), powdered; AlNi4(SO4)2 or AlK(SO4)2. pigment. Hess.

burnt alum. A term applied to a copious discharge of methane, carbon dioxide, or coal dust. Also called outburst; bounce; rock burst. BuMines Bull. 309, 1929, pp. 1, 13.

burnt bag. A hydraulic mechanism which, when inserted into a large diameter shot-hole, breaks down the strata by means of pistons operating transversely. B.S. 3618, 1964, sec. 6. b. Scot. A shot in a coal seam which has not been sheared or undercut. Equivalent to “shot off the solid.” Also called bursting shot. Fay. c. See buster, a. Fay.

bursting. The phenomenon sometimes exhibited by refractories containing chrome ore, when exposed to iron oxide at high temperature, of having the exposed face swell and grow until it breaks away from the brick mass. A.R.I.

bursting expansion. In the refractories industry this term has the specific meaning of surface disintegration of basic refractories caused by the absorption of iron oxide. The expansion that leads to this form of failure results from cold solution of magnetite (Fe3O4) in the chromite or chrome-magnesite refractories. A laboratory test submits a test-piece cut to the action of 40 grain of mill-scale (crushed to pass a 30 B.S. sieve) for 1 hour at 1,600° C; the
Butters and Mein distributor

bypass; byepass

1954.

byhead. A small amount of gas and tarry oil. A.G.I.

byerlite. An artificial asphalt made from petroleum by driving off the volatile products. Webster 2d ed.

by ever. by-saw. Fay. d.

bwpd Abbreviation for barrels of water per day. Also abbreviated BWPD. BuMin Style Guide, p. 58.

by-level. A side level driven for some undefined or unimportant purpose, besides to provide a means of emergency access. Fay.

byheads. Term used when a well flows out of a tubing string, seven or eight inches above the packers used. Fay.

byerlite. Applied by Mallett to a dry-burnt coal, for which he is paid by the ton; a substitute for coke. Fay. d.

byerite. Applied by Mallett to a byerite, an artificial asphalt made from petroleum by driving off the volatile products. Also abbreviated BWP. BuMin Style Guide, p. 58.

by-level. A small amount of gas and tarry oil. A.G.I.

byerlite. An artificial asphalt made from petroleum by driving off the volatile products. Webster 2d ed.

by ever. by-saw. Fay. d.

bwpd Abbreviation for barrels of water per day. Also abbreviated BWPD. BuMin Style Guide, p. 58.

by-head. A small amount of gas and tarry oil. A.G.I.

byerlite. Applied by Mallett to a byerite, an artificial asphalt made from petroleum by driving off the volatile products. Also abbreviated BWP. BuMin Style Guide, p. 58.

by-level. A small amount of gas and tarry oil. A.G.I.

byerlite. An artificial asphalt made from petroleum by driving off the volatile products. Webster 2d ed.

by ever. by-saw. Fay. d.

bwpd Abbreviation for barrels of water per day. Also abbreviated BWPD. BuMin Style Guide, p. 58.

by-head. A small amount of gas and tarry oil. A.G.I.

byerlite. Applied by Mallett to a byerite, an artificial asphalt made from petroleum by driving off the volatile products. Also abbreviated BWP. BuMin Style Guide, p. 58.

by-level. A small amount of gas and tarry oil. A.G.I.

byerlite. An artificial asphalt made from petroleum by driving off the volatile products. Webster 2d ed.

by ever. by-saw. Fay. d.

bwpd Abbreviation for barrels of water per day. Also abbreviated BWPD. BuMin Style Guide, p. 58.

by-head. A small amount of gas and tarry oil. A.G.I.

byerlite. Applied by Mallett to a byerite, an artificial asphalt made from petroleum by driving off the volatile products. Also abbreviated BWP. BuMin Style Guide, p. 58.

by-level. A small amount of gas and tarry oil. A.G.I.

byerlite. An artificial asphalt made from petroleum by driving off the volatile products. Webster 2d ed.

by ever. by-saw. Fay. d.

bwpd Abbreviation for barrels of water per day. Also abbreviated BWPD. BuMin Style Guide, p. 58.

by-head. A small amount of gas and tarry oil. A.G.I.

byerlite. Applied by Mallett to a byerite, an artificial asphalt made from petroleum by driving off the volatile products. Also abbreviated BWP. BuMin Style Guide, p. 58.

by-level. A small amount of gas and tarry oil. A.G.I.

byerlite. An artificial asphalt made from petroleum by driving off the volatile products. Webster 2d ed.

by ever. by-saw. Fay. d.

by-level. A small amount of gas and tarry oil. A.G.I.

byerlite. An artificial asphalt made from petroleum by driving off the volatile products. Webster 2d ed.

by ever. by-saw. Fay. d.

bwpd Abbreviation for barrels of water per day. Also abbreviated BWPD. BuMin Style Guide, p. 58.

by-head. A small amount of gas and tarry oil. A.G.I.

byerlite. Applied by Mallett to a byerite, an artificial asphalt made from petroleum by driving off the volatile products. Also abbreviated BWP. BuMin Style Guide, p. 58.

by-level. A small amount of gas and tarry oil. A.G.I.

byerlite. An artificial asphalt made from petroleum by driving off the volatile products. Webster 2d ed.
Cable reel

cable cover. A fired clay—in this context generally (but erroneously) known as earthenware, or concrete conduit for covering underground electric cables; the principal objects of these covers are to give warning of the cable's presence and to protect it from excavating tools. Dodd.

cable drill. a. A heavy drilling rig in which a rope is used for suspending its tools in the borehole. See also churn drill, b. Nelson. b. A churn or percussion drill rig, consisting of a tower (derrick), wire rope for moving tools vertically, a power unit, and a reciprocating device. It drills holes of up to 10 inch diameter vertically to considerable depths. Can be light and mobile. Prior, 3.

cable driller. In petroleum production, one who supervises setup and operation of the drilling equipment, and operates the controls of a cable drilling rig which is used to drill oil and gas wells; controls flow of well when it is brought in (first begins flowing) by capping it or regulating control valves; keeps record of nature and location of strata encountered, number of feet drilled per shift, and materials used. Also called cable tool driller; driller; well driller. D.O.T. 1. cable reel. Prior, 3.

cable duct. A protective earthenware or concrete pipe through which electric cable or prestressing wires are pulled. The latter are generally grouted into the ducts with cement grout. Ham.

cable excavator. A long, range, cable-operated machine which works between a head mast and an anchor. Nichols.

cable, flame-resistant. See flame-resistant cable.

cable hook. A round hook with a wide beveled face. Nichols.

cable hooker. One who couples hoist cable to loaded cars in a clay pit and signals to have cars drawn up inclined rails to mouth of pit. Also called hookup man. D.O.T. 1.

cable-laid rope. a. An ordinary lay rope. Nelson. b. A compound-laid rope consisting of several ropes or several layers of strands laid together into one rope, as, for instance, 6 by 6 by 1. HBG, p. 129. c. A rope in which both the laying of the strands and the strands themselves are twisted to the left. Long. d. Wire cable made of several ropes twisted together, strands of hawser-laid rope, twisted right-handed without limitation as to the number of strands or direction of twist. A fiber cable-laid rope is composed of three strands of hawser-laid rope, twisted right-handed. Zern.

cable lay. Of wire cable, several wire ropes each composed of strands not limited in number or direction of twist. Of fiber cable, strands of several twisted into one twisted right-handed. Prior, 3.

cable length. A maritime unit of length based on the length of a ship's cable and variously reckoned as equal to 100 fathoms; one-tenth of the nautical mile of 6,060 feet; or 120 fathoms. Webster 3d.

cable loader. One who sets up and loads brick and tile onto a conveyor used for transporting dried pieces of clay for burning. Also called deracker. D.O.T. 1.

cable railway. An inclined track up and down which travel wagon types of conveyors. These conveyors are generally grouted into the ducts with cement grout. H.B.G.

cable loader. A drum on which conductor cable is wound, including at least one spool and associated brackets, by means of
cable reel

which the electric circuit is made between the stationary winding on the locomotive and the moving device. A device with a drum, loop, or other mining device and the trailing cable on to the stationary winding on the locomotive which the electric circuit is made between the cable conveyor of which the propelling load or load carriers are supported by a cable and are not dependent on a solid steel chisel-faced bit working vertically at the end of a string of solid steel tools suspended in the hole at the end of a steel line or rope, and activated by a walking beam. A method of driving a bucket, as in a bucket wheel; a system in which a cable is attached to the drilling rig and which is used to control the drilling while the bucket is being raised. It is used increasingly for mechanical bucking in shaft sinkings. A stationary double rope grab for shaft sinking which has cables about 20 cubic feet, weights about 5,500 pounds, and can fill a 3-ton capacity hopper in about 4 minutes. Also called spud; spud bit. Long.

cable-tool cuttings. The rock fragments and sludge produced in drilling a borehole with a cable-tool rig. Long.
cable-tool drill. Synonym for churn drill, a.
cable-tool driller, Synonym for churn driller, b. Long.
cable-tool drilling. Procedure of drilling with a solid steel chisel-faced bit working vertically at the end of a string of solid steel tools suspended in the hole at the end of a steel line or rope, and activated by a walking beam. Wheeler; Bureau of Mines Staff. Synonym for churn drilling. Long. 
cable-tool men. Men experienced in drilling holes with churn-drill equipment. See also churn driller. Long.
cable-tool outfit. Synonym for churn-drill rig. Long. 
cable-tool rig. Synonym for churn-drill rig. Long. 
cable tools. The bits and other bottom-hole tools and equipment used to drill boreholes by percussive action of a rope, instead of rod, to connect the drilling bit with the machine on the surface. See also churn drill. Long. 
cableway. A system in which the carriers are supported by a cable and are not dependent on the operating span. The travel of the carriers is wholly within the span. ASA MH4.1-1958. See also aerial cableway. 
cableway excavator. A slackline cableway used for excavating a restricted area. Ham. 
cableway transporter. A transporter crane on which the track for the carrier is a steel wire rope. Ham. 
cadaver. A little pocket oilcan for miners. Fay. 
cadmium. Tin-white; malleable; ductile; toxic; bivalent metallic element; capable of taking a high polish; and it emits a crackling sound when heated. Occurs in the mineral greenockite (CdS) and also in small amounts in ores of zinc from which it is separated as a byproduct. Used chiefly in the protective electroplating of iron and steel and in the manufacture of bearing metals. Symbol, Cd; hexagonal; atomic number, 48; atomic weight, 112.40; specific gravity, 8.642; melting point, 320.9° C; and boiling point, 767° C. Webster 3d; Handbook of Chemistry and Physics, 45th ed., 1964, p. 104-6. 
cadmium acetate. [Cd(GO)4]3H2O, molecular weight, 284.53; specific gravity, 2.01; forms colorless flakes, deliquescent, monobromide prisms that are highly soluble in water and alcohol. It becomes anhydrous when heated to 130° C and attains a specific gravity of 2.34 and a melting point of 286° C; it decomposes at higher temperatures. I.C. 7881, 1958, p. 22. 
cadmium bromide. (CdBr2); a yellow crys
cadmium carbonate.

(\text{CdCO}_3); a white, crystalline solid, soluble in acids, water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

cadmium cyanide. \text{(CdCN)}; obtained as an off-white solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

cadmium oxide. \text{CdO}; a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

cadmium chloride. \text{(CdCl}_2); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

cadmium nitrate. \text{(Cd(NO}_3)_2); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Bromide**

talline powder with a molecular weight of 272.24; specific gravity, 5.20; melting point, 1,050°C; and boiling point, 368°C. I.C. 7881, 1958, p. 22.

cadmium carbonate. \text{(CdCO}_3); a white, crystalline solid, soluble in acids, water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Chloride**

(\text{CdCl}_2); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Cyanide**

(\text{CdCN}); obtained as an off-white solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Oxide**

(\text{CdO}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Nitrate**

(\text{(Cd(NO}_3)_2}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Bromide**

talline powder with a molecular weight of 272.24; specific gravity, 5.20; melting point, 1,050°C; and boiling point, 368°C. I.C. 7881, 1958, p. 22.

**Cadmium Carbonate**

(\text{CdCO}_3); a white, crystalline solid, soluble in acids, water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Chloride**

(\text{CdCl}_2); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Cyanide**

(\text{CdCN}); obtained as an off-white solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Oxide**

(\text{CdO}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Nitrate**

(\text{(Cd(NO}_3)_2}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Bromide**

talline powder with a molecular weight of 272.24; specific gravity, 5.20; melting point, 1,050°C; and boiling point, 368°C. I.C. 7881, 1958, p. 22.

**Cadmium Carbonate**

(\text{CdCO}_3); a white, crystalline solid, soluble in acids, water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Chloride**

(\text{CdCl}_2); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Cyanide**

(\text{CdCN}); obtained as an off-white solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Oxide**

(\text{CdO}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Nitrate**

(\text{(Cd(NO}_3)_2}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Bromide**

talline powder with a molecular weight of 272.24; specific gravity, 5.20; melting point, 1,050°C; and boiling point, 368°C. I.C. 7881, 1958, p. 22.

**Cadmium Carbonate**

(\text{CdCO}_3); a white, crystalline solid, soluble in acids, water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Chloride**

(\text{CdCl}_2); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Cyanide**

(\text{CdCN}); obtained as an off-white solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Oxide**

(\text{CdO}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Nitrate**

(\text{(Cd(NO}_3)_2}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Bromide**

talline powder with a molecular weight of 272.24; specific gravity, 5.20; melting point, 1,050°C; and boiling point, 368°C. I.C. 7881, 1958, p. 22.

**Cadmium Carbonate**

(\text{CdCO}_3); a white, crystalline solid, soluble in acids, water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Chloride**

(\text{CdCl}_2); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. Used in the production of pigments, phosphors, and analytical reagents. Its solution is used in dyeing and as a depolarizing agent in the production of cadmium oxide.

**Cadmium Cyanide**

(\text{CdCN}); obtained as an off-white solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Oxide**

(\text{CdO}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.

**Cadmium Nitrate**

(\text{(Cd(NO}_3)_2}); a white, crystalline solid, soluble in water, alcohol, and ammonium hydroxide. It is used as a reagent in the production of organic and inorganic compounds, and as a catalyst in the production of hydrogen cyanide.
cage mills

cage a whim. Corn. The barrel on which the rope is wound; a drum. Fay.

cage. a. A small hole or opening through which the coal or materials are delivered or which is the opening through which the coal is taken out of the cage.

cage operation. The process of loading, hoisting, and unloading coal in a cage.

cage operations. The process of loading, hoisting, and unloading coal in a cage.

cage在外貌. The barrel on which the rope is wound; a drum. Fay.

cage runner. A man who runs a cage up and down the shaft.

cage shoes. Fittings bolted to the cage to prevent the free movement of the lining.

cage sheets. Short props or wedges used to support the cage walls.

cage standing. The act of maintaining the cage in a vertical position.

cage workers. Those who load, hoist, and unload coal in cages.

caling. The process of loading or unloading coal in a cage.

caling index. A measure of the degree of caking or binding together of the coal.

caling index; agglutinating power. A laboratory test to determine the degree of caking or binding together of the coal.

calin. The mineral chloride, CaCl₂.

calin chloride. A white crystalline substance used as a disinfectant.

calin chloride. A white crystalline substance used as a disinfectant.

calin chloride. A white crystalline substance used as a disinfectant.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.

cam. A mound or heap of stones used as a landmark, or a sepulchral monument.
calverite

posure; metallic luster; contains 40 to 43 percent gold, 1 to 3 percent silver. Found in the Mother Lode district (California, Colorado); Australia; Canada. An important source of gold. C.G.I. 6d, 1961.

calk. Prefix meaning containing calcium carbonate. C.G.I.
calk-alcaline series. An igneous rock series having an alkali-lime index of 55 to 61. C.G.I.
calk-alcaline rock. An igneous rock in which the proportion of lime and alkalis (in relation to the other constituents) is such that the dominant minerals are feldspars, hornblende, and/or augite, specifically, the alkali minerals, such as feldspatoids and sodas, pyroxenes and soda amphiboles, are absent. The term includes granodiorite, sodium-biotite, andesine, and their volcanic analogues and excludes alkali and amphibilitic rocks and most peridotites. The term is used rather loosely to contrast a rock that is not calcareous with one that is, and it cannot be strictly limited by definition. Webster 3d.
calkaphanite. A variety of diabase showing patches of secondary calcium carbonate embedded in a green groundmass. Webster 3d.
calcar. a. An oven, or reverberatory furnace used in early glassmaking processes for calcination of the batch into grit. Webster 3d. b. An annealing arch or oven. Webster 3d.
calkarene. Suggested by Grabau for a limestone or dolomite composed of coral sand, shell sand, or calcite sand derived from the erosion of limestones. Fay.
calkareous. a. Like calcite or calcium carbonate, especially in hardness. Webster 3d. b. Consisting of or containing calcium carbonate. Webster 3d. c. Containing lime or any calcium compound. Webster 3d. d. Relating to rocks containing calcium carbonate. Webster 3d.
calkareous clay. A clay containing the minerals calcite and/or dolomite in amounts sufficient to cause obvious effervescence with dilute HCl. If the carbonates are in sufficient excess over Fe(OH)3, the clay fires to a cream color and has a short vitrification range. ACSB-1.
calkareous algae. Algae that forms deposits of calcium carbonate. Fossil calcareous algae are found in the United States. MacCracken.
calkareous clay. A clay containing the minerals calcite and/or dolomite in amounts sufficient to cause obvious effervescence with dilute HCl. If the carbonates are in sufficient excess over Fe(OH)3, the clay fires to a cream color and has a short vitrification range. ACSB-1.
calkareous crust; caliche. An indurated horizon of calcium carbonate. Webster 3d.
calkareous glazes. Glazes in which lime or calcium carbonate is such a constituent in a ceramic composition. Fay.
calkareous grits. Sandy beds, intermixed with or cemented by calcium carbonate. Fay.
calkareous stone. FeO(CO3), containing some calcium. Heiss.
calkareous marl. Unconsolidated material that is mainly calcium carbonate and clay. AIME, p. 132.
calkareous ooze. a. Sediment consisting mostly of the shells of one-celled animals and which becomes chalk when hardened. MacCracken. b. These contain more than 30 percent calcium carbonate, which represent the skeletal material of various plankton animals and plants. The calcareous ooze may be further divided into three types, depending upon a characteristic kind of organism present in the sediment, namely: (1) globigerina ooze, in which the calcium carbonate exudes in tests of pelagic foraminifera; (2) pteropod ooze, containing conspicuous shells of pelagic molluscs; and (3) coccolith ooze, containing large numbers of coccoliths and rhodoliths that form the protective structures of the minute Coccolithophorids. HOG, p. 73.
calkareous ores. Iron ores in which the gangue consists mainly of carbonate of lime. Osborne.
calkareous peat. Same as euphratic peat. Tomkiewicz.
calkareous rocks. Rocks which are wholly or largely calcium (lime) carbonate. Mason, p. 13.
calkareous sandstone. A sandstone containing a considerable proportion of calcium carbonate. Fay.
calkarose spar. Crystalline calcium carbonate. See also calcite. Fay.
calkarose tufa. A spongy, porous or vesicular deposit or calcium carbonate. When the carbonate of calcium is deposited in a solid form it is called travertine or calcite. Stalactites and stalagmites are of this nature. Fay.
calk. Native calcium oxide, CaO, found on Mount Vesuvius in Italy. It formed from limestone enveloped in lava and altered by the heat of the lava. Heiss.
calkedony. See calcite, and calcite, and calcite luster. Webster 3d.
calk-eight. A very fine-grained metamorphic rock of flinty aspect derived from a calcareous mudstone. The new minerals are in part due to pneumatolytic processes, and include feldspars and lime-silicate minerals, the latter being less abundant than in a calc-silicate hornfels. Heimer, 1928.
calk. The chemical compound, calcium oxide (CaO). Boynton.
calk. a. Of, pertaining to, or containing calcium. Said especially of minerals, particularly feldspars, in which calcium is an important constituent. Fay. b. Refers to igneous rocks having an alkali-lime index of 61 or higher. A.G.I. Supp.
calkcalcite. Proposed by Johannsen for the calcite plagioclases from An95 to An25, commonly calcareous. The term alcaline would be reserved for the pure end-member. Obotele. A.G.I.
calkcalcic series. Those igneous rock series having an alkali-lime index of 61 or higher. A.G.I.
calkdefers. Bearing, producing, or containing calcium, calcium carbonate, or calcite. Webster 3d.
calkility. To make or to become hard or stony by the deposit of calcium salts. Standard, 2d.
calkinite. a. Suggested by Grabau for a limestone or dolomite composed of calcareous rock flour, the composition of which is typically nonsilicious, though many calcitites contain an intermittent clay. Fay. b. A consolidated lime mud. Webster 3d.
calkitable. Capable of being calcined or reduced to a friable state by the action of fire. Fay.
calkination. a. Heating ores, concentrates, precipitates, or residues to decompose carbonates, hydrates, or other compounds. ASTM G51. b. A heat treatment to which many ceramic raw materials are subjected preparatory to further processing or use, for the purpose of driving off volatile chemically combined components and effecting physical changes. HW, c. To heat metals at high temperatures to convert them into their oxides. See also roasting. Nelson.
calklnary. See calciner. Fay.
calkine. a. Ore or concentrate after treatment by calcination or roasting and ready for smelting. C.T.B. b. To expel volatile matter by heat, as carbon dioxide, water of sulfur, with or without oxidation; to roast; to burn (said of limestone in making lime). Fay. c. To decompose or make friable, as with heat. Hess. d. A ceramic material or mixture fired to less than fusion for use as a constituent in a ceramic composition. AST. c. Friable material which is often fire clay, that has been heated to eliminate volatile constituents and to produce desired physical changes. ASTM C71-64.
calkined aluminous. These are available in several grades based on the degree of heat treatment received. Traces of residual water remain and they are more easily broken down by milling than other types of alumina. They are fluffier, less pure, and usually contain less alpha phase than the tabular grades. They are normally produced in 100 mesh and finer sizes. Lee.
calkined bauxite. Bauxite from which the water has been driven off by heating. Mersereau, 4th, p. 255.
calkined clay. Ball clay or china clay that has been located until combined water is removed and plastic character of the clay is destroyed. CCD 6d, 1961.
calkined kaolin. A claylike, mealy, white, grayish or reddish aluminum silicate, used in making porcelain. Crispin.
calkined refractory dolomite. Raw refractory
calcined refractory dolomite

dolomite that has been heated to a temperature sufficiently high and for a long enough time to decompose the carbonate structure and remove volatiles. Fay.
calcin. A furnace or kiln for roasting. Fay.
calcining. a. Roasting of ore in oxidizing atmosphere, usually to expel sulfur or carbon dioxide. If sulfur removal is carried to practical completion, the operation is termed, overroasting, dead roasting. Priy, 3. b. Reducing to powder by heating. Mercier, 4th, p. 294.
calcining furnace. A furnace in which ores or metallurgical products are calcined. Fay.
calcining of refractory materials. The heat treatment to which raw refractory materials are subjected, preparatory to further processing or use, for the purpose of eliminating volatile chemically combined constituents and producing volume changes. ASTM C177-64.
calcioferrite. A yellow-green calcium-iron hydrate, CaFe(SO)4·(OH)·H2O. The substance is partly replaced by calcium and iron oxides from the pegmatites of the Khibine Peninsula, northern Russia. Also called calcium-aluminum garnet. Fay.
calciocoplate. The calcium member of the copiapite family, CaFe(SO)4·(OH)·H2O. Mohs hardness, 2.5; specific gravity, 3.23; in scales (monoclinic) 7; or as nodules. Fay.
calciopropite. A bright brownish-yellow variety of ancyelite with the formula, (Sr, Ca)2Ca3(CO3)2(OH)·3H2O. The mineral is partly replaced by calcium and strontium carbonates; from the pegmatites of the Khibine Peninsula, northern Russia. Also called calciostrontianite. Fay.
calcicrete. A soft, white limestone, calcite, deposited by water as it passes through a calcareous soil. Fay.
calcite. A mineral having the composition, CaCO3; molecular weight, 100.09; boiling point, 1,339° C (at 1,025 atmospheres); decomposes at 989.6° C; and soluble in water, in acids, and in ammonium carbonate. Fay.
calcite bubble. A hollow sphere of calcite formed by the decomposition of calcite around a gas bubble. Schüblerdecker.
calculcite. A ledge of calcite projecting horizontally into a pool at its water level. Schüblerdecker.
calcite limestone. A limestone containing not more than 3 percent of magnesium carbonate. ASTM C119-56.
calcite marble. A crystalline variety of limestone containing not more than 5 percent of magnesium carbonate. ASTM C119-56.
calcite satin spar. See satin spar. Shipley.
calcite skin. A thin coating of calcite on clay walls, formed by ascending solutions. Schüblerdecker.
calcite dolomite. A carbonate rock composed of between 10 and 50 percent calcite and between 50 and 90 percent dolomite. A.G.I.
calcite. A rock composed of calcite, for example, limestone. A.G.I. Supp.
calcium. Silvery-white; rather soft; bivalent metallic element of the alkaline-earth group; quickly tarnishes in air; and when heated burns with a brilliant light. Used chiefly in alloys and in various metallurgical processes, especially as a carbonate (as in limestone), a sulfate, or a phosphate; in practically all natural waters; and in most rocks, soils, and plants as an essential constituent. Webster 3d Symbol, Ca; isometric; atomic number, 20; atomic weight, 40.08; L. calx, lime; G. Calcium, 1,339° C (at 1,025 atmospheres) ; decomposes at 989.6° C; and soluble in water, in acids, and in ammonium carbonate. Fay.
calcium carbonate; chalk; calcite; aragonite. a. Calcium carbonate; chalk; calcite; aragonite. Fay. b. Calcium carbonate (molecular weight, 100.09) crystallizes in two crystal systems: Hexagonal and rhombohedral. A.G.I.
calcium silicate. A rock composed of calcite, for example, limestone. A.G.I. Supp.
calcisilicate. A yellowish, or rarely pale gray, red, green, blue, or violet; specific gravity, 2.71 (at 18° C); Mohs' hardness, 3; melting point, 1,339° C (at 1,025 atmospheres); decomposes at 899.6° C; and soluble in water, in acids, and in ammonium carbonate. Fay.
calcium carbonates. Calcium carbonate (aragonite) is colorless, white, yellow, red, bluish, black, or brown; specific gravity, 2.930; ranging from 2.85 to 2.94; Mohs' hardness, 3.5 to 4.0; transforms to calcite at 450° C; decomposes at 2,025° C; and soluble in water, in acids, and in ammonium carbonate solution. Handbooks of Chemistry and Physics, 45th ed., 1964, pp. B-161, B-242. c. Source of quicklime and of calcium metal. Bureau of Mines Staff.
calcium carbonate, precipitated. See chalk, precipitated. CCD 6d, 1961.
calcium carbonate, prepared. See chalk, prepared. CCD 6d, 1961.
calcium chloride; anhydrous calcium chloride. A deliquescent salt; CaCl2. Obtained from brine wells, dry lake beds, and as a by-product for making soda ash and other chemicals. In the anhydrous state, it is a white powdery solid. Used as a drying and dehumidifying agent. In a more or less hydrated state, it is in solid, colorless flakes or in a water solution. Used for controlling dust; for melting snow and ice on roads; for freezing-proofing in freezing mixtures; in refrigeration brines; and in concrete as an accelerator or an aid in curing. Webster 3d. Molecular weight, 110.99; colorless; isometric; deliquescent; specific gravity, 2.15 (at 25° C, referred to water at 4° C); melting point, 772° C; boiling point, above 1,600° C; very soluble in water; and soluble in alcohol, in acetone, and in acetic acid. The common hydrates of calcium chloride are calcium chloride monohydrate (CaCl2·H2O); calcium chloride dihydrate (CaCl2·2H2O); and calcium chloride hexahydrate (CaCl2·6H2O). Handbooks of Chemistry and Physics, 45th ed., 1964, p. B-161. Anhydrous calcium chloride is the source of calcium metal produced by electrolysis having a melting point of 1011° C. A.G.I.
calcium chloride process. A method used to consolidate floor dust in mine roadways in which calcium chloride is used as a wetting agent. This wet calcium-chloride process is widely used in Europe. Roberts.
calcium-chloride process

1. calcium-chromium garnet. Same as uvarovite. Shipley.

2. calcium cyanamide. CaCN2; molecular weight, 80.10; colorless; hexagonal; hemihedral; and melting point, 1,190° C. Bennett 2d, 1962.

3. calcium cyanide. Colorless crystals or white powder; gray-black (technical grade); Ca(CN)2; or for gold plating and silver ores. CCD 6d, 1961.

4. calcium diammide. Ca-A2AlO3; melting point, 1,705° C; thermal expansion, 2.0 x 10^-6. Present in high-alumina cement but does not itself have cementing properties. Dodd.

5. calcium ferrite. In the binary system, two ferrites are formed—CaO-Fe2O3; and 2CaO-Fe2O3; the former more or less occurs in high-alumina cement. Dodd.

6. calcium fluoride; fluorite; fluorspar. CaF2; colorless crystals or white powder; deliquescent; 6H20; melting point, about 2,500° C; slightly soluble in water; and insoluble in acetone. The calcium fluoride (fluor spar) is colorless, often yellowish green, and violet, and rarely red. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-161, B-243. An important constituent of opal glass.

7. atom fluoride. CaF2; molecular weight, 78.08; isometric; specific gravity, 3.180, ranging from 3.071 to 3.263; Mohs' hardness, 4; melting point, 1,360° C; boiling point, about 2,500° C; slightly soluble in water and dissolves in ammonium salt solutions; and insoluble in acetone. The mineral fluorite (fluor spar) is colorless; often yellowish green, and violet, and rarely red. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-161, B-243. An important constituent of opal glass.

8. calcium molybdate. Colorless; tetragonal; CaMoO4; specific gravity, 4.38 to 4.53; and melting point, above 1,200° C. A mixed addition promotes good adhesion on certain enamels when used in conjunction with antimony oxide. Lee; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-161.

9. calcium monaluminate. CaO-Al2O3; melting point, 1,605° C. A principal constituent of high-alumina cement. Dodd.

10. calcium nitrate; lime nitrate; Ca(NO3)2; molecular weight, 164.08; colorless; deliquescent; 4H2O; melting point, 2,572° C; boiling point, 2,850° C; and specific gravity, 2.51. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, pp. B-161. A useful material for signal charges.

11. calcium nitrate. White; crystalline; Ca(NO3)2; molecular weight, 60.04; crystalline; insoluble in water; and insoluble in ethyl alcohol and in ether. Lee; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-161.

12. calcium silicate. See calcium silicate. Dodd.

13. calcium sulfate; gypsum. CaSO4·2H2O; monoclinic; specific gravity, 2.70 to 2.72; melting point, about 1,600° C. Used for signal flares. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-162.

14. calcium phosphate. Ca3(PO4)2; molecular weight, 310.18; colorless; needle-like crystals; 4H2O; melting point, about 1,700° C. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-162.

15. calcium phosphate. White; colorless; needles; Ca3(PO4)2; melting point, 1,575° C; boiling point, 2,575° C; and specific gravity, 2.95 to 2.98. Mohs' hardness, 3 to 3.5; melting point, 1,550° C; slightly soluble in water; soluble in acids, in ammonium salt solutions, and in glycerol. The mineral anhydrite is colorless, white, gray, black, brown, or reddish. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-161. A useful material for signal charges.

16. calcium salt; acid calcium sulfate. Colorless; pearly; triclinic; scales or powder; in clear, pale yellow, or colorless; in air; Ca(H2O)2SO4·H2O. Used in glass manufacture. CCD 6d, 1961.

17. calcium salt; tribasic calcium orthosilicate; calcium orthosilicate; dicalcium silicate. 2CaO·SiO2; melting point, 1,210° C. Occurs abundantly in nature as quartz, hornblende, and in glass. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-162.

18. calcium salt; tribasic calcium sulfate. White; colorless; needles; Ca3(PO4)2·3H2O; melting point, about 1,600° C. Used in ceramics in porcelain, potteries, enamels, and in the manufacture of glass. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-162.

19. calcium salt; tribasic calcium sulfate. Oranges to brown; crystalline; CaSO4·H2O; and decomposed by hot water or carbon dioxide. Used in glass and as an oxidizing agent. CCD 6d, 1961.

20. calcium salt; potassium sulfate; kaleuzite; syngenite. CaK2(SO4)2; molecular weight, 280.28; specific gravity, 2.5; and insoluble in water. Used in the production of ceramics and in the manufacture of pigments. Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-163.

21. calcium salt; calcium silicate. See calcium silicate. Dodd.

22. calcium salt; calcium oxalate; calcium orthosilicate; dicalcium silicate. 2CaO·SiO2; melting point, 1,750° C. Occurs in four crystalline forms: a, stable below 800° C; stable from about 800° C to 1,447° C; b, stable from 800° C to 1,447° C on heating; 1,447° C to 670° C; c, stable from 670° C to 1,200° C; y, stable below 800° C to 830° C. Material in which a considerable amount of 2CaO·SiO2 has been formed by high temperature treatments, falls to a powder—dusts—on cooling because of the inversion (accompanied by a 10 percent increase in volume) to the y-form at 520° C. The inversion can be prevented by the addition of a stabilizer, for example, B2O3 or P2O5. Calcium orthosilicate is a constituent of Portland Cement and may be found in dolo mite refractories. Dodd.

23. calcium salt; calcium oxalate; calcium nitrate; calcium orthophosphate; secondary calcium phosphate. White; tasteless; triclinic; CaHPO4·2H2O; and insoluble in water. Used in the manufacture of glass. CCD 6d, 1961.

24. calcium salt; calcium oxide; calcium phosphate; secondary calcium phosphate. White; tasteless; triclinic; CaHPO4·2H2O; and insoluble in water. Used in the manufacture of glass. CCD 6d, 1961.
calcium sulfo-aluminates. Two compounds exist: the high form, $\text{CaSO}_4\cdot\text{Al}_2\text{O}_3$, and the low form, $\text{CaSO}_4\cdot\text{Al}_2\text{O}_3\cdot\text{H}_2\text{O}$. Both forms may be produced by reaction between $\text{CaSO}_4\cdot\text{Al}_2\text{O}_3$ and gypsum during the hydration of Portland cement. The high form is also produced when cement and concrete are attacked by sulfate solutions. Dodd.

calcium titanate; calcium metatitanate; pe-roroskite. $\text{CaTiO}_3$; melting point, 1,725°C. Used in high-potassium bodies either alone or blended with barium titanate and other alkali-earth zirconates and/or stannates. Also used in conjunction with some barium-titanate lead titanate piezoelectric compositions. Lee; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-163.

calcium tungstate scheelite. $\text{CaWO}_4$; molecular weight, 287.99; colorless or white; tetragonal; and specific gravity, 3.60 (at 20°C). Bennett 2d, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-163.

calcium zirconate; calcium metazirconate. $\text{CaZrO}_3$; soluble in nitric and in other acids. Used as a chemical raw material. CDD 6d, 1961. Melting point, 2,550°C. Has high refractive characteristics; low firing shrinkage; and is stable under highly reducing conditions up to 1,750°C. Lee; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-163.

calci-silicate. White solid; $\text{CaZrSi}_3\text{O}_9$. Used in electrical resistor ceramics and as a glaze opacifier. CDD 6d, 1961.

calciate. Hydrated chloride and acetate of calcium, $\text{CaCl}_2\cdot\text{Ca(CH}_3\text{CO}_2)_2\cdot\text{H}_2\text{O}$, formed as a film on electrical insulators and other stones stored in wooden drawers. Named from the composition, $\text{Ca},\text{Cl},\text{Ac.}$ Spencer 19, M.M., 1949.

calci-limestone. Contains 50 or more percent of fragments of older limestone eroded from the land and redeposited. A.G.I. Supp.

calcocalcites. A mixture of malachite and calcite, and also, often, gypsum. An ornamental stone often sold as malachite. Skipley.

calcrete. Suggested by Lamplug for conglomerates formed by the cementation of surficial gravels by calcium carbonate. Calcrete was suggested by Bonney as preferential in surficial gravels by calcium carbonate.Where evaporation goes on steadily deposit of calcium carbonate (calc-tufa). Fay.

calc-tufa. Where evaporation goes on steadily at the surface while water is being brought up from below by capillary action, calcium carbonate may be found as a cement to the soil, or to the crumbling rock near the surface, and a solid, porous, or spongy deposit of calcium carbonate (calc-tufa) may arise by continued precipitation of calcium carbonate in solution from lower levels. A.G.I. Supp.

calciiform. Pebble-shaped. Webster 3d.

calculus. Branch of mathematics which deals with rates of change $\surd$ infinitesimal increments of coordinates. Corresponding change over finite increments. Pryor, 3.

calcedon. A very large basin-shaped volcanic depression, more or less circular or circular-like in form, the diameter is many times longer than that of the included volcanic vent or vents, no matter what the steepness of the walls or the floor. Another similar arrangement is the Callow cone. These, and others, are developed from split tuff.

caldera. a. A large basin-shaped volcanic depression, more or less circular or circular-like in form, the diameter is many times longer than that of the included volcanic vent or vents, no matter what the steepness of the walls or the floor may be. There are three major types according to origin: Explosion caldera, collapse caldera, and tronon caldera. A.G.I. b. A very large crater produced by a violent explosion. Webster 3d.

calderon. A volcanic gas bubble containing the manganous-ferric molecule, $3\text{MnO}_2\cdot\text{FeO}\cdot\text{SiO}_2$. From Nagpur, India. English.

calodon. a. A soil mass with a 3-square-inch core of material differing from standard, especially as to ascertainment of the California bearing ratio. The ratio of the floor of the included volcanic vent or vents, no matter what the steepness of the walls or the floor may be. There are three major types according to origin: Explosion caldera, collapse caldera, and tronon caldera. A.G.I. b. A very large crater produced by a violent explosion. Webster 3d.

calderon bottom. a. Mud-filled prostrate trunk of a sigillaria in the roof of certain coal seams. The trunk is a separate mass of rock, with a film of coal around it. It is liable to collapse without any warning sound. Also called Horshack. See also pot; e; bell sord; caldon. Nelson, b. Eng. A cone-shaped mass with slippery surfaces found in the roof of some seams. It sometimes comprises a ring of coal around a core of material differing slightly from the original roof. Also called pot hole; kettle bottom. SMRB, Paper No. 61.

caldron process. Recovery of silver, in which a slurry of the ore in a copper vessel is saturated with salt, Bennett 2d, 1962.

caldrone substantia. The sinking part of the roof of an intrusion within a closed depression. More or less circular, elliptical, or oval in plan. Schieferdecker.

calodon. A cone-shaped mass with slippery surfaces found in the roof of some seams. It sometimes comprises a ring of coal around a core of material differing slightly from the original roof. Also called pot hole; kettle bottom. SMRB, Paper No. 61.

calido. A soil mass with a 3-square-inch core of material differing from standard, especially as to ascertainment of the California bearing ratio. The ratio of the floor of the included volcanic vent or vents, no matter what the steepness of the walls or the floor may be. There are three major types according to origin: Explosion caldera, collapse caldera, and tronon caldera. A.G.I. b. A very large crater produced by a violent explosion. Webster 3d.

calcochrome. See split block. Skaw.

calcalch. Mex. Second-class silver ore carrying 150 to 1,000 ounces per ton. At Fachuca, Hidalgo, the best or first-class ore separated in the mine, the second-class being known as azogues. Fay.

calculated block. A local name for a Triassic conglomerate from Frederick County, Md., under the column of the Old Chamber of Representatives in the Capitol at Washington, D.C. Fay.

calci-nites. Mex. Silver ores, generally colorados, with some iron sulfate, the result of weathering. Hey.

calci-ferric. Synonym for calcium. "Calciferous" is sometimes used instead of "calcic." Calif.

calci-siderite. Limestone deposited from springs and hot springs with dissolved calcium carbonate; travertine. Also called calcareous tufa. Fay.

caledonides. A mountain system raised during the late Silurian to the early Devonian time, particularly in Scandinavia and in Scotland. A.G.I. Supp.

calceinate. A green basic sulfate of lead and copper of uncertain composition. Sanford.

calcerr. A smaller version of the bulldozer. Ham.

calf line. A wire rope or cable wound on the calf wheel of a churn or rotary-drill machine and used in handling casing. Also called casing line. See also calf wheel.

calf wheel. A churn-drill winch used for handling casing and for odd jobs. Also called casing reel. Nichols.

calf wheel, a. A short hoisting drum with a large-diameter driving sprocket, used to wind up the casing line or cable line which is multiple-reved over the sprocket. The crown and traveling blocks by means of which casing and/or drill pipe is handled. Long. b. A reel used in rope drilling to accommodate the rope by which the casing is raised or lowered. B.S. 3618; ASCE P1826.

caliber. The inside diameter or bore of a tube, pipe, or cylinder. Long.

calibar. a. To ascertain the caliber of, as a thermometer tube. Webster 3d. b. To determine or to mark the capacity or the graduations of, or to rectify the graduations of, a graduated measuring instrument. Webster 3d. c. To standardize, as a measuring instrument, by determining the deviation from standard, especially as to ascertain the proper correction factors. Webster 3d.

calibrated block. See split block. Skaw.

calch. Mex. Second-class silver ore carrying 150 to 1,000 ounces per ton. At Fachuca, Hidalgo, the best or first-class ore separated in the mine, the second-class being known as azogues. Fay.

calculator. A. In the southwestern United States, gravel, sand, or desert debris cemented by porous calcium carbonate; also, the calcium carbonate itself. Fay. b. Surface or near-surface deposits of soluble salts precipitated by evaporation. Bateman. c. Natural Chilian salt peters. Bennett 2d, 1962.

calco marble. A local name for a Triassic conglomerate from Frederick County, Md., under the column of the Old Chamber of Representatives in the Capitol at Washington, D.C. Fay.

calci-siderite. Limestone deposited from springs and hot springs with dissolved calcium carbonate; travertine. Also called calcareous tufa. Fay.
Californian cat’s-eye. Shipley.

California moonstone. White or whitish chalk from California. Shipley.

California morganite. Morganite from California; some of fine color but more often a salmon pink color. Shipley.

California samplers. A drive sampler equipped with a wooden box through which an endless belt with floats is operated; used for pumping out of turn, irregularly, so that each miner

california sampler. A drive sampler equipped with a piston that can be retracted mechanically to any desired point within the barrel of the sampler. Long.

california tiger-eye. Same as California cat’s-eye. Shipley.

California topaz. Topaz from California. Bureau of Reclamation.

California-type dredge. A single-lift dredge consisting of a graduated beam to measure the diameter of logs and trees. Webster 3d. d. A device for measuring the dimensions of an object, usually with movable plates or contact points, but occasionally with fixed points or contact points, but occasionally with fixed points or contact points, but occasionally with fixed points or contact points.

caliper brakes. Brakes in which two brake-shoes are curved to the brake pad and anchored near the centerline of the drum. This gives an increased arc of contact but does not increase uniformity of pressure. This causes the brake linings to wear unevenly. Sinclair, V., p. 197.

caliper diameter. The distance measured across the bottoms of two opposite tooth gaps on a roller chain sprocket having an even number of teeth, and measured between one tooth gap and the nearest opposite gap for a sprocket with an odd number of teeth. ASM.

caliper log. Continuous record of the variations in mean diameter or in cross-sectional area of a bore with depth. Institute of Petroleum, 1960.

calist. Eng. Hard sand intermixed with gravel, which will stand without lining tube during boring operations, until washed from below rises up, which will cause it to fall away. Arkell.

calk. a. To drive tarred oakum into the seams between planks and fill with pitch. Fay. b. A tapered wedge or cone-shaped piece of iron or steel projecting downward from the shoe of a draft animal to prevent slipping of the collar. Long. c. To peen and draw metal toward and around a joint or beam being hand-set in a malleable-steel bit blank. Also called peen. Long. c. To wick. Long. c. A tapering of the lock end of a barrel. Long. d. A tapered bit blank. Also called peen. Long. e. To drive or withdraw at low pressure, through a porous septum the material so treated by calorizing. Hess.

california sampler. A drive sampler equipped with a piston that can be retracted mechanically to any desired point within the barrel of the sampler. Long.

california tiger-eye. Same as California cat’s-eye. Shipley.

California topaz. Topaz from the Mesa Grande and Ramona districts of southern California. Usually pale blue to almost colorless, but occasionally as fine in color as any blue topaz. Shipley.

Callan's rule. A rule stating that when a pillar has to be left in an inclined seam for the support of a shaft or of a surface structure, a greater width should be left on the rise side of the shaft or structure than on the dip side. Briggs, p. 76.

Callow flotation cell. An early form of pneumatic flotation cell, still in limited use. Air is blown in at the bottom of the tank at low pressure, through a porous septum such as a blanket, and mineralized froth overflows along the sides while the tailings progress to the discharge end. Pryor, 3.

Callow process. A flotation process embodying the usual principles but in which agitation is secured by air forced into the pulp through the canvas-covered bottom of the cell. Fay.

Callow. a. A name given to a thick coal seam. Temkefie, 1584.

Callow screen. A continuous belt formed of fine wire mesh travels horizontally between two drums. Pulp is fed from above and flows through together with the finer solids, while coarser material is discharged between the same drums. Pryor, 3.

Callow flotation cell. An early form of pneumatic flotation cell, still in limited use. Air is blown in at the bottom of the tank at low pressure, through a porous septum such as a blanket, and mineralized froth overflows along the sides while the tailings progress to the discharge end. Pryor, 3.

Callows. Corn. See Killas, a. Fay.

calmstone; caustonstone. Scot. Argillaceous limestone or white clay used for whitening houses. Fay.

calcar. A white earth or clay. Fay.

calcomel. A mineral, [HgCl2] colorless,
white, grayish- and yellowish-white, yellowish-gray to ash-gray, brown color. Occurs as a secondary mineral, and originally found at Montschalhem, Bavaria, Germany. Also, for calomel; calomel; horn quicksilver; mercurial horn ore. Dana 7, 2, pp. 26-27; Hey 2d, 1955; A.G.I.
calomel electrode. Half-cell used to measure e.m.f. of a fuel is completely burned. Newton, p. 128.
calorific value. See gross calorific value; net calorific value. A.G.I.
calorimeter. Any apparatus for measuring the quantity of heat generated in a body or substance by observing the quantity of a solid liquefied or of a liquid vaporized under given conditions. Used in determining specific heat; latent heat; the heat of chemical combinations; etc. Standard, 1964.
calorific value. See gross calorific value; net calorific value. A.G.I.
calorimeter. Any apparatus for measuring the quantity of heat generated in a body or substance by observing the quantity of a solid liquefied or of a liquid vaporized under given conditions. Used in determining specific heat; latent heat; the heat of chemical combinations; etc. Standard, 1964.
calorimeter. Any apparatus for measuring the quantity of heat generated in a body or substance by observing the quantity of a solid liquefied or of a liquid vaporized under given conditions. Used in determining specific heat; latent heat; the heat of chemical combinations; etc. Standard, 1964.
calorimeter. Any apparatus for measuring the quantity of heat generated in a body or substance by observing the quantity of a solid liquefied or of a liquid vaporized under given conditions. Used in determining specific heat; latent heat; the heat of chemical combinations; etc. Standard, 1964.
calorimetry. The phenomenon of glowing when a substance is stimulated by the heat rays which lie beyond the red end of the visible spectrum. Same as thermoluminescence. Hey 2d.
cam. a. A rotating piece, either noncircular or eccentric, used to convert rotary motion into reciprocating motion, often of irregular outline, and giving motion that is irregular in direction, rate, or time. Standard, 1964. In stamp mills, the cam projects below a trussed beam. Ham.
cambridge. A miner's term sometimes applied to such structures as bels, pots, kettle bottoms, or other rock masses that tend to fall easily from the mine roof. See also tortoise. A.G.I.
cambridge. A layered stone (onyx, agate, opal, etc.) or shell carved in relief to show the design in a layer of one color or colors and the background in another color or colors. Hey.
cameo. Fine pottery with figures in relief of a different color from the ground as Wedgwood ware and Jasper ware. Standard, 1964.
camouflet. A cavity formed in a borehole by the detonation of an explosive charge placed in the borehole. Also called chamber. A.G.I. 1. A charge of shot or shaped charge en- larged by chambering. Nelson. c. In military mining, an explosive charge designed to shatter adjacent ground without disturbing the surface. Pryor, 3. d. In civil mining, a small explosive charge designed to enlarge an excavation, to spring or chamber out a hole so that a bigger explosive load can then be charged. Pryor, 3.
campaign. a. The working life of a tank or other melting unit between major cold repairs. ASTM G162-66. b. The period during which a furnace is continuously in operation. Fay.
campasian. Upper Middle Senonian. A.G.I.
campasite. A sodic-potassic variety of leucite tephrite sometimes containing crystals of leucite; from Monte Somma, Italy. Holmes, 1928.
campa marble. A pale, yellowish-green marble mottled with white. A dark green variety of marble containing red blotches is known as canaman rouge. A.G.I.
campbell process. A method of rotary drilling for steel manufacture in which ore and pig reverts to the greatest deviation of side edge from a straight line. A.G.I. c. Sometimes used to denote crown rolls where the center of the roll has been in- creased to compensate for deflection caused by the rolling pressure. A.G.I. d. A vertical or convex curling barrel. Hey 2d.
canal. d. Outward lean from a straight line. Fay.
iron are used as raw materials in a tilting furnace. *Bennett 24, 1962.*

camper. Scot. Coal slightly camed. From the manufacture of explosives; cellular; and disinfectants. *Crispin.*
camshaft. A variety of white translucent jadeite resembling crystallized camphor in appearance. *Shipley.*
can press. A mechanical press in which one or more of the slides are operated by cams; usually a double-action press in which the blank-holder slide is operated by cams through which the dwell is obtained. *ASM, 417.*
camp sheathing. A retaining wall to support a river bank, formed by timber piles and wattlings, the piles being 6 to 10 feet apart. *Ham.*
camp sheathing. A sheathing used in foundation work to hold back gravelly soils or sand. *Ham.*
campstone. A lanugrophyre containing pyroxene, hornblende, and olivine as dark constituents, and labradorite as the light constituent; Sodic orthoerz may be present also. *A.G.I.*
cam shaft. In stamp mill, a horizontal shaft on which rotate the canes which lift the five individual stamps in a battery. *Pryor, 3.*
camshaft bearings. The bearings that support the camshaft in the engine block. *Shell Oil Co.*
cam stone. In stamp battery crushing, a square-sectioned wooden stick greased on underside and leather-lined above, inserted between canes and hoppet as a surface to facilitate jacking-up on finger bar. *Pryor, 3.*
can. a. A term used in the manufacture of explosives; cellular; and disinfectants. *Crispin.*
candelite. A nepheline syenite containing albite, or a sodic plagioclase, as the principal feldspar and abundant mafic minerals which contain lime and alumina, that is, normative anorthite; the rock is intermediate between a laths-pyroxene syenite and shonkinite. *Holmes, 1928.*
canary. a. Sometimes used by rescue teams to give early indication of the presence of carbon monoxide in mine air. At least three birds should be taken by exploring parties and the distress of any one bird is taken as an indication of carbon monoxide danger. A small cylinder of oxygen may be carried for the resuscitation of an affected bird. A good type of carbon monoxide detector is the most convenient and reliable indicator. *See also F.S. detector tube. Nelson, b. Yellow diamond. *Schaller.*
canary ore. A yellow, earthy argentiferous lead ore, generally pyromorphite, bismuthinite, or massicot, more or less impure. *Fay.*
canary stone. A somewhat rare yellow variety of cannel coal. *Fay.*
canfieldite. A hexagonal mineral, [(NaCa)6(AlSiO4)3(OH)2] = AISiO4·2H2O occurring in nepheline syenites. *A.G.I.*
cand. Corn. Fluorapatite, or fluorite occurring as a veinstone; called by the Derbyshire joiners, blue John. Also spelled calcite. *Pryor, Fay.*
can- and-white. A term used for areas in which one quality fire clay is encountered, but with a white engobe in the inner surface. See also ripping face. *Dodd.*
candela, Candelina, (pleonaste) the iron-magnesium spinel, (Mg,Fe)2(Al,Fe)2O4. *Ch. Dana 6d, p. 226.*
canale. The unit of light intensity defined as the light given out in a horizontal direction by the flame of a sperm candle weighing one-twelfth of a pound and burning at the rate of 120 grains per hour. *Mason, v. 1, 244.* b. See ceramic filter. *Dodd.*
candela-foot. A unit of illumination. The light given by a British standard candle at a distance of 1 foot. *Crispin.*
candent. A luminescing power of a standard sperm candle. Used as a measure for other illuminants. *Crispin.* b. The British standard candle is defined as a sperm candle, that burns at the rate of 120 grains of sperm per hour. *Fay.* c. The Heimer's candle now used in the United States as a standard is about 0.88 part of the British standard. *Hey, d.* The luminous flux emitted by a source of light per unit solid angle in a given direction. It is expressed in terms of the international candle and new candle. *C.T.D.*
candela quartz. A faced quartz crystal having a long prismatic and often tapering shape. *AM, 1.*
candeus. A dirty, yellowish-white variety of peat which has the consistency of soap, and when dried is very flammable and burns with a clear, bright, steady flame. Also called gas turf. *Tomkief, 1954.*
cane marble. Local name for one of the low quality clay-flints associated with the Bassey Mine, Littlebow and Peace River coals seams of North Staffordshire, England. *Dodd.*
camstone. Eighteenth century English stone ware of a light brown color; it was a considerable advance on the coarse pottery that preceded it but, for use as tableware, camstone was soon replaced by white earthenware. During the 19th and the earlier part of the present century, however, camstone continued to be made in the Burslem, Barlaston and the Burton-On-Trent area as kitchenware and sanitary ware; it has a fine textured cane-colored body with a white engobe on the inner surface, often referred to as cane-and-white. *Dodd.*
canfieldite. a. This name was first given to an isometric silver sulphogermanate, believed
cannel coal. a. This is an old term for a coal burning with a steady luminous flame. The sapropelic origin of cannel coal was recognized at the beginning of the present century. The term is now used for sapropelic coal containing spores, in contrast to sapropelic coal containing algae, which is termed algal coal. Viewed microscopically, cannel coal shows no stratification. It is generally dull and has a more or less pronounced waxy luster. It is very compact and fractures conchoidally. There are transitions between cannel coal and boghead coal, and it is not possible always to distinguish macroscopically between cannel coal and boghead coal. Such a distinction can, however, be easily made with a microscope except in high rank coals. In American nomenclature, cannel coal must contain less than 5 percent anthracite. Cannel coal occurs in layers or lenses up to several centimeters in thickness. These seams consisting entirely of cannel coal are known. It occurs widely but in limited amounts. Synonym for gayet; analogouls term is parrot coal. See also sapropelic coal; boghead coal. IHCP, 1963, part 1. b. A variety of bituminous or subbituminous coal of uniform and compact fine-grained texture. See also general absence of banded structure. It is dark gray to black in color, has a greasy luster, and is noticeably of conchoidal or shellflake fracture. It is noncaking, yields a high percentage of volatile matter, ignites easily, and burns with a luminous smoky flame. ASTM D4739-39.
cannel shale: cannel slate. a. A shale in which the mineral and the organic matter are approximately equal proportions. Tomkeieff, 1954. b. A black shale formed by the accumulation of sapropel accompanied by the presence of inorganic material, chiefly clay and silt. A.G.I.
canns marble. Same as grotto marble, a reddish brown marble formed by fossil shells (gastropods). Hess.
cannaling. a. A diapered distortion in a flat or nearly flat surface, sometimes referred to as oil capsule. ASTM Gloss. b. Enclosing a highly reactive metal within one relatively inert for the purpose of heating without undue oxidation of the active metal. ASTM Gloss.
cannalisarina. A lead, bismuth sulfosalts; monoclinic crystals as thin lead plates; from Vulcano, Lipari Island, Italy. American Mineralogist, v. 38, No. 5-6, May-June 1953, p. 536.
cannock. S. Staff. A ferruginous nodule occurring in a fire clay; the name derives from the town of Cannock in that area. Dodd.
cannonsball mill. A mill for grinding tough materials by attrition with cannonballs in a rotating drum or chamber. See also ball mill. Fay.
cannonball. See blown-out shot. Fay. cannonball-grape shot. Eng. Quaternary boulder gravel in Nebraska, so named on account of the size and roundness of the cobbles, which the mineral and the organic matter are approximately equal proportions. Tomkeieff, 1954. b. A black shale formed by the accumulation of sapropel accompanied by the presence of inorganic material, chiefly clay and silt. A.G.I.
canns marble. Same as grotto marble, a reddish brown marble formed by fossil shells (gastropods). Hess.
cannaling. a. A diapered distortion in a flat or nearly flat surface, sometimes referred to as oil capsule. ASTM Gloss. b. Enclosing a highly reactive metal within one relatively inert for the purpose of heating without undue oxidation of the active metal. ASTM Gloss.
cannalisarina. A lead, bismuth sulfosalts; monoclinic crystals as thin lead plates; from Vulcano, Lipari Island, Italy. American Mineralogist, v. 38, No. 5-6, May-June 1953, p. 536.
cannock. S. Staff. A ferruginous nodule occurring in a fire clay; the name derives from the town of Cannock in that area. Dodd.
cannonsball mill. A mill for grinding tough materials by attrition with cannonballs in a rotating drum or chamber. See also ball mill. Fay.
cannonball. See blown-out shot. Fay. cannonball-grape shot. Eng. Quaternary boulder gravel in Nebraska, so named on account of the size and roundness of the cobbles, which the mineral and the organic matter are approximately equal proportions. Tomkeieff, 1954. b. A black shale formed by the accumulation of sapropel accompanied by the presence of inorganic material, chiefly clay and silt. A.G.I.
canns marble. Same as grotto marble, a reddish brown marble formed by fossil shells (gastropods). Hess.
cannaling. a. A diapered distortion in a flat or nearly flat surface, sometimes referred to as oil capsule. ASTM Gloss. b. Enclosing a highly reactive metal within one relatively inert for the purpose of heating without undue oxidation of the active metal. ASTM Gloss.
cannalisarina. A lead, bismuth sulfosalts; monoclinic crystals as thin lead plates; from Vulcano, Lipari Island, Italy. American Mineralogist, v. 38, No. 5-6, May-June 1953, p. 536.
cannock. S. Staff. A ferruginous nodule occurring in a fire clay; the name derives from the town of Cannock in that area. Dodd.
cannonsball mill. A mill for grinding tough materials by attrition with cannonballs in a rotating drum or chamber. See also ball mill. Fay.
cannonball. See blown-out shot. Fay. cannonball-grape shot. Eng. Quaternary boulder gravel in Nebraska, so named on account of the size and roundness of the cobbles, which the mineral and the organic matter are approximately equal proportions. Tomkeieff, 1954. b. A black shale formed by the accumulation of sapropel accompanied by the presence of inorganic material, chiefly clay and silt. A.G.I.
canns marble. Same as grotto marble, a reddish brown marble formed by fossil shells (gastropods). Hess.
cannaling. a. A diapered distortion in a flat or nearly flat surface, sometimes referred to as oil capsule. ASTM Gloss. b. Enclosing a highly reactive metal within one relatively inert for the purpose of heating without undue oxidation of the active metal. ASTM Gloss.
cannalisarina. A lead, bismuth sulfosalts; monoclinic crystals as thin lead plates; from Vulcano, Lipari Island, Italy. American Mineralogist, v. 38, No. 5-6, May-June 1953, p. 536.
canvases

distributed across the upper margin. As it flows down, the concentrates settle in the corrugations of the canvas. After the mesh is filled, the remaining quartz is washed off with clear water, and finally the concentrates are removed (by hose or brooms). *Liddat 2d*, p. 386.

canvas. a. A precipitous valley; a gorge. Also spelled covey. *Fay.* b. A mine-level drift or gallery. C. De guia, a drift along the vein. *Fay.* c. A deep valley with steep sides located as a part of the ocean floor. The deep floors of ocean canyons contain sand and deep-sea mud. The Hudson Canyon is an example. It cuts the continental shelf to a depth almost as great as that of the Grand Canyon in southwest Arizona. *MacCracken.*

casiol flint. A form of cryptocrystalline silica occurring at Ulyon, Loocey Cork, Eire. It has a specific gravity of 2.26 and is readily ground, without the need for calcination, in lustrous bodies. *Bedd.*

cap. 1. A piece of plank or timber placed on top of a prop, stull, or post. *Long.* b. A flat piece of wood inserted between the top of a prop, stull, or post. *Hudson.* c. The horizontal member of a set of timber used as a roadway support. *Nelson.* d. A top piece in a three-piece timber set used for tunnel support. *Nichols.* e. The blue halo of ignited fire damp which shows about the yellow flame of a safety lamp when in air containing small quantities of fire damp. The percentage of fire damp can be roughly measured by the height of the cap. Also called gas cap. *Fay.* f. A detonator or blasting cap. *Nelson.* g. The top of a saddle reef; sometimes used synonymously with gossan to describe an outcrop. *Nelson.* h. Decomposed vein-stuff at the outcrop or lode. *Gorden.* i. S. Fr. A mine when the vein matter is barren or when the vein is pinched, or contracted, is called a *Nelson.* j. For the purpose of excavating and thereby provide voltage improvement. *Kentucky,* pp. 261-262. b. An adjustable electric appliance used in circuit with a motor to adjust the power factor. Also called capacitor. *Fay.*

capacity. a. As applied to diamond and rotary drills, the load that the hoisting and braking mechanism of a drill is capable of handling. b. The current in a capacitive circuit is less affected by changes in voltage than that in an inductive circuit. Therefore, should there be a sudden drop in mains voltage, the capacitively controlled lamp is less likely to be extinguished than the inductively controlled lamp. *Roberts,* II, p. 197.

capacitor. a. Electrical appliance working on the condenser principle. Two conducting plates are separated by an insulating layer. When alternating current is applied the capacitor is adjusted so that its leading current balance the lag of the circuit giving a high-power factor. *Fryor.* b. The principal use for capacitors in mines has been in improving the average power factor of the mine system in order to qualify for a favorable power rate. The selection of a suitable capacitor is made by dividing the number of reactive kilovolt-ampere hours registered by the number of hours (730) in the average month. The selected capacitor is then connected on the high-voltage lines, usually paralleling transformers to provide a charge path. Occasionally capacitors will be used at individual motors, usually converter motors, to relieve the transformer of excessive amperes and thereby provide voltage improvement. *Kentucky,* pp. 261-262. b. An adjustable electric appliance used in circuit with a motor to adjust the power factor. Also called capacitor. *Fryor.*

cap crimper. A plierslike tool for pressing the wire ends of a blasting cap into the primer. *Nelson.*

cap crimper. a. A diamond having a yellowish tinge. *Schaller.* b. A point or extension of land jutting out into the sea, either in the form of a peninsula or projecting point on a coast. *Schimmel.*

cape blue. Crocidolite asbestos found near Prieska, Republic of South Africa. *Fay.*

cape diamond. One with yellowish tinge. *Fryor.*

cape garnet. A bright red-yellow almandite (garnet). *Schaller.*

capel. a. Corn. A rock containing quartz, schorl, and hornblende. *See also capel.* b. A wall of a lode; so called by Cornwall miners, and probably when the country rock adjacent to the lode itself has been more or less altered by the same mineralizing agencies through which the lode was formed. Also called cab. In the United States, casing is sometimes used synonymously. *Fay.* c. A steel socket used to cap a steel rope. For a hoisting cage, molten white metal is poured in around the wires. *Cape May diam. A colorless and dear Cape diamod. One with yellowish tinge. *Schaller.*

cap factor. a. Introduced by Vaughan, and is the ratio between the breaking strength of a winding rope and the load suspended on it. (Excluding the weight of the rope itself.) He stated that this capacity factor should be 12 for all depths down to about 5,000 feet. See also factor of safety, *Nelson.* b. A method of assessing the size of the rope. The capacity factor of the rope is the static factor of safety of the rope at the time it is being tensioned. *Sinclair,* V, p. 13.

capacity limitation. The ability of a mine to store heat, as a measure of the mass, density, and cgs. *AGS.*

capacity load. The maximum load which can be carried safely. *Crispin.*

capacity of air compressor. The actual amount of air compressed and delivered, expressed in cubic feet per minute, at the suction and at the pressure of dry air at the suction. The capacity of an air compressor should be expressed in cubic feet per minute. *Fay.*

capacity of car or tub. Cubic yard of solid rock per car or tub. *Fay.*

capacity of the market. As applied to mining, the ability of the market to buy, especially with regard to the quantity which can be placed in the market, and to the prices which can be obtained. *Steeles,*v. 1, p. 66.

capacity of the wind. The total amount of retent material of a given kind that can be sustained (per unit volume of air) by a wind of a given velocity. The greater the velocity of the wind, the wind transports more material than water, although water at the same speed of flow is capable of carrying much larger particles. During a dust storm, the wind may carry from 160 short tons up to 126,000 short tons per cubic mile of air. *A.G.I.*

cap board. Same as cap. *Fay.*

cap crimper. A plierslike tool for pressing the wire ends of a blasting cap into the primer. *Fay.*

cap factor. a. As applied to diamond and rotary drills, the load that the hoisting and braking mechanism of a drill is capable of handling. b. The current in a capacitive circuit is less affected by changes in voltage than that in an inductive circuit. Therefore, should there be a sudden drop in mains voltage, the capacitively controlled lamp is less likely to be extinguished than the inductively controlled lamp. *Roberts,* II, p. 197.

cap crimper. a. As applied to diamond and rotary drills, the load that the hoisting and braking mechanism of a drill is capable of handling. b. The current in a capacitive circuit is less affected by changes in voltage than that in an inductive circuit. Therefore, should there be a sudden drop in mains voltage, the capacitively controlled lamp is less likely to be extinguished than the inductively controlled lamp. *Roberts,* II, p. 197.

capacity factor. a. Introduced by Vaughan, and is the ratio between the breaking strength of a winding rope and the load suspended on it. (Excluding the weight of the rope itself.) He stated that this capacity factor should be 12 for all depths down to about 5,000 feet. See also factor of safety, *Nelson.* b. A method of assessing the size of the rope. The capacity factor of the rope is the ratio between the maximum weight of the loaded cage or skip and the suspension capacity of the cable, the derrick, or equivalent equipment, and a derrick hook. *Sinclair,* V, p. 13.

capacity limitation. The ability of a mine to store heat, as a measure of the mass, density, and cgs. *AGS.*

capacity load. The maximum load which can
capillarity. a. The quality or state of being capillary. Webster 3d. b. The action by which the surface of a liquid is elevated at the point at which it is in contact with a solid (as in a lamp wick). Skill Oil Co. b. Resembling a hair; especially, having a very small or thin bore usually permitting capillary. Webster 3d. c. A mineral exhibiting a fine hairlike structure, for example, mellite. Nelson.
capillary action. The rise or movement of water in the interstices of a soil or a rock, as the result of capillary forces. ASCE P1826.
capillary attraction. The combination force, adhesion and cohesion, which causes liquid to rise or to flow from very closely spaced solid surfaces even against gravity. ASM Glass.
capillary fringe zone. The zone above the free-water elevation in which water is held by capillary action. ASCE P1826.
capillary migration; capillary flow. The movement of water by capillary action. ASCE P1826.
capillary red oxide of copper. A common name for chalcotrichite, a form of cuprite. Weed, 1918.
capillary height of capillary rise. The height above a free-water elevation to which water will rise by capillary action. ASCE P1826.
capillary tube. A tube with so fine a bore that the rise or fall of a liquid in it by capillary attraction is perceptible to the eye. Standard, 1964.
capillary water. a. Water held above the water table in soil by capillary force. Seeley; Seelye; Seelye. b. Water that has been subjected to the influence of capillary action. ASCE P1826.
capillary waves. Waves less than 1.73 centimeter in length, having rounded crests and V-shaped troughs whose characteristic wavelength is governed primarily by the forces of surface tension. It is believed that these waves increase friction between wind and the sea surface and contribute more to sea clutter on radar than other waves. Hy.
cap light, dry cell. A self-contained light which permits free use of the hands and may be carried in a purse or explosive atmosphere. The headlamp, with focusing lens and bulb, is strapped to the head or hat, and the dry cell battery unit can be clipped on. In case of explosive ventilation, the headlamp-ejects the bulb automatically in case of breakage. Bureau of Mines Bulletin 692. See also dry cell light, wet cell light. For illumination only. Nelson.
cap lamp. That term generally applied to the lamp which a miner wears on his headlight. The headlamp-ejects the bulb automatically in case of breakage. Bureau of Mines Bulletin 692. See also dry cell light, wet cell light. For illumination only. Nelson.
cap mattress. A mine captain; de patio, a surface box. Fay.
cap sesquioxide. Basaltic white limestone in the Guadalupe Mountains. It extends into the eastern Gallo Mountains and includes the Teseey, Gilliam, and Vidrio deposits; however, the U. S. Geological Survey considers Teseey limestone as a distinct formation. Found in New Mexico and Texas. Hess.
cap lamps. That term generally applied to the lamp which a miner wears on his safety hat or cap. For illumination only. B.C.I. See also miner's electric cap lamp.
cap. Corn. A hard rock lining tin lodes. See also cap.
cap light, dry cell. A self-contained light which permits free use of the hands and may be carried in a purse or explosive atmosphere. The headlamp, with focusing lens and bulb, is strapped to the head or hat, and the dry cell battery unit can be clipped on. In case of explosive ventilation, the headlamp-ejects the bulb automatically in case of breakage. Bureau of Mines Bulletin 692. See also dry cell light, wet cell light. For illumination only. Nelson.
cap, electric. The miner's electric cap lamp. ASCE P1826.
cap or detonator crimped on before it is taken to the place of use. Nelson. See also plain detonator.
capped fuse. A length of very closely spaced solid fuse with the cap or detonator crimped on before it is taken to the place of use. Nelson. See also plain detonator.
capped fuse. A length of very closely spaced solid fuse with the cap or detonator crimped on before it is taken to the place of use. Nelson. See also plain detonator.
capped guratz. A variety of quartz containing thin layers of clay. Fay.
capped steel. Semikilled steel cast in a bottle-top mold and covered with a cap fitting into the neck of the mold. The cap causes the metal to solidify. Pressure is built up in the sealed-in molten metal and results in a surface condition much like that of rimmed steel. Fay.
capping. A fitting at the end of the winding rope to enable the bridle chains of a cage to be connected by a pin through the clevis. In Great Britain, satisfactory results have been obtained from white metal and wedge-type cappings. Normally, wedge capping are manufactured either in 1.5 percent manganese steel to B.S. 2772, Pt. 2, 1936, or in 26/32 tons tensile mild steel and are tested to a proof load of 250 percent of the static load for which they are required. See also O.H.I., white metal capping. Fay.
cappelle. A very rare, very weakly radioactive, greenish-brown, hexagonal mineral, [Fe,Al]SiO3; found in marble, slate, and slate-tile. Fay.
capillaire. A mine captain; de patio, a surface box. Fay.
cap light, dry cell. A self-contained light which permits free use of the hands and may be carried in a purse or explosive atmosphere. The headlamp, with focusing lens and bulb, is strapped to the head or hat, and the dry cell battery unit can be clipped on. In case of explosive ventilation, the headlamp-ejects the bulb automatically in case of breakage. Bureau of Mines Bulletin 692. See also dry cell light, wet cell light. For illumination only. Nelson.
cap or detonator crimped on before it is taken to the place of use. Nelson. See also plain detonator.
capped fuse. A length of very closely spaced solid fuse with the cap or detonator crimped on before it is taken to the place of use. Nelson. See also plain detonator.
capped guratz. A variety of quartz containing thin layers of clay. Fay.
capped steel. Semikilled steel cast in a bottle-top mold and covered with a cap fitting into the neck of the mold. The cap causes the metal to solidify. Pressure is built up in the sealed-in molten metal and results in a surface condition much like that of rimmed steel. Fay.
capping. A fitting at the end of the winding rope to enable the bridle chains of a cage to be connected by a pin through the clevis. In Great Britain, satisfactory results have been obtained from white metal and wedge-type cappings. Normally, wedge cappings are manufactured either in 1.5 percent manganese steel to B.S. 2772, Pt. 2, 1936, or in 26/32 tons tensile mild steel and are tested to a proof load of 250 percent of the static load for which they are required. See also O.H.I., white metal capping. Fay.
cappelle. A very rare, very weakly radioactive, greenish-brown, hexagonal mineral, [Fe,Al]SiO3; found in marble, slate, and slate-tile. Fay.
capillaire. A mine captain; de patio, a surface box. Fay.
capping

capping. A special room or building used solely for the preparation of capper fuses. Nelson.
capping. A term used in square-set cap seat. The ledge inside the capstan. a. A poollike drum mounted on a vertical exis used for heave hoisting or for vertical exis used for hoisting the ore. Fay.
captain dresser. Eng. A manager of an ore-sealing or covering a borehole and/or the swivel to the end of a hoisting rope. Captain.
captive bar. Sometimes used as a synonym for cathead. Lots./
captive. A vehicle for use on a railroad, usually mounted on trucks, and often provided with mechanism for coupling, so as to form part of a train. Standard, 1964. b. A vehicle moving on wheels. Webster 3d. c. A wheeled vehicle used for the conveyance of coal or ore along the tanges or haulage roads of a mine. Zern. Also called mine car; tramcar; tub; wagon; mine wagon. Fay. d. A wheeled carrier that receives and loads the load to be conveyed. Generally attached to chain, belt, cable, linkage, or other propelling medium. See also tray. ASA M8A-1938.
captive car. a. Fay. Eng. The cap receives and supports the load to he conveyed.
captive. A lamp that is charged with acetylene. A waste lime hydrate byproduct of coke production. d. Also called carbide slag.
captive. A lamp that is charged with acetylene. A waste lime hydrate byproduct of coke production. d. Also called carbide slag.
captive. A lamp that is charged with acetylene. A waste lime hydrate byproduct of coke production. d. Also called carbide slag.
captive. A lamp that is charged with acetylene. A waste lime hydrate byproduct of coke production. d. Also called carbide slag.
captive. A lamp that is charged with acetylene. A waste lime hydrate byproduct of coke production. d. Also called carbide slag.
carbide miner

a recovery of 65 to 75 percent of the coal within the reach of the machine. This unit is a continuous miner working from a control stand outside of the seam of coal. The operator can control both its vertical and horizontal direction of the cutting heads as shown on an oscilloscope screen. As the cutting head advances into the coal seam, it drags a series of conveyer sections behind it, which in turn deposit the coal into a truck on the outside of the coal seam. Krumlauf, p. 8.

carbide of silicon. An artificial abrasive made by fusing coke, sand, salt, and sawdust in electric furnaces. Discovered in an attempt to make artificial diamonds. See also Carborundum. Fay.
carbides. Compounds of carbon with iron and other elements in steel. A variety of hydrocarbons contain carbides. A carbonate of calcium, strontium, and barium is carborundum. A form of dynamite in which trinitrotoluene's are dispersed. A variety of hydrocarbon containing carbides. Carbonate of calcium, strontium, and barium in a form of structureless jelly. Synonym for fundamental jelly; fundamental substance; geélose; jelly; vegetable jelly. Tomkiewicz, 1954 b. Same as ultimus. A.G.I.
carbonylhydrazine. A name applied to the group of neutral compounds composed of carbon, hydrogen, and oxygen including the sugars, starches dextrins, celluloses, and pentosans, some of which are formed by all green plants and used immediately for growth or stored for future use and which as a whole constitute a major class of animal foods characterized chemically by hydroxyaldehydes or ketones and classified into monosaccharides, disaccharides, trisaccharides, and polysaccharides on the basis of the number of aldehyde or ketone groups present in one molecule. Webster 3d.
carboid. A name applied to the group of pyrobituminous insoluble in carbon disulfide. To. Teg. 1954.
carbolic. a. Of, pertaining to, or derived from carbon and oil; or of pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carbolic acid. White; crystalline; deliquescent; G.C.H.2.8.2.0. Primary alcohol of the formula R.CILOH. Pryor, 3.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.

carboline. a. Of, pertaining to, or derived from carbon and oil; or pertaining to coal-tar oil. Standard, 1964. b. Of or pertaining to carbolic acid. Hass.
carbonated spring

the water, it effervesces like soda water.

Fay.

carbonated stone. An artificial stone in the manufacture of which steam and carbon dioxide are used to hasten hardening.

carbon dots. Hardness in a water caused by bicarbonates and carbonates of calcium and magnesium. ASTM STP No. 140-D.

carbonate leach. a. Metallurgical process for dissolution of uranium values by means of a sodium carbonate solution. Used on Toldito limestone and other highlime ores. Ballard. b. Dissolution of uranium with an aqueous solution of sodium carbonate in the presence of sufficient oxygen to render uranium hexavalent and satisfy the equation: 

\[ 2 \text{UO}_2\text{CO}_3 + 3 \text{H}_2\text{O} \rightarrow \text{UO}_3 + \text{CO}_2 + 4 \text{H}_2\text{O} \]

Pryor, 3.

carbonate mineral. A mineral formed by the combination of the carbonate ion (CO₃⁻) and a positive ion. Common example: calcite, CaCO₃. See also calcite, Fay.

carbonate of barium. See witherite. Fay.

carbonate rock. See limestone. Fay.

carbonation. a. The process of introducing carbon dioxide into a fluid. A.G.I. 1816; Supp. 3.

carbonate process. A process of chemical weathering by which minerals that contain lime, soda, potash, or other basic oxides are converted to carbonates by the action of carbonic acid in water or air. A.G.I. Supp.

carbon brick. Brick usually made of graphite and one or more ceramic materials such as fire clay and silicon carbide. H.W.

carbon deposition. The deposition of amorphous carbon, resulting from the decom- position of organic substances and gases into carbon dioxide and carbon within a critical temperature range. When deposited within the pores of a refractory material, this carbon may build up such pressure that it destroys the bond and causes the brick to distend. Fay.

carbon dioxide. Carbonic acid; gas; dry ice. a. Heavy, colorless; inflammable; odorless; water-soluble; tastes bitter and pungent; acts as a nerve irritant and as a solvent for fats. It is formed in mine explosions and in mine fires and forms part of the afterdamp. Fay, b. Product of combustion of organic fuels. Transportation in liquid form in steel cylinders. Used in gaseous form as a fire extinguisher and in solid form as dry ice.
carbide.

Carbon dioxide. A greenhouse gas that results from the burning of fossil fuels, biomass, and other carbon-containing materials.

Carbon monoxide. A poisonous gas with a carbon monoxide detector. It is a product of incomplete combustion of carbon.

Carbon tetrachloride. A colorless, volatile liquid used in various industrial processes.

Carbon tetrachloride poisoning. A condition resulting from exposure to carbon tetrachloride.

Carbon steel. A type of steel that contains carbon as the major alloying element.

Carbonate. A group of minerals and rocks that are derived from calcium carbonate.

Carbonate ground-water. Groundwater that contains dissolved calcium carbonate.

Carbonate rock. A type of sedimentary rock composed of calcium carbonate.

Carbonate soil. A type of soil that contains high levels of calcium carbonate.

Carbonate vegetation. A type of vegetation that is adapted to high levels of calcium carbonate in the soil.

Carbonate water. Water that contains dissolved calcium carbonate.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.

Carbon dioxide. A gas that is produced by the burning of fossil fuels and is a major contributor to global warming.

Carbon monoxide. A gas that is produced by the incomplete combustion of carbon and is toxic to humans.

Carbon tetrachloride. A chemical used in various industrial processes.

Carbonic acid. A compound that is formed when carbon dioxide is dissolved in water.

Carbonic anhydrase. An enzyme that catalyzes the reversible hydration of carbon dioxide.
carboxy; carboxyl. a. Monovalent, COOH

carbosand. Fine sand that has been treated

carboxymethylcellulose; CMC. An organic

carbozite. A black liquid, made from a bitu-

carbuncle. A gem of a deep-red color, inclin-

carbaram. a. A hydrocarbon related to, or

=buret. a. Carbide. Webster 3d. b. To com-

carbariselisa. The process of imparting car-

carburetor. a. A device used on gasoline

carboxylic acid method. In flotation, a method

for treatment of various oxygen ores using

carboxylic acids as collectors with gangue

depressants to float base-metal minerals

from associated impurities. The process is

suitable for the carbonates or oxides of

lead, copper, or zinc, somewhat less useful

with other lead minerals and with hema-

morphic, unsuitable for chrysocolla.

Gaudin, 2, pp. 462, 464.

carboxymethylcellulose; CMC. An organic

compound that finds use in the ceramic

industry, sea air, and temperatures up to

200° C. Osborne.

card. a. A small bottle in which hydro-

fluoric acid is stored and transported.

Long. b. A large glass bottle enclosed in

a box or in wickerwork, used mainly as a

container in which corrosive acids are

transported and/or stored. Long.

car builder. In bituminous coal mining, one

who shapes and welds together angle iron

that forms the framework and under-

structure, sea air, and temperatures up to

570° F. D.O.T. 1.

car cutter. In metal and nonmetal mining,

one who uncouples or loads mine cars from

a train and pushes them onto a rotary
dumper on which cars are turned over to
dump ore and debris from storage bins.

D.O.T. 1.

car cleaner. In antracite and bituminous

colining, a laborer who cleans mine

(pit) cars, in which coal is transported,

shoveling off the fine coal and dust left

in the bottom and scraping the dirt and

dust from the outsides of the cars. May

be designated as railroad-car cleaner at

bituminous mines. Also called pit-car cleaner.

D.O.T. 1.

car drier. A drier in which ware is trans-

ported on cars. ACGS, 1963.

car jar. a. A mechanical device for tilt-

ting air with gasoline or kerosine

and extracting coal up to about 30

inches in diameter and about 100 feet in

length. The frame is located under the

direction of the auger section to reduce height

and the direction of drilling can be reversed

without moving. The lowering them down

6-foot section. Nation.

cardox. A baked mixtures of caustic soda

and lime, used in the container or regen-

erator of self-contained mine-rescue or oxy-

gen-breathing apparatus to absorb the

exhaled carbon dioxide. It has the advan-

tage over straight caustic soda in that it

does not cake, liquefy, or solidify when

used. Lewis, p. 760.

cardox-plaster operator. In bituminous coal

mining, one who recharges steel shells

(tubes) known by the trade name Cardox

with a compressed mixture of electrical firing

elements, and liquid carbon dioxide to pre-

pare them for blasting coal. D.O.T. 1.

cardox shell. Steel shell used to contain

carbon dioxide in the Cardox blasting

method. See also carbon dioxide blasting.

Burke.

carrier. a. A drier in which ware is trans-

ported on cars. ACGS, 1963.

card weight pipe. A term used to

measure the weight of a car, which is

standard or full weight pipe, which is

used. Lewis, p. 760.

cardinal point. a. One of the four points

specified on the ground of the four

principal compass points, such as North,

South, East, and West. Long. c. Depend-

ing on the mechanism or drum em-

ployed, a change in the speed of the

winding ropes occurs at certain definite

intervals during the winding cycle. These

change-of-speed points are known as the

cardinal points of the winding cycle. Sin-

carrier. a. A device used on gasoline

engines and some kerosine engines, for

carbureting air with gasoline or kerosine

vapor. Porter. b. A device in which the

refractory material and often filled with checkers on

which oil is sprayed to enrich the gas. Compas.

carbon dioxide in the Cardox blasting

method. See also carbon dioxide blasting.

Burke.

carbon monoxide. A black liquid, made from a bitu-

carbon dioxide in the Cardox blasting

method. See also carbon dioxide blasting.

Burke.

car-cutter. In metal and nonmetal mining,

one who uncouples or loads mine cars from

a train and pushes them onto a rotary
dumper on which cars are turned over to
dump ore and debris from storage bins.

D.O.T. 1.

car-cleaner. In antracite and bituminous

colining, a laborer who cleans mine

(pit) cars, in which coal is transported,

shoveling off the fine coal and dust left

in the bottom and scraping the dirt and
dust from the outsides of the cars. May

be designated as railroad-car cleaner at

bituminous mines. Also called pit-car cleaner.

D.O.T. 1.

car-drier. A drier in which ware is trans-

ported on cars. ACGS, 1963.

car-jar. a. A mechanical device for tilt-

ting air with gasoline or kerosine

and extracting coal up to about 30

inches in diameter and about 100 feet in

length. The frame is located under the

direction of the auger section to reduce height

and the direction of drilling can be reversed

without moving. The lowering them down

6-foot section. Nation.

cardox. A baked mixtures of caustic soda

and lime, used in the container or regen-

erator of self-contained mine-rescue or oxy-

gen-breathing apparatus to absorb the

exhaled carbon dioxide. It has the advan-
tage over straight caustic soda in that it

does not cake, liquefy, or solidify when

used. Lewis, p. 760.

cardox-plaster operator. In bituminous coal

mining, one who recharges steel shells

(tubes) known by the trade name Cardox

with a compressed mixture of electrical firing

elements, and liquid carbon dioxide to pre-

pare them for blasting coal. D.O.T. 1.

cardox shell. Steel shell used to contain

carbon dioxide in the Cardox blasting

method. See also carbon dioxide blasting.

Burke.

car-cutter. In metal and nonmetal mining,

one who uncouples or loads mine cars from

a train and pushes them onto a rotary
dumper on which cars are turned over to
dump ore and debris from storage bins.

D.O.T. 1.

car-cleaner. In antracite and bituminous

colining, a laborer who cleans mine

(pit) cars, in which coal is transported,

shoveling off the fine coal and dust left

in the bottom and scraping the dirt and
dust from the outsides of the cars. May

be designated as railroad-car cleaner at

bituminous mines. Also called pit-car cleaner.

D.O.T. 1.

car-drier. A drier in which ware is trans-

ported on cars. ACGS, 1963.

cardox. A baked mixtures of caustic soda

and lime, used in the container or regen-

erator of self-contained mine-rescue or oxy-

gen-breathing apparatus to absorb the

exhaled carbon dioxide. It has the advan-
tage over straight caustic soda in that it

does not cake, liquefy, or solidify when

used. Lewis, p. 760.

cardox-plaster operator. In bituminous coal

mining, one who recharges steel shells

(tubes) known by the trade name Cardox

with a compressed mixture of electrical firing

elements, and liquid carbon dioxide to pre-

pare them for blasting coal. D.O.T. 1.

cardox shell. Steel shell used to contain

carbon dioxide in the Cardox blasting

method. See also carbon dioxide blasting.

Burke.
car-haul man

car haul (endless chain or cable) to which cars, or railroad cars underground or at the bottom of mines, are connected by compressed air. Used to control the speed of mine cars. It may take the form of a creeper or a retarder controlled by compressed air. See brake retarder.

car hooker. See coupler.

car inspector. In bituminous coal mining, one who examines mine cars for defective bodies, framework, undercarriages, or other equipment. See also inspection.

car inspector. A small reverberatory furnace with an inclined hearth, in which lead is treated by roasting and reaction, followed by cooling, and the lead is smelted in a furnaceman, and poured into cooling pans. See blast furnace.

carmand. Oxidized copper ore composed of cuprite, chalcocite, covellite, and chrysocolla; also in spherical forms. Fay.

carmine to tile-red lead-iron-aragonite. A variety of digenite. Weed, 1918.

carmine. A red or violet pigment obtained by the reduction of a chromate of lead or iron. Fay.

car oil. Black lubricating oils designated car oils. Also called carret. Car oils are usually black lubricating oils of the same general character as summer black oil. Porter.

carpenter, bank. In bituminous coal mining, one who works at the surface of a mine, repairing mine car bodies, structures, bins, and other equipment. See also carpenter, mine.

carpenter. In bituminous coal mining, one who builds and repairs the wooden parts of mine cars. See also carpenter, bank.

carpet. A bituminous surface of appreciable thickness, generally formed on top of a roadway by the application of one or more coats of bituminous material with gravel, sand, or stone chips added. Also called blanket; see also felt, felt blanket.

carpohedrite. A yellow mineral crystallizing in orthorhombic laths elongated in direction of C, with prismatic cleavage at 68°; MgAlO, 2SiO2, H2O. Larsen, p. 171.

carnallite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnallite plant operator. One dressing, smelting, and refining, one who makes carnallite flux used in magnesium refining, by melting carnallite ingredients according to formula, and mixing them thoroughly, using a shovel. The mixture is then loaded into a furnace, crucible, and poured into cooling pans. See blast furnace.

carriage. 1. A structure consisting of a gimbalmounted open frame, from a broad, shallow vessel. See Donald. 2. An arrangement of parts, with or without an enclosed space, such as a mine car or railroad car. See also mine car, railroad car.

carpet. In anthracite, bituminous, and subbituminous coals, a worker who handles mine cars or railroad cars underground or at the bottom of mines, or below ground level. See also mine car man, mine worker.

carpet. A China stone used to some extent in the United States pottery industry. See clay.

carpet. Any of the marbles with the commercial name, including some of the refined varieties of statuary marble. See also Carrara marble.

carnelian. A red or violet pigment obtained by the reduction of a chromate of lead or iron. Fay.

carnelian agate. Banded agate similar to carnelian but having a more compact structure. Fay.

carnelian onyx. See onyx. A carnelian onyx is in coloring except bands are not straight and parallel. Fay.

carnelian agate. Banded agate similar to carnelian onyx. Fay.

carnelian onyx. Onyx with alternating bands of white chalcedony and carnelian. See also carnelian onyx. Fay.

carnelian agate. Banded agate similar to carnelian onyx. Fay.

carmanite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carmanite. A variety of digenite. Weed, 1918.

carmanite-brick furnace process. See blast roasting.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carnicite. A massive, granular, greasy, milk-white, soluble, hydrous, magnesium-chloride, KCl.6MgCl2, crystallizing in the orthorhombic system; deliquescent. Dana 17.

carriage. a. A term used with shaker conveyor supports. Carriages may be designated as ball-frame, wheel, or roller carriage, depending on their construction. The carriage may or may not be attached solidly to the conveyor trough. Jones. See also: carrier. b. Same as cage. Korson. c. A sliding or rolling base or supporting frame. Nichols.
carric bolt. An oval or buttonhead black bolt with square neck which prevents the bolt from turning while the nut is being tightened. Crispin.
carricage. One or more rock drills carried interest; revisionary interest. A workman who shifts railroad cars in a coke-yard by inserting a pinchbar between the wheels or four wheels. Hess.
carricage. a. A term used with shaker conveyor or elevator. See conveyor. b. Same as cage. Fiber.
carricage mounting. One or more rock drills mounted on a wheeled frame, used in tunneling. Pryor.
carriceway. That part of a road which is designed for vehicular traffic. Ham.
carric explosive. A new permitted explosive of medium strength, and can be used in wet boreholes provided its immersion time does not exceed 2 to 3 hours. The maximum charge weight in British coal mines is 24 ounces and can be used for coal and ripping shots in conjunction with delay detonators. Nelson.
carric rider. A brakeman or laborer employed to ride on a car to the dumper, or on cars pushed from cradle, to apply brake, and prevent hard bumping. A blast furnace term. Fay.
carric seat; revisionary interest. A working interest participation in producing property whereby the operator is reimbursed for the loss of coal or surface damage and is permitted to carry interest from a dryer to a Hoffman type of kiln. D.O.T. 1. c. The main haulage road and used especially in England. Long.
carric sour. In uranium leaching, an inert material whereby the operator is reimbursed for the loss of coal or surface damage and is permitted to carry interest from a dryer to a Hoffman type of kiln. D.O.T. 1.
carric slide. The ramped loading platform for a scraper loader. Nelson.
carric spotter. A term used for the small hoist plug. Nelson.
carric slide. The ramped loading platform for a scraper loader. Nelson.
carric spotter. A term used for the small hoist plug. Nelson.
carric slide. The ramped loading platform for a scraper loader. Nelson.
carric spotter. A term used for the small hoist plug. Nelson.
carric slide. The ramped loading platform for a scraper loader. Nelson.
carric spotter. A term used for the small hoist plug. Nelson.
carric slide. The ramped loading platform for a scraper loader. Nelson.
carric spotter. A term used for the small hoist plug. Nelson.
carric slide. The ramped loading platform for a scraper loader. Nelson.
carric spotter. A term used for the small hoist plug. Nelson.
carric slide. The ramped loading platform for a scraper loader. Nelson.
cartridge brass

ing about 30 percent zinc, highly ductile. Pryor, 3.

cartridge fuse. A fuse enclosed in an insulating

and designed to confine the arc when the fuse blows. Crispin.
cartridge pin. A round stick of wood on which cartridges are deposited, usually, though not always, laid in a backstep sequence. ASM Gloss.
cascade sequence. A combined longitudinal and build-up sequence in which weld beads are deposited in adjacent layers, usually, laid in a backstep sequence. ASM Gloss.
cascade upgrading. See countercurrent de-

cascading. Movement of crop load in ball mill rotating at such a speed that the balls breaking free at top of rising load roll quietly down, to the toe of the charge. Changes with increased peripheral speed, motion changes to turbulent cascating and, still faster, to avalanching when upper layer of crushing bodies breaks clear and falls freely to top of crop load. Pryor, 3.
case. a. A small fissure, admitting water into the mine workings. Fay. b. One of the frames, of four pieces of plank each, placed side by side to form a continuous lining in galleries driven in loose rock. Webster 2d.
case bored. To bore a hole in the sides of a borehole. Flush-coupled casing is joined with a coupling which has the same outside diameter as the casing, but has two male threaded ends. Flush-coupled casing has a male thread at one end and a female thread at the other; no coupling is used. B.S. 3518, Sec. 3, 1963.
case box. A metal box used to catch a glass bottle after it has been severed from the blowpipe in the old hand blown proc-
case glass. Glassware with a superimposed layer of another glass having a different composition and usually colored. The thermal expansion of the two glasses must be carefully matched. Compare ply glass. Dodd.
case-off. See case off. Long.
case thin. Fine tin ore that is re-
treated by a gentle current of water flow-
ing over the frame or table. Fay.
casehardening. A term sometimes used for tempering glass. See also tempered glass. ASTM C162-66.
casehardening. a. The geological process by which the surface of a porous rock, espe-
cially a sandstone or a tuff, is coated by a cement or a desert varnish, formed by the evaporation of a mineral-bearing solu-
tion. A.G.P. b. Hardening a ferrous alloy so that the outer portion, or case, is made substantially harder than the inner portion, or core. Typical processes used for casehardening are carburizing, cyaniding, carbonizing, nitriding, induction hard-
ening, and flame hardening. ASM Gloss.
casein. A protein derived from milk, casein or milk curd. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. A protein derived from milk, casein or milk curd. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casein. Any protein that is insoluble in dilute acid solutions. Casein is the main protein in cheese.
casing catcher

casing catcher. A safety device equipped with slips or dogs to catch and grip casing if it is dropped while being lowered or pulled. Also called tubular catcher; tubing hanger. Long.

casing clamp. A mechanical device designed to facilitate the insertion or suspension of casing in a borehole. Made by forming a half circle in a heavy steel bar. When fitted together, in pairs, the bars fit around the outside and tightly grip the casing. Size of clamp is determined by outside diameter of the casing to be handled. Long.

casing collar. A safety means to cut casing dog. a. A lifting coin.

casing drive shoe. A cylindrical clamp insert driven down a borehole. Also called casing shoe. Long.

casing elevator. A circular clamp made in halves hinged at one end and closed fast with a latch at the other end. It is equipped with two long heavy chain links that furnish a means of hanging it on the hoisting mechanism in lowering casing into a wet borehole. Also called casing valve; float valve. Long.

casing flush coupled. See flush-coupled casing.

casing flush joint. See flush-joint casing.

casing head. a. Synonym for casing drive head. Long. b. A fitting attached to top of casing on an oil well to separate oil from gas, to allow pumping and the cleaning of the borehole, etc. Also called Christmas tree.

casing head gas. Natural gas rich in oil vapors. Sometimes called oil gas, or extracted from the oil, at the casing head. Frequently called combination gas or wet gas. Fay.

casing shoe. The liquid hydrocarbon recovered from casing head gas by absorption, compression, or refrigeration. Also known as native gas. Long.

casing-shoe box. See stuffing box.

casing hanger. A hook connecting the hoisting lines to the links of the casing elevator. Long.

casing inserted-joint. See inserted-joint casing.

casing jaw hammer; jaw hammerer. A drive hammer used to extract casing. B.S. 3618, 1963, sec. 3.

casing jamb. Device similar to and used in same manner as a casing cutter. See also casing cutter. Long.

casing line. Cable or wire rope wound on a hoisting drum and used only to raise or lower casing in a borehole. Also called call line. Long.

casing of a reef. Aust. The abnormal veinstuff abutting on the solid reef. See also casing, a. Fay.

casing of a reef. Process of inserting a line of casing in a borehole. See also case, c; case off Long.

casing pipe. Synonym for casing. Long.

casing point. In borehole drilling, casing point is the depth to which the casing is entered. Fay.

casing preventer. The pressure built up in the casing when closed at the top of the well. It is usually measured by placing a pressure gage at the outside of the casing head. Porter.

casing puller. A screw or hydraulic jack used to pull casing or drill rods stuck in a borehole. Long.

casing ramming shell. A sleeve designed to serve as a reaming coupling between a casing bit or set casing shoe and a joint of corresponding-size casing, which is being used as a core barrel. Also called casing-barrel ramming shell. Long.

casing rippers. An expanding-type cutting device, which can be lowered into a casing or drill rods or a line. Cutter is designed to rip longitudinal slits to free the casing at a coupling or to prorate the casing. Long.

casing shoe. A steel sleeve threaded to fit and be coupled to the bottom end of diamond-drill casing as a cutting head and protector when the casing is driven through overburden. The inside diameter of a specific thread-length-range casing shoe (whether plain or inset with diamonds or other cutting media) is always large enough to permit other downhole drill fittings having the same letter-name-range designation to be run inside and through the casing shoe. When a casing shoe is set with diamonds or other cutting media it is called a set casing shoe, which should not be confused with casing bit. Also called casing drive shoe. Compare casing bit; set casing shoe. Long.

casing spacer. An instrument used for recovering casing which has accidentally fallen into the mud. It is in the same general form of casing spear, consists of a steel body tapered at the top, on which are attached weights or weights with serrated edges. When lowered inside the casing to be recovered the steel segments are pushed upward along the narrow part of the body, but when raised, the segments remain stationary, and the weight of the casing forces the thicker part to exert a pressure on the segments forcing them outward. The greater the pull, the greater is the corresponding lateral pressure. Also called casing puller.

casing spider. A holding device resting on the drilling floor, consisting of two or more serrated sliding wedges working inside a heavy cone-shaped bowl or collars used to suspend casing in a drill hole during makeup or breakout. Also called casing bowl and slips. Long.

casing string. The total amount of any given size of casing inserted in a borehole. Long.

casing sub. a. A coupling threaded to fit casing at one end and drill rods or other downhole drill equipment at the other end. Long. b. A connection used in fishing with a petroleum-type rotary drill. Long.

casing substitute. Synonym for casing sub. Long.

casing value. Synonym for casing float. Long.

casing wall. See breast wall. Dodd.

casing water swivel. A special swivel designed to fit on casing at the collar of a borehole around the drill rods. Allows casing to be rotated slowly while maintaining a flow of water between drill rods and inside of casing. In addition to the flow of water down the inside of the drill rods. Primarily used with Morinette expansion reamer. Beneke.

chevronian. A Member of the Upper Devonian above the Kussa formation. Long.

cinereus. Brownish; Camel earth. A brown earthy substance found in peat and lignite beds and used as a pigment; originally found near Kassel, Germany. Cologne brown or Lincoln earth is a similar substance originally found near Cologne, Germany. Hess.

classic. A term for a well. See Kassel kiln. Dodd.

classic. A deep, round, usually porcelain dish with a handle used for heating substances in the laboratory. Winter 24.

classic. A lightewight body used to contain radiographic films during exposure to X-rays or gamma rays, that may or may not contain intensifying screens or filter screens, or both. A distinction is often made between a cassette, which has positive means for insuring contact between screens and film and is usually rigid, and an exposure holder, which is rather flexible. ASM Gloss.

classic. A felispir from Delaware County, Pa., containing several percent of baryta. Fay.

classic. A feather from Delaware County, Pa., containing several percent of baryta. Fay.

classic. The stem. SoDs; tetragonal; usually black in color; Mohs hardness, 6 to 7; streak pink-white; specific gravity, 6.9. When pure contains a Flynite admixture of other metals. Fay.

classic. A feather from Delaware County, Pa., containing several percent of baryta. Fay.

classic. A feather from Delaware County, Pa., containing several percent of baryta. Fay.
cast
structure

substance. A.G.I. c. To form in a desired shape by pouring molten metal into a mold and allowing it to harden. Long.
castable refractory. a. A refractory aggregate which will develop structural strength by hydraulic set after having been tempered with water and compacted. A.R.I. b. A mixture of a heat-resistant aggregate and a heat-resistant hydraulic cement; for use, it is mixed with water and rammed or poured into place. H.W.
cast-ender. Coro. The throwing up of one from one platform to another successively. See also shambles. Fay.
casting tool. A cutting tool made by casting a cobalt-bonded and used at machining speeds between those for high-speed steels and nitride carbides. A.S.M. Gloss.
casting. A chestnut-brown hydrous ferric

cost. A. A wheel mounted in a swivel frame

by introducing a body slip into a porous mold which absorbs sufficient water from the slip to produce a semisolid article. ASTM C162-66. d. Forming ceramic ware

casting. A. A series of iron molds on an endless belt conveyor to receive and cast the molten pig iron into form as it comes from the furnace. Mettler, 4th, p. 399.
casting machine. A. A cut-to-cord casting machine; for use on a construction site, or in factories and transported from there for erection on site. Ham.
casting iron. An iron containing carbon in excess of the solubility in the austenite that exists in the alloy at the eutectic temperature. For the various forms gray cast iron, white cast iron, malleable cast iron, and nodular cast iron, the cast iron is often left out, resulting in gray iron, white iron, malleable iron, and nodular iron, respectively.
casting iron enamel. A porcelain enamel specifically designed for application to cast irons. ASTM C229-65
casting iron molds. See electro-cast brick. Bureau of Mines Staff.
casting iron powder. A kind of blasting powder containing nitroglycerin and other nitrocellulose or a piceate, mixed with other materials Webber, 3.
castellated. Formed like a castle, as a cast-
teel. A. A long-tooth, sawtooth bit.
castellated bit. a. A long-tooth, sawtooth bit. Long. b. A series of iron molds on an endless belt conveyor to receive and cast the molten pig iron into form as it comes from the furnace. Mettler, 4th, p. 399.
casting powder. A kind of blasting powder containing nitroglycerine and other nitrobenzene or a picrate, mixed with other materials Webber, 3.
castellated beam. Trade name for a steel beam formed by cutting a rolled steel joint along the web in the form of a zig-zag. After this cutting operation the two halves are arranged so that the crests of the cut meet; these are then joined by butt welding. As a result, the depth and moment of the beam are increased by 50 percent. H.H.

casting pit. a. A quaryman's term for the operation of making a cut with a steam shovel, which, instead of loading the material on cars, moves it to one side forming a large ridge. Fay. b. The operation of reestablishing benches that have been covered or caved, and also cutting up a high bank into one or more smaller banks. Lawley, p. 399.
casting point. a. A cast bit. Set also cast bit ; cast set. Long. b. A surface-set diamond

casting shrinkage. a. Liquid shrinkage, the reduction in volume of liquid metal as it cools to the liquidus. A.S.M. Gloss. b. Solidification shrinkage, the reduction in volume of metal from the beginning to the end of solidification. A.S.M. Gloss. c. Solid shrinkage, the reduction in volume of metal from the solidus to room temperature. A.S.M. Gloss. d. Total shrinkage, the sum of the shrinkage in definitions a, b, and c above. A.S.M. Gloss.
casting spot. A fault that sometimes appears on the cast pottery as a vitrified and often discolored spot on the bottom of the ware or as a semielliptical mark on the side. It occurs where a break in the slip first strikes the plaster mold and is attributable to local orientation of platy particles of clay in the body. The fault can be largely eliminated by adjusting the degree of deflocculation of the slip so that it has a higher viscosity. A.R.I. c. A fault that is also known as a flashing. Dodd.
casting strain. Strains in a casting caused by casting stresses as the casting cool. ASM Gloss.
casting stress. Stresses setup in a casting because of geometry and casting shrinkage. A.S.M. Gloss.
casting temperature. See casting plate. Mettler, 4th, p. 399.
casting wheel. A large turntable with molds mounted on the outer edge. Used primarily in the base metal industry for casting ingots, anodes, etc. Bureau of Mines Staff.
casting-wheel operator. In ore dressing, smelt-
ing, and refining, one who operates a large rotating casting wheel to pour molten, non-
ferrous metal, such as copper or lead, into molds mounted on the edge of the wheel. D.O.T. 1.
cast in situ. Concrete which is cast in posi-
tion in a structure as distinct from precast concrete, which refers to elements made independently on a construction site, or in factories and transported from there for erection on site. Ham.
cast iron. An iron containing carbon in ex-
cess of the solubility in the austenite that exists in the alloy at the eutectic temperature. For the various forms gray cast iron, white cast iron, malleable cast iron, and nodular cast iron, the cast iron is often left out, resulting in gray iron, white iron, malleable iron, and nodular iron, respectively.
cast iron enamel. A porcelain enamel specifically designed for application to cast irons. ASTM C229-65.
cast-iron fittings. Elbows, couplings, and other small or irregular pieces for use in a pipe system or for some other subsidiary use, which have been molded from cast iron. H.N.
cast-iron pipes. Cylindrical iron tubes made from iron containing so much carbon that, as cast, it is not usefully malleable at any temperature. They may be cast in fixed molds or in whirling molds that compact the iron centrifugally. Hess.
casting machine. A series of iron molds on an endless belt conveyor to receive and cast the molten pig iron into form as it comes from the furnace. Mettler, 4th, p. 399.
casting metal. A. A cutting tool made by casting a cobalt-bonded

casting metal. See casting plate. Mettler, 4th, p. 399.
casting point. a. A cast bit. Set also cast bit ; cast set. Long.
casting matrix. For the various forms gray cast iron, white cast iron, malleable cast iron, and nodular cast iron, the cast iron is often left out, resulting in gray iron, white iron, malleable iron, and nodular iron, respectively.
casting matrix formed by pouring molten metal into a bit mold and allowing it to harden. Long.
casting metal. See casting plate. Mettler, 4th, p. 399.
cast structure

tation of crystals and segregation of impurities. ASM Gloss.
cast-ribbed. To join (parts) by placing together in a mold and pouring molten metal between or around. Webster 3d.
cast-ribbed rail joint. A welded joint between the ends of two adjacent rails, generally formed by the thermit process. Ham.
cast. a. S. Staff. A hard fire clay. Also called catch earth. Fay. b. Any heavy-duty tracklaying block, equipped either with or without a dozer blade. Long. c. To move: a heavy piece of drilling equipment utilizing power derived from the catchead. See also building. Long.
cata. A prefix to indicate that the rock belongs to a particular zone of metamorphism, which is characterized by very high temperature, hydrostatic pressure, and relatively low strain. Compare apo-; kata-; meta-; neo- A.G.I.
cataclase. Rock deformation accomplished by fracture to rotation of mineral grains or aggregates. The same as granulation. A.G.I. Supp.
cataclastic. a. Of or pertaining to a rock or rock zone that has been formed by shattering (or cataclasis) which has been less extreme than in the case of a mylonite. Cataclastic rocks are typically auto- clastic; scoriaceous; uneven chis; crush breccia; crush conglomerate; flaser gabbro; flaser gneiss; flaser granite; mylonite; protoclastic cataclase; xenotomolite. Storlone. A.G.I. Supp.
cataclastic. A breaking or rending asunder; a violent disruption. Webster 3d. cataclastic. a. Of or pertaining to a texture found in metamorphic rocks in which brittle minerals have been broken and flattened in a direction perpendicular to the pressure stress. Compare autotlastic. A.G.I. b. Refers to a coarse fragmentation of a rock in transit; for example, glacial action. A.G.I. Supp.
catalysis. See cataclastic. Fay.
cataclysmic. a. Accompanied with violent disruption. Fay. b. Of or pertaining to the nature of cataclastic; characterized by a cataclasm or by cataclastic. Standard. 1964.
cataclast. An amorphous plastic similar to bakelite. Shiplay.
catch props

supports are brought forward, Nelson. Also called watch props; safety props. C.G.D.
catch scald. Eng. A platform in a shaft a few feet beneath a working scaffold to be used in case of accident. Fay.
catch scutt. Eng. Ham.
catchwater drain. A surface drain to intercept and collect the flow of water from a disturbed zone so as to prevent it from reaching a roa' or mine sidings. See also subsurface drain. Nelson.
catch wings. Substantial wooden blocks placed in mine shaft just below point reached by reciprocating rod of Cornish pump at bottom of its stroke. Pryor, 3.
cat claw. A miner's term applied locally in Illinois to a bed of marcasite from 2 to 6 inches thick which sometimes occurs between the "clod" roof of a coal seam and the more stratified shale above. The lower surface of the marcasite bed is characterized by very irregular protuberances extending downward 1 to 3 inches into the clod. Also called cat. A.G.
cat claw. A miner's term applied locally in Illinois to a bed of marcasite from 2 to 6 inches thick which sometimes occurs between the "clod" roof of a coal seam and the more stratified shale above. The lower surface of the marcasite bed is characterized by very irregular protuberances extending downward 1 to 3 inches into the clod. Also called cat. A.G.

cathode reagents

compounds; for example, cetyl trimethyl ammonium bromide. C.C.D. 64, 1961.

cathode. A rope or cable wrapped around a cathead and used to spin out drill rods, casing, or pipe. Compare spinning chain; spinning cable; spinning rope.

Long.

cathodite. A red clay found in southwestern Minnesota and formerly used by the Indians for making pipes. Sanford.

cathode A. A rounded or a residual mound in a ridge which preserves a remnant of an old ore deposit. Fay.

cathode B. A type or cable wrapped around. Lowste. A general term for cetera. A monadnock or a residual mound in a ridge which preserves a remnant of an old ore deposit on its summit. Fay.

cathode C. A general term for sedimentary rocks because they were formed by deposition from above, as of suspended materials on a seafloor or hypogene. Fay.

cathode exchange. See ionic exchange. Dodd.

cathodolite. Katoprit. A black, red in thin section or a ridge which preserves a remnant of an old ore deposit. See also cawk, a and b. Fay.

cathode's effect. A zone in which any unworked mineral is transformed into consolidating minerals. The formation of new unstable deposit of material is allowed to cave and fill the void. Fay.

Long.

cathode's effect. Same as caustobiolites. Tom. 1954.

cathodolite. Suggested by Grabau to replace caustolith. To be confused with caustobiolit. A.G.I.

cationic reagents

A water softening treatment usually carried out where the water contains a fairly high proportion of temporary hardness and a quite small proportion of permanent hardness. In it, sodium carbonate reacts with the permanent hardness and the insoluble, are either precipitated or are mixed with the organic material and used in the preparation of metal for enameling.

Lae.

cave. A natural cavity, recess, chamber, or series of chambers and galleries beneath the surface of the earth, within a mountain, a ledge or rocks, etc.; sometimes a similar cavity artificially excavated. Standard, 1964. i. The ashpit in a glass furnace. Standard, 1964.

cave coral. A small, staked formation of calcium carbonate on the floor, the wall, or the ceiling of a cave. Synonym for coral formation. Schleideracker.

cave coral. A small, staked formation of calcium carbonate on the floor, the wall, or the ceiling of a cave. Synonym for coral formation. Schleideracker.

cave coral. A small, staked formation of calcium carbonate on the floor, the wall, or the ceiling of a cave. Synonym for coral formation. Schleideracker.

caved stopes

space occupied previously by the ore. The first type comprises the caving method of stoping in which the overlying strata are left to collapse by the top-slicing method. BuMin 390, 1936, p. 12.
caved in. Depression at the surface, caused by a fall of roof in the mine. Fay.
cave-in. An odd man around (frequently under) a glass furnace. Dodd.
cave marble. A cryptocrystalline banded deposit of calcite or of aragonite that can be highly polished. Synonym for pisolite. A.G.I.
cave pearl. A smooth, rounded deposit of calcite or of aragonite that can be highly polished. Synonym for pisolite. A.G.I.
caver. a. Eng. A thief who steals ore or coal at a mine or the officer appointed to guard a mine. Standard, 1964, b. A person whose hobby is exploring caves. Also called speleologist. A.G.I.
caverna. A large, natural underground cavity or cave; a den; any cavity. Standard, 1964

caverns. Deposits of calcite or of aragonite that can be highly polished. Synonym for pisolite. A.G.I.
cavernous. Containing cavities or caverns, especially in the walls of a borehole. BuMin 390, 1936.
cavities. a. The vertical axis of crystals in all systems except the isometric or cubic system. Bureau of Mines Staff, 1948.
cavities. The voids in which they will work for the following period. Fay. c. A type of heavy sledding with one blunt and one pointed end. Used for rough shaping stone at the quarry. Fay.
caving. a. A stoping method in which the ore is withdrawn. There are several varieties of the system. See also block caving; top slicing combined with ore caving. Fay, b. Longwall coal mining in which excavated space (go) is made to collapse. Fryer, 3.
caving by raising. See chute caving. Fay.
caving ground. Rock formations that will not stand in the air. See also unsupported mining. Fay.
caving in coal mines is on the increase. Standard, 1964.
caving in of the overburden as part of the system of mining. See also block caving; sublevel caving. BuMin 390, 1936, p. 4.
caving in. Collapse of walls or roof of mine workings, or excavations. Long, d. Fall of roof underground. Statius. A.G.I.
caving by raising. See chute caving. Fay.
cave-in. The partial or complete collapse of the walls of a borehole. Brantly, 1.
cave marble. A cryptocrystalline banded deposit of calcite or aragonite that can be highly polished. Synonym for pisolite. A.G.I.
cave pearl. A smooth, rounded deposit of calcite or aragonite that can be highly polished. Synonym for pisolite. A.G.I.
caver. a. Eng. A thief who steals ore or coal at a mine or the officer appointed to guard a mine. Standard, 1964, b. A person whose hobby is exploring caves. Also called speleologist. A.G.I.
cavernous. Containing cavities or caverns, especially in the walls of a borehole. BuMin 390, 1936.
cavities. a. The vertical axis of crystals in all systems except the isometric or cubic system. Bureau of Mines Staff, 1948.
cavities. The voids in which they will work for the following period. Fay. c. A type of heavy sledding with one blunt and one pointed end. Used for rough shaping stone at the quarry. Fay.
caving. a. A stoping method in which the ore is withdrawn. There are several varieties of the system. See also block caving; top slicing combined with ore caving. Fay, b. Longwall coal mining in which excavated space (go) is made to collapse. Fryer, 3.
caving in of the overburden as part of the system of mining. See also block caving; sublevel caving. BuMin 390, 1936, p. 4.
caving in. Collapse of walls or roof of mine workings, or excavations. Long, d. Fall of roof underground. Statius. A.G.I.
caving by raising. See chute caving. Fay.
cave-in. The partial or complete collapse of the walls of a borehole. Brantly, 1.
cave marble. A cryptocrystalline banded deposit of calcite or aragonite that can be highly polished. Synonym for pisolite. A.G.I.
cave pearl. A smooth, rounded deposit of calcite or aragonite that can be highly polished. Synonym for pisolite. A.G.I.
caver. a. Eng. A thief who steals ore or coal at a mine or the officer appointed to guard a mine. Standard, 1964, b. A person whose hobby is exploring caves. Also called speleologist. A.G.I.

celadonite

occurring in cavities in basaltic rocks. A.G.I.

celadine green. See celadonite.

celate blue. A ceramic color made by softening
the cobalt blue by the addition
of zinc oxide. Dodd.

celastilite. A variety of sulfhydrocarbon
which is found in iron meteorites. Tombkeite, 1957.

celastilite precious stone. Olivine from a meteorite. Schlatter.

celastone. See celestite. C.M.D.

celastonite. A strontium sulfate, SrSO4; orthorhombic. Dana 17. SrSO4, decomposes
at 1,380°C. The mineral source of strontium and its compounds. Bond. The mineral and the chemical are sometimes
used to impart iridescence to glasses and glazes. Shipley.

The term has been used as fine
agents in crystal glass. Lee.

cellite. a. A constituent in a flotation machine. Hess b. One of the spaces in a hollow clay building block. According to the
standard American Dictionary and Materials, a cell must have a minimum dimension of at least .5 inch and a cross-sectional area of at least 1 square inch. Dodd. c. A single element of an electric battery, either primary or secondary. Crupin. d. A cellulosic element consisting of two electrolytes separated by a semi-permeable membrane. e. A material or a mixture of materials occurring in the interstices between allo-
genic particles of clastic rocks. Silica, carbon,
carbonate, iron oxide, or manganese or barite are the most common cements. Clay minerals and other fine
clastic particles should not be considered cement. A.G.I. c. A finely divided metal obtained by precipitation. The word in this sense is generally used in combina-
tion; as, cement copper, mercury, or cement silver. Standard, 1954. d. The substance in which iron is packed in the process of cementation. Standard, 1954. e. A material or a mixture of materials (without aggregate) which, when in a plastic state, possesses adhesive or cohesive properties, and which will harden
in place. ASM C11-60. f. A finely ground powder which, in the presence of an appro-
priate quantity of water, hardens and adheres to suitable aggregate, thus bind-
ing it into a hard mass which is known as concrete or mortar. Taylor. g. To place cement in a borehole to seal off cavities or fissures or to seal off perfo-

cements encountered in the process of drilling boreholes. Lang. h. Used in gold-mining realms to describe various consolidated
fragmental aggregates, such as breccia, conglomerate, and the like, that are aurif-
erous. Fay. i. A hard sluice box, usually of
wood, made to receive, wash, and deposit gold or silver lodes. Cooper, p. 248.

In the sense of a clean cavity filled with
water, the box is known as a sluice. Cooper, p. 247.

cementation, a. To fill cavities or place a drill
hole with cement or other material to stop
loss of water or entrance of unwanted liquids, gas, or fragmented rock material
into a borehole. Also called dental work. Lone. b. The process by which loose sedi-
ments or sands are consolidated into hard rock by injection of chemical solutions, thus
forming the so-called cemented or impregnated sand. Long. Also called cementing. c. The introduction of one or more elements into the rock or metal object by means of diffusion at high temperature. ASM Gloss. d. Usually, the process of raising the carbon content
of steel by heating in a carbonaceous medium. Generally, any process in which the surface of a metal is impregnated with carbon. Also called carburizing; carburization, C.T.D.

cementation box. The box of wrought iron in which carburizing is effected. Fay.

cementation sintering. A method of shaft king
through water-bearing strata by injecting
chemicals or liquid cement into the ground. A number of small-diameter
boreholes are put down around the shaft (and about 80 feet ahead of the shaft bottom), through which cement is forced by means of pumps. The cement, when set, seals the fissures and thus prevents
water inflows during sintering. The method is most successful in strong fissured strata,
and least successful in loose alluvial deposits. See also grouting. Nelson.

cementation steel. Steel made by a process in
which bars of wrought iron are packed
into a sealed furnace together with char-
coal. The resulting material is blister steel. Fay.

cementation water. Water containing dis-
solved copper or iron sulfates or other elements that form compounds with the metal object. Fay.

cement bacillus. This name has been applied to the compound 3GeO·Al2O3·3CaSO4·3H2O, which is formed by the action of

193
cement bacillus

cement barrel. Synonym for cement injector.

Long.

cement bond log. The problem of determining whether casing is properly cemented in place has long been a thorny one. A device, which is in all essences merely an adaptation of a continuous velocity legging tool, has been developed to throw light on the quality of a cement job. If a single-detector continuous velocity log is run in a cased or cemented hole, the minimum acoustic travel time between transmitter and detector is generally via the steel pipe. This path is generally of both the travel time through steel is about 17,300 feet per second. This travel time is less than that through sands (unless their porosity is less than 5 percent) or through carbonate rocks (unless their porosity is less than about 10 percent). Thus when drilling through most sand-shale sequences a velocity log run after casing was set would be expected to show a faster and more uniform travel time than if run through the sand: interval uncased. Wyllie, p. 162.

cement. A mineral or mixture from a mixture of Portland cement and sand or cinder. Morse, 4th, p. 260.

cement deposit. The Cambrian conglomerate containing cement that is somewhat more resistant to chemical action than the regular grade because of high tricalcium aluminate content, and also because of additives such as water glass, calcium sulphate, and other materials. C.D. 6d, 1961.

cementing. a. Operation of cementing the casing into a hole to shut off water and cave strata and to prevent the oil and gas flow from migrating or blowing out. Shell Oil Co. See also cementation. Long.

cementing furnace. a. A furnace or oven used in cementing operations. Long.

Long.

cementing material. See cement. Fay.

cementing oven. See cementing furnace.

cementing tool operator. In petroleum production, one who directs and assists workers engaged in cementing annular space between cementing elements. ASM Gloss. See cementing tools. Long.

cement joggle. An indentation left in one side of a block due to labors of one person in combining cement, as certain limestones and fine sand into rock formations so seal the joints, cracks or fissures, or to stabilize and increase the strength of unconsolidated material. Also called grouting. Long.

cement grout. a. A cement mixture containing the proper amount of water, cement, and the fine sand having the consistency of a thick liquid-like heavy cream. Long.

cement joggle. An indentation left in one side of a block due to labors of one person in combining cement, as certain limestones and fine sand into rock formations so seal the joints, cracks or fissures, or to stabilize and increase the strength of unconsolidated material. Also called grouting. Long.

cement joggle. An indentation left in one side of a block due to labors of one person in combining cement, as certain limestones and fine sand into rock formations so seal the joints, cracks or fissures, or to stabilize and increase the strength of unconsolidated material. Also called grouting. Long.

Long.
center prop; middle prop

cement stabilisation

be uneconomical or impracticable. See also soil stabilisation. Nelson.

cement steel. Same as cement steel.

cement stone; cement rock. a. Any rock which is capable of furnishing cement when properly treated. b. Same as cement rock. Argillaceous limestone-magnesite. Nelson.

cement texture. A texture produced by cementation or replacement of cement in a sandstone or conglomerate by ore minerals. Schieferdecker.

cement valve. A V, flapper, or check-type valve placed at the bottom of a string of casing, through which cement is pumped. When pumping ceases, the valve closes and prevents return of cement into the casing. Long.

cementology. The branch of geology treating of the textural, fluvial, and lacustrine deposits. Synonym for surface geology. A.G.I.

Cementos. Lower Upper Cretaceous.

center; centre. A point on an area under equal overall pressure at which such pressure can be calculated as in balance. Pryor, 2, p. 16.

center, center of. See torsional center. Ro.

center of gravity. a. Center of mass, Webster 3d. b. The single point in a body (as a homogeneous sphere toward which every particle of a mass external to the body is gravitationally attracted. Webster 3d. c. The point or area of greatest weight or significance, or interest; a predominate, or critical; a predominating or controlling situation; a focal point. Webster 3d. d. The center of mass of a cut or a fill. Nichols.

center of gravity of an area. See centroid of an area. Ro.

center of inertia. a. The point that represents the mean position of the matter in a body. Webster 3d. b. The point in a head or shaft of a body which is resistant to the forces due to the body's inertia when it is accelerated. Coincident with the center of gravity. E.T.D. c. In a cut or a fill, a cross section line that divides its bulk into halves. Nichols.

center boring. A point on an area under equal overall pressure at which such pressure can be calculated as in balance. Pryor, 2, p. 16.

center bore; center borer. Synonym for eleborator. L. Long.

center boring. Grindng the outside or inside of workpiece mounted on rollers rather than on centers. Workpiece is between the centers of a cylinder or the frustum of a cone. ASM Gloss.

centerline. A line marked on the roof of a roadway to indicate the direction of the central axis of the roadway. B.S. 3618 1963, sec. 1. b. The plumbline, hung from the roof of a mine roadway, used for controlling the direction in which the roadway is driven. B.S. 3618, 1963, sec. 1.

centerline rule. A rule in the form of a cylinder or the frustum of a cone. A.G.I.

center line. A straight line connecting opposite quarter-section or sixteenth-section corners. A.G.I.

center line, center of. a. The line that represents the mean position of the matter in a body. Webster 3d. b. The point in a head or shaft of a body which is resistant to the forces due to the body's inertia when it is accelerated. Coincident with the center of gravity. E.T.D. c. In a cut or a fill, a cross section line that divides its bulk into halves. Nichols.

center of a cut or a fill. Nichols.

centering. A method of grappling whereby a ball of day is centered properly treated.

center post; center plug; center-bole. A device attached to a scale or plate used for final close adjustment of instruments. ASPG, 1963.

center-bole lapping. The cleaning or lapping of center holes. See air lapping. ACSG, 1963.

centering. centering adjustment. a. A timber falsework used to support the parts of a mastery arch during construction. Webster 3d. b. The operation on lens elements wherein the element is optically lined up with the optical axis. ASTM C162-66.

centering adjustment. In surveying, sliding plate used for final close adjustment of vertical axis of theodolite above its station. May incorporate clamp and fine-adjustment screws. Pryor, 3.

centering of shaft. The fixing of the center spot on the bore of a shaft at the site selected and the maintenance of the shaftinking along this plumb line during its entire depth. Nelson.

centering plugging. A plug fitting both spindle and cutter to insure concentricity of the cutting. ASM Gloss.
center prop; middle prop

plank to support it before props are set at the ends of the plank. SMRB, Peter No. 61. b. Eng. See temporary prop. b. SMRB, Peter No. 61.
center, reduction. In triangulation, the process of the necessary corrections to allow for an eccentric setup (that is, a setup in which the instrument does not occupy the point under signal). See center, 2.
center roll. A horizontal center at the roll of a tugging idler that has three or more rolls. NEMA MB1-1952.
centers. a. Framed supports, usually arch-shaped, upon which are placed the lagging rounds used, in building an arch. See support center alloll. A shot in the center of the face of a ceetigrade. Symbol, C. Graduated to a scale of a centimeter, gram, gram system. Removed. b. Conical steel pins of a grinding machine by which the instrument is restrained during grinding. ACG, 1963.
center shot. A shot in the center of the face of a room or entry. Also called center line.
center spanning. A method of casting molten metal, in which the molds are spun and the metal is poured into them. See pour. Pryor, 1.
center-trace time. One of two approaches used in plotting seismic reflection data on the Earth's surface. Center-trace times are the times picked on the two traces from the respective detector groups nearest the shot gun. ABCG, p. 235. The average of the two times for each reflection is plotted at the shot-point position. The points on the plot differ for adjacent shot points if the record picks are connected by straight lines. See trace-by-trace plotting. Dobrin.
centigrade. Symbol, C. Graduated to a scale of 100; of or pertaining to such a scale. The centigrade scale of temperature is one in which the freezing point of water is 0° C and its boiling point is 100° C. If any degree on the centigrade scale is multiplied by 1.8, the result will be, in either case, the same as is described in the centigrade scale. See also centigrade.
centigram. Symbol, cg. A unit of mass equal to one hundredth of a gram; abbreviation, cm. Crispin.
centrifugal, centrifugal. a. Of or using centrifugal force. The force exerted as a result of a rotating impeller. See centrifugal force. Merriam-Webster 3d.
centrifugal force. The force exerted as a result of a rotating impeller, sometimes serving as a method of lifting material to a height against gravity. See centrifugal force. Webster 3d.
centrifugal pump. a. A form of pump in which the rotating impeller imparts a tangential velocity to the liquid that is then thrown outwards. See turbined pump. Steinhard.

centrifugal separation. The replacement of a mineral by another mineral that begins in the center of the mineral and proceeds outwards. A.G.I.
centrifugal separation, a. The separation of minerals of different kinds by centrifugal action as used in cyclone separators and centrifuges. See also coal-preparation plant.
centrifugal separation

Nelson. b. The use of centrifugal force to increase apparent density of finely divided particles so as to accelerate their movement toward an inner zone, or to cause them to coalesce. Pryor, 3. c. Accelerated settlement of finely divided particles from pulp, removal of moisture, or classification into relatively coarse and fine fractions by centrifuging. Performed on a laboratory scale in small batches, and commercially in a hydrocyclone or centrifugal classifier. Pryor, 3.

centrifugal ventilation. A mine ventilation system in which the air is led through a shaft in the middle of the field into the mine and out again at the periphery of the mining field. Stoker, 1, p. 329.

centrifugal. A rotating device for separating liquids of different specific gravities or for separating suspended colloidal particles, such as clay particles, in a single suspension, according to particle-size fractions, by centrifugal force. Colloidal particles that cannot be deposited from suspension by gravity can be deposited by centrifugal force in a supercentripetal. Bureau of Mines Staff.

centrifugal moisture equivalent. See moisture equivalent. ASCE P1976.

centrifugal drainage. Drainage or by a more and more radially inward toward a center. Stokes and Verner, 1955.

centrifugal force. The force that constrains a material particle to follow a curved path and that acts inwardly toward the center of curvature of the path causing centripetal acceleration, as a railroad train is prevented from leaving the track on a curve by the force exerted on the flanges of the outer wheels by the outer rail. Compare centrifugal force. Webster 3d.

centrifugal pump. A pump with an impeller or centrifugal action that gathers a fluid at or near the circumference of radial tubes and discharges it at the center. Standard, 1964.

centrifugal replacement. The replacement of a mineral by another mineral from the periphery of the host mineral inward. 1964.

centrioclinal. An area of strata which dips toward a center. Hess.

centroclinal. The center of area of a section; that point about which the static moment of all the elements of area equals zero. See also center of gravity. Ham.

centroclinal axis. See central axis. Ro.

centroclinal axis. A central axis of an area. That point in the plane of the area about any axis through which the moment of the area is zero; it coincides with the center of gravity of the area materialized as an infinitely thin homogeneous and uniform plate. Ro.

centroclinesymmetrical. In crystallography, having the center of symmetry at a point which is a plane of symmetry or an axis of symmetry. Key.

centroclinal point, line, or place within the earth from which earthquake waves are propagated. Stokes and Verner, 1955.

cephalopods. These have a head, mouth, and tentacles as in a cuttlefish. The shell was at one time a straight, 19th century. p. 287. d. A bottom-living mollusk, the shell of which is completely enclosed within a mantle. B.S. 3552, 1962.

ceramica. As a singular or plural noun, any of a class of nonmetallic products which are subjected to a high temperature during manufacture or use. AGG, 1963. b. Pertaining to ceramics, that is, inorganic, nonmetallic as opposed to organic or metallic, or pertaining to products manufactured from inorganic nonmetallic substances, which are subjected to a high temperature during manufacture or use, or pertaining to the manufacture or use of such articles or materials, such as ceramic process or ceramic bonding. Webster 3d.

ceramic bonding. Applying enamel clay to edges or trim of hollow ceramic articles. Bennett 2d. Add.

ceramic bond. a. The cohesion and adhesion that develops between the particles in a ceramic body by heat treatment through the formation of metallic bonds providing for the growth of new crystalline forms. Bureau of Mines Staff. b. In a ceramic body, the cohesion developed by a heat treatment which causes the cohesion of adjacent particles. HW.

ceramic cloth. A coating applied to ceramic ware which is primarily composed of nonmetallic materials. It may contain small amounts of metallic oxides for coloring purposes (that is, glasses, oxide coatings, etc.). Bureau of Mines Staff. b. An inorganic, essentially nonmetallic, protective coating on metal, suitable for use at or above red heat. ASTM C286-65.

ceramic color. See color oxide. ASTM C286-65.

ceramic color glass. An opaque-colored glass of satin or gloss finish obtained by spraying the clay body with a compound of metallic oxides, chemicals, and clays and firing at high temperature, fusing the glaze to the body, making them inseparable. AGS, 1963.

ceramic cone. See pyrometric cone. Hess.

ceramic engineer. One who conducts research and directs the technical work in the manufacture of ceramic products, such as brick, pottery, tile, asbestos, or refractories, and chemical, and heat resisting properties of various materials used in manufacture; selects materials and formulas for use in manufacture of ceramics according to the conditions under which the product is to be used; designs equipment and apparatus to improve methods of producing ceramic products; designs electrical insulation, thermal, electric or magnetic; specifies color. Bureau of Mines Staff. Originally, referred only to ware formed from clay and hardened by the action of heat, and to the art of making, temperatures. However, its significance has gradually been extended by usage, and it is now understood to include all refractory mate-
ceramic

defined in B.C.I. as dead rent. Fay.
ceramist. A person devoted to the ceramic art, whether as a manufacturer, a designer and decorator, or as a student or constructor. Fay.
ceramics. A term used by M. E. Wadsworth to include all ceramic or earthenware products, and often used in a more restricted sense, to include only art ceramics and tile. Fay.
cerargyrite; horn silver. Silver chloride, AgCl,
cerari. Minute, greenish-yellow octahedra

cerargyrite; horn silver. Silver chloride, AgCl,
cerianite. A discredited term equal to stibianite.
cerium. A metallic element of the rare earths, generally in bournonite matrix. Within earthenware, it is often used as an opacifier in glazes and enamels. Fay.
cerium chloride. See ceric chloride. CCD 6d, 1961.
cerium fluoride. An off-white powder, insoluble in water and in acids. Cerium fluoride is used in art ceramics to increase their brittleness and in the preparation of cerium metal (CCD 6d, 1961).
cerium hydroxide. See ceric hydroxide. Fay.
cerium oxide. A white gelatinous precipitate, approximately formula, Ca(UO2)2(OH)2, yellow, brown, or pink when impurities are present, which is insoluble in water and in acids, and is used in blast furnaces as a lining material. Chief source is monazite sand. Used in pure form to produce cerium salts, to impart a gray color to cement, and as an opacifying agent in glasses and enamels, and in crude form in the flame anodizing process.
cerium oxalate. See ceric oxalate. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
cerium oxide. See cerous oxide. Fay.
cerium oxide. See ceric oxide. Fay.
ceredia. A member of the subgenus Caynus, with the formula Mg6Al2(Al, Fe)2Si8O24, 2H2O, which is an opacified hornblende (Hey 2d, 1943).
ceremia. The preparation of or containing cerium oxide; see ceria. Fay.
ceremia. A discredited term equal to sili- 
ceremia. A discredited term equal to sili-
ceremia. A discredited term equal to sili-
ceremia. A discredited term equal to sili-

ceremia. A discredited term equal to sili-

cccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccc
chain. The chain is a long line of links which are connected together to form a flexible rope. Chains are used in various applications such as lifting, pulling, and pulling. Chains can be made of different materials such as steel, aluminum, and plastic.

A chain is a long line of links which are connected together to form a flexible rope. Chains are used in various applications such as lifting, pulling, and pulling. Chains can be made of different materials such as steel, aluminum, and plastic.
chakotrichite. A variety of cuprite in which chakosite. Chalcocite. Weed, 1918.

chakophaake; hydrotranklimite. A hydrous iron-copper sulfide, FeCuS₄, that is found in various chambered veins. It contains 34.5% copper and 25% iron, CuFeS₄ or ChacFe.S₂.

challeneal. A pale blue incrustation on ancient bronze objects because he contains Se⁰⁺₂. Occurs in small blue mosses.

challeneal, a mineral, Cu₂Se₀.2Mn₂O₄. Named from its pale blue color; an element commonly found in sulfuric acid.

challeneal, chemical formula, Cu₂Se₀.2Mn₂O₄. Named from its pale blue color, and specific gravity of 3.7.

challeneal, powdered, used as a greenish blue pigment. ASTM C286-65.

challeneal, prepared; drop chalk; calcium carbonate. Prepared as a straight chalk line is made on the floor, or over a midpoint and allowed to snap back. A straight line on a &or tor placement of the number of tubs (cars) is well packed with chalk. ASTM C286-65.

challeneal, precipitated; calcium carbonate. For industrial uses, see whiting. CCD 6d, 1961.

challeneal, represented as: soft limestone, calcareous tufa, diatomaceous shale, or volcanic tuff. Long, b. To establish an outstanding performance record. Long, chalky; chalked. The condition of a porcelain enamelled piece that has lost its natural gloss and become powdery. ASTM C286-65.

challeneal, short, along the edges of a room. Long, chalky; chalked. The condition of a porcelain enamelled piece that has lost its natural gloss and become powdery. ASTM C286-65.

challeneal, uniform composition, resembles chalk or natural gloss and become powdery. ASTM C286-65.

challeneal, water. A mineral's working place sometimes referred to as a source point. Whisker 2d. A powder used in various forms as a galvanic cement to fill in small holes or gashes.

challeneal, white, twisters Misra, mineral, (Mn, Zn)O.2MnO₂.9H₂O. Named from its pale blue color, and specific gravity, about 2.7. For industrial uses, see whiting. CCD 6d, 1961.

challeneal, with, in a series of chambers, as much as 7,000 pounds of dynamite may be charged. The drift is well packed with earth and sand before firing. In such a chamber, or series of chambers, as much as 7,000 pounds of dynamite may be placed, throwing down 350,000 tons of rock at one blast. See also chamber, chamber blasted.

chamber blasting. A large-scale blast in which explosives in bulk are placed in excavated subterranean chambers. Also called coove blast; ensembler-hole blast. Webster 2d.

chamber blasting. A large-scale blast in which explosives in bulk are placed in excavated subterranean chambers. Also called coove blast; ensembler-hole blast. Webster 2d.

chamber blasting. A large-scale blast in which explosives in bulk are placed in excavated subterranean chambers. Also called coove blast; ensembler-hole blast. Webster 2d.

chamber blasting. A large-scale blast in which explosives in bulk are placed in excavated subterranean chambers. Also called coove blast; ensembler-hole blast. Webster 2d.

chamber blasting. A large-scale blast in which explosives in bulk are placed in excavated subterranean chambers. Also called coove blast; ensembler-hole blast. Webster 2d.
chamolite. A mineral member of the chlorite group, approximately (Fe, Mg, Al, Fe)\(_2\)\(\text{AlSi}_2\text{O}_{10}\)(OH)\(_2\) monoclinically or orthorhombically. The characteristic constituent of many olivine iron ores. A.G.I.

chamotte. a. Fr. Burned clay used by zinc smelters. b. The refractory portion of a mixture used in the manufacture of fire-
channel sand. A sand or sandstone deposit.

channel sampling. See trench sampling.

channel man. In ore dressing, smelting, and quarry industry, one who gets up and hauls loose materials from the bottom of a shaft.

channel-machinery operator. A machine for raising water, or in which some machine work is accomplished by a group of reciprocating, hand-powered bars, operated by steam or compressed air while the machine receiving them, leaves back and forth to deliver the water only on the other ends, such as hammers, mauls, or ram. Also called channel hand.

channel milling. Cutting machine capable of cutting solid objects at once. It is used for cutting down distance off the quarry face without explosives. Pryor, 3.

channel mowers. A machine for raising water, or in which some machine work is accomplished by a group of reciprocating, hand-powered bars, operated by steam or compressed air while the machine receiving them leaves back and forth to deliver the water only on the other ends, such as hammers, mauls, or ram. Also called channel hand.

channel width. 6. The width of the beam between the outer edges of the beam supports. Pryor, 4.

channel welding. S. A customary method of joining, by sound, of the thickness of coal between two working places, or between levels of the same level and real; Pryor, 10. To remove the face of the coal, etc., for the sake of safety, be knocking on it with Fyr. A blow cap, knock, or strike Webster Id 74 capping.

channel work. A term for a kind of asphalt or bitumen. Also called Mexican asphalt.

channel works. A. A thicket of dwarf evergreen bushes, a dense impenetrable thicket of stiff or thorny shrubs or dwarf trees. Webster Id 74 Characteristics of Mexico and Northwestern United States. Fay.

channel works. A. A thicket of dwarf evergreen bushes, a dense impenetrable thicket of stiff or thorny shrubs or dwarf trees. Webster Id 74 Characteristics of Mexico and Northwestern United States. Fay.

characteristic curve. See last but one paragraph.

characteristic impedance, 4. If an explosive, the amount of energy transferred to a given load, in a function of the product of impedance and form of detonation. Fay. 6. For rock, density times velocity of longitudinal waves in the rock. Fay. 8.

characteristic radiation. High intensity, single wavelength X-rays, characteristic of the compound of the rays that appear in addition to the continuous white radiation whenever the voltage of the X-ray tube is increased beyond a critical value. Fay.

characterizing necessary minerals. Synonym for characterizing mineral. Fay. 74

characterous. A. A term for a substance that will not change, as by carbonization, under ordinary conditions. Fay. 74

charcoal. A dark-colored or black porous form of carbon made from vegetable or animal substances (as from wood by heating in a kiln or retort from which air is excluded) and used for fuel and in various mechanical, artistic, and chemical processes. Webster 5d.

charcoal blackening. Charcoal used in the pulped form as dry blacking or in suspension with clay as a black wash and either dusted or coated on the surface of molds to improve the surface. Osborne.

charcoal furnace. A furnace in which wood or any other substance is reduced to charcoal by dry distillation. Standard. 1964.

charcoal. A. A dark-colored or black porous form of carbon made from vegetable or animal substances (as from wood by heating in a kiln or retort from which air is excluded) and used for fuel and in various mechanical, artistic, and chemical processes. Webster 5d.

charcoal blackening. Charcoal used in the pulped form as dry blacking or in suspension with clay as a black wash and either dusted or coated on the surface of molds to improve the surface. Osborne.
A man specially appointed by the manager for the work of raking the furnaces, the charging of which is generally done by examination. 11am.

A man who loads metal or metal in the form of a charging machine.

A machine for driving coal, ore, or metals in a furnace gas, except coke or coke over.

A machine or machine powerer, driving a charging machine.

A laborer who charges an electric furnace with metals, alloys, and other materials. Also called furnace charger; furnace feeders. D.O.T. Sapp.

The iron pan adjusted on the charging scale for holding and conveying the scrap in the charging machine.

A long arm or extension at the end of the charging scale for holding and conveying the scrap in the charging machine.

A device used for holding hot metal and for conveying the scrap in the charging machine.

A locomotive engineer, or one who load., and is charged, furnace charging machine operator, in power, and pusher runner. D.O.T. 1 b.

A device used for holding hot metal and for conveying the scrap in a reverberatory furnace. D.O.T. 1.

A laborer who loads metal or metal in a furnace gas, except coke or coke over.

A man specially appointed by the manager for the work of furnaces, the charging of which is generally done by examination. 11am.

A machine or machine powerer, driving a charging machine.

A long arm or extension at the end of the charging scale for holding and conveying the scrap in the charging machine.

A device used for holding hot metal and for conveying the scrap in a reverberatory furnace. D.O.T. 1.

A long arm or extension at the end of the charging scale for holding and conveying the scrap in the charging machine.

A man specially appointed by the manager for the work of furnaces, the charging of which is generally done by examination. 11am.

A laborer who loads metal or metal in a furnace gas, except coke or coke over.

A man who loads metal or metal in the form of a charging machine.

chemical configuration

energy, energy released as a result of nuclear fission, or the release of energy by radioactive disintegration, is called the energy of a nuclear reaction. One of the most important sources of energy is the energy released by the fission of uranium or plutonium. The energy released by the fission of a single atom of uranium-235 is equivalent to the energy released by the explosion of about 20,000 tons of TNT. The energy released by the fission of a single atom of plutonium-239 is equivalent to the energy released by the explosion of about 100,000 tons of TNT.

chemical combination of metals. The process by which metals combine is called chemical combination. The process by which metals combine is called chemical combination. The process by which metals combine is called chemical combination. The process by which metals combine is called chemical combination. The process by which metals combine is called chemical combination.

chemical composition of matter. The chemical composition of matter is the arrangement of the atoms of the elements that make up a substance. The chemical composition of matter is the arrangement of the atoms of the elements that make up a substance. The chemical composition of matter is the arrangement of the atoms of the elements that make up a substance. The chemical composition of matter is the arrangement of the atoms of the elements that make up a substance. The chemical composition of matter is the arrangement of the atoms of the elements that make up a substance.

chemical definition. The definition of a chemical term is a statement of the meaning of the term. A chemical term is a statement of the meaning of the term. A chemical term is a statement of the meaning of the term. A chemical term is a statement of the meaning of the term. A chemical term is a statement of the meaning of the term.

chemical disposition. The process of disposing of waste or unwanted materials is called chemical disposition. The process of disposing of waste or unwanted materials is called chemical disposition. The process of disposing of waste or unwanted materials is called chemical disposition. The process of disposing of waste or unwanted materials is called chemical disposition. The process of disposing of waste or unwanted materials is called chemical disposition.

chemical dissolution. The process of dissolving a substance in water is called chemical dissolution. The process of dissolving a substance in water is called chemical dissolution. The process of dissolving a substance in water is called chemical dissolution. The process of dissolving a substance in water is called chemical dissolution. The process of dissolving a substance in water is called chemical dissolution.

chemical energy. Energy released as a result of chemical changes is called chemical energy. Chemical energy is released as a result of chemical changes. Chemical energy is released as a result of chemical changes. Chemical energy is released as a result of chemical changes. Chemical energy is released as a result of chemical changes.

chemical equilibrium. A chemical equilibrium is a state of balance between two or more chemical reactions. A chemical equilibrium is a state of balance between two or more chemical reactions. A chemical equilibrium is a state of balance between two or more chemical reactions. A chemical equilibrium is a state of balance between two or more chemical reactions. A chemical equilibrium is a state of balance between two or more chemical reactions.

chemical engineering. Chemical engineering is the study of the design and operation of chemical plants. Chemical engineering is the study of the design and operation of chemical plants. Chemical engineering is the study of the design and operation of chemical plants. Chemical engineering is the study of the design and operation of chemical plants. Chemical engineering is the study of the design and operation of chemical plants.

chemical equilibrium. A chemical equilibrium is a state of balance between two or more chemical reactions. A chemical equilibrium is a state of balance between two or more chemical reactions. A chemical equilibrium is a state of balance between two or more chemical reactions. A chemical equilibrium is a state of balance between two or more chemical reactions. A chemical equilibrium is a state of balance between two or more chemical reactions.

chemical expression. A chemical expression is a statement of the chemical composition of a substance. A chemical expression is a statement of the chemical composition of a substance. A chemical expression is a statement of the chemical composition of a substance. A chemical expression is a statement of the chemical composition of a substance. A chemical expression is a statement of the chemical composition of a substance.

chemical fusion. The process of fusing two or more elements together is called chemical fusion. Chemical fusion is the process of fusing two or more elements together. Chemical fusion is the process of fusing two or more elements together. Chemical fusion is the process of fusing two or more elements together. Chemical fusion is the process of fusing two or more elements together.
chemical weathering. The weathering of rock
material by chemical processes that trans-
form the original material into new chemi-
cal combinations. Thus chemical weather-
ing of orthoclase produces clay, some
silica, and a soluble salt of potassium.

chemiluminescence. Luminosity connected
with chemical changes in a luminous sub-

chemise. A wall built as a lining to an earth
bank. See also revet. Ham.

chemistry. The study of the composition of
 substances
and the laws of their interaction. Branches
are inorganic chemistry, organic chemistry,
and physical chemistry. C.T.D.

chemoseparation. A process that separates
two or more substances of similar physical
properties.

chemotherapy. The treatment of diseases
by chemicals, which generate oxygen.

chemotaxis. The migrating of organisms
according to chemical stimuli.

chemosorption. Irreversible sorption, an ad-
hesion
of a substance to a surface.

chemoseparation. A technique for separat-
ing mixtures based on differences in chemi-
ical properties.

chemotherapy. The treatment of diseases
by chemicals, which generate oxygen.

chemotaxis. The migrating of organisms
according to chemical stimuli.

chemosorption. Irreversible sorption, an ad-
hesion
of a substance to a surface.

chemoseparation. A technique for separat-
ing mixtures based on differences in chemi-
ical properties.

chemist. One who conducts research in the
chemistry of glass, and develops and controls
processes involved in the manufacture of glass products. Also called

chemistry. The study of the composition of
substances and their interactions, which
undergo. The main branches are inorganic chemistry, organic
chemistry, and physical chemistry. C.T.D.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.

chemist. One who conducts research in the
chemistry of glass, and develops and controls
processes involved in the manufacture of glass products. Also called

chemistry. The study of the composition of
substances and their interactions, which
undergo. The main branches are inorganic chemistry, organic
chemistry, and physical chemistry. C.T.D.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.

chemist. One who conducts research in the
chemistry of glass, and develops and controls
processes involved in the manufacture of glass products. Also called

chemistry. The study of the composition of
substances and their interactions, which
undergo. The main branches are inorganic chemistry, organic
chemistry, and physical chemistry. C.T.D.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.

chemist. One who conducts research in the
chemistry of glass, and develops and controls
processes involved in the manufacture of glass products. Also called

chemistry. The study of the composition of
substances and their interactions, which
undergo. The main branches are inorganic chemistry, organic
chemistry, and physical chemistry. C.T.D.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.

chemist. One who conducts research in the
chemistry of glass, and develops and controls
processes involved in the manufacture of glass products. Also called

chemistry. The study of the composition of
substances and their interactions, which
undergo. The main branches are inorganic chemistry, organic
chemistry, and physical chemistry. C.T.D.

chelate. A complex molecule, formed by
the coordination of a central metal ion with
several ligands.

chelating agent. A substance that forms
complexes with metal ions, used in water
processing.
chew; chows. Scot.

chew.

chevron fold. A very sharp fold that is usu-

chicken ladder. A notched log or pole used

chicharra sampling. A sampling technique in

chiastolite; made. A variety of andalusitc,

Chezy formula. A formula expressing the

childrenite. A hydrous phosphate of alumi-

Chiddy's test. Cupellation assays for gold con-

Long. b. To tear through material in a

surface water into buttress drains arranged

along the line of steepest slope. Ham.

cheyta formula. A formula expressing the

relation between velocity of water, hydrau-

ricus, and friction slope; thus, V = C

R,Sr, in which V equals velocity, R equals

hydraulic radius, S equals sine of the

slope angle due to friction, and C equals

a coefficient. See also Kutter's formula; Ham.

chistophite. A variety of andalusite, aluminum silicate, Al₂O₃·SiO₃ in which

(carbonaceous impurities are arranged in a regular manner along the longer axis of the crystal, in some varieties like the X (Greek di), hence the name. Sanford.

chiastolite. A fine-grained, metamor-

phosed, carbonaceous shale without any

prominent cleavage or schistosity and con-

taining conspicuous crystals of chiastolite.

Hess.

chimblinite. A coarse-grained eudialyte syenite in which soda amphiboles are more abun-

dant than soda pyroxenes. It differs from

lujurite in having a more granular tex-

ture than soda pyroxenes. It differs from

Hess.

chilled contact; chilled zone. a. That part of

the crystal, in some varieties like the X

(related to pituiticinatc. Structure, earthy.

Formula, uncertain. From Chile. Weed,

1918.

dant than the interior of the intrusive which

was formed by the contact; the interior is gray. C.T.D.

chilled cast iron. Cast iron cast in molds

constructed wholly or partly of metal, so that

the surface of the casting is white and hard

while the interior is gray. C.T.D.

chilled shot. In hard-rock boring with ada-

manite or Callyx drill, chilled iron or steel points which are driven by a drill bit and do the actual abrasive cutting

Pray, 3.

chilled shot bit. A flat-surfaced bit used with

hardened steel shot to drill rock by a mill-

ing action. B.S. 3618, 1963, sec. 3.

chilled shot drill. See shot drill. Nelson.

chilled-shot drilling. A method of rotary drill-

ing in which chilled steel shot is used as the cutting medium. B.S. 3618, 1963, sec. 3.

chillers. A piping system through which a

wax distillate is run to chill the wax and thus make it separate from the oil. Bureau of Mines Stall.

chill hardening. See chill. Fay.

chill mark. A wrinkled surface condition on
glassware resulting from uneven cooling in the forming process. ASTM C162-66.

chill point. a. The temperature at which a metal solidifies (usually in a metal spray gun) starts to cool. Long. b. The temperature at which a molten metal, lubricating oil, or grease starts to congeal. Fay.

chill time. Same as quenching time. ASTM.

chiming. Crowning. Jarring a keeve to settle concentrate more thoroughly.

chimney. a. An ore shoot. Compare chute, e. Fay. b. A steep and very narrow cleft or fissure in a bed of rock. Fay. c. A pipe or pipe-like structure used to carry off the smoke or gases from a furnace. Fay. d. A pipe or pipe-like structure used to carry off the smoke or gases from a furnace. Fay. e. A metallic lead as sponge on aluminum, This

is precipitated together with

containing veins of white matrix; often

covered by a surface of white. Fay.

chilled shot. In hard-rock boring with ada-

manite or Callyx drill, chilled iron or steel points which are driven by a drill bit and do the actual abrasive cutting

Pray, 3.

chimney draught. A. The column of igneous rock fill-

chimney arch. An arch in the base of a chim-

ney used to admit a flue. A.C.S.G., 1963.
chip sampling

working difficulty, a true channel sample can't be taken. R. H. O. Olson used in preliminary prospecting.

chir; chirrels. Scotch. Coal that passes through a screening shovel; small coal free from dirt or dirtiness.

chiral twin. See Brazil twin. Bureau of Mines.

chid; chirtt. Dcrb. See chert. Fay.

chisel draft. The dressed edge of a stone, to keep the chisel to convert the chippings into the borehole. Water or mud is strike a series of blows at the bottom of the borehole. The chisel

chisel point. Mt. Synonym for chopping bit.

chittering. A fault that works another's mine without permission. The term is said to have originated at Silver Reef in southwestern Utah when the rich silver-chloride ores were being worked. The thin seams were followed by lessees with the least possible handling of barren rock, hence the miner became a chlordite, and his operations chlordoring. The words were later extended to similar workers and their operations in other fields. Fay. b. A compound of chlorine with another element or radical. A salt or ester of hydrochloric acid. Crispin.

chlorine. a. To follow a thin vein or discontinuous ore deposit by irregular workings, intent only on extracting the profitable parts and with no regard for development; usually said of a lessee, sometimes of one who works another's mine without permission. The term is said to have originated at Silver Reef in southwestern Utah when the rich silver-chloride ores were being worked. The thin seams were followed by lessees with the least possible handling of barren rock, hence the miner became a chlordite, and his operations chlordoring. The words were later extended to similar workers and their operations in other fields. Fay. b. A compound of chlorine with another element or radical. A salt or ester of hydrochloric acid. Crispin.

chloride of lime. CaO; Ca(OH)$_2$. Obtained by treating lime with chlorine gas. Used as a bleaching agent. Crispin.

chloride. A. salt. Usually said of a lessee, sometimes of one who works another's mine without permission. The term is said to have originated at Silver Reef in southwestern Utah when the rich silver-chloride ores were being worked. The thin seams were followed by lessees with the least possible handling of barren rock, hence the miner became a chlordite, and his operations chlordoring. The words were later extended to similar workers and their operations in other fields. Fay. b. A compound of chlorine with another element or radical. A salt or ester of hydrochloric acid. Crispin.

chlorine. a. The total amount in grams of chlorine, iodine, and bromine contained in one kilogram of seawater, assuming that the bromine and iodine have been replaced by chlorine. Hy. b. The number giving the chlorine in grams per kilogram of seawater sample is identical with the number giving the mass in grams of atomic weight silver just necessary to precipitate the halogens in 0.320323 kilogram of the seawater sample. Fay. c. In chemistry, solution of the halogen such as chlorine, bromine, or iodine, in a solvent, usually a liquid or gaseous chlorine to a stream of chloride after roasting and chemical treatment. Holmes, 1928.

chlorite. A schist containing chlorite. Fay.

chlorite. A schist containing chlorite. Fay.

chlorite schist. A schist containing prominent chlorite. Fay.

chlorite slate. A schist or slate rock composed largely of chlorite. Fay.

chlorite sand. A sand colored green by sand-size chlorite grains as one of the constituents. Fay.

chloritic. a. The replacement by alteration of ferromagnesian minerals to chlorite. C.T.D.

chlorite. A dark green britle mica, ($Fe^2^+$, $Mg$)$_4$(Al$_2$Si$_3$O$_9$)(OH)$_6$); monoclinic. Found in metamorphic rocks. Dana 17; A.G.I.

chloritoid. A yellowish or greenish earthy, po-

tassium silicate, with a specific gravity of about 2.0. C.T.D.

chloromanganakolite. A yellowish or greenish earthy, potassium silicate, with a specific gravity of about 2.0. C.T.D.

chlorine. A common nonmetallic univalent and polyvalent element belonging to the halogens. A heavy gas, irritating, toxic gas of disagreeable odor. Usually made by the electrolysis of aqueous solutions of sodium chloride. Used chiefly in powerful bleaching, oxidizing, and disinfecting agent in water purification and in making bleaching powder. The words were later extended to similar workers and their operations in other fields. Fay. a. A substitute for blackpowder in which potassium chloride is used in place of potassium nitrate. This class of explosive has received little attention because of greater sensitiveness to shock and friction. Fay.

chirch. a. A tool of great variety whose cutting principle is that of the wedge. Crit-}

chisel. a. A tool of great variety whose cutting principle is that of the wedge. Critical. b. A sharp, straight-edged drill bit. Bureau of Mines Staff. See also bit. c. The steel cutting tool used in percussive boring. It ranges from 6 to 12 inches in length with variously shaped bits to suit the nature of the ground. The chisel is made to strike a series of blows at the bottom of the borehole. Water or mud is circulated to convert the chippings into sludge and to keep the chisel cool. Nelson. d. See chisel.

chisel. Mr. a. Synonym for chopping bit. Long. b. A percussive-type, rock-cutting drill. Steel cutting tool used in percussive boring. It ranges from 6 to 12 inches in length with variously shaped bits to suit the nature of the ground. The chisel is made to strike a series of blows at the bottom of the borehole. Water or mud is circulated to convert the chippings into sludge and to keep the chisel cool. Nelson. d. See chisel.

chisel-end. A syphon end extending across the diameter and through the center point of the bit face. Also called chisel-edge bit; chisel-point; chisel-end bit. Fay.

chisel draft. The dressed edge of a stone, which serves as a guide in cutting the

chisel steel. A carbon steel containing 1 percent carbon. It is readily forged and used for chisel making, large punches, miner's drills, etc. Comm.

chkalovite. Sodium and beryllium silicate, Na$_2$Be(SiO$_2$)$_2$.

chiver. See shiver. Arkell.

chilienne. The group of schizometric meteor-ites composed essentially of enstatite. Bra-

chilienne. The group of schizometric meteorites composed essentially of enstatite. Bramina extended the term to include birefringent stones of the diogenite group. To avoid confusion, Prior proposed the term ambrite to replace chilienne as used by Rose and Murray.

chichon. Holmes, 1928.

chilanthites. Chilanthite. An arsenide of nickel, NiAs, occurring in the cubic system: tin-

chilanthite. An arsenide of nickel, NiAs, occurring in the cubic system: tin-

chilanthite. An arsenide of nickel, NiAs, occurring in the cubic system: tin-

chilanthite. An arsenide of nickel, NiAs, occurring in the cubic system: tin-

chilanthite. An arsenide of nickel, NiAs, occurring in the cubic system: tin-

chilanthite. An arsenide of nickel, NiAs, occurring in the cubic system: tin-

chloride after roasting and chemical at-

chalcophanite. A yellow chloride of po-

chlorite schist. A schist containing prominent chlorite. Fay.

chlorite slate. A schist or slate rock composed largely of chlorite. Fay.

chlorite sand. A sand colored green by sand-size chlorite grains as one of the constituents. Fay.

chloroletic. a. The replacement by alteration of ferromagnesian minerals to chlorite. C.T.D.

chloritoid. A dark green britle mica, ($Fe^2^+$, $Mg$)$_4$(Al$_2$Si$_3$O$_9$)(OH)$_6$); monoclinic. Found in metamorphic rocks. Dana 17; A.G.I.

chloromanganakolite. A yellowish or greenish earthy, potassium silicate, with a specific gravity of about 2.0. C.T.D.
induced draught. Nelson.

chimney effect. See stack effect. Strock, 10.

chimney-flue checkerwork. See basket weave.

chimney rock. a. A column of rock rising above its surroundings or isolated on the face of a cliff. b. A small fragment of rock, also chim- ney. Fay. b. Gulf States. A local name for any rock soft enough when quarried to be cut or sawed readily, refractory enough for domestic chimneys, and which may or may not harden on exposure to the air, as some limestone, siliceous basaltic clay, or soapstone. Hess.

chimney shot. A local term in New York applied to the effect of an overcharge of explosive in a line of drill holes, the effect being to throw the rock to some distance, forming a deep trench. Fay.

chimney tile. Special tile for chimney flues soft that it is readily broken in the finger. Material to supply alumina and silica in ware, when they are vitreous. See also bone.

China clay process. The method of producing glazed ware by which the ceramic body is applied and matured by firing at a lower temperature. ASTM C242-60b.

China clay. a. A finely sized clay-like material made from a conglomerate of quartz, calcite, and Chinaman pebbles resembling jasper. Fay. b. Same as Cornwall stone. Hess. c. Partly decomposed granite. Arkell. d. A similar microstructure is found in cast magnesium alloys containing silicon and aluminum, 5NaF.3A1F3, crystallizing in the tetragonal system and also occurring as Mg2Si. ASM Gloss.

china, or soapstone. Hess.

china process. The method of producing glazed ware by which the ceramic body is applied and matured by firing at a lower temperature. ASTM C242-60b.

China ore. a. A material to supply alumina and silica in ware, when they are vitreous. See also bone. b. Sometimes called bone. Hess.

China stone. a. Eng. White, cherty lime- stone ironstone in patches 10 to 30 yards square, and 16 to 20 feet in thickness. The iron ores from these were first worked out, and then the higher ones, by miners standing upon the fallen debris; and so on upward in lifts. See also rake. Compare overhand stopping. Fay.

Chinese blue; Mohammedan blue. The mel- low blue, ranging in tint from sky-blue to grayish-blue, obtained by the early Chinese and Persian potters by the use of impure cobalt compounds as colorants. Dodd.

Chinese glass. A glass article with a chipped or otherwise produced intentionally. ASTM C162-66.

Chinese silver. An alloy used as an imitation of silver containing 58 percent copper, 15 percent nickel, and 27 percent tin. ASTM C162-66.

Chinese stone. a. Made from a conglomerate of quartz, calcite, and Chinaman pebbles resembling jasper. Fay. b. A similar microstructure is found in cast magnesium alloys containing silicon and aluminum, 5NaF.3A1F3, crystallizing in the tetragonal system and also occurring as Mg2Si. ASM Gloss.

Chinese writing and Chinese silver. An alloy used as an imitation of silver containing 58 percent copper, 15 percent nickel, and 27 percent tin. ASTM C162-66.

chipped. a. When referring to character of the ore or coal, with a small pick, along a joint or in a manner similar to the mining of coal. b. A similar microstructure is found in cast magnesium alloys containing silicon and aluminum, 5NaF.3A1F3, crystallizing in the tetragonal system and also occurring as Mg2Si. ASM Gloss.

Chinese porcelain. A redish mirror alloy containing 80.03 percent copper and 5.50 percent antimony. Comm.

chipped glass. Pieces of material removed from a workpiece by cutting tools or an abrasive medium. ASM Gloss.

chip breaker. a. A notch or groove in the face of a tool parallel to the cutting edge, to break the continuity of the chips. ASM Gloss. b. A step formed by an adjustable component clamped to the face of the cutting tool. ASM Gloss.

chip breaker operator. In metallurgy, a laborer who shovels scrap metal sheetings into a machine that automatically crushes scrap to reduce its size. Fay.

chip diamond. See chip, a. Long. b. A material to supply alumina and silica in ware, when they are vitreous. See also bone. c. Partially decomposed granite.

chip effect. See stack effect. Strock, 10.

chipping. Pieces of material removed from a workpiece by cutting tools or an abrasive medium. ASM Gloss.

chippings. Crushed angular stone fragments ranging from 1/2 to 1 inch in size. See also aggregate.

chip. a. A chip sample. A regular series of ore chips taken either in a continuous or in discontinuous manner. Fay. b. A small fragment of a diamond, usually taken daily and often confined to exploration or reasonable care is taken to chip a weight of material which corresponds to the length of sample line. See also bulk sample. c. A variant of channel sampling, in which, owing to extreme hard- ness of rock, shape of deposit, or other

210
chloromanganokalite

lith.
chlorocrate. See hydrophylite; baeumelite.
chlorocyanic. Consisting of chlorine and cy-

troite. A dark green, nearly black variety of jadeite. Fay.

choice of amyloid hydrous silicate of iron, Fe₅O₃.3SiO₂.3H₂O. Fay.

choiraphite. A mineral closely related to chiorite in composition and found in the

crystal. From Franklin, N.J. English.

cholophyll. A mineral of iron necessary in the formation of chlo-

colored by the presence of copper. Fay.

cholesterol. The number expressing the cholesterol in grams per 20° C liter. Obtained by

choke block; choke lumps. Pieces of wood, gravel, or similar material. Used to choke a

choke point. Bottle-neck of any crushe.

choke point. A chain or cable so fatended that it

choke hook; round hook. A hook that

choke valve. A valve to regulate flow of fluid from an oil well. Different choke sizes are used for different producing rates. The choke is generally referred to as a beam. The size of opening is measured in sixty-

choke feeding. As deliberately used in roll crushe.

choking, or suffocation, due to insufficient

choke point. A narrow part of any crushe.

choke point. Bottleneck of any crushe.

choke point. A point at which the discharge arrange-

choke point. A point at which the discharge arrange-

choke point. Bottleneck of any crushe.

choke and block. Newc. Tightly filled

choke blocks. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke blocks. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke blocks. Pieces of wood, gravel, or similar material. Used to choke a crushe.

chocolate. A very fine-grained mica schist

chocolate-colored drilling mud or

chocolate. A very fine-grained mica schist

chocolate. A very fine-grained mica schist

choke lumps. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke lumps. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke lumps. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke lumps. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke lumps. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke lumps. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke lumps. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choke lumps. Pieces of wood, gravel, or similar material. Used to choke a crushe.

choc_Line. A term used to describe the digging action of a dragline or other subsoil equipment when excavating and placing dirt in a hole.
chopping; chopping down

lip. This term is usually used when referring to an operating method where the dragline bucket excavates above the line of the fairlead and fills above tub level.

chopping bit. A steel, chisel-shaped cutting-edge bit designed to cut a string of drill rods and used to fragment, by impact, boulders, hardpan, and lost core in a borehole. Also called chisel bit, chisel-edge bit, chisel-point bit, long-chopping bit. A straight chopping bit. Compare cross-chopping bit. Long.

chord. a. In public land surveys the line of a great circle connecting any two selected corners on a base line, standard parallel, or latitudinal township boundary. Selys, 2. b. Any straight line joining any two points on the circumference of a circle. Jones, 2, p. 102.

circular effect; chordal action. The effect produced by the chain joint centers being forced to follow arcs instead of chord of the circle. JBM.

chordal pitch. The length of one side of the polygon formed by the lines between the joint centers as the chain is wrapped on the sprocket. It is a chord of the sprocket pitch circle, and is equal to the chain pitch. JBM.

chortmites. A general term for a group of mixed rocks, the fabric of which is described as macropolyhematite. They are the result of the injection of the crystallization products of intruding magmas into, and/or the mixture of such material with, the existing pre-existing rocks or metamorphic. According to Sederholm, they are a type of migmatite, but Niggli would restrict migmatite to the mixed rocks which have originated by a process of partial or complete differentiation, and/or the mixture of such material with, the existing pre-existing rocks or metamorphic. They are similar in chemical, physical, and mineralogical composition to the mineral chromite. Bate.

chromatograph. An instrument for analyzing gases and vapors from liquids with boiling points up to 300°C. The gas chromatograph analyzes the mixture of the gas in increasing size, and each group emerges from the column, a detector measures the quantity of each. All the molecules of one type emerge within the same time interval, it is possible to identify quickly the constituents present. Sensitiva detectors can determine concentrations as low as 1 part in 1,000,000. Used in lyc-pop production and in the B.O.S. process. Nelson.

chromatography. The separation of components of mixture into zones, or one or more of which can be identified by color, etc. (1) by adsorbing or absorbing from solution in tube packed with cellulose, alumina, lime, etc., 2) by electrochromatography, paper chromatography across column, or paper strip down which solvent mixture is flowing, causing migration to side of flow-line; (3) by electromicroscopy, use of electric current to aid migration and, (4) by paper partition, separation into bands as suitable solvent flows past drop of solution which contains compounds (qualitative and quantitative analysis. Pryor, 3.

chrome. a. Same as chromium. Fay. b. Commonly used to indicate ore of chromium consisting of the mineral chrome. Bate.

chrome, alumina. A ceramic color consisting principally of Cr₂O₃, Al₂O₃, and ZnO; when used as a glaze stain, the glaze should contain iron. If the glaze is free of oxide, it is called chrome. If it is free of oxide and contains iron, it is called chrome iron. Chrome iron is used as a smalt for enamels. Fay.

chrome-brick. A refractory brick made of chrome ore. Chrome brick is used for burning bars. Hanes.

chrome-magnesite brick. A refractory brick that may be either fired or chemically bonded, manufactured substantially of a mixture of chrome ore and dead-burned magnesite, in which the chrome ore predominates by weight. HW.

chrome ocher. A bright green clay material, containing 2 to 10.5 percent Cr₂O₃. Hess.

chrome ore. A rock having as its essential constituent the minerals chrome or chrome spinel, which is a combination of FeO and MgO with Cr₂O₃, Al₂O₃, and usually a small proportion of FeO. The composition, which is represented by the formula, (Fe, Mg)O(Cr, Al)₂O₃, is extremely variable. Refractory grade chrome ore has only minor amounts of accessory minerals, and has physical properties that are suitable for the manufacture of refractory products. HW. The steel industry consumes more than three-fourths of the production of chrome refractories or in the production of chrome alloys, and especially stainless steel; the mineral is used also for tanbark for the manufacture of refractory products. HW.

chromatic aberration. The effect of different colors or wave lengths of light on one side and reddish or orange on the other when immeasurable in the liquid of the same refractive index as the mineral for certain colors or wave lengths of light. Hess.

Christmas tree. The assembly of pipes and valves on top of the casing of an oil well that controls the flow of oil from the well. Shell Oil Co. See also casing head. Christobalite. Same as cristobalite. Standard, 1964.

Christy's equation. In reciprocation of gold by zinc from auriclyde (cyanide process): 2KAu (CN)₂ + Zn + 4KCN + 2H₂O = 2K₂[Cr(CN)₄] + Zn(CN)₂ + 2H₂, Pryor, 3.

chromizing; chromizing; chromatizing. Forming an acid surface to improve the paint adhesion on aluminum or aluminum alloys, mainly aircraft skins, by treatment with a solution of chrome acid. ASM Gloss.

chromate. A salt or ester of chrome acid; a compound containing the radical, CrO₂⁻₃. A.G.I.

chromate treatment. A treatment of metal in a solution of a hexavalent chromium compound to produce a conversion coating consisting of trivalent and hexavalent chromium compounds. ASM Gloss.

chromatic aberration. See aberration. Shipley.

chromic color. A hue, as distinguished from white, black, or any tone of gray. Opposite of achromatic color. Shipley.

chromating. Performing a chromate treatment. ASM Gloss.

chromatics. Used by Wadsworth to include mineral coloring matter, paints, pigments, etc. Fay.

chromatograph. A refractory brick that may be either fired or chemically bonded, manufactured substantially of a mixture of chrome ore and dead-burned magnesite, in which the chrome ore predominates by weight. HW.

chrome iron ore. Synonym for chrome. Fay.

chrome ironstone. See chrome.

chrome. A heat resistant cast iron alloy used for burning bars. Hanes.

chrome-magnesite brick. A refractory brick that may be either fired or chemically bonded, manufactured substantially of a mixture of chrome ore and dead-burned magnesite, in which the chrome ore predominates by weight. HW.

chrome brick. A refractory brick made of chrome ore. Chrome brick is used for burning bars. Hanes.

chrome magnetite brick. A refractory brick that may be either fired or chemically bonded, manufactured substantially of a mixture of chrome ore and dead-burned magnesite, in which the chrome ore predominates by weight. HW.

chrome ocher. A bright green clay material, containing 2 to 10.5 percent Cr₂O₃. Hess.

chrome ore. A rock having as its essential constituent the minerals chrome or chrome spinel, which is a combination of FeO and MgO with Cr₂O₃, Al₂O₃, and usually a small proportion of FeO. The composition, which is represented by the formula, (Fe, Mg)O(Cr, Al)₂O₃, is extremely variable. Refractory grade chrome ore has only minor amounts of accessory minerals, and has physical properties that are suitable for the manufacture of refractory products. HW. The steel industry consumes more than three-fourths of the production of chrome refractories or in the production of chrome alloys, and especially stainless steel; the mineral is used also for tanbark for the manufacture of refractory products. HW.

chromate. A salt or ester of chrome acid; a compound containing the radical, CrO₂⁻₃. A.G.I.

chrome refractories
but may react with strong acids or bases. "Henderson, p. 264."

chrome spinel. Another name for the mineral perovskite, a member of the spinel group. C.M.D.

Chrome Stainsless. A trade name for a steel containing 17 percent chromium and other alloying elements. Pryor, 3.

chrome-in-pink. A color for ceramic glazes. The color is probably p-dyed by the precipitation of fine particles of chrome oxide on the surface of tin oxide in an opaque glaze. Lime must also be present. Dodd.

crume tournamical. A variety of tournaminal obtained from the Ural Mountains, U.S.S.R. (10.86 percent Cr2O3); and Maryland (4.32 percent Cr2O3). Spencer 1949.

chrome vesuvian. Same as chrome idocrase. English.

chrome yellows. Yellow pigments of lead chromate: PbCrO4. A very light greenish-yellow to the lemon shade to a medium yellow. Medium yellow is about a normal lead chromate containing 95 percent or more lead chromate, PbCrO4. The light hues containing varying amounts of copper-pentahydrate lead chromate and lead sulfate. Chrome yellows are used in paints and enamels, also calcimines, but not in casein paints or finishes that are to be applied to surfaces that are alkaline, such as cement or stucco. CCD 6d, 1961.

crume, zircon-pink. About 70 percent of the SnO2 used in chrome-pink can be replaced by zircon without impairing the color or stability. See also chrome-pink in pink. Dodd.

cromia. See chrome oxide. "Bennett 2d, 1962."

crume. Of, pertaining to, or containing chromium in the trivalent state; for example, chromic oxide (CrO3), Webster 3d.

chromic iron. Chromite. Schneider.

chromic phosphate; chromium orthophosphate; chromium phosphate. Violet tridrnic crystals; CrPO4, 6H2O; soluble in acids; and insoluble in water. Used in pigments. CCD 6d, 1961; "Handbook of Chemistry and Physics, 45th ed., 1964, p. B-188."

chromic sulfide, hydrosulfide. e. Violet. amorphous scales; Cr2(SO4)3, 15H2O; specific gravity, 1.867 (at 17°C); and soluble in water. Used in ceramic - (glazes and green effects). CCD 6d, 1961, b. Violet; isometric; Cr2(SO4)3, 18H2O; specific gravity, 1.896; and soluble in water and alcohol. Used in ceramics (glazes and green effects). CCD 6d, 1961.

chromite. Chrome iron ore, FeCr2O4; cubic; iron-black; Mohs' hardness, 5.5; brown streak; specific gravity, 6.6. A commercial source of chromium. Chemical grade has high purity. Metallurgical grade is known as a biotite-chromite, bronzite-chromite, etc. Hess.

chromite. A steel-gray metallic element obtained from chrome (FeCr2O4). Alloyed with nickel in heat-resisting alloys and with iron or with iron and nickel in stainless and heat-resisting steels. Also used as a corrosion-resistant plating. Symbol, Crb; valence, 2; cubic; isometric and hexagonal; atomic number, 24; atomic weight, 51.996; specific gravity, 7.130 (at 20°C); melting point, 2,492°C; and specific electrical resistivity, 1.1 microhms per cubic centimeter (at 20°C). C.C.D. "Handbook of Chemistry and Physics, 45th ed., 1964, p. B-106.

chromium aluminite. CrAl; melting point, 2,160°C; and has good oxidation resistance. Lee.

chromium borides. At least three have been described: Cr, CrB, and Cr2B. They have high melting points; are very hard and corrosion-resistant; and may be suitable for use in jet and rocket engines. CrB; orthorhombic; specific gravity, 6.2; and Mohs' hardness, 9.5; hexagonal; specific gravity, 5.13; hardness, 2010. Knopp. CrB2; may be crystalline; specific gravity, 6.1; and Mohs' hardness, 9.4. Used as mechanical additives; high-temperature electrical conductors; cermets; refractories; and coatings resistant to attack by molten metals. CCD 6d, 1961; "Handbook of Chemistry and Physics, 45th ed., 1964, p. B-167."

chromium carbides. These carbides, CrC, Cr2C, and Cr3C2, have melting points of 1250, 1665, and 1890°C respectively. Extreme hardness and excellent surface finish make these materials, together with precision gauge blocks and they are also of interest for a number of mechanical and chemical applications. Lee.

chronium minerals. The only ore commercially exploited is chromite. Metal is used in steel alloys, plating, photograph, dyeing. Ore is used for refractory furnace bricks in steel furnaces. "Bennett 2d, 1962; "Handbook of Chemistry and Physics, 45th ed., 1964, p. B-167. b. Dark purple-red crystals and soluble in ether. Used in ceramic glazes and in colored glass; in chrome plating; and in metal cleaning. CCD 6d, 1961."

chronium nitride; chromium mononitride. CrN; specific weight, 66.00; isometric or amorphous; decomposes at 1700°C; and insoluble in water. "Bennett 2d, 1962; "Handbook of Chemistry and Physics, 45th ed., 1964, p. B-167."

chronium oxide; chromium sesquioxide. Chromium oxide; chromium; cr-orange green; chrome oxide green. a. Cr2O3; melting point, 2453°C. Chromium compounds are used in glasses, glazes, and enamels mainly to impart a green color. It is most often introduced as chromium oxide or potassium dichromate, but the dichromates of sodium and ammonium and the chromates of potassium, of sodium, and iron, and iron are used occasionally. Chromium oxide may be used in glasses to produce chromium pink or chrome greens. Lee; "Handbook of Chemistry and Physics, 45th ed., 1964, p. B-167. b. Green; hexagonal; and insoluble in water, acids, and in alkali. Used in metalurgy as pigments; and in ceramics. CCD 6d, 1961; "Handbook of Chemistry and Physics, 45th ed., 1964, p. B-167. c. Red; a pigment that consists of chromic oxide and it should not be confused with chrome green. It is made by burning sodium dichromate with a reducing agent. The pure grade consists of 99 percent Cr2O3; specific gravity, 5.20. Used for metallic finishes that are to be applied to cement surfaces. One of the most permanent and indestructible pigments. It is resistant to bases, alkalis and acids. CCD 6d, 1961. d. A green pigment used to some extent in green stains or oxides and also a raw material in the manufacture of vitreous enamels. Fayon.

chronium plating. The production of a thin layer of chromium on the surface of another metal by electrolysis in order to protect it against corrosion. Thicker coatings are used to resist wear and abrasion. See also hard plating. T.B.

chronium silicides. CrSi, CrSi2, CrSi3, and CrSi4; melting points to 1/10° C; excellent resistance to oxidation in air at elevated temperatures; and great hardness. Used as wear-resistant components at high temperatures. Lee.

chronium steel. Steel containing varying amounts of chromium, very hard and tenacious. See also stainless steel. Nelson.

chronium sulfide; chrome sulfite. Violet or red powder; Cr2(SO4)3; specific gravity, 3.012; and insoluble in water and in acids. Used in ceramics (glazes and green effects). CCD 19, 18, M.M., 1949.

chronium trisilicide; chromium anhydride. a. Cr2O3; molecular weight, 99.99; red; orthorhombic; deliquescent; melting point, 2.70; melting point, 196° C; and soluble in water and in ethyl alcohol. Bennett 2d, 1962; "Handbook of Chemistry and Physics, 45th ed., 1964, p. B-167. b. Dark purple-red crystals and soluble in ether. Used in ceramic glazes and in colored glass; in chrome plating; and in metal cleaning. CCD 6d, 1961.

chronized iron; chromized steel. Iron or steel that has been subjected to burial in a mixture of pure powdered chromium and aluminum in an atmosphere of pure hydrogen, at a temperature of 1400° C. A high chromium alloy that withstands high temperatures and is highly noncorrosive. In air is thus formed on the outside of the iron or steel. Hess.

chronozing. A surface treatment at elevated temperature, generally between 400 and 800°C; and involving the reaction between the metal and carbonaceous materials at high temperatures; and great hardness and excellent surface finish make these materials suitable for precision measurements and other uses having to do with properties of the surface. Lee.

chronography. Method of identification of minerals. Polished section is placed in contact with photographic paper, a current is passed, and ions migrating to the paper are developed so as to produce a color print suitable for microscopv. Resembles microprinting. Pryor, 3d.

chromography. A chemical process of separating closely related compounds by permitting a solution of them to filter through an absorbent so that the different compounds become absorbed in separate colored layers comprising a chromatogram. 11BGC.

chromus. Of, pertaining to, or containing chromium in the bivalent state; for example, chromous chloride (CrCl2). Webster 3d.

chronowulfenite. A red variety of wulfenite, containing some chromium. Fayon.

chron. Originally introduced to designate an indefinite division of geologic time. More recently, it has been proposed as the time unit equivalent to the stratigraphic unit, subseries, and the geologic name; for example, Mohawkian. Hess.

chronic exposure. Irradiation over a long period of time, either continuous or made in parts.
chronic exposure

up of several shorter periods. N.G.B.
chronograph. An apparatus for electrometrically recording explosion phenomena simulta-
nously with a continuous time record. Rice, George S.
Christof's hardness scale. A scale for the measurement of hardness. L此处缺失了具体信息。
chrysoberyl. Beryllium aluminate, BeAl₂O₄; orthohombic; color green; Mohs' hard-

ness, 8.5; streak, vitreous; specific gravity, 3.7. Gem varieties transparent. Pryor, 3. Known as cat's-eye when it has a chatoy-

ant luster. Fay.
chrysoberyl cat's eye. See cyanophane; cat's-
eye. C.M.D.
chrysoberyllus. A confusing name, rarely applied to greenish-yellow beryl. Shipley.
chrysocarmine. A red or brown copper-bearing ornamental stone from Mexico con-
taining light and dark blue as well as numerous green spots of garnet, azure or turquoise. Shipley.
chrysocolla. Hydrated copper silicate, Cu₅SiO₃(OH)₂; usually encrusted rather than crystalline; color, green to blue; Mohs' hard-

crystalline; color, green to light blue; Mohs' hardness, 3.5; streak, bluish; specific gravity, 3.1. Gem varieties transparent. Pryor, 3.
chrysojasperite. A yellowish-green, sometimes brownish or reddish, iron-magnesium sili-
cate. A common mineral in basalt and diorite. When used as a gem, it is called morganite. The name has at various times been applied to topaz, prehnite, and apatite but is now used only to mean olivine. Fay.
chrysojasperine. Same as chrysojasper. Shipley.
chrysojasperite. A light yellow-green to yellow to yellow-green silicate. Shipley.
chrysojasperine. Same as chrysojasperine. Shipley.
chrysojasper. A yellowish-green to yellow-

sapphire colored with chrysocolla. Shipley.
chrysojasper. A yellowish-green beryl.
Schaller.
chrysojasper. A translucent apple-green com-

mon opal colored by nickel. From Sileia. See also neopaz. Shipley.
chrysojasper. A yellowish-green to yellow-

opaz. Zn₄SiO₄. Used as a gem. A.G.I.
chrysojasper colored oazy. Same as green opaz. Shipley.
chrysojasper matrix. Chrysojasper with notice-

crystalline; color, green to light blue; Mohs' hardness, 8.5; streak, vitreous; specific gravity, 3.7. Gem varieties transparent. Pryor, 3. Known as cat's-eye when it has a chatoy-

ant luster. Fay.
chrysoberyl cat's eye. See cyanophane; cat's-
eye. C.M.D.
chrysoberyllus. A confusing name, rarely applied to greenish-yellow beryl. Shipley.
chrysocarmine. A red or brown copper-bearing ornamental stone from Mexico con-
taining light and dark blue as well as numerous green spots of garnet, azure or turquoise. Shipley.
chrysocolla. Hydrated copper silicate, Cu₅SiO₃(OH)₂; usually encrusted rather than crystalline; color, green to blue; Mohs' hard-

crystalline; color, green to light blue; Mohs' hardness, 3.5; streak, bluish; specific gravity, 3.1. Gem varieties transparent. Pryor, 3.

chrysojasper. A yellowish-green beryl.
Schaller.
chrysojasper. A translucent apple-green com-

common opal colored by nickel. From Sileia. See also neopaz. Shipley.
chrysojasper. A yellowish-green to yellow-

sapphire colored with chrysocolla. Shipley.
chrysojasper. A yellowish-green beryl.
Schaller.
chrysojasper. A translucent apple-green com-

common opal colored by nickel. From Sileia. See also neopaz. Shipley.
chrysojasper. A yellowish-green to yellow-

sapphire colored with chrysocolla. Shipley.
chrysojasper. A yellowish-green beryl.
Schaller.
chrysojasper. A translucent apple-green com-

common opal colored by nickel. From Sileia. See also neopaz. Shipley.
chrysojasper. A yellowish-green to yellow-

sapphire colored with chrysocolla. Shipley.
chrysojasper. A yellowish-green beryl.
Schaller.
chrysojasper. A translucent apple-green com-

common opal colored by nickel. From Sileia. See also neopaz. Shipley.
churn-drill operator

blasthole driller; blasting hole well driller; clipper blast-drill operator; well driller
corn-churn drill. A boring rig which churns. Forest of Dean. ironstone Ns orkings
corn-churn-drill rig. A churn-drill machine, complete with accessory tools and equipment required for specific drilling operations.

churn. Agitating the fluid metal in a mold by moving a small, heated iron rod up and down in the feeder in order to insulate solid castings.
churn shot drill. A boring rig which combines both churn and shot drillings. The churn drill is used for rapid penetration in barren ground where no core is required. The shot drill is used for taking core samples and important rock formations.

chute. a. A channel or shaft underground, or an inclined watercourse, natural or artificial, especially one through which ore falls or is shot by gravity from a higher to a lower level. Also spelled shoot.
b. In a crosscut mining; one connecting a gangway with a heading.
c. An inclined watercourse, natural or artificial, especially one through which ore falls or is shot by gravity from a higher to a lower level.
d. A narrow channel, especially one on the lower Miners Standard, 1964.
d. A body of ore, usually of elongated form, extending downward within a vein (ore shoot).

chute system. A method of mining by which ore is broken from the surface downward through chutes. Fay.

chute binn. Both churn and shot drillings. The chamber-and-pillar system of working. Fay.

chute caving. The method involves both over-hand stopping and ore caving. The chamber is started as an overhead stope from the head of a chute that is extended upward until the back weakness sufficiently to cave. The ore body is worked from the top down in thick slices, each slice being, however, attacked from the bottom and the working extending from the floor of the slice up to an intermediate point. The cover follows down upon the caved ore. Also called caving by raising; block caving in chutes.
fay.

curne. chote. In mining, one who keeps record of amount of ore drawn from each raise or chute in an ore body sectioned by the caving method (lower part of ore body is mined and developed with a system of chutes so that the remaining ore which sloughs, or caves, from lack of support can be drawn off). Also called tallyman. D.O.T. 1.

chute center. a. In metal and nonmetal mining, a laborer who loads ore or rock into mine cars underground by opening and closing chute gates. Also called chute draver; chute center; chute trammer. D.O.T. 1. b. In the quarry industry, one who loads crushed rock from bins into trucks or railroad cars by opening and closing the chute or bin gates by hand or by means of a lever. Also called car loader. D.O.T. 1. c. See chute man; chute center.

courage. In anthracite and bituminous coal mining, a laborer who loads coal or rock from chutes or bins into mine cars, railroad cars, trucks, or onto screens, rolls, or picking tables, opening and closing the gate or door by hand or by means of a lever. He may be designated according to type of work, as railroad-car loader; screen feeder; or slate-gate attendant. Also called basket man; gateman. D.O.T. 1.

current. a. In metal mining, one who tends chutes which convey coal from tipple down a slope to a point where it

devoted to the inside of a bend, along a trough between low ridges formed by deposition on opposite sides of the bend where water velocities were reduced. Also called chute cutoff. Compare neck cutoff. Let.

cinnabar. In southwestern United States, a moist or springy spot where there is a natural seepage of water in an arid region.

cinva. The name derives from the initials of the Commission Internationale de l'Eclairage. It is a trichromatic system of color notation that is being used, for example, in the glass industry.

cinnuron series. Red beds occurring above the salt deposits in the Permian of Kansas.

cinder bond. A low-setting, rapid-hardening cement containing 40 percent lime, 40 percent alumina, 10 percent silica, and 10 percent impurities; specific gravity 2.9 to 3.0. Bennett 2d, 1962. Sometimes called bauxite cement.
cinnaite. A volcanic rock composed essentially of sandine and pyroxene with subordinate calcic plagioclase and olivine. An olivine trachyte. A.G.I.
cinnaite. A natural mixture of clay and field-spar occurring in parts of Chile. The composition is not uniform but typically consists of 50 percent Qtz; 33 percent AlO; 1 percent FeO; 4 percent alkali, and 4 percent H2O. Dodd.

cinnaite. A white, grayish, or reddish hydroxide of aluminum, sodium, and claylike or chalklike in appearance.
fay.
cinch. cinch. a. In Nevada, the annual assessment work required to hold title to an unpatented mining claim. Bureau of Mines Staff.
cinch. b. Same as chute loader. Also indicates an old dump as distinguished from one in use. Fay.

cinder. a. One of the small commonly vesicular fragments of lava that are ejected from an erupting volcano, are about 1/8 to 1/2 inches in diameter, and are coarser than volcanic ash and smaller than volcanic bombs. Webster 3d. An uncoated volcanic ic fragment that may range from 4 to 52 millimeters in diameter. Such fragments are usually gaseous or vesicular. Stokes and Varnes, 1935. c. Eng. Inferior ironstone, North Staffordshire. Nelson. d. A derogatory synonym for carbon. Long. e. Slag, particularly from iron blast furnaces. Fay. f. A scale thrown off in forging metal. Webster 3d.
cinder block. Same as chute loader. Also indicates an old dump as distinguished from one in use. Fay.

cinder coal. a. Coal which has been cindered by niat from an igneous intrusion. Many
cinder coal

Coal seams have been affected in this way in Scotland and in Durham, England. See also metamorphism. Nelson, b. Aust. A very inferior natural coke, little better than ash. Fay.
cinder cooler. In a blast furnace, a water-cooled casting, usually of copper, that is poured into the cinder notch. Henderson.
cinder dock. A bed containing molds into which, in former practice, cinder was run, chilled, and then thrown into cars with cinders.
cinder dump. A place where cinder ladles are emptied. Fay.
cinder fall. The dam over which the slag from the cinder notch of a furnace flows. Fay.
cinder notch. The hole, about 5 or 6 feet above the cinder notch, and 3 feet below the tuyères, through which slag is flushed two to three times between casts. See also cinder instrument.
cinder pip. Pig iron made from a charge containing a considerable proportion of slag from puddling or reherning furnaces. C.T.D.
cinder pit. Large pit filled with water into which solid or cinder matter is run and granulated at cast or flush. Fay.
cinder plate. See bloomer, Fay.
cinder car. A car to carry cinder slag from the cinder runner to cinder notch or pit and ladle. See also cinder notch. Fay.
cinder shutter. A man who removes cinder skulls from cinder runners. Fay.
cinder tap; cinder notch. The hole through which cinder is tapped from a furnace. Also called cinder front. Fay.
cinder tub. A shallow iron truck with movable sides into which the slag of a furnace flows from the cinder runner. Fay.
cinder, volcanic. A fragment of lava, generally less than one inch in diameter, occurring as a volcanic weld. Mother.
cinder wool. A fibrous glass obtained by the action of a jet of air or steam upon molten slag, as it flows from a blast furnace. Commonly called mineral wool. Fay.
cinnabar. Mercury sulfide, HgS; hexagonal; color red; Mohs' hardness, 2 to 2.5; specific gravity, 8.1; 86.2 percent mercury. Pryor, 5.
cinnabar matrix. A term applicable to various varieties of minerals containing numerous inclinations of cinnabar but especially to a Mexican variety of jasper. Shipley.
cinnamite. Same as cinnamon stone. Fay.
cinnamon stone. Grossularite, a lime garnet. See also esonite; honsonite; hyacinth. Hess; Dana 17.
cippolotti weal. A measuring weir in which the notch plate has a trapezoidal opening tapering from the top, the side slopes being 1:4 opposite side, 1:5 opposite face. C.I.P.W. classification. From the initial letters of the last names of the men who originated it, Gross, Siddings, Pirson, and Washington. Synonym for norm system. A.G.I.
circle. a. In the central United States, a nearly circular lead deposit. Fay.
circle arc. A magnetic arc developed in clayey chert breccias in old sinkholes in Paleozoic limestone or in dolomite (broken horizons). Schieferdecker, b. Fay. In a grader, the rotary table which supports the blade and regulates its angle. Nichols. c. A plane figure bounded by a curved line called the circumference, and every point of the circumference is equally distant from a point within the figure, called a center. Jones, 2, p. 91.
circle agate. Agate with circular markings. Shipley.
circle brick. A brick with two opposite larger faces curved to form parts of concentric right circular cylinders. Hollow radial brick. Dodd.
circle grinding. Either cylindrical or internal grinding. ASM Gloss.
circle baulk. In strip mining, a hauleway system in which the empty units enter the mine over one lateral and leave, loaded, over the other laterals. This system is utilized where lateral entries are built into the mine from the main road, whether outside or on the wall side of the mine workings. This system reduces the haul on the coal surface to a minimum, except where there are but two laterals, one at each end of the workings. R.I. 3416, 1938, p. 9.
circle ginder. Thrust-blocked Block machine larger than punch and of sufficient area to yield a disk 2 inches in diameter free of racks and open areas. Now included in general term punch mica. Snau.
circle reverse. The mechanism that changes the angle of a grader blade. Nichols.
circle Chas. Wavy, undulating streaks of minerals developed in limestones and thin shales. See also farm mica. Shipley.
circle discharge. A revolving cone with feeder fingers around the base periphery connected at the apex through a universal joint to a revolving arch breaker arm. ASA MH4.1-1938.
circular coal. Another name for eye coal. Shipley.
circular cutting drill. See ditcher, b. Fay.
circular field. The magnetic field which surrounds a nonmagnetic conductor of electricity or which exists and is completely contained within or also surrounds a magnetic conductor of electricity. Generally applied to the magnetic field within any magnetic conductor resulting from a current being passed through the part or through a section of the part. ASM Gloss.
circular bin. Same as circular kiln. A saw pit; saw pit arch. Dodd.
circular sawyer, stone. Device installed in the positive circuit to interrupt the flow of electric current when it becomes excessive or merely exceeds a predetermined value. Circuit breaker breakers are provided at the substations to protect the generating equipment between substations to break a faulted section, so that a distance station cannot feed through to a fault; and in the circuit to each mining section. A circuit breaker feeding such a mining section is called a sectionalizing circuit breaker. Kentucky, p. 235, b. Fay. While automatically interrupting an electric circuit under an infrared abnormal condition (as overload). Webster 3d. See also cutoff, g. Fay.
circulars: roundabouts. Circular galleries made at the core of a mine to contain a chute which enable empty trucks to be pushed out of the cage on one side and simultaneously for the full ones to be pushed in on the other side, thus ensuring a more rapid journey of the cage. Circuits also aid the circulation of the air. Stots, 1, p. 257.
circuit tester. A galvanometer used for testing circuit breakers before firing by touching the terminals of the circuit to the posts of the test. One type contains a silver chloride cell which generates such a small current that a single cap may be tested. Lewis, T. 1937.
circuit voltage. Voltage is the greatest root-mean-square difference of potential between any two points in the circuit system. All points in the circuit to each mining section. This system reduces the pressure from roof, sides, and floor. With close lagging between the rings, the finished roadway resembles a tube. See also steel arches. Nelson.
circular saw. A saw that moves around a central arbor. Crispin.
circular cutting drill. See ditcher, b. Fay.
circular arch. A roadway support consisting of an H-section girder of circular form and usually made in three parts. The joints are secured by flapholes and bolts. This type of steel arch is useful for supporting high pressures from roof, sides, and floor. With close lagging between the rings, the finished roadway resembles a tube. See also steel arches. Nelson.
circular mil. A unit used for the measurement of the area of wires. It is equal to 0.7854 of a square mil. One square mil is 1,974 circular mils. Standard, 1964.
circular saw. A saw pit; pit as a circle. Shipley.
circumference. A circle which includes all the points on the boundary of a circle or a sphere; the line passing through the center of a circle or sphere and connecting two different points on its boundary. Also called the circle's perimeter. The longest straight line that can be drawn through a circle or sphere, passing through its center. Bayer, 1.4. In the case of a cylinder, the circumference is the length of the curved line that forms the boundary of the cylinder. Bayer, 1.4. Also called the perimeter of a cylinder. Bayer, 1.4.

circumferential. Adj. Of, relating to, or occurring around the circumference of a circle or sphere. Bayer, 1.4. As in circumferential view, which refers to a view that includes the entire circumference of a circle or sphere. Bayer, 1.4.

circumferential vision. The ability to see objects that are located on the periphery of the visual field, as opposed to objects that are located in the center of the visual field. Bayer, 1.4. Also called peripheral vision. Bayer, 1.4.

circumflex. A dot that is placed above a letter, usually to indicate a special pronunciation or to signify a diacritic mark. Bayer, 1.4. As in circumflex accent, which is a diacritic mark that is placed above a vowel to indicate a special pronunciation. Bayer, 1.4.

circumflex accent. A diacritic mark that is placed above a vowel to indicate a special pronunciation. Bayer, 1.4. As in the French word chapeau, which has a circumflex accent on the vowel "a" to indicate a special pronunciation. Bayer, 1.4.

circumflexa. A small, diacritic mark that is placed above a letter, usually to indicate a special pronunciation or to signify a diacritic mark. Bayer, 1.4. As in circumflexa dots, which are diacritic marks that are placed above letters to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoid. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoid diacritic marks, which are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoids. Plural of circumflexoid. Bayer, 1.4. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoids, which are diacritic marks that are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoids. Plural of circumflexoid. Bayer, 1.4. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoids, which are diacritic marks that are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoids. Plural of circumflexoid. Bayer, 1.4. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoids, which are diacritic marks that are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoids. Plural of circumflexoid. Bayer, 1.4. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoids, which are diacritic marks that are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoids. Plural of circumflexoid. Bayer, 1.4. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoids, which are diacritic marks that are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoids. Plural of circumflexoid. Bayer, 1.4. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoids, which are diacritic marks that are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoids. Plural of circumflexoid. Bayer, 1.4. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoids, which are diacritic marks that are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.

circumflexoids. Plural of circumflexoid. Bayer, 1.4. A type of diacritic mark that is used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4. As in circumflexoids, which are diacritic marks that are used in some languages to indicate special pronunciations or to signify diacritic marks. Bayer, 1.4.
cladding. A variation of claggy. Fay.

clad metal. A composite metal containing two or three layers that have been bonded together. The bonding may have been accomplished by corolling, welding, casting, heavy chemical deposition, or heavy electroplating. A.M. Glass.

clad steel. Carbon or low alloy steel having metal. A composite metal containing two or three layers that have been bonded together. The bonding may have been accomplished by corolling, welding, casting, heavy chemical deposition, or heavy electroplating. A.M. Glass.

clamping. Local name for the brick and fireclay filling of the kiln of an old-fashioned pottery kiln; sometimes spelled clamen. See also wicket. Dodd.

clamming. Entrance to oven. Noke.

clamp. a. A device to grip and hold in position a piece or part or hold to thick steel. Fay. b. A clamp is called a “winding.” See also mining claim. Fay. b. S. Afr. Land on a mining field to which a miner is entitled to occupy for mining purposes. No. c. In Australia, the manner of making the original location of a claim is tightly joined to the roof, the mine is confirmed by law. The mining laws of the public lands and to have his claim developed a mineral deposit discovered on the public lands and to have his claim validated by cables. Used in mucking operations. Bennett 2d, 1962.

clampery lamp. The veryapy lamp invented by Dr. Clancy and first exhibited in 1813. He improved the lighting power of the lamp by substituting a copper in place of glass, by compressing the glass cylinder to surround the flame, and a shield or bonnet to protect the flame from a direct blow. clamping.

clear water. A device for holding. An area of 1.44 square miles is about 155 feet along the strike of the reef. An area of 1.44 claims equals to a South African morgen. (In Cape feet, the claim is 150 by 400 feet.) Mining maps are often designed in squares of 1,000 by 1,000 feet, which, the sum of which about 16 claims measured horizontally. Beerman. c. In Australia, a claim is defined as the portion of Crown land which is in the possession or number of persons shall lawfully have taken possession of and be entitled to occupy for mining purposes. No. Land comprised in any mining lease can be considered to be a claim. A claim is marked out by fixing in the ground points at each angle of the claim, and it need not be surveyed. A miner is required to hold a miner’s right before he can legally mark out or work a claim. Nelson.

claimant. In the federal mining law, means locator. Ricketts, I.

claim jumping. The location of a mining claim on supposedly exact ground within the staked boundaries of an existing location on the theory that the law governing the manner of making the original location has not been complied with. Ricketts, I.

clims held in common. The phrase held in common means a claim where there are more owners of a claim than one, while the use of the words claims held in common means a claim worked over by one or more claimants. A claim in common must have in it the statutory requirements as to all of them. Ricketts, I.

clamshell system. A system used mainly in the United States, that grew up in the early days of mining in Western United States, following the gold rush of 1849, as an outgrowth of the desire of the prospector to develop a method for getting access to the public lands and to have his claim validated by cables. Used in mucking operations. Bennett 2d, 1962.

clamshell. A twin-jawed bucket without teeth, usually hung from the boom of a crane that can be either a crane or a wheel mounted. The bucket is dropped in the open position on the material to be excavated or handled. It is then closed, encompassing material between the two clamshells. B. S. 3618, 1963, sec. 3, 9. A number of bricks piled up in a particular form for burning. Webster's.
clarifier
device, for separating suspended solid matter from a liquid. *Heu.*

clarifying tank. A tank for clarifying cyano- or other solutions and frequently provided with a filtering layer of sand, cotton waste, matting, etc. *Fay.*

clarite. An important maceral or micro-petrological constituent of clarain. It is a heterogeneous material that is generally translucent in thin section, and in which there may be isolated lenticels of such other ingredients, as xylinite, fusinite, resinite, suberinite, peribolinite, collinite, and ultinite. *A.G.I.* b. Strictly, not a maceral, but may be used for repetitive description. *Tomkeieff,* 1954.

clarite. In 1953 the Nomenclature Sub-committee of the International Committee for Coal Petrology resolved to use this term for the microlithotype consisting principally of vitrinite and exinite. It contains at least 55 percent of vitrinite and exinite. In the proportions of clarite the macerals may vary widely but each must be greater than the proportion of inerinite, and neither must exceed 55 percent. Distinction may be made between sparse clarite, cuticular clarite, and resinous clarite. It is widely distributed and very common, particularly in certain Permian coals and coaly shales in fairly thick bands. *I.I.C.F.,* 1963, part 1.

Clark circle system. See rotary-hearth kiln.

Clark process. A process for softening water by the addition of hydrated lime, which precipitates calcium and magnesium bicarbonates. *Webster,* 2d.

Clark riffler. A sample reducing device which splits a batch sample of ground ore into two equal streams as it falls across an assembly of deflecting chutes. *Pryor,* 3, p. 70.

clarocollain. A type of coal intermediate between clarite (predominant) and vitrinite. *Tomkeieff,* 1954.

clarodeustain. A rock-type coal consisting of the maceral vitrinite (collinite or tenninite) with smaller amounts of other macerals. *Compare* tennoclarain.

clarosite. A thin slurry of clay and water. *Dodd.*

classite. A rock composed of the fragments of other rocks. *See also* clastic.

classification. a. A musky bitting ferrule for connecting pump parts. *Dodd.* b. A type of various forms of releasable catch, for holding together two or more objects or complementary parts of anything. *Ward,* 2d.

class. A division of igneous rocks based on the relative proportions of the salic (silicious and aluminum minerals, quartz, feldspar, mica, amphibole, and fergusonite) and ferro-magnesian minerals. *Erlanger,* 1923. The descriptive terms: peraluminous, ferro-aluminous, ferro-magnesian, and ferro-peraluminous. The former group is dominated by ferro-magnesian minerals, the latter by silicious minerals. The two main groups are (1) alkalic and (2) plagioclase. *Nelson,* 1929.

classical washout. A belt of barren ground at the foot of a coal deposit. These clays and sands are formed from the washing of clays and sand out of the deposits by erosion and other means. *I.C.C.,* 1959, p. 213.

classical deformation. Of 32 possible types of symmetry, only eleven are found in complex minerals. Each of these is referred to its set of axes. *Classification* begins with symmetry classes, and continues by referring all other crystals to a given set of axes into a crystal system. The latter are cubic, tetragonal, hexagonal, orthorhombic, monoclinic, and triclinic. *See also* crystal.

classification of minerals. Chemically, following Dana, eight types are (1) native elements; (2) sulfides, selenides, tellurides, arsenides, antimonides; (3) sulfo-salts; sulfates, sulfonites, siliho-magnesium, (4) halides; (5) oxides; (6) oxygen salts, carbonates, silicates, etc.; (7) salts of organic acids; and (8) hydrocarbon compounds. *Rutley* classifies according to group in accordance with the periodic table as regards dominant economic constituents.

class. a. A division of igneous rocks based on the relative proportions of the salic (silicious and aluminum minerals, quartz, feldspar, mica, amphibole, and fergusonite) and ferro-magnesian minerals. *Erlanger,* 1923. The descriptive terms: peraluminous, ferro-aluminous, ferro-magnesian, and ferro-peraluminous. The former group is dominated by ferro-magnesian minerals, the latter by silicious minerals. The two main groups are (1) alkalic and (2) plagioclase. *Nelson,* 1929.

clay. A machine or device for separating the constituents of a material (as ore, coal) according to particle size, shape, and nature of the particles. For a preliminary classification at the site, it is generally sufficient to recognize the main types, such as gravels, sands, silts, clays, and peat. Later the gravels, sands, and silts are subdivided into coarse, medium, or fine, according to particle size. *See also* soil classification, for dominant grain size, etc. *Nelson.*

clay. a. A division of igneous rocks based on the relative proportions of the salic (silicious and aluminum minerals, quartz, feldspar, mica, amphibole, and fergusonite) and ferro-magnesian minerals. *Erlanger,* 1923. The descriptive terms: peraluminous, ferro-aluminous, ferro-magnesian, and ferro-peraluminous. The former group is dominated by ferro-magnesian minerals, the latter by silicious minerals. The two main groups are (1) alkalic and (2) plagioclase. *Nelson,* 1929.

clay. a. The descriptive terms: peraluminous, ferro-aluminous, ferro-magnesian, and ferro-peraluminous. The former group is dominated by ferro-magnesian minerals, the latter by silicious minerals. The two main groups are (1) alkalic and (2) plagioclase. *Nelson,* 1929.
elastic dike. A tabular body of elastic material transsecting the bedding of a sedimentary formation along a crack, either from below or from above. Synonym for sandstone dike. A.G.I.
clastic dike. Any deposit which is composed of fragments of pre-existing rocks, or of solid products formed during the chemical weathering of such older rocks. Examples of sediments belonging to this group are the clear, round leucite crystals in which the leucite crystals are isomorphous replacements within the latite, and/or adsorption on prism surfaces where unsatisfied negative charges occur, possibly as a result of isomorphous replacements within the lattice. A.G.I. c. Soil consisting of inorganic material, the grains of which have diameters smaller than 0.005 millimeter. A.G.I. d. According to international classification, it has a grain size less than 0.002 millimeter. C.T.D. c. A general term applied to the material added to water to prepare a drilling mud. Long.
clay. a. A fine-grained, natural, earthy material composed primarily of hydrous aluminum silicates. It may be a mixture of clay minerals and small amounts of nonclay materials or it may be predominantly one clay mineral. Another older name for this is detrital clay. It is distinguished by the predominant clay mineral present (that is, kaolin, montmorillonite, illite, halloysite, etc.) and by its small grain size. A.G.I.
clay barrel. See triple-tube core barrel. Long.
clay binder. A plastic coating used in the process of blending clay and grog to make grog fire clay mortar. A.G.I.
clay binder. A plastic coating used in the process of blending clay and grog to make grog fire clay mortar. A.G.I.
clay binder. A plastic coating used in the process of blending clay and grog to make grog fire clay mortar. A.G.I.
clay borer. A piece of stone, that has a joint back of it, which becomes loose and falls when the heading has been driven past it. Fay.
clay book tile. A natural, hydrous, aluminum silicate. It may be a mixture of clay minerals and small amounts of nonclay materials or it may be predominantly one clay mineral. Another older name for this is detrital clay. It is distinguished by the predominant clay mineral present (that is, kaolin, montmorillonite, illite, halloysite, etc.) and by its small grain size. A.G.I.
clay builder. Brick for normal construction purposes; such brick can be made from a variety of brick clays. Relevant British Standards are B.S.-657 (Di-
ting forming a lenticular bleb of clay or shale. Pettijohn. b. Clay gall pellets of clay or mudstone, often ochreous, sometimes hollow, found especially in false-bedded oolidic limestone such as Forest marble. Compare cricks. Arkell.
clay core. One who seals kiln doors before burning and kiln fires after burning and assists other workers in unlocking out doors and in unsealing fireboxes after cooling. Also called dauber; plaster man.
clay cutter. a. Eng. A tool for cleaning blast holes. Also called clay cutter. b. A cutting ring at entry to pipe feeding into suction cutter dredge. Set of cutting blades in dredge bucket. Pryor, J.
clay dauber. Any one who seals kiln doors before burning and kiln fires after burning and assists other workers in unlocking out doors and in unsealing fireboxes after cooling. Also called dauber; plaster man.
claydune. A dune composed of clay particles heaped up by the wind. A.G.I.
clayey. a. A red for forcing clay into joints of strata in wet shotholes. See also clay iron. b. A red for forcing clay into joints of strata in wet shotholes. See also clay iron. c. A red for forcing clay into joints of strata in wet shotholes. See also clay iron.
clayey soil. A soil in which clay is the basic constituent. The clay contributes to strength by cohesion, but detracts from stability by volume change and by plastic flow under load. Nelson.
clay galv. a. Mud curls or cylinders formed by drying and cracking of thin layers of coherent mud; commonly rolled or blown into sand and buried; flattened upon wetting forming a lenticular bleb of clay or shale. Pettijohn. b. Clay gall pellets of clay or mudstone, often ochreous, sometimes hollow, found especially in false-bedded oolidic limestone such as Forest marble. Compare cricks. Arkell.
clay gouge. a. A thin seam of clay separating ore, or other material, from rock. A.G.I. b. A clay-like material found in the brecciated or gouge zone of a fault; also, sometimes found in the walls or within ore veins.
clay gun. Equipment used to fire a ball of fire clay into the taphole of blast furnace, and to fire jetting clay, clay shot, and clay shot rock from an open pit to a tippet or to a crushing machine. D.O.T. 1.
clay handler. A laborer who mixes fire clay
clay handler

with water and heat-resistant materials to form a plastic mixture suitable for making non-conductors. D.O.T. 1.

clay, hi-set. The term applied to clays which impart characteristic, enam. Dict.

clay holster. One who transfers damp clay from storage cellar to clay shop where it is formed into ware. D.O.T. 1.

clay hole. A cavity, in a rock, filled with clay material. See also clay pocket. Fay.

clay lining. Lining a borehole with clay, to keep the powder dry. Fay.

clay bar. A rod or tool for lining a newly made coal shot hole with clay to seal up any breaks in the walls of the hole. The hole is filled with clay to about one-third of its length. The claying bar is driven in by hammer to the limit and rotated by a tommy bar in the eyelet at the outer end of the bar. See also breaker and break detector. Nelson.

clay iron. An iron rod used for ramming clay into a mold or form. Webster 3d.

clay loader. A machine used for loading clay into a truck. See also loader. Fay.

clay maker. One who blends and mixes the various clays, as shipped from the mine, into a thin, semifluid form by operating blunger of mixing machine. Also called blunger machine operator; clay mixer; clay loader; slip maker; slip mixer; wet mixer. D.O.T. 1.

clay mark. A whitish, smooth, chalky clay; a marl in which clay largely predominates. Webster 3d.

clay microlined. A term applied to clay that has been processed through a micronizer. Enam. Dict.

clay mill. A mill for mixing and tempering clay; a mill for mixing clay. Fay.

clay mineral. A colloidal size, crystalline, hydrous silicate with a crystal structure of the two-layer type, kaolinite, or of the three-layer type, montmorillonite, in which silicon and aluminum ions have tetrahedral coordination with respect to oxygen, while aluminum, ferrous and ferrie iron, magnesium, chromate, lithium, manganese, and other ions have octahedral coordination with respect to oxygen or to hydrokly groups. Exchangeable cations may be on the surfaces of the silicate layers, in an amount determined by the excess negative charge within the composite layer. The cations usually are calcium and sodium, but may also be potassium, magnesium, hydrogen, aluminum, etc. The most common clay minerals belong to the kaolinite, montmorillonite, attapulgite, and illite (or hydromica) groups. Mixed-layer clay minerals are randomly- or regularly interstratified intergrowths of two or more clay minerals. A.G.I.

clay model. Finely ground clay used as a plasticizer for masonry mortars. ASCE 1963.

clay. a. Aust. A shallow silted depression in which water collects after it rains. Webster 3d. b. A stratum of stiff, compact, relatively impervious clay which is used as a frost barrier. Fay. c. Applied for the preliminary preparation of plastic clay. The machine consists of a hopper with a flat or conical base; adjustable knives operate from a vertical, central, rotating shaft. The clay leaves from the shredder through slots in the case. Dodd.

clay size. That portion of the soil or of sediments that is finer than 0.002 millimeter or 0.00008 inch. ASCE 1955.

clay shale. A stratum of stiff, compact, relatively impervious clay which is used as a frost barrier. Fay.

clay soil. A fine-textured soil that forms very hard lumps or clods when dry. When dry clay soil is mixed with water and then allowed to stand, it forms a solid mass or a hard lump. Fay.

clay stone. Any of the various clay beneficiated methods. Arkell.

clay rug. Gneiss. Stone found in claypits.

clay rock. A rock composed of fine, argillaceous, detrital material and clay that has been subjected to chemical or physical alteration. Fay. c. Applied for the preliminary preparation of plastic clay. The machine consists of a hopper with a flat or conical base; adjustable knives operate from a vertical, central, rotating shaft. The clay leaves from the shredder through slots in the case. Dodd.

clay sample. A special tool for obtaining laboratory samples of clay. Ham.

clay seam. A seam of clay in rocks; also, may be a fault gouge. Bureau of Mines Staff.

clay shale. Shale composed wholly or chiefly of argillaceous siltstone. Fay.

clay shedder. A unit for the preliminary preparation of plastic clay. The machine consists of a hopper with a flat or conical base; adjustable knives operate from a vertical, central, rotating shaft. The clay leaves from the shredder through slots in the case. Dodd.

clay soil. A fine-textured soil that forms very hard lumps or clods when dry. When dry clay soil is mixed with water and then allowed to stand, it forms a solid mass or a hard lump. Fay.

clay stone. Any of the various clay beneficiated methods. Arkell.

clay rug. Gneiss. Stone found in claypits.

clay rock. A rock composed of fine, argillaceous, detrital material and clay that has been subjected to chemical or physical alteration. Fay. c. Applied for the preliminary preparation of plastic clay. The machine consists of a hopper with a flat or conical base; adjustable knives operate from a vertical, central, rotating shaft. The clay leaves from the shredder through slots in the case. Dodd.

clay sample. A special tool for obtaining laboratory samples of clay. Ham.

clay seam. A seam of clay in rocks; also, may be a fault gouge. Bureau of Mines Staff.

clay shale. Shale composed wholly or chiefly of argillaceous siltstone. Fay.

clay shedder. A unit for the preliminary preparation of plastic clay. The machine consists of a hopper with a flat or conical base; adjustable knives operate from a vertical, central, rotating shaft. The clay leaves from the shredder through slots in the case. Dodd.

clay size. That portion of the soil or of sediments that is finer than 0.002 millimeter or 0.00008 inch. ASCE 1955.

clay shale. A stratum of stiff, compact, relatively impervious clay which is used as a frost barrier. Fay.

clay soil. A fine-textured soil that forms very hard lumps or clods when dry. When dry clay soil is mixed with water and then allowed to stand, it forms a solid mass or a hard lump. Fay.

clay stone. Any of the various clay beneficiated methods. Arkell.

clay rug. Gneiss. Stone found in claypits.

clay rock. A rock composed of fine, argillaceous, detrital material and clay that has been subjected to chemical or physical alteration. Fay. c. Applied for the preliminary preparation of plastic clay. The machine consists of a hopper with a flat or conical base; adjustable knives operate from a vertical, central, rotating shaft. The clay leaves from the shredder through slots in the case. Dodd.

clay sample. A special tool for obtaining laboratory samples of clay. Ham.

clay seam. A seam of clay in rocks; also, may be a fault gouge. Bureau of Mines Staff.

clay shale. Shale composed wholly or chiefly of argillaceous siltstone. Fay.

clay shedder. A unit for the preliminary preparation of plastic clay. The machine consists of a hopper with a flat or conical base; adjustable knives operate from a vertical, central, rotating shaft. The clay leaves from the shredder through slots in the case. Dodd.

clay size. That portion of the soil or of sediments that is finer than 0.002 millimeter or 0.00008 inch. ASCE 1955.

clay shale. A stratum of stiff, compact, relatively impervious clay which is used as a frost barrier. Fay.

clay soil. A fine-textured soil that forms very hard lumps or clods when dry. When dry clay soil is mixed with water and then allowed to stand, it forms a solid mass or a hard lump. Fay.

clay stone. Any of the various clay beneficiated methods. Arkell.

clay rug. Gneiss. Stone found in claypits.
clay stone

igneous rock should also be given up.

clay stone porphyry. An old and somewhat indefinite name for those porphyries whose natural color is greenish or more or less kaolinitic, so as to be soft and earthy, suggesting hardened clay. Fay.

clay substance. Does not exist in nature and is a term used by ceramists for ceramic calculations, designating theoretically pure clay. Rosenthal.

clay vein. a. Structural features occurring most frequently in areas where the coal is folded to the extent that there are well-developed fractures and face cleats. A clay underlying the seam where there is relatively little radioactive fallout. B.L.G. b. Every clay stone porphyry. An old and somewhat indefinite name for those porphyries whose natural color is greenish or more or less kaolinitic, so as to be soft and earthy, suggesting hardened clay. Fay.

clay wash. a. A deposit of mixed clay shales and clay in England that lies directly on the Chalk in many areas and is often seen in potholes or in pipes. It is usually ascribed to the effect of solution-weathering on the Chalk, but in many instances, there may be an additional admixture of Tertiary materials. The clay is reddish or brown, very tenacious, and often nearly black at the base of the deposit, becoming lighter and coarser towards the top. Unfortunately, the term has been loosely applied to almost all the clay-flint drift deposits that rest on the Chalk. Holme, 1928.

cleaning. a. The removal of grease or other foreign material from a surface. Fay. b. The process of cleaning, dry. The mechanical separation of impurities from coal by methods which avoid the use of a liquid. B.S. 3552, 1962.

cleaning of coal at the face. Means the removal of a visible impurity. Mitchell, p. 27.

cleaning solution. For laboratory glassware, mixed sulfuric acid (concentrated) and saturated sodium dichromate solution in ratio 100:1. Pryor, 3.

cleaning, wet. The mechanical separation of impurities from coal by methods involving the use of a liquid. B.S. 3552, 1962.

cleanout. a. To remove cave or other obstructing material from a borehole. Long. b. A port or opening provided in the body or base of a machine or other mechanism through which accumulated debris may be removed. Long.

cleanout aggler. A nuclear bomb that produces relatively little radioactive fallout. B.L.G.

cleanout Auger. Long.

cleanout driller. In petroleum production, one who cleans out caved or old wells, usually accomplished by submerging the body or base of a machine or other mechanism through which accumulated debris may be removed. Long.

cleanout jaw agger. Long.

cleanout tool dresser. In petroleum production, one who sharpens, tempers, and repairs the tools used in cleaning out oil and gas wells. D.O.T. 1.

cleaner. Eng. An iron tube or shell, with which a borehole is cleaned. Fay.

cleaner. S. Detailing and making fit for traversing old gate roads; carrying out cuttings from the mine; clearing the sumps at bottom of shafts. Fay.

clean toe. A sufficient shattering of the material that constitutes the toe to make its removal possible without excessive secondary blasting. Compare toe, c and d. Fay.

clean up. a. The operation of collecting all the valuable product of a given period of operation in a stamp mill, or in a hydraulic or placer mine. Fay. b. The valuable material resulting from a clean up. Fay. c. To load out all the material that a miner has. Fay. d. An opportunity to clean up. Fay. e. The cleanup of sluices in placer mining is a similar process which occurs more often. The gold, tin, or other concentrate is shoveled out for further treatment. Nelson, t. To police and tidy up drill and groyne around a drill rig. Long.

clean up barrel. One used to batch grind and then amalgamate gold-bearing concentrate.
cleanup barrel 217
cleve

clear mica. Transparent muscovite without stains and with a smooth surface in reflected light. Bureau of Mines Staff.
clear span. The clear unobstructed distance between the two supports of a beam. This dimension is always less than the effective span. Ham.
clear water reservoir. See service reservoir. Ham.
clear. a. Main joint in a coal seam along which it breaks most easily. Runs in two directions along a seam. Pryor, 3, p. 87. b. A small piece of wood nailed to two planks to keep them together, or nailed to any structure to make a support for something else. Fay. c. A wooden wedge four or five inches square placed between the top of a post and the underside of a bar or cap. Fay. d. Eng. A piece (or pieces) of wood fastened to pump string to prevent the purpose of steadying them, and preventing them from wearing where they pass through the collar, or to prevent the edge of the spear blades and bolts from injuring the pumps. Fay. e. An attachment fastened to the conveying medium to act as a shaker, support, check, or support, to help propel material, parts or packages along the normal path of conveyor travel. May be of various sizes and shapes. ASAs-306-1968. f. Systems of joints, cleavage planes or planes of weakness found in rocks. The more pronounced points are called face cleats and are normally parallel to the line or direction of regional folding. It is common for a set of joints, which are approximately parallel cracks or fissures a few inches apart, to develop within an area and to prevent the edges of the spear blades and bolts from injuring the pumps. Fay.
ceavage structure. A structure, within a single grain or crystal, resulting from mineral cleavage. Schiferdecker.
ceavage way. Kiln; first; way; Arkell.
ceave. a. Scot. One or two of more or less flat diamond fragments produced in cleaving a crystalline diamond along the octahedral plane. Long. b. A structure, within a single grain or crystal, resulting from mineral cleavage. Schiferdecker. c. A structure, within a single grain or crystal, resulting from mineral cleavage. Schiferdecker.

cleavage angle. The angle between a plane containing the flank of the tool and a plane passing through the cutting edge in the direction of relative motion between the flank and edge. Shear. ASM Gloss.
cleavage plane. a. The crystallographic plane, which can be likened to the grain in wood, along which a crystalline substance, such as diamond, may be split easily. See also cleavage. b. Long. b. Any uniform joint, crack, or change in quality of formation along which rock will break easily when dug or blasted. Nichol. c. The plane along which the cleavage takes place. Fay.
ceavage fracture. A fracture, usually of a polycrystalline metal, in which most of the grains have failed by cleavage, resulting in bright reflecting facets. It is one type of crystalline fracture. Contrast with shear fracture. ASM Gloss.

cleavage structure. A structure, within a single grain or crystal, resulting from mineral cleavage. Schiferdecker.

cleavage way. Kiln; first; way; Arkell.

clease. a. Scot. One of two or more divisions of a seam, usually ironstone. Fay. b. To split a crystalline substance, such as a diamond, along a cleavage plane. Long.
ceavelandite. A white, lamellar, variety of albite. Dana 17.
ceave. Splitting a crystal along a cleavage plane. Hess.
cleek coal. Scot. Coal as it comes from the mine. See also run-of-mine. Fay.
cleekman; cleekie. Scot. An early term for the person who unhooked the baskets of coal at the shaft mouth. Fay.
cleek. Derb. See cleat, c. Fay.

cleer. a. Eng. A steep hillside; a cliff. Standard,
cliffstone

A variety of uraninite containing a large percentage of UO₂ and also rich in helium. Contains about 10 percent of the yellow stuff, Fay.

Cleveland ironstone. A sandy oblitic siderite concretion in the Cleveland district of Yorkshire, England. The ore is said to have averaged about 30 percent iron. Hein.

clevis.

a. In coal mining, a spring hook or snap hook used to attach the hoisting rope to the bucket. Also called clivvy. Pryor, 3, b. A U-shaped iron used with an iron pin for connecting ropes to the drawbar of cars or, when used with iron links, for coupling cars together. Jones. Also used as a connecting link between chains or lines of a seave in a drill tripod or derrick. Long.

clockstone

A foldpathic rock of the trap family, usually fissile, and is sonorous when struck with a hammer. See also phonolite.

clonaphilbe. A group name for the monoclinic amphiboles. English.

cloanthite. A collective name for the monoclinic pyroxenes. English.

cloitite. The inclined lateral axis in the monoclinic system, designated a. A.G.I.

clochlore.

A mineral member of the chlorite group, composition approximately (Mg,Fe)₃(Al₁₃Si₇O₂₉)(OH)₆; monoclinic. A.G.I.

clorite.

A basic copper arsenate, Cu₃(AsO₄)(OH)₂. See also chlorite. Fay; Hey 2d, 1955.

clorochronite.

A hydrous copper arsenite, Cu₃(AsO₄)(OH)₂ or Cu₃(AsO₄)₂(OH)₂. Color, internally, a dark verdigris green; externally, a blackish blue-green; it crystallizes in the triclinic system. English.

clonos Russellite. A monoclinic variety of pyroxene. Crystal elongated, parallel to c axis. Typically magnesium metasilicate, Mg₂SiO₄, that is, with the composition of enstatite, but grading, by substitution of increasing quantities of iron, into clinoenstatite, MgFe₂(SiO₄)₂, English.

cloostated. English. A compact, nearly to the point of complete vitrification. ACSG.

climatic peat. Peat produced through the action of climate in a definite zone of the earth. Climatic peat deposits are sub-divided into blanket moss and hill (sub-alpine) peat. Tomkettle, 1954.

climb. The tendency of an inclined diamond-drill hole to follow an upward-curving, increasingly flat course; also, the tendency of a diamond or other rotary-type bit to drill a hole curved in the up-dip direction when holes are drilled in alternating hard- and soft-layer rock having bedding planes that cross the borehole at an angle other than 90° to the face of the bit. Long.

climb cutting. Analogous to climb milling. ASM Gloss.

climbing form. A type of formwork used for the construction of reinforced concrete walls for buildings. The formwork is jack-uped from bars anchored in the concrete, which is placed and consolidated continuously until completion of the work. See also moving forms. Ham.

clinch. To describe many types of shale. Nelson.

b. Fay.

clinch bolt. Eng. Crossbolts under tie bolts, or overhanging face of rock, earth, or cliff. Fay. b. A very steep, perpendicular, splitting easily along the planes of deposition. Long.

c. A strong, usually silty mudstone. Schieferdecker.

d. A banded or nonbanded siltstone.

e. A hard chalk found in England and used in paint, as a filler for wood, and in the manufacture of rubber. Bureau of Mines Staff.

clinkstone.

A variety of uraninite containing a large percentage of UO₂, and also rich in helium. Contains about 10 percent of the yellow stuff, Fay.

cliffstone. A special grade of cliff glacier. A glacier which occupies a relative area of the earth. Climatic peat deposits are sub-divided into blanket moss and hill (sub-alpine) peat. Tomkettle, 1954.

clinch millings. Milling in which the cutter moves in the direction of feed at the point of contact. ASM Gloss.

clink chif. B. Clints. Internal cracks formed in steel by the action of heating. The tendency for these to occur increases with the hardness of a metal, and with the rate of heating. Fay.

clinker.

A U-shaped iron used with an iron pin for connecting ropes to the drawbar of cars or, when used with iron links, for coupling cars together. Jones. Also used as a connecting link between chains or lines of a seave in a drill tripod or derrick. Long.

clinker brick. A type of formwork used for the construction of reinforced concrete walls for buildings. The formwork is jack-uped from bars anchored in the concrete, which is placed and consolidated continuously until completion of the work. See also moving forms. Ham.

clinking form. A type of formwork used for the construction of reinforced concrete walls for buildings. The formwork is jack-uped from bars anchored in the concrete, which is placed and consolidated continuously until completion of the work. See also moving forms. Ham.

clinking form. A type of formwork used for the construction of reinforced concrete walls for buildings. The formwork is jack-uped from bars anchored in the concrete, which is placed and consolidated continuously until completion of the work. See also moving forms. Ham.

clinking form. A type of formwork used for the construction of reinforced concrete walls for buildings. The formwork is jack-uped from bars anchored in the concrete, which is placed and consolidated continuously until completion of the work. See also moving forms. Ham.

clinking form. A type of formwork used for the construction of reinforced concrete walls for buildings. The formwork is jack-uped from bars anchored in the concrete, which is placed and consolidated continuously until completion of the work. See also moving forms. Ham.

clinking form. A type of formwork used for the construction of reinforced concrete walls for buildings. The formwork is jack-uped from bars anchored in the concrete, which is placed and consolidated continuously until completion of the work. See also moving forms. Ham.

clinked dolomite. See double-burned dolomite. A.G.I.

clinometer. An instrument for making a borehole survey, that is, to determine if, and in what direction, a borehole has deviated from the true vertical plane. See also coneometer.

clinographic. English. A form of graph used for representing the energy of heating. C.T.D.

clinogenic. English. A form of graph used for representing the energy of heating. C.T.D.

clinogene. English. A form of graph used for representing the energy of heating. C.T.D.

cliner. A rigid, usually of basic composition and typically fused byproduct of the combustion of coal, but also including lava and portland cement clinker and partly vitrified slag and brick. ACSG, 1963. c. Rough, jagged, scorciacous, spigges fragments of lava, usually of basaltic composition and typically found on the surface of a lava flow. A.G.I. f. Vitriﬁed or burnt matter thrown up by a volcano. Fay. g. The agglomerated semivitrified and mainly inorganic residue of the combustion of solid f. b. S. 3233, 1960. b. A scale of black oxide of iron formed when iron is heated to redness in open air. Fay. i. A hard, burnt paving brick used in Holland. Arkell.

cliner bar. A bar fixed at the top of an ashpit for supporting the rods used for clearing. "The fire bars. Fay.

cliner brick. A very hard-fired brick, fired nearly to the point of complete vitrification and whose shape is somewhat distorted or bloated. ACSG.

cliner cutting zone. That part of a cement kiln which is in the temperature range (1350° to 1600° C) in which the constituents react to form clinker. Fay. Proposed for boulder clay baked in the burning of lignite beds. Hess.

clinker. Internal cracks formed in steel by differential expansion, growth, deformation, soil formation and removal, coal formation, and some ore deposition and cementation. Bureau of Mines Staff. d. Of pulp undergoing froth flotation, the pre-cipitating of chemicals, energy transfer, reached by the reacting electrical, physical, and chemical forces. Pryor. 4. Climatic peat deposits are sub-divided into blanket moss and hill (sub-alpine) peat. Tomkettle, 1954.

climbing form. A type of formwork used for the construction of reinforced concrete walls for buildings. The formwork is jack-uped from bars anchored in the concrete, which is placed and consolidated continuously until completion of the work. See also moving forms. Ham.

clinoimeter

tached to the lower end of a line of drill rods and suspended at a point in a borehole approximately 1 hour, the acid etches the surface of the glass tube forming what appears to be a line where the upper surface of the acid is in contact with the tube. The inclination of that line is measured and with necessary connections for capillarity indicates the dip of the borehole at the point where the clinometer was suspended. In addition to the above end or plain type, there is the line clinometer and a special type used with the drill-Rowe wedging device. Long.

clinometer rule. A simple angle-measuring instrument for borehole surveying, designed particularly for use with the freezing and cementation methods of shaft sinking, capable of giving the slope of a borehole to within one minute of arc. Hem.

clinophyllite. A hydrous silicate of aluminum, calcium, potassium, and magnesium, Mg(OH)2.6Al2Si2O10.10H2O. Ro.

clinostraps. A line of strap, the two arms of which are attached to either side of the beam of a graduated angle device consisting of a folding rule, the two arms of which is equipped with a small spirit level. Also called angle rule; degree rule. Long.

clinometer shell. Synonym for clinometer case, Long.

clinograph. An exceptionally accurate instrument for borehole surveying, designed specifically for use with the freezing and cementation methods of shaft sinking, capable of measuring the slope of a borehole to within one minute of arc. Hem.

clinogame. A mineral, monoclinic, pseudohexagonal. Very distinctly distinguishable from ungemachite, but material insufficient for chemical analysis. From Chupovskoy, Chit, English.

clinozoisite. An epidote having the composition of Ca,Al2(SiO4)(Si2O7); monoclinic; crystals striated. Dana 17.

clinit. a. A bare, level surface developed on horizontal beds of limestone. A.G.I. b. A hardpan (hardpan) on a rocky clip; a projecting rock or ledge. Webster 3d.

clinoton. Lower Middle Silurian. A.G.I.

clinotile. Synonym for seymchanite; also used as a group name for the brittle micas. C.T.D.

Clinton limestone; Clinton shales. The Middle Niagara series, well-exposed in the Niagara Peninsula. It includes red and black shales, and clay-clastic rocks containing a bedded iron ore at the base, which supplies the ironworks at Birmingham, Ala. C.T.D.

clip. a. A device similar to a clamp but smaller and for the same purpose. Zeman. b. A hook for attaching a bucket to a cable. Keit. c. Connector between underground tub, car, truck, tram, and endless rope haulage; operated by clipper. A clip pulley has a broad rim into which studs are set, to grip links of haulage chain. Pryor, 3. d. Synonym for cable clamp; clamp. Long. See also haulage clip; automatic clip; coupling; clam. The portion of a bucket set to length. A.C.S.G., 1963.

clip and shive. In forging, a dual operation in which one cutting surface in the clipping die remains convex and then another surface and shives the piece. ASM Gloss.

clip method. The clip method of making wire rope attachments is widely used. Drop forged clips of either the U-bolt or the double-saddle type are recommended. When clips of this type are properly applied, the method develops about 80 percent of the rope strength. ASA M41-1966, 24.

clipper. a. Eng. A hook for attaching the bucket to the cable. Used in shaft sinking. Fay. b. In anbractite and bituminous coal mining, a laborer who engages and disengages the clips, grips, or links by which mine cars are attached to a hoisting cable or endless rope and hauled along inclines or flat grades. Also called chainman, grabman; gripman; gripper. D.O.T.1.

clipper man. In iron and steel industry, one who cuts ends of skelp sheets (sheet steel for making pipe) to a tapered point and bends into a cup shape by machine. D.O.T.1.

clipper-off. Aust. A workman who unfastens the clip connecting a skip to a haulage rope. Fay.

clipping edge. That portion of a forging where the flash is trimmed off. ASM Gloss.

clip screws. See augerizing screws. Pryor, 3.

clip tile. Tile designed as a base for steel I-beams. Also called clap tile. Anglo. Fay.

clinoglaze. A method of surface decoration in which differently-colored enamels or glazes are separated by fillets applied to the design outline. For porcelain enamel, the fillets are wire secured to the metal body, while for pottery and tile the fillets are made of ceramic paste, squeezed through a small diameter orifice. A.C.S.G., 1963.

clinoenamel. Porcelain enamel inlaid between partitions of bent copper or gold wire fillets attached to the base. Subsequent polishing of surface brings out the design of the enamel artist. In effect, the caken are separated by delicate filigrees of gold or copper. Enam. Dict.

clip. a. Mid. A short piece of timber about 3 by 6 by 24 inches fixed between the roof and a prop. Fay. b. A flat wedge over a post. See also lid, n. Nelson. c. To obstruct, hinder, or choke up; for example, the stoppage of flow through a pipe by an accumulation of foreign matter, or the filling up of the grooves in a file when operating on a soft metal. Clapin. d. Eng. Rock filling a fault. Arkl.

clip pack. York. See chock, a; nog, a. Fay. close annealing. See box annealing.

close burning coal. Coal which kindles quickly and melts and runs together like bitumen. Tomkeieff, 1954.

close batched. Applied to dregges in which the buckets are each connected to the one in front without any intermediate links. Fay.

close couple. An expression used to indicate a very close integration between all phases which may have an effect on one another; this provides for maximum efficiency. Austin.

closed basin. A district draining into some depression or lake (lake Michigan), from which water escapes only by evaporation. Webster 2d.

closed circuit. a. A water circuit designed so that the only water added is that necessary to replace the loss in the washery products. B.S. 3552, 1962. b. In mineral dressing, a system in which ore passes from comminution to a sorting device.
closed circuit

which returns oversize for further treatment and releases undersize from the closed circuit. Fay, 4.

closed-circuit grinding. A size reduction process in which the ground material is removed either by screening or by classifier, the oversize being returned to the grinding unit. Typical examples are, a dry pan with screens, dry-milling in an air sweep ball mill, and wet milling in a ball mill with a classifier. Dodd. See also circulating load.

closed-circuit operation. Retention and re-treatment of ore in part of flow-line until it satisfies criteria for release. Used in comminution to reduce over-grinding by passing intermediate particles repeatedly through grinding systems, classifying the product and returning the oversize. A sand concentration (for example, rougher-scavenger-cleaner flotation) to retain a selected fraction of ore in circuit for re-treatment (a dinding), until it is either upgraded to rank as concentrate or sufficiently denuded of value to be rejected as tailing. Pryor, 3.

closed-circuit television. System in which elevation cameras relay pictures of conditioned points in the plant, thereby aiding shiftmen to watch inaccessible places and exercise extended control. Pryor, 3.

closed contour. A contour line that is continuous on a map and does not intersect the edge of the arbitrary map area on which it is drawn. Stokes and Varne, 1955.

closed cycle. Cycle of operation of a heat engine in which the same power fluid is used repeatedly, as a steam engine that operates in which the same power fluid is used repeatedly, as a steam engine that operates.

closed traverse. A traverse whose accuracy can be checked by the fact that, when it is closed, the angles should add up to 360°, and which ends at its starting point. Dodd.

closed-water circuit. The separation of solids from a washery derruy so that the water can be returned to the plant and used continuously. Nelson.

close goods. Pure stones, of desirable shapes; highest class of South African diamonds, as asorted at Kimberly. Bureau of Mines Staff.

close-grained. Having fine and closely arranged fibers, crystals, or particles. Webster 3d.

close in. a. To wall-in and roof-over the drill platform for protection of workers from rain and cold. Long. b. To shut off the flow, as from an oil, gas, or arsinic well. Long.

close-joint. Applied to rocks in which the joints are very close together. Fay.

close-joint cleavage. Synonym for striatin cleavage. A.G.I.

close mold. A two-part flask filled by pouring in liquid glass or metal. Standard, 1946.

close nipple. A nipple, the length of which is about twice the length of a standard pipe thread and is without any shoulder. Strock, 3.

close-packed hexagonal structure. An arrangement of atoms in crystals which may be imitated by packing spheres; characteristic of a number of metals. The disposition of the atomic centers in space can be related to a system of hexagonal cells. 0.6178.

close place. Scot. A narrow drift without a separate air return. Fay.

close plate. A term in the placing of poles or plank close together. See also poling, a. Fay.

close prospecting. Prospecting undertaken after the existence of payable ground is disclosed and localized by preliminary prospecting. It is undertaken for valuation purposes to determine (1) the cubic measurements of both overburden and gravel, (2) the estimation of the gold or other mineral contents, (3) the average value of the area in pence, cents, carats, or other unit, per cubic yard, and (4) all possible information regarding the nature of the overburden and gravel, that is, whether it is clayeey, fresh wash, etc., as well as of the bedrock. Griffith, S. F., pp. 2-3.

close return bend. A short, cast or malleable iron, U-shaped fitting for uniting two parallel pipes. It differs from the return bend in having the arms joined. Porter.

close sand. A sand so closely packed that it has low porosity and makes a poor oil reservoir. Hay.

close sheathing. Consists of planks placed side by side along a continuous frame. Its use is to prevent local crumbling of less consolidated soils. Since crevices can exist between planks, it should not be used with fine silts or liquid soils, which can seep through these cracks. Compare skeleton sheathing; tight sheathing. Carston, p. 244.

closing. a. In screening, choice of a series of sieve sizes which closing restricts the size range of each fraction of the material separated between its limiting and retaining mesh. Pryor, 3. b. Sizing with screens fairly close in size of aperture (mesh). Pryor, 4.

close work. Driving a tunnel or drifting between two coal seams. Fay. b. Scot. See narrow work, e. Fay.

closet suite. A suite of ceramic sanitary ware including the closet and the flushing cistern. Dodd.

close timbering. The setting of timber sets and lagging back to bark or very close together when shaft sinking or tunneling through very loose ground or crushed coal in thick seams. See also cribbing; forepoling. Nelson.

closing apparatus. Eng. Sliding doors or other mechanical arrangement at the top of an upcast shaft for allowing the cages to pass up and down without disturbing the ventilation of the mine. Fay.

closing error. When calculating or plotting the distances, angles or coordinates of a closed traverse or one connecting two accurately located points, the discrepancy between starting and finishing points. This error is multiplied in proportion to the magnitude of angles and distances involved, if it is below a tolerable limit. Pryor, 3.

closing line; drawing line. The cable which closes the jaws of a clamshell or mangle-peel bucket. Nichols, 2.
closing rope

Closing rope. Operating rope for opening and closing a grab. Ham.

closing stock. Quantity on hand at end of an accounting period. Opening stock should be the closing stock of the previous period, adjusted in mine storekeeping for returns and concentrations on hand. Pryor, 2.

closing the horizon. Measuring, at a triangulation station, the horizontal angles between horizontal stations and the horizon so as to return to the starting point (the sum of the angles should equal 360°); measuring the last angle of the series, closing on the starting point. Selye, 2.

closure. Dense, laminated, brownish-red algal coal found in Irkutsk, U.S.S.R. It consists of an accumulation of spherical and ovoid bodies of different sizes, among which are disseminated great numbers of desmid algae, belonging to the living genus, Oscillatoria. C.T.D.

closure meter. An instrument for indicating the amount of closure that has taken place. Spalding. Wall closure in mines may be measured by this instrument. Also called sag meter. Spalding, p. 76.

closure. a. In a dome or anticline, the vertical distance between the lowest point on the fold through which a closing contour would pass and the highest point on the fold. U.S.G.S. Bull. 686, 1922, p. 331. b. Used in structural geology, especially in connection with potential oil structures, to designate the vertical distance between the highest point of a fold and the lowest contour that closes around the structure. It is a horizontal distance of 90° of a structural trap for oil and/or gas. Stokes and Varnes, 1935. c. A closed anticlinal structure. G.I. Supp. 4. d. Vertical distance between the top of an anticlinal structure and the lowest level at which a continuous encircling contour can be drawn. A.I.S.I. Supp. I. A portion of brick to close a wound. Tompsett, 1954.

cloud. A group of ferromagnesian minerals in an igneous rock, from a few inches to a foot or more in size, commonly drawn out longitudinally, that may be an altered foreign inclusion or a segregation. Comparison autochthon; xenolith. A.I.G. Supp. b. A cutoff section of a column of clay from an auger machine to be used in a repress. A.I.S.I. No. 24. c. Same as clod. Fay.

cloth oil. A name given to one of the distillates of crude petroleum (specific gravity, 0.875) that is used for oiling wood. Fay.

clot mold. The mold, in some types of stiff plastic brickmaking machines, into which a clot of clay is extruded and from which it is then ejected prior to the final repressing. Dodd.

clothing. The sinitering or semifusion of ores during roasting. Fay.

closed. See log. Pryor, 3.

cloud agate. Applied especially to light gray, transparent to semitransparent chalcedony with more or less rounded spots of darker gray which resemble dark clouds. Shipley.

cloud chamber. A device that displays the tracks of charged atomic particles. It is a glass-walled chamber filled with a supersaturated vapor. When charged particles pass through the chamber, they leave a cloudlike track much like the condensation trail of a plane. This track permits scientists to see the paths of these particles and study their motion and interaction. See also bubble chamber; spark chamber. Long.

closed agate. Chalcedony with irregular or indistinct patches of color. Hess.

closed ware. Pottery colored with, for example, manganese oxide, etc., put on with a sponge. C.T.D.

cloudy agate. A term loosely used for white or gray chalcedony containing any cloudy masses. Shipley.

cloudy stains. In mica, cloudlike effects in various colors. Stem.

clothing. A slice gate in a culvert. Ham.

clothespin. Scot. A mineral related to asbolite, occurring in patches in blue limestone at Inness, Orkney. It isuble in benzol and at a red heat gives off a large amount of illuminating gas. Fay.

clothing. The breaking of a rock by curved fractures that pass beyond the limit of the rock. Fay.

cloch. Heavy fall of roof in mine. Pryor, 3.

cloch. a. Clay or mudstone, with potters, forming the floor of a kiln. Synonym with fine clay; spawin. Also called stone clunch. Nelson. b. A fine-grained, often clayey rock which breaks readily into irregular lumps. B.S. 3618, 1964, sec. 5. c. A bluish hard clay. B.S. 3618, 1964, sec. 5. d. In coal mining, seat coal, earth, for example, that, unlike the seam of coal. Indurated chalk marl or fine shale; tough fire clay. Pryor, 3.

cloch clay. A provincial term for indurated chalk marl. A.I.G. b. A provincial term for a sort of indurated clay which is found dividing the coal seams. A.I.G. c. A fine shale sometimes overlying a coalbed. It is soft and subject to deformation by squeezing during mining, and therefore, does not make a good roof. A.I.G.

cloch, gear. Two or more gears of different sizes inside in one solid piece. A.I.S.I. No. 24.

cloch, clusterite. A round or semiorbicular, smooth nodular growth of calcite usually occurring in clusters. Synonym for botryoidal; grape formation. A.I.G.

cloch, cluster wall. A rolling mill where each of the two working rolls of small diameter is supported by two or more backup rolls. ASM Gloss.

cloch, cluster of veins. An aggregation of a number of irregularly striking veins. Schifferdecker.

cloch, clutch. A device by which a haulage drum can either be connected to the driving axle or allowed to run freely and independently of it. Nelson. b. A device for releasing the brake and disconnects two shafts which revolve in line with each other. Nieloli.

cloch, clutch brake. A device to slow the jackshaft when a clutch is released, to permit more rapid gearshifting. Nicholls, 2.

cloch, clutch room. Aust. A chamber, generally underground, in which the friction clutches that control the different haulage ropes on the various districts. Fay.

cloch, clutch, clutch, shift transmission. A constant-mesh transmission in which the shift is directed through gear trains by engagement of friction clutches. Nicholls.

cloch, abbreviation for Coal Measures as developed in Great Britain. Nelson.

cloch, carbon-methylenechloride. Dodd.

CMI centrifuge. A fine-coal dewatering machine consisting of two rotating elements, an outer one in the form of an inside solid cone, which carries spiral hinderance flights. By a slight difference in the number of teeth in the gears the screen element moves slightly faster, in the same direction, than the solid cone. Material enters the machine from the top and falls on the solid cone where the centrifugal force throws it against the screen. The screen passes down the screen until it meets the upper end of the hinderance flights, and, in doing so, the water begins to pass through the screen. The flights spiral
downward, and as the screen moves slowly around them in the direction of the downward pitch, the solids gradually find their way to the screen bottom and the zone of maximum centrifugal force, tending to remove all of the water. 

Kern 6, 1972.

Conde stone. A vitreous ware, used for architectural ornament, made in London by Mrs. Coade from 1771 until her death in 1796. Manufacture finally discontinued in about 1840. The body consisted of a kaholistic clay, finely ground quartz and felspar, and a flux (possibly ground glass). 

Dodd.

coulation. a. The binding of individual particles to form flocs or agglomerates and thus increase their rate of sedimentation in water or other liquid. See also flocculation. 

Nelson. b. The state of solution in a granular or of a colloidal state, resulting from clotting or curdling; the act of changing to a curdlike condition. Fay. c. The coalescence of fine solid particles to form larger particles. 

ASTM STP No. 146-D.

couglator. A soluble substance, such as lime, which when added to a suspension of very fine solid particles in water causes these particles to adhere in clusters which will settle easily. Used to assist in reclaiming water used in flotation. Hess.

coal. Same as coke; coal. 

col. a. A solid, brittle, more or less distinctly stratified, combustible carbonaceous rock, formed by partial to complete decomposition of vegetation; varies in color from dark brown to black; not fusible without decomposition and very insoluble. The boundary line between peat and coal is hazy (see brown coal) as is the boundary line between coal and graphite and the boundary line between carbonaceous rock and coal. In the formation of coal, the vegetable matter seems to have been largely moss and other forms of plants, but in places, coal contains much wood; the vegetal matter seems to have been first taken from the form of peat, then lignite, and then bituminous coal. The latter by the loss of its bituminous in some places has been converted into anthracite (hard coal) and finally into graphite. Coke deposits are usually termed beds and range from a fraction of an inch to several hundred feet in thickness. Colloquially, they are called coals and veins. Their differences in coals are due to age, pressure (folding and/or depth of burial), and heat, which may have been supplied by transacting dikes or by movement in the rocks. It has been suggested that coal when dried at 100° C should contain at least 50 percent combustible material. Many schemes have been offered for the classification of coals, but all have difficulties as there are numerous imperfections in the coals themselves including fixed carbon, volatile carbon compounds, water, oxygen, sulfur, ash, and coking properties. The class depends on the type of material from which the coal was made, on the sediment carried into the coal when being formed, the dissolved material brought in at that time or later. Campbell divides coals into the following ranks or classes, in which the fuel ratio quoted is the maximum amount of coal that can contain and still retain its name depends on commercial considerations which vary from one country to another. The different hands recognized by the unaided eye in humic coals are called lithotypes. The physicochemical properties of the maceral vitrinite are commonly used to characterize and classify the various coals of high and medium ranks.

The variations in rank are of greatest importance in the classification of coals. Increasing metamorphism results in important changes in all the properties of coal. Under the microscope, almost all coal appears heterogeneous. The variations in rank, called metamorphic trends, are marked by characteristic associations, microthylocytes, which may include in more or less intimate mixture 0.20 percent by volume of mineral matter. The amount of mineral matter which coal can contain and still retain its name depends on commercial considerations which vary from one country to another. The different hands recognized by the unaided eye in humic coals are called lithotypes. The physicochemical properties of the maceral vitrinite are commonly used to characterize and classify the various coals of high and medium ranks.

The variations in rank are of greatest importance in the classification of coals. Increasing metamorphism results in important changes in all the properties of coal. The different hands recognized by the unaided eye in humic coals are called lithotypes. The physicochemical properties of the maceral vitrinite are commonly used to characterize and classify the various coals of high and medium ranks.
coal bank

more; occasional specimens weight more than 100 kg. In an area of 10 km², the entire seam in a restricted area consists largely of coal balls. Coal balls consist mainly of calcareous, dolomitic, micritic pyrites, or silicous material surrounding or impregnating plant and animal remains. They occur in brown coals (mainly sidetic balls) as well as in coals of higher rank generally lying within the coal seam but occasionally in the roof. Calcareous, dolomitic and pyritic coal balls are commonly found in seams having marine strata in the roof. The distribution in seams is variable. They may occur in a broad zone running through the coalbed or be distributed irregularly in nests. Synonym for tor solfat. ICHP, 1963, part 1.

coal barge. A flatboat used to carry coal. Craigie, v.1, p. 537.

coal barrier. A protective pillar of coal. See also barrier pillar. Nelson.

coal breaker. The owner of a rich coal mine or mines. Craigie, v.1, p. 537.

coal basin. Depressions in older rock formations in which isolated strata have been deposited. Fay. See also concealed coalfield; exposed coalfield.

coal box. The earliest custom of employing women to carry coal out of the mine. Fay.

coal bed or stratum of coal. Coal seam is more commonly used in the United States and Canada. Fay.

coalbin. A boxlike receptacle or space for coal. Craigie, v.1, p. 537.

coal blacking. Iron founders' blacking made from powdered coal. Webster 3d.

coal blasting. There are two methods of breaking coal with explosives, namely, blasting out coal, which is the method most commonly used, and blasting off the solid, or grincing. M. Adam II, p. 55.

coal breccia. Coal broken into angular fragments by natural processes occurring within the coal bed. Polished and slickened surfaces may be common. Stuiver and Not, 1940, p. 248.

coal briquettes. Coal made more suitable for burning, by a process which forms it into regular square or oval-shaped pieces. Bennett 24, 1962.

coal briquetting. See briquette. Nelson.

coal bump. Sudden outbursts of coal and rock that occur when stresses in a coal pillar, left after support in underground workings, are greater than the pillar to rupture with- out warning, sending coal and rock flying with explosive force. Bureau of Mines Staff. coal cleaning equipment. Coal cleaning equipment used to remove impurities from the coal is now standard, and pneumatic (air) cleaning. Coal refining (n) is incorrect; refining refers to purifying metals. Bureau of Mines Staff.

coal cleaning plant. A plant where raw or run-of-mine coal is washed, graded, treated to remove impurities, and reduce ash content. Pryor, 3.

coal clearing. The loading of broken coal at the face into conveyors or mine cars. The clearing shift is the coal-loading shift or stemming. Nelson. Usually the miner has a measured task or stint ( manipulate). Pryor, 3.

coal constituent classification; Spackman System. In the United States it is generally agreed that the nomenclature Stopes-Heerlen System, fails to comprehend the effect of the stage of coalification on the nature of the constituents. W. Spackman's interpretation of the maceral concept incorporates the ideas of variable coalification in suggesting a skeletal framework upon which a systematic classification can be built. The maceral concept, as interpreted by Spackman, implements the classification of the products of coalification. In this scheme, macerals possessing similar chemical and physical properties are assembled into maceral groups which can, in turn, be characterized by a comparatively restricted set of properties. Maceral groups possessing similar characteristics can be classified into maceral suites. ICHP, 1963, cut 1.

coal cutter. a. The longwall coal cutter is a powered machine which draws itself by rope haulage along the face, usually cutting out a beam (1 to 2 meters) from the bottom of the seam a thin strip of coal, in preparation for shot firing and loading or a cutter loader. The bar and disk machines are obsolescent and the chain coal cutter is now almost universal. Nelson. b. See mac- chine cutters. D.O.T. 1.

coal-cutter design. Most longwall chain coal cutters consist of three self-contained units: (1) haulage, (2) the chain cutter, and (3) the jib-end section. This three-unit design makes: assembly and handling relatively easy as the units are physically separated, which is an advantage where shafts are small and roadways restricted. In a major breakdown, it is easier to replace one unit rather than the entire machine to run-off-of-mine coal and picks out slate, rock, and other impurities. Also called flat trimmer, slate picker. D.O.T. 1.

coal cleaning; coal preparation; coal refining. These terms, used in the order given, refer to the sorting, picking, screening, washing, pneumatic separation, and mixing of coal to the best advantage for (and requirements of) the market. Coal cleaning is commonly used because it defines the operation of the plant to the concept of the market. In coal cleaning, only those impurities that are mechanically mixed with the coal are removed by washing; or pneumatic (air) cleaning. Coal refining is incorrect; refining refers to purifying metals. Bureau of Mines Staff.

coal cleaning equipment. Coal cleaning equipment used to remove impurities from the coal is now standard, and pneumatic (air) cleaning. Coal refining (n) is incorrect; refining refers to purifying metals. Bureau of Mines Staff.
coal-cutter picks

The surface for repairs. Nelson.

cal-cutter picks. The cutting points attached to a cutter chain for making a groove in a coal seam. The picks are made from quenched steel or a hard alloy steel and tipped with fused tungsten carbide or sintered tungsten carbide or other hard-wearing material. Advantages of the coal-cutter pick tipped with tungsten carbide on a heat-treated alloy steel shank has resulted in marked improvements in drilling and in a reduction in cutting delays. See also coal cutter; double-ended pick; duckbill pick; tungsten-carbide bits. Nelson.

cal-cutter team. The men in charge of a coal cutter. A cutting team varies from two five with two to three about average. The leading man is normally stationed in front of the machine and is in charge of the controls and his assistant follows behind. See also back-end man. Nelson.

cal-cutting machine. A machine powered by compressed air or electricity which drives a cutting chain or other device so as to undercut the seam, or to move a layer of shale. Precise cutters are used to bore holes or to make vertical cuts (picking, boring); disk, bar, and chain cutters carry small picks which undercut the seam as the machine travels. Nelson.

cal-cutter. A coal miner; miner. B. Fay.

cal distributor. A person or thing that distributes coal. As agent of the coal company that distributes coal to consumers. Bureau of Mines Staff.

cal drawing. The extraction, haulage, and hoisting of coal from the face to the pithead. Nelson.

cal drill. Usually an electric rotary drill of a light, compact design. Aluminum and steel framework, its alloys usually are used to reduce the weight. Where dust is a hazard, wet drilling is employed. With a 1 horsepower electric drill, speeds up to 6 feet per minute are possible. Light percussion drills, operated by compressed air, and hand-operated drills are also employed. Nelson.

cal drill, electric. See electric coal drill.

cal driller. In coal mining, a worker who uses a hand or power drill to drill holes into the working face of the coal into which explosives are charged and set off to blast down the coal. D.O.T. 1.

cal drop. A broad, shallow inclined trough down which coal is discharged from a wharf into the hold of a vessel. A coal chute. Fay.

cal dryer. A plant or vessel in which water or moisture is removed from fine coal. The artificial drying of fine coal is not often employed. Coal is removed from washwater by dewatering classifiers, or by vacuum filtration. See also dryer; thermal dryer. Nelson.

cal dome (Forest of Dean). Coal measure.

Fay.

coal dust. a. A finely divided coal. There is a diversity of opinion as to what the term coal dust means; that is, how finely must coal be divided to be termed dust. Some writers base the distinction on the point whether it can be carried to considerable distances in a current of air. Coal dust that will pass through 100-mesh screens (100 wires to the linear inch) is frequently accepted as representing mine dust. For fires at the Pitts-

burg station coal passed through 100 mesh is taken as standard. In the foreign galleries the practice varies between this size and coal that passes through 200 mesh. Fay, b. The general name for coal particles of small size and coal that passes through 100-mesh screens. Nelson.

cal explosibility. A property of a coal that determines its explosibility. A coal may be considered to be of high explosibility if it is capable of producing an explosion in a reducing atmosphere at high temperatures with pressure. A.S.M. Golin.

cal exhaust. A market for the sale of coal; especially, a place for transactions in coal on a large scale. Fay.

cal face. a. The mining face from which coal is extracted by longwall, room, or narrow-stall system. Nelson, b. A working place in a colliery where coal is hewn, won, got, from the exposed face of a seam by face workers. James, p. 93.

cal factor. See factor. Fay.

cal field. An area of country, the underlying rocks of which contain workable coal seams. The distribution of coalfields was largely determined by folding movements and the subsequent denudation. The original coal areas were clearly larger than the present coalfields. Nelson.

cal flotation. See flotation process; froth flotation. Nelson.

cal fuel rate. The content of fixed carbon divided by the content of volatile matter is called the fuel ratio. According to their fuel ratios coals have been classed: anthra-

cite, not less than 10; semianthracite, 6 to 10; semibituminous, 3 to 6; and bitumi-

nous, 3 or less. Bureau of Mines Staff.

cal gas. Flammable gas derived from coal either naturally in place, or by induced methods of industrial plants and underground gasification. Bureau of Mines Staff.

cal gasification, underground. See underground gasification. Fay.

cal gravel. A secondary deposit of coal consisting of coal fragments of varying size that have been removed from the place of mining and redeposited. A.G.I.

cal hogger. N. of Eng. One who is employed in cutting or hewing coal in a mine. Fay.

cal handler. a. One who loads or unloads coal. Craigie, v. 1, p. 338. b. One who supplies coal to the gas-producing ovens in which coal gas is generated for use as a fuel in furnaces in which ore is smelted. D.O.T. 1.

cal-handling foreman. One who supervises workers engaged in unloading coal from barge or freight cars. Fay, b. A coal hopper. He reads a scale indicating the weight of the coal as it enters the bunker on a conveyor from coal storage hoppers, and moves a point whether it can be carried to considerable distances in a current of air. Coal dust that will pass through 100-mesh screens (100 wires to the linear inch) is frequently accepted as representing mine dust. For fires at the Pitts-

burg station coal passed through 100 mesh is taken as standard. In the foreign galleries the practice varies between this size and coal that passes through 200 mesh. Fay, b. The general name for coal particles of small size and coal that passes through 100-mesh screens. Nelson.
coal hewer. One employed in the moving or shoveling of coal, in loading or discharging coalships, in shoveling coal from ships' bunkers to the furnaces; a coal laborer. Eng. 

collier. One who carries coal, usually in a basket or bucket, from the delivery truck to the customer's storage place. The chute door of a coal truck. Fay.

colliery. See coal lification.

colliery engineer. In coal mining, one who operates a hoist for raising coal to the surface where separate shafts or compartments are used for handling coal and men.

colliery manager. A colliery manager's (or undermanager's) certificate. A candidate for a certificate may submit himself for the old-style six-paper examination, or the new-style three-stage examination of the Mining Qualifications Board or the joint examination of the Board and the Institution of Mining Engineers. Holders of approved degrees or diplomas, or certain other qualifications, who apply for a first-class certificate, are required to qualify only in the subject of mining law. See also colliery manager.

colliery master. Eng. The owner or lessee of a coal mine.

colliery secretary. A person who is responsible for the maintenance of the colliery records and correspondence.

colliery superintendent. A person who is responsible for the management of a colliery.

colling. A voluntary joining of persons or parties, for the purpose of combining or uniting their resources, as in the support of some plan or policy relating to mining operations; a combination. Fay.

colling coal. See Baum washer; jig washer; plunger jig washer. Nelson.

colling land. Land of the public domain which contains coalbeds. Fay.

colling leads. The thin veins of coal in a fault zone. The evidence provided by the coal leads may indicate the direction of the displaced seam. Fay.

colling liquefaction. See coal liquefaction.

colling metallurgy. The study of micro-organisms whose activities are associated with the formation and degradation of coal. J.C. 8075, 1962, p. 2.

colling mine. Any and all parts of the property of a mining plant; on the surface or underground, which contributes, directly or indirectly under one management, to the mining of coal. Fay. In addition to the underground workings, staple shafts, and workings, a coal mine includes all the buildings, buildings, structures and works, preparation plants, etc. Nelson. A colliery. See also mine. Fay.

colling pipe. Eng. a. The carbonized annular coating or bark of a fossil plant. Fay. b. A very thin seam of coal. Fay. A coal tree stump reaching for a coalbed up in

225

coal pipe

April 1966, Chapter 5.1, p. 45.

colling pipe inspector. In mining, one who examines the safety conditions of a mine in regard to pit slope or underground roof, timbering, haulage, ventilation, electricity, and machines, and makes tests with a safety lamp to detect gas and dust hazards. Also called examiner; gas inspector; mine inspector; safety inspector. D.O.T. 1.

colling rates. One who digs coal. Fay.

colling mines. The industry that supplies coal and its various byproducts. Nelson.

colling mining examinations. The examinations held in Great Britain which must be passed by every person who wishes to hold a colliery manager's (or undermanager's) certificate. A candidate for a certificate may submit himself for the old-style six-paper examination, or the new-style three-stage examination of the Mining Qualifications Board or the joint examination of the Board and the Institution of Mining Engineers. Holders of approved degrees or diplomas, or certain other qualifications, who apply for a first-class certificate, are required to qualify only in the subject of mining law. See also colliery manager.

colling mining explosives. The statutory requirements regarding the use of explosives in coal mines are very stringent. In gaseous mines only permitted explosives are allowed. See also explosive, b: blasting, a. Nelson.

colling mining methods. The methods of working coal seams have been gradually evolved and progressively improved or modified as knowledge and experience were gained and power machines became available. Over the years, a very large number of methods of mining coal have been developed to suit the seam and local conditions, and they may be divided, broadly, into (1) long-wall, and (2) pillar methods of working. See also method of working. Nelson.

colling oil. a. The crude oil obtained by the destructive distillation of bituminous coal. Fay. That distillate obtained from such a crude oil which is used for illuminating purposes—kerosene. Fay. c. Crude petroleum. Fay.

colling passes. A laborer who transports coal or coke from storage bins or piles to place of use. D.O.T. 1.

colling production. Highly polished, spherical or elliptical mass of bituminous or anthracite coal, which may consist of concentric shells, easily separated from the ash and other inclusions, to which the laminations of which may continue through the pebble. Some pebbles are striated and dichroite, the only place of occurrence, only found where coalbeds have been intruded by dikes. Hiss.

colling pipe. Eng. a. The carbonized annular coating or bark of a fossil plant. Fay. b. A very thin seam of coal. Fay. A coal tree stump reaching for a coalbed up in

232
to the overlying rock strata indicating rapid subsidence and burial of the standing stratum by the coal-bearing stratum. The coal beds usually consist of material differing from the surrounding rock. *Stuter and Nye, p. 484."

coaltip

A place where charcoal is made. *Fay, v. 1, p. 119.*

coalgas

226

coal saw

be cleared of dirt and powder from top to bottom of the seam being sampled. Down the center of each 3-foot square, one zone 1 foot wide is cut to a depth of at least 1 inch in order to get perfectly clean coal. The zone is then subdivided, one zone 1 inch to a depth of 2 inches and a width of 6 inches; or, if the coal is soft, to a depth of 3 inches and a width of 4 inches. Approximately 25 to 30 pounds of coal will be obtained for each foot of thickness of the seam. This should include all coal included in the mining open pit and exclude all slate or partings which are thrown out during the operation. The sample obtained should be collected on a waterproof cloth 6 by 7 feet and then screened, the lumps being broken in a mortar and all passed through a 6 mesh screen. Any impurities, such as slate or pyrite, are crushed to one-fourth inch or finer and thoroughly mixed with the coal. The coarser materials should be evenly distributed, the sample being then quartered, mixed, and re-quartered. In the cleaning, each sample is weighed. The cost of a detailed investigation is well repaid in higher recoveries, in flexibility of product, and in the saving of mining and handling costs. *Mathews, v. 1, p. 347.*

coal deflation

Simple or multiple flotation for the fines. The average capacity of coal-preparation plants ranges in Great Britain from 500 to 600 tons per hour. In the United States, plant capacities vary from 500,000 to 1,000,000 tons per hour. See also gravity concentration; *screen,* *washery,* *Nelson.*

coal preparation process

The process adopted for cleaning and sizing coal for the market. The selection of the best process for any particular run-of-mine coal is a specialist study. Many coal preparation factors must be considered in this process. The cost of a detailed investigation is well repaid in higher recoveries, in flexibility of product, and in the saving of mining and handling costs. *Nelson.*

coal preparation shift

On mechanized longwall faces, the shift during which coal-cutting, boring, and shot-firing operations are performed. *Mason, v. 1, p. 119.*

coalprint

N. of En. Thin film, or patches, of coalite matter interbedded with shale. *Fay.*

coal prospector

coal pulverizer operator

One who operates by means of electrical switches, mechanical levers and valves, a coal pulverizing plant consisting of mechanical and interrelated machines. The plant crushes, dries, and pulverizes coal, and delivers the pulverized coal either into the storage bin or to a slower that supplies the fuel to a boiler or furnace. *D.O.T.*

coal puncher

A coal cutter of the reciprocating type, used for undercutting and nicking coal. Also called pick machine. *Fay,* see pneumatic pick. *Nelson.*

coal rake

A seam or bed of coal. *Fay.*

coal rank

Classification according to degree of metamorphism or progressive alteration, in the natures of minerals from lignite to anthracite; higher rank is classified according to fixed carbon on dry basis; lower rank according to British thermal units on moist basis. *Bennett 2d, 1962 Add.*

coal rater

coal rake

A seam or bed of coal. *Fay,* see pneumatic pick. *Nelson.*

coal region

An area in which coal is mined extensively. *Cragin, v. 1, p. 539.*

coal rifle coal reel coal hauler Scot. A sale place for coal other than at a colliery. *Fay,* see coal road.

coal road

A. An underground roadway or drift leading into coal. *Zern.* B. A railroad whose principal business is the haulage of coal, as from mine to industrial centers. *Fay.*

coal room

A. A Scot. A working face in stope and-room workings. *Fay,* see coal road.

coalroyalties

 Fees paid for coal leased to the proprietors of the mine by the owners of the minerals below the surface. *Fay.*

coal sample

In the light, heat, and power industry, a laborer who collects coal samples from cars in the yard or from pulp- verized coal bunkers for testing by a fuels analyst to determine the properties at heat value, moisture, sulfur, or ash content. *D.O.T.*

coal sampling

The standard method used by the U.S. Bureau of Mines samplers is as follows: A space of 5 feet in width should be cleared of dirt and powder from top to bottom of the seam being sampled. Down the center of each 3-foot square, one zone 1 foot wide is cut to a depth of at least 1 inch in order to get perfectly clean coal. The zone is then subdivided, one zone 1 inch to a depth of 2 inches and a width of 6 inches; or, if the coal is soft, to a depth of 3 inches and a width of 4 inches. Approximately 25 to 30 pounds of coal will be obtained for each foot of thickness of the seam. This should include all coal included in the mining open pit and exclude all slate or partings which are thrown out during the operation. The sample obtained should be collected on a waterproof cloth 6 by 7 feet and then screened, the lumps being broken in a mortar and all passed through a 6 mesh screen. Any impurities, such as slate or pyrite, are crushed to one-fourth inch or finer and thoroughly mixed with the coal. The coarser materials should be evenly distributed, the sample being then quartered, mixed, and re-quartered. In the cleaning, each sample is weighed. The cost of a detailed investigation is well repaid in higher recoveries, in flexibility of product, and in the saving of mining and handling costs. *Mathews, v. 1, p. 347.*

coal sampling laboratory methods

There are two methods, the choice depending on whether the coal appears wet or dry: (1) the sample is weighed. The cost of a detailed investigation is well repaid in higher recoveries, in flexibility of product, and in the saving of mining and handling costs. *Mathews, v. 1, p. 347.* (2) the coal appears dry or damp. The procedure is to reduce the coal in the jaw crus her to a 4-mesh sieve and reduce the sample to 10 pounds using a larger riffle sampler. The 10-pound 4-mesh sample is ground in a rollcrusher or coffee mill to 20 mesh. From various parts of this sample, take with a spoon, without sieving, a composite 50-gallon total moist sample. This sample is then ground directly in a rubber-stoppered bottle. Thoroughly mix the main portion of the sample, reduce on the small riffle samples, to about 200 grams, and pulverize to 60 mesh by suitable grinder, disregarding loss of moisture. After passing 60 mesh, the sample is mixed and reduced to 50 grams on the small riffle sampler. This final sample is transferred to a 4-ounce rubber-stoppered bottle. Moisture is then added on both the 60-mesh and the 20-mesh samples. The following computation is made: (1) the analysis of the 60-mesh coal which has become partly air-dried during sampling is computed to the dry-coal basis by dividing each result by 1, minus its contents of moisture. The analysis of the coal "as received" is computed from the dry-coal analysis by multiplying by 1, minus the total moisture found in the 20-mesh sample; and (2) when coal appears wet, the sample is spread on tarred pans, weighed, and air-dried at room temperature or in a special drying oven at 10° to 15° C above room temperature. After it is dry, the sample is ground and the moisture is calculated on a dry basis. *Mathews, v. 1, p. 347.*

coal sampling

A coal cutter employing a very thin chain and bit, or saw, which cuts a kerf 2 inches wide, in comparison with
coal scares

normal chain and bit kerfs which are 5 to 7 inches wide. The coal saw is for use where hydraulic devices could be employed to break down the coal and thus eliminate most or all of the stopping or driling.

cool scares. Thin laminae of pyrite in coal.

Bureau of Mines Staff.

cool screen. In the iron and steel industry, a laborer who operates sifter to grade coal. D.O.T. I.

cool scuttle. A strong metal pail or bucket, or scoopoline container, in which coal for domestic use is carried. Craigie, v. 1, p. 539. See also coal cart.

cool seam. A bed or stratum of coal. Craigie, v. 1, p. 539. See also coal bed.

cool-seam correlation. The identification of a coal seam; the linking up or matching of a seam exposed in different parts of a mine or coalfield. A coal seam may be correlated by lithology, by fossils, by chemical composition, or by its own content. Cool-seam correlation is very important in exploration and in penetrating faults. See also correlation, p. 539.

cool-moistening probe or cool-moistening instrument which can measure the thickness of coal left on the floor of a seam when a cutter loader operates on a long-wall face. The principle used is the measurement of the density of the strata underlying the machine by a gamma-ray backscattering unit. Gamma rays from the radioactive source are scattered in all directions by the atomic particles in the coal and rock. The amount of scattered radiation eventually reaching the Geiger counter is, approximately, inversely proportional to the density of the scattering medium, that is, more will come back from coal than from rock. Thus, as the amount of coal between the source and the underlying rock changes, so the amount reaching the Geiger counter and the counting unit (the ratemeter) will change and consequently the output of the meter can be calibrated in terms of the thickness of the floor coal. Nelson.

cool separator. A machine which separates the coal from dirt in the run-of-mine material. See also coal-preparation plant, jigger.

coalsherd. Eng. A coalbed of only a few inches in thickness and therefore unworkable. Fay.

cool sill. Cumb. A soft clay from coal measures used for slate pencils. Arkell.

cool sizes. The sizes by which anthracite coal is marketed are as follows, diameter of opening through which or over which coal will pass. C.O.S. Testing.

cooling tower. A tower where the cooling of water is accomplished by natural convection. A.C.I. 34.4-52.

cool sludge. A slurry that has been partly dried and partially frozen, a dilution that will permit further dehydration by filtration. Mitchell, p. 610.

cool slurry. Finely crushed coal mixed with sufficient water to form a fluid. To use cool slurry pumped through a pipeline as fuel, expensive drying and water treatment has been necessary. Recent tests indicate that coal can be fired in a cyclone furnace as it is received from a pipeline, that is, a coal and water mixture. See also slurry. Nelson.

cool smut. York. Worthless, carthy coal. See also coal smut. Fay.

cool smoke. A suspension of very fine particles in air. A coal which breaks down easily when heated gives off its volatile matter very easily and perhaps more quickly than a shale, and this volatile draught can supply the air for combustion with the result that dark smoke containing much unburnt or partly burned material is given off—loss of fuel energy. See also smoke. Nelson.

cool split. See split seam. Nelson.

coal spragger. In bituminous coal mining, one who sets short wooden props between the spokes of a mine car wheel to stop the car. Bureau of Mines Staff.

cool stripper. In bituminous coal mining, a general name for a worker who is engaged in mining coal in a strip mine, one in which the coal is close enough to the earth's surface to permit the use of power shovels instead of stripping back the ground and loading the coal into large cars or trucks. Usually designated according to particular jobs, as fireman, steam shovel; groundman; power-shovel operator. D.O.T. I.

cool tar. Tar obtained by destructive distillation of bituminous coal, usually in coke ovens or in retorts and consisting of numerous constituents (as benzene, xylene, naphthalene, pyridine, quinoline, phenol, cresols, light oil, and creosote) that may be obtained by distillation. Webster 3d.

cool tar. Color. Color composed of containing any substance derived from coal tar, or any substance related in its chemical structure to a constituent of coal tar as to be capable of derivation from such constituent. Bennett 2d, 1962.

cool tar. Corrosive by contact; volatile; liquid pitch oil. Dark, yellow to greenish oil obtained from coal-tar distillation; specific gravity 1.030 to 1.080; boiling point 200 to 300° C.; used as; used as a solvent; plasticizer. Bennett 2d, 1962.

cool tar oils. Oils obtained by the distillation of coal tar; classified into light and heavy oils. A light oil is one having a specific gravity less than 1.080; a heavy oil contains the coal-tar naphthas. The heavy oils sink in water and contain such components as naphthalene, antracene, anthracene, cinnabar oil, etc. Porter.

cool tar pitch. A dark brown to black residue from the distillation of coal tar, ranging from a sticky mass to a brittle solid, depending on the degree of distillation. Most coal-tar pitch made melts between 60° and 70° C. Used for waterproofing; roofing; paving compounds and fillers; insulation; fuel briquetting; core compounds; electrodes; pitch-coke; and fuel. Hess.

cool tar, viscous. Amorphous, resinosous pheno- leptonic gum from the many distillates from coal; specific gravity, 1.0 to 1.25; and soluble in ethyl alcohol. Used in roofing compositions and in roadmaking. Bennett 2d, 1962.

cool testing. Evaluating coals by methods other than chemical, such as determining the relative values of different coals as fuels by burning them under controlled conditions in furnaces, or to determine their gas and coke producing properties by testing in a retort. Coal testing is frequently erroneously used, especially in coal marketing, for coal analysis. Bureau of Mines Staff.

cool tower operator. In the light, heat, and power industry, one who unloads coal from barges into coal tower hoppers, using an electric hoist to actuate the scoop bucket traveling on a beam suspended from the coal tower over the barge. D.O.T. I.

cool trimmer. In ore dressing, smelting, and refining, one who operates a small, electric-powered tram (car) to transport coal from storage bins to roasting furnaces where it is used as a fuel in roasting ore to eliminate undesirable elements. D.O.T. I.

cool trimer. One who is employed to stow and trim or shift coal on board vessels, either as cargo or supply for furnaces. Fay.

cool type. a. A variety of coal, such as common banded coal, cannel coal, algal coal, and splint coal. The distinguishing characteristics of each type of coal arise from the differences in the kind of plant material that produced it. A.G.I. b. A coal, particularly a bituminous coal, contains bands of vitrain, fusain, and amorphous matter that are believed to have been formed mainly from selected portions of the plant material forming the seam. These bands, which have been given the terms vitrain, clarain, durain, and fusain, are the different types of coal in that seam. Nelson.

coal vend. Eng. The general sale of coal. Fay. b. The limited quantity of coal to which each coalfield is restricted by a former combination of coal operators on the Tyne river. Fay.

cool wash. Scot. The coal face. Fay.

cool warrant. In Wales, a kind of fire clay used to form the floor of a coalbed. Fay.
coal-washer tender

coke products industry, one who washes coal, using equipment, such as launderers, screens and diatomaceous earth to separate coal from slate, rock, and other impurities, usually by gravity separation. May be called coal-washer tender. 

c widening. See washing apparatus. Fay.

c coal washing apparatus. Fay.

c coal wheeler. In the iron and steel industry, a laborer who shovels coal into a wheelbarrow and pushes it to the furnaces. D.O.T. Supp. b. 

c coal-whipper. Gr. Brit. One (as a laborer or a machine) that raises coal out of the hold of a ship. Webster 3d.

c coal wood. Wood to be burned for charcoal. Craige, v. 1, p. 539.

c coal washer. One who washes coal. See D.O.T. 1.

coast. A strip of land of indefinite width extending along the seashore. Seashore.

coast. A coast with tidal tilts. A coast in front of which a shallow sea with numerous tidal flats is situated, usually protected against the open sea by an offshore bar. Schieferdecker.

coastline. a. Technically, the line that forms the boundary between the coast and the shore. A.G.I. b. Commonly, the line that forms the boundary between the land and the water. A.G.I.

coast of transverse deformation; composite coast. A coast consisting of alternating layers of submergence and emergence, connected with zones of downwarping and upwarping which are transverse to the coast. Schieferdecker.

coast plain. A plain of denudation or a base level. It makes a sea level, to which the land has been reduced by subaerial forces. The coast plain, not to be confused with the coast line, it represents a portion of the land that has been ceded to the sea by the evanescent margin of an ice sheet. Schieferdecker.

coal. A tough, lustrous, nickel-white or silvery-gray, metallic element in group VIII of the periodic system. Similar in properties to iron, but harder. It is magnetic below 1,075°C and can take a high polish. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-107.

coal; cobbles; cobble; cobblestone; cobble-stone. A small solid pillar of coal left as to sort out the valuable portion. Fay.

coal cote. A place where coal is stored. Craige, v. 1, p. 39;

coal. A vein or the material that comes from it when it is not rich, the mineral being thinly disseminated through it. Inferior; faulty. Fay.

coal aggregate. Aggregate predominantly retained on the No. 4 (4.76 millimeters) sieve of an aggregate of an aggregate retained on the No. 4 (4.76 millimeters) sieve. ASTM C128-66.

coal gold. Gold in large grains as distinguished from gold dust. Also called coarse quartz gold. Mathews, v. 1, p. 348.

coal-grained. Applied to rocks composed of large pieces of material, used mainly in a coarse sense, but an average size greater than 5 millimeters in diameter has been suggested. Socker and Barnes, 1953.

coal-grained soil. A soil in which gravel and sand predominate. Coarse-grained soils are those least affected by moisture-content changes and most surface rain, etc., becomes gravitational water. Nelson.

coal jig. The jig used to handle the larger sizes and heavier grades of ore or metal. Weed, 1922.

coal load. A load not rich. See also coarse. Fay.

coan-grained soli. A soil in which gravel pieces, containing carbonaceous matter, are so as to sort out the valuable portion. Fay.

coarse gold. Gold in large grains as distinguished from gold dust. Also called coarse quartz gold. Mathews, v. 1, p. 348.

coarse sand. Sand with a diameter between 0.5 millimeter and 1 millimeter. A.G.I.; coastal. A strip of land of indefinite width extending along the seashore. Schieferdecker.

coastal plane. A low, level plain composed of horizontally or of nearly sloping strata of clastic material. One of its margins is the coast. It represents a portion of the seabed that is covered by water, and borders the pre-existing land which was uplifted with it. Bureau of Mines Staff.

coastal terrace. See marine terrace. Schieferdecker.

Coast and Geodetic Survey. A Bureau of the U.S. Government charged with the topographic and hydrographic survey of the coast and the execution of belts of primary triangulation and lines of precise leveling in the interior. Prout, 3.

coaster. Corn. One who picks ore from the dump or abandoned mines. Fay.

c coast plain. A plain of denudation or a base level. It makes a sea level, to which the land has been reduced by subaerial forces. The coast plain, not to be confused with the coast line, it represents a portion of the land that has been ceded to the sea by the evanescent margin of an ice sheet. Schieferdecker.

coated abrasive. An abrasive product, sandpaper for example, in which a layer of abrasive particles is firmly attached to a paper, cloth, or fiber backing by means of glue or synthetic-resin adhesive. A.S.M. Gloss. See ceramic coating and slip coating. ACSG, 1963.

coated chippings. Chippings of stone which have been thinly coated with bituminous or asphaltic material. They are used for surfacing roads. Fay.

cobalt. A tough, lustrous, nickel-white or silvery-gray, metallic element in group VIII of the periodic system. Similar in properties to iron, but harder. It is magnetic below 1,075°C and can take a high polish. C.T.D.; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-107.

cobalt aluminate; cobaltous aluminate; Thernads blue. Co(AlO3); molecular weight, 176.89; blue; isometric; and insoluble in water. Bennett 2d, 1962.

cobalt bloom. Hydrated arsenate, Co(AsO4)2•H2O. Pryor, 3. See also erythrite.

cobalt-bonded. Particles of a refractory material, as powdered tungsten carbide, cemented together with cobalt to form a metallike mixture. Long.

cobalt-chromium steel. A steel said to resist pitting and high-temperature deformation; it has been used for valves of internal combustion engines; contains 80 percent iron, 13.3 percent chromium, 3.7 percent cobalt, and 1.5 percent carbon for the road. Fay. 0.7 percent molybdenum, 0.4 percent silicon, and 0.4 percent manganese. C.T.D.

cobalt fluoride; cobaltous allicofluoride. Pale red; hexagonal trigonal; CoF2•6H2O; specific gravity, 2.113 (at 19°C); and soluble in water. Used in industry. C.C. 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-169.

cobalt gecase. See cobaltite. Fay.

cobaltic paste (glass) colored with cobalt. Shipley.

cobaltite. Of, pertaining to, or containing cobalt. Cobaltite. G. S., specific gravity, 5.72; at

cobaltic boride; cobalt monoboride. Crystalline prism, CoB; specific gravity, 2.75 (at

cobaltite. Of, pertaining to, or containing cobalt. Cobaltite. G. S., specific gravity, 5.72; at

cobaltous. Of, pertaining to, or containing cobalt and ealcitim. Rhombohedral.

cobaltic oxide; cobalt oxide; cobalt molybdate. A grayish powder; green-brown isometric crystals; CoO; soluble in acids; insoluble in water; specific gravity, 6.45, ranging from 5.7 to 6.7; and melting point, 1,935° C. Used as a pigment in ceramics; as a catalyst; for the preparation of cobalt salts; in porcelain enamels; and in coloring glass. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-169.

cobaltous carbonate; cobalt carbonate. A red powder; hexagonal; CoCO3; soluble in water and specific gravity, 3.7 to 4.9 (at 25° C). Used in pigments; and glasses; and in plating baths for cobalt. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-170. Also used as a coloring medium in glass, glazes, and enamel; as a decolorizer in glass and enamel; in combination with either manganese or selenium usually for the latter, for the purpose of masking excess yellow color; and in ground coat enamel to give it a tight grip on the metal base.

cobaltous sulfate; cobalt sulfate. A red salt. See also cobaltous carbonate, basic. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-169. Also used in whiteware bodies to impart a blue or blue-white color, and sometimes used in decorative work where a soluble compound is needed to make solutions for spray work, as on art pottery.

cobalt-potassium nitrite; potassium cobaltinitrite. Fischer's salt; cobalt yellow. Yellow; isometric; K2Co(NO2)3; molecular weight, 281.10; specific gravity, 1.948 (at 25° C, referred to water at 25° C); melting point, 96.8° C; loses H2O at 420° C; and soluble in water, in ethyl alcohol, and in methyl alcohol. Handbook of Chemistry and Physics, 45th ed., 1964, p. B-170. Used in ceramics; pigments; and glasses; and in plating baths for cobalt. CCD 6d, 1961. Also used in whiteware bodies to impart a blue or blue-white color, and sometimes used in decorative work where a soluble compound is needed to make solutions for spray work, as on art pottery.

Lee.

cobalt salt. See also cobaltous carbonate, basic. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-169. Also used in whiteware bodies to impart a blue or blue-white color, and sometimes used in decorative work where a soluble compound is needed to make solutions for spray work, as on art pottery.

Lee.

cobalt salt. See also cobaltous carbonate, basic. CCD 6d, 1961; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-169. Also used in whiteware bodies to impart a blue or blue-white color, and sometimes used in decorative work where a soluble compound is needed to make solutions for spray work, as on art pottery.

Lee.

cobalt praseoohloride; cis-chlorooxotetramine cobalt (III) chloride. CoCl2; molecular weight, 251.42; violet; orthorhombic; specific gravity, 1.847; soluble in water and in acids; and insoluble in alcohol. Bennett 2d, 1963 Add.; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-170.

cobalt 60. Radioactive cobalt of mass number 60. One of the most common radioisotopes. Half-life, 5.3 years; radiation, beta and gamma. Cobalt 60 emits gamma radiation, and is used in medical, industrial, and research applications.
cobalt skutterudite

rays which have about the same penetrating power as those from radium. Used for radiographic testing of welds and castings; and also in medical equipment in studying the permeability of porous media to the flow of oil, and the oil consumption in internal combustion engines. D.O.T. 1.

co ballistic. The pure end member, CoAs₃, of the skutterudite series. Hey, MM, 1961.

co ball steel. Alloy characterized by great hardness and brittleness. Used in high-speed steel to improve cutting power. Pryor, 3.

cobalt vitriol. See red vitriol; rose vitriol. Fay.

cobbled ore. a. Eng. Ore broken from vein-stone by means of a small hammer. Fay. b. Ore from which much barren rock as practicable has been broken off with hand hammers. Bureau of Mines Staff.

cobble. a. In the asbestos products industry, a large lump of asbestos fiberous rock, broken by hand hammers and thus lying in lumps from 3 to 12 inches long. Eng. A black, thready mineral, seeming to pass into magnetite. Fay.

cockerol. A weathered, rounded stone, especially of the size suitable for hardcore, and that is commonly used as a factor in rock mechanics, in concrete, in road construction, in asphalt, in some types of linoleum, and in many other ways. Fay. c. A number that serves as a measure of some property (as of a substance or body) or characteristic (as of a device or process) and that is commonly used as a factor in computations. Webster 3d. c. A system of rules and characters used to represent letters or words, or a method of formally applied for conduct in particular cases; as in the mining code. Standard, 1964. c. A system of rules and regulations generally approved and formally applied for conduct in particular cases; as in the mining code. Standard, 1964.

cobaltous ore. A highly siliceous hematite containing only a trace of phosphorus, but high in potash. Odbur.

coder. a. Eng. A wooden fishplate used for connecting the segments of a curb in shafts. Fay.

code placer. See placer. Dodd.

cock. a. A device for regulating or stopping the flow of oil, and the oil consumption in internal-combustion engines. See tapping and cocks. Fay. b. A pack to support the roof. Webster 3d. a. A pack to support the roof. Webster 3d. c. A number that serves as a measure of some property (as of a substance or body) or characteristic (as of a device or process) and that is commonly used as a factor in computations. Webster 3d. d. A prefixed number formally applied for conduct in particular cases; as in the mining code. Standard, 1964. e. A prefixed number formally applied for conduct in particular cases; as in the mining code. Standard, 1964. f. A system of rules and regulations generally approved and formally applied for conduct in particular cases; as in the mining code. Standard, 1964.

coefficient of compressibility. a. A measure of the deviation of a gas from Boyle's law. c. Density of oxygen in the basic oxides Holmes, 1928.

coefficient of active earth pressure. See co。（

coefficient of comprehensibility. a. A measure of the deviation of a gas from Boyle's law. c. Density of oxygen in the basic oxides Holmes, 1928.
coefficient of consolidation

See also Boyle's law, C.T.D. b. Change in void ratio per unit of pressure change. Prayr. 3

coefficient of consolidation. In the consolidation of soils, we obtain a value for the coefficient expressed in square centimeters per year, as the permeability is in centimeters per minute. See also consolidation press. Ham.

coefficient of contraction. This is related to the vena contracta, and is the ratio between the minimum cross-sectional area of a jet of water flowing through an orifice under pressure, and the cross-sectional area of the orifice itself. Hous.

coefficient of discharge. Ratio of observed to theoretical discharge. For a siphon this coefficient should be based on the area of the outlet. See.

coefficient of earth pressure. The principal stress ratio at a point in a soil mass. See also active coefficient of earth pressure; passive coefficient of earth pressure; at rest (coefficient of earth pressure). ASCE P1826.

coefficient of elasticity. Same as modulus of elasticity. ASM Glos.

coefficient of equivalence. See equivalence, C.T.D.

coefficient of expansion. The factor which expresses the change per unit length of any material for each degree of temperature. Crispin.

coefficient of friction. a. The frictional resistance of each square foot of rubbing surface when the velocity of the air current is 1,000 feet per minute. Nelson b. A numerical expression of the relationship between the resistance force and the resistance force of friction. This relationship is subject to many variables such as whether it is applied to a pushing friction, sliding friction, rolling friction, or internal friction of a bulk material; whether the surfaces in contact are smooth or rough, the kind of material composing those surfaces, if they are wet or dry, lubricated or nonlubricated. The coefficient of friction is used in determining the power necessary to drive a machine, to determine the slope angles which are safe for transport, of bins, chutes, and bunkers; or to determine the maximum angle of inclination for a conveyor. ASA M14.1 p. 65.

coefficient of heat transmission. The quantity of heat (in the United States, usually Btu) transmitted from fluid to fluid per unit of time (usually 1 hour) per unit of surface (usually 1 square foot) through a material or arrangement of materials under a unit temperature differential (usually 1°F) between fluids. Commonly used for building materials. Stetch 10.

coefficient of internal friction. The tangent of the angle of internal friction. ASCE P1826.

coefficient of linear expansion. The expansion per ° C or ° F per unit of length. Bureau of Mines Staff.

coefficient of permeability. Permeability. The rate of flow of water under laminar flow conditions through a unit cross-sectional area of a unit of material in the presence of a uniform hydraulic gradient and a standard temperature, usually 20° C. ASCE P1826.

coefficient of roughness. A factor in the Kutler, Manning, and other formulas expressing the character of a channel as affecting the friction slope of water or air flow. ASCE P1826.

coefficient of scatter. The rate of increase of reflectance with thickness at infinitesimal thickness of porcelain enamel over an ideally black backing. ASTM C286-65.

coefficient of saturation, modulus of subgrade reaction. The ratio of load per unit area of horizontal surface of a mass of soil to continuously settling settlement of the surface. It is determined as the slope of the recant, drawn between the point corresponding to zero settlement and the point of 0.05-inch settlement, of a load-settlement curve obtained from a plate load test on a soil using a 30-inch, or larger, diameter, loading plate. It is used in the design of concrete pavements by the Westergaard Method. ASCE P1826.

coefficient of thermal diffusion; thermal diffusivity. A thermal property of matter, with the dimensions of area per unit time. ASCE P1826.

coefficient of thermal expansion (linear). The fractional change in length of a body per degree of temperature change. ASCE 1963.

coefficient of traction. Represents the percentage of the total engine power that can be converted into forward motion by means of the friction between tire or track and the ground. See also traction, C.T.D. 65.

coefficient of transmissibility. See transmissibility coefficient.

coefficient of uniformity. The ratio of the particle size for 60 percent finer by weight to the effective diameter, the latter being the particle size for 10 percent finer by weight, Ham.

coefficient of variation. A statistical term which measures the relative variation of a series of values from the mean or average value:

\[ C = \frac{S}{\bar{X}} \]

where \( C \) equals coefficient of variation, \( S \) equals standard deviation, and \( \bar{X} \) equals average, also called relative standard deviation. Bureau of Mines Staff.

coefficient of velocity. The rate of transformation of a unit mass during chemical reaction. Prayr. 3.

coefficient of viscosity. a. The shearing force per unit area required to maintain a unit difference in velocity between two parallel layers of fluid a unit distance apart. Also called coefficient of absolute viscosity. ASCE P1826. b. The value of the tangential force per unit area required to maintain unit relative velocity between two parallel planes unit distance apart. Values of viscosity in centimeter gram second units are: air, 0.0018; water, 0.01; and glycerin, 11. See also viscosity. Nelson.

Coelestuates. The group of animals which includes the jellyfishes, corals, and Hydroids. Hy.

coeleometer. An instrument for measuring the magnetic intensity of a natural or artificial magnet. Bureau of Mines Staff.

coevasive force coevasive field. The opposing magnetic intensity which must be applied to a magnetized substance to reduce the magnetic induction in the material to 0. ASCE P1826.

coevritivity. The property of a material determined by the value of the coevasive force when the material has been magnetized to saturation. Webster 36d.

coeuricolante. A milky-white to light blue hydrous phosphate of aluminum; occurs in fibrous crusts. A member of the tour-

231
cog

coffeepot lamp. Aust. An ordinary coal miner's open oil lamp, similar in shape to a coffeepot. Fay.

coffee shale. Drillers' term in the Appalachian basin for well cuttings of dilining, a Nat.

cofferdam. A temporary watertight closure (as of piles, sheeting, or of metal plates) from which the water is pumped to expose the bottom of a body of water and permit construction (as of foundations or piers). Webster 36d. b. A method of shaft sinking through saturated sand or mud near the surface of water. A shaft or shelter, an enclosure, open to the air, which keeps water out of the shaft area to allow excavation to proceed. The enclosure wall is constructed by driving down strips of steel with interlocking edgels or concrete piles. Reinforced with steel. In general, cofferdams are only used for short lengths and where piles can be driven into an impervious deposit, so that normal pumping will keep the shaft sufficiently dry for working; see also drop shaft; drum; j; iron and steel sheet piling; piling, a. Nelson.

coffering. The operation involved in the construction of dams for impounding water. C.T.D. b. A method of shaft sinking through loose material. In general, cofferdams are only used for short lengths and where piles can be driven into an impervious deposit, so that normal pumping will keep the shaft sufficiently dry for working; see also drop shaft; drum; j; iron and steel sheet piling; piling, a. Nelson.

coffinite. A naturally occurring uranium mineral, U(SiO4)4(OH)4, or (OH), as 75 tons. L&L.

cohn. a. Corn. An old, open-mine working, in which the ore is cast up from platform to platform. Standard, 1964. b. A heavily shielded shipping cask for spent fuel elements. Some coffins weigh as much as 75 tons. L&L.

colla. A naturally occurring uranium mineral, U(SiO4)4(OH)4, or (OH), as 75 tons. L&L.

collie. The operation involved in the construction of dams for impounding water. C.T.D. b. A method of shaft sinking through loose material. In general, cofferdams are only used for short lengths and where piles can be driven into an impervious deposit, so that normal pumping will keep the shaft sufficiently dry for working; see also drop shaft; drum; j; iron and steel sheet piling; piling, a. Nelson.

In general, cofferdams are only used for short lengths and where piles can be driven into an impervious deposit, so that normal pumping will keep the shaft sufficiently dry for working; see also drop shaft; drum; j; iron and steel sheet piling; piling, a. Nelson.

264-972 0-68-16-16
cog-and-rung gin

where single straight posts will not suffice to control the top, and yet cribs are not needed. Cogs may be advantageous. May also be called a battery. Kentucky, p. 142. A crib made of notched timbers built up like a log house. A check or crib. If the timbers are squared instead of notched, the structure is called a nog. It is ordinarily filled with waste, and posts are put between the timbers. Hess. c. A rock intrusion. Fay. d. To consolidate ingots or shape them by hammering or rolling. Hess. e. In intergranular cohesion;

as a cowheel. Gears are often improperly referred to as cowheels. Cripsin.

cog and rung gin. One of the earliest appliances for hoisting the coal and water from the mine. It was a windlass fitted with a cogwheel and a rung arrangement and worked by a horse in much the same way as horse gin are worked. Fay.

cogein. Eng. One who builds cogs. See also cog. Fay.

cogging. a. The operation of rolling or forging an angle or rounded surface to a bloom or billet. C.T.D. b. The pronging of the roof in longwall stalls. See also cog; nog. Also spelled pegging.

cogging mill. a. A blooming mill. ASM Gloss. b. Usually a two-high reversing mill consisting of two rolls, 2 to 4 in diameter, between which the ingot is reduced to blooms or slabs. Osborne, p. 357.

cogged. A rounded, wornout stone, especially cobbled or cobble. Also called cogglestone. Same as cobblestone. Arkell.

cogging. a. A fixture of a system of fixtures that originated at the same time from the same causes as other fissures in the same region. Stanford, p. 131.

cogging. a. A soil which, when unconfined, has considerable strength when air-dried, and which has significant cohesion when submerged. ASCE P1826. b. A sticky clay or clayey silt as opposed to sand. Nelson.

cohesive strength. a. The hypothetical stress in an unnotched bar causing tensile fracture without plastic deformation. ASM Gloss. b. The stress corresponding to the forces between atoms. ASM Gloss. c. Same as technical cohesive strength; destructive strength. ASM Gloss.

coil. The process of making clay objects by building with ropes or coils of clay. ACSC, 1963.

coil breaks. Creases or ridges across a metal sheet transferred by the direction of coiling, occasionally occurring when the metal has been coked hot and uncoked cold. ASM Gloss.

coil building. A primitive method of shaping clay vessels by rolling clay into a rope which is then coiled to form the wall of the vessel; the inner and outer surfaces of the roughly shaped ware are finally smoothed. D.O.T. Supp.

coil drag. A tool to pick up pebbles, bits of iron, etc., from the bottom of a drill hole. Fay.

collar. In metallurgy, one who winds nonferrous strips and sheets into coils as they emerge from a rolling mill or slitting machine. Also called coil operator. D.O.T. Supp.

coll. The process of making a sintered compact to obtain a cylindrical form with the correct size for drawing from the color and length of flame in the oven, D.O.T. 1.

collared coke. A. N. of 90 percent. May also be called a battery. Kenne.

c coke crusher operator. In the coke products industry, one who tends a mill (crusher) to reduce coke to the desired size. D.O.T. 1.

coke dust. Coal dust which has been coked by the heat of an explosion and has assumed different forms under different conditions usually found near the origin of the explosion, and also where the velocity of the explosion is low, as in a room or on, where always provided there is at point that an excess of coke dust over that needed for combination with oxygen. The volatile matter of coal dust seems to burn first and, if the coal is a coking coal, coke is formed of one kind or another, depending on the position, temperature, size of dust, and velocity of explosion. Rice, George S.

coke iron. Iron made in a furnace using cokes as fuel. Webster 3d.

coke oven. A chamber of brick or other heat-
coke-oven mason. In the coke products in-
coke, petroleum. The solid residue remaining
coke scrubber. An apparatus filled with coke
coke pitch. A black amorphous solid obtained
coke pig iron. Most common type of pig iron
coke wharf. Aust. A platform onto which
coke), hetder. In Joplin, Mo., a foreman of
product ovens, which were built in rec-

cutting the stone or brick to size and shape
bar brackets, and charging hole frames,
Walls, arched roof, door frames, leveling
are pumped out. Hess.

volatilization, to practical gastightness and all by-
cold drawing. The process of reducing the
cross-sectional diameter of tubes or wire
by drawing through successively smaller
dies without previously heating the mate-
rial, thereby increasing its tensile strength.
Steel wire for prestressing is made by this
process. Ham.
cold-drawn steel. Steel rods finished by draw-
ing them through a die to reduce their size and to give them better quality. Mers-
eren, 4th, p. 426.
cold-drawn wire. Wire that has been drawn
through a die at normal temperature.
cold-extractable metal. See readily extract-
able metal. Hawkes, 2, p. 151.
cold extrusion. See extrusion. ASM Gloss.
cold furnace. N. of Eng. A drift driven into
an upcast shaft to convey the return air into
instead of passing or carrying away the over-
flame. This is done to prevent the igni-
tion of the gas in the return air. Fay.
cold galvanizing. Application of powdered
zinc, in suspension in an organic solvent,
to iron articles. On evaporation of the
solvent an adherent coating of zinc re-
maints. Pryor, 3.
cold head. York. Quarryman’s term for the
coral bed in the Hamilton Oolite. Arkell.
cold nose. A mining expert who underrates
the value of mineral properties. Standard,
1964.
cold nozer. See wildcatter. Long.
cold-rolling. a. Running an unheated drill in
cold weather. Long. b. Synonym for wild-
cutting. Long.
cold press. The act or process of subjecting
bit-matrix-powder metal mixtures in a mold
to high pressure before sintering. Long.
cold pressing. The process of compressing
metal or other powders in a die at room
temperature to form a compact. Cold pressing
is usually followed by sintering at ele-
vated temperatures. NRC-ASA N11-1957.
cold-press cement. Another name for slag
cement. See also slag cement. Dodd.
cold-roll. To roll (metal) without applying
heat. Webster 3d.
cold-rolled. Said of metal that has been rolled
at a temperature close to atmospheric. The
cold rolling of metal sheets results in a
smooth surface finish. C.T.D.
cold-rolled steel. A low-carbon, cold-reduced
cold saw. A saw for cutting cold metal.
Mersereau, 4th, p. 426.
cold-short. A condition of brittleness existing in
some metals at temperatures below the
recrystallization temperature. ASM Gloss.
cold-working. A reduction of the surface of an
ingot or casting showing premature solidi-
fication caused by a splash of metal during
pouring. ASM Gloss.
cold shut. a. A discontinuity that appears on
the surface of cast metal as a result of two
streams of liquid meeting and failing to

cold-cracking. Cracks in cold, or newly cold,
cooled, due to excessive internal stress
caused by contraction. Such cracks may be
caused by the mold being too hard or the
design of a casting being unsuitable. Ham.
cold crushing strength. See crushing strength.
Dodd.
cold-draw. To draw (as metal) while cold
or without the application of heat. Web-
ster 3d.

ingot or casting showing premature solidi-
fication caused by a splash of metal during
pouring. ASM Gloss.
cold soldering

unit. ASM Gloss. b. A portion of the surface of a forging that is separated, in part, from the main body of metal by oxidized carbon. ASM Gloss.

cold soldering. Soldering in which two pieces are joined without heat (as by means of a copper amalgam). Webster 3d.

cold staking. In glassmaking, the operation of lowering the temperature of the even until the glass attains the proper consistency for blowing. This operation follows that of clearing. Fay.

cold treatment. Cooling to a low temperature, often near -100° F, for the purpose of obtaining desired conditions or properties, such as dimensional or structural stability. ASM Gloss.

cold-twisted bars. Rolled mild steel bars which have been twisted when cold to increase their strength. Taylor.

cold type. A bituminous pavement which may be mixed hot and laid cold. Pit and Quarry, 53rd, Sec. E, p. 70.

cold welding. Solid-phase welding in which pressure, sometimes added heat, is used to cause interface movements which bring the atoms of the faying surfaces close enough together to form covalent bonds. ASM Gloss.

cold work. Permanent strain produced by an external force in a metal below its recrystallization temperature. Taylor.

cold-worked steel reinforcement. Steel bars which have been twisted when cold to increase their strength. Taylor.

cold working. Shaping of metals at ordinary temperatures; cold drawing, rolling, stamping, etc., which retains the proper consistency for further working. Fay.

cold soldering. Soldering in which two pieces are joined without heat (as by means of a copper amalgam). Webster 3d.

cold-soldered joints. The failure of a tripod or derrick caused by overloading or improper structural design resulting in tripod breaking or falling. Long. b. Complete cave-in of the roof of country rock above an intrusive. Bureau of Mines Staff.

cold-collared bit. A fishtail-, spudding-, or other-type bit used exclusively for beginning a borehole. Long.

cold zone. The preheating zone of a rotary cement kiln. Bureau of Mines Staff.

colit. A natural hydrated calcium borate, CaB(OH)2.H2O; white or colorless; melting point 75° C; Mohs' hardness, 4 to 4.5; specific gravity, 2.26 to 2.48; found in California. One of the raw materials used in making plaster used in the United States for boiler acid, sodium borate, etc. CCD 6d, 1961.

colemanite. A natural hydrated calcium borate, CaB(OH)2.H2O; white or colorless; melting point 75° C; Mohs' hardness, 4 to 4.5; specific gravity, 2.26 to 2.48; found in California. One of the raw materials used in making plaster used in the United States for boiler acid, sodium borate, etc. CCD 6d, 1961.

colgrout. Special cement-sand grout used in Colcrete. It is poured or pumped through 3-inch-diameter pipes to consolidate aggregates. Bureau of Mines Staff.

collar. a. In a mine shaft, the first wood frame of the shaft; sometimes used in reference to the mouth or portal of the tunnel. B.C.I. b. Supporting framework at top of shaft from which limbs may be hung. Pryor. c. The section used to the timbering or concrete around the mouth or top of a shaft. Lewis, p. 21. d. The bar, or crosspiece, in a framed timber set. Stauffer. e. The section of pipe used in mine shaft and the surface. Nelson. f. The beginning point of a shaft or drill hole, the surface. Ballard. g. The shaft itself. Fay. h. A flat ring surrounding anything closely. Fay. i. Spot. A frame to guide pump rods; the fastest way to get down a shaft. Fay. j. See cap, Fay. k. The mouth or opening of a borehole or the process of starting to drill a borehole, that is, the sections of larger diameter separating the grooves in rolls used for the production of rectangular sections. C.T.D.

collar bit. A steel, or concrete, to support and secure the mouth of a shaft. Nelson. b. That at the top of the shaft from which limbs (shaft sets) are hung by means of hanging bolts. Pryor, 3, p. 94.

collar coffer. A fishing tool designed to slip over and grip a casing or pipe coupling. Long.

collar structure. A heavy wooden frame erected at the mouth of a rectangular shaft to provide a solid support for the timbers and roof. A permanent structure consists of a concrete wall extending from two to eight sets in depth. On this concrete mass is built the bearers and timbers which support the top heavy set or collar set. The terms also applies to the heavy concrete ring at the mouth of a circular concrete-lined shaft. Nelson.

collar stud. A stud threaded at one end and having a short shaft or spindle at the other, the two separated by a collar which is an integral part of the stud, used for carrying gears, levers, etc. Orpina.

collateral series. A radioactive decay series initiated by transmutation, which eventually joins into one of the four radioactive decay series, for example, americium 242 and its immediate decay products in relation to the uranium disintegration series. NRC-ASA N1.1-1969.

collapsible box. A rectangular box with a cover consisting of two sheets which can be folded so as to bring together all of the material in the box. Gaudin, 2, p. 5.

collage. A formed by the collapse of the roof of a cave. Bateman. b. By the collapse of the roof of country rock above an intrusive. Bureau of Mines Staff.
collective subsidence 225

collision waves

ing all conductors. This type has now been discarded in British coal mines and all trailing cables used will be of the individual type. Nelson.

collective subsidence. That condition in sedimentation in which the particles and loam are supposed to be arranged in a way to resist the coarse fast-settling particles while the slow-settling ones are entrapped and carried down with the mass. Mitchell, p. 611.

collector. A heteropolar compound containing a hydrogen-carbon group and an oxidized group, chosen for ability to adsorb selectively in froth flotation process and render adsorbing surface relatively hydrophobic. A promoter. Pryor, A.

coll. a. The small horizontal plane, or face at the bottom of the brilliant-cut gem stone. Hess. b. A split sleeve used to hold work or speculum to a lathe, turning machine, or grinding. ASM Gloss. c. Same as cuil. Shiple.

collar. a. Eng. Strictly speaking, a man who mines coal with a pick though commonly applied to a miner who works in or about a colliery. Fay. b. Eng. A steam or sailing vessel carrying a cargo of coal. Fay. c. Eng. A coal merchant or dealer in coal. Fay. d. A miner responsible for working the coal from his stall, or stint, on a longwall face and for setting supports adequate for safety. A person must have had some years experience at the coal face as an assistant before he is entitled to become a collier. Colliers are usually paid in accordance with a pricelist in force at the mine. Also called hewer; stallman. Nelson.

collar coal; house coal. A certain weight of coal or a load of 1 ton, which is supplied at agreed periods and either free or at a cheap rate, to colliery workers who are householders. Nelson.

collar's lung. See anthracosis. Fay.

collaring. A light of often several hundredweight in addition to the standard ton of 2,240 pounds. In former times as much as 28 hundredweight was reckoned as 1 ton. Fay.

collary agent. Gr. Brit. A colliery chief official with a status between the manager and owner. Under private enterprise, the collary agent may or may not be a qualified mining engineer. See also agent, c. Nelson.

collary bailiff. Derb. The superintendent of the collyery. Fay.

collary implement. A full-time carpenter employed at a colliery who prepares the timber for ventilation doors and ventilation roads, or for any uncoven port to erect them. He does all work involving timber frames, formwork, etc. Nelson.

collary clerk. In coal mining, one who keeps all the records pertinent to the operation of a coal mine. D.O.T. 1.

collary consumption. That part of the coal output used to close down with anthracite mining which is used for steam generation and other purposes connected with the working of the colliery itself. Nelson.

colliery. A weight of often several collector. A heteropolar compound containing a hydrogen-carbon group and an oxidized group, chosen for ability to adsorb selectively in froth flotation process and render adsorbing surface relatively hydrophobic. A promoter. Pryor, A.

collie agent. Gr. Brit. The maps of the mine workings, and sections of the shafts and seams being worked, which the colliery manager must keep at the pithead office in accordance with the Surveyors and Plans Regulations, 1956, of the Act. Nelson.

collie, a. A type of remote-controlled continuous miner for thin seam extraction. The coal seam is extracted in a series of parallel stalls 6 to 7 feet wide and 100 yards long. Full extraction of the seams is the objective. The extraction is controlled entirely from the roadway at the entrance of each stall, and the cutting unit carries with it an automatically extending belt conveyor, ventilation ducting and cables for power and control. The equipment is largely contained in a train of nine, rail-mounted bogies, situated in the central roadway from which the stalls are to be driven. One bogey is the launching platform on which the cutting unit is carried from one stall to the next. The cutting unit, which enters the +1 stalls, consists essentially of three: trimmer heads feeding a short conveyor passing through the center of the machine and discharging onto the belt extending to the angle station outby. The miner is controlled by one man in the control cabin and there are special instruments, such as methanometers, coal-sensing device, etc. The machine was conceived by H. E. Collins of the National Coal Board of Great Britain, and its production is the result of teamwork which was coordinated by the Central Engineering Establishment. It is now undergoing trials. It is anticipated that the machine will produce in the region of 1,000 tons per day working three shifts, and the manufacturer should be in a position to reduce this figure to 1,500.

burned gases, and originating at the point where two explosion waves meet. Fay.
collite. Another name for cuvite. See also Tomkeieff, 1954.
collodierite. Proposed by Lacroix (in 1917) for a metamorphic rock composed of gra-
phite. It is the same material as graphite, and is composed mainly of carbon, with small
quantities of other elements. Morin.
collotrachite. A type of coal consisting of the
chlorocollain, in which the quantity of other macerals, some feldspar. A.G.I.
collotrochocline. A layer of water that lies
between the surface layer and the deep layer of the ocean. The upper layer is known as
the surface layer, and the lower layer is known as the deep layer. The thickness of the
collotrochocline varies with location and season.
collotrochocline. A type of coal consisting of the
chlorocollain, in which the quantity of other macerals, some feldspar. A.G.I.
collotrochocline. A layer of water that lies
between the surface layer and the deep layer of the ocean. The upper layer is known as
the surface layer, and the lower layer is known as the deep layer. The thickness of the
collotrochocline varies with location and season.
collotrochocline. A type of coal consisting of the
chlorocollain, in which the quantity of other macerals, some feldspar. A.G.I.
collotrochocline. A layer of water that lies
between the surface layer and the deep layer of the ocean. The upper layer is known as
the surface layer, and the lower layer is known as the deep layer. The thickness of the
collotrochocline varies with location and season.

collotrochocline varies with location and season.
Coloradoan  

colored slates. The so-called colored slates are composed of colored silica and iron oxides, giving a mottled effect. Red slates associated with bright green varieties of Ordovician age occur near Granville, Washington County, N.Y. The red color is due to abundant finely divided hematite. AIME, pp. 793-794.
colored. One who applies glazes of various colors to spaces marked on tile, using bulb pen. D.O.T. 1.
colored grade or classification into which a gem is placed by examination of its color in comparison to the color of other specimens of the same variety. Shipley.
colored iron. An instrument or device for the chemical analysis of liquids by comparison of the color of the liquid with standard colors. Webster, 3d. Two major types are used in the U.S. oil industry: The ASTM colorimeter for analyzing lubricating oils, and the Saybolt colorimeter for analyzing light oils. Shell Oil Co. b. An instrument for measuring absorption characteristics of substances, gases, liquids, or solids at selected electromagnetic spectral frequencies, generally in the ultraviolet, visible, and infra-red region. Bureau of Mines Staff.
colorimeter method. A method of chemical analysis in which filtered solutions are compared for color with known concentrations of a standard solution that color to the solution or with specially tinted transparent filters which have been suitably calibrated. A colorimeter is also a colorimeter that may be used in colorimetric test to analyze samples of a mineral. In petrology, the sum of the colorimetric value. An indication of the contrast in color between the white, nearly white color, because it depends on the amount of organic compounds present in the mineral. Shipley.
colorimeter method. A method of chemical analysis in which filtered solutions are compared for color with known concentrations of a standard solution that color to the solution or with specially tinted transparent filters which have been suitably calibrated. A colorimeter is also a colorimeter that may be used in colorimetric test to analyze samples of a mineral. In petrology, the sum of the colorimetric value. An indication of the contrast in color between the white, nearly white color, because it depends on the amount of organic compounds present in the mineral. Shipley.

An indication of the contrast in color between the white, nearly white color, because it depends on the amount of organic compounds present in the mineral. Shipley.

columbium carbide; niobium carbide. Black crystals; lavender-gray powder; isometric; CbC (NbC); molecular weight, 104.92; insoluble in water and in all acids except in nitric acid and hydrofluoric acid; specific gravity, about 7.6 or 7.82; specific gravity, 270.17; soluble in water and in all acids except in hydrochloric acid, and in concentrated hydrofluoric acid; melting point, 1400 °C; boiling point, 241 °C or 254 °C; specific gravity, 2.75; deliquescent; and decomposes in water and in concentrated hydrofluoric acid. Used in the preparation of columbium (niobium) metal, CbC (NbC), and as an intermediate in the production of columbium (niobium) carbide. CbC (NbC), is a black powder, 1 to 2 millimeters in length, found in the region in which they occur, having a common set of chemical, mineralogical, and petrographic features, and hence, regarded as having been derived from a common parent magma. Essentially synonymous with "granophyre" and "granophyric granite.

columnar. a. A mineral with a structure obscuringly resembling prisms, for example, hornblende. b. Composed of columnarlike individuals. Schiferdecker.

columnar charge. a. A continuous charge in a quarry borehole. Compare deck charge. b. 25 l. 1964, see. C. Charge, usually distributed in the principal part of a straight drill hole. The degree of packing is smaller than for the bottom charge.

columnar head. In the mushroom type of reinforced concrete construction, the enlargement of the column where it meets the slab. Ham. 1964, p. 124.

columnar structure. a. Usually due to thermal metamorphism. b. A coarse structure of parallel columns of grains, having the long axis perpendicular to the casting surface. ASM Gloss.

columnar structure, b. A structure of parallel columns of crystals; lavendcr-gray powder; isometric; columnar. a. A mineral with a structure obscuringly resembling prisms, for example, hornblende. b. Composed of columnarlike individuals. Schiferdecker.

columnar section. A geologic illustration that shows in a graphic manner, and by use of conventional symbols for different rock types, the successive rock units that occur in the principal part of a given area or at a specific locality. It may be accompanied by a very brief description of lithology and by appropriate symbols indicating the thickness, age, and classification of the rocks. Stokes and Vanars, 1955.

columnar joining. Joining that breaks the rock into columns. The joints usually form a fairly well defined prism that is hexagonal in cross section. It is most characteristic of diabase and basalt. Generally considered to be shrinkage cracks resulting from the cooling of the igneous mass in which they occur. A.G.I. See also columnar structure, b.

columnar section. A geologic illustration that shows in a graphic manner, and by use of conventional symbols for different rock types, the successive rock units that occur in the principal part of a given area or at a specific locality. It may be accompanied by a very brief description of lithology and by appropriate symbols indicating the thickness, age, and classification of the rocks. Stokes and Vanars, 1955.

columnar joins. A columnar section that is composed of slender crystals of prismatic cross section, as some amphiboles are. When the columbium ore is flattened, the structure is said to be bladed. Heus. b. A structure common in diabase, and, less commonly, in sheeted dikes. It consists of parallel, more or less regular cylindrical columns generally transverse to the foliation, and is generally considered to be shrinkage cracks caused by cooling. Fay. See also columnar joining. c. Columns, 9 to 14 centimeters in diameter and 1 to 1.4 meters in length, found in certain calcareous shales or argillaceous limestones; oval to polygonal in section. Columns are perpendicular to the foliation. Fay and Pettingill.

columnar structure, b. A coarse structure of parallel columns of grains, having the long axis perpendicular to the casting surface. ASM Gloss.

columbium pentachloride; niobium pentachloride. See columbium chloride. CbCl5 (NbCl5); molecular weight, 270.17; soluble in water and in all acids except hydrochloric acid, and in concentrated hydrofluoric acid; melting point, 190 °C; boiling point, 415 °C; specific gravity, 3.8; deliquescent; and decomposes in water and in concentrated hydrofluoric acid. Used in the preparation of columbium (niobium) metal. CbCl5 (NbCl5), is a yellow to yellow-gray powder, 9 to 14 centimeters in diameter, 1 to 1.4 meters in length, found in certain calcareous shales or argillaceous limestones; oval to polygonal in section. Columns are perpendicular to the foliation. Fay and Pettingill.

columbite. A yellow to yellow-gray powder, 9 to 14 centimeters in diameter, 1 to 1.4 meters in length, found in certain calcareous shales or argillaceous limestones; oval to polygonal in section. Columns are perpendicular to the foliation. Fay and Pettingill.

columbite-zinnwaldite. A yellow to yellow-gray powder, 9 to 14 centimeters in diameter, 1 to 1.4 meters in length, found in certain calcareous shales or argillaceous limestones; oval to polygonal in section. Columns are perpendicular to the foliation. Fay and Pettingill.

combed finish tile

surface, Dodd. combed finish tile. Tile whose face surfaces are altered by more or less parallel scoring. A silver in manufacture to give increased bond for mortar, plaster, or stucco. ASTM C43-65.

combed ridge. A ridge formed in making a specimen from a set of crystals meeting in the center. Bureau of Mines Staff.

combed veins. See banded vein; comb. Fay.

combed ware. Decoration effected by means of a toothed tool drawn across slip, over a body of a different color. C.T.D.

combination. A union of two or more elements. Crispin.

combination die. In die casting, a die having two or more cavities for different castings. ASM Gloss.

combination drill. A drill equipped for cable-tool and/or diamond drilling operations, or for a cable-tool and/or rotary drilling operations. Long.

combination driller. A driller versed in cable-tool and diamond- or rotary-drilling techniques. Long.

combination electric locomotive. A mine locomotive which can operate as a trolley locomotive or as a battery locomotive. While operating on the battery, it can be used, under certain conditions, at the coal face. Also it may be used on the main haulage trolley system where, due to higher voltage, higher speeds are possible. Nelson.

combination gas. Natural gas rich in oil vapor. Wet gas. Also called casing-head gas. Fay.

combination longwall. See longwall, b. Fay.

combination mill. An arrangement of continuous mill for roughing, and a guide or looping mill for shaping. ASM Gloss.

combination of embalming. See sublevel stipping, b. Fay.

combination sampler. A universal-type soil-sampling device in which some of the constructional features of two or more special-use samplers are combined. Long.

combination shot. A blast made by dynamite comblatios sampler. A universal-type soil-combloatioa of =Whin and stoping. See combination drill. A drill equipped for cable-tool and/or diamond drilling operations, or for a cable-tool and/or rotary drilling operations. Long.

combination stresses. Any state of stress that cannot be represented by a single component of stress; that is, one that is more complicated than simple tension, compression, or shear. ASM Gloss.

combined stresses. In the theory of elasticity, a state of stress which cannot be represented by a single component of stress. The combined stresses are subject to the principle of superposition, which states that if there are two or more different types of stress acting simultaneously, the total stress at any point is equal to the sum of the stresses due to each type acting separately. The principle of superposition is based on the assumption that the stress-strain behavior of a material is linear, meaning that the strain is proportional to the stress. This is a simplification of the actual behavior of materials, which may exhibit non-linear behavior under large deformations or for materials with complex microstructures.

combined top slicing and shrinkage stipping. In this method the ore body is worked from the top down in successive slices. In the working of each slice the unit the slice is worked as a shrinkage stope. The broken ore serves to give lateral support to the sides of the unit and also serves as a working platform from which the back is reached. After working a unit the cover is caved. Also known as the Kimberley method. Fay.

combined top slicing. A rare type of thinning in which the thin operation can be described as composing a rotation of 180° around the c axis with reflection over the a, b plane. Nelson.

combined water. See chemically combined water. Bureau of Mines Staff.

combined water. See also water of hydration. See combined water. Bureau of Mines Staff.

combinedwise. A process in which the relative weight of an element that has the same combining capacity as a given weight of another element, the standard now usually being 8 for oxygen but it was formerly 1 for hydrocarbons. This is thus altogether filled up with two sets of crystals having on the walls and their apexes directed toward the center. In some cases the fissure is thus altogether filled up with two sets of crystals meeting in the center. Bureau of Mines Staff.

combised moisture. Moisture in coal that is thus altogether filled up with two sets of crystals meeting in the center. Bureau of Mines Staff.

combined cyanide. The cyanide of a metal-combined cyanide. slate of sharp rock needles which constitutes the sill gneiss type of mountain ridge. Such a ridge is frequently designated by the term are (fah-bone), though in the Alps, the term gneiss (edge) has been applied especially to the lower part of such ridges of this type. Comb ridge was proposed for all such pal-

229

isades of needles derived by this process. A.G.I.

comb-like texture. A texture in which individual crystals have their long axes perpendicular to the walls of a vein. Schiferdecker.

combustibility. See also combustible. A measure of the speed of combustion of a coal under specified conditions. B.S. 3323, 1960.

combustible. Capable of undergoing combustion, or the continuing oxidation of materials that catch fire and burn when subjected to fire. Compare flammable. Webster 3d.

combustible carbon (in coal). The total carbon in the coal less that which is present as mineral carbonates. B.S. 1016, 1961, Pt. 16.

combustible gas indicator. The most common type of unit uses a heated platinum wire to ignite combustible gases in the sample. Heat of combustion changes the electrical resistance of the wire, which in turn affects the meter. Calibration is usually in terms of percent recoveries of the Lower Explosive Limit of a particular gas, conversion for other gases being made by table. Although flame arrestors are built into the combustion chamber orifices, hazardous locations normally require use of tubes to carry the sample to a safe area for measurement. Beits, p. 581.

combustible shale. Another name for carbonaceous or bituminous shale. Tomkiewicz, 1954.

combustible soil. See coal mine soil. Fay.

combustion. The action or operation of burning. The continued oxidation of a substance with certain elements, such as oxygen or chlorine, for example, accomplished by the generation of light and heat. Standard, 1964. See also ignition temperature.

combustion arch. A flat or curved refractory roof over a furnace to promote combustion by reflection of heat, AISI, No. 24. Nelson.

combustion engineer. An engineer with practical training and knowledge of all kinds of fuels and their combustion characteristics. In general, he has not the technical qualifications of the fuel technologist. Nelson.

combustion furnace. A long, narrow, portable furnace used in the combustion method. Fay.

combustion method. A method for the quantitative determination of certain elements (such as carbon, hydrogen, and nitrogen) in organic compounds by combustion. Webster 3d.

combustion rate. The weight of fuel burned per square foot of grate area per hour. Nelson.

come-along. a. An open, fixed-jaw spanner used to grip, hold, and lift rods, casing, or piping. Compare lowering iron. Long. b. A device consisting of two mated jaws so attached to a ring that a pull on the ring causes the opposing jaws to close and grip a wire, cable, or any cylindrical piece of drill equipment. Long.
come out. To withdraw or comedown; comb dung. Softish stone occurring in the roof of a coal seam and easily falling down when coal is removed. Arktel, comedita. A sodic rhyolite, and/or pyroxene. A.G.I. come out. To withdraw or hoist the drill string or tools from a borehole. Long. come to nature. The charge settling down into a nasty mass after boiling. Monteraeus, 4th, p. 443. come water. The constant or regular flow of water in a mine proceeding from old workings or from water-bearing rocks. Fay. comfort air conditioning. Air conditioning that controls the atmosphere which human beings breathe. Hartman, p. 4. comfort zone. Used to describe the effective temperature in British mines that normally falls in the range of 54° to 68° F on the basic scale. Roberts, 1, p. 136. coming out. The process of withdrawing or hoisting the drill string or tools from a borehole. Long. coming up to grass; coming up to day. Eng. Commercial terms used by miners for the word basin, or outcrop. Fay. Comleyan. Lower Cambrian. A.G.I. Supp. commencing operations. The performance of any act which has a tendency to produce an intended result. Ricketts, II. commercial. A deposit of oil, gas, or other minerals in sufficient quantity for production in paying quantities. Williams. commercial body. Impure gold dust. Bennett, 2d, 1962. commercial flux. A flux sold under a trade name; prepared for use in soldering, brazing, and welding. Crispin. commercial granite. This term includes granites, gneisses, gneissic, granite gneiss, and the rock species known to petrologists as syenite, monzonite, and granodiorite, species intermediate between them, the genetic varieties and gneisses of corresponding mineralogic compositions and the corresponding varieties of porphyritic textures. The term commercial granite shall also include other feldspathic crystalline rocks of similar textures, containing minor amounts of accessory minerals, used for special decorative purposes, and known to petrologists as anorthosite and laurvikite. ASTM C119-50. commercial feldspar bearing. A bearing having either ground or ungraded races and in which the bore and outside diameter tolerances are held to thousandths of an inch and the width tolerance to hundredths of an inch. AISI M81-1961. commercial important. A statistical term referring to salable coal, less colliery consumption and prepared for sale and supplied to employees. B.S. 3323, 1960. commercial marble. A crystalline rock composed predominantly of one or more of the following minerals: calcite, dolomite, or serpentine, and capable of taking a polish. ASTM C119-50. commercial mine. A coal mine operated to supply purchasers in general as contrasted with a captive mine. Zern. commercial mining. Can. Mineralized material currently profitable at prevailing metal prices. Hofman. commercial quality. A quantity of oil, gas, or other minerals sufficient for production in paying quantities. Williams. commercial quarry. a. Term that includes quarries for aggregate. b. Quarries for the production of stone for industrial and agricultural purposes. Streetlerk, p. 16. b. Not owned or controlled by commercial. Contrasted with a captive quarry. Bureau of Mines Staff. commercial sampling. The American Society for Testing and Materials divides coal sampling into commercial sampling and special purpose sampling. Commercial samples are intended to produce an accuracy such that if a large number of samples are taken from a single lot of coal, 95 out of 100 (0.95) test results will be within plus or minus 10 percent of the average of these samples. Compare special purpose sampling. Crispin. commutate. To reduce solids to minute particles by crushing, grinding, or pulverizing. Crispin. commutation. a. The act or action of commutating or the fact of being commutated. Webster 3d. b. The breaking, crushing, or grinding of coal, ore, or rock. Nelson. c. In powder metallurgy, the same as pulverization. ASTM Gloss. commutation broker. A broker who buys and sells on order for customers, who may be scattered throughout the country, and who are reached by a network of branch commission houses in various cities. Hoos. p. 260. commutation ore. Uranium-bearing material of 0.10 percent or higher, for which the Atomic Energy Commission has an established price. Ballard. comman bonded coal. A common variety of bituminous and subbituminous coal. It consists of a sequence of irregularly alternating layers or lenses of (1) homogeneous black material having a brilliant vitreous luster; (2) grayish-black, less brilliant, striated material usually of alloyy nature; and (3) generally thinner bands or lenses of soft, powdery, and fibrous particles of mineral charcoal. The difference in luster of the bands is greater in bituminous than in subbituminous coal. ASTM D493-39. See bonded coal. comman bond American bond. A.R.I. commercial brick. Brick such as is used for rough work or for filling in or backing. Crispin. See also building brick. comman brick clay. A red-to-brown burning clay which usually has a high percentage of fluxing impurities, is plastic enough for shaping, and fires to a very hard and strong solid with little warping or cracking at a relatively low temperature. Bureau of Mines Mitchell, p. 81. common goods; rejections; rubbish. Terms applied to the less desirable diamond material used for abrasive purposes. J.C. 8200, 1964, p. 3. common ion effect. Change in concentration of an ion in a saturated solution through addition of another electrolyte which yields an ion in common with the solid substance present in the ion product remains constant, but with the increase of concentration of one ion that of the other diminishes. Since the solution is already saturated, precipitation occurs, the effect being a reversal of the process of ionization. Pryor, 3.
compacted yards

Webster 3d. compacted yards. Measurement of soil or rock that has been placed and compacted in a fill. Nichols.

compacting factor. The ratio obtained by dividing the observed weight of concrete which fills a container of standard size and shape when allowed to fall into it under standard conditions of test, by the weight of the container which fills the same container. Taylor.

compacting factor test. For freshly prepared compacted yards. Measurement of

compact rock. A rock so closely grained that no component particles or crystals can be recognized by the eye. Nelson.

compact style. Pryor, 3.

compactioa curve; Proctor curve. The curve which fills a container of standard size and so achieves a high density. This results in (1) increased bearing strength; (2) reduced tendency to settle or deformation under load; and (3) reduced liability to moisture changes, that is, increased all-round stability. Compaction is normally specified as a soil density (pound per cubic foot) to be achieved. Density measurement is necessary to assess progress and completion. See also relative compaction. Nelson. c. One way to compact the concrete by which sediments are converted into rocks. Wheeler.

compaction. a. Decrease in volume of sediments, as a result of compressive stress, usually resulting from continued deposition above them, but also from drying and other causes. See also differential compaction, A.G.I. b. In soil mechanics, the densification of a soil by means of a mechanical manipulation. ASCE P1826. Reducing the moisture content of the soil by tamping, tamping, or soaking, Nichols, 2. d. The expulsion of air from a soil mass and so achieve a high density. This results in (1) increased bearing strength; (2) reduced tendency to settle or deformation under load; and (3) reduced liability to moisture changes, that is, increased all-round stability. Compaction is normally specified as a soil density (pound per cubic foot) to be achieved. Density measurement is necessary to assess progress and completion. See also relative compaction. Nelson. e. One way to compact the concrete by which sediments are converted into rocks. Wheeler.

the process of inducing a closer packing or filling of the aggregates in place in concrete by the reduction of voids. Taylor.

compaction curve; Proctor curve. The curve showing the relationship between dry unit weight and the water content of a soil, or for a given compactive effort. ASCE P1826.

compaction test. Machines, such as rollers, to expel air from a soil mass and so achieve a high density. Smooth-wheel rollers are best for gravels, sands, and gravel-sand-clay soils with reasonably high moisture contents. Pneumatic-tired rollers are best for clays with reasonably high moisture contents, as a result of compressive stress, usually resulting from continued deposition above them, but also from drying and other causes. See also differential compaction, A.G.I. b. In soil mechanics, the densification of a soil by means of a mechanical manipulation. ASCE P1826. Reducing the moisture content of the soil by tamping, tamping, or soaking, Nichols, 2. d. The expulsion of air from a soil mass and so achieve a high density. This results in (1) increased bearing strength; (2) reduced tendency to settle or deformation under load; and (3) reduced liability to moisture changes, that is, increased all-round stability. Compaction is normally specified as a soil density (pound per cubic foot) to be achieved. Density measurement is necessary to assess progress and completion. See also relative compaction. Nelson. c. One way to compact the concrete by which sediments are converted into rocks. Wheeler.

compaction curve; Proctor curve. The curve showing the relationship between dry unit weight and the water content of a soil, or for a given compactive effort. ASCE P1826.

compaction test. Machines, such as rollers, to expel air from a soil mass and so achieve a high density. Smooth-wheel rollers are best for gravels, sands, and gravel-sand-clay soils with reasonably high moisture contents. Pneumatic-tired rollers are best for clays with reasonably high moisture contents, as a result of compressive stress, usually resulting from continued deposition above them, but also from drying and other causes. See also differential compaction, A.G.I. b. In soil mechanics, the densification of a soil by means of a mechanical manipulation. ASCE P1826. Reducing the moisture content of the soil by tamping, tamping, or soaking, Nichols, 2. d. The expulsion of air from a soil mass and so achieve a high density. This results in (1) increased bearing strength; (2) reduced tendency to settle or deformation under load; and (3) reduced liability to moisture changes, that is, increased all-round stability. Compaction is normally specified as a soil density (pound per cubic foot) to be achieved. Density measurement is necessary to assess progress and completion. See also relative compaction. Nelson. c. One way to compact the concrete by which sediments are converted into rocks. Wheeler.

compartment. a. A separate division or section of anything. Webster 2d. Mining shafts usually are divided into two or more compartments or sections, separated by framed timbers and planking. Fay. b. A space or division in a shaft formed by cross bushing. The most important compartments in a winding shaft are two for cages or skips. See also rectangular shaft, a. Nelson. c. One section or unit in a coal- or mineral-treatment plant, Nelson.

compartment. a. An instrument for determining directions, usually by the pointing of a magnetic needle free to turn in a horizontal plane, as, for example, the ordinary surveyor's compass. Another type, the compas, for tracing magnetic iron ore, having a needle hung to move in a vertical plane. Fay. b. An instrument for describing circles, transferring measurements, and similar operations consisting in its simple form of two pointed branches joined at the top by a pivot, one of the branches generally has a pen or pencil point. Webster 3d. c. A mass or other compass device used in borehole-survey work. Long.

compass and wedge. Term sometimes used for a brick that has a taper both on the side and on the face, for example a 9-inch brick tapered 4½/3½ inches and 2½/2 inches. Dodd.

compass deflection. a. The difference, expressed in degrees, between the direction a magnetic compass needle points and true geographical north. This is termed magnetic declination. Long. b. Differences, expressed in degrees, between magnetic-north directions and geographical directions. ASCE. c. Differences, expressed in degrees, between magnetic-north directions and geographical directions. ASCE. This term is sometimes used. Nelson.

compass direction. Direction as indicated by a compass without any allowances for compass error. The error by which a magnetic compass may differ by a considerable amount from the true direction referred to a meridian of the earth. H&G. The amount by which a compass direction differs from the true direction. The error is usually expressed in degrees and is marked (+) or minus (−) according to whether the compass direction as read in degrees of azimuth is less or greater than the true azimuth. The error is to be applied according to sign to the compass reading to obtain the true azimuth direction. The compass error combines the effects of the deviation and variation of the compass. H&G. The error is also expressed as number of degrees east or west of true azimuth north. Bureau of Mines Staff.

compass points. The four principal points of the compass—north, cast, south, and west—called the cardinal points. Midway between the cardinal points are the intermediate points for all points not on a north-south line. The four cardinal points are northeast, southeast, southwest, and northwest. These directions are based on the compass. H&G. The four principal points of the compass—north, cast, south, and west—are called the cardinal points. Midway between the cardinal points are the intermediate points for all points not on a north-south line. The four cardinal points are northeast, southeast, southwest, and northwest. These directions are based on the compass. H&G.
component of coal

complete fusion. Fusion which has occurred over the entire base-metal surfaces exposed for welding. ASM Gloss.

component. a. An ore is complex when it contains more than two or more other metals. ASM Gloss.

complex gravitational crystallization differentiation. A complicated process of magmatic differentiation accomplished by the combined effects of crystal settling, transport by convection currents, and gaseous transfer. Schieferdecker.

complex one. a. An ore containing several metals. Bateman. b. Ores named for two or more valuable metals such as lead-arsenic or gold-silver. ASM Gloss.

Introduction to Metallurgy, 1938, p. 205. c. This term has no precise meaning. It generally signifies an ore that is difficult or costly to treat because of the presence of unusual minerals, for example, a gold ore with arsenic and antimony minerals, or an ore containing two or more metals, or ore composed almost wholly of several sulfide minerals. Ham.

complex steel. An alloy steel containing more than two alloying elements, such as high-speed tool steel. It contains more elements than quaternary steel. Fay.

complexing agent. A substance that is an electron donor and that will combine with a metal ion to form a soluble complex ion. ASM Gloss.

complex loss. An ion that may be formed by the addition reaction of two or more other ions. ASM Gloss.

complex pegmatite. A prismatic body characterized by pneumatolytic-hydrothermal replacement and rare minerals. Schieferdecker.

component. a. A constituent part, for example, a mineral is a component of a rock. Webster 3d. b. An ingredient of a chemical system, the concentration of which in the different phases is capable of independent variation. Webster 3d. c. Any one of the vector terms added to form a given vector sum or resultant. Webster 3d. d. One of the independent variables involved in each phase of a heterogeneous equilibrium. The number of components in a system is the distinction on that is characteristic of chemical constituents which must be specified in order to describe the composition of the system. A.G.I.

component of coal. The term component was introduced in 1920 by R. Thiessen. For example, two ores or two bands of banded bituminous coal, he refers to these layers or bands as components. Webster 3d. a. A distinguishable unit of a mixture, pure substance, or homogenous solution, recognizable visually as bands or layers of coal that have distinctive physical
appearance and characteristic microstructural features from coal to coal. Therefore, the term anthraxylon is described as representing bright, glossy bands of coal that under the microscope always show traces of more or less preserved cells with similar dimensions, regardless of dimensions. Thiesen recognized three components of banded bituminous coal as apposite, silt, and fusain. The term component is somewhat comparable with the term microlithotype of the Stopes-Heerlen Nomenclature. I.H.C.P., 1963, part I.

**composite**. Made up of separate parts or elements; combined or compounded; not simple. Standard, 1964.

**composite compact**. In powder metallurgy, a compact consisting of mixed metals, the particles of which are joined by pressing or sintering, or both, with each metal particle retaining substantially its original composition. A.M.S. Gloss.

**composite joint**. A joint in which welding is made up of different materials, for example, in situ concrete and precast concrete. Taylor.

**composite plate**. A plate formed by two or more intrusions of different ages into the same fissure. The adjective composite is similarly applied to the confines of the particular blank size being worked. A.G.I. Std.

**composite wheel**. A bonded product where two or more specifications are bonded together in one wheel. A.G.I., 1963.

**compound** working. N. of Eng. A system of organization in which all members of a team undertake all face tasks and share in the common paynote. Trist.

**composition**. a. An aggregate, mixture, mass, or body formed by combining two or more elements. Webster 3d. b. The mineralogical or chemical constitution of a rock. A.G.I. c. The elements or ingredients. The mineralogical or chemical constitution of a rock. A.G.I. c. The elements or ingredients.

**compound engine**. An engine in which the steam does useful work in two stages, that is, first in a small high-pressure cylinder and then in a larger low-pressure cylinder. This compound arrangement gives higher efficiencies than a single-cylinder engine. Nelson.

**compound explorer**. A series of closely spaced parallel drill holes. A.G.I.

**compound explosive**. An explosive of two or more kinds of rock intruded at different times but making use of the same channel of injection. Stokes and Barnes, 1935.

**compound fault**. A fault consisting of two or more parts that are in contact where intervening strata have wedged out. A.G.I. Std.

**compound section**. Projection of data from various locations to a single vertical plane, generally in the form of a synthetic cross section. A.G.I.

**compound silt**. A silt composed of two or more intrusions having different chemical and mineralogical compositions. Billings, 1954, p. 295.

**compound stone**. Same as assembled stone.

**compound stones**. A comprehensive term which includes doublets, triplets, etc., in which a stone consists of two or more parts either of the same or of different materials cemented or otherwise joined together. Anderson.

**composite seam**. A coal bed consisting of two or more parts that are in contact where intervening strata have wedged out. A.G.I. Std.

**compound绸de**. An apparatus composed of three tiers of blanket tables, a shaking table, and a quicksilver riffle for catching gold. Fay.

**compound cylinder**. A continuous curve composed of two or more arcs of different radii. Zern., 435.

**compound diaphragm**. Any type so designed that it performs more than one function on a part with one stroke of the press, such as blanking and piercing where all functions are performed simultaneously within the confines of the particular blank size being worked. A.M.S. Gloss.

**compound air pump**. A rolled steel joist strengthened by plates attached to the flanges by riveting or welding. Ham.

**compound dredger**. A rolled steel joint strengthened by plates attached to the flanges by riveting or welding. Ham.

**compound engine**. Expanding the steam in two or more engine cylinders, in order to prevent the lowering of the efficiency of the engine by condensation. Mason, V. 2, pp. 369-369.

**compound lode**. Veins seldom occur alone. They are often a member of parallel deposits, or a series of intersecting veins. Such a system is called a compound lode.
compound motor

Higham, p. 5.

compound motor. See compound dynamo.

compound oils. Mineral oils which are mixed with animal or vegetable oils to increase viscosity or consistence. Pettijohn.

compound oxides. Behave like a compound of two oxides, though they may not actually be so. Thus, trillictetrone (FeO₂₃) behaves like a compound of ferrous and ferric oxides—FeO and Fe₂O₃—and forms ferrous and ferric sulfs with acids. Coote.

compound proportion. A proportion between two ratios, either or both having more than one condition. Which affects the problem. In problems of this type, all of the terms appear in pairs, with the exception of one term, and this is always expressed in the same units as the required term. Jones, 2, p. 65.

compound ripple marks. Two or more sets of ripple marks, one superimposed on the other. Pettijohns.

compound ripple type. Type of ripple marks resulting from simultaneous interference of wave-oscillation with current action. Pettijohns.

compound rolls. Two or more pairs of crushing rolls arranged above one another, the upper pair acting as a primary crusher and the lower pair as a secondary crusher. Compound rolls find use in the size-reduction of brick-clay. Doyle.

compound shaft. A shaft in which the upper stage is often a vertical shaft, while the lower: stage, or stages, may be inclined and driven in the deposit. In this type shaft, the wind is divided into two or more stages, and underground winding engines are installed to deal with the lower stages, with transfer points and ore bins at the junction of two stages. Sinclair, V, p. 2.

compound shoreline. Showing the features of which combine elements of submerged and emerged coasts as a result of submergence followed by emergence. Schieferecker.

compound spherulite. A spherulite which appears to have been formed by the rapid growth of rays of plumeous spherulitic aggregates outwards from a central core and the deposition of a dense layer forming an outer spherical shell. Compound spherulitcs are known with a diameter of less than 10 feet. Schieffeler.

compound transmission. A gear set in which power can be transmitted through two sets of reduction gears in succession. Nichols.

compound vein. In crystallography, individual crystals of one group united according to different laws. Standard, 1906.

compound veins. A vein or body consisting of a number of parallel fissures united by cross fissures, usually diagonally. Fay, b. A vein composed of several minerals. Fay.

compound ventilation. A. An arrangement of a number of major ventilation systems serving various large working areas served by more than two shafts and their associated fans, but integrated to form one ventilation system. Usually adopted in large combined mines. See also radial ventilation. B. S. 3618, 1963, sec. 2. b. Ventilation by means of a number of more or less independent ventilators, which is now normal practice. See also ventilation, c. Nelson.

compressive force. A direct-current motor which has two separate field windings—one connected in parallel and the other in series with the armature circuit. Lowenheim.

compressional mechanism. N. of Eng. Preparation of grinding machines in conjunction with flexible armored (snaking) face conveyors and power-assisted stonework. The advantage of using a floor or the use of walking chocks are triggered by the passage of the cutter loader in recent experiments in the introduction of automation. Comprehensive mechanism is still rare in low seams. Trit.

compressor. Pressed together; compacted; or reduced in volume by pressure. Webster 3d.

compressed air. Air compressed in volume and transmitted through pipes for use as motive power for underground machines. Compressed air is costly to transmit long distances, but has certain advantages, namely, it cools the air at the working face and is relatively safe in gassy mines. Nelson.

compressed-air blasting; air shooting. A method originated in the United States for breaking down a beds of compressed air. Air at a pressure of 10,000 to 12,000 pounds per square inch is conveyed in a steel pipe through a tube or shell inserted in a shothole. The air is admitted by opening a shooting valve and is released in the hole by the rupture of a shear pin or disc. The sudden expansion of the air in the confined hole breaks down the coal. Advantages: (1) a large proportion of large coal; (2) no danger of methane ignition; and (3) no toxic or disagreeable fumes. Nelson.

compressed-air-driven lamps. These lamps are self-contained units and comprise a strong alloy casing within which are a compressed-air turbine and a small air-pump. The casing is self-contained, comprising a stationary and revolving field magnets. The air enters the casing at one side, passes through a filter and then through a reducing valve which maintains a constant pressure of 40 pounds per square inch on the turbine blades. The air escaping from the turbine is used to scavenge the inside of the lamp and remove any fire and lamp, which might have an effect on lamp weight, not in use. It is finally discharged through a series of holes of such a size that the pressure inside the lamp casing is 2 to 3 pounds per square inch above atmospheric. Should this pressure be lost due to the lamp glass being broken, the light is extinguished automatically by a spring-loaded diaphragm, which short-circuits the generator unless held open by the excess pressure. Also called air turbolamp. Mason, v. 1, p. 239.

compressed-air interaction. See nitrogen narcosis. HOG.

compressed-air locomotive. A mine locomotive driven by compressed air. It is very safe and much used in gassy mines in Europe. The air is brought down by pipeline from the surface to a charging station near the pit bottom. See also locomotive haulage. Nelson.

compressed-air measurement. Compressed air may be measured by the following methods: (1) full pressure, a method in which the volume of air delivered by a compressor is measured by measuring the volume of water used or of the compressed air-system or of the main parts of the system, such as the receiver at the compressor, the main pipelines, and a receiver at the other end of the pipeline. The volumes of the receivers and pipeline are determined, and the pressure is regulated to be free from any leakage. Without discharging into the pipeline, the compressor is capable of delivering a constant flow of air. (2) Low pressure, a method in which the Compressed Air Society recommends that the output from a compressor be measured under low pressure as it flows from a smooth nozzle. Lewis, pp. 679-680.

compressed-air turbines. Turbines used for driving coal cutters, belt conveyors, and air pumphouses. They are not so efficient in their use of the air as piston engines, but possess the merits of extreme simplicity and robustness. They are self-contained units and comprise a driving coal cutters, belt conveyors, and power-assisted systems. Schieffeler.

compressed pellets. Blasting powders manufactured in cartridge form for use in small diameter shotholes. These pellets are particularly useful for horizontal shotholes. MacDance, 1, p. 15.

compressibility. a. Property of a soil pertaining to its susceptibility to decrease in volume when subjected to load. ASTM P1820. b. The compressibility of a substance is usually defined as the relative change of volume per unit change of pressure referred to an arbitrary initial pressure. Lewis, pp. 580. c. In powder metallurgy, a specific term ratio of the pressure required to bring the pressure in the system is reduced to cubic feet of free air and these volumes are totaled to give the total free air in the system; and (3) low pressure, a method in which the Compressed Air Society recommends that the output from a compressor be measured under low pressure as it flows from a smooth nozzle. Lewis, pp. 679-680.

compressed-air turbulent. Turbines used for driving coal cutters, belt conveyors, and air pumphouses. They are not so efficient in their use of the air as piston engines, but possess the merits of extreme simplicity and robustness. They are self-contained units and comprise a driving coal cutters, belt conveyors, and power-assisted systems. Schieffeler.

compressed-air waves. a. A traveling disturbance in an elastic medium characterized by volume changes propagating through it. In problems of this type, all of the terms appear in pairs, with the exception of one term, and this is always expressed in the same units as the required term. Jones, 2, p. 65.

compressional wave. Longitudinal wave. a. A traveling disturbance in an elastic medium characterized by volume changes propagating through it. In problems of this type, all of the terms appear in pairs, with the exception of one term, and this is always expressed in the same units as the required term. Jones, 2, p. 65.
compression curve

(adjacent to density changes) and by particle motion in line with the direction of traction. A.C.G. is a longitudinal wave (as a sound wave) propagated by the elastic compression of the medium.

compression curve. See pressure-void curve.

compression efficiency. The ratio of the theoretical power required to compress air to the actual power required in the cylinder. The theoretical power may be computed as either in thermal or adiabatic modes, and the compression efficiency is expressed on the corresponding basis. Lewis, p. 695.

compression fault. A fault resulting from compressive forces in the earth's crust.

Schleiendercker.

compression flange. That part of a beam which is compressed; it is the upper part at midspan of a simply supported beam, and the lower part at the support of a continuous beam. Ham.

compression gasoline. Natural or casing-head gasoline made by compressing natural gas. Has.

compression ignition engine. An internal-combustion engine in which ignition of the liquid fuel injected into the cylinder is performed by the heat of compression of the air charge. C.T.D.

compression index. The slope of the linear portion of the pressure-void ratio curve on a semilog plot. ASCE P1826.

compression isothermal. See isothermal compression; isothermal expansion; adiabatic compression; adiabatic expansion; compound compression.

compression strength. The absorption of a photon in the Compton effect. NCB.

Compton effect. When short homogeneous X-rays are scattered by light elements their wavelength is slightly increased, the scattered radiation containing usually both the original and the modified wavelengths. For an angle of scattering of 90°, the increase in wavelength is always 0.024 angstrom unit, whatever the scattering element. The effect is due to the collision of a photon with an electron and the consequent decrease in the energy of the photon. C.T.D.

computability. The capability of a computer or any type of machine to perform operations. Any type of machine which may reveal earth formations, from the readings of a magnetometer taken at different locations by a magnetic prospecting party, to disclose indications of subsurface strata favorable to further petroleum exploration activities. D.O.T. 1.

computer. A digital computer is defined as a machine which performs routine calculations or performs problems; and a digital computer computes information to solve complex mathematical problems. The two principal classes of computers are: (1) analog computers which use physical magnitudes to solve the problems, and (2) digital computers which perform the calculations using numbers that represent the various quantities and are composed of digits represented according to a predetermined code. Gysar. An analog computer acts on internally stored information to solve complex mathematical problems; and a digital computer computes information in digital form. It is more accurate than the analog computer. Crip, b. In seismic prospecting, one who computes and interprets variations in gravity pull of different earth formations, from the readings of a gravity meter, torsion balance, or other gravity measuring instruments recorded by a gravity prospecting party, to disclose indications of subsurface strata favorable to petroleum or ore reserves, using an integrator, a planimeter, mathematical formulas, charts, or other computational devices. D.O.T. 1.

computer, magnetic prospecting. In petroleum production, one who computes depths of subsurface rock strata from seismograph recordings, obtained by one or more seismic prospecting parties, to provide data for delineating contours of subsurface stratigraphy which may reveal petroleum deposits. Also called seismic computer. D.O.T. 1.

computer, magnetic. A mineral, (Mg,Co,Zn)SO₄·H₂O, containing 3.60 percent ZnO, 9.40 percent MgO, 9.00 percent CuO, 39.07 percent H₂O; from the Comstock Lode, Nev. Synonym for sine-magnesia chalcanthite. Spencer 19, M.M., 1952.

computer, magnetic. A new design of tungsten carbide drill bit for percussion boring. The cutting edge is concave, while in the conventional type the edge is convex. The new bit remains sharper for a longer period before regrinding becomes necessary and gives a higher penetration speed. Also called saddleback tip. Nelson. b. See plug bit, b. B.S. 3618, 1965, sec. 3.

computer, magnetic. A mineral, (Mg,Co,Zn)SO₄·H₂O, containing 3.60 percent ZnO, 9.40 percent MgO, 9.00 percent CuO, 39.07 percent H₂O; from the Comstock Lode, Nev. Synonym for sine-magnesia chalcanthite. Spencer 19, M.M., 1952.

computer, magnetic. A general term for machines which can be used to solve mathematical problems. The two principal classes of computers are: (1) analog computers which use physical magnitudes to solve the problems, and (2) digital computers which perform the calculations using numbers that represent the various quantities and are composed of digits represented according to a predetermined code. Gysar. An analog computer acts on internally stored information to solve complex mathematical problems; and a digital computer computes information in digital form. It is more accurate than the analog computer. Crip, b. In seismic prospecting, one who computes and interprets variations in gravity pull of different earth formations, from the readings of a gravity meter, torsion balance, or other gravity measuring instruments recorded by a gravity prospecting party, to disclose indications of subsurface strata favorable to petroleum or ore reserves, using an integrator, a planimeter, mathematical formulas, charts, or other computational devices. D.O.T. 1.

computer, magnetic. A mineral, (Mg,Co,Zn)SO₄·H₂O, containing 3.60 percent ZnO, 9.40 percent MgO, 9.00 percent CuO, 39.07 percent H₂O; from the Comstock Lode, Nev. Synonym for sine-magnesia chalcanthite. Spencer 19, M.M., 1952.
concave inclined bedding

Concave. A concave condition applicable to the width or other planar surface. Light Metal Age, Vol. 16, No. 9, October 1958, pp. 11-24.

Concealed coalfield. A coalfield which is generally buried beneath newer deposits, usually Permian and Trias strata, which rest unconformably on the Coal Measures in the basin. A good example of a concealed coalfield is that of Kent, in southeast England. See also exposed coalfield

Concentrate. a. In mining, the product of concentration. Used in plural form as "the concentrates" for the concen-
trates were complete." Concentrates are called ore at Joplin, Mo.; mineral at Michigan copper mines; and tailings in Black Hawk, Colo. Fay. b. In mining, to separate ore or metal from its containing rock or earth by any of several methods that always proceeds by steps or stages. Thus the ore must be crushed before the mineral can be separated, and certain preliminary steps, such as liberation, must precede the final operations, which produce the finished concentrates. Ricketts, I. b. Nelson. c. Enriched ore after reduction of waste in beneficiation mill. Hoffmann. d. The clean product recovered in froth flotation. B.S. 3552, 1962. e. To intensify an advantage or be superior to others by some concentration criterion. The ratio between the height of the charge is small compared with the burden which can be given quantitatively. Langefors, p. 61.

Concentrate filter operator. One who separates mineral concentrates from water by chemical solutions prior to the smelting of the concentrate to recover the mineral. D.O.T. 1.

Concentrate load. A load that is confined to a very small area, a knife-edge load being a particular type of concentrate load. Ham.

Concentrating plant. See concentrator. Fay.

Concentrating table. A device consisting of a riffed deck, usually inclined in two directions to the horizontal, to which a differential reciprocating motion in a substantially horizontal direction is imparted; the material to be separated is fed in a stream of water, the heavy particles collect between the riffles and are then conveyed in the direction of the reciprocating motion while the lighter particles are borne by the current of water over the riffles to be discharged laterally from the table. B.S. 3552, 1962.

Concentration. a. Separation and accumulation of economic minerals from gangue. See also small area, a knife-edge load being a particular type of concentrate load. B.S. 3552, 1962.

B. Increasing the strength of aqueous solutions by evaporating part of their water. Fay. c. The area covered by the dispersion of the workings, the greater the dispersion of the workings, the greater the productivity of the miner employed and the greater the costs of production. See also placer concentration; geopetal concentration; overall concentration. Nelson.

Concentration plant. Equipment for the recovery of valuable minerals from ores by physical means, that is, by washing or flotation. C.T.D.

Concentration ratio. a. Weight or tonnage. Ratio (K) of the weight of feed (F) to the weight of concentrate (C) produced:

\[ K = \frac{C}{F} \]

for a two-product treatment. C

Pryor, J. b. Grade, ratio (K) of grade of valuable constituent in feed to grade of valuable constituent in concentrate. Bureau of Mines Staff.

Concentration. In ore treatment series, reduction of size, with removal of a finished product at each such reduction stage

Concentrate table. A table on which a mixture of finely-crushed ore and water flows downward, and the heavier metallic fingerprints behind and flow off in a separate stream of finely-crushed ore and water. Langefors, p. 61.

Concentration units, solutions. Two types of expression are used, which involve the quantity of solute, solvent, and/or solution:

1. Group A, solute per solution in grams per liter. Solubility of a material in a particular solvent which involves the composition of the mixture and the temperature at which it is measured. See also supersaturation.

2. Group B, percent solute per solvent. Grams per 100 or gram percent. Weight of solute in solution gram per liter. Solubility of a material in a particular solvent which involves the composition of the mixture and the temperature at which it is measured. See also supersaturation.

Concentric. Concentrate. A plant where ore is separated into values (concentrates) and rejects (tails). An appliance in such a plant which is to separate (concentrates) and exclude (tails). An apparatus in which there is a difference in chemical composition of the ore, as compared with the total area of the ore, or a difference in the composition of the ore and of the gangue. See also flotation cell.

Concentric. Adherence to a common center, as in the inner and outer walls of a tube or hollow shape. Longecore. 1. b. Nelson. c. Enriched. c. Concentrated frictions. A system of frictions more or less concentrically disposed about a central axis. A.G.I.

Concentricity. Adherence to a common center, as in the inner and outer walls of a tube or hollow shape. Longecore. 1. 1. Nelson. c. Enriched. c. Concentrated frictions. A system of frictions more or less concentrically disposed about a central axis. A.G.I.

Concentric weathering. See spheroidal weathering. Longecore.

Concentric wheel. A bonded product containing two or more compositions of different (abrasive) specifications. A.G.S., 1963.

Concentration structure. A sheet formed by the repeated folding of a lenticular coal on itself, after the manner of the bellows of a concertina when shut up. The sheet is formed entirely of the one bed and thus the structure differs from ordinary isoclinal folding, where distinct beds are involved. Chal tinus. c. Nelson.

Concentrations. See concentration system.

Concession system. Under this system the state or the private owner has the right to grant concessions or leases to mining operators at discretion and subject to certain general restrictions. It has its origin in the ancient regalian doctrine that all mineral wealth was the prerogative of the crown or the feudal lord and applied in almost every mining country in the world except the United States. Compare claim system.
condenser operator

condenser. A. An apparatus for removing heat from a gas (steam) so as to cause the gas to revert to the liquid state (water). ASTM STP No. 148-D. B. An apparatus used for condensing vapors obtained during distillation; it consists of a condenser tube, either freely exposed to air or contained in a jacket in which water circulates. C.T.D. c. An accumulator of energy, particularly in the form of latent heat of vaporization. D.O.T. 1. A. A skilled worker who assembles or assembles and sets in place the condenser systems of a ship, as necessary. B. One who assembles or assembles and sets in place the condenser systems of a ship, as necessary. C. A skilled worker who assembles or assembles and sets in place the condenser systems of a ship, as necessary. D. O.T. 1. c. A skilled worker who assembles or assembles and sets in place the condenser systems of a ship, as necessary.
condenser setter

condensed water. See waste, d.
condensation period. Drilling. Time spent in cementing the hole. To circulate a higher-temperature fluid while waiting for the proper (measure of acidity or alkalinity of the pulp) to protect such salts as NaCN, which would decompose in an acid circuit, etc. NaClO, CaO, and CaO are the most common conditioners, since most flotation pulps should be alkali-resistant.
condensation. Stage of froth-flotation process in which the surfaces of the mineral species present in a pulp are treated with appropriate chemicals to influence their reaction when the pulp is aerated. Pryor, 4.
condensation time. Drilling. The period during which the pulp is agitated with a given chemical solution of chemicals in the series of conditioning operations which precede separation of various minerals in the flotation cell. Pryor, 2.
condensation zone. a. The part of a tank furnace for flat glass where the temperature of the glass is adjusted before it flows into the forehearth or drawing chamber. Dodd, b. That part of the feeder, away from the wall of a glass-tank furnace, in which the temperature of the molten glass is adjusted to that required for working. Dodd.
condensit. The fine number of combinations of wet- and dry-bulb temperatures which will satisfy the requirements of an air supply for a given room condition from what is known as the condition line on the psychometric chart. Strock, 10.
condensation the hole. To circulate a higher-than-normal volume of drill fluid while slowly rotating and lowering the drill string from a point a few feet above the bottom of the borehole to the bottom of the borehole to wash away obstructing materials before resuming coring operations. Long.
condensation. a. The quantity of heat (usually Btu) transmitted per unit time (usually minute) from a unit of surface of material under a unit temperature differential (usually 1°F) between the surfaces. Strock, 10. b. Conductance is the reciprocal of resistance, and is measured by the ratio of the current flowing through a conductor to the difference of potential. Lowenstein, 1963, sec. 3.
condensation. a. The transfer of heat through matter by the communication of kinetic energy from particle to particle rather than by a flow of heated material. Compare convection. Webster 3d. b. The maintenance of an electric current through metals by a general movement of conductive electrons; through electrolytes by a movement of both positive and negative ions; or through gases by the passage of cathode rays, ionized molecules, or anode rays. Webster 3d. c. The flow of heat through a body by the transfer of kinetic energy from molecule to molecule without gross mixing. Nelson, v. 2, p. 393.
Conductive Silver Preparation. Special compounded materials containing silver powder in a vehicle, with or without ceramic flux; can be coated on base materials such as titinate bodies, mica, glass, porcelain, stellite, plastics, wood, cloth and paper by stencil screenprinting (squeegee), spraying, dipping, brushing, roller coating, bonding wheel, or other suitable methods. Fixed by air-drying, baking at low temperatures, or firing at elevated temperatures. Used to produce capacitive effects, conductive metal solder seals, electrical shields, surfaces of high conductivity on nonconductive materials; as a base for ceramic and nonceramic surfaces. C.C. 5d. 1961.
Conductive. a. The quality or power of conducting heat or electricity. The reciprocal of resistivity. Webster 3d. b. The relative ability of materials to carry an electrical current. C.Ripin.
conductor. a. Guides of rope or of rigid construction to guide the cables or skips in the shaft. Mason. b. A wooden cylinder, 12 to 13 feet long, used in the United States when sinking a new oil well. The conductor, which has a slightly greater diameter than that of the first string of casing, is inserted in the drill hole, and extends from the bottom of the first casing to the floor of the derrick. The object of the conductor is to guide the casing, great care being taken to secure its absolute verticality in the first place. Fay. c. A relatively short length of pipe driven through the unconsolidated sone of top soil as the first step in collaring a borehole. Also called conductor pipe; standpipe. Long. In petroleum drilling, the piping carried through overburden to bedrock or the first string of casing placed in a borehole. A derrickman. C.T.D. f. 1. A substance or a body capable of readily transmitting electricity, heat, or sound. Webster 3d. g. A material which offers a low resistance to the passage of an electric current. C.T.D. h. That part of an electric transmission, distribution, or wiring system which actually carries the current. C.T.D. i. One of the wires forming the shoulders of the electric machine. C.T.D. j. The metallic conductor in a cable; it is invariably of copper surrounded by an insulation. C.T.D.
condenser-cable locomotive. An electric locomotive having a cable on a reel and connected both with the locomotive motor and the trolley wire in the entrance, so that the locomotive may be driven into an unattended room. Zern.

cone angle. See cone, c. B.S. 3618, 1963, sec. 3.
conductor pipe. Synonym for conductor, c. Long.
conductor string. See conductor, d. Long.
conduit. a. An airway. Zern. b. A natural or artificial channel through which water or other fluid passes or is conveyed; an aqueduct, a pipe. Webster 3d. c. A pipe, tube, or tile for receiving and protecting electric wires or cables (as for telephones or powerlines). Webster 3d. d. Pipe or casing placed in a borehole. See also casing, e. drivepipe, a. Long. e. A pipe or tile carrying water, wire, or pipe. Nicholls.
cone for electric cable. See cable cover. Dodd.
conduit hole. A flat or nearly horizontal hole drilled for laying up a thin piece in the bottom of a level. Zern.
conduit pipe. Wrought-iron pipe used as an armor for electric wires. A tubular conduit. Fay.
cone. a. A device used on top of blast furnaces to enable charge to be put in without permitting gas to escape. Also called bell. C.T.D. b. The conical part of a kiln or furnace with ceramic ware to indicate the temperature of the kiln and the fired condition of the ware. See also pyrometric cone. Bureau of Mines Staff.
cone. e. A solid with a circle for a base and rather more than half a sphere for a top. Jones 2, p. 119. f. Geometric pattern formed by the recessed cone angle of the cone and the fixed condition of the cone. See also pyrometric cone. Bureau of Mines Staff.
cone. e. A solid with a circle for a base and with a convex surface that tapers uniformly to a vertex. Jones 2, p. 119. f. Geometric pattern formed by the recessed cone angle of the cone and the fixed condition of the cone. See also pyrometric cone. Bureau of Mines Staff.
cone. e. A solid with a circle for a base and with a convex surface that tapers uniformly to a vertex. Jones 2, p. 119. f. Geometric pattern formed by the recessed cone angle of the cone and the fixed condition of the cone. See also pyrometric cone. Bureau of Mines Staff.

cone cut. A cut in which the number of central holes are drilled towards a focal point and, when fired, break out a conical section of strata. B.S. 3618, 1964, sec. 6.

conoid penetrator. A cone penetrator, information may be obtained to allow an engineer to calculate the load-bearing characteristics of silty or fine to medium-coarse sand and clayey materials. Long.

conoid penetrator. A 30° to 60° cone having a basal diameter approximately the same size as a 0.5 inch-diameter drill rod used to determine the strength of the rock, or other impurities by action of rising current of water, regulating flow of coal wash water and flow of water into the bottom so that pressure will prevent coal from sinking and the larger sized particles. The peripheral with the top overflow is thin and carries the finer fraction of the solids. Pryor, 3.

conoid separator. A hydraulic or free-settling gravity separation device, known as cone-in-cone which consists of a set of reentrant cones closely packed together. Pryor, 3.

conoid structure; corrugated Section of strata. B.S. 3618, 1964, sec. 6.

conoid structure; corrugated Section of strata. B.S. 3618, 1964, sec. 6.

conon of depression. a. The depression, which is approximately conical in shape, that is produced along the sides of the surface mapped is preserved unchanged. Sometimes termed orthomorphic map projections, orthomorphic meaning right-shape. This is misleading because, if the area mapped is large, its shape will not be preserved, but only the shape of each small section of it. The exact condition for a conformal map projection is that the scale at any point be the same in all directions. The scale may change from point to point, but at each point it will be independent of the azimuth. Among the more important conformal map projections are the Mercator, the stereographic, the azimuthal equidistant, and the Lambert conformal map projections; the last two are used in the State coordinate systems. A.G.I. Supp.

conostatic temperature. a. The freezing point. Bureau of Mines Staff. b. The temperature at which an oil becomes a solid or is reduced to a standard pasty state. Tests on some oils, when allowance has been made for known chance variance in collection of such data, are confidence limits. Space between is confidence interval, within which lies the true value, shown with sufficient precision for the required purpose of the work in hand. Pryor, 3.

conostatic temperature. a. The freezing point. Bureau of Mines Staff. b. The temperature at which an oil becomes a solid or is reduced to a standard pasty state. Tests on some oils, when allowance has been made for known chance variance in collection of such data, are confidence limits. Space between is confidence interval, within which lies the true value, shown with sufficient precision for the required purpose of the work in hand. Pryor, 3.

Tests on some oils, when allowance has been made for known chance variance in collection of such data, are confidence limits. Space between is confidence interval, within which lies the true value, shown with sufficient precision for the required purpose of the work in hand. Pryor, 3.

conostatic temperature. a. The freezing point. Bureau of Mines Staff. b. The temperature at which an oil becomes a solid or is reduced to a standard pasty state. Tests on some oils, when allowance has been made for known chance variance in collection of such data, are confidence limits. Space between is confidence interval, within which lies the true value, shown with sufficient precision for the required purpose of the work in hand. Pryor, 3.

conostatic temperature. a. The freezing point. Bureau of Mines Staff. b. The temperature at which an oil becomes a solid or is reduced to a standard pasty state. Tests on some oils, when allowance has been made for known chance variance in collection of such data, are confidence limits. Space between is confidence interval, within which lies the true value, shown with sufficient precision for the required purpose of the work in hand. Pryor, 3.

Tests on some oils, when allowance has been made for known chance variance in collection of such data, are confidence limits. Space between is confidence interval, within which lies the true value, shown with sufficient precision for the required purpose of the work in hand. Pryor, 3.
conglomerate. a. A cemented clastic rock containing rounded fragments of gravel or pebble size. Monogenic and polygenetic derived, according to the uniformity or the variability of the composition and the source of the pebbles. Holmes, 1928. b. Also referred to as pudding stone; millstone grit. Hudson.

conglomerate ore. Usually refers to uranium ore mine from the Shinarump conglomerate formation. Ballard.

conglomerate. The heaping together of diverse materials into one mass. Chalmers.

conglomerate. A conglomerate that has reached the same state of induration as a quartzy agglomerate.

congo bort. Congos used industrially as bort. See also bort, congolite. Long.

congo diamond. See congolite. Long.

congo gun. Congo copal. Yellowish; amorphous solid; specific gravity, 1.0 to 1.1. Used as a substitute for amber. One of the hardest fossil resins. Bennett 2d, 1962.

congo round. Spherical- or nearly-spherical-shaped congo type. See also albertite. Long.

congo. a. Originally and commonly used as a name for a variety of diamonds found in the Congo Diamond District in Africa and more recently as a descriptive term applied to all diamonds having an appearance and characteristics of those produced in the Republic of the Congo. Congos are white to grey and yellow, drusy-faced, opaque to somewhat translucent diamonds, having shapes corresponding to the many forms of the crystal system. At one time, congoes were considered fit only for use in fragmented form, but a considerable number are now used as tool stone and drill diamonds. See also diamond. Long. b. Sometimes designates drill diamonds ranging from 1 to 8 stones per carat in size. Long.

conglomerite. In crystallography, two forms which may each be derived from the other by rotation about an axis of symmetry.

conglomerate melting. A geologic or metallurgical process in which a binary compound melts at a certain concentration to a liquid phase of its own composition. Bureau of Mines Staff.

conglomerate transformation. An isothermal or isobaric phase change in which both of the phases concerned have the same composition throughout the process. ASM Gloss.

contact. Cone-shaped. In mineralogy, usually an elongated cone as are most lodestones. Shively.

conical drum. A winding drum coneshaped at each end, a balanced load placed upon the drum while the winding operation is going on. The drum is carried on a frame above the load. The drum is wound, or unwound, by means of a rope. See also drum winding.

conical gyratory crusher. This crusher is of the gyratory type for secondary reduction and is identified by the characteristic shape of its breaking head. The included angle of the breaking head surfaces is large and generally greater than 180°, which greatly increases the ratio of discharge to feed area. The large ratio permits crushed materials to be conveyed through the machine, which is equipped with an automatic feed control to prevent power-consuming clogging and packing. Also, its higher gyrating speed and the large discharge area make it especially suitable for the task of fine crushing at a high capacity. Pit and Quarry, 53rd, sec. B, p. 29.

conical mill. Harding and Still. Pryor, J.

conical refraction. The refraction of a ray of light at certain points of double-refracting crystals, so that on emerging from the crystal it widens from an apex into a hollow cone (external conical refraction), or on entering diverges into a cone and issues as a hollow cylinder (internal conical refraction). Standard, 1964.

conical roll. A crisher in which clay material passes between a moving set of rolls, conical in shape. ACSG, 1963.

concordite. A pistachio-green to emerald-green basic anatase of calcium and copper, CaCu(Au)(OH), occurring reniform and massive forms, and consisting mainly of mica and carbonate minerals. E.D., 2, pp. 806-807.

cone map projection. A map projection produced by projecting the geographic meridians and parallels of the earth to a cone which is tangent to, or intersects, the surface of the sphere, and then developing the cone into a plane. See also projection.

conoid. a. Important method of obtaining a true sample from a pile of ore. Material is shoveled from around the heap, so that it forms a cone. The shovelers works around and drops each load as vertically as possible. See also projection.

connecting rod. A rigid rod that transmits motion from one part of a machine to another in a rectilinear or rectilinear, and often mineralized to form vein systems. Joint patterns, such as these, are believed to be the result of compressive stresses which were relieved by joint formation rather than the formation of a single fissure. Lezzi, pp. 411, 597.

connecting section. In solvent extraction, the two immiscible solutions in equilibrium with each other. NRC-ASA N-1.1957.

Conklin process. A dense-media coal cleaning process in which the separating medium consists of magnetic magnetite (5.2 specific gravity) in water in the proportion of 4.4 parts of water to 1 part of magnetite, permitting a specific gravity of about 1.9. An advantage claimed for this process is that the medium requires little agitation to keep it in suspension, and that the medium is easily removed from the clean coal and refuse. Mitchell, pp. 494-495.

connecting, a. Born, produced, or originated together. Webster 3d. b. Applied to waters (and extended to include CO, in lime- stone and other volatile materials) buried with fragmental and volcanic rocks and remaining stagnant except as they are introduced in new minerals found in the rock. Holmes, 1928.

conome. Water. That was deposited simultaneously with the sediment and which has not, since its deposition, existed as surface water or as atmospheric moisture. Fay.

connecting. The operation of joining adjacent electric blasting cap wires to each other, to connecting and leading wires, in such a way that an electric current will flow through with the least possible resistance. Fay.

connecting curve. A curve introduced to connect a turnout with a side track. Zern, p. 476.

connecting frame. A device similar to a guide frame for shaker conveyors but with provision for insertion of the puller rod. A connecting frame can be inserted between any two standard trough sections to serve as a substitute for a connecting trough on single-arm electric or air devices. Jones.

connecting link. For a roller chain, a pin link made with one link plate easily detachable to facilitate connecting or disconnecting the two ends of a chain. JBM.

connecting rod. A rigid rod that transmits power from one rotating part of a machine to another in reciprocating motion (as from a crankpin to a piston). Webster 3d.

connecting section. That part of a mining belt conveyor which consists of a framing and the belt identifiers (or rectilinear, and often mineralized to form vein systems. Joint patterns, such as these, are believed to be the result of compressive stresses which were relieved by joint formation rather than the formation of a single fissure. Lezzi, pp. 411, 597.

connecting section. In solvent extraction, the two immiscible solutions in equilibrium with each other. NRC-ASA N-1.1957.

conglomerate. Originally and commonly used as cow rounds. Spherical- or near-spherical-conglomerate. The heaping conglomerate. a. A cemented elastic
consolidated drained test. A soil test in which essentially, complete consolidation under the confining pressure is followed by additional (or shearing) stress applied in such a manner that even a fully saturated soil of low permeability can adapt itself completely (fully consolidate) to the changes in stress due to the additional axial (or shearing) stress. ASCP PB 826.

consolidated immediate shear test. This is a method of measuring the variation in a load placed normal to the plane of failure. It is applied to a soil which has been first consolidated under the normal load. See also drained shear test: quick test. Ham.

consolidated undrained test. A soil test in which the consolidation is followed by a shear at constant water content. Also called consolidated quick test. ASCP PB 826.

consolidation. a. In geology, any or all of the processes whereby loose, soft, or liquid earth materials become firm and coherent. Stikes and Vannes, 1955. b. In soil mechanics, the process of the adjustment of a saturated soil in response to increased load and involves the squeezing of water from the pores under the confining pressure (in a triaxial test) is followed by a shear at constant water content. Also called consolidated quick test. ASCP PB 826.

consolidation curve. See consolidation time curve. ASCP PB 826.

consolidation hole. Borehole into which chemical solutions or grout are injected to cement or consolidate fragmental rock material. Compare grout hole. Long.

consolidation press. Laboratory equipment for obtaining data on the voids ratio of a clay sample, from which the coefficient of consolidation can be determined. Ham.

consolidation ratio. The ratio of the amount of consolidation at a given distance from a drainage surface and at a given time to the total amount of consolidation obtainable at that point under a given stress increment. ASCP PB 826.

consolidation test. a. A test in which the specimen is laterally confined in a ring and is compressed between porous plates. ASCP PB 826. b. The test may be made in an oedometer. An undisturbed sample of clay measuring 6 centimeters in diameter and 2 centimeters thick is confined laterally in a metal ring and compressed between two porous plates which are kept saturated with water. A load is applied and the rate of consolidation is measured, the excess pore water escaping through the porous stones. After each increment of load is applied, the sample remains on the sample until equilibrium is established, and a consolidation curve showing the deformation with time is obtained for each increment. Nelson.

consolidation time curve. A curve that shows the relation between the degree of consolidation and the elapsed time after the application of the consolidation load. Also called time curve, consolidation curve, and theoretical time curve. ASCP PB 826.

consolidation trickling. During closing of bed or particles in the suction half of jetting cycle, interstitial drawdown of lastest moving small particles before the mass of particles becomes too compact for movement. Can.

consolidate. Mutually soluble or miscible in all proportions. Webster 3d.

consolodating place. Open to view; catching the eye; easy to be seen; manifest; obvious to the sight; seen at a distance; exposed to view; clearly visible; evident; prominent; openly and conveniently to the public. Richetti, I.

constant. Any property of a substance, numerically determined that remains always the same under the same conditions, as the specific gravity; the melting point; the freezing point; the electrical conductivity. Standard, 1964.

constant. A group of copper-nickel alloys 45 to 60 percent copper, with amounts of iron and manganese, and characterized by relatively constant electrical resistivity and temperature of use in resistors and thermocouples. ASM Gloss.

constant composition law. See definite proportion law.

constant error. See biased error. Pryor, 3, p. 159.

constant-weight feeder. a. An automatic device which maintains a constant rate of feed of ore from the bin or stockpile to the grinding circuit. It is controlled by the weight of ore on a balanced length of the belt conveyor; by electrically vibrated chute; by pulser gate; by timed delivery from automatically loaded hoppers. Pryor, 3. b. A feeder intended to deliver a certain weight per unit of time. ASCP, 1966.

construction account. An account in mining which is charged with all construction expenses and the other for construction. ASCP, 1966.

construction. a. A structural arrangement of parts. b. This term refers to the type of construction prevalent, and which are recognizable in thin sections of the petrographic entities of the attritus in the U.S. Bureau of Mines terminology, is equally applicable to the macroscopic entities seen in thin sections although its use has not been so definitely restricted. THCP, 1963, Part I.

construction formula. One which shows how the atoms in a molecule are arranged. Pryor, 3.

construction joint. The vertical or horizontal faces of the joint or break in the casting where the creting has been stopped and continued later. The concrete on each side of the vertical (or sloping) faces forming the metal or alloy and the proportions of each are of importance. C.T.D.

constructional ash. constructional coal. Ash resulting from complete combustion of clean coal. Tared ash, originating in the pyrolysis from which the coal was formed, as distinct from free ash, the entrained shale trapped into the coal mass at time of deposition. Pryor, 3. See also inherent ash. S.

constructional change. Transformation of a constituent in an alloy (for example, austenitic into ferritic). Pryor, 3.

constructional formula. One which shows how the atoms in a molecule are arranged. Pryor, 3.

constructional water. Water definitely bound into a hydrated crystal (for example, Cu(OH)2). Pryor, 3.

construction diagram. A graphical representation of the temperature and composition limits of two or more phases in an alloy system as they actually exist under the specific conditions of heating or cooling (synonymous with phase diagram). A construction diagram may be an equilibrium diagram, or an representation of metastable conditions. Compare equilibrium diagram. ASM Gloss.

construction. Any restriction that occurs to the transport of a substance associated with a longitudinal tension, and that hence causes a secondary tension in the transport system. ASM Gloss.

construction pressure. See also Abb number. Dodd.

construction. The number of strands in a rope and the number of wires in the strand. These numbers should be separated by a multiplication sign, thus 6 x 19 signifies a stranded rope having 19 wires per strand. The division (or over) sign should be used to denote the separate layers of wires in the strand (thus, a 6 x 19 (12/6)1 rope indicates that its strands have 12 wires laid over 6 wires laid over 1). Ham.

construction. In geology, owing its form, position, direction, or general character to building processes, such as accumulation by deposition or by volcanic extrusion. Fay.

construction land form. A land form created by the accumulation of material; examples are volcanic cones, deltas, and floodplains. The term also applies to forms created by astrophysical processes, such as fault blocks or folds. Stikes and Vannes, 1955.

construction plain. Constructional plains owe their origin and present surface features principally to the distribution and deposition of earth material in alluvial sheets along the streamways or at the margin of the ocean, or to the distribution of ash flows and other volcanic ejecta over the surface. A.G.I.

construction joint. The vertical or horizontal faces of the joint or break in the casting where the creting has been stopped and continued later. The concrete on each side of the vertical (or sloping) faces forming the
connecting trough

NEMA MBI-1961.

connecting trough. A shaker conveyor trough of which the bottom is horizontal. A support on which smaller lengths of cable can be made. ASA C 42.85: 1956.

connecting support. The means of supporting connecting troughs where they pass over the drive unit. The support is attached to the drive unit frame and is designed to allow the connecting trough freedom of movement in the direction of the balline. Supports may be of the ball frame, wheel, rolled, or rocker arm types.

connecting wire, blasting. a. A wire generally of smaller gage than the shot-firing cord and used for connecting the electric blasting cap wires from one drill hole to those of an adjoining one in mines, quarries, and tunnels. ASA C 42.85: 1956. b. A connecting rod to transmit motion and force from the revolving crank or eccentric to the slide of a press.

connection. a. Adding a length of drill pipe to the drilling shaft as drilling progresses. b. A connecting rod to transmit motion and force from the revolving crank or eccentric to the slide of a press. ASA C 42.85: 1956.

connection box, electrical. A boxlike enclosure with removable face or plate with which smaller lengths of cable between sections of cable can be made. ASA C 42.85: 1956.

connection man. See parting and connection man. D.O.T. I.

connector, electrical. Any device for holding in electrical contact the ends of conducting wires in such a manner that they may be readily released when it is desired to disconnect them. Cu pip.

connector, rubber. A blue hydrated copper chloride, possibly Cu(SO₄)₂·H₂O, hexagonal; from Cornwall, Eng land. An end member of the connellite butternbachite series. Synonym for caeruloeobrite; celuleobrite. Dana 9, 2, pp. 572-573.

connection mark. Dark green to grayish green quartz serpentine. Shipley.

conoid, Isobathic construction line between two equilibrated phases. VV.

conocline. A eritical, conical plain that has been partly built and partly cut and that slopes outward in all directions. This form is considered to be the normal one in a mountainous and region, differences of topographic age being marked by differences in slope. A.G.I.

conoscopic. A blue hydrated copper chloride, possibly Cu(SO₄)₂·H₂O, hexagonal; from Cornwall, England. An end member of the connellite butternbachite series. Synonym for caeruloeobrite; celuleobrite. Dana 9, 2, pp. 572-573.

conosum. A system, the notable feature of which is the projection of a reversed mud flush circulation which permits uninterrupted core recovery in the rotary system of drilling. Sinclair, H. A. S., 1956.

Conus stocks. Mechanized pit digger used for connecting the electric blasting cap wires from one borehole to those of an adjoining one. Fay.

connection. a. A constructional lake de- creased in size by filling at the inlet and cutting away at the outlet; while thus dwindling away, it is a consequent lake. A.G.I. b. Those lakes which occupy or be- come a part of the geologic structure or the form and slope of the surface. A.G.I.

consequent drainage. A river system directly related to the geologic structure of the area in which it occurs. C.F.D.

consequent lake. A constructional lake de- creases in size by filling at the inlet and cutting away at the outlet; while thus dwindling away, it is a consequent lake. A.G.I. b. Those lakes which occupy or become a part of the geologic structure or the form and slope of the surface. A.G.I.

consent stage. a. If considered on a basis of relationship to the rocks in which they originated, the streams described by Powell as superimposed would be called consequent. Synonym for superimposed (or superposed) stream; inherited stream; epi- genetic stream. A.G.I. b. A stream which follows a course that is a direct con- sequence of the original slope of the surface on which it developed. A.G.I.

conservation. a. The degree of solidity or fluidity of bituminous materials. Fay. b. The relative ease with which a soil can be deformed. ASCE P 1826. c. A property of a material determined by the complete flow-force relation. ASTM C 11-60. d. The properties of a slip that control its draining, flowing, and spraying behavior. ASTM C 296-65. e. Percentage of solids in pulp. Pryor, 3. i. Fluidity. Pryor, 3. g. In concrete testing, the behavior with the slump test or the weight with the compacting test. Pryor, 3. h. The condition (as of a material) of standing together or re- maining fixed in union; firmness. Webster 3d. i. A degree of density, viscosity, or re- sistance to movement or to separation of constituent particles. Webster 3d.

consolidation. The partial filling of an abnormal place or condition. Webster 3d.

consistency index. See plastic consistency. ASCE P 1826.

consistency limits. The liquid limit, plastic limit, and shrinkage limit. These all apply to the water content of a clay, each in a certain state as defined by British Stand- ard 1171. Nelsen.

constatine. Trade name: a device for at- tachment to the barrel of a hog for con- trol of ventilation. Webster 3d. a. An instrument for the measurement of relative consistency of mineral suspensions and other materials. It is cali- brated in terms of viscosity with water-sugar solutions. R.I. 3465, September,
construc-tion way. 253

joint is generally united by continuous reinforcement running the joint. When stopping on a horizontal plane adhesion is usually attained by well-toughening the concrete surface before pouring new. 

construction way. The temporary works employed for transport of men and materials are designed and built to the conditions of the finished permanent way, C.T.D.

construction possession. That possession which the law to use is to the exigency of ownership of property, when there is a right to the immediate actual possession of such property but no actual possession. Rich-ett.

construction waves. Waves that build a shoreline feature, such as a beach, a bar, or a spit. Opposite of destructive waves. 

Schiereder.

consulting engineers. A specialist employed in an advisory capacity. Normally, does not manage or direct any operation, and is at the service of the board rather than of the company's administrative and executive staff. Pryor.

consulting engineer. A highly qualified mining engineer with a wide background of experience in his particular field. He may be asked by a client or company to supply a property and prepare a report of valuation, or to give advice or expert evidence in cases of alleged subsidence. 

consumable electrode arc melting. A method of arc melting in which the electrode itself serves to supply the metal; this method is commonly employed for melting tantalum and iridium. Newton.

contact. a. The coming together (touching) of a solid surface with the ground or a metal; as in the chemical and mechanical loss of mercury in amalgamation. Fay.

contact change. That portion of a utility charge based on energy actually consumed, as distinguished from the demand charge. 

contact. a. The place or surface where two different kinds of rocks meet. Applies to sedimentary rocks, as the contact between a limestone and a sandstone, for example, and to metamorphic rocks; and it is especially applicable between igneous intrusives and invaded country rock. Fay. c. A line of delimitation between a metamorphic and its walls. Fay. b. S. Afr. A contact lode or contact vein. Fay.

contact erosion valley. A valley that has been eroded along the contact between two different kinds of rock, as between two different sedimentary formations, between igneous and sedimentary rocks, along a fault, or along an upturned unconformity. 

contact geoelectrical. A protractor for measuring the angles between adjacent crystal faces. Fay.

contact line. The line of intersection of a contact surface with the surface of an exposure or with the surface of bedrock contact. a contact line may be exposed or concealed. Stokes and Varnes, 1955.

contact logging. a. A method of recording the position of a borehole wall. b. A contact deposit. c. A contact deposit, b: contact deposit: contact vein. Fay.

contact logging. In this type log, provision is made for automatically breaking or making an electrical contact against the borehole wall. By doing this, current flowing from the electrodes to the wall of the borehole need longer to traverse the mud filtrate. The contact of the electrodes through the mud filter cake which shrivels permeable beds is also reduced to a minimum. The spacing of contact logging devices is very small by comparison with the spacings used in conventional logging devices. Consequently, contact logging devices are very much more detailed in the beds they pass through. 

contact logging device. A contact logging device consists of a spring bow very analogous to a section gage. On one arm of the bow is a rubber pad shaped to fit the curvature of the hole. In this pad, slightly recessed, are three electrodes about one-half inch in diameter and located at 1-inch intervals. These three electrodes are used to record two resistivity curves. One curve is a three-electrode type with a spacing of 1½ inches and the second is a two-electrode type with a spacing of 2 inches. 

contact metamorphism. Applied to rocks and/or minerals that have originated through the process of metamorphism. A.G.J.

contact metamorphic deposit. An ore body that formed along the contact of a mass of igneous, country, or invaded rock, the ore having been derived wholly, or in part, from the intrusive mass. If the term contact-metamorphic deposit is used for this type, it would not include the term contact deposit applied to any ore body occurring along the boundary between two kinds of rock. Stokes and Varnes, 1955.

contact metamorphism. a. Metamorphism generally related to a magma (or intrusion) of magmas and taking place in rocks at or near their contact with a body of igneous rock. See also thermal metamorphism. A.G.J. b. The changes that take place along the contact of an igneous rock and the enclosing rocks into which it has been intruded, or the underlying rocks over which it has been extruded. Some of the contact-metamorphic changes are the recrystallization of limestone and the formation of the typical lime-silicate minerals of the contact zone. Metamorphism produced by the heat of an igneous intrusion. Also called thermal metamorphism; thermometaustomorphism; local metamorphism. Fay. See also metamorphic aureole.

contact metamorphic deposit. A deposit formed by high-temperature magmatic emissions along an igneous contact. Beiterman.

contact metamorphism. a. A mass change in the composition of the rock other than the elimination of gases involved in simple metamorphism. USGS Prof. Paper 57, 1907, 117 b. Reporting of contact rocks adjacent to an intrusive resulting from high-temperature emissions from a deep-seated magma. Much material is added. Beiterman.

contact mineral. A mineral formed by contact metamorphism. Fay.

contact. A device for making and breaking an electric power circuit repeatedly. 

contact. Deposition of a metal, without the use of an outside source of current, by immersion of the work in a solution containing the metal ions. 

contact pressure. The unit of pressure that acts at the surface of contact between a material and the underlying soil mass. 

contact rocks. Rocks produced by the heat of a magma; metamorphosed portions of the intruded rocks, such as products from shales, slates, or lime-

260
contact scanning

254

continental plateau

stones; sandstones are less influenced by intrusions. Lewis, p. 603. Also called harm; tachite.

contact scanning. In ultrasonics, a planned systematic movement of the beam relative to the object being inspected, the search unit being operated with and coupled to the object by a thin film of coupling material. ASM Gloss.

contact shoe. A device in contact with the conducting wire or rail and the electric vehicle being powered. Foy, p. 3.

contact twin. The simplest type of twin, in which two portions of a crystal appear to have been unitized along a common plane after one portion has been rotated 180° relative to the other portion. The plane of contact (plane of union or the composition face) may or may not be the twinning plane. See also juxtraposition twin. Foy.

contact vein. A variety of fissure vein, between different kinds of rock occupying a typical fracture from faulting, or it may be a replacement vein formed by mineralized solutions percolating along the contact where the rock is usually more permeable and being replaced one or both of the walls by a metasomatic process. Also called contact deposit. Foy.

contact zone. See aureole. A.G.I.

container. Containment. The provision of a gastight shell or an enclosed space. Webster 2d; Holmes, 1926.

contemporary deformatiom. Deformation, especially folding and faulting, that takes place while the rocks are being deposited. In contrast to the folding and faulting that take place long after the sedimentation. A.G.I.

contemporary erosion. Erosion of local character which is taking place generally elsewhere. Stokes and Vaniers, 1955.

contemporary filling. Methods of mining where the stopes are filled as in filled stopes. Nelson.

contiguous. a. Touching without fusion; applicable whether the parts are like or unlike. A.G.I. b. Touching along boundaries, often for considerable distances. Next to or adjoining with nothing similarly intervening. Synonym for adjacent. Not distant. Touching or connected throughout. Synonym for continuous; unbroken; uninterrupted. Webster 3d. c. Immediate preceded. Webster 3d.

contiguous claims. Mining claims which have a side or end line in common. Lewis, p. 31.

contiguous limestones. Limestones in the same general area and adjoining a cavity or a group of cavities formerly occupied by iron-bearing sulfide. A.G.I.

continent. a. A large landmass rising more or less abruptly above the deep ocean floor. It includes marginal areas that are shallowly submerged. At present continents constitute about one-third of the earth's surface. A.G.I. Supp. b. A continuous extent or mass of land. One of the great divisions of land on the globe. Geologically, a large body of land differing from an island or a peninsula in its size and in its structure, which is divided into basins bordered by mountain chains. Webster 3d.

continental alluvium. Alluvium produced by the erosion of a highland area and deposited by a network of rivers to form a continental plain. A.G.I.

continental basin. A region in the interior of a continent that may comprise one or several closed sub-basins. Such basins are characterized by their depth, water area, and volume of deposits. A.G.I. Supp. c. A terraced area or a submerged plateau adjacent to a continental shelf. A.G.I. Supp. d. Synonym for borderland. A.G.I.

continental deposit. A sedimentary deposit laid down within a general land area in lakes or streams by the wind, as contrasted with marine deposits, laid down in the sea. Foy.

continental drift theory. The hypothesis that the continents can drift on the surface of the earth because of the presumed viscosity of the substratum, much as ice shifts through water. For example, the supposed movement of North America and South America away from Europe and Africa to which this is contrasted with the hypothesis. A.G.I.; Hsu.

continental margin. The zone separating the emergent continents from the deep sea bottom. It generally consists of the continental shelf, the continental slope, and the continental rise. A.G.I. Supp.

continental shelf. That part of the deep ocean overlaying a layer of sial, as contrasted with true ocean floored by sial. A.G.I. Supp.

continental plateaux. A broad proclivity of the surface of the earth, coinciding approximately with a continent but including also the continental shelf. Synonym
for continental platform. Contrast with ocean basin. Webster 3d; Fay.

continental platform. The flat, horizontal surface that forms the base of the continental slope. It is characterized by poorly sorted, mixed sediments and a range of depths from 1,000 to 5,000 feet.

continental process. A method of processing minerals, such as copper, where the ore is smelted to remove impurities and concentrates the metal.

continental slope. The steep, oceanic edge extending from the continental shelf to the floor of the ocean. It is typically characterized by a gradient of less than 1 to 25.

continental shelf. A submerged platform extending from the coast to the continental rise. It is typically shallow and has a gradient of less than 1 to 20.

continental rock. A rock unit deposited on the edge of a continent, extending from the low-water line to the depth of approximately 100 fathoms (600 feet).

continuous azimuth method. A method of traversing by which the azimuth of the survey lines is obtained from the instrument. BS 3518, 1963, sec. 1.

continuous bucket elevator. A conveyor system that consists of a series of buckets attached to a chain or belt that the back of each bucket rides on. It is used to transport materials vertically.

continuous bucket excavator. An excavator consisting of a series of buckets attached to a continuous chain, guided by two or more ladders. The buckets are drawn against the bank face, taking a cut of constant depth, while simultaneously the machine moves slowly along the ground on a bench above or below the bank; often used in opencast mining in soft deposits.

continuous casting. A casting technique in which the shape is continuously solidified while which an ingot. This type of casting is used to produce continuous rolls of steel.

continuous drier. A drier in which the ware is dried in the space at the top required for stemming. It is designed to remove coal from the face and load it onto conveyors or into shuttle cars in a continuous operation.

continuous elevator bucket. A bucket having sides projecting beyond the front and rear, which when spaced continuously with other buckets forms a chute for the material discharged by the following bucket. They pass over the elevator head wheel. Thus, the drilling and blasting do not need more than a part of the shift. Langefors, p. 206.

continuous flow pattern. A type of flow pattern in which the material flows continuously without the use of cutting machines, drills, or explosives. Jones. See also Colmol miner; Crawford-Wilcox continuous miner; Colman miner; Joy miner; Mantetta miner.

continuous mining. A mining method in which the mining machine cuts or strips coal from the face and loads it onto conveyors or into shuttle cars in a continuous operation. Thus, the drilling and shooting by rupture. G.S.A. Memoir 6, 1938, p. 32.
opulations are eliminated, along with the necessity for working several headings in ordinary mining, a heading in which the loading can be in progress at all times. *Woodruff, v. 3, p. 35, b.* Methods of coal mining and the new methods that have become known, broadly, as continuous mining. The longwall machine and conveyor are in that same track which is situated between the last row of props and the face. The conveyor is moved forward progressively as the coal is cut and loaded on the machine. There are no separate or cyclic operations as in conventional machine mining and the aim is to make each shift a continuation of the previous shift.

Where the conditions are favorable, faces up to 250 yards in length may be worked. See also cyclic mining. *Nelson.*

**continuous mixer.** A concrete mixer into which the water, cement, and aggregate are fed without stopping, and from which the mixed concrete pours in a continuous stream. *Ham.*

**continuous burn-off zone.** A regional zone predominantly underlain by permafrost. There is no permafrost at widely scattered spots.

**continuous phase.** In an alloy or portion of an alloy containing more than one phase, the phase that forms the background or matrix in which the other phase or phases are present as isolated units. *ASM Gloss.*

**continuous precipitation.** Precipitation from a supersaturated solution accomplished by a gradual change of lattice parameters of the matrix with aging time. It is characteristic of the alloys which produce uniform precipitation throughout the grains. See also discontinuous precipitation. *ASM Gloss.*

**continuous process of distillation.** A petroleum distillation process in which the crude oil flows into by gravity through a series of stills or retorts each placed slightly lower than the preceding one. Each still has a carefully maintained temperature and yields, therefore, continuously a product of given volatility.

**continuous profiling.** A seismic method of shooting in which seismometer stations are placed along the length of a line and shot from holes spaced along the line so that each hole records seismic waves generated by shots from those immediately adjacent holes, so that events may be carried continuously by equal-time comparisons. *A.G.I.*

**continuous rating.** An electrical machine, or other piece of apparatus, is said to be continuously rated when it gives its rated output continuously without exceeding a certain specified temperature rise or suffering any ill effects. Compare intermittent rating. *C.T.D.*

**continuous reaction series.** That branch of reaction series. That branch of chemical reactions. *Webster 3d.*

**continuous sampler.** A type of sampler for taking a sample from a volumetrically flowing stream at a fixed rate by manual or mechanical means. *Webster 3d.*

**continuous sintering.** Presintering, or sintering, in such manner that the objects are advanced through the sinter at a fixed rate by manual or mechanical means. *Webster 3d.*

**continuous smelter.** Any smelter which feeds melted and continuously and which discharges it at a fixed rate by manual or mechanical means. *Webster 3d.*

**continuous welding.** Any welding which is said to be continuous if it can be carried on without stopping and from which the weld metal is continuously fed into the weld.

**continuous weld.** A weld extending continuously from one end of a joint to the other; where the joint is essentially circular, completely around the joint. Contrast with intermittent weld. *ASM Gloss.*

**continuous wool.** Contiguous wool. *C.T.D.*

**contour diagram.** A type of petrofabric diagram prepared by the contouring of a point diagram. Its purpose is to obtain easier visualization of the results of the petrofabric study. *A.G.I.*

**contour mapping.** See stretch forming; tangent bending; wiper forming. *ASM Gloss.*

**contour gradient.** A line marked on the ground surface at a given constant slope. *Ham.*

**contouring.** There are two general methods in use: (1) the direct method, when the actual points of equal elevation, or level, are located on the ground and surveyed; and (2) the indirect method, when the levels of the contour lines are interpolated and the contour lines are interpolated. The control being the same as in the direct method.

**contour line.** A line connecting points of equal elevation, or level, on the ground. *Ham.*

**contour plan.** A plan drawn to a suitable scale showing surface contours or calculated contours of coal seams to be developed. *Webster 3d.*

**contour trace.** A watercourse following the contour of the ground. *Ham.*

**contour map.** A map showing the configuration of a surface by means of contour lines drawn at regular intervals of elevation, as one for every 20 feet. A crowding of the contour lines indicates steepness. *Webster 3d.*

**contour mapping.** Milling of irregular surfaces. *ASM Gloss.*

**contour line.** A line connecting points of equal elevation, or level, on the ground. *Ham.*

**contour plan.** A plan drawn to a suitable scale showing surface contours or calculated contours of coal seams to be developed. *Webster 3d.*

**contour tracing.** A watercourse following the contour of the ground. *Ham.*

**contour map.** A map showing the configuration of a surface by means of contour lines drawn at regular intervals of elevation, as one for every 20 feet. A crowding of the contour lines indicates steepness. *Webster 3d.*

**contouring.** There are two general methods in use: (1) the direct method, when the actual points of equal elevation, or level, are located on the ground and surveyed; and (2) the indirect method, when the levels of the contour lines are interpolated and the contour lines are interpolated. **contour plan.** A plan drawn to a suitable scale showing surface contours or calculated contours of coal seams to be developed. *Webster 3d.*

**contour tracing.** A watercourse following the contour of the ground. *Ham.*
In coal mining, a term meaning contractioins. A. The action or process of contracting. Drilling work done for a contract in area. The difference between the original cross-sectional area of a ten-contraction hypothesis. The theory that compression causing folding and thrusting is a part of job to the contractor. Pryor, 3. A modification of ingot proper. When, however, the supply of molten metal falls at con- this contracted magma may produce in- contraction miner. a. An experienced man employed by the contractor responsible for carrying out a building or civil engineering contract. Hem. A system for the blowing in of air at the exit end of a tunnel. An act to counteract the normal convection currents. Dodd. a. Something that affords a standard of comparison or a means of verification. As a verb, to check, to test, or to verify by counter examples. As accurate starting points may be regulated. Long. h. Points on the ground, accurately fixed in position horizonally or vertically (or both), which are used as accurate starting and closing points for traverses, plane-tables, or aerial photographic surveys, etc. A system of control points with which local secondary surveys may be tied in to insure their essential accuracy. Control points being tied in to the use of wedges or by manipulation of the drill string. Entwicklung, 5. A mechanism by which the speed or rate of an operation may be regulated. Long. h. Points on the ground, accurately fixed in position hori- zontally or vertically (or both), which are used as accurate starting and closing points for traverses, plane-tables, or aerial photographic surveys, etc. A system of control points which are usually established by triangulation or traverses, and by leveling. Seelye, 2. i. That part of a conduit where the water level gives a good indication of the rate of water. See also Variations of Geologic Formations. A system of control points being tied in to the use of wedges or by manipulation of the drill string. Long. g. A mechanism by which the speed or rate of an operation may be regulated. Long. h. Points on the ground, accurately fixed in position horizonally or vertically (or both), which are used as accurate starting and closing points for traverses, plane-tables, or aerial photographic surveys, etc. A system of control points which are usually established by triangulation or traverses, and by leveling. Seelye, 2. i. That part of a conduit where the water level gives a good indication of the rate of water. See also Variations of Geologic Formations. A system of control points being tied in to the use of wedges or by manipulation of the drill string. Long. g. A mechanism by which the speed or rate of an operation may be regulated. Long. h. Points on the ground, accurately fixed in position horizonally or vertically (or both), which are used as accurate starting and closing points for traverses, plane-tables, or aerial photographic surveys, etc. A system of control points which are usually established by triangulation or traverses, and by leveling. Seelye, 2. i. That part of a conduit where the water level gives a good indication of the rate of water. See also Variations of Geologic Formations. A system of control points being tied in to the use of wedges or by manipulation of the drill string. Long. g. A mechanism by which the speed or rate of an operation may be regulated. Long. h. Points on the ground, accurately fixed in position horizonally or vertically (or both), which are used as accurate starting and closing points for traverses, plane-tables, or aerial photographic surveys, etc. A system of control points which are usually established by triangulation or traverses, and by leveling. Seelye, 2. i. That part of a conduit where the water level gives a good indication of the rate of water. See also Variations of Geologic Formations. A system of control points being tied in to the use of wedges or by manipulation of the drill string. Long. g. A mechanism by which the speed or rate of an operation may be regulated. Long. h. Points on the ground, accurately fixed in position horizonally or vertically (or both), which are used as accurate starting and closing points for traverses, plane-tables, or aerial photographic surveys, etc. A system of control points which are usually established by triangulation or traverses, and by leveling. Seelye, 2. i. That part of a conduit where the water level gives a good indication of the rate of water. See also Variations of Geologic Formations. A system of control points being tied in to the use of wedges or by manipulation of the drill string. Long. g. A mechanism by which the speed or rate of an operation may be regulated. Long. h. Points on the ground, accurately fixed in position horizonally or vertically (or both), which are used as accurate starting and closing points for traverses, plane-tables, or aerial photographic surveys, etc. A system of control points which are usually established by triangulation or traverses, and by leveling. Seelye, 2. i. That part of a conduit where the water level gives a good indication of the rate of water. See also Variations of Geologic Formations. A system of control points being tied in to the use of wedges or by manipulation of the drill string. Long. g. A mechanism by which the speed or rate of an operation may be regulated. Long. h. Points on the ground, accurately fixed in position horizonally or vertically (or both), which are used as accurate starting and closing points for traverses, plane-tables, or aerial photographic surveys, etc. A system of control points which are usually established by triangulation or traverses, and by leveling. Seelye, 2. i. That part of a conduit where the water level gives a good indication of the rate of water. See also Variations of Geologic Formations.
controlled chart

the amplitude of responses before their
recording, including the rapid recovery of
response levels after an onset of energy and
its sensitivity, with the decay of amplitudes received with time. A.G.I.

controlled chart. Graph showing, horizontally,
the operating norm and also the upper and
lower limits within which deviations must
be held. Should these exceed the permitted
variance, special steps must be taken to
locate and correct the upsetting factor or
factors. Pryor, 2.

controlled factor. The ratio between the mini-

um compressive strength and the average
compressive strength. Taylor.

controlled flow. A large gate valve designed to
provide a clear opening for the passage of
drilling tools into a borehole and to act as a head or cap on the casing at the
collar of the borehole. Long.

controlled joints. Provision for the dimensional
change of different parts of a structure
due to shrinkage, expansion, temperature
variation or other causes, so as to avoid the development of stress struts. See also
expansion joint, b. Taylor.

controlled atmosphere. An atmosphere cir-
cumambient to a working space (e.g., a furnace or other heating unit, the oxygen
content of which is regulated or adjusted
to a level low enough to prevent oxidation of diamonds during the sintering stage of
producing a diamond bit by a powder
process. ASM Gloss.

controlled caving. A mining method utilizing
the advantages of longwalls but at the
same time without filling. In this method,
the working room in front of the working
face is protected by close lines of props and
cubs, which are portable and easily
taken to pieces. As the face proceeds the
cubs are shifted as well as the props with the
face, leaving the mined-out room to
cave. This method is also called mining

controlled cooling. Cooling from an elevated temperature in a predetermined manner
to avoid hardening, cracking, or internal
damage, or to produce a desired micro-
structure. It may involve a hot-forming operation. ASM Gloss.

controlled flow. The specified maximum
number of feet of borehole a single dia-
mond- or other-type bit may be allowed
to drill in a specific type rock, as pre-
liminated by the drillorman. Long.

controlled gravity conveyor. See controlled
velocity roller conveyor. ASA M414.1-1959.

controlled mottle. A mottle fitted to a con-
trol plot by rephotographing the compo-
nent vertical photographs to compensate
for any drift of curl, rotation or other
causes, so as to avoid the development of
stress struts. See also expansion joint, b. Taylor.

controlled-pressure cycle. A forming cycle
during which the hydraulic pressure in the
forming cavity is controlled by an adjustable
head. Webster 3d. a. The transfer of heat by
means of convection. See also convection.

conventional machine mining

conventional machine mining. A system of
mining established over many years in
British coal mines. The longwall face is
undercut, blasted and loaded by hand on
to a face conveyor. The conveyor is then
moved forward ready for the next day,
the packs are built and the back props

...c.a.

controlled production. A process for by-
passing the incept phase in iron and steel-
making. Enyclopedia Britannica. Britan-

controlled production. Production of oil by
the manipulation of gas pressures so as to
produce a maximum quantity of oil and
a minimum of gas. Potter.

controlled rectifier. A rectifier in which means
for controlling the current flow through the rectifier devices is provided. Coal
Age, 1.

controlled splitting. When airways are ar-
anged in parallel and a prescribed quan-
ty of air is made to flow through each
branch, being allowed to escape into the
adjacent workings. A.G.I.

controlled strains test. A test in which the
load is so applied that a controlled rate of
damage, or to produce a desired micro-
structure. It may involve a hot-forming operation. ASM Gloss.

control chart. Graph showing, horizontally,
the operating norm and also the upper and
lower limits within which deviations must
be held. Should these exceed the permitted
variance, special steps must be taken to
control the waste or to produce a desired micro-
structure. It may involve a hot-forming operation. ASM Gloss.

conventional milling

withdrawn. Such faces still produce about 60 percent of the total output and is known as conventional machine mining. In machine mining it is often assumed that there are limits to production because it is cyclic mining, that is, it involves separate operating units which are then salvaged above. See also continuous mining. Nelson.

conventional milling. Milling in which the coal is cut into sizes suitable for shipment. It is an operation performed on the feed at the point of contact. ASM Gloss.

conventional mining. The cycle of operations which includes cutting the coal, drilling the shot holes, charging and shooting the holes, loading the broken coal, and instilling roof support. Also known as cyclic mining. Woody, p. 3, pp. 34-35.

conventional strain. See strain. ASM Gloss.

convergence. a. Applied to the diminishing interval between geographic horizons. In some instances, this is due to an unconformable relationship and in other instances to variable rates of deposition. See also imbrach. A.G.I. c. The line of demarcation between turbid river water and clear lake water, which denotes a downstream movement of water on the lake. It is also an index to the kind of water at the surface. A.G.I. c. In reflection phenomena, the decreasing of the distance between the direct or the reflected wave of water travel. This denotes an area of increasing wave height and energy concentration in the foreshore, resembling the one which cannot be attributed to a direct relationship or to genetic affinity. See also convergent evolution. A.G.I. c.

in oceanography, an area or zone in which the water sinks slowly downward from the ocean surface. Schiferdecker. I. When a coal seam is extracted on a lowwall face, the roof lower and the floor lifts causing a convergence of roof and floor, with consequent loss of height. Convergence is an important factor in thin seam mining. Nelson.

convergence map. See isochore map. A.G.I. c. convergence recorder. An appliance for measuring the quality or quantity of electrical energy; a term formerly applied to the transformer, but now restricted to a machine utilizing mechanical rotation. Standard, 1964, b. A furnace in which air is blown through a bath of molten metal or matte, oxidizing the impurities and maintaining the temperature through the heat produced by the oxidation reaction. ASM Gloss. Also used in connection with jet and high speed water at the surface. Stock, 10.

counter air. See primary air, a. Newton, p. 259.

counter foreman. A foreman who supervises the cleaning of coal, and also conducting the conveyer; mate to blister copper; and directs activities concerned with charging conveyor, blowing charge, pouring of slag and copper, casting of blister copper, and removal of castings. D.O.T. Supp.

counter plant. A plant that takes up an insoluble element from the soil, builds it into its living structure, and at death returns it to the soil in soluble form. Hamer.

counter reactor. A nuclear reactor that produces some fissionable material that produces some fissionable material, but less than it consumes. In some usages, a reactor that produces a fissionable material different from the fuel burned. Regardless of the ratio. The process is known as counter in both usages. See also breeder reactor. L&L.

counter smoker. In ore dressing, smelting, and refining, one who makes blister copper (high-grade crude copper) by oxidizing iron and sulfur impurities in copper matte, using a conveyor. D.O.T. Supp.

countering. The process of removing impurities from molten metal or metallic compounds by blowing air through the liquid. The impurities are changed either to gaseous compounds, which are removed by volatilization, or to liquids which are removed as slags. L&L. p. 6, p. 927, b.

the process was applied to the metallurgy of copper by Pierre Manhes. Air is blown through molten copper matte in the presence of free silica. The iron is oxidized to FeO which forms a slag with the silica; the sulfur is oxidized and goes off as SO2. Liddell 2d, p. 493.

converting coal. Mid. A local name given to coal suitable for steelmaking purposes at Sheffield, Fay.

Converting process. A process for flocculating the coal particles in a pulp by means of oil so that they are retained on a suitable screening surface and thereby separated from un flocculated material and the bulk of the water. B.S. 3352, 1962.

corner. Curving like the surface of a sphere. See corner.

conveyor. One who or which conveys, transports, transmits, imparts, or transfers, or specifically; any mechanical contrivance for conveying material in the working of mills, elevators, etc., such as endless chains, etc. Standard, 1964. See conveyor.

conveying, hydraulic. Use of flowing water or slow moving liquids based on water mixed with suitable heavy minerals to convey rock, coal, etc., in p.p. Pryor, 3. conveying pneumatically. Use of compressed air to move fairly fine aggregates laterally and/or vertically, as with small coal, cement, etc. Pryor, 3.

conveyor belt. A belt used to carry the materials which receive the coal from several unit conveyors in rooms or entries. B.C.I. See also armored conveyor, conveyor; gate conveyor, shaker conveyor, trunk conveyor. A. Included are skip hoists and vertical reciprocating conveyors, except those devices known as industrial trucks, tractors, and trailers, tiering machines (truck-type), cranes, hoists, monorails, power shovels and slough power scoops, bucket draglines, platform elevators designed to carry passengers or the elevator operator, and highway or rail vehicles. ASA MH4.1-1958.

conveyor air-lock. A ventilation stopping or separating door through which a conveyor has to run. It consists of at least two well-built partitions, each with some form of air-lock designed to pass the belt and yet reduce to a minimum the leakage of air and the raising of dust. An air-lock chute is sometimes used. Nelson.

counter belt. A belt used to carry the materials and transmit the power required to move the load being conveyed. See also cord conveyor belt; interwoven conveyor belt; rubber conveyor belt; solid woven conveyor belt; steel band belt; steel cable conveyor belt; wired mesh conveyor belt. ASA MH4.1-1958.

conveyor belt joint. The joining of two ends of a belt conveyor to make a continuous band without gaps or exposed ends. The vulcanized joint is the best type and some authorities give its strength as about 80 percent or more of that of the belt. Nelson.

conveyor belt type. See conveyor belt type.

counter, belt-type. A conveyor consisting of
conveyor chain. A chain used in the convey-
cooperite. A soft, greyish-yellow, metallic substance derived from olivine in various localities. The name is derived from Cooper, England, where it was first discovered. The atoms of cooperite are arranged in a hexagonal lattice, with each atom surrounded by six others in a plane. The hardness of cooperite is about 3, and its density is 4.9 g/cm³.

copper. A reddish metallic element, symbol Cu, atomic number 29, and atomic weight 63.55. Copper is a good conductor of heat and electricity, and it is used in a variety of applications, including wiring, plumbing, and jewelry. Copper has a characteristic reddish-brown color, and it is malleable and ductile.

copper machine. A machine that processes copper, such as a casting machine or a rolling mill. Copper machines are used in the production of copper products, such as copper pipe, wire, and sheet metal.

copper machine cutter. A cutting tool used in copper machining operations. Copper machine cutters are typically made of high-speed steel or carbide, and they are designed to remove material from copper parts with minimal tool wear.

copper machine operator. An operator who operates a copper machine, such as a casting machine or a rolling mill. Copper machine operators are responsible for setting up and running the machine, as well as maintaining the equipment and ensuring that the product is of the desired quality.

copper ore. A mineral ore containing copper, such as chalcopyrite, bornite, or chalcocite. Copper ores are typically concentrated by flotation or gravity separation, and the copper is then extracted by leaching, roasting, or smelting.

copper ore concentrating plant. A facility that processes copper ore to produce a concentrate containing a higher copper content. Copper ore concentrating plants may use a variety of processes, such as flotation, roasting, or direct smelting, to concentrate the copper.

copper ore recovery. The process of extracting copper from ore, typically by flotation, roasting, or direct smelting. Copper ore recovery is an important step in the production of copper, as it is the first step in converting copper ore into a commercial product.

copper ore smelting. The process of converting copper ore into a smelter feedstock, typically by roasting or direct smelting. Copper ore smelting is an important step in the production of copper, as it is the second step in converting copper ore into a commercial product.

copper ore welding. The process of welding copper ore, typically to form a concentrate or a feedstock for further processing. Copper ore welding is an important step in the production of copper, as it is the final step in converting copper ore into a commercial product.

copper ore welding furnace. A furnace used for welding copper ore, typically to form a concentrate or a feedstock for further processing. Copper ore welding furnaces are typically equipped with a variety of equipment, such as a charging system, a fuel system, and a gases evacuation system.
copper acetaconte

copper acetaconite; cupric acetaconite; cuprous acetate; Paris green. An emerald-green powder; (Cu(OH)₂, Cu₂O). It is soluble in water; and in most organic solvents. Its molecular weight is 99.85; blue; monoclinic; specific gravity, 1.9. Copper sulfate. D.C. D., Handbook of Chemistry and Physics, 45th ed., 1964, p. B-171. Also added to glass and pottery instead of getting the ground and grounds of copper oxide. It is desirable to get the levulons, reds, and purpures obtainable under these conditions. Copper cement. See emulguage. Hess.

Copper chalcanthite. Synonym for chalc.

Copper calcine. Copper-bearing sulfide ore.

Copper calcite. A white variety of calcite. See also calcite.

Copper calcite. Dioptase. Shipley.

Copper calamine. A brown or yellow powder. Used in refining copper, gold, and silver, in recovering mercury from its ores by the wet process, and in electroplating copper on aluminum. (C.D. 64. 1961).

Copper chloride dihydrate; copper chloride dihydrate. Green, deliquescent; orthohombic. CuCl₂·2H₂O; specific gravity, 2.19. It is used in refining copper, gold, and silver, in recovering mercury from its ores by the wet process, and in electroplating copper on aluminum. (C.D. 64. 1961).

Copper concentrate. A metal which comprises copper scrap from bars for use in casting refined copper. Aby, a bar of metal, of the copper concentrate. (C.D. 64. 1961).

Copper concentrate. The product of any one of a number of forms of concentration processes. (Ricketts.).

Copper, native. See copper oxide. C.D. 64. 1961.

Copper. Native. Like those of gold and silver, crystals of copper are of the cubic system, but well-shaped cubes are quite exceptional, and even complete crystals are rare. The metal usually has the form of thin plates filling narrow crevices in igneous rocks, slate, or sandstone. These are often dendritic. Many aggregates are also common, particularly in the upper parts of veins of copper ore. Native copper is usually dull and lustrous. It is seldom in sufficient quantity to be worked. C.M.D.

Copper nickel. See copper oxide. C.D. 64. 1961.

Copper nitride. Dark green powder; Cu₃N; molecular weight, 79.54; black; monoclinic; specific gravity, 5.84 (at 25° C. referred to water at 4° C). Decomposes at 300° C; decomposes in cold water and in acids. Bennett 2nd, 1962; Handbook of Chemistry and Physics, 45th ed., 1964, p. B-172.

Copper ore. Rock carrying copper mineral or minerals. Wed. 1922; Copper ore; also chalcopyrite, atacamite, azurite, torbernite, lin-arite; malachite; tetratetrahedrite. Copper-ore gems. A mixture of various copper minerals, such as green malachite, green or blue chrysocolla, blue azurite, and red cuprite. Schaller.

Copper ore. Native copper. See copper nitride.

Copper ore, ruby. See cuprite.

Copper ore, zinc. See copper oxide; cupric oxide; copper monoxide; zinc oxide; and also chalcopyrite, atacamite, azurite, tetratetrahedrite, paramelaconite, Cu₂O; molecular weight, 79.54; black; monoclinic; specific gravity, 6.40; and insoluble in water. Bennett 24,
copper oxide, red

1922 Handbook of Chemistry and Physics. 5th ed. 1922 p 177

Copper oxide, red. Copper oxide, red. A form in which copper oxide was being treated with coal to reduce the copper to metallic state before leaching with an ammoniacal ammonium carbonate solution. The process involves heating the oxidized ore with a reducing agent and a halide salt at about 700 degrees C to produce metallic copper which may then be recovered by:

- Reduction with carbon: This can be achieved by reacting copper(II) oxide with carbon monoxide gas in the presence of a suitable catalyst, such as nickel or iron, to produce metallic copper.
- Electrolysis: Copper(II) oxide can be reduced electrolytically in molten cryolite to produce copper metal.
- Reduction with hydrogen: Copper(II) oxide can be reduced with hydrogen gas in the presence of a suitable catalyst, such as nickel or iron, to produce metallic copper.

Copper oxide, red. Copper oxide, red. A form in which copper oxide was being treated with coal to reduce the copper to metallic state before leaching with an ammoniacal ammonium carbonate solution. The process involves heating the oxidized ore with a reducing agent and a halide salt at about 700 degrees C to produce metallic copper which may then be recovered by:

- Reduction with carbon: This can be achieved by reacting copper(II) oxide with carbon monoxide gas in the presence of a suitable catalyst, such as nickel or iron, to produce metallic copper.

- Reduction with hydrogen: Copper(II) oxide can be reduced with hydrogen gas in the presence of a suitable catalyst, such as nickel or iron, to produce metallic copper.
Coral reef. Coral reefs are massive structures composed of calcium carbonate secreted by marine organisms, primarily corals. These reefs are found in tropical and subtropical regions, typically in waters shallower than 200 meters.

Coral-reef coast. A coastal area characterized by coral reefs, which extend from the shoreline into the sea. Coral reefs provide vital habitats for a wide range of marine life.

Coral-reef coral. A type of coral that forms the framework of coral reefs. Corals belong to the phylum Cnidaria and are classified in the class Anthozoa.

Coral sand. Sand composed primarily of the remains of coral skeletons. These sands can be found in areas where coral reefs are located.

Coral-reef limestone. A type of limestone formed from the remains of coral skeletons. Coral reef limestones are found in areas where coral reefs are present.

Cordierite. A silicate mineral formed from the breakdown of other minerals, such as andalusite or sillimanite. Cordierite is often found in metamorphic rocks.

Corolite. A type of natrolite, a hydrated potassium feldspar, which is often found in metamorphic rocks.

Cordite. An explosive material consisting of a mixture of nitroglycerin, potassium nitrate, and absorbent matter.

Cordite relay. A device used in blasting operations to initiate the detonation of explosive charges. Cordite relays are often used in conjunction with other blasting devices.

Cordite test. A method used to determine the sensitivity and safety of cordite or other explosives. This test involves measuring the time it takes for a given weight of explosive to detonate.

Cordofan. A region in northeastern Africa, which is characterized by a series of mountain ranges.

Cordobian. A term used to describe events that occurred during the Cordobaian Stage of the Early Carboniferous Period.

Cordilleran. Pertaining to a mountain range or system of mountain ranges. The Cordilleran includes the Rocky Mountains, Sierra Nevada, and Cascade Range.

Cordilleran orogeny. A period of mountain building that occurred in the Cordilleran region during the Late Cretaceous and Early Tertiary periods.

Cordilleran province. A division of the Cordilleran region, which includes the Rocky Mountains, Sierra Nevada, and Cascade Range.

Cordynod. A term used in geology to describe the structural features of a region.

Core deposit. A core sample taken from a drilling operation to determine the characteristics of the rock formation.

Core material. The sample material extracted from a core sample.

Core sample. A cylindrical or rectangular piece of rock or sediment extracted from a core barrel.

Core sample. A section of rock or sediment that is extracted from a borehole or drill hole.

Core sample. A sample of rock or sediment that is extracted from a core barrel.

Core sample. A sample of rock or sediment that is extracted from a borehole or drill hole.

Core sample. A sample of rock or sediment that is extracted from a core barrel.

Core sample. A sample of rock or sediment that is extracted from a borehole or drill hole.

Core sample. A sample of rock or sediment that is extracted from a core barrel.

Core sample. A sample of rock or sediment that is extracted from a borehole or drill hole.

Core sample. A sample of rock or sediment that is extracted from a core barrel.

Core sample. A sample of rock or sediment that is extracted from a borehole or drill hole.

Core sample. A sample of rock or sediment that is extracted from a core barrel.

Core sample. A sample of rock or sediment that is extracted from a borehole or drill hole.

Core sample. A sample of rock or sediment that is extracted from a core barrel.
core-drill sampling. The act or process of obtaining earth or rock samples by means of annular-cutting bit to penetrate rock formations, using a core-drill machine and equipment. Long.

core equipment. Bits, core barrel, and other equipment used to drill a borehole bored with a core-drill machine with a hollow core that is not bored or drilled in the shop; also, the parts or accessories which serve to retain the shape of a core while it is being removed or transported. 

core extractor, core fisher, core pick. A device used to recover a rock core from the core barrel in which it was drilled. Long.

core filed. A core hole bored to a desired diameter and depth, and having a solid or tube core selected as a sample for study. Long.

core fisher. See core extractor.

core-fishing machine. A device used to recover a rock core from the drill hole where it was drilled. Long.

core fishing. The act or process of recovering a rock core from a drill hole where it was drilled. Long.

core hole. A borehole bored into a rock formation to obtain a recognized portion thereof. Long.

core house. A structure in which boxed core samples are kept temporarily and for a time or permanent storage. Long.

core jam. Synonym for core block. Long.

core jammer. A device used to recover a core from the core barrel in which it was drilled. Long.

core jamp. A device used to recover a core from the core barrel in which it was drilled. Long.

core lifter. Long.

core lifter. A core-handling device consisting of a cup which is driven into a core barrel to recover a core from the core barrel. Long.

core lifting tong. Long.

core lining. Long.

core loss. The portion of rock cored but not recovered. Long.

core magazine. Long.

core library. A structure in which boxed cores are kept for study and reference. Long.

core matcher. A device used to recover a core from the core barrel in which it was drilled. Long.

core mixed. Long.

coreoperator. See diamond driller.

core operator. See diamond driller. 

core operating. Long.

core orientation. Long.

core orientation. The point in a borehole where a core or core body is recovered, as shown by the core; also, the width or thickness of the core body, as shown by the core. Long.

core sample. One or several pieces of whole rock, using a core-drill machine and equipment. Long.

core sample. Long.

core samples. Long.

core samples. Long.

core samples. Long.

core samples. Long.

core samples. Long.
...of rock. A. a core taken from the well drilbng that may be liquid and an inner core, that may be solid. B. a core produced into pieces by chemical treatments. C. core balance method. D. The central part of an anticlinal structure, the core of a hollow object. A. The central part of a plaster mold of the type used in foundries. B. The center of a nuclear reactor containing the fuel elements and usually the moderator. C. the central portion of the earth below itisolvew and chemical analvos. D. A specially formed material to make a cavity in a casting of Masonry. E. A one piece refractory or heat-insulating body, used in foundries. F. One or more members of a sand mold attached to an extrusion die to form holes inextruded brick or tile. G. 1963. A. A center of a nuclear reactor containing fuel elements and usually the moderator.

...of core. A. A. A specially formed material to make a cavity in a casting. B. A core taken from the well drilling that may be liquid and an inner core, that may be solid. C. A. The central part of an anticlinal structure, the core of a hollow object. A. The central part of a plaster mold of the type used in foundries. B. The center of a nuclear reactor containing the fuel elements and usually the moderator.

<tbody>
<tr>
<td>Correlation</td>
<td>Example</td>
<td>Use of correlation in geology</td>
</tr>
</tbody>
</table>

Correlation, a. The determination of the equivalency in geologic age and or stratigraphic position of two formations or other stratigraphic units in separated areas; or more broadly, the determination of the contemporaneous events in the geologic histories of two areas. The same fossils constitute the chief evidence in problems of correlation. Fay. b. Determination of synchrony of homotaxia, or of relation to the scale of geologic time; usually used in the comparison of geologic formations or of fossil faunas or fossil floras belonging to different districts. Webster 3d. c. Correlation of beds. Fay. c. Determination of the similarity of paleontologic or physical evidence, A.G.I. d. In seismic interpretation, the picking of corresponding phases, the examination of the separations and seismometer spreads, of those seismic events which appear to originate at the
Erosion. a. Erosion of land or rock; specifically, wearing or denuding action of a river on its bed and on the banks. b. Anode. c. A diamond surface that has the appearance of having been etched by acid. d. A chemical liquid or gas that eats away a corrosion layer. e. A corrosion product or residue. f. A corrosion coating. g. A corrosion layer or film. h. A corrosion product or residue. i. A corrosion coating. j. A corrosion layer or film. k. A corrosion product or residue. l. A corrosion coating. m. A corrosion layer or film. n. A corrosion product or residue. o. A corrosion coating. p. A corrosion layer or film. q. A corrosion product or residue. r. A corrosion coating. s. A corrosion layer or film. t. A corrosion product or residue. u. A corrosion coating. v. A corrosion layer or film. w. A corrosion product or residue. x. A corrosion coating. y. A corrosion layer or film. z. A corrosion product or residue.
cotton miner. In Quebec, a miner employed in an asbestos mine. Fay.
cotton rock. A variety of chert with a black dense interior and a porous, colored exterior. A.G.I. b. A white to slightly gray or buff variety of limestone colored "cotton rock." The term is colloquial. A.G.I. Also cotton rock.
cottonite. A soft porous appearance suggestive of cotton.
cotton rock. The term is colloquial. A.G.I. Also cotton rock.
cottonite. A soft porous appearance suggestive of cotton.
cotton rock. The term is colloquial. A.G.I. Also cotton rock.
cottonite. A soft porous appearance suggestive of cotton.
cotton rock. The term is colloquial. A.G.I. Also cotton rock.
cotton rock. The term is colloquial. A.G.I. Also cotton rock.
cotton rock. The term is colloquial. A.G.I. Also cotton rock.
cotton rock. The term is colloquial. A.G.I. Also cotton rock.
cotton rock. The term is colloquial. A.G.I. Also cotton rock.

Cottrell operator. In ore dressing, smelting, coulee;
cottontite. A soft white to yellowish lead chalchite, 
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work- 
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work-
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work-
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work-
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work-
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work-
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work-
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work-
Dodd.
coulee. A dry creek bed sometimes running in a straight line until it cuts off the faces of the work-
Dodd.
counterflush. Synonym for reverse circulation.

counterflushing. A method of core drilling in which the circulating fluid passes down the borehole and returns up the inside of the rods, providing continuous recovery of the core. B.S. 3618, 1963, sec. 3.

counterflushing. Strengthening pier bonded and perpendicular to the inner side of a retaining wall, thereby stabilizing it against overturning, and increasing its strength. Ham.

countergangway. A gangway driven obliquely to an existing structure, built on the level or a lower level, or a gangway driven between two lifts and sending its coal down to the bottom. Fay.

counterion. Those able to neutralize anion or cation. Pryor, 3.

countersink. In a twist drill, the tapered and rounded portion around the top of a hole for deburring, for the pilot drill and the body. Osborne.

countershaft. a. A shaft which receives power from one part of a machine and transmits it to another part of the main shaft or to working parts. b. A shaft that allows one end of a main shaft to drive the other through reduction gears. Nichols.

counterstock. A taper drill, the taper and reduced portion situated between the pilot drill and the body. Osborne.

counterstamping. Forming a facing depression around the top of a hole for deburring, for receiving the head of a fastener, or for receiving a center. ASM Gloss.

countervent. A crossover running at approximately right angles to the main ore body. Weed. 1922.

counterweight. a. A weight used with a cylinder, with a chain, or at a pinch driving. Hag. b. A device for joining two rope ends, or pipe. Fay. c. A device for transferring electrical energy from one circuit to another, and may be applied to either straight or reducing sizes. Strock, 3. h. An arrangement for transferring electrical energy from one section of the mine to another or for checking the amount of refuse in coal. Shoot. Nelson. i. A horizontal line on which it cuts the country rock. Fay.

couple. a. In mining, a miner who performs the tasks of a drift miner, of a gang miner, of a skip miner, and of a scraper miner. b. A weight used with a cylinder, with a chain, or at a pinch driving. Hag. c. A device for connecting two cylinder ends of mine cars for joining a chain to the end of a rope. Fay. f. The degree of mutual interaction between the complex of elements resulting from mechanical, acoustical, or electrical linkage. ASM Gloss. g. Occasionally used to mean the connecting device and may be applied to either straight or reducing sizes, Stock, 3. h. An arrangement for transferring electrical energy from one section of the mine to another or for checking the amount of refuse in coal. Shoot. Nelson. i. A horizontal line on which it cuts the country rock. Fay.

coupled wave. A wave with surface seismic wave of complex motion in an elastic medium. It is described only by mathematical explanation. Also called coupled wave, A.G.I.

coupler. a. In mining, a laborer who connects drawbar, hook, chain, or automatic coupling of mine cars to form a set or journey. See also coupler, b. Long. c. A mechanical device used for connecting two rope ends, or pipe. Fay. d. An automatic clip; shackle. C. Nelson. e. An automatic clip; shackle. Nelson. f. A mechanical device used for joining two rope ends, or pipe. Fay. g. A weight used with a cylinder, with a chain, or at a pinch driving. Hag. h. A device for joining two rope ends without splitting. Zero. i. A horizontal line on which it cuts the country rock. Fay.

courthouse. A method used by companies for settling the channel through in coal. The refuse is picked from a few cars of run-of-mine coal daily, and when the amount of refuse is considerable, it is shown to the miner and his laborers. They may be suspended from work if the amount of refuse is too high. Mitchell, p. 216.

courthouse inspector. In bituminous coal mines, one, who examines mine cars of coal for impurities, such as slate, rock, and dirt, by the courthouse system (selecting cars at random for examination). Rejets, on basis of inspection, any group or lot piece as on a casting or forging. ASM Gloss.

coupe-over. Aust. A small chamber, into which an empty skip can be upset to as to allow a full skip to pass when there is only a single line. Called coup-up in Scotland. Fay.

couple plate. In coal mining, steel plate on which tubs are turned from one set of rails to another. Pryor, 3.

course. a. To conduct the ventilation backward and forward through the workings, by means of properly pitched stops and regulators. Fay. b. Som. A team of coal. Fay. c. A progressing or proceeding along a straight line without change of direction. Webster 3d. d. To ventilate a number of faces in series. B.S. 3618, 1963, sec. 2. e. Corn. An inoperative vein as opposed to a lode. See also cross-course. f. The horizontal direction of a geologic structure. Synonym for strike. Webster 3d. g. An influx of water from one direction. Strick, 1960. h. An unperforated lining or row of brick in a structure. HW.

courseted over. See course.

coursed blockwork. When concrete blocks weighing from 10 to 50 tons are used in breakwater construction, the blockwork is laid in horizontal, bonded layers or courses.

coursed brick. See brick, 272.

coursed ventilation. Mine ventilation by the same air current, that is, without splitting of air. Nelson.

course, g. Occasional or frequent. Standard, 1964.

courseted. A method of core drilling in which the circulating fluid passes down the borehole and returns up the inside of the rods, providing continuous recovery of the core. B.S. 3618, 1963, sec. 3.

countrystock. A strengthening pier bonded and perpendicular to the inner side of a retaining wall, thereby stabilizing it against overturning, and increasing its strength. Ham.

countrystock. See counterstock. Fay.

country. The name given by miners to the adjacent to an ore deposit. Fay.

country, c. The rock traversed by or adjacent to an ore deposit. Fay. b. Applied to the rock surrounding and penetrated by mineral veins or invaded by and surrounding an igneous intrusion. Holmes, 1920. c. The rock in which a mineral deposit or ore body is enclosed. Synonym for country. Webster 3d. d. The common rock of a region. Webster 3d.

country estate. Scot. Sale of coal at the mine; sale by cart, as distinguished from disposal by rail or sea. Fay.

country of锭. A combination of plant and equipment for mining. See also room-and-pillar. Fay.

country vertical. The deviation from the vertical. Webster 3d. 1. a. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. b. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. c. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. d. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. e. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. f. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. g. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. h. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. i. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. j. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. k. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. l. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. m. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. n. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. o. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. p. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. q. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. r. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. s. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. t. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. u. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. v. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. w. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. x. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. y. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. z. See dip angle; slope angle; vertical angle; horizon angle. Webster 3d. 

countryside. The name given by miners to the adjacent to an ore deposit. Fay.

countryside, a. A combination of plant and equipment for mining. See also room-and-pillar. Fay.

countryside, b. See course. Fay.

countryside, d. See course, a. Fay.

countryside, e. See course, b. Fay.

countryside, f. See course, c. Fay.

countryside, y. See course, v. Fay.

countryside, z. See course, w. Fay.

countryside, A. A combination of plant and equipment for mining. See also room-and-pillar. Fay.

countryside, B. See course, a. Fay.

countryside, C. See course, b. Fay.

countryside, D. See course, c. Fay.
courtzilite. A form of asphaltum allied to gilsonite. Fay.
cousin wheel. Scot. The drum or pulley on a self-acting plane. Fay.
Cowinian. Lower Middle Devonian. A.G.I.
cove. a. A small sheltered inlet or bay. For example, an irregular shoreline broken by many coves. A tidal stream. Webster 3d, b. A place wheretidal streams come together.
cove buffer. A group of boreholes drilled in advance of mine workings to probe for and detect water-bearing fissures or structures. Long.
cove half. In die casting, the stationary half of a die. ASM Gloss.
cove hole. One of a group of boreholes drilled in advance of mine workings to probe for and detect water-bearing fissures or structures. Long.
covering bored. Yor. A series of bored (rooms) formed on the side of a shaft pillar, from which longwall working is commenced. Fay.
covering formation. Very often beds containing economic deposits of minerals are folded, faulted, and in part eroded. If later they are covered with other younger layers which do not include economic minerals or contain deposits of a different kind from those found in the deeper sequence, then this layer is spoken of as the covering formation. Sheets, v. 1, p. 4.
covering power. a. The degree to which a porcelain enamel coating obscures the underlying surface. Bureau of Mines Staff. b. The degree to which a glaze hides or obscures a ceramic surface. Bureau of Mines Staff.
covering room. The space in which the dust and chippings are extracted from the holding chamber. Long.
cover brick. See cover brick, a.
cover brick. Common term for arch brick used to line soaking pit covers. Bureau of Mines Staff.
cover coat. The top or last coat of porcelain enamel coating obscures the underlying surface. Bureau of Mines Staff.
cover half. In die casting, the stationary half of a die. ASM Gloss.
cover hole. One of a group of boreholes drilled in advance of mine workings to probe for and detect water-bearing fissures or structures. Long.

If later they are covered with other younger layers which do not include economic minerals or contain deposits of a different kind from those found in the deeper sequence, then this layer is spoken of as the covering formation. Sheets, v. 1, p. 4.
covering power. a. The degree to which a porcelain enamel coating obscures the underlying surface. Bureau of Mines Staff. b. The degree to which a glaze hides or obscures a ceramic surface. Bureau of Mines Staff.
covering room. The space in which the dust and chippings are extracted from the holding chamber. Long.
cover brick. Common term for arch brick used to line soaking pit covers. Bureau of Mines Staff.
cover coat. The top or last coat of porcelain enamel coating obscures the underlying surface. Bureau of Mines Staff.
crabhole. A. A coalbreaker. Fay. b. A manila crab locomotive. A trolley locomotive fitted with a crab or winch for hauling mine cars from workings where a trolley wire is not installed. Nelson.
crab locomotive. A trolley locomotive fitted with a crab or winch for hauling mine cars from workings where a trolley wire is not installed. Nelson.
cracking of oil. A name given to the method in which the molecule largely into carbon and petroleum fractions is performed in a shaft. Fay. b. In mining coal. Fay. c. A coal breaker. Fay. d. A hoisting winch used to pull ladles, drums, or other heavy objects that are to be hoisted up and down. Fay. e. A movable platform or scaffold suspended by a cable or rope from the surface, upon which repairs or other work is performed in a shaft. Fay. f. A type of drill that may be attached to a drill, column or arm. Also called caddie. Long. h. Mounting for rock drill. Fay. j. An instrument for holding the tip of a mounted pneumatic drill. C.T.D. k. A support bracket with a hinged connection to its load. Nichols. l. A cartridge. Nichols.
crakle. A. A crazed or cracked surface on art pottery or glass. To produce the effect on pottery the glaze is compounded so as to have a higher thermal expansion than the body; the craze pattern is sometimes emphasized by rubbing coloring matter, such as umber, into the fine cracks. Fay. b. A crazed or cracked surface on pottery, the glaze being made from a material that has undergone little or no relative displacement. A.G.I. c. A glaze in which the surface of which has been intentionally cracked by water immersion and partially heated by reheat- ing before final shaping. ASTM C162-66. d. A motarelled textural effect in a wet process porcelain enamel resembling a wrinkled surface. Fay. e. Enamel characterized by a novel pattern-work of surface resulting from special application and handling. C.T.D. f. See cracked stones. Shipley.
cracked quartz. See cracked stones. Shipley.
cracked stones. Stones in the structure of which numerous small cracks or fissures have been produced by heating and sudden cooling in water, at which time dyes may be forced into the cracks producing stones of various colors. See also Indian emerald. Shipley.
crackled texture. A concentric texture in which minute cracks have developed by shrinkage during crystallization. Schakel.
crackled wood. A term applied to glazed ware in which the glaze shows extensive crazing. Shipley.
crack off. The process of severing a glass article by breaking it, scraping and then polishing it until it splits. Fay. c. A short bar of metal having its two ends bent downwards at right angles for insertion into two adjoining pieces of stone, wood, etc., to hold them together. Fay. d. A pillar of rock or mineral left for support. Fay. e. A contrivance for holding parts of a frame in place during drilling. Fay. f. A locking bar of in-corrodible metal used to bind together adjacent stones in a course, and having bent ends, one of which is pointed and the other is adjustable for position by means of a screw. C.T.D. g. A locking bar of in-corrodible metal used to bind together adjacent stones in a course, and having bent ends, one of which is pointed and the other is adjustable for position by means of a screw. C.T.D. h. A pillar of ore left to support the roof or hanging wall. Fay. i. A part of a series of unworked during previous mining operations. Nelson.
crandallite. A. A stonecutter's hammer for dressing ashlar. Its head is made up of pointed steel bars of square section wedge in a slot in the end of the iron handle. Standard, 1946. b. To dress stone with a crandall. Standard, 1946. c. A movable platform or scaffold suspended by a cable or rope from the surface, upon which repairs or other work is performed in a shaft. Fay. d. A type of drill that may be attached to a drill, column or arm. Also called caddie. Long. h. Mounting for rock drill. Fay. j. An instrument for holding the tip of a mounted pneumatic drill. C.T.D. k. A support bracket with a hinged connection to its load. Nichols. l. A cartridge. Nichols.
crane

fibrous. Formerly called kalkwavelite. From Tiitnic district, Utah; Dehrn, Nassau, Germany. English.

crane. A machine for lifting and transporting heavy weights, generally from above. Mer-

erscave, 4th, p. 414.

crane board. N. of Eng. A return air course connected directly with the furnace. Fay.

crane ladle. A pot or ladle supported by a crane brae.

crane tower. That tower of a derrick crane to the top of which the jib is con-

ected by a tie rod. C.T.D.

cranny. A crack or opening of 6 strands of 37 wires around a hemp center. H & G, p. 129.

crater. A small coal, Wales. Fay. b. Term used in the pottery industry in two related senses: (1) a thin refractory belt used as an item of kiln furniture in the glint firing of wall tiles. A number of cranks, each supporting one or more tiles, are built-up to form a stack; the cranks are kept apart by refractory distance pieces known as dots; and (2) a composite refractory structure for the support of flatware during glint firing and decorating firing; the crank is designed to prevent the glazed surfaces of wall tiles from coming into contact with other ware or kiln furniture. Dodd.

crank. a. Small coal, Wales. Fay. Term used in the pottery industry in two related senses: (1) a thin refractory belt used as an item of kiln furniture in the glint firing of wall tiles. A number of cranks, each supporting one or more tiles, are built-up to form a stack; the cranks are kept apart by refractory distance pieces known as dots; and (2) a composite refractory structure for the support of flatware during glint firing and decorating firing; the crank is designed to prevent the glazed surfaces of wall tiles from coming into contact with other ware or kiln furniture. Dodd.

crank angle. In the pendulum industry, (1) the angle of the centerline of the crank with the centerline of the cylinders or the centerline of the attached slider; and (2) the angle through which the crank turns in a unit time. Porter.

crank press. A mechanical press, the slides of which are actuated by a crankshaft. ASM Gloss.

crankshaft. The engine shaft that converts the reciprocating motion and force of pistons and connecting rods to rotary motion and torque. Nichols.

cranny. Any small opening, fissure, or crevice, as in a wall or rock. Fay.

crappy. York. A term applied to friable or of small size. Webster 3d.

craquelé. See crackle, a. Dodd.

crate dam. A dam built of crates filled with molten metals into molds. Fay.

a. In general, a bowl-shaped topographic depression with steep slopes and gen-

erally an enclosing bowl-shaped area. Webster 3d.

b. The depression above or around the orifice of a volcano that often appears as a bowl-shaped area maintained by successive explosions at the top of a built-up cone. Webster 3d. c. The flaring or bowl-

shaped depression at the top of a volcano. Webster 3d. d. A depression formed by the impact of a meteorite. Webster 3d. e. Any one of thousands of formations on the surface of the moon that range in size from small

pocks less than 1 mile in diameter to walled plains nearly 150 miles across and thought by many investigators to have been caused by the impact of huge meteors and by others to be of igneous origin. Webster 3d. f. In blasting, the funnel of rupture, void, or crater that have very steep sides and a relatively small volume of broken rock. Steaufer. g. The formation of a crater in a volcano. Webster 3d. h. A crater is formed at the top of a well, resulting from a blowout or occasionally from caving. Brantly, 1. b. In machining, a depression in a cutting tool face eroded by chip contact. ASM Gloss. i. In welding, a depression at the termin-

ation of a bead or in the weld pool beneath the electrode. ASM Gloss.

crater; craterlike; craterous. Of or belonging to a crater. Webster 3d.

crater cone. A cone built up around a volcanic vent by lava which reached the surface through that vent, either in a molten state or in fragmental condition. A.G.I.

crater cuts. These cuts consist of one or several fully charged holes in which blasting is carried out towards the face of the tunnel, that is, towards a free surface at right angles to the walls. Langfors, p. 230. These represent in principle a completely new type of cut and make use of the crater effect which is obtained in blasting a single hole at a free rock surface. The possibility of a uniform enlargement can be counted on. This means that if the scale is enlarged so that the diameter and depth of hole and length of the charge are all doubled, the crater cut along the double depth will be obtained. The number of holes can be increased instead of increasing the diameter of the holes. Langfors, p. 232.

cratered. Having a crater or craters. Full of craters, as the cratered moon. Webster 3d.

crater lip. In explosion-formed crater nomenclature, the elevation increase at the crater edge formed by (1) uplifting of strata and (2) deposition of ejecta from the crater. About 25 percent of the apparent crater volume is deposited on the lip. Mining and Minerals Engineering, v. 2, No. 2, February 1956, p. 65.

crater, volcanic. A steep-walled depression at the top of a volcanic cone or on the flanks of a volcano. It is directly above a pipe or vent that feeds the volcano, and out of which volcanic materials are ejected. In its simplest form, it is usually a flat-bottomed cone, or bowl-shaped, or less circular in plan. The diameter of the floor is seldom over 1,000 feet; the depth may be as small as several hundred feet. It is precisely the result of explosions or of collapse at the top of a volcanic con-
duct. See also crater; explosion crater; lat-
cral crater; spatter crater; volcanic crater well. A gas or oil well which blows

its pipe out or leaks along the pipe and washes the soil away from the well until, around the well, a pond or small lake is formed. Bureau of Mines Staff.

crater. A relatively immobile part of the earth and generally of large size. Also spelled krate. The term is preferred in the United States. A.G.I.

cratonic shelf. The zone lying between the more positive and negative areas of a cra-

cranch. A piece of a vein left uncut as a support. Arkell.

crater Sunflower method. A method of mine roadway area measurement utilizing the Sunflower apparatus. This instrument consists essentially of a graduated brass rod, of adjustable length, which can be rotated through 360° in a vertical plane. Radial measurements are made from a central point in the airway, and at observed angles, and these are taken to the periphery of the road. From the data obtained, either a scale diagram of the roadway section is prepared, or else the area is calculated. R.C.M. p. 50-60.

crawler. a. A defect of glasses in which the glass draws up into droplets on the outside of the parts of the surface with insufficient glass. ACSC. b. Synonym for crawway; cat run. Dredges. c. Any machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawler tracks; caterpillars. An endless chain of plates driven by sprockets and used instead of wheels, by Caterpillar power shovels, tractors, bulldozers, drilling machines, etc., as a means of propulsion. Also a mining machine mounted on such tracks. Bureau of Mines Staff. d. Crawlers, etc. A term applied to friable or of small size. Webster 3d.

crawling. A condition very similar to tearing in which broken rock becomes caked or congealed, leaving visible explosions at the top of a built-up cone. The formation of a crater or a cratered area. Webster 3d. c. Any one of a pair of an endless chain of plates driven by sprockets and used instead of wheels, by Caterpillar power shovels, tractors, bulldozers, drilling machines, etc., as a means of propulsion. Also a mining machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawlers, etc. The formation of a crater or a cratered area. Webster 3d. c. Any one of a pair of an endless chain of plates driven by sprockets and used instead of wheels, by Caterpillar power shovels, tractors, bulldozers, drilling machines, etc., as a means of propulsion. Also a mining machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawlers, etc. A longwall cutter machine mounted on such tracks.-Bureau of Mines Staff. Also any machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawlers, etc. A longwall cutter machine mounted on such tracks. Bureau of Mines Staff. Also any machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawlers, etc. A longwall cutter machine mounted on such tracks. Bureau of Mines Staff. Also any machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawlers, etc. A longwall cutter machine mounted on such tracks. Bureau of Mines Staff. Also any machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawlers, etc. A longwall cutter machine mounted on such tracks. Bureau of Mines Staff. Also any machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawlers, etc. A longwall cutter machine mounted on such tracks. Bureau of Mines Staff. Also any machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.

crawlers, etc. A longwall cutter machine mounted on such tracks. Bureau of Mines Staff. Also any machine mounted on such tracks. Bureau of Mines Staff. Local term for an apron feeder to a pan mill used in brickmaking. Dodd.
May be caused by too heavy application, improper drying conditions or too finely ground enamel. Hansen.

crawley. A low passageway that only permits the passage of a man by crawling. A.G.I.

craw picker. Scot. One who picks stones from coal or shale. Fay.

craze. a. Corn. The tin ore which collects in the middle of the buddle. middling. Fay. b. Hairlike cracks appearing in a glaze. Also called crazing. C.T.D.

crazing. The cracking of a surface layer into small irregularly shaped contiguous areas. Tayler. b. Almost invisible cracking in a finished enamel surface, extending down to the base metal. This condition should not be confused with "hairlines". Exam. 2d. 1956.

crazing pot. Popular name in the pottery art. Fay.

crazing. a. The cracking of a surface layer into small irregularly shaped contiguous areas. Taylor. b. Almost invisible cracking in a finished enamel surface, extending down to the base metal. This condition should not be confused with "hairlines". Exam. 2d. 1956.

crease limestone. Forest of Dean. Division of the Carboniferous limestone containing coal or shale. Fay.

creassy peat. Term used in Scotland for a variety of the Carboniferous limestone containing coal or shale. Fay.

creasy peat. Term used in Scotland for a variety a highly bituminous peat. Tompkins 1954.

creede. An iron-black to steel-gray metallic mineral with a black to brownish streak and pavonine cleavage, CaMnO3. Dana 7d, 1956, p. 723.

creek. a. In maritime districts, a small tidal inlet. Fay. b. In inland districts, a small stream or branch of a river; a brook. Fay. c. A stream of less volume than a river. A small tidal channel through a coastal marsh. Local in Maryland and Virginia, a wide arm of a river or bay. A long shallow stream flowing intermittently or an arroyo; local in the southwestern United States. A.G.I.

creek claim. A claim which includes the bed of a creek. Under the statute of Oregon, a tract of land 100 yards square, one side of which abuts on a creek or rather extends to the middle of the stream. Fay.

creekology. a. An ironical term for unscientific methods of choosing drilling sites or prospective oil or gas seepage and particularly applied to selection based on the general appearance of outcrops, topography, drainage, etc. A.G.I. b. The term was derived from a prehistoric, primitive, unscientific practice of locating drilling sites for oil wells along creeks in Pennsylvania in the 18th and 19th centuries. Burwell 1957, p. 761.

creek placers. Placers in, adjacent to, and at the level of small streams. Fay.

creeper. An endless chain, with projecting coils. Used by Crosby to describe mineral veins which have been deposited by upwelling sea water; and hus a continuous boiling range. Webster 3d. c. As used in the petroleum industry for the purpose of working a creek claim. Fay.

creeper. An endless chain, with projecting coils. Used by Crosby to describe mineral veins which have been deposited by upwelling sea water; and hus a continuous boiling range. Webster 3d. c. As used in the petroleum industry for the purpose of working a creek claim. Fay.

creeper. A crane of high lifting capacity for building steel arch and camisole bridges. It generally travels along the top chord of such a bridge during construction. Fay.

creeper. A crane of high lifting capacity for building steel arch and camisole bridges. It generally travels along the top chord of such a bridge during construction. Fay.

creeper. An endless chain, with projecting coils. Used by Crosby to describe mineral veins which have been deposited by upwelling sea water; and hus a continuous boiling range. Webster 3d. c. As used in the petroleum industry for the purpose of working a creek claim. Fay.
creosote, beefwood
C. Also called creosote oil; creosote distillate. ASTM D324-41.
creosote, beefwood. See creosote, wood-tar.
creosote coal-tar solution. A solution of coal tar in creosote in various proportions. Used to contain 80 to 40 percent of coal tar. ASTM D324-41.
creosote, wood-tar; creosote, beefwood. A colorless or faintly yellow, oily liquid; characteristic smoky odor; miscible with alcohol, ether, and fixed or volatile oils; and specific gravity, 1.080. Used as an oreflotation agent. CCD 6d, 1961.
creosoting. The injecting of creosote into timber which is to be exposed to the weather, in order to increase its durability.
Cripin.
crescent cylinder. Strong wrought-iron cylinder in which railroad ties, etc., are exhausted of their moisture and filled with creosote pumped in under pressure. Cripin.
crep bord. Eng. A bord or room more or less straight ridge rising above the general land surface and extending parallel to the direction of ice movement. A.G.I.
crepe pillars. Eng. Pillars of coal which have crept through the various stages of creep. Fay.
crescent cast. See current crescent. Pettijohn.
crest. a. A. The summit of any eminence; the highest natural projection which crowns a hill or mountain, from which the surface dips downward in all directions, or in opposite directions. A.G.I. b. The highest point on an anticline. See also crestline. A.G.I. c. The line connecting the highest points on the same bed in an anticline. See also crest. A.G.I. d. Consisting of groups of tabular crystals forming ridges. Stepley.
crest gate. A gate for maintaining or lowering water level, erected at the crest of a dam. See also gate. Ham.
crimping; after it has been burned-in, the furnace bottom characterized by the fine-grained, earthy appearance. Hess.
crimping; after it has been burned-in, the furnace bottom characterized by the fine-grained, earthy appearance. Hess.
crifly. A miner's luncheon. Fay. c. Erg. A wooden foundation upon which a cast-iron ring in a shaft upon which tubber is supported.
critchie. A method of timbering used primarily to rectify a mistake of removing too great a percentage of the coal on the advance, and has the effect of replacing part of the coal. Some are made by using timbers in pigpen style; first laying timbers one way then placing other timbers across the first. This is continued in a zigzag fashion between the bottom and the roof is filled and wedged tight. Others are made by laying a layer of timbers first in one direction, then another layer across at right angles to the bottom layer. Space between the timbers in a layer varies according to requirements. The hollow type are generally filled with gob. Kentucky, p. 142.
criff dam. A dam constructed of interlocking rectangular sections of timber or precast concrete, laid to a batter, having cells, which are filled with earth or broken rock. See also gravity retaining wall. Hnm.
crib dam. See also crib. Fay.
crib. Segments of oak to encircle the shaft. Peel.
cribwork. A construction of timbering made by piling logs or beams horizontally one above another, and spiraling or chaining them together, each layer being at right angles to the one above and below. Also called crib, b. Fay.
cricktonite. A variety of ilmenite in which the proportion of titaniferous oxide is less than normal. Standard, 1964.
cribbing. Term used in South Wales for a carbonaceous shale or clay associated with coal. Tomkentff, 1834.
crill and Eversen process. A flotation process in which the ore is crushed to 50 mesh and mixed with a thick black oil. Boiling water containing enough acid to give it a tart taste is then added. This process was tested at Borough City, Ore., and at Denver, Colo., in 1889. Liddell 2d, p. 406.
crimp. The flattening made by a crimper near the mouth of a blasting cap for holding the fuse in place. Fay. b. To fix detonator on blasting fuse by squeezing it with a special plier. Fay. c. A tight bend in metal made under pressure. Nichols.
crimp and Bruges' formula. A formula connecting the rate of flow with its hydraulic mean depth and slope:
\[ v = \frac{244m^0.5}{2n} \]
where \( v \) is the velocity of flow, \( m \) is the hydraulic mean depth, and \( n \) is the hydraulic gradient. The units are in feet per...
crimp

second and see. See also Barnes' formula. Ham.
crimp. A tool specially made for fastening a cap to a fuse. Stauffer. See also cap opener.
crimping. a. The action of squeezing the open end of a metal, or detaching, that end from the body of the metal, or metal sheet, by means of a tool. b. Forming relatively small corrugations in order to: (1) set down and lock in place. c. An operation whereby the metal around or along the edge of the piece is shaped into the form of a roll or curl. Hensel.
crimson night shade. Purple flourite from Idaho. Schaller.
crinacea. A rock composed of sodic plagioclase, much titanaitaegite and olivine, with minor analcite,apatite, and opaque oxides. The texture is ophitic. A variety of theralite. Ag.
crinkle. A small fold, usually a fraction of an inch in wavelength. A.G.I.
crinkled. A textural effect on a porcelain enamel surface having the appearance of fine wrinkles or ridges. ASTM C286-65.
crinkled bedding. Bedding of laminations displaying minute wrinkles; in carbonate rocks crinkled bedding is believed related to algal mats. This term is also used for convolute bedding. Pettijohn.
crinkle marks. A series of sub-parallel corrugations of the bedding surface related to both the folded internal structures ascribed to subaqueous solifluction. See also creep wrinkles. Pettijohn.
crinal. A series of sub-parallel corrugations of the bedding surface related to both the folded internal structures ascribed to subaqueous solifluction. See also creep wrinkles. Pettijohn.
crinoidea. A large class of chiefly tropical echinoderms that have a more or less cup-shaped body provided with five or more feathery arms that are commonly bifurcated or many-branched and bearing pinnules, a mouth lying between the arms on the concave upper surface, and opposite the mouth usually a long jointed stalk fixed to the base of the body and having its opposite end divided into rhizoid processes that anchor the animal to the sea bottom. A.G.I.
crinoidea. A large class of chiefly tropical or fossil echinoderms that have a more or less cup-shaped body provided with five or more feathery arms that are commonly bifurcated or many-branched and bearing pinnules, a mouth lying between the arms on the concave upper surface, and opposite the mouth usually a long jointed stalk fixed to the base of the body and having its opposite end divided into rhizoid processes that anchor the animal to the sea bottom. A.G.I.
crinoidea. A large class of chiefly tropical or fossil echinoderms that have a more or less cup-shaped body provided with five or more feathery arms that are commonly bifurcated or many-branched and bearing pinnules, a mouth lying between the arms on the concave upper surface, and opposite the mouth usually a long jointed stalk fixed to the base of the body and having its opposite end divided into rhizoid processes that anchor the animal to the sea bottom. A.G.I.
crinoidea. A large class of chiefly tropical or fossil echinoderms that have a more or less cup-shaped body provided with five or more feathery arms that are commonly bifurcated or many-branched and bearing pinnules, a mouth lying between the arms on the concave upper surface, and opposite the mouth usually a long jointed stalk fixed to the base of the body and having its opposite end divided into rhizoid processes that anchor the animal to the sea bottom. A.G.I.

278

critical minerals

damping constant and the undamped frequency of a seismometer or seismograph are of great practical importance. After a certain moving mass approaches rest position without overswing and the motion is said to be aperiodic.
critical density

density of a substance at its critical temperature and under its critical pressure. A.G.I. b. The unit weight of a saturated granular material below which it will lose strength and above which it will gain strength when subjected to real degradation. The critical density of a given material is dependent on many factors. ASCE P1826.6. In particle classification under approximately free conditions of fall through water, the minimum ratio of solid to liquid at which the hindered effect caused by the solid-liquid mixture is effective. Pryor, 3.
critical depth

given quantity of water in an open conduit may flow at two depths having the same energy head. When these depths coincide, the energy head is a minimum and the corresponding depth is Belanger's critical depth. Selsey, 1.
critical distance

in refraction seismic work, that distance at which the refracted wave and the direct wave in an upper medium is matched in arrival time by that of the refracted wave from the medium below having greater velocity. ASCE P1826.6.
critical experiment

an experiment conducted to verify the results of calculations relative to the critical size and other physical data affecting a reactor design. The power is kept so low that equipment to remove heat is not required. Critical facilities are acquired and used as the need arises. Pryor, 3.
critical facility

a facility where critical experiments are conducted. LBL. A. A condition of flow for which the mean velocity is at one of the critical values. See also critical velocity, subcritical flow.
critical height

the heights of vertical cuts in a cohesive soil (for example, clay) at which they will stand without supports. Nelson.
critical hydraulic gradient

the hydraulic gradient at which the effective pressure in a mass of cohesionless soil is reduced to zero by the upward flow of water. ASCE P1826.6.
critical mass

the state of a nuclear reactor when it is sustaining a chain reaction. See also dry criticality, wet criticality.
critical mass

the smallest mass of fissionable material that will support a self-sustaining chain reaction under stated conditions. ASCE P1826.6.
critical material

a material that is vital to the national defense, the main source of which is within the continental limits of the United States, and which may not be produced in quality and quantity sufficient to meet requirements. A.G.I.
critical minerals

minerals essential to the national defense, the procurement of which is difficult, which is less serious than those other strategic minerals because they can be either domestically produced or obtained in more adequate quantities or have a lesser degree of essentiality, and for which some degree of conservation and distribution control is necessary. ASCE P1826.6. A. Metals essential to national defense. B. Minerals or mineral associations that are stable only under the conditions of one given metamorphic facies and will change upon change of facies. For example, in Eskola's green schist facies, sericite and
critical path schedule. A methodical and critical rate. The rate of cooling required to critical speed. a. The speed at which a rotating or oscillating member reaches a specified level of performance.

critical point. The point at which the properties of a liquid and its vapor become indistinguishable. It is generally synonymous with critical temperature. A.G.I. b. The temperature or pressure at which a change occurs in the properties of a substance. ASM Gloss.

critical pressure. a. The maximum feed pressure which can be applied to a diamond bit without damaging the bit or core barrel. Long, b. The minimum load, in pounds per square inch, at which the diamonds cut the rock. Below this load, the diamonds slide on the rock surface without penetrating into a bit face, at which the diamonds cut the rock. Below this load, the diamonds slide on the rock surface without penetrating into the rock, and the diamonds polish, become dull, and are rendered unfit for further use in that particular ground unless renewed. Long, c. The pressure exerted by a substance in its critical state. Webster 3d. d. The pressure at which a substance can just be condensed to liquid by an increase in pressure. ASM Gloss.

critical range. The range of temperature in which the reversible change from one form to another (stable at high temperature) to ferrite, pearlite, and cementite (stable at low temperature) occurs. The upper critical range will be at a higher temperature than the lower limit for slow heating and cooling is about 700° C. C.T.D.

critical rate. The cooling rate required to prevent the formation of pearlite and to secure the formation of martensite in steel. With carbon steel this means cooling in cold water, but it is reduced by the addition of other elements, hence oil- and air-hardening steels. C.T.D.

critical slope. The maximum angle with the horizontal at which a sloping bank of soil or given height of soil will stand unsupported. A.G.I. P1826. b. Synonym for angle of repose, A.G.I.

critical speed. a. The speed at which a rotating drill bit begins to vibrate excessively; hence by either decreasing or increasing the rotational speed of the drill stem the vibration may be reduced or alleviated. Long, b. The theoretical speed at which a bit is held to the inner surface of the smooth drill lines by centrifugal force n = \[ \frac{7.66}{\sqrt{d}} \] 

where n equals revolutions per minute, and d the mill diameter in feet. Pryor, 4. c. A rotational speed that correlates with the efficiency and the endurance of the rotating member. ASM Gloss.

critical state. An unstable condition of a substance when on the point of changing from a liquid to a vapor, or vice versa, defined by its critical temperature and its critical pressure. The former is the highest temperature at which that particular substance can exist in a liquid state at any pressure. The latter is the vapor pressure at the critical temperature. For example, the critical temperature of dioxygen is 31° C and its critical pressure is 73 atmospheres. Standard, 1964.

critical strain. The strain just sufficient to cause the growth of very large grains during heating where no phase transformations take place. A.G.I. P1826.

critical surface. See critical circle.

flows. Magnetic solids adhere to underside of belt and are dragged clear. Pryor, 3.

crococite. See crocoite.

crocoite. An orange Siberian mineral consisting of lead chromate, PbCrO4; monochlor. Also called crocidolite. C.T.D. Also called crocodile ore. Webster 3d.

crocus. A term used in the Milford, N.H., quarries to denote gneiss or any other rock in contact with granite. Fay.

crocus cloth. Cloth to which pulverized oxide of iron is glued; used for polishing. Gruppin.

crocus bally. A name used for impure red ferric oxide pigments and polishing powders, usually produced by heating iron sulfate containing calcium sulfate, lime, or other inert filler. Also sometimes applied more generally to other impure oxides of red or yellow color. C.C.D. 6d, 1961.

crucible. A shallow, open vessel of clay or porcelain for holding a body during a fusion or other process; also, a mixed mass; as, a slag in refining. Webster 3d.

crus. red. A red pigment based on ferric oxide but containing a large proportion of calcium sulfate or similar material. Similar to Venetian red. C.C.D. 6d, 1961.

crop hang. Crags. Eng. A name to indicate recesses or concrescentionary masses of limestone. Arkell.

crokan. The rocks of the Upper Cambrian age in the Pacific province from St. Croix, Minn., to the type locality. C.T.D.

crokatlite. An alkali pyroxene, containing augite, melilite, and biotite; from the Crook Hill's, Antyll, Scotland. Holmes, 1928.

croknitting process. A process. ASM Gloss.

cronite #1. Explosive; used in mines. Bureau of Mines Staff.

croscendite. A coal-black to brownish-black hydrous iron silicate, 6Fe₂O₃·9SiO₂·2H₂O, with some admixture of Fe₅O₇; by Fe₅O₇ (Si ?); sometimes contains magnesium; structurally related to kaolinite, (+) = a chlorite. Fay, H.W., 2d, 1955.

crooked hole. A borehole which has deviated from the vertical or from the direction along which it was started. Horizonal and inclined diamond drill holes over 300 feet in length are liable to deviate badly. Holes which are drilled vertically may also deviate but not usually to the same degree. A borehole may become crooked due to (1) dipping strata of different hardness; (2) fault planes or shear zones; or (3) drilling defects or inefficiency. See also borehole surveying. Nelson.

crooketsite. A massive, compact, metallic, lead-gray selenide of copper, tellurium, and silver, Cu₂Te₃(Sb). See Fay. b. Synonym of tellurite. Fay 2d, 1922.

crop. a. The outcrop of a ledge; or the coal of poor quality at the outcropping of a
crop coal

steam. Standard, 1964. a. As a verb, to appear at the surface; to outcrop. Webster 3d.

crop coal or stone which has to be taken down in order to secure a safe roof in the workings. Fay. d. Corn. See crop tin, Fay. e. To leave coal at the bottom of a bed. See also cropping coal. Fay.

to fine when the coal in a tub contains too much refuse; it is done by deducting a percentage of the weight. Standard, 1964. g. A defective end portion of an ingot which is cut off as scrap. A.M. Gloss.

crop coal. a. Coal of inferior quality near the surface. Fay. b. N. of Eng. Coal remaining on the pit bottom due to a lack of points not on the outcrop of the bed. Synonymous with day fall. Fay.

crop line. A line following the outcrop. Austin.

cropping COW. The leaving of a small thickness of coal at the bottom of the seam by the cutterjib rising from the floor. Has to be taken up by picks. In miners' parlance, to crop upwards. Eng. In miners' parlance, to allow water to drain from the face into the coal. Trist. c. The coal next to the roof in a seam. Fay.

crop fall. A caving in of the surface at the outcrop of the bed caused by mining operations. Applied also to fragments of coal or stone which have to be taken down in order to secure a safe roof in the workings. Fay. d. Corn. See crop tin, Fay.

crop load. The mixture of crushing bodies, which is cut off as scrap. A.M. Gloss.

crop tin. Fay. To leave coal at the bottom of a bed. See also cropping coal. Fay.

crop upwards. Eng. In miners' parlance, to allow water to drain from the face into the coal. Trist. c. The coal next to the roof in a seam. Fay.

crop tin. Fay. To leave coal at the bottom of a bed. See also cropping coal. Fay.

crop topp. N. of Eng. Coal remaining on the pit bottom due to a lack of points not on the outcrop of the bed. Synonymous with day fall. Fay.

crop line. A line following the outcrop. Austin.

cropping COW. The leaving of a small thickness of coal at the bottom of the seam by the cutterjib rising from the floor. Has to be taken up by picks. In miners' parlance, to crop upwards. Eng. In miners' parlance, to allow water to drain from the face into the coal. Trist. c. The coal next to the roof in a seam. Fay.

crop fall. A caving in of the surface at the outcrop of the bed caused by mining operations. Applied also to fragments of coal or stone which have to be taken down in order to secure a safe roof in the workings. Fay. d. Corn. See crop tin, Fay.

crop load. The mixture of crushing bodies, which is cut off as scrap. A.M. Gloss.

crop tin. Fay. To leave coal at the bottom of a bed. See also cropping coal. Fay.

crop load. The mixture of crushing bodies, which is cut off as scrap. A.M. Gloss.

crop tin. Fay. To leave coal at the bottom of a bed. See also cropping coal. Fay.
used with niscal prisms (or equivalent polarizing devices) in the crossed position, will be often called crossed (crossed Nicol). Two niscal prisms placed one in front of the other, or one below the other, are polarizers. The light intensity will remain the same. Syenitic rock.

cross frog. A frog adapted for railroad tracks laying, essential for parallel track construction.

cross-folding. A folding mechanism that produces folds in a rock layer that is essentially parallel to the flow line. A.G.I. Supp. b. A junction in sedimentary rocks with more prominent joints at an approximate right angle. A.G.I. Supp. c. See head joint. ACSG.

cross-fossae. A system of cross joints in igneous rock oriented more or less perpendicular to the flow lines. Synonym for tension joint. A.G.I. Supp. b. A junction in sedimentary rocks that consists of tabular, irregularly lenticular, or wedge-shaped bodies lying essentially parallel to the plane of foliation and which themselves show a pronounced decorated structure in which the laminae are steeply inclined to the general bedding. A.G.I. c. Cross-stratification of foresets less than 1 centimeter thick. Pettijohn.

cross-bedding. A heading driven horizontally to cross a drift or to intersect and work coal seams. Nelson.

cross bedding. Fay.
crown flint glass

crown. In power shovel nomenclature, crowning is the thrusting of the dipper stile upward over the back of the dish. The term extruding is the reverse of crowning. Carson, p. 38.
crowing buffle. In froth flotation, a slotted board used to direct the rising mineralized froth toward the overflow lip of the cell. Pryor, 3.
crowing barrel. A handbarrow for bricks; it has a base and front, but no sides. Dodd.
crowe process. The treatment of ores to convert cyano-solution to remove air before the gold is precipitated. Nelson.
crowfoot. A V-shaped notch in an arch block; sometimes made in the bottom block where this rests upon the wall plate. Stauffer. b. A tool with a sideclaw, for grasping and recovering broken rods in deep boreholes. Fay. c. An iron claw or fork, to which a rope is attached, and by which the rods are lowered and raised when changing the tools in deep boreholes. Fay. d. Irregular or zigzag markings found in Tennessee marble. Also called stylolite. AIME, p. 331.
crowned. a. A timber crossbar up to 16 ft long supported by two heavy legs, or uprights, one at each end. Crowns may be set at 3-foot intervals and sometimes a roof bolt is put through the center of the crown. Nelson. b. The elevation of a road center above its sides. Nichols. c. The curved roof of a tunnel. Nichols. d. As used by the drilling and bit-setting industries in the United States, the portion of the bit insert or impregnated with diamonds formed by casting or pressure-molding and sintering processes; hence the steel bit blank to which the crown was not considered part of the crown. Long. e. The topmost part of a drill tripod, derrick, or mast. Long. f. Used in some countries other than the United States as a synonym for bit. Long. g. The part of a furnace forming the top or roof. ASTM C 17. h. A contour on a sheet or roll where the thickness or diameter increases from edge to center. ASTM Glass. i. The top section of a pulley, set where the cylinder and other working parts may be mounted. Also called dome; head; top plate; crown block. Asm glass.
crown arch. The arched plate which supports the crown sheet of the firebox of a boiler. Fay.
crown bar. a. One of the bars on which the crown sheet of a locomotive rests. Fay. b. Strong timber, usually round, in supporting the roof of a tunnel in the English method of driving. Stauffer.
crown blast. The procedure of blowing air at roof level into the exit end of a tunnel kiln to counteract the natural flow of gases in this part of the kiln. Dodd.
crown block. A pulley, set of pulleys, or sheaves at the top of a drill derrick on and over which the hoist and other running parts run. Also called crown pulley; crown wheel; Long.
crown brick. See key brick; center brick. Dodd.
crown die. Synonym for bit mold. Long.
crowned pulley. In power transmission, one with convex curve of driving rim, aiding flux flow to the teeth. Stauffer. 3.
crown fire. A fire burning in tree tops. Nichols.
crown flint glass. An optical crown glass bordering on optical flint glass because of the addition of a substantial content of
crown formation

lead oxide and with somewhat higher dispersion than optical crown glass. ASTM C3-65. A rod can be replaced by crown formation. Aust. Used in Bendigo for the outcrop of saddle reefs crowning the hills, from which points the reefs dip into the surrounding country.

crown glass. a. Glass of the alkaline-silica type, as opposed to lead glass (flint glass); used for electric light bulbs. Also called soda-lime glass. C.T.D. b. Glass of uneven thickness and slightly convex (therefore, producing some optical distortion), handmade by blowing and spinning. Compare optical crown glass. Dodd.

crown gold. Gold that is eleven-twelfths fine (91.67 percent pure gold). Used in the minting of the crown of the rose from 1526 and adopted in 1663 by King Charles II for other English gold coins. Webster 3d.

crown-in. The pressure of the overlying strata causing falls of roof or creep in the floor of a rock-salt mine. Nelson.

crowning. The heaving or lifting of the floor beds along a roadway to form a ridge or crown along the center line. Nelson. crowning-ins. S. Staff. The strata forming the roof or cover. Fay.

crown. a. The top of the furnace or firebox of an internally fired steam boiler. Webster 3d.

crown pulley. A pulley whose diameter is greater at the middle than at the edges of its face. This crown tends to prevent the belt from running off the pulley provided the belt is not slipping. Cripin.

crown sheet. The plate that forms the top of the furnace or firebox of an externally fired steam boiler. Webster 3d.

crown tree; crown. A piece of timber set on props to keep them in place. Fay.

crown's foot. A clavelike tool used to withdraw broken rods from a borehole. See also screw bell; spiral worm. Nelson.

crub. A bulldozer blade that follows the wheel or ladder of a ditching machine to clean and shape the bottom. Nichols.

crubble. Frangible earthy peat or peaty soil. Nelson.

283

erump; bump

crozzle. a. To shrivel or cake with heat; to crozzle. a. Shriveling. b. Term used in Derbyshire for caking coal. Tomkeieff, 1954.

crucible. a. Crucible furnace. The hearth of a blow furnace, cupola, or open hearth; a refractory vessel for melting or calcining metals, ores, etc. Bureau of Mines Staff.

crucible assay. See assay; lead button. Nelson.

cruckles. Ball clays that are relatively refractory, rather than producing clays that will withstand high temperatures. CCD 6d, 1951.

crude asphalt; crude pitch. Raw asphalt as it is obtained. Mersereau, 4th, p. 206.

crude intermediate. A naturally occurring mixture, consisting primarily of hydrocarbons, usually with traces of sulfur, nitrogen, or oxygen compounds.

crude liquid. Petroleum in the crude state. See also crude.

crude mineral oil. Crude petroleum.

crude ore. a. Raw petroleum as it comes from the earth. Mersereau, 4th, p. 198. b. A bitumen of liquid consistency, comparable in volatile content, principally of hydrocarbons, usually with traces of sulfur, nitrogen, or oxygen compounds.

crude oil. a. Oil petroleum. A naturally occurring mixture, consisting primarily of hydrocarbons, and/or sulfur, nitrogen, and/or oxygen derivatives of hydrocarbons, which is removed from the earth in liquid state capable of being so removed. ASTM D288-57.

crude shale oil. The oil obtained as a distillate by the destructive distillation of oil shale. ASTM D50.

crude sulfur; brimstone. Elemental sulfur that is 99.0 to 99.9 percent pure and is not altered or prepared. BuMines Bull. 630, 1965, p. 903.

crude tar bases. Mixtures of those constituents of coal tar which can be extracted from the lower boiling distillates by distillation. Contains essentially of basic compounds of the pyridine series. Bennett 2d, 1960.

crump; bump

Ground movement, perhaps violent, due to failure under stress of ground surrounding underground workings, particularly in Arkell deposits or seams, phenol, pyridine, indene, coumarone, naphthalene, and crude mica. The crude crystals or books as extracted from crozzling coal. Tomkeieff, 1954.

crude mineral oil. Crude petroleum. Fay.

crude oil. a. Oil petroleum. A naturally occurring mixture, consisting primarily of hydrocarbons, and/or sulfur, nitrogen, and/or oxygen derivatives of hydrocarbons, which is removed from the earth in liquid state capable of being so removed. ASTM D288-57.

crude shale oil. The oil obtained as a distillate by the destructive distillation of oil shale. ASTM D50.

crude sulfur; brimstone. Elemental sulfur that is 99.0 to 99.9 percent pure and is not altered or prepared. BuMines Bull. 630, 1965, p. 903.

crude tar bases. Mixtures of those constituents of coal tar which can be extracted from the lower boiling distillates by distillation. Contains essentially of basic compounds of the pyridine series. Bennett 2d, 1960.

crump; bump

Ground movement, perhaps violent, due to failure under stress of ground surrounding underground workings, particularly in Arkell deposits or seams, phenol, pyridine, indene, coumarone, naphthalene, and crude mica. The crude crystals or books as extracted from crozzling coal. Tomkeieff, 1954.

See also bump. Pryor, 3.
crumpled ball: Highly irregular, crumpled-up masses of laminated sandstone, 5 to 25 centimeters across, flattened and bulging up from the bed on which they lie, to form a pile of stubble balls which have smooth surfaces. Pettijohn.

crumpled mud-crack casts: Sand fillings (of mud cracks) that display playmud deformation or crumpling produced by adjustment of fillings to compaction of enclosing mud matrix. Pettijohn.

crass: A gradual settling of the measures having been crushed together during or into the floor. A variation of creep. Fay.

crush a. A general settlement of the strata above a coal mine due to failure of pillars; generally accompanied by numerous local falls of roof in mine workings. Fay. b. A species of fault in coal. Fay. c. Breakage of supports of underground workings under roof pressure. Pryor. 3. d. A casting defect caused by a partial destruction of the mold before the metal was poured. ASM Gloss.

crushability: The relative ease of crushing a sample under standard conditions. B.S. 3552, 1962.

crush belt: A belt of intensely crushed rock.

crush border: A microscopic granular texture sometimes characterizing adjacent fossil particles in consequence of their having been crushed together during or subsequent to their crystallization. Fay.

crush brecia: A breccia produced by the shearing of rocks along a fault. Fay. b. A breccia formed essentially in situ by cataclasis. S. 22; cataclasite; crush conglomerate. A.G.I.

crush bursts: Rock bursts in which there is actual failure at the face of movement of the walls. Higham, p. 208.

crush conglomerate: a. A conglomerate produced by the crushing of rock strata in the shearing often accompanying folding. Standard, 1964. b. Similar to a fault breccia, but the rock fragments are more rounded in a crush conglomerate. A.G.I.

crush dress: A process of using steel rolls to form or dress the face of grinding wheels to any desired contour. ACSG, 1963.

crush gravel: The product resulting from the artificial crushing of gravel with substantially all fragments having at least one face resulting from fracture. ASTM C125-66.

crush gypsum: Gypsum subjected to a primary crushing operation. ASTM C11-60.

crush steel: A metallic abrasive made from high carbon and crushable sheet steel specifically treated to impart brittleness. It is then crushed to sizes ranging from 2 to 200 mesh. After screening, each batch is heat treated and separated into 25 sizes ranging from 20 to 200 mesh. AIME, p. 19.

crush stone: a. The product resulting from crushing or grinding of rocks, boulders, or large cobblestones, substantially all faces of which have resulted from crushing, grinding. operation. ASTM C125-66. b. Term applied to irregular fragments of rock crushed or ground to small sizes. Also called broken stone. Bu Mines Bull. 650, 1965, p. 865.

crush vein: A mineralized zone or belt of crushed material. The crushing was caused by folding or faulting. Fay.

crush: A machine for crushing rock or other materials. Among the various types of crushing devices are: jaw, gyratory, cone, hammer, and tube mills. Fay. Hus.

crush and blend operator: In the coke products industry, one who prepares coal for cooking by mixing coal of various compositions and cooking it in mechanical blending and crushing plant. D.O.T. Supp.

crush feeder: In quarry industry, one who feeds broken rock into crusher after it is dumped from trucks or cars, by pushing it down a chute with a shovel or bar, or by pushing it directly into crusher from a platform. Also called crusher loader; laborer, crusher; stone breaker; trap man. D.O.T. Supp.

crush foreman: A foreman who supervises workers engaged in unloading, transporting, crushing, and grinding ore. Oversees activities, such as unloading of ore from cars into bins, discharging of ore from bins onto conveyors to crusher, crushing of ore to designated size, selection of ore by mechanical samplers, and transportation of ore by elevators and belts to various bins or storage areas. D.O.T. Supp.

crush loader: A general term used to designate workers performing any one or a combination of unskilled tasks, concerned with crushing and grinding ore preparatory to concentration of metal. D.O.T. Supp.

crush man: a. In anthracite and bituminous coal mining, one who operates a crusher through which large coal is run to break it into smaller sizes. D.O.T. 1. b. In quarrying, one who operates a crusher through which broken quarry rock is run to break it into crushed stone for construction work. D.O.T. 1.

crush opener: In the concrete products and construction industry, one who operates an electric, gasoline, or steam-powered rock-crushing machine that may be provided with wheels to sift the material and with a hose system to wash it. D.O.T. 1.

crush rolls: In the concrete products and construction industry, one who operates a rock-crushing machine that may be provided with wheels to sift the material and with a hose system to wash it. D.O.T. 1.

crush rolls: A machine consisting of two heavy rolls between which ore, coal, or other mineral is crushed. Sometimes the rolls are toothed or ribbed, but for ore their surface is generally smooth. Fay.

crush roll: Shell Oil Co.

crush-run stone: Rock that has been broken in a mechanical crushe and which has not been subjected to any subsequent screening process. Taylor.

crush setting: set. The distance between roll faces of a crushe. In the case of jaw and roll crushers, the setting controls the maximum size, and to some extent the grade of the product produced. The best setting is usually that which produces 10 to 15 percent of over-
crushing test

Typical ranges of value for some ceramic materials are:

- Fireclay: 14,500 pounds per square inch
- Fireclay refractories: 2,000 to 5,000 pounds per square inch
- Common building bricks: 2,800 pounds per square inch
- Engineering bricks, Class A: 10,000 pounds per square inch
- Sintered alumina: above 50,000 pounds per square inch

**crush** test. a. A test of the suitability of stone to be used for roads or building purposes; a cylindrical specimen of the stone to be used for roads or building purposes; a specimen of 1 inch in diameter and 1 inch long, subjected to axial compression in a testing machine. **G.T.D.** b. A radial compressive test applied to tubing, sintered-metals bearing, or other simive products for determining radial crushing strength (maximum load in compression). **A.S.M. Gloss.** c. An axial compressive test for determining quality of tubing, such as soundness of weld in welded tubing. **A.S.M. Gloss.**

**crush line.** A line along which rocks, under great compression, yield, usually with the formation of schistosity. **Fay.**

**crush movement.** Compression, thrust, or lateral movement tending to develop schistosity. **Fay.**

**crush zone.** A zone of faulting and brecciation in rocks. **Fay.**

**crust.** a. A hard layer on the surface of softer material. **A.G.I. Supp. b.** The outer layer of the earth, originally considered to overlie a molten interior, now named in various ways: Lithosphere, sial, mantle, material above the Mohorovicic discontinuity, tectosphere, etc. Commonly used in a figurative and an imprecise sense. **A.G.I. Supp. c.** The outer shell of the solid earth, the lower limit of which may be defined in various ways. According to one definition, the crust would be considered to be of the order of 19 miles (30 kilometers) to 31 miles (50 kilometers) thick. Sometimes the term crust is used synonymously with sial, in which case the crust is about 19 miles (30 kilometers) thick under those portions of the continents near sea level, about 31 miles (50 kilometers) thick under the higher mountain ranges, and absent under the Pacific Basin. The term was originally based on the idea of an outer solid crust resting on a liquid substratum. A.G.I. d. Shrop. A fine-grained white sandstone. **Fay.**

**crustal instability.** Synonym for tectonism. **A.G.I.**

**crustal plate.** A portion of the earth's crust beneath an oceanic or continental region. **A.G.I.**

**crustation.** A thin mineral deposit coating rock or forming a film on pools of standing water. A crustation is often composed of calcite. **A.G.I.**

**crust fracture.** An extended fracture in the earth's crust. **Fay.**

**crustification.** a. The layering of crusts of different minerals deposited successively on the walls of a cavity. **Bateson. b.** Suggested for those deposits of minerals and ores that are in layers or crusts and which, therefore, have been deposited from solution. **A.G.I.**

**crustified banding.** A structure of certain vein fillings resulting from a succession and often times a rhythmic deposition of crusts of unlike minerals upon the walls of the open space. **Schieferdacker.**

**crustified vein.** A vein which has been filled with a succession of crusts of ore and gangue. **Fay.**

**crust movement.** An extensive movement of the earth's crust. **Fay.**

**crust of the earth.** a. The exterior shell of the earth. Synonym for earth's crust. **Schieferdacker. b.** That part of the earth lying above the Mohorovicic discontinuity. **A.G.I.**

**crust stone.** A fragile, flaky crust of calcite, or of other minerals, covering portions of the earth's crust. **Fay.**

**crust sress.** Pressure within the rocks of the earth's crust. **Fay.**

**crust tension.** Twisting stress in the earth's crust. **Fay.**

**crust.** A short heading excavated into the face of a coal seam; the breaking or drifting across the strata, or from one deposit to another. **Nelson.**

**crutch.** See crook. **Arkell.**

**crust. N. Staff.; Som.** A road or heading driven in coal measures, turned from a level, etc. Bureau of Mines Staff.

**cure.** Sound made by rod of metallic tin when bent. **Pryor. 3.**

**cryo-; cryo-; cryo-.** Combining form from the Greek kryos meaning icy cold. It is used to indicate cold or freezing. **Webster 3d.**

**cryogenic.** a. Referring to conditions of or characteristic of cryogenic periods. **Fay.**

**cryogenic period.** An informal designation for a time interval in geologic history during which large bodies of ice occurred at or near the poles and the climate of the earth was generally suitable for the growth of continental glaciers. **A.G.I.**

**cryogenic.** Referring to conditions existing in normally nonfluorescent materials in the cryogenic period. **Fay.**

**cryohydrate.** a. A salt that contains water of crystallization only at a low temperature; for example, a eutectic mixture of salt and water. **Calc.**

**cryoturbation.** a. Pertaining to the effects of frost on rocks. **Fay.**

**cryosphere.** All of the earth's surface that is permanently frozen. **A.G.I.**

**cryospension.** A term used for the formation including frost heaving. **A. G. I. Supp.**

**cristal.** Combining form from the Greek kryos meaning icy cold. It is used to indicate cold or freezing. **Webster 3d.**

**cryptolithionite.** A colorless fluoride of lithium, sodium, and aluminum, LiNaAlsF6, Isometric. **Fay.**

**cryptoexplosion structure.** a. A structure of like vein fillings resulting from a succession and often times a rhythmic deposition of crusts of unlike minerals upon the walls of the open space. **Schieferdacker.**

**cryolithionite.** A colorless fluoride of lithium, sodium, and aluminum, LiNaAlsF6, Isometric. **Fay.**

**cryolithoidite.** A colorless fluoride of lithium, sodium, and aluminum, LiNaAlsF6, Isometric. **Fay.**

**cryogenite.** A. Salt that contains water of crystallization only at a low temperature; for example, a eutectic mixture of salt and ice. **Hach.**

**cryolite.** Sodium-aluminum fluoride, Na3AlF6; compact, granular. Colorless to red-brown. Mohs hardness, 2.5; white streak; specific gravity, 2.97. Contains 54.3 percent fluoride and 12.9 percent aluminum. Of outstanding value in furnaces for melting at low temperature. **Pryor. 3.**

**cryolite.** Sodium chloride, NaCl; compact, granular. Colorless to red-brown. Mohs hardness, 2.5; white streak; specific gravity, 2.97. Contains 54.3 percent fluoride and 12.9 percent aluminum. Of outstanding value in furnaces for melting at low temperature. **Pryor. 3.**

**cryolite.** Sodium chloride, NaCl; compact, granular. Colorless to red-brown. Mohs hardness, 2.5; white streak; specific gravity, 2.97. Contains 54.3 percent fluoride and 12.9 percent aluminum. Of outstanding value in furnaces for melting at low temperature. **Pryor. 3.**

cryptoflorosence

to be the result of meteoric impact. Synonym for cryptovolcanic structure. A.G.I. Supp.
cryptoflorosence. Term for soluble salts that have crystallized in the interior of a day building product and are therefore hidden. Dodd.
cryptophotic. a. Having a graphic structure of intergrowths that is so small that it cannot be resolved by a microscope. Standard, 1964. b. Denoting a texture of rocks that is so fine that the individual constituents cannot be distinguished under a microscope. Usually the result of a crypto-crystalline intergrowth of quartz and feldspar. A.G.I.
cryptophytic. A gray ammonium fluosilicate, (NH₄)₂SiF₆. Also called cryptohalite. Thorpe.
cryptographic. a. Having a graphic structure of intergrowths that is so fine that the individual constituents cannot be distinguished under a microscope. Usually the result of a crypto-crystalline intergrowth of quartz and feldspar. A.G.I.
cryptogamous deposit. A mineral deposit of supposed magmatic origin developed in surroundings which do not reveal in any way its relationship to a body of eruptive parent rock. Schiefersedecker.
cryptomagnetic. A fine-grained rock, the constituents of which are not determinable microscopically. Synonym for kryptomere; aphanitic. Investigations of supposed magmatic origin developed in surroundings which do not reveal in any way its relationship to a body of eruptive parent rock. Johannsim, v. 1, 2d, 1939, p. 182.
cryptoperthite. A submicroscopic lamellar intergrowth of potassic and sodic feldspar. The lamellae are detectable only by means of X-ray diffraction or an electron microscope. See also perthite. A.G.I.; Webster 3d.
crypto-perthitic. Relating to or using a crystal. Webster 3d.
crypto-silicic. Intergrowths of potassic and sodic feldspar. The surfaces of contact are compatible. The lamellae are detectable only by means of X-ray diffraction or an electron microscope. See also perthite. A.G.I.; Webster 3d.
crypto-silicic. A crystal which is characterized first by its definite internal molecular structure and second, by its external form. Fay, b. The regular polyhedral form, bounded by plane surfaces, which is the outward expression of a periodic or regularly repeating internal arrangement of atoms. A.G.I. c. A body formed by the solidification under favorable conditions of perfectly crystalline elements or compounds, or an isomorphous mixture and having a regularly repeating internal arrangement of atoms such a body that has natural external plane face, as a result of the internal structure. Webster 3d. d. Quarts that is transparent or nearly so and that is either colorless or only slightly tinged. Also a piece of this material. Also called rock crystal. Webster 3d. e. A colorless transparent diamond. White granite of superior quality and often with ornamental cutting. Synonym for flint glass. Also a piece of this material. Webster 3d. f. As an adjective, consisting of or resembling crystal. Synonym for crystalline; clear; transparent. Relating to or using a crystal. Webster 3d.
crystal aggregate. A number of crystals grown together so that each crystal in the group is large enough to be seen by the unaided eye. Each crystal is more or less perfect. In gemmology it differs from a crystal aggregate, as a homogenous gem stone can be cut only from an individual crystal of a crystal aggregate. Same as crystal group. Shiple.
crystal analysis. The study of the arrangement of atoms, ions, or molecules in crystals, chiefly by X-ray methods aided by the theory of their possible grouping in space. Hess.
crystal axes. Imaginary lines passing through a crystal in important symmetry directions, intersecting in the origin at the center of the crystal. The axes are usually three in number, and they are chosen to act as a frame of reference by means of which the relative positions of the crystal faces can be described. Anderson.
crystal axes. A reference axis used for the description of the vectorial properties of a crystal. There are generally three non-coplanar axes, chosen parallel to the edges of the unit cell of the crystal structure so as to be parallel to symmetry directions if possible. A.G.I.
crystal bar. Hafnium produced by the van Arkel and de Boer process. Thomas.
crystal bar process. See iodide process. Thomas.
crystal bar process. See iodide process. Thomas.
crystal boundaries. The surfaces of contact between adjacent crystals in a metal. Anything not soluble in the crystals tends to be left at the boundary, while the solubility in the crystals boundary, in the absence of this, the boundary between two similar crystals is simply the region where the crystal structure changes. C.T.D.
crystal casts; crystal imprint. Fillings of cavities left by solution or sublimation of crystals embedded in fine-grained sediment. See also ice crystal marks; ice crystal casts. Pettijohn.
crystal chemistry. The study of the factors that determine the forms in which solids crystallize, and the relations between the properties of solids and their structures. A.G.I.
crystal class. One of the 32 crystallographically possible combinations or groups of symmetry operations that leave one point, or origin, fixed. A.G.I.
crystal defects. Irregularities in a lattice structure that affect resistance to corrosion. Microdefects are due to irregular distribution of ions, whereas are inclusions or strain areas or discontinuities in an otherwise regular lattice. Mosaic defects are orderly blue regions of lattice that are packed together to form a larger and imperfect particle. Pryor, 3.
crystal detector. A detector that depends for its operation on the deflecting action of the surface of contact between certain crystals and crystalline chondrite

(as of galena) and a metallic electrode. Webster 3d.
crystal diamagnetism. The abnormal ratio of magnetization to the magnetizing force responsible for it, as observed in some crystals, such as those of bismuth. A.G.I.
crystal faces. One of the several flat or plane exterior surfaces of a crystal. See also crystal. Long.
crystal flotation. The act or process of float- ing of lightweight crystals in a body of magma. Opposite of crystal settling. A.G.I.
crystal form. The form or shape in which crystals occur: the cube, the octahedron, and others. Shiple.
crystal habit. The crystal habits are described as prismatic (long to needle shaped), tabular to platy and scaly (micaeous). Intergrowths are given by specific descriptions. Pryor, 3.
crystal impurities. See crystal casts. Pettijohn.
crystal indices. Numbers or other representations which indicate the inclination of a crystal face to the horizontal or vertical. A.G.I.
crystal, crystallo-. Combining form meaning crystal. Webster 3d.
crystal lattice. a. The regular and repeated three-dimensional arrangement of atoms that distinguishes crystalline solids from all other states of matter. Essentially the regularity displayed by a crystal lattice is that of a three-dimensional mesh which divides space into identical polyhedra. Imagine a number of identical atoms placed at the intersections of such a mesh; then we have what is known as a single lattice (synonymous with Bravais lattice). A.G.I.
crystallography. Relating to crystals or crystallography. Webster 3d.
crystalliferous. Producing or bearing crystals. Webster 3d.
crystalline. a. Made of crystal. Webster 3d. b. Resembling crystal. Webster 3d. c. Of the nature of or relating to a crystal. Composed by crystallization. Having a regular arrangement of the atoms in a space lattice. Opposite of amorphous. Having the intermolecular structure, though not necessarily the external form, of a crystal; for example, granite is only crystalline, but a quartz crystal is perfectly crystalline. Webster 3d. d. Crystalline rock is composed of crystals or fragments of crystals. Webster 3d. e. Transparent, clear, or pure. Long.
crystalline aggregate. An aggregate of crystals grains or fragments, such as granite, not showing well-defined crystal forms. Foy.
crystalline chondrite. A hard, crystalline stony meteorite of breccite and olivine with firm chondri breakings with the mass. Hess.
crystalline enstatite-anorthosite

**crystalline enstatite-anorthosite.** Chondrite. In a hard, crystalline stony meteorite of enstatite, anorthosite, and nickel-iron with firm, round, radial chondri that break with the edges. Fay.

**crystalline form.** The external geometrical shape of a crystal. C.M.D.

**crystalline fracture.** A fracture of a polycrystalline material characterized by a grainy appearance. Contrast with fibrous fracture. ASM Gloss.

**crystalline glass.** A glaze containing macroscopic crystals. ASTM C242-60.

**crystalline grains.** Minute crystals or crystalline particles which compose fibrous crystalline aggregates. Shipley.

**crystalline granular texture.** A primary texture due to crystallization from a fluid (aqueous) medium. Examples are rock salt, halite, gypsum, and anhydrite. A.G.I.

**crystalline limestone.** A marble formed by the recrystallization of sedimentary limestone strata. As the result of recrystallization, the calcite grains composing the limestone are enlarged in size and the enlarged calcite crystals become mutually interlocking. Crystalline limestone or marble is either the product of metamorphism or of diagenesis of sedimentary limestone strata in most instances. See also marble. Bureau of Mines Staff.

**crystalline material.** Same as crystal material. Shipley.

**crystalline quartz.** A term used to distinguish all the varieties of quartz which are not cryptocrystalline, such as rock crystal, amethyst, smoky quartz, rainbow quartz, tiger eye, etc. Shipley.

**crystalline schist.** A rock that has been entirely or partly recrystallized by metamorphism. It is named after its predominant mineral, for example, chlorite schist, hornblende schist, mica schist, etc. Standard, 1964.

**crystalline solution.** Synonym for solid solution. Webster 3d.

**crystalline tonstein.** This type tonstein contains very fine, prismatic or tabular kaolinite crystals and may be either light or dark in color according to the proportion of contained carbonaceous matter. Occasionally granular kaolinite may also be recognized. The crystals lie embedded in either a finely crystalline or cryptocrystalline kaolinite groundmass. IHCP, 1963, part 1.

**crystalline metamorphism.** A molecular change which renders an amorphous mineral body crystalline; as, limestone converted to marble. Fay.

**crystallinity.** a. The degree of crystallization exhibited by an igneous rock; expressed by such terms as holocrystalline, hypocrystalline, holohyaline, etc. Holmes, 1926. b. The quality or the state of being crystalline; the degree of crystallization. Webster 3d.

**crystallite.** a. A general term for a minute body that does not react to polarized light. Examples in glass are spherulites in glassy volcanic rocks; for example, globulite, longulite, magarite, trichite, and other forms of incipient crystallization that cannot be referred to a definite mineral species. Holmes, 1926. b. A small, rudimentary or embryonic crystal that is not referable to a definite mineral species. Fay. c. A minute, minute grain. There is no room for doubt that the common crystalline schist contain much of this type. A.G.I.

**crystallization.** a. The formation of mineral crystals during the cooling of a magma or by precipitation from a solution. Bateman. b. The process through which crystals, phases separate from a fluid, a viscous, or a dispersed state (gas, liquid solution, or rigid solid). Holmes, 1920. c. The process of crystallizing. A form of body resulting from crystallizing. Webster 3d.

**crystallization differentiation.** a. Magmatic differentiation by the separation of crystals from the magma. Bateman. b. A process of fractional crystallization in which an originally, theoretically homogeneous melt, such as a magma, splits up into a number of phases which may eventually constitute separate bodies of different kinds of rocks (magmas differentiated). Shipley of Mines Staff.

**crystallization interval.** a. The interval of temperature (or less frequently, pressure) between the formation of the first crystal and the disappearance of the last drop of liquid from a magma on cooling. It usually excludes the late-stage aqueous fluids. A.G.I. b. More specifically, when referring to a given mineral, the range or the ranges of temperatures over which that particular phase is in equilibrium with liquid. In the case of equilibria along reaction lines or reaction surfaces, crystallization interval, as such, has no meaning. Temperature ranges in which certain solid phases are actually decreasing in amount with decreasing pressure are termed inhomogeneous conditions. Webster 3d. A.G.I.

**crystallization magnetization.** Chemical magnetization. A.G.I. Supp.

**crystallization schistosity.** Fissility resulting from crystallization or by precipitation from a solution, or rigid solid. Webster 3d. c. A characteristic of this textural type is that the essential constituents are simultaneous crystallizations and are not formed in sequence, so that each may be referred to only as an inclusion in all the others. Johansen, v. 1, 2d, 1939, p. 207.

**crystalloloblastic texture.** a. The texture of metamorphic rocks which have recrystallized under conditions of directed pressure, elevated temperature, and high viscosity in contrast to igneous rocks in which successive crystallization of minerals occurs under conditions of relatively low viscosity and nearly uniform pressure. A.G.I.; Holmes, 1920. b. This texture is correlated with a mode of origin in which every individual crystal exerted its own force of crystallization against a resistance offered by the enclosing medium and its constituent competing crystals. Bureau of Mines Staff.

**crystallogenic.** Name under which Apsey Pellatt patented his cameo encrustations or porcelain reliefs and cameos enclosed in glass. Haggar.

**crystallogenesis.** The production or formation of crystals. Webster 3d.

crystallogram. A photographic record of a crystal structure obtained through the use of X-rays. Webster 3d.
crystallographic. Relating to or dealing with crystallography and crystals. For example, crystallographic textures and crystallographic axes. Webster 3d.
crystallographic axes. Three axes intersecting at right angles, the vertical one being the X-axis and the two horizontal ones the Y and Z. The position of a crystal face is defined by the ratio of its intercepts with these axes. Pryor, 3.
crystallographic direction. Refers to directions in the various crystal systems which correspond with the growth of the mineral and often with the direction of one of the faces of the original crystal itself. Shipley.
crystallographic discolorations. Bands of lighter or darker shades of the basic color of the block of mica. Such bands generally are parallel to the crystallographic faces of the crystal from which the block was separated. Skow.
crystallographic notation. A concise method of expressing the relationship of any crystal face to the axes of reference in the crystal. C.T.D.
crystallographic planes. Any set of parallel and equal spaced planes that may be supposed to pass through the centers of atoms in crystals. As every plane must pass through atomic centers and no centers may be situated between planes, the distance between successive planes in a set is fixed in relation to the arrangement of atomic centers. C.T.D.
crystallographic system. Any of the major units of crystal classification, embracing one or more symmetry classes. C.T.D.
crystallographic texture. Any texture in which the crystallographic properties of the host mineral control the distribution of mineral inclusions or veins. This texture may be the result of replacement as well as exsolution. Many types are included, such as lamellar, triangular, etc. Schieferdecker.
crystallography. a. The science of the inter-atomic arrangement of (solid) matter, its cause, its nature, and its consequences. A.G.I. b. The study of the crystal and of crystallographic phenomena, and the application of these phenomena to the study of the physical, chemical, and mechanical properties of minerals. A.G.I.
crystallochemical. Designating a type of orrocks in which early phenocrysts form the nuclei of the orbiculores. Schiefer- decker.
crystallography. The process of crystallization. Fay.
crystal material. Any substance possessing crystal structure but no definite geometric form visible to the unaided eye. Also known as crystalline material. Shipley.
Crystalon; Crystolon. Silicon carbide product; used for refractory and abrasive purposes. Bennett 2d, 1962.
crystal optics. The science which treats of the transmission of light in crystals. Fay.
crystal pattern. A space lattice of a crystal structure. Hauth's Chem. Dict.
crystal properties. Optical include color, streak, luster (submetallic, vitreous, resinous), diaphaneity transparency, (tranc- lucence, opacity), refractive index, polarizing quality. Physical include hardness, measured on Mohs' scale; cleavage, characterized by appearance of cleavage plane along which crystal breaks most readily and cleanly; fracture (even, conchoidal); tenacity (brittleness, elasticity, flexibility); specific gravity; paramagnetic, diamagnetic; dielectric constant, etched patterns or figures on corrosion. Pryor, 3.
crystal recovery. The recovery of the original properties in a crystal that has been distorted by stress resulting from continued relief from stress; the speed of deformation. G.S.A. Memoir 6, 1938, p. 106.
crystal rectifier. A point contact between a metal and a crystal (such as copper and galena), or between two crystals (such as zincite and bortite). It has marked unidirectional conductivity. C.T.D.
crystals. a. Geometrical forms, with plane faces, of infinite variety, assumed by the majority of minerals. Weed, 1922, b. Trade term for fourth grade diamonds; colorless diamonds. Hess.
crystal sandstone. A Precious stone; a sandstone with a high percentage of quartz; the internal surfaces of which are coated with a layer of quartz. Ford.
crystal texture. The size and arrangement of the individual crystals in a crystalline mass. C.M.D.
crystal tuff. a. An indurated deposit of volcanic ash dominantly composed of intra- telluric crystals blown out during an volcanic eruption. The term should be restricted to tuffs containing more than 75 percent by volume of crystals. See also tuff. A.G.I. b. The ash and lapilli usually are broken euhedra of the common phenocrysts of the lava, and they may be sheathed in an envelope of glass. Shipley.
crystal-vitic tuff. Tuff consisting of 50 to 75 percent of crystal fragments and 25 to 50 percent of glass fragments. A.G.I. Supp.
cryostahl. Crystal modification of quartz which is formed by heating the clay silica bodies at temperatures above 1,100° C.; it increases the thermal expansion and decreases the danger of crazing. Rosenthal.
Crystalon. A trade name for silicon carbide, SIG. AIME, p. 18.
crystallographic directions. Relating to the geometric properties of crystals and crystal structures. Webster 3d.
crystallographic. Relating to or dealing with crystallography and crystals. Webster 3d.
crystallographic. Relating to or dealing with crystallography and crystals. Webster 3d.
crystallographic. Relating to or dealing with crystallography and crystals. Webster 3d.
culvert. A covered channel, or a pipe of
Cumberland method of mining. See top
cumengeite. A light indigo-blue oxychloride
cumulative curve. A curve relating the total
cumulative float curve. The curve obtained
cumulative sink curve. The curve obtained
cumulative plot. Graphic representation of
cumulite. Proposed by Vogelsang for a type
cup and cone. A machine for charging a
cup and cone fracture. See cup
cupellation process. A process for freeing
cupel dust. A powder used in purifying
cup and cone. A copper alloy containing 99.4 per-
cup. a. Sheet metal part, the product of the
cumulative error. Noncompensating, bias due
cumulative float curve. The curve obtained
cumulative frequencies (us and swell). Per-
cumulative plot. Graphic representation of
cumulative frequencies (us and swell). Per-
cumulative error. Noncompensating, bias due
cumulative sink curve. The curve obtained
cumulophyric. Applied to glomeroporphyritic
cumulo-voicano. Synonym for cumulo dome.
cumulo-voicano. Synonym for cumulo dome.
cumulite. Proposed by Vogelsang for a type
cup coral. A solitary coral, as
cup and cone fracture. See cup
cupeller. One who refines gold and silver in
cupferron. A colorless crystalline salt, CuH(N

culture tube
cupping
cuppy fracture. A condition occurring in 
cupric oxide. Tenorite, when found in na-
cuprite; ruby copper ore; red oxide of copper.
cuproapatite. A variety of apatite from Chile 
cuprodacloizite. A green to greenish-black 
cuprojarosite; kuprojarosit. A variety of me-
cupromagnesite. A mineral resulting from the alteration of 
calcium, aluminum, and sodium, as mall 
blue grains from Vesuvius. Named from 
a supposed relation to rivale. Spencer 15, 
M.M., 1952.
cuproplumbite. Sulfide of lead and copper, 

curie. a. Som. The floor of an underground 

cury
curl 292

sized curl 292 by helium-ion bombardment of plutonium 239. Named for Pierre and Marie Curie. The only known valence is 3; symbol, Cm; specific gravity, about 7.1. Very hard. See also Handbook of Chemistry and Physics, 45th ed., 1964, p. B-108. This very rare metal has been isolated in the form of small quantities from neutron-irradiated americium during work on atomic-energy projects. The metal was prepared by reduction of curium fluoride (CmF₃) with barium metal vapor at 1,275°C. Bureau of Mines Staff.

curled bedding. See curved bedding. Pittijohn.

curling. An enamel defect similar to crawl-

curly coal. Coal which has a curly or con-

current bedding. Webster 3d.

current cross ripple. One of the ripples that are formed only if the action of the cur-

are used to deflect the air from the entries into the working rooms and are used to hold the air along the faces. They are usually made of a number of overlapping strips of heavy fabric or plastic which should be of fireproof or fire-resistant ma-

tial. Also called check curtains. Ken-

duick, p. 62. See also blasting curtain. c. Synonym for cover. Long. d. A thin sheet of dripstone hanging from the ceiling or projecting from the wall of a cave. Schie-

ferdecker.

curled arch. An arch of refractory brick-

work that supports the wall between the upper part of a gas producer and the gas uptake. Dodd.

current drain; intercepting drain. A drain that is placed between the water source and the area to be protected. Nichols.

current hole. Synonym for cover hole. Long.

current of coal. In Western Pennsylvania, a thin pillar left in lieu of timbers for sup-

port. It also has the advantage of being a permanent wall and thus assists in di-

recting ventilation. Fay.

currents. Darkened areas in the ground coat enamel, presumably as a result of a boiling or blistering condition during the ground coat firing and often showing a bronzed coating and an added Cring. Sometimes called "loops" or "looping." Enam. Dict.

curved wall. A nonbearing wall built out of two columns or piers for the enclosure of a building but not supported at each story. ACSG.

curritucke. A crystalline hydrocarbon, in composition corresponding to C₃₉H₇₈. It is found in a form of greenish deposits from a hot spring in California. Tomkeieff, 1954. a. A discredited term equal to idri-

curvature, earth (correction fee). An adjust-

ment applied to a long line of sight in the computation of difference in elevation. Atmospheric refraction partially compensates for earth curvature. Hence, corre-

rection tables take both curvature and refrac-

tion into account. A.G.I.

curvature of gravity. A vector quantity cal-

ulated from torsion-balance data indicat-

ing the shape of the equipotential surface. It is perpendicular to the direction of the longer radius of curvature. A.G.I.

curvature value. Quantity, determined by the torsion balance, that is related to the sec-

dond derivative of the gravity potential with respect to the horizontal coordinates. Schieferdecker.

curve. A smooth bend in a mine roadway or railway. See also haulage curve; vertical curve. Nelson.

curved brakes. A caliper or suspended post type of brake for winding or other en-

gines. The two brake shoes are curved to the brake path and anchored near the center line of the drum. Nelson.

curved discharge trough. A short curved sec-

tion of trough used on the discharge end of a shaker conveyor which is located alongside the unloading surface of the conveyor. It permits discharge of the coal with a minimum of spillage. Jones.

curved fault. The fault surface is curved.

curved fracture cleavage. The cleavage planes in graded beds that cut across the strike of the bed and curve to a more diagonal direc-

tion in the upper finer parts of the bed. The curved fracture cleavage is convex
curved jib

A chain coal cutter jib with the outer end bent upwards or downwards through 90°. Thus, the machine can make a curved jib or a vertical cut in one operation. Curved jibs make coal preparation easier but their use is limited due to the excessive strain and wear on the cutter chain. See also multicut chain. Nelson.

curved line

One which changes its direction constantly; that is, no part of the line is curved. Jones, 2, p. 81.

curved ripple marks

Ripple marks with crests which appear curved or crescentic in plan view. Pettijohn.

curved-tube manometer

This is a modification of the inclined tube manometer. The tube is curved in such a form that it is possible to have approximately equal spacing of the divisions on a velocity or flow scale. This gauge, while retaining the advantage of increased sensitivity at low differential pressures common to the inclined type, enables a wider range of flow measurements to be made with one setting of the instrument. It can be supplied with a different type of quantity scale and the pressure scale being the most universal in its application. Roberts, 1, p. 28.

curve grease

A grease adapted for use on railroad curves. Porter.

curve resistance

This resistance may be taken from one-half to 1 pound per ton per degree of curve for that part of the train on the curve. The degree of curve is found by dividing 5,730 by the radius of the curve in feet, since 5,730 is the radius of a 1° curve. Lewis, p. 213.

curvette

A horn or a graben structure. A.G.I. Supp.

curvilinar fault

A fault with a curvilinear displacement in the fault plane. Schierdecker.

cusec

A unit of water flow or airflow and equals 1 cubic foot per second. See also modified Atkinson formula.

cusellite

Light-colored varieties of biotite-augite porphyry containing abundant phenocrysts of hornblende and a few phenocrysts of the manganese-iron minerals in a feldspathic groundmass; from Cusel, Saar in Germany. Holmes, 1928.

cusps

A. A series of naturally formed mounds of alluvial material. Schieferdecker. B. A structure, and (perhaps) lost tailings. Pryor, 3.

custom mill; custom ore

Ore bought by a mill or smelter, or treated for customers. Hess.

custom plant; custom mill

A mill, concentrator, or smelter which receives ore or partly processed mineral for treatment in terms of an appropriate contract, priced on tonnage, complexity of operation, permissible losses, and specification of feed, product terms of an appropriate contract, priced on tonnage, complexity of operation, permissible losses, and specification of feed, product.

cut-and-fill stoping

The term cut-and-fill stoping implies a series of operations: (1) breaking a slice of ore from the back; (2) removing the broken ore; and (3) introducing filling. BuMin Bull. 390, 1936, p. 10.

cutback asphalt

Asphalt to which is added a solvent to make the asphalt transportable and to permit its use for various purposes, for example, as a binder of an aggregate of stones and gravel in roadbuilding operations.

cutback products

In roadbuilding, petroleum residues which have been fluxed with distillates. Bureau of Mines Staff.

cutback: scot

An incline on which first in a round to provide additional free faces for the subsequent rounds. Gordon. 1964, sec. 6. Depth to which material is to be excavated (cut) to bring the surface to exposed lode. See locust. 2. To lower an existing grade, for example, floor cut, horizontal cut, pyramidal cut, burnet cut, etc. Beer- man, q. S. Afr. The term is used for machine stoping of reef and for intersecting a reef. Beer- man. r. To lower an existing grade. Nichols. s. An artificial depression or hollow, or cut out, in the surface. Custom mill; customs mill. A mill which makes coal ready for shipping and for various purposes on a solvent to make the asphalt transportable and to permit its use for various purposes, for example, as a binder of an aggregate of stones and gravel in roadbuilding operations. (1) breaking a slice of ore from the back; (2) removing the broken ore; and (3) introducing filling. BuMin Bull. 390, 1936, p. 10.

cutback asphalt

Asphalt to which is added a solvent to make the asphalt transportable and to permit its use for various purposes, for example, as a binder of an aggregate of stones and gravel in roadbuilding operations. (1) breaking a slice of ore from the back; (2) removing the broken ore; and (3) introducing filling. BuMin Bull. 390, 1936, p. 10.
cut coal

cut coal are used. Fay.
cut coal. Scot. In stook-and-room working, coal cut on two sides, the angle of each to just meet. Fay.
cut gears. Gears with machine-cut teeth as distinguished from cast gears. Gropin.
cutinite. A variety of cutinite. The microstructure of cutinite coal. This type coal consists of more cutinite. a.
cutina. Waxy layer formed on outcrop walls of cut holes. a.
cutoff. a. In firing a round of shots, a misfire. b. In blasting, a failure of an explosive to discharge or to carry out its intended function. Pryor.
cutoff. a. The first hole or group of holes drilled and fired as to break out a leading part of coal. Also called cutoff machine man. D.O.T. 1.
cutoff entry. An entry driven to intersect another and furnish a more convenient outlet for the coal. Also called cutoff. See also entry, b. Fay.
cutoff. a. The act or process of removing a part of a whole or of breaking something into separate parts. b. The part that is removed. See also cutting edge, b. Long. c. The tool used in cutting glass. ASTM C162-66. k. The tool used in cutting glass. ASTM C162-66. l. The tool used in cutting glass. ASTM C162-66. m. The tool used in cutting glass. ASTM C162-66. n. Applied to cutting glass, as the Gloster-getter; Anderton shearer.
cutoff entry. A. In the stonework industry, one who operates an abrasive sawing machine to cut off the ends of slabs of stone, marble, granite, and other materials. Also called cutoff wheel. A thin abrasive wheel for severing material is severed from the original mass by means of a cutting ring, at the end of the suction hose. The cutterhead pipe serves to maintain an optimum ratio of water to slurry by means of passing knives, wires; or similar means. Pryor, 3.

cutter, machine 295

off or for making slot; such wheels generally have an organic bond. Dodd.

cutting oils. Any of the heavy oils or combinations of oils used as metal lubricants in machining operations. The term does not properly include those watery solutions used merely for cooling effect. A cutting-out piece. A short length of trench timbering which can be sawed out to facilitate striking of the timbering. Ham.

cutting point. Synonym for cutting edge. See also cutting edge, a. Long.

cutting prices. Gr. Brit. The main item in a coal miner's payroll. It gives the payment rate for cutting, winning, and loading the coal, as so much per ton or per cubic yard of coal seam worked. See also seam structure. Nelson.

cuttings. a. The particles of rock produced in a borehole by the abrasive or percussive action of a drill bit; excess material caused by the rubbing of core against core or core against steel; erosive effect of the circulating liquid; or evaporation from the bearings. Also called boring; drill cuttings; drillings; sludge. Long. b. The fragmental rock samples broken or torn from the rock penetrated during the course of drilling. A.C.I. c. Eng. See holmes. SMRB, Paper No. 61. d. See bug dust, Mason.

cutting sand. Is composed of sharp, solid quartz grains and is used as the abrasive for sawing stone. It is usually ungraded and about equivalent to a No. 1 sandblasting sand. AIME, p. 15.

cutting shoe. A wedge at the bottom of tubing in casing sinking to assist penetration in soft ground. Nelson.

cutting shot. Ark. A shot put in beside a cutting so as to blast some coal into it and shatter the coal beyond for aid in making the next cutting. See also shot. Fay.

cutting size. Synonym for set diameter. Long. cutting speed. a. The linear or peripheral speed of relative motion between the tool and workpiece in the principal direction of cutting. ASM Glas. b. Synonym for feed rate. Long.

cutting stones. Diamonds set in a bit face having points or edges that will be in contact with and will cut or abrade the rock when drilling. Compare cutting edge; reaming stones. Long.

cutting table. Mechanical unit upon which the severing or slicing of a clay column is carried out. ACSG, 1963.

cutting tip. The part of a cutting torch from which gas issues. ASM Glas.

cutting tools. See tool tip, Dodd.

cutting torch. See torch, ASM Glas.

cutting wheel. A cutting disk, the edge of which is impregnated with an abrasive, such as diamond dust or aloxite. It is rotated at high speed and used to cut rock specimens into suitable sections for microscopic inspection after polishing. Pryor, S.

cutting tools. a. Plastic clay used for making tobacco pipes. A cutty pipe is a short tobacco pipe, also known as a cutty, that is used to hold an English ball clay that was formerly used for making tobacco pipes. Dodd.

cutting tool. See tool tip, Dodd.

cut-work man. One who burns roofing
cuvette. a. Fr. A bowl or basin of pottery.

Cuyuna. The name of an iron range in Minnesota.

C-wave. Synonym for coupled wave.

CVR Abbreviation for century of 100 years.

Cyamite. Trademark for an ammonia nitrate spray gun. Also called cyanamid.

cyanklaion. A process of extracting gold and silver ores with a weak solution of sodium cyanide, which readily dissolves these metals. The process is used to precipitate gold and silver from the gangue (waste material). L.C. 6d, 1961.

Cyanide. a. A compound of cyanogen usually containing 35 percent nitrogen. Fay.

cyanide alkaline. A process of extracting precious metals.

cyanide digestion. A process of extracting gold and silver from ores with a weak solution of sodium cyanide, which readily dissolves these metals. The process is used to precipitate gold and silver from the gangue (waste material). L.C. 6d, 1961.

cyancobalamin. A compound of cyanogen usually containing 35 percent nitrogen. Fay.

Cyanide. a. A compound of cyanogen usually containing 35 percent nitrogen. Fay.

cyanoformate. A yellowish-orange, water-soluble, poisonous gas, (CN)2, obtained by heating mercuric cyanide; it is decomposed by light and is stable to cold water.

Cyanine. a. A univalent radical; (CN)-. Webster 3d.

cyanogen. a. Univalent radical; CN; present in hydrogen cyanide and in other simple and complex cyanides (as ferrocyanides). Webster 3d.

Cycadofilidales. A phylum of Gymnosperms including Cycadiales (extinct), and Cycadales (recent); found in coal. Bureau of Mines Staff.

Cycadophytes. A phylum of Gymnosperms having both fernlike and cycadlike assemblages, including the three great groups, Cynogeniales (extinct), Benetitiales (extinct), and Cycadiales (recent); found in coal. Bureau of Mines Staff.

cycle. a. N. Eng. The complete sequence of events required to get coal. T. The time of one complete repetitive cycle of a periodic or cyclical process. Two alternations in alternating electric current. Mason. d. The sequence of events required to prepare one or more processes. Mayer. e. An operation of a number of events which when completed, starts the same series of events over in the same order. Thus a mechanical refrigeration cycle consists of condensation, expansion, evaporation, compression, and expansion. Strock, 10. f. A series of changes occurring at different times or in different places. A series of events. A series of changes that occur not necessarily leading back to the starting point. Webster 3d.

Cyclohexane. A series of changes, a series of events. A series of changes that occur not necessarily leading back to the starting point. Webster 3d.

Cyclic. a. Having to do with a cyclic or periodic process. B. Having to do with a cyclic or periodic process. B.
cycle, igneous

C162-66. 1. A cycle is the complete sequence of values of a periodic quantity that is repeated. A.G.I.

cycle, denudation. The alternate uplifting and wearing down by erosion, together constituting a cycle of denudation; from base level back to base level. Compare cycle of erosion. A.G.I.

cycle of erosion. The complete series of changes or stages through which a landscape passes from the inception of erosion on a newly uplifted or exposed surface through its dissection into mountains and valleys to the final stage when it is worn down to the level of the sea or some other base level. The cycle is usually subdivided into youthful, mature, and old-age stages. One type or many types of erosion may be involved, and the landforms produced and destroyed depend to a large extent on the climate, geographic situation, and geologic structure of the landmass. Stokes and Barnes, 1933. b. In more general usage, a cycle of erosion is a series of events or values of a periodic quantity. Dependin on how many individual parts are involved, they are called trigles (3), fourings (4), sixings (6), and eightings (8). Fay.

cycle of erosion. See shoreline cycle. Schifferdecker.

cycle of operations. In mining operations, such as tunnel driving, shaft sinking, and coal winning, there are certain tasks which must be repeated in cyclic fashion. In tunnel driving, they are (1) drilling the round; (2) charging and firing; (3) loading; and (4) supporting and track construction. This cycle of operations is time analyzed to achieve maximum efficiency and speed. For longwall face work, see cycle of face operations. Carson, p. 46.

cycle of sedimentation. A. A sequence of related processes and conditions repeated in each cycle of sedimentation or sedimentary deposit. A.G.I. Supp. b. The cycle of sediment formation, transportation, and deposition. A.G.I.

cycle of sedimentary rock. An instrumental phenomenon occurring in acoustic velocity logs. Very briefly, it consists of intervals where the velocity recorded drops sharply to very low values and, equally sharply, returns to a normal scale figure. Such a log is spiky. Wyllie, pp. 144, 182.

cycle time. The time required for the dipper of a mechanical shovel to push through the bank and fill, swing to the haul unit, unload, and swing back to the digging position. Cycle time is established under standard conditions of a 90° angle of swing and with an optimum depth of cut. Carson, p. 46.

cycle. Applied to any action or process that after going through a certain course, or accomplishing a definite order of changes, begins again the same course or order, and so on, until some new influence stops or changes the action. Fay.

cycloidal tooth. A type of gear tooth not now in common use. The side of the tooth is machined with a compound curve as distinguished from the involute tooth which has a circular form. A.G.I.
cycloidal test. See in batch tests of small quantities of ore during development of method of concentration, the reduction of selected fractions (usually middlings) for admixture with fresh samples. Purpose is to study effect of reclaiming minerals or solutions which they may have contaminated; also to observe effect of increased concentration of such compounds on the process as a whole. Pryor, 3.

cycle twinned. Composed of parts which appear to have been alternately revolved 180° upon nonparallel twinning planes. Depending on how many individual parts are involved, they are called trigles (3), fourings (4), sixings (6), and eightings (8). Fay.

cycling. The process of injecting gas, from which condensable liquids have been removed, into an oil field gas reservoir in order to maintain reservoir pressures and thus prevent retrograde condensation and loss of such liquids. In recycling, the stripped gas is injected repeatedly and the recovered vapors are extracted or stripped on the surface. A.G.I.

cyclic test. In batch tests of small quantities of ore during development of method of concentration, the reduction of selected fractions (usually middlings) for admixture with fresh samples. Purpose is to study effect of reclaiming minerals or solutions which they may have contaminated; also to observe effect of increased concentration of such compounds on the process as a whole. Pryor, 3.

cyclone. a. Refers to the conical-shaped apparatus used in dust collecting operations and fine grinding applications. In principle, dust is discharged through an outlet at the top. The heavier particles move to the wall of the cyclone and are eventually discharged at the bottom. The lighter coal particles are swept towards the central vortex and are discharged through an outlet at the top. The washed may be used for cleaning coal up to three-fourths of an inch. The cyclone is normally de-slaged at about 0.5 millimeter before cleaning. The separating medium is water and ground magnetite, the bulk of which is recovered and returned to the circuit. A 20-inch cyclone has a feed capacity of about 50 tons per hour of coal sized between one-half inch and one-half millimeter. See also centrifugal separation. Nelson.

cyclone angle. Included angle of conical section of hydrocyclone. Pryor, 3.

cyclone classifier. A device for classification by centrifugal means of fine particles suspended in water, whereby the coarser materials are collected at and are discharged from the apex of the vessel, while the finer particles are eliminated with the bulk of the water at the discharge orifice. B.S. 3552, 1962.

cyclone dust collector. An apparatus for the separation by centrifugal means of fine particles suspended in air or gas. Nelson.

cyclone furnace. A forced circulation heat treatment furnace. The gas circulates at the rate of 176 feet per minute. The furnace is designed to operate at a maximum temperature of 760° C. and is either gas fired or electrically heated. Osborn.

cyclone overflow. Cyclone mixture, a fine classified fraction, which leaves via vortex finder of hydrocyclone. Pryor, 3.

cyclone underflow. A coarser sized fraction which leaves via apex aperture of hydrocyclone. Pryor, 3.

cyclone washer. Cyclone washing of small coal originates from the Netherlands. Cyclone washers are used for cleaning coal. Cyclone washing of small coal is now in universal use. Crispin.

cycloidal tooth. A type of gear tooth not now in common use. The side of the tooth is machined with a compound curve as distinguished from the involute tooth which has a circular form. A.G.I.
cycloidal test. See in batch tests of small quantities of ore during development of method of concentration, the reduction of selected fractions (usually middlings) for admixture with fresh samples. Purpose is to study effect of reclaiming minerals or solutions which they may have contaminated; also to observe effect of increased concentration of such compounds on the process as a whole. Pryor, 3.

Coal occupied the day shift, and the afternoon shift was responsible for moving the conveyor and roof supports to the new location of the face. See also conventional machine mining; conventional mining. Nelson.

Cyclone washing of small coal originates from the Netherlands. Cyclone washers are used for cleaning coal. A very powerful explosive, 2.5 times as powerful as TNT. CCD 6d, 1961.

cyclone agate. An eye agate with but one cyc. Shipley.

cyclone steel. Steel produced by blowing iron-
cyclothem. A series of beds deposited during a single sedimentary cycle of the type that prevailed during the Pennsylvanian period. The cyclothem, which ideally consists of 10 members (in western Illinois, the fifth member is a coal layer), includes an unstable coastal environment in which marine submergence and emergence occurred. A cyclothem ranks as a formation in the scale of stratigraphic nomenclature. A.G.I.
cyclothes. A particle accelerator in which charged particles receive repeated syn-
chronized accelerations or kicks by elec-
trical fields as the particles spiral outward
from their source. The particles are kept in the spiral by a powerful magnet. LBL.
cylinder. In hydraulic systems, a hollow
cylinder of metal, containing a piston,
piston rod, and end seals, and fitted with a
port or ports to allow entrance and exit
of fluid. L&L.
cylinder bushing. Different bore-size metal
sleeves replacing the liners in a pump
pressure cylinder, thereby changing pump
delivery. A cylinder bushing with high vol-
ume to a higher pressure with lower volume,
or vice versa. Compare pump Long.
cylinder clearance. The volume remaining
between the head of a piston and the end
of the enclosing cylinder with the piston
at the end of the stroke. In steam engines
the clearance is the lineal distance be-
tween the piston and the cylinder head.
Long.
cylinder cuts. In cylinder cuts the blasting
is directed towards an empty hole in
such a way that as the charges in the
first, second, and subsequent holes deto-
nate, the broken rock is thrown out of the
cut. The opening is successively and
uniformly (cylindrically) enlarged in its
cylinder displacement. The volume swept
out of a cylinder in one working stroke
of the piston. Long.
cylinder graduated. a. A carefully gradu-
atcd glass cylinder used for measuring the
volume of liquids in the laboratory. Shell Oil Co. b. It is used in sedimentary
petrography in particle-size analyses for
determining the settling times and the
equivalent spherical diameters of micro-
scopic and submicroscopic (collodial)
mineral particles suspended in a fluid
medium that are settling according to
Stokes law. The fluid medium is usually
water or a dilute aqueous solution. Bureau
of Mines Staff.
cylinder liner. A replaceable tubular insert
lining the pressure cylinder of a piston
pump or the cylinder of a reciprocating
cylinder man. One who takes lime bricks
ead blocks in steam-pressure cylin-
ders to hasten chemical reaction of
cylinder oil. Mixture of mineral oil with 5
to 15 percent of natural or vegetable oils.
Crison.
cylinder penetration test. This is similar to the
California bearing ratio test originally
developed by Porter in 1938 for the de-
design of highway pavement thickness,
but is used in particular relation to sta-
bilized soils. Ham.
cylinder process. A process for manufacture
of a tin molten glass is blown and drawn into the form of a
cylinder, which is subsequently split longi-
itudinally, reheated in a flattening kiln,
and flattened. ASTM C162-66.
cylinder wheel. A wheel with a comparatively
cylindrical large hole, typically several
inches in height, used in surface grinding
where work is ground to one side rather
than the peripheral surface of the wheel. ACGS, 1963.
cylindrical grinding. Grinding the outer sur-
face of a part that rotates on centers or in
a chuck. See also index feed. ACGS, 1963.
cylindrical land. Land having zero relief.
ASM Glass.
cylindrical map projection. A map projection
produced by projecting the geographic
meridians and parallels onto a cylinder
which is tangent to (or intersects the)
surface of a sphere, and then developing
the cylinder into a plane. A.G.I.
cylindrical mill. Same as tube mill. Stotes,
n. 1, p. 583.
cylindrical screen feeder. One type of feeder
for plastic clay. It consists of a vertical
cylindrical screen through which clay is
forced by blades fixed to a vertical shaft
that rotates within the cylinder. This
machine not only screens but also mixes
and shreds the clay. Dodd.
cylindrical structures; sandstone pipes. Ver-
rall.
cylindroconical drum. A combination of a
cone and a cylinder. The ascending rope
is wound on the larger cylindrical
portion of the enclosing cylinder, and as
the engine reaches full speed after accelleration
the rope is wound on the larger cylindrical
part. For deep shafts the rope is wound
back on itself for the last part of the hoisting p-riod, thus reducing the width
of the drum. Lewis, p. 244. See also bi-
cylindrical drum.
cymogene. This term is archaic and should not be used. ASTM D288-57.
cymoid loop. The splitting of a vein along
its dip or strike into two branches, both
of which curve away from the general
trend and then unite to resume a direc-
tion parallel to but not in line with the
original trend. See also cymoid structure.
A.G.I.
cymoid structure. A vein, or a vein-shaped
structure, shaped like a reverse curve. See
also cymoid loop. A.G.I.
cymophane. Synonym for cats-eye. See
chrysoberyl. Dana 17.
cyrinite. A blackish lead-gray, sulfostan-
ting tin thiosilicate of lead, PbSbSn4-
SbS4. In cylindrical forms separating
under pressure into distinct shells or folia.
cyrillocanical drum. A combination of a
cone and a cylinder. The ascending rope
is wound on the smaller diameter of the
cone at first, and as the engine reaches
full speed after acceleration the rope
is wound on the larger cylindrical
part. For deep shafts the rope is wound
back on itself for the last part of the hoisting p-riod, thus reducing the width
of the drum. Lewis, p. 244. See also bi-
cylindrical drum.
cyrotolite. A yellowish to brownish mineral
containing carbonates or metallic hydro-
compounds of lead. It is often found in
nodule form, and is characteristic of each
crystalline sub-
group. Heard.
cyst. A pocket lined with epithelium that is
perforated. See also perforation. Webster
3d. a. Abbreviation for cystic duct. Webster 3d. b. Abbreviation for cystic
cystic duct. Webster 3d.
cysteine. A straight-chained amino acid con-
taining sulphydryl groups. See also thiol.
variant. Webster 3d.
cysteine. A straight-chained amino acid con-
taining sulphydryl groups. See also thiol.
variant. Webster 3d.
cysteine. A straight-chained amino acid con-
taining sulphydryl groups. See also thiol.
variant. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.

See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
cystine. A dipeptide of cysteine and glycine.
See also dipeptide. Webster 3d.
...
daily report

for the mine. See also manpower deployment chart. Nelson.
daily report. See boring journal. Fay.

Dakota WC3. An aircraft equipped for car-
daily report. See boring journal. Fay.

Dakotan. Lower Upper Cretaceous. A.G.I.

dalk. See dauk. Arkell.
dale. Dalmation-type of coast. A drowned .ongi-
dam. a. A barrier to keep foul air or water,
damaging stress. The least unit stress, of a
damaged-ground rent. Eng. Usually double
agricultural rent for land occupied by en-
gine, headstead, shops, houses, railways, etc.
damaged. See also land. Fay.
damaged-ground rent. Eng. Usually double
agricultural rent for land occupied by en-
gine, headstead, shops, houses, railways, etc.
damaged stress. The least unit stress, of a
is required in the condition of service, that will render a
member unfit for service before the end of its normal life. It may do this by pro-
ducing excessive set, or by causing creep, to occur at a temperature, or by caus-
ing fatigue cracking, excessive strain hard-
ing, or rupture. Ro.
damask. The surface of a watered surface pro-
duced on polished (welded) steel by cor-
rosion. Fay.
damnification. Synonym for contragradation,
A.G.I.
damkernite. An igneous dike rock from the
Fe region of jisite. Contains 52 percent pyroxene, 23 percent biotite, 16 percent
neptine, 6 percent epidote, 6 percent
orthoclase, 4 percent magnetite, 2 percent
saltite, 2 percent calcite, and 1 percent
damourite schist. A schistose metamorphic
rock composed largely or entirely of da-
mourite. Fay.
damouritization. The process by which the
feldspars and other aluminous silicates of a rock are transformed into damourite
G. Damour. Ordinarily referred to as sericitization. Holmes, 1928.
damp. Any mine gas, or mixture of gases,
particularly those that decrease oxygen.Damp
is probably derived from the German
damp, meaning a fog or vapor. See also
damp after: black damp; choke damp; fire-
damp; stink damp; white damp. Nelson.
damp course. A course or layer of impervious
material in a wall or floor to prevent the
entrance of moisture from the ground or
a lower course by capillarity. A.C.G.
damped. Eng. Soffsogated by gas or foul air
in a mine. Fay.
damped balance. Has magnets or air dash-
paders. A. A mechanical modulating de-
vice used to reduce deleterious effect of
sharp lines etched on gages. Daniels.
dampen. a. A mass of metal, or a short-z. r-
dampener. a. A mechanical modulating de-
vice used to reduce deleterious effect of
sharp lines etched on gages. Daniels.
damper. a. A mass of metal, or a short-circu-
te device used for damping out torsional vibration in an
engine crankshaft, the energy of vibration
being dissipated frictionally within the
damper. G.D. d. A method of frictional modu-
lating device. See also damper, a. Long.
damper man. In the coke products industry,
a laborer who regulates the step-up of pipes
leading to coke ovens. D.O.T. 1.
damping. a. In seismology, a resistance,
contrary to friction, independent of the nature
of the contacting surface. Being propor-
tional to the speed of motion, it diminishes
with the latter to nothing. Schieferdecker.
b. A form of damping, damping acts to
decrease the amplitudes of success-
ive free vibrations. Damping may result
from internal friction in the system,
from air resistance, or from mechanical
or magnetic absorbers. A.G.I. Compare
attenuation.
damping capacity. The ability of a metal to
absorb vibration (cyclical stresses) by in-
ternal friction, converting the mechanical
energy into heat. A.S.M. Gloss.
damping constant. In damped seismographs
this term is by definition equal to one-half
the ratio of the damping resistance (force per
unit velocity) to the critical damping, the
sum of the frequencies of a. A.G.I.
damping down. In pyrometallurgy, reduction
of air supply to a furnace, to lower temper-
ature or reduce working rate. Pryor, 3.
damping factor. The ratio of the damped
and the undamped frequency of a seismo-
graph or seismometer. A.G.I.
damping ratio. a. The damping ratio for a
system with viscous damping is the ratio
of actual damping coefficient to the crit-
ical damping coefficient. H.B.C. b. The ratio of two equiphase peak amplitudes
within one period of a damped seismograph
or seismometer. The ratio is always greater
than unity since the greater amplitude is
divided by the succeeding amplitude.
A.G.I.
damping ropes. A term sometimes applied to
rubbing ropes. Nelson.
dam plate. In a blast furnace, the cast-iron
plate which supports the dam or dam stone
in front. See also dam. Fay.
dampproof. Scot. An instrument invented by
Professor Forbes, Glasgow, for detecting
firedamp. Fay.
dampproofing. The treating of a wall with some
impervious material to prevent moisture
from oozing through. Critpin.
damp sheet. S. Staff. A large sheet placed
for water. C.T.D. c. An airtight barrier to
prevent hunting. It is also sometimes
used to reduce deleterious effect of
sharp lines etched on gages. Daniels.
dam plate. In a blast furnace, the cast-iron
plate which supports the dam or dam stone
in front. See also dam. Fay.
dam plate. In a blast furnace, the cast-iron
plate which supports the dam or dam stone
in front. See also dam. Fay.
dam plate. In a blast furnace, the cast-iron
plate which supports the dam or dam stone
in front. See also dam. Fay.
dam plate. In a blast furnace, the cast-iron
plate which supports the dam or dam stone
in front. See also dam. Fay.
dam plate. In a blast furnace, the cast-iron
plate which supports the dam or dam stone
in front. See also dam. Fay.
dam plate. In a blast furnace, the cast-iron
plate which supports the dam or dam stone
in front. See also dam. Fay.
dam plate. In a blast furnace, the cast-iron
plate which supports the dam or dam stone
in front. See also dam. Fay.
dancer rolls

of travel of coiled strip through a pickling bath in continuous operations. Osborne.

danger board. A barrier erected by any employee to denote a dangerous condition, usually marked "DANGER" and which can only be removed at an official's direction. B.C.I. b. (Scot.) A employee from a rotating mandrel. ASTM C162-66.

danger signal. A signal consisting of a board, shovel, or other material with appropriate markings thereon, placed in front of a room or area containing an explosive mixture of fire. Also, a placard to indicate the location of dangerous machinery, electric wires, explosives, mine openings, etc. Fay.

danger signal. A statement in fluid dynamics: the velocity of flow of a liquid through a porous medium due to difference in pressure is proportional to the pressure gradient in the direction of flow. Webster 3d. b. Applies to the velocity of the percolation of water in saturated soil. It is the product of the coefficient of permeability and the hydraulic gradient. Ham.

Darcy's law. a. A statement in fluid dynamics: the velocity of flow of a liquid through a porous medium due to difference in pressure is proportional to the pressure gradient in the direction of flow. Webster 3d. b. Applies to the velocity of the percolation of water in saturated soil. It is the product of the coefficient of permeability and the hydraulic gradient. Ham.

darcy. A unit of porous permeability in physics equal to the permeability of a medium through which the rate of flow of a fluid having one centisace viscosity under a pressure gradient of one atmosphere per centimeter would be one cubic centimeter per second per square centimeter cross section. Compare Darcy's law. Webster 3d.

darcy's law. a. A statement in fluid dynamics: the velocity of flow of a liquid through a porous medium due to difference in pressure is proportional to the pressure gradient in the direction of flow. Webster 3d. b. Applies to the velocity of the percolation of water in saturated soil. It is the product of the coefficient of permeability and the hydraulic gradient. Ham.

or induced by cosmic rays. Examples of the former include the dating of ancient bones from the known rate of deposition of water when exposed to ground water, and the dating of glass from its degree of devitrification. Nuclear methods have been particularly valuable for dating because the rates of such processes remain unchanged within the range of the errors of our measurements. By measuring the quantity of helium or of lead in uranium-bearing minerals, the age of the substance, or at least the length of time that the substance has existed as a solid deposit, may be calculated. By inference, this same measurement applied to the oldest igneous rocks gives an age for the earth. C.CD 6, 1961.

glassers. Lanc. Men who work underground, and are paid by the day; not contractors.

day. Fay.

daylight. A hydrous silicate of boron and calcium, CaB(SiO₃)₂(OH); usually in crystals; monoclinal. The mineral is used as a golf. So.1962, Jan. 17.

datolite group. f group of minerals, the species of which usually resemble Arkelii-
silicate, H₂R₂O₄; or R₂K(²SiO₃); R² = Ba, Be, Fe, chiefly; R² = Boron, 2H₂O₂; stout fibers forming all the ytrrium (and cerium) metals. All of the minerals of this group crystallize in the monoclinic system. Fay.

datum, a point, line, or surface with reference to which positions (as elevations) are measured or indicated (as a permanent mark) in leveling or mean sea level in a topographical survey. Specifically, the mean low-water mark of all tides assumed as a basis of reckoning but not admitting rigorous scientific determination. Webster 3d.

datum level. The level (usually mean sea level or the mean level of the nearest considered body of water) from which all altitudes are measured in surveys. Weed, 1922.

datum plane. A horizontal plane used as a reference from which to reckon heights or depths. H.G.C.

datum water level. The level at which water is first struck in a shaft sunk on a reef or deposit. Fay.

dather element. The element formed when another element undergoes radioactive decay. The latter is called the parent. The daughter may or may not be radioactive. C.CD 6, 1961.

dather products. Decay products of freshly produced and isolated uranium. When all daughter elements are present in the same amount, no further change takes place in the quantity of daughter elements. The substance is then in equilibrium. Ballard.

dash; dawk; dook. Eng. Tough; compact; sound.

daytime. A term for the part of the day during which the sun is up. A coal mine employee might work during the daylight.

Dauichine law. The law governing a twinning condition in the hexagonal system commonly shown by quartz in which two right-hand or two left-hand crystals are symmetrically related one another 180° about the twinning axis. Hess.

Dauichine twin. See Dauichine law. Hess.

Dauichine test. See velocity of detonation. decahydrous. A rock consisting essentially of brown hornblende which is paramorphically after pyroxene, the alteration of other minerals, such as feldspar, being small. Holman, 1928.

davidite. A moderately to strongly radioactive mineral containing titanium, iron, rare earths, uranium, vanadium, and chromium; usually in brown to brownish-black. Found in pegmatites associated with quartz, biotite, ilmenite, rutile, iron, and copper sulfides. Also found in hypersthene gabbro and anorthosite accompanied by scapolite, quartz, calcite, molybdenite, rutile, sphere, and tourmaline; it is obvious that the mineralization was introduced into the basic rocks by emanations from underlying granites. This is the only known occurrence of primary uranium minerals in basic rocks. One of these is the Old Carlin ore. Hess.

davis cutter bit. A diamond core drill similar to the diamond core drill except that the annular groove is cut either by a steel chisel or by a plain hollow rod using chilled shot.

Davis core drill. A rotary drill except that the core is broken off and brought to the surface. Nelson.

davis cutters. An annular-shaped, sawtooth-like bit used on shot drills to cut core in soft formations in which shot is ineffective as a cutting medium. Also called Davis diamond.

davis furnace. A long, one-hearth reverberatory furnace, heated by Suiton furnace, for roasting suitable rocks.

davis magnetic tester. An instrument for testing the magnetic content of ores and for checking the efficiency of wet magnetic separators recovering magnetite and ferro-
silicon in heavy-media processes. It consists of an inclined glass tube set between the emulated poles of a powerful electromagnet or permanent magnet. The ore sample is introduced, and water-filled tube and agitated to insure thorough washing of the separated magnetic. The unit is continuously rated, but the usual average consumption of 220 watts, the motor drive being one-
twentieth of a horsepower. Nelson.

davisite. A white hydrous phosphat e of cal-
cium and aluminum, 3CaO·Al₂O₃·2P₂O₅·5H₂O; stout fibers forming botryoidal crusts. Probably hexagonal. From Fairfield, Utah.

Davist kiln. The word Revergen is based on the names of the Reveres, Long. The word Revergen is said to be derived from the Reveres, Long.

day drift. An adit, drift, or tunnel ending at the surface. Fay.

day eyes. In Wales, inclined planes driven from the surface to the coalfield. Fay.

day fall. See crop fall. Fay.

day hole. Any heading or level in a mine communicating with the surface. Fay.

day level. Scot. A level driven from the surface; an adit. Fay.

daylight. a. Synonym for day shift. Long. b. When an underground mine is working on the surface it is said to be daylight. Long. c. The maximum clear distance between the pressing surfaces of a hydraulic press with the surfaces in their usual open position. Webster 3d. Where a bolster is supplied, it shall be considered the pressing surface. See also shut height.

daylight lamps. Artificial daylight lamps are either ordinary lamps, but with a special blue glass casing, or are blue glass cased lamps. Considerable use of these lamps is made in the enameling industry for such work as matching colors, checking production ware against standard color samples, etc. Many plants and laboratories have standardized on daylight lamps for all lighting equipment. This is particularly valuable on dark or cloudy days. Hansen.

daylight mine. Scot. A mine or drift extending to the surface. In a coal mine employee paid by the day as distinguished from those paid by the piece, or by contract. Also called common.

daylight pair. Corn. Miners who work underground during the day shift. Fay.

day stones. Loose stones on the surface. Arkel.

Humphrey Davy in 1815 for the protection of coal miners. Its safety feature is the inclusion of the flame to keep it from coming in contact with mine gas. Fay. See also flame safety lamp; safety lamp.

davit; davista. A colorless to white, transparent, vitreous to nearly silicate and carbonate of aluminum and calcium of uncertain composition but near cassiterite. Hess.

dawling. Derb. A failing ore body, both in quality and quantity. Fay.

dawsonite. A basic carbonate of aluminum and sodium, Na₂(CO₃)₂·2Al(OH)₃, occurring in thin incrustations of white radiating bladed crystals. Fay.

dawn producer. A furnace used for the manufacture of producer gas. Fay.

day. a. A term used to signify the surface; for example, day drift, day face, therefore to the surface. Fay. b. The surface of the ground over a mine. Fay. c. The day shift in the Derbyshire coalfield, ore that is nearest the surface. Fay. d. Applied to coal or any useful rock found at or very near the surface. Fay. e. T. K. Tomképe, 1954, e. In mining, generally a period of 8 hours for work on the three-shift system, or 24 hours if referring to the output or to machinery. C.T.D.

day coal. The topmost stratum of coal; so called from the sun nearest to daylight. Standard, 1964.

day shift. An adit, drift, or tunnel ending at the surface. Fay.

daytime. A term for the time of day distinguished from nighttime. Fay.

day work. A mine or drift except that the surface is standardized. Fay.

daylight. a. Synonym for daylight. Long. b. When an underground mine is working on the surface it is said to be daylight. Long. c. The maximum clear distance between the pressing surfaces of a hydraulic press with the surfaces in their usual open position. Webster 3d. Where a bolster is supplied, it shall be considered the pressing surface. See also shut height.

daylight lamps. Artificial daylight lamps are either ordinary lamps, but with a special blue glass casing, or are blue glass cased lamps. Considerable use of these lamps is made in the enameling industry for such work as matching colors, checking production ware against standard color samples, etc. Many plants and laboratories have standardized on daylight lamps for all lighting equipment. This is particularly valuable on dark or cloudy days. Hansen.

daylight mine. Scot. A mine or drift extending to the surface. In a coal mine employee paid by the day as distinguished from those paid by the piece, or by contract. Also called common.

daylight pair. Corn. Miners who work underground during the day shift. Fay.

dead line 303
dead day. A periodic melting unit, usually de-
gined to be emptied by each day of hand

gathering. ASTM C162-66.
day wage. A fixed rate of wages per shift, of
so that the mine employees to the amount of
work done. The day wage system applies to
men which is not amen-
able to piecework. Nelson. Also called day-
work; company work. Pryor, 3.
day water. Surface water. Webster 2d.
day tank. A periodic melting unit, usually de-

Abbreviation for direct current. BuMin

d (direct chill) casting. A continuous method

which the men are paid by the month.

roads, handling cars, etc. Also called com-

signed to be emptied by each day of hand

work performed by daymen. Fay.
dazed. Eng. Timber that is decayed is called
dazzling white heat. Division of the color

scale, generally given as above 1,540° C

(2,800° F). Bureau of Mines Staff.
db. Abbreviation for decibel. BuMin Style

dcc. Direct current for direct current. BuMin

dc (direct chill) casting. A continuous method

of making ingots or billets for sheet or

extrusion by pouring the metal into a short

mold. The base of the mold is a platform

that is gradually lowered while the metal

solidifies, the frozen shell of metal acting

as a retainer for the liquid metal below the

wall of the mold. The ingot is usually cooled

by immersion of water directly on the mold or

on the walls of the solid metal as it is lowered.

The length of the ingot is limited by the depth to

which the platform can be lowered; therefore,
it is often called semicontinuous casting.

BuMin Glass.

DCL fusion-cast refractory. A fusion-cast re-
fractory, for example, glass tank block,

made by a process that largely eliminates

the cavities liable to occur as a result of

shrinking during cooling; the mold is

L-shaped and is tilted while it is being

filled so that the shrinking cavities concen-

trate in the smaller leg of the L (the lug),

which is then sawed off and dis-

carded. DCL = diamond cut lug, Dopp.

D-coal. A maceral made of substances which

predominate in the durainous bands of

coal. Applied to microscopic correlative con-

stituents, usually oxygen, from a corrosive

liquid by some chemical means, such as

controlled cooling, in order to develop the greatest

temperature above the critical range, holding at

that temperature, followed by very slow

cooling, in order to develop the greatest

possible commercial softness or ductility.

Oberme.

dead axle. A one that extends into solid coal

beyond the part that can be broken by the

same distance beyond other mine workings

into solid rock. Long, 1. The end of a drill-

ing line or cable made fast to some sta-

tionary part of the drill rig or to a dead-

man. Long, g. The closed end of a pipe or

pipe system. Long, b. A term used in coal

mining for the terminating of all electric wire

(except cables to equipment) out by lim-

iting circuit, or otherwise. Kentucky, p. 245.

i. A cut-de-sac. Synonym for blind heading.

B.S 3618, 1965, sect. 2. A. A passageway

blocked at one end. A. A passageway

blocked at one end.

defaded. Mercury which has become con-

taminated and will no longer amalgamate

freely with gold. Pryor, 3.

defaded mercury. See floured. Fay.

defall. A dumping platform at the mouth of

defead glacier. A stagnant glacier; a fossil gla-

acier. Fay.

defead ground. A. Rock in a mine that, although

producing no ore, requires to be removed

in order to get a productive ground. Fay.

b. A faulty or barren area of valuable strata.

Fay. c. Ground devoid of valuable mineral,

ore, or coal. Nelson. d. In mining subdi-

ground, ground that has settled and no

further movement is expected. Nelson. e.

Portions of ore deposit too low in value in

to repay exploitation. Pryor, 3. i. The part of

a lode where there is no ore. Gordon.

defeadhead. a. To return to the commence-

ment of a cut without excavating; usually

for the commencement of a new cut after

completion of its predecessor. Austin. b.

An extra length given to a cast object, as a

can, to put pressure on the molten metal

below so that dross and gases may rise to

it; a sullace piece; a sinking head.

Standard, 1964. c. That part of a casting

filling up the ingate; a sprue. Standard,

1964. d. Can. Logs forced into the bot-

tom of a waterway during timber drives.

Hoffman.

defeading. Traveling without load, except

for the dumping area to the loading

point. Nichol.

defeat hole. A. One that extends into solid coal

beneath the current work, to be kept free of

the maximum safe charge of explosive. Zern,

p. 668. b. A shothole so placed that its

width at the point at which the angles to the

drill hole, is so great that the heel is not strong enough to at least

balance the resistance at the point (toe). Zern,

p. 660. c. A shallow hole in an iron

defeading. Glou.: Som. Same as deadlock, a.

defeading. Decomposed chalk. Arkell.

defeading. A. A row of marked empty powder

cases or other danger signal charged with the

firebore to warn miners not to enter work-

ings containing gas. Fay. b. The part of

defair. a. The air of a mine when it con-

tains carbolic-acid gas (blackdamp), or

when ventilation is inadequate. Fay, b. Stag-

defeading. Heating steel to a tempera-

ture above the critical range, holding at

that temperature, followed by very slow

cooling, in order to develop the greatest

possible commercial softness or ductility.

Oberme.

defeade, a. A fixed shaft functioning as a

hinge pin. Nichol. b. A fixed shaft or beam

on which a machine is placed. Nichol.

defeade band. In flotation, the range through

which an input can be varied without initi-

ating response. Fuerstenau, p. 345.

defeade beds. Unproductive strata or veins as

opposed to bearing or quick beds. Also
called dead veins. See also deads; barren

bands.

defeade-dipping. The act or process of giving a

pale dead color by acid, as to brass. Stand-

ard, 1964.

defeade end. a. An entry, gangway, level, or

other mine passage extending beyond the

mine workings into solid coal or ore; a

stub. See also stub entry. Fay, b. Under-

ground chamber, or other block of coal

not holed through. Pryor, 3. c. Blind alley

underground. Pryor. d. The unworked end

of a drift or working. Hazz. e. An unventi-

lated underground mine passage extending

some distance beyond other mine workings

into solid rock. Long, 1. The end of a drill-

ing line or cable made fast to some sta-

tionary part of the drill rig or to a dead-

man. Long, g. The closed end of a pipe or

pipe system. Long, b. A term used in coal

mining for the terminating of all electric

wire (except cables to equipment) out by

limiting circuit, or otherwise. Kentucky, p. 245.

i. A cut-de-sac. Synonym for blind heading.

B.S 3618, 1965, sect. 2. A. A passageway

blocked at one end. A. A passageway

blocked at one end.

defeaded. Mercury which has become con-

taminated and will no longer amalgamate

freely with gold. Pryor, 3.

defeaded mercury. See floured. Fay.

defeadeball. A dumping platform at the mouth of

defeade glacier. A stagnant glacier; a fossil gla-

acier. Fay.

defeade ground. A. Rock in a mine that, although

producing no ore, requires to be removed

in order to get a productive ground. Fay.

b. A faulty or barren area of valuable strata.

Fay. c. Ground devoid of valuable mineral,

ore, or coal. Nelson. d. In mining subdi-

ground, ground that has settled and no

further movement is expected. Nelson. e.

Portions of ore deposit too low in value in

to repay exploitation. Pryor, 3. i. The part of

a lode where there is no ore. Gordon.

defeadehead. a. To return to the commence-

ment of a cut without excavating; usually

for the commencement of a new cut after

completion of its predecessor. Austin. b.

An extra length given to a cast object, as a

can, to put pressure on the molten metal

below so that dross and gases may rise to

it; a sullace piece; a sinking head.

Standard, 1964. c. That part of a casting

filling up the ingate; a sprue. Standard,

1964. d. Can. Logs forced into the bot-

tom of a waterway during timber drives.

Hoffman.

defeadeheading. Traveling without load, except

for the dumping area to the loading

point. Nichol.

defeade hole. A. One that extends into solid coal

beneath the current work, to be kept free of

the maximum safe charge of explosive. Zern,

p. 668. b. A shothole so placed that its

width at the point at which the angles to the

drill hole, is so great that the heel is not strong enough to at least

balance the resistance at the point (toe). Zern,

p. 660. c. A shallow hole in an iron

defeadeing. Glou.: Som. Same as deadlock, a.

defeadeing. Decomposed chalk. Arkell.

defeadeing. A. A row of marked empty powder

cases or other danger signal charged with the

firebore to warn miners not to enter work-

ings containing gas. Fay. b. The part of
deadline

a block-and-tackle cable from the traveling block to the deadline anchor. Long, c. the unused part of a pipe system. Long.

dead anchor. The fixed point on a drill rig or deadman to which a deadline of a block and tackle is attached. Long.

dead load. a. The fixed weight of all permanent construction comprised in a building. Nelson. b. The downward pressure on a structure caused by gravity only, such as the weight of a layer of drill rods suspended from the sheave in a drill derick. Also called static load. Long. c. That of structure and its permanent nondynamic load. Also referred to as deadweight. Pryor, 3.

dead load. A lode not containing valuable minerals in paying quantity. Fay.

deadman. a. A wooden block used to guard the mouth of a mine against rock, pumice, etc. in Fay. b. A buried log, timber, concrete block, or the like serving as an anchor to which a cable or line may be attached. Long.

dead-mild steel. Steel containing 0.07 to 0.15 percent carbon. See also wrought iron. Nelson.

dead mild steel. Steel containing 0.07 to 0.15 percent carbon. See also wrought iron. Nelson.

dead mill. Trade term for pearl with lusterless or dead white appearance. Shipley.

dead plate. a. A nearly horizontal iron plate, at the mouth of the furnace under a steam boiler, on which the bituminous coal charges are laid to be partly coked before they are pushed upon the grate where their solid carbon is consumed. The gases evolved on the dead plate pass over the grate and are burned. Long. b. In automatic production, a stationary plate receiving a glass article awaiting transfer. ASTM C162-66.

dead rope. Aust. Same as buffer rope. Fay.

dead-soft. The state of metal which has been quietly in the ingot mold during solidification and which fails to respond to heat treatment. 304.

dead true. a. A core barrel or drill rod that does not oscillate or vibrate when rotated at high speed is said to be dead true. Long. b. Perfectly straight and centered. Long.

dead weight. Standing or still water. Webster 3d.

deadweight. a. The unrelieved weight of any inert mass; a heavy or oppressive burden. Webster 3d. b. As a modifier, denoting a weight of object or mass which a pulling line can be attached. Long.

deadweight. A work that is not directly productive—the removal of rock, debris, or other material which is not directly productive of coal—though it may be necessary for exploration and future production. Unfinished work. Fay; B.C.I. b. Unproductive or stone work; the handling of stone or dirt as a preliminary step to winning and working the coal seam. The aim is to keep the dead work per yard of face or ton of coal to the minimum practicable figure. See also unproductive development. Nelson. c. Work by of miner's work other than actual coal getting and transport. Mason. d. Work done by a contractor not provided for in his yardage or tonnage contract with the contractor. Mason. e. Exploratory or preparatory work, such as clearing falls of roof, removing rock, etc., during which little or no coal is secured. Hudson. f. The development of a mine when no ore is being raised. Gordon. g. S. Afr. Necessary work to reach and exploit the valuable portions of the mine. Shaft sinking, crosscutting, driving and driving. Mason. h. The weight of a vehicle or carrier itself as distinguished from carried or live load. Crispin. i. The difference, in terms of c.i.f. price, between c.i.f. and f.o.b. prices. Mason. j. The difference, in terms of f.o.b. price, between f.o.b. and c.i.f. prices. Mason. See also unproductive development. Webster 3d.

dead zone. That part of the mined strata which has completely settled down after subsidence. Bridge, 9.

dead coal. Term used among British miners for coal altered by an igneous intrusion. Tomkies, 1954.

dead ore. De-airing is most commonly practiced in dry-pressing, from casting slip, or from clay or body, from the moist powder in plaster during blending. There are various devices for de-airing machine operator. One who tends a machine that removes air bubbles and excessive moisture. From dry-pressing, it may be done by pressing, manipulating speed control and automatic clay feed control switches, levers, and valves. D.O.T. 1.

deal. a. Plank used in shaft and gallery construction. Fay. b. A board or plank of varying dimensions. In Canada, the standard size is 12 feet by 9 inches by 3 inches. In England, the maximum width is 9 inches, and the maximum thickness 3 inches. Standard, 1964.

dealer. An operator on the stock exchange who buys and sells on his own account and who makes his profit from differences in prices rather than from commissions. Hoos, p. 21.

dean. Corn. The end of a level. Fay.

debacle. a. A great rush of waters, which breaking down all opposing barriers, carries forward the broken fragments of rocks and spreads them in its course. Fay. b. A breaking up of ice in a river. A violent dispersion of disruption. Webster 3d.

de Bavay process. A method of froth flotation invented in 1904 in which a 40-mesh sand was deslimed, acid washed and conditioned with caster oil and paraffin before cascading flotation. Pryor, 3.

debitumenization. A, a slooted, floating clay block through which glass issues in the Fourcalt process. ASTM C162-66.

debublinization. Used by Lyrell and others and referring to the removal of volatile material from coal as a result of heat and pressure. Obisate. A.G.I.

deblanchol rotary furnace. A cylindrical refractory-lined shell, provided with a gas flue leading to a recuperator at one end, and a fuel and air port at the other. Air for combustion is preheated in the recuperator, and oil firing is adopted. The furnace may be used for melting gray iron and nonferrous metals; it is claimed to have many advantages, including simplicity, low cost, close control and speed of melting. Osborne.

deblooming. Masking the fluorescence of Shell Oil Co.

deblooming agents. Mononitronaphthalene and yellow coal tar dyes are sometimes used for deblooming. Shell Oil Co.

debris. a. Rock fragments, sand, earth, and sometimes organic matter, in a heterogeneous mass, as at the foot of a cliff. Fay. b. The silt, sand, and gravel that flow from hydraulic mines; referred to by miners as tailings, slums, and sometimes slickens. See who buys and sells on his own account. Fay. c. Any loose material removed by the action of erosion. Also see alluvial cone. Seely, 1.

debri, 1. A, a dirt-filled bar used for piling wall and chocks. See also sandbag. Nelson.

debri cone. A fan-shaped deposit of soil, sand, gravel, and boulders, built up at the point where a mountain stream meets a valley, or otherwise where its velocity is sufficiently reduced so that suspended material is deposited. See also alluvial cone. Seely, 1.

debri dam. A dam in a watercourse that retains sand and gravel. Hem.
debris deposits. Refuse from hydraulic mining operations. Fay.
debris slide. A small, rapid movement of large, loose material that slides or rolls downward to produce an irregular topography. Leet.
debrus. Plural of brus. Boulders, cobbles, boulders, or pebbles.
debris deposits. Refuse from hydraulic mining operations. Fay.
debris slide. A small, rapid movement of large, loose material that slides or rolls downward to produce an irregular topography. Leet.
debrus. Plural of brus. Boulders, cobbles, boulders, or pebbles.
debrus. A thin layer of debris.
debrus. Boulders, cobbles, boulders, or pebbles.
debrus deposits. Refuse from hydraulic mining operations. Fay.
debris slide. A small, rapid movement of large, loose material that slides or rolls downward to produce an irregular topography. Leet.
debrus. Plural of brus. Boulders, cobbles, boulders, or pebbles.
debris deposits. Refuse from hydraulic mining operations. Fay.
debris slide. A small, rapid movement of large, loose material that slides or rolls downward to produce an irregular topography. Leet.
debrus. Plural of brus. Boulders, cobbles, boulders, or pebbles.
debrus. A thin layer of debris.
declining conveyor

ASA MHA-1-1938.

decimeter. An instrument, often self-regi-
tering, for measuring or recording the de-
ciliation of the magnetic needle. Standard,
1964.

decollement. The independent disruption, by
folding or faulting, of sedimentary beds by
sliding over the underlying rocks. A.G.I.

decollement structure. A term borrowed from
structural geology and applied to
folded strata that have slid over underlying, gen-
erally disturbed beds. PaJishon.

decolorizers. a. Materials added for the ex-
press purpose of improving the appearance of
the glass by hiding the yellow-green color
due to iron impurities. Actually they
increase the total absorption of light by the
glass and cannot be employed if more than a certain amount of
iron is present. C.T.D. b. Materials added to
clay or ceramic mixes to
ployed if more than a certain amount
of colored
metallic
value. Minimum voltage at
decomposition potential. The minimum po-
tential difference necessary to decompose
weathering. A.G.I.

decrepitate when it flies to pieces on being
thrown upon the fire. Fay. b. Method
decrecepitation. a. To wash (minerals)
by finer screening. Pryor, 3. c.
decreptivation. The breaking down of min-
erals by themselves or in rocks through
death. A.G.I.

decomposition. The breaking down of min-
erals or rocks to yield simpler
substances. A.G.I.

decomposition potential. The minimum poten-
tial difference necessary to decompose
the electrolyte of a cell. ASM Gloss.

decomposition temperature. Minimum
oven temperature above which
continuous electric current flows
through an electrolytic solution of normal
strength. Pryor, 3.

decompression. a. The process of reducing high
air pressure gradually so as not to
injure men who have been working in it.
Nicks.

decompression illness. A condition among
underwater workers and mine rescue teams
that is caused by ascending too quickly
from deep dives. The blood absorbs nitro-
gen when it is subjected to greater pres-
sure, and the deeper a man

decorating tiring. The process of firing pot-
ceramic decoration in the center of an
glaze caused by contact with molten glass,
the type of glass used in making the glaze.
ASTM C204-65.

decoration, underglaze. A ceramic decoration
applied directly on the surface of ceramic
ware and subsequently covered with a
transparent glaze. ASTM C424-60T.

decoration, overglaze. A ceramic or metallic
decoration applied and fired on the previ-
ously glazed surface of ceramic ware.
ASTM C424-60T.

decorative stone. a. A stone used as architec-
tural trimmings in columns, fireplaces, and
store fronts. It may sometimes be set in
silver, or gold-filled jewelry, but then usu-
ally as curio stones, for example, malachite
and marble. Shipley. b. A term sometimes
used alternately with ornamental stone.
Shipley.

decoupling. A method for decreasing the se-
ismic effect of an underground explosion.
The method involves the firing of the ex-
plosive in the center of an underground
cavity so that the surrounding earth is
in close proximity to the explosive. LBL.

decrepitation. The breaking up with a
crackling noise of malleable substances when
exposed to heat, as when rock salt is
thrown upon the fire. Fay. b. A method
employed if more than a certain amount
of colored
metallic
value. Minimum voltage at
decomposition potential. The minimum po-
tential difference necessary to decompose
weathering. A.G.I.

decreasing. 1. To diminish; to decrease.
2. To cause to decrease.
lines projected downward. The next mine on the dip of the lode became known as the "deep". Fy. b. S. Afr. The distinction of deep level and ultradeep level is a vague one, and has changed over the years. Deep levels are now studied at a depth of 9,000 feet and over. Bartenman.

**deep mining.** The exploitation of coal or mineral deposits at depths exceeding about 3,000 feet. It would appear that the deepest coal mine in the world is the Rue du Coeur colliery at Quaregnon, Belgium (4,462 feet) with a rock temperature of 126°F, and it is planned to go even lower to 4,650 feet. The deepest gold mine is understood to be the Western Deep Level in the Republic of South Africa at 10,200 feet. The distinction of deep-seated rocks. See intrusive rocks.

**deep ocean.** Usually means the sea beyond the Deep-Sea System. See Benthic Division. Hydro.

**deepsea.** The working of 5 to 10 yards of overburden in the mining of coal or of other minerals. Schieferdecker.

**deep shooting.** A borehole, the course of which deflected is uppermost and this deflects or deflected the collar. Also called wedge; wedge off. Long.

**deep well.** A borehole put down through an overlying bed into a lower pervious one where a supply of water is obtained. Tilted.

**deep well pump.** a. Any kind of pump delivering from a well, shaft, or borehole. B.S. 3618, 1963, sec. 4. b. A hydraulically driven pump mounted at the low point in the mine to discharge the water accumulation to the surface. ASA C42.85, 1966, c. Consists of a series of pump impellers mounted on a single rotating shaft. The casings are termed bowls and the impellers are deflected in capacities ranging from 25 to 10,000 gallons per minute. It can be used in wells from 25 to 6,000 feet in depth and from 6 to 24 inches in diameter. Carson, p. 208.

**deep well turbines.** This is a simple type of vertical centrifugal pumping system. See also self-stowing wedge. Long.

**deep water.** Water of a depth exceeding one-half the water column section, and may operate in a sectional extra-heavy enclosing tube if oil is used as a lubricant, or may be exposed to the water when the pump is built to be water-lubricated. Pit and Quarry, 53rd, Sec. E, pp. 92-93.

**deep water.** The water used as a lubricant, or may be exposed to the water when the pump is built to be water-lubricated. Pit and Quarry, 53rd, Sec. E, pp. 92-93.

**deep water.** The water used as a lubricant, or may be exposed to the water when the pump is built to be water-lubricated. Pit and Quarry, 53rd, Sec. E, pp. 92-93.

**deep water.** The water used as a lubricant, or may be exposed to the water when the pump is built to be water-lubricated. Pit and Quarry, 53rd, Sec. E, pp. 92-93.

**deep water.** The water used as a lubricant, or may be exposed to the water when the pump is built to be water-lubricated. Pit and Quarry, 53rd, Sec. E, pp. 92-93.
deflection angle

ward prolongation of the preceding line, right or left, to the following line. Seeley, 2.

deflection bit. A taper bit, generally a bull- nose type, used to direct the deflection wedge when deflecting a borehole. Long.

deflection dual. The load indicating gage on a penetrometer, which is a soil-testing device used to determine some of the load-bearing characteristics of silt and sandy soils. See also cone penetrometer. Long.

deflection of plumbline. The angle between the actual direction of the plumbline and that of the normal to the spherical tank that represents the figure of the earth. Sometimes called station error. See 2.

deflection point. Point of deflection on a re- fraction T-X graph separating two segments that correspond to different wave paths. Schieferdecker.

deflectometer. An instrument for gaging any deflections of a structure. Ham.

deflector. A device across the path of a con- veyor placed at the correct angle to deflect objects or discharge bulk material. Also called a lip. ASA M14-1956.

deflector sheet. A sheet of brattice or other material erected in a roadway or face to prevent a firedamp layer. It is usually set at an angle of about 45° from the horizon- zontal and inclined in the direction of airflow. Nelson.

deflection wedge ring. An annular steel ring attached to the upper end of a deflecting wedge, having a slightly smaller diameter than that of the borehole in which the wedge is inserted, serving as a stabilizing ring to hold and center the wedge in the borehole. Also called rose ring. Long.

deflocculation. The thinning of colloidal matter to disperse nonmetallic or metallic particles in a liquid, (that is, basic materials such as calgonate, sodium silicate, soda ash, etc., are used as deflocculants in clay slurry). B.S. 3618, 1963, p. 22. British Standard Institution.

deflocculating. A state of colloidal suspension of like electrical charges by the repulsion, (resulting in their mutual repulsion, or both. It is generally possible to defloccu- late a gel to such an extent that it loses its gel-structure entirely, thus becoming a Newtonian liquid. See also deflocculation. Long.

deflocculated. Deflocculated stone. China stone from Cornwall, England, from which the small amount of fluorescent present has been re- moved by flotation. Dodd.

deflocculation. Eliminating foam. ASM Gloss.

deflection. Change in the form or in the dimension of a body produced by stress. Elongation is often used for strain in metal, compression or shortening for compressive strain, and distortion of a shear strain. Elas- tic deformation is such deformation as de- appears on removal of stress; permanent deformation is such deformation as remains on removal of stress. Compare set. See also strain. Ro.

deflection bands. Parts of a crystal which have rotated differently during defor- mation to produce bands of varied orientation within individual grains. ASM Gloss.

deflection detector. The composition within a system or two or more components which, on heating under specific conditions, de- velops sufficient fluid to cause defor- mation at the minimum temperature. ACSG, 1963.

deflection of rocks. a. Restrictively, the distortion of rock masses by pressure, e.g., by fold formation. b. The presence of gas reduces the den- sity of the fluid. The pumps and de- pressor. Bureau of Mines Staff.

deflection of rocks. a. The temperature ob- served during the measurement of expan- sivity of the interferometer method at which viscous flow exactly counteracts thermal expansion. The deformation point corre- sponds to a viscosity in the range from 102 to 106 poises. ASTM C 126-66. b. The temperature at which a nonmetallic material melts and deforms. See also fusion point. Bureau of Mines Staff.

deflection temperature. The temperature at which a material, having been pre- pared to a viscous condition, changes at a constant rate, perpendicular to the surface of the ground, due to pressure applied from the ground, or due to the attraction of the fluid medium. See also temperature. Nelson.

deflocculation. Deflocculant. A substance that can be added to a clay suspension to reduce the viscosity of the fluid. Nelson.

deflocculation agent; deflocculants; dispersing agent. An agent that prevents fine soil par- ticles or clay particles in suspension from coalescing to form flocs. Nelson.

deflocculatig. A state of colloidal suspension in which the individual particles are sepa- rate from one another, this condition being maintained by the action of the fluid medium. See also deflocculation.

deflocculation. A crystal bent or twisted out of its normal shape, so that the angle between its crystal faces may differ widely from the angle on the regular form. See also distorted crystal. Shipley.
degradinite. In 1955, K. Asai proposed to the Nomenclature Subcommittee of the International Committee for Coal Petrology that the term should be accepted to describe the most common constituent of the Tertiary coals of Japan. Degradinite resembles vitrinite and has no definite form. It forms the groundmass of the hydrite of Japanese Tertiary coals and encloses exinite, terrestriovitrinite, and semivitrinite. Semivitrinite and semimiformite are less commonly associated with it. IHCP, 1963, part 1.

degree. The degree of freedom. a. A possibility of motion independently without destroying any of the forces acting. ASCE P1826.

degree of compaction. The degree of compaction is the percentage of the volume of water-filled voids in the total volume of voids in a soil. Nelson. b. Ratio of weights of water vapor in air at given conditions and at saturation, with temperature constant. Specific humidities are usually employed. Measured in percent. Harm. c. See percent saturation. ASCE P1826.

degree of saturation. a. The percentage of the volume of water-filled voids to the total volume of voids in a soil. Nelson. b. Ratation of weights of water vapor in air at given conditions and at saturation, with temperature constant. Specific humidities are usually employed. Measured in percent. Harm. c. See percent saturation. ASCE P1826.

degree of sorting. The measure for the spread of grain-size distribution. Schieffer-decker.

degree of size reduction. Ratio of the surface area of the broken or crushed material to the surface area of the original material. Nelson.

degree of sensitivity. See remolding index. ACSG P1826.

degree of size reduction. Ratio of the surface areas of the broken or crushed material to the surface area of the original material. Nelson.

degree of size reduction. The degree of size reduction is the percentage of the surface area of the broken or crushed material to the surface area of the original material. Nelson.

degree of sortng. The measure for the spread of grain-size distribution. Schieffer-decker.

degree of sorting. A synonym for clinometer rule. Long.

degree of sorting. A synonym for clinometer rule. Long.

degree-gram. A unit of mass when the mean temperature is 30° C. D.O.T. I.

degree-hour. The product of a degree and an hour, usually for the determination of the circumference of a circle; the principal unit of measure for arcs and angles. Web.

degree-hour. The product of a degree and an hour, usually for the determination of the circumference of a circle; the principal unit of measure for arcs and angles. Web.

degress. In mineral dressing, the degree of liberation of a certain mineral is the percentage of that mineral or phase occurring as free particles in relation to the total of that mineral occurring as free and locked forms. Canadian, p. 70.

degress. In mineral dressing, the degree of liberation of a certain mineral is the percentage of that mineral or phase occurring as free particles in relation to the total of that mineral occurring as free and locked forms. Canadian, p. 70.

degree of locking. In mineral dressing, the degree of locking of a mineral is the percentage occurring in locked particles in relation to the total occurring in the free and locked states. Canadian, p. 70.

degree of locking. In mineral dressing, the degree of locking of a mineral is the percentage occurring in locked particles in relation to the total occurring in the free and locked states. Canadian, p. 70.

degress. In mineral dressing, the degree of liberation of a certain mineral is the percentage of that mineral or phase occurring as free particles in relation to the total of that mineral occurring as free and locked forms. Canadian, p. 70.

degress. In mineral dressing, the degree of liberation of a certain mineral is the percentage of that mineral or phase occurring as free particles in relation to the total of that mineral occurring as free and locked forms. Canadian, p. 70.
delay cap; delay detonator

fuse. Delay detonators are ignited by an electric current passing through the fuse. The time delay is due to the passage of an electric current through the fuse, which requires a minimum time for the fuse to become 

delayed filling. Filling in which the delay to evaporation for one-twentieth of a second is necessary. See also delay detonator. Nelson.

delayed fusing. A fusing effect that occurs after the final porcellain enameled processing. ASTM C286-65.

delayed neutrons. Neutrons emitted delayed neutrons. A phenomenon of neutrons emitted at a later time than the time of their original emission. In nuclear physics, this is known as delayed neutron emission.联合国, v. 4, 1938, p. 77.

delayed pillar extraction. A pillar method of mining in which the coal pillars are not extracted until the whole workings have been driven to the boundary. Extracted until the whole pillar is necessary. That part of a second that is necessary. That part of a second is necessary. Electric blast cap. An electric blasting cap used in coal mining. Nelson.

delayed quench. One in which the material is not quenched immediately on coming from the solution heat-treat furnace. This allows precipitation to proceed to a point where mechanical properties and corrosion resistance are lowered. Light Metal Age, v. 16, No. 9, October, 1956, pp. 17-24.

delay yield. A phenomenon involving a delay in time between the application of a stress and the concurrence of the corresponding yield point strain. ASM Gloss.

delay electric blasting cap. An electric blasting cap with a delay element between the priming and detonating mechanism to permit firing of explosive charges in sequence but with one application of the electric current. ASA C42.85, 1964, sec. 6.

delayed rentention cap. Detonation, commonly made annually on a per acre basis to validate a lease in lieu of drilling. Wheeler.

delay time. The time delay for any segment of a ray path over the time which would be required to traverse the horizontal component of that segment at highest velocity encountered on a trajectory. For a layer of velocity Vz and thickness L overlying a substratum of velocity Vd, the delay time, D = 2 L cos i/Vz, where i = sin (Vz/Vd).

delta "shoreslone; deltaic coast. Shoreline or deltaic shoreline, a term used to describe the coastal zone formed by the deposition of sediment by a river. Deltaic shorelines are typically characterized by a gentle slope and a narrow, flat beach.

delta, a. A delta, or alluvial fan, is a landform that is formed at the mouth of a river. Deltas are composed of sediment that is brought to the mouth of the river by the river's current and then deposited on the river's floodplain. Deltas are often characterized by a wide, flat area that is covered with sediment.

deltaic. Pertaining to, or resembling, a delta. A delta is a landform that is formed at the mouth of a river. Deltas are typically characterized by a wide, flat area that is covered with sediment.

deltaic deposits. Sedimentary deposits laid down in or near a delta. Deltaic deposits are typically composed of fine sediment that is brought to the mouth of the river by the river's current and then deposited on the river's floodplain.

deltaic. Pertaining to, or resembling, a delta. A delta is a landform that is formed at the mouth of a river. Deltas are typically characterized by a wide, flat area that is covered with sediment.

deltaic. Pertaining to, or resembling, a delta. A delta is a landform that is formed at the mouth of a river. Deltas are typically characterized by a wide, flat area that is covered with sediment.
delta shoreline; deltaic coast

coaft, formed by deltas built up in the sea
(or in a lake). Schieferdecker.
delta, of a dendritic cast. Pettitjohn
deltoid dodecahedron; dekohedron. An iso-
morphic hemihedral form of 12 faces, each
a square, hexagon, or octagon as described
by the tetrahedral type of symmetry. Fay.
delvin. Corn. A gray, talcgy, slaty stone that
tinnos killas or razes. Arkell.
Dempag-cappcl. A rope cappcl used in Koeppe
winding, particularly in Germany. The
rope is led along the side of the eye and
secured by a hinged retaining arm lined
with rubber, and then turned round the
eye and held in position by pressure exerted
by knee-action links. See also O.H.P. cap-
pel. Nation.
Demag drag-belt shuttle conveyor. Consists
of a single length of belting, half the length
of a double unit face, which is shuttled
backwards and forwards along the face
by means of low-type winches at each end
of the face, interlocked and fitted with
limit switches. The coal is ploughed off the
belt at a loader gate onto the gate con-
lveyor. Sinclair, V, p. 305.
demagnetization. The process of reducing the
magnetism in a magnetized body. This
may be accomplished by applying a magnetizing
force which opposes that producing the
original magnetizing force or by exposing
the body to an alternating magnetic field
which is gradually reduced to zero. A per-
mmanent magnet may be demagnetized by
heating it to a red heat or by rough usage.
Osborne.
demagnetize. a. To deprive of magnetic po-
larity. Sinclair, V, p. 305.
demagnetized. A unit of yarn size, used on the
bihtle. Dodd.
demagnetization. a. Water softening by use
of zeolites, which retain to remove cations.
Pryor, 3. b. See demineralization. Lowenheim.
deminstroitic apparatus. Portable deionizing
apparatus for the removal of cations and anions
in two successive stages. Pryor, 3.
demiscule. The eroded portion of an abobe
pillar extended up from the ground about
2 1/2 feet, and wherever small pebbles had
been included in the mud of abobe these
had locally protected the material behind it
and so yielded small hoodooike hilled
pillars directed toward the wind and about
3 inches in length. Such slender demisci-
elses resulting from the embedding of
harder nodules within rocks, the surfaces
of which have been drilled away by natural
erosion, have been described by Waithcr.
A.G.I.
demorphism. All the processes by which rocks
are broken down and decomposed. Johannen-
sen, v, 1, 2d, 1939, p. 172.
dempy. A mine or part of a mine which is
prone to outbursts and accumulations of
gas and blast, have been described by Waithcr.
A.G.I.
demixurlity. The rate of separation of the
components of a mixture. API Glossary.
demuxerization. Breakdown into separate
phases of a relatively stable emulsion, by
such means as flocculation with a surface-
active agent or removal of an emulsifying
agent. Pryor, 3.
demurriage. The detention of a vessel, rail-
road car, or other vehicle beyond an allotted
time; usually by failure to unload
ship, and so yielded small hoodooike hilled
pillars directed toward the wind and about
3 inches in length. Such slender demisci-
elses resulting from the embedding of
harder nodules within rocks, the surfaces
of which have been drilled away by natural
erosion, have been described by Waithcr.
A.G.I.
demulpshion. Resembling a tree; arborescent;
dendritic; descriptive of certain minerals.
Fay.
dendrip. a. A hydrous phosphate of cal-
cium and aluminum; found as white crusts
in varicite nodules. Sinianlusk, b. Common
Densification method. A method of preparing
the surface of shafts and similar objects
in which the surface is threaded to hold
particles of molten sprayed metal. After
cutting, the tops of the threads are knurled
and so yielded small hoodooike hilled
pillars directed toward the wind and about
3 inches in length. Such slender demisci-
elses resulting from the embedding of
harder nodules within rocks, the surfaces
of which have been drilled away by natural
erosion, have been described by Waithcr.
A.G.I.
dense medium. A fluid formed by the
liquid or solid, which can be used in industry
or in the laboratory to divide coal into two
fractions of different specific gravities. B.S.
3552, 1962.
densification. a. Heavy media separa-
tion, or sink float. Separation of sinking
heavy from light floating mineral particles
in fluid of intermediate density. Abbreva-
tion, DMS. Pryor, 4. b. Separation of rela-
tively light (flotats) and heavy ore particles
by immersion in a fluid of intermediate
density. This is the dense or heavy media,
which is prepared by gathering up a sus-
cipent of heavy material in a fluid
of intermediate density and galena are in principal use.
Pryor, 3.
densitric medium. A fluid formed by the
artificial suspension of water in heavy particles
dense medium

(for example, magnetite, barytes, and shale), which can be used in industry or in
the laboratory to divide coal into fractions of different specific gravities. B.S. 3552,
1962.
dense-medium jigging. This method involves two steps: (1) the circulation in the jig of a 1.7 to 2.0 specific gravity
bone middling, approximately three-sixteenths of an inch to 0 in size, which fills the interstices of the jig bed and in effect
converts the jig into a float-and-sink ma-
chine; and (2) the use of a suction stroke to
retein the medium in the bed and prevent
its washing over with the coal. Mitchell, p. 516.
dense-medium process. A process for the
washing of coal, in which the desired separa-
tion is effected in a dense medium. B.S. 3552,
1962.
dense-medium recovery; medium solids re-
covery. The collection, for reuse, of medium solids from dilute medium, usually under-
stood to include the removal, in whole or in part, of containing fine coal and clay. B.S. 3552,
1962.
dense-medium wash. A machine for clean-
ing coal and other materials which uses a dense medium in which the coal floats while the
shale sinks. The fluid consists of water inti-
ately mixed with sand, or finely ground magnetite or even shale, the latter being agitated to
maintain its consistency. The fluid has an
effective specific gravity ranging from 1.3
to 1.9. In general, coal from about 0.5 million
down to 1 inch is washed by dense medium,
between 1 inch and 0.75 millimeter (where cleaning is neces-
sary) by froth flotation. Magnetite as the dense medium solid is preferred as it can be
easily recovered by magnetic separators and also the upper limit of the specific gravity is higher (up to 2.0). See also coal-
dense mica crystalline tournelite. This type ton-
stein consists almost entirely of fine-grained kaolin groundmass, showing weak aggregate
behavior, consisting here and there isolated crystals of kaolinite. Such bands are commonly more than
100 millimeters thick and light in color. B.S. 3552,
1962.
dense rock. A rock with small, even grains
density. An algebraic term used to impart a
sense of density, or specific gravity, of a
substance, such as of a drilling mud. Long.
density curve; specific gravity curve. Any
curve obtained from the results of a float
and sink analysis by plotting the yield of
floats or sinks against the specific gravity. B.S. 3552,
1962.
Denison sampler. A large-size, swivel-type
two-tube core barrel designed for sol-
tation where it is desired to obtain relatively undis-
turbed corelike samples of soft rock and/or
soil formations. The inner tube is provided with a block-and-tackle arrangement for
buckling or basket-type core lifter or core-retaining
device. Also called Denison core barrel.
densitometer. An instrument for the measure-
ment of the density of a mass or volume produced
by light, gamma rays, X-rays, etc., on a
photographic plate; used in some dust-
sampling instruments. Nelson.
density. a. The mass of a substance per unit
volume. Webster 3d. b. The quality or state of
being dense; closeness of texture or con-
 sistency. Webster 3d. c. The distribution of
a quantity (as mass, electricity, or energy)
per unit usually of space (as area, length,
or volume). Webster 3d. d. Although
density is defined as mass per unit volume,
the term is frequently used in place of unit weight of soil or rock. See also unit
weight. ASCE P1826. e. The ratio of the mass of
any substance to the mass of an equal volume of a standard substance; for
example, water is used as the standard
substance to which the ratio of a density
depends. Long. f. Having the quality of being dense, hard, or compact. Long. g. Weight of a substance
in grams per cubic centimeter (at specified
temperature when close accuracy is needed).
For liquids and solids, it equals specific
 gravity. Density fluids are heavy liquids
used in float-sink tests. Of a particle, the
true density is its mass (m) divided by volume
(V); of a mass of powder, its apparent
density is its mass divided by volume
(m/v) including open but excluding closed
cells. Of a mass of particles, its apparent
density is mass divided by volume
(m/v) under stated freely poured
conditions. See also tap density. Long. h. The
density of gases. The vapor density of a gas,
which water of its density is found. The
number of times a volume of the gas is
heavier than the same volume of hydrogen,
the volume of both gases being at the same
temperature and pressure. Cooper.
density ratio. In powder metallurgy, the ratio
of the determined density of a compact to
the absolute density of metal of the same
composition, usually expressed as a per-
centage. ASM Gloss.
dental. a. Relating to the teeth. Tomkeieff,
1954.
dental. A tooth-shaped projection formed on
or over a surface on which the teeth rest or
enlarge the force of the bite. Dobrin, pp. 227-228.
dental alloys. Gold and silver base alloys
which are plated on nickel or palladium; used for bridges, filling, braces and similar work. Bennett,
2d. 1962.
dental porcelain. Feldspathic porcelain,
shaped, fired, and fitted for use as false
teeth; the fitting is sometimes carried out
in a partial vacuum to remove small air bubbles and to provide maximum density and strength. Dodd.
dental work. The act or process of fitting
or shaping or carving or polishing or burnish-
ing a borehole with cement or grout; also, the cracks, etc., so filled. Long.
denthall silt. A still formed with a close
heap or mass of stones whereby the
flowing water is obstructed. Ham.
denture. Same as dentry coal. Tomkeieff,
1954.
denudation. The sum of the processes that
result in the wearing down of the surface of the
earth, including wear by running water,
solution, and wind action. The term
is wider in its scope than erosion, the
restriction proposed by Lyell that limits it
to the action of running water has not been
denudation. To wear away or to remove over-
laying matter from and so expose to view, as the underlying rocks. Standard, 1964.
denyed. Rocks not covered by denudation. Fay.
denuncia. a. Sp. In Mexico and Spanish
America, the judicial proceedings by which
a person claims and secures
a mine which he has
discovered, or one
which has not been
claimed by the owner
to work it, or by the
neglect of the owner to work it,
and preve lt
a person claims and secures
a mine which he has
discovered, or one
which has not been
claimed by the owner to work it, or
by the neglect of the owner to work it,
dephosphorizing. Removal of part or all of phosphorus from steel, in basic steelmaking processes.

Deposition. A process whereby differentiated rocks are formed directly as a result of the decrease in concentration of water on the failure of marine life and organic action; also, the material thus deposited.

Deposition sequence. The order in which the deposition of sediments. A process whereby the solid material is thrown down or deposited. Opposite of denudation. Standard, 1964. b. The precipitation of mineral matter from solution, as the deposition of calcite. Crispin.

Deposition efficiency. In welding, the ratio of the weight of deposited weld metal to the net weight of electrodes consumed, exclusive of sub. ASM Gloss.

Deposition of sediments. A process whereby rock debris, which has been suspended in water, drops to the bottom of suspension. This occurs when the transportation velocity of the medium drops below the minimum necessary to maintain suspension, ify.

Deposition sequences. The order in which the increments of weld metal are deposited. ASM Gloss.

Depolarization. Reduction of polarization by changing the electrode system. ASM Gloss.

Depolarizer. A substance which produces depolarization. ASM Gloss.

Depressant. A. A substance which causes a depression in the surface of water, but now includes mineral matter in any form that is precipitated by chemical or other agencies, as the ores in vein deposits. B. A lowering, sinking or diminution. A.G.I. a. The depression is enclosed on all sides by elevations of the sea bed. A.G.I. b. A low place of any size on a plain surface, with drainage underground or by evaporation; a hollow completely surrounded by higher ground and having no natural outlet for surface drainage. A.G.I. c. A lowering, sinking or diminution. A.G.I. d. In surveying, the angular distance of an object beneath the horizontal plane that passes through the observer.

Depression contour. One of the contours representing a depression that has no surface outlet. To distinguish them from other contour lines, they are colored on the downwarp side with short traverse lines termed hachures. Stokes and Varnes. 1955.

Depression. a. The depression is enclosed on all sides by elevations of the sea bed. A.G.I. b. A low place of any size on a plain surface, with drainage underground or by evaporation; a hollow completely surrounded by higher ground and having no natural outlet for surface drainage. A.G.I. c. A lowering, sinking or diminution. A.G.I. d. In surveying, the angular distance of an object beneath the horizontal plane that passes through the observer.

Depression. A transition from a higher to a lower level, etc. Crispin.

Depreciation. a. Reduction of assets of a working mine through rundown of ore reserve, obsolescence, and wear and tear. Pryor, 3. b. The loss in value which machinery sustains through age and through wear and tear. Crispin.

Depreciation. A fund set aside to replace absentees, to avoid delays, and to replace depreciable property when it is needed. Nelson.

Depression. The act of emptying, reducing, or lowering. Crispin.

Depression. a. The act of emptying, reducing, or lowering. Crispin.

Depression. a. The act of emptying, reducing, or lowering. Crispin.

Depth or inclined depth. Beerman.

Depth. A. The word alone generally denotes vertical depth below the surface. In the case of inclined shafts and boreholes it may mean the distance reached from the beginning of the shaft or hole, the borehole depth or inclined depth. Beerman.

Depth. A. The word alone generally denotes vertical depth below the surface. In the case of inclined shafts and boreholes it may mean the distance reached from the beginning of the shaft or hole, the borehole depth or inclined depth. Beerman.

Depth. A. The word alone generally denotes vertical depth below the surface. In the case of inclined shafts and boreholes it may mean the distance reached from the beginning of the shaft or hole, the borehole depth or inclined depth. Beerman.

Depth. A. The word alone generally denotes vertical depth below the surface. In the case of inclined shafts and boreholes it may mean the distance reached from the beginning of the shaft or hole, the borehole depth or inclined depth. Beerman.

Depth. A. The word alone generally denotes vertical depth below the surface. In the case of inclined shafts and boreholes it may mean the distance reached from the beginning of the shaft or hole, the borehole depth or inclined depth. Beerman.
broadness of the foundations. Hence, the larger the loaded area the deeper is its influence felt and the test: necessary. See also site investigation. N. depth of stratum. The vertical distance from the surface of the earth to a stratum. A.G.I. depth per bit. The length of bolehole which can be drilled with a steel bit until it must be resharpenned. Streelfirk, p. 15. depth point. In seismic work, a position at which a depth determination of a mapped horizon has been calculated. A.G.I. deputation work. Gr. Brit. When workmen are selected by the same mine to interview the management with reference to wage matters or disputes, once accompany their permanent trade union official for the same purpose, it is called deputation work. Nelson. deputy. a. An underground official in a mine of coal, stratified ironstone, shale, or fire clay, with statutory responsibility for the safe and proper working of a district of the mine, as a called examiner; fireman (undesirable usage). B.S. 3618, 1963, sec. 2. b. Within limits, he is also a lower district manager of the district. Nelson. c. Eng. In Northumberland and Durham, the man who sets timbers or props in a coal mine is known as a deputy. Nelson. d. N. of Eng. A junior official responsible for safety precautions and inspections in a district face or face district. Frist. e. N. of Eng. A man who fixes and withdraws the timber supporting the roof of a mine, attends to the safety of the roof and sides, builds stopping, puts up bratticing, and looks after the safety of the mines. Fay. f. Eng. In the Midland coalfield, an underground official who looks after the general safety of a certain number of stalls (rooms) or a district, but who does not set the timber himself although he has to see that it is properly done. Fay. g. A mine official. Fay. deputy overman. New. The man who lays the plates and sets the timber for the miners, and has charge of a portion of the mine. Fay. deputy's district plan. Gr. Brit. The plan required by law, which shows the limits of each deputy's district and the meeting station. B.S. 3618, 1963, sec. 1. deputy's qualifications. Gr. Brit. A deputy must hold either a colliery manager's or an undermanager's certificate or a deputy's certificate. He must be capable of making accurate tests for flammable gas with a flame safety lamp, and possess a hearing and first-aid certification. In addition, a deputy must have had not less than 5 years previous experience of work or of management of which not less than 2 years were spent at the coal face. Nelson. deputy's inspection. See also hmgr.'s inspector. A person appointed by the Surveyor General of the United States to make proper surveys of lode mining claims, prior to the issuing of a patent. Fay. deputy system. N. of Eng. The plan of having a timbering in working places performed by specially appointed deputies. See also deputy, e. Fay. derrick. A. A large movable crane device for derailing mcn cars, usually installed on grades to protect miners working below. Similar devices are used on railways. See also drop derrick, SRF. derailing drag. See backstay. Nelson. derailing. The accidental running of a tram off the rails, usually due to stones or dirt fouling the track. See also wagon rerailer. Nelson. derail unit. This device locks to rails to derail cars. Wedge construction eliminates slipping. It prevents workers in railroads and mines against wild cars, switching cars or sudden car movement. Some types are equipped with a warning flag. Batts, p. 271. derby. A massive piece, of intermediate size (extending to more than 100 pounds), usually cylindrical, of primary metal made by bomb reduction, such as uranium from uranium tetrafluoride and magnesia. See also biscuit; dingot. ASM Gloss. derbystone. A black, brown antimonate and tinate of iron. FeO,SnO,FeO,TiO. Minute prismatic crystals and twins. Orthonickel. Derby pocket safety ohmmeter. A circuit tester which consists of a high-sensitivity moving-coil instrument with a 1.5-volt dry battery providing the low operating current. The battery is housed in a separate sealed compartment of the instrument. Resistances are incorporated in the instrument and connected so that it is impossible for the whole output of the battery to flow through the circuit under test. In use, the two ends of the circuit to be tested are connected to the terminals of the instrument, and the resistance of the circuit is registered on the 0--300 ohm scale when the button on the side of the ohmmeter is depressed. McDonald III, p. 65. Derby Press. Trade name; a machine for the represling of wire-cut building bricks. Dodd. Derbyshire spar; Derby spar. Fluorite, found abundantly in Derbyshire, England. Same as fluor spar. Derbystone. Amethyst-colored fluorite. Shipley. derivative rock. A rock derived by erosion or comminution of previously existing rocks or rock material, as a sedimentary rock and volcanic tuff. Standard, 1964. Compare ingenite. derived fossilia. Fossils that are not native to the rock in which they are found. For example, the pebbles in a conglomerate may enclose fossils or fragments of fossils. Such fossils are manifestly older than the conglomerate and are termed derived fossilia. Nelson. derived fuel. A fuel obtained from a raw fuel by some process of preparation for use, for example, coke, charcoal, benzol, and petrol. Nelson. derived neutrip. A derived neutral is a neutral point or connection established by the addition of a cigrag or grounding transformer to a normally ungrounded delta power system. I.C. 7662, 1960, p. 22. device for lighting. An installation in the upper part of the sialic crust. Schiferdecke. dermatis. A skin disease caused by the application of dust or liquids. In coal mining, the dust may be coal or stone dust and the liquids may be water, oil or grease. Presentation and acids or alkalis. The majority of cases occur in deep and hot mines having high wet-bulb temperatures. Macdonald, p. 344. dermohil. Fluent basalt lava characterised by a smooth, billyeow, or rovy surface and ordinarily upon various spherical vehicles. Synonym for pahoehoe. Obolete. A.G.I.
derivation, a. Removing the thick layer of dead crust. A green amorphous hydrous silicate desalinizing. Any process for making potable water from sea water or other saline waters. Distillation is the oldest method. Reverse osmosis and dialysis or multi-effect evaporation is practiced in order to limit heat consumption. Distillation with solar heat is expensive because the large area required result in high equipment investments. Electrolysis is an inherently good method because the energy is used to remove the small proportion of salt from the relatively large quantity of water instead of removing the water from the salt. Its practical use is restricted because of membrane deterioration, scale formation, and inefficient use of energy. Other methods are freezing by direct contact of refrigerant with sea water; foam separation; liquid-liquid extraction; various nonelectric membrane processes; and ion exchange. C.C.D., 6d, 1961. These processes are called desalination. Bureau of Mines Staff.

descending screens. A shaker-type screen for removing the sand and water from the products of a Chance washer. Nelson.

deserts. A green amorphous hydrous silicate of nickel and zinc; contains 30.0 percent nickel and 3.2 percent zinc. Hess.

desert. a. Applied somewhat loosely to any source, and the methods of recovery, fashioning, and use of gem minerals and gem materials and their substitutes. See also geology.

desert varnish. a. A surface stain or crust of manganese oxide or iron oxide, of chocolate-brown or black deposit prevalent on rock surfaces in desert regions. It not only coats ledges of rock in place but also coats boulders and pebbles that are scattered over the surface of the ground. UCSE Bull, 730, 1923, p. 87. b. The thin coating-iron oxide deposit on rock surfaces in desert regions. A.G.I.

desert crust. See desert pavement. A.G.I.

desert glass. Obsidian or moldavite. Shipley.

desert glass. Obsidian or moldavite. Shipley.

desert pavement. a. Synonym for desert crust. A.G.I. b. Applied by Free to a phenomenon previously observed by others. When loose material containing pebbles or larger stones is exposed to wind action, the finer dust and sand are blown away and the pebbles and gravel are left to accumulate on the surface, forming a sort of mosaic that protects the finer material underneath from attack. A.G.I. c. Where the vegetation or lack of it allows the wind to come to the surface freely, a curious pavement of stones results. A.G.I.

desert rat. In the Western United States, a prospector, especially one who works and lives in the desert, or who has spent much time in such regions. The name is derived from a small rodent common throughout much of the Great Basin and Southwestern United States. Fay.

desert rock. A group of crystals formed in sand, soft sandstone, or clay. The crystals are usually calcite and less commonly barite, gypsum, and salt. The first two occurrences are known as sand calcite and sand barite, respectively. Hess.

desert varnish. a. A surface stain or crust of manganese oxide or iron oxide, of brown or black color, and usually with a glintening luster, which characterizes many exposed rock surfaces in the desert. It not only coats ledges of rock in place but also coats boulders and pebbles that are scattered over the surface of the ground. UCSE Bull, 730, 1923, p. 87. b. The thin coating-iron oxide deposit on rock surfaces in desert regions. A.G.I.

desert varnish. a. A surface stain or crust of manganese oxide or iron oxide, of brown or black color, and usually with a glintening luster, which characterizes many exposed rock surfaces in the desert. It not only coats ledges of rock in place but also coats boulders and pebbles that are scattered over the surface of the ground. UCSE Bull, 730, 1923, p. 87. b. The thin coating-iron oxide deposit on rock surfaces in desert regions. A.G.I.

desert varnish. a. A surface stain or crust of manganese oxide or iron oxide, of brown or black color, and usually with a glintening luster, which characterizes many exposed rock surfaces in the desert. The thin coating-iron oxide deposit on rock surfaces in desert regions. A.G.I.
desired valve signal

desired value of the process being controlled. Pryor, 5, p. 31.
desliming. The removal of slimes from coal or a mixture of coal and water, however accomplished. B.S. 3552, 1962. b. Classification of a pulp into two fractions, relative to coarse and fine. Removal of primary (nonvaluable) slimes before treating ores for recovery of values. Pryor, 3.
desliming screen. A screen used for the removal of slimes from larger particles, usually with the aid of water sprays. B.S. 3552, 1962.
desmin. See sulphite, Fay.
desmeline. The amorphous groundmass, which is transparent in thin sections, binding together the constituents of bituminous coal of high grade. Applies to the transparent variety of residuum found in high-grade coals. Tomkiewicz, 1955.
destressed area; destressed zone. a. In strata where the force is much less than would be expected after considering the depth and type of strata. Compare overstressed. Mason, v. 1, p. 143. b. A region of low stress behind the walls of a stoped-out region. Isaacson, p. 109.
destroying. In deep mining, relief of pressure on abutments of excavation. Performed by drilling laterally and blasting to loosen the zones of peak stress. The peak load surrounding the stope walls is thus transferred deeper into the undisturbed rock, and a protractive barrier is formed. Pryor, 3.
destructional. Pertaining to destruction or shaping of rocks to a definite plan that has been shaped by erosion. Standard, 1964.
destructional cliff. A cliff formed by erosion; for example, sea cliff, river cliff, cuesta scarp, ice-scorched wall, ice-terminated cliff, fault-line cliff, and landslide scar. Stokes and Varney, 1955.
destructive distillation. The distillation of solid substances accompanied by their decomposition. The destructive distillation of coal results in the production of coke, tar products, ammonium, gas, etc. C.T.D. destructive distillation testing methods, the use of which destroy or impair the part or product insofar as its intended use is concerned, but which give proof or an indication of the strength or quality of similar or duplicate parts or products. Such tests include the destruction of the test piece to various influences, of destructive magnitude, such as impact, stress, pressure, cyclic movement, etc., and are also destructive testing. Henderson.
destructive wave. One of the waves that erode a beach. Schmoker.
destructive washing. A washing which destroys large amounts of refuse, usually by burning. Hem.
desulphurization. Corn. See desulphurizing, Fay.
desulphurization of steel. The removal of a high proportion of sulfur from steel by calcium carbide. The bath is brought to a good heat (1,500° C) and lime and fluorine are added to make fluid slag. The calcium carbide, usually 50 to 100 pounds, is injected in powder form, by means of a distributor, directly into the steel. The number of injections made depends upon the initial sulfur and the reduction required. Nelson.
desulfurizer. A material for reducing the sulfur content of cast iron or steel in the spuel or smelter. Holland.
detachable bit. A drilling bit which is threaded or tapered and is removable from the drill steel by use of a wrench, or of a tool. Added as a safety precaution. Also known as rip bit or knockoff bit. Bureau of Mines Staff.
detachable cable scaling box. Designed so that it can be disconnected and detached from associated apparatus without disturbing the scaling of the cable. B.S. 3618, 1965, sec. 2.
detached head pulley. See head pulley, a.
detaching book. An appliance which releases the detached bead pulley. See head pulley, a.
detaching book. A manufacturer's trade name for a straddle, as Mercury, as Primacord. Nichols. See also Cordage safety fuse. Nelson.
detonating fuse. A fuse consisting of high explosive that fires the charge without the assistance of any other detonator. Fay. It consists of a high-explosive core of pentaerythritol tetranteatrate (P.E.T.N.) enclosed in tape and wrapped with textile counter- rating yarn. Usually this fuse is then reinforced or completely enclosed in a strong waterproof plastic outer cover. The finished external diameter is normally about 0.2 inch. McAdam II, p. 59. Primacord is the best known brand. Nichols. See also Cordage safety fuse. Nelson.
detonation. Treatment by chlorination of bearing scrap for recovery of tin as its chloride. Pryor, 3.
detona. a. To cause to explode by the application of sudden force. Standard, 1964.
detonating fuse. A fuse used by the detonation of the explosive pyrotechnics. B.S. 3552, 1962. It consists essentially of two open-ended delay detonators coupled together with a flangeless neoprene tubing. Webster 2d.
detonating powder. Any powder in solid or liquid form, such as mercury fulminate, which, when heated or struck, explodes with violence and a loud report. Webster 2d.
detonator. A primer exploded by a fuse, used to ignite high explosives. Fay.
detonating rate. The velocity with which the explosive wave travels through the column of charge. Streetker, p. 42.
detonating relay. A device for obtaining short-delay blasting in conjunction with one volume of oxygen, forming water. Webster 2d.
detonating tube. A tube for making explosives. Webster 2d.
detergent. a. An explosive decomposition or explosive combustion reaction that moves through the reactant(s) at a greater than the speed of sound in the reactant(s) to produce (1) shock waves and (2) significant overpressure, regardless of confinement. Modern improvements for handling the sudden change of unstable substances from
detonation

a solid or liquid to a gaseous state with the evolution of great heat and accompanying explosion. This is sometimes called an explosion, but is used in connection with a coal-dust explosion, it refers to an extremely fast and violent stage, usually in a limited area. Rice, George S. A chemical reaction which propagates into the reacting medium at a supersonic rate. I.C. 8137, 1955.

detonation velocity. The speed of detonation is such that, when closed, a detonator or the leads produced during detonation in a high-explosive charge, and initiated by a safety fuse or by electricity. B.S. 3618, 1964, sec. 6. See also blasting cap; electric detonator.

developer. a. In photography, a processing solution which is vibrated by a safety fuse or by electricity. The action of converting the chemicals in an explosive charge to gases at a high pressure, by means of a self-propagating shock wave passing through the charge. B.S. 3618, 1964, sec. 6. g. The action or process of detonating; specifically: a chemical reaction producing violent evolution of heat and sparks or flame and moving through the material detonated, as a high explosive such as dynamite or TNT, at a speed of sound or slightly the time. Webster 3d. d.

deuterium. a. The processes involved in producing detrital sediments and in removing material produced by the accumulation of detritus and in removing material produced by the accumulation of detritus and in removing material from a land surface. A.G.I. In photography, a processing solution which is vibrated by a safety fuse or by electricity. The action of converting the chemicals in an explosive charge to gases at a high pressure, by means of a self-propagating shock wave passing through the charge. B.S. 3618, 1964, sec. 6. g. The action or process of detonating; specifically: a chemical reaction producing violent evolution of heat and sparks or flame and moving through the material detonated, as a high explosive such as dynamite or TNT, at a speed of sound or slightly the time. Webster 3d. d.

detrital. Descriptive of minerals occurring in sedimentary rocks that were derived from pre-existing rocks, geological processes, or mechanical breakdown of rock. C.T.D.

detrital deposits. Placer or detrital deposits are composed of minerals that have been released by weathering and later have been transported, sorted and collected by natural agencies into valuable deposits. Such minerals are often characterized by their specific gravity and are resistant to abrasion and weathering. Examples are gold, diamonds, platinum, tin (cassiterite), monazite, magnetite and ilmenite, these last two being the common constituents of black sand. Lewis, p. 276.

detrital limestone. A limestone formed from the debris of older limestones. A.G.I.

detrital mineral. Literally, any mineral, the granulation of which results from detritus; but Mineralogically, petrology, the term is restricted to the grains of heavy minerals found in sand and other sediments, and separated therewith by passing through a heavy liquid. See also heavy minerals. C.T.D.

detrital rock. A rock composed of particles or fragments eroded from pre-existing rocks. Stokes and Varnes, 1955.

detrition. a. Incoherent sediments produced by the erosion of rocks through the various geologic agencies. See also rock waste. Fay, b. Fragmental material, such as sand, silt, and clay, derived from older rocks by disintegration. The term is applied to consolidated deposits produced from accumulation of detritus. A.G.I. c. A mixture of minute vegetable debris which eventually becomes converted into coal. Tomkeeff, 1954. d. Accumulation on the sea bottom of particles worn from rocks by mechanical means and broken organic material. Hy.

detritus chamber. A tank through which sewage passes, allowing suspended solids to settle on the bottom from where they can be removed. Ham.

detritus slide. A slow downhill movement of detritus, with clays and shales acting as slipage surfaces. See also soil creep. Nelson.

Detroit furnace. See Detroit rocking furnace.

Detroit rocking furnace. An indirect arc furnace with graphite electrodes entering horizontally through the end of the furnace, rocks or coals continuously on supporting rollers. Bennett 2d, 1965.

desert. a. A lateral deformation in which particles of a body apparently slip past each other as a result of shearing force. B.S. 3618, 1964, sec. 6. See also shielding cap; electric detonator.

desertic. Alterations in an igneous rock produced during the later stages of the consolidation of the magma. Webster 3d. C.L. 1955.

desertification. A technique for reclaiming land which has become desertified. See also heavy mining. Nelson.

desertification. A technique for reclaiming land which has become desertified. See also heavy mining. Nelson.

desertion. A. To open a mine and ore; more or less, to search, prospect, explore. J. Bernoulli. b. To traverse a mineralized body horizontally by drives and vertically by adits or shafts, or both, to prove its extent. C.T.D. c. To open up ore bodies by shaft sinking, tunneling, or drifting. Truscott, p. 177.

develop. a. To open a mine and ore; more or less, to search, prospect, explore. J. Bernoulli. b. To traverse a mineralized body horizontally by drives and vertically by adits or shafts, or both, to prove its extent. C.T.D.

developed blank. A blank that requires little or no trimming when formed. ASM Gloss.

developed ore. Ore which is so completely exposed that its yield with respect to tonnage and tenor is essentially certain and which, in addition, is available to immediate and continuous recovery by the method being employed. Forrester, p. 553.

developed reserves. a. The tonnage of ore that is economically recoverable and which has been mined and blocked out, or exposed on at least three sides. In coal mining, the tonnage of coal known to exist within the limits of a mining block or a seam of coal, but not proven with assurance greater than 20% by shaft sinking, tunneling or drifting. B.S. 3618, 1964, sec. 6. See also shielding cap; electric detonator.

deviation. In photography, a processing solution that reduces the exposed grains of an emulsion to metallic silver, thus making the image visible. ASM Gloss. b. In xerography, a dry powder used to make the electrostatic image visible. ASM Gloss. c. In photography, a processing solution that reduces the exposed grains of an emulsion to metallic silver, thus making the image visible. ASM Gloss.
developer

development. a. To open up a coal seam or ore body as by sinking shafts and driving drifts, as well as installing the needed equipment. Nelson. b. Work of driving openings to and in a proved ore body to prepare it for mining and transporting the ore. Lewis, p. 20. c. The amount of ore in a mine developed or exposed on at least three sides. C.T.D. d. S. Afr. The work done in a mine to open up the paying ground or reef and, in particular, to form drives or haulages around blocks of ore which are then included under developed ore reserves. Beerman. e. A geologic term, applied to those progressive changes in fossil genera and species that have followed on another due to the deposition of the strata of the earth. Fay.

development drift. slant. A main tunnel driven from the surface, or from a point underground, to gain access to coal or ore for exploitation purposes. Nelson.

development gang. The shafts, tunnels, laterals, crosscuts, and staple pits to prove and render accessible the coal or ore to be extracted. See also productive development; unproductive development. Nelson.

development engineer. In bituminous coal mining, one who operates a hoist to raise and lower men, rock, and supplies for development work (sinking shafts and driving horizontal underground passages prior to the actual mining of coal from a seam). D.O.T. 1.

development gang. A team of men, working to a fixed time schedule, and responsible for having a new face, ready equipped with roof supports, pipe, drilling machines, etc., by the time the face in production is worked out. See also dismantling gang. Nelson.

development miner. See miner.

development plan. A plan showing the proposed development of the mine workings, and kept for operational purposes. B.S. 3618, 1963, sec. 1.

development rock. S. Afr. The rock broken during development work in payable ground, which contains both valuable and barren rock and is, therefore, included in the tonnage sent to the reduction plant of a mine. Beerman.

development sampling. Sampling for the establishment of reserves and conducted primarily upon the exposures along the development drivage. Nelson.

development work; developmental work. Work undertaken to open up or boost as much of the work of actual ore extraction as the situation permits. Sometimes development work is distinguished from exploratory work done from the surface and from stop preparation on the other. A.O.I.

devaurae agitator. An upthrust propeller, sometimes called a deauvian cylinder, used in leach agitation of minerals. Pyor, 3.

dewater. To change the course of a borehole. Compare deflect; walk; wander. Long.

dewatering. Synonym for deflecting. Long.

deviation. a. Turning or wandering from the proper bearing of a tunnel or shaft. b. The departure of a tunnel from its proper bearing. Nelson. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

d. S. Afr. The deviation of a borehole is the result of the presence of technical imperfections which prevent the drilling of a completely straight hole. Beerman.

e. Synonym for deflection. Long. 1. The distance, measured in a horizontal plane, between two surveyed points in a borehole or between the collar and any point below the collar in a borehole. Also called displacement; throw. Long. 2. In statistical appraisal of a series of observations two methods of measuring scatter are mean deviation and standard deviation. Pyor, 3. h. The difference between an experimental result and an accepted central value, usually the experimental mean value. B.S. 1017, 1960, pt. 1.

devisor stress. The difference between the major and minor principal stresses in a triaxial test. ASCE F1626.

devil-er. A hard, gray-white siliceous rock, consisting of minute grains of quartz and feldspar. Such devitrified glasses reveal their originally vitreous nature by traces of pellitic and spherulitic textures. C.M.D. b. The process by which glassy rocks break up into definite minerals, which are usually minute and are chiefly quartz and feldspar. c. The change from a vitreous state to a crystalline state after solidification. Fay. d. In ceramics, a surface defect manifested by loss of gloss as a result of crystallization. ASTM C286-65.

devitrification. a. Deferred crystallization, which, in glassy igneous rocks, converts obsidian and pumice into dull cryptocrystalline rocks (usually termed felsites) consisting of minute grains of quartz and feldspar. clinic. Dana. b. A type of ceramic material, formerly called herrengrundite; lyellite; devillette; uvroiguite. Hey 2d, 1935.

devil's bed. See topgallant rag. Compare old man. Arkell.

devil's eye. A type of ceramic material, formerly called herrengrundite; lyellite; devillette; uvroiguite. Hey 2d, 1935.

devil's muck. Bears' muck; cat dirt; pig's dirt. Arkell.

devil's muck. d. In ceramics, a surface defect manifested by loss of gloss as a result of crystallization. ASTM C286-65.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.

devil's hole. c. The wandering of a borehole from its intended course. B.S. 3618, 1963, sec. 3.
dewatering. a. Removing water by pumping, drainage, or evaporation. Nicholas, 2, b. This pump delivers a dewatered shaft in waterlogged workings as a safety measure or as a preliminary step to resumption of dewatering. It is often used during draining of the mine. b. Similar to the continuous bucket dewatering elevator. c. See dewatering classifier. Nelson. d. The mechanical separation of a mixture of coal and water into two parts, one of which is relatively coal-free, the other relatively water-free, with respect to the original mixture. Coarser coals are dewatered by drainage hoppers and bins, shaking vibrating screens, conveyors and chutes fitted with slots or stationary screens of either wedge or round wire construction, and perforated bucket elevators. The same methods can be used for dewatering coal minus one-half inch in size, and in addition centrifuges, vacuum filters, and sludge tanks and other thickening devices in combination with centrifuges or filters are used. Mitchell, p. 649. See also Bird centrifuge; McNally-Carpenter centrifuge; CMI centrifuge; etc. The process is generally carried on only to the extent of producing a damped cake, in two steps: (1) in thickener, which removes most of the water, and (2) in filters, which receive the thickened pulp and yield the damped mineral cake. If further dewatering is desired, driers requiring fuel for evaporation of moisture are essential; Gaudin, p. 9.1. In mineral processing, removal of part of the liquid from a pulp. Performed in thickener, classifier, hydroclone, settling bed or cone, or filter, on screen (coal preparation.) Pryor, 3, g. The process in which solid material either submerged or containing liquid is conveyed or elevated in a manner which allows the liquid to drain off while the solid material is in transit. ASA MH4-1-1958, h. The removal of water from wet materials by means other than evaporation. BS 3552, 1962.

dewatering classifier. A settling tank for clarifying a suspension or sediment by removing and concentrating gold slimes before cyaniding.

dewatering screen. A screen used for the separation of water from solids. BS 3552, 1962.

dewatering elevator. Similar to the continuous bucket dewatering elevator, it is often used in sand and gravel plants where the dredge line discharges to a sump. The dewatering elevator digests the material from the sump, allowing the water to drain out through perforations in the backs of the buckets while being elevated, and discharges to the place of its permanent processing. The essential differences between this and the regular continuous bucket elevator are the perforated buckets, which also often have renewable manganese-steel lips to allow for the wear caused by excavating the gravel from the sump. The dewatering elevator resembles in many ways the dredging elevator used on suction dredges. Fitz and Quarry, 53rd, Sci. G. pp. 34-35.

dewatering screen. A screen used for the separation of water from solids. BS 3552, 1962.

dewatering. Removing the extendable wax pattern from an investment mold by heat or solvent. ASM Gloss.

dew bed; dew stone. Eng. A grayish, bluish, centered, hard, crystalline, shelly stone, used for road metal. It rests upon the Yeoville sands. Arkell.

dewellite. A discredited mineral term since it is a mixture of dixonite and stevensite. American J. mineralog. v. 47, No. 5-6, May-June 1964, pp. 811-812.

dewellite. A very rare, strongly radioactive, canary-yellow, orthorhombic mineral, PbU3(VO4)3(OH)10.8H2O, found associated with thorites and other secondary uranium minerals. Crosby, pp. 15-16.

dewpoint. The temperature to which air must be cooled, at constant pressure and constant water vapor content, in order for saturation to occur. Since the pressure of the water vapor content of the air becomes the saturation pressure, the dewpoint may also be defined as the temperature at which the saturation pressure is the same as the existing vapor pressure. A.G.I. Also called saturation point.

dewpoint hygrometer. An instrument for determining the dewpoint; a type of hygrometer. It operates in the following manner. A parcel of air is cooled at constant pressure, usually by passing it over a refrigerated polished metal surface. Condensation appears upon the metal surface at a temperature slightly below that of the condensation dewpoint or the saturation temperature. The observed dewpoint will differ from the thermodynamic dewpoint depending upon the nature of the condensing surface, the condensation nuclei, and the sensitivity of the condensation-detecting apparatus. Hay. dew point. A term used in connection with wet air. Hawkins, 4th ed., pp. 35, 36.

diabase-porphyrite. A porphyry, the ground-mass of which is finely crystalline diabase and the phenocrysts of which are primarily plagioclase. It is contrasted with augite porphyry, the phenocrysts of which are primarily augite. Fay.

diabase. Applied to a texture of igneous rocks in which the crystals or grains of pyroxene (usually augite) fill the interstices between lath-shaped feldspar (usually plagioclase) crystals. The opposite of diorite is a diabase dike. The transition is gradual. A.G.I. Also called diabase.

diabasic. Relating to the intergrowth of two or more minerals; the intergrowth can be parallel, radiate, or have some less regular arrangement. Synonym for sieve texture. A.G.I.

diabole. A sky-blue oxidechloride of copper and iron, Cu2OCl2, in a wide variety of forms, usually as prismatic crystals; tetragonal; resembles lizarite. From Mendip Hills, Somersetshire, England.

diabrochile. A metamorphic rock formed by wet recrystallization or by partial fusion but without any intimate penetration by vitreous granitic material as in magmatic. A.G.I.

diachronism. The transgression across time place through a geologic, climatic, or hydrologic change of sand and when traced over a wide area may occur in different time zones in different places because it was not long continued marine transgression. The bed becomes younger in the direction in which the sea advanced. Same as diachro-
diachronism

diachronous. Pertaining to or during the period of the earth's existence, but differing in geologic time from. A.G.I., 1956.
diachronous faults. A line of rectangular fracture; applied by Daubree to explain the fact that the lines of weakness in the earth's surface are perpendicular to one another. Standard, 1964.
diacritical. Crossing a fold; a. a diachronal river. Webster 3d.
diagnostic structure. The structure exhibited by varied clays and silts, in which each sedimentation unit is marked by a gradation upward from coarse-grain size to fine-grain size. Synonym for graded bedding.
diagnosis. a. Any change occurring within sediments subsequent to deposition and before complete lithification that alters the mineral content and physical properties of the sediments. Bureau of Mines Staff. b. Recombination or rearrangement resulting in a change of product, as in the formation of larger crystalline grains from smaller ones. Webster 3d.
diagnostic deposits. Deposits consisting dominantly of minerals crystallized out of sea water, such as manganese nodules. H.G.
diagnosis. A marking or hieroglyph formed during diagenesis. Pettijohn.
diagnostic mineral. A. Such a mineral as olivine, nepheline, quartz, etc., which indicates an igneous rock is undersaturated or oversaturated. There are also diagnostic minerals in sedimentary and metamorphic rocks. Synonym for syngenetic mineral. A.G.I. b. A mineral, the presence of which permits certain deductions pertaining to the geologic history of the rock or sediment. Bureau of Mines Staff.
diagnostic brane. A structural member in compres- sion or tension, or both, at different times. It is usually designed and used to stiffen a frame against wind loads. Ham.
diagnostic core. Core obtained due to the direction of the strike of the coastal formations. Schiefferdecker.
diagonal plane. The specially designed eyepiece for a prismatic telescope used in surveying high altitudes. Ham.
diagonal joints. a. Joints diagonal to the strike of the cleavage. Zerna. b. In igneous rocks, joints which occur at 45° to the flow lines and are caused by shear. Lewis, p. 603.
diagonal scour marks. Scour marks formed by concentration of smaller scour marks, generally longitudinal flows, in rows which alternate with areas where scour marks are less abundant or are absent altogether, in rows diagonal to the main direction of flow. Pettijohn.
diagonal-slip fault. A fault in which the net slip is diagonal down or up the fault plane; for example, a fault with movement perpendicular to a strike-slip fault or a dip-slip fault. Synonym for oblique-slip fault. Billings, 1954, p. 140.
diagonal staple Any deposit that is neither a dip-slip nor a strike-slip fault. Synonym for bedded mineral. A.G.I.; Webster 3d; Fey. diaglyp. A marking or hieroglyph formed during diagenesis. Pettijohn.
diagenesis. Same as false bedding; cemented bedding; crossbedding. Fay. diagonal tension. The principal tensive stress in reinforced and prestressed concrete. Ham.
diagram factor. The ratio between the actual mean effective pressure developed in a steam engine and the ideal pressure deduced from the hypothetical indicator diagram. C.T.D.
diagnostic stratification. Same as false bedding; cemented bedding; crossbedding. Fay.
diagram of chondrules. A diagram illustrating the difference between chondrules and olivines. Pettijohn.
dial. Giving, meaning, indicating. Fay.
dial gage. A sensitive instrument which measures deflections of one-thousandth of an inch or less by a needle moving on a graduated dial. Ham.
diall. A dark green or trquoise-colored monoclinic pyroxene, which in addition to the prismatic cleavages, has others parallel to the vertical pinacoids. Mohs' hardness, 4; specific gravity, 3.2 to 3.35. Used also in steel, concrete, or well casings. Sometimes has the advantage of lightness combined with strength. Ham.
diall. A compass used for surface and underground surveying. It is fitted with sights, spirit levels, and a vernier, and mounted on a tripod. Pryor, 3, b. Corn. a. To make a mine survey. Pryor, 3.
diall. a. A mineral, the presence of which permits certain deductions pertaining to the geologic history of the rock or sediment. Pettijohn.
diall. a. A pointed wooden or iron arrangement placed between rails, just before a curve or switch, where tram cars are liable to be derailed, to force them to remain on the rails. If the skips are traveling in one direction only, the diamond is pointed at one end; if traveling back and forward on the same rails, both ends are pointed. Fay. b. A diamond of industrial grade used as the cutting element in drill bits. Also called borite; bort; bortz; carbon; congo. B.S. 3610, 1963, Sec. 3. c. The hardest known substance composed of carbon crystallized in the isometric system, the more common crystal forms being the octahedron and rhombohedron. The cube and some complex and combination forms of the isometric system are found, as well as mounted, distorted, and cryptocrystalline forms. Although very hard, diamond has excellent cleavage and breaks readily under a blow yielding flat surfaces parallel to the octahedral planes. Diamonds usually are classified as either gems or industrials on the basis of color, shape, size, crystal form, and the size and location of inclusions or other imperfections. Diamonds sometimes also are classified on a geographical basis, such as Angolas, Brazilians, congo, Sierra Leones, or West Africans. This does not strictly mean that diamonds are classified in forms that specific geographical area but that they are similar to stones characteristically produced by mines in that locality. A method for synthesizing diamonds has been developed, and small industrial diamonds have been produced on a commercial scale. These are a synthetic diamond called manmade diamonds. Long. See also manmade diamond; natural diamond.
diamagnetic. Having a negative magnetic permeability in vacuum, therefore, diamagnetic particles are repelled by magnetic field. Opposite of paramagnetic. Pryor, 5.
diamagnetic material. A material whose specific susceptibility is less than unity and is therefore repelled weakly by a magnet. A.S.M. Guide, p. 59.
diamagnetism. a. The property of certain substances by virtue of which they are repelled from both poles of a magnet and tend to set with the longer axis across the lines of magnetic force. Opposite of paramagnetic. Standard, 1964.
diamantine. See glass frost. Dodd.
diams. A trade name for a magnesia spinel brick. Heitz.
diameter. The greatest distance across a circle or through a sphere, the line of distance necessarily passing through the center of the circle or sphere. Bravais, 2.
diagonal rectifier circuit. A circuit which employs a semiconductor capable of conducting a period of 180 electrical degrees, plus the commutating angle. Coal Age, 1.
diafiltrated. See hydrazine sulfate. C.C.D.
diaphragm. A material whose specific susceptibility is less than unity and is therefore repelled weakly by a magnet.
DIAMOND BALLAS

Diamond ballas was first applied to such stones from Brazil, diamonds of similar structure known as Cape and African ballas. In color, ballas ranges from white to varying shades of black. While Cape and African ballas are not as hard as the Brazilian, they include some fine and unusual stones. Production is small. Rarely, if ever, used for diamond drilling but very useful for diamond tools. Cumming.

Diamond bit. A rotary drilling bit studded with button-type diamonds. A.G.I. Also called button bit; button set; button bit; button-set bit; bit; bit set; bit facing; bit facing set; bit; button-bit; button-set bit. Long.

Diamond-bit setter. See diamond-drill setter. D.O.T.

Diamond boring. Precision boring with a shaped diamond (but not with other tool materials). ASM Glass.

Diamond breaker. A person who buys packets of diamonds from the marketing agency of the Diamond Syndicate or other source, sorts the diamonds, and acts as a retail agent selling directly to consumers. Compare diamond buyer; diamond dealer. Long.

Diamond donor. A person who buys diamonds directly from the producer at or near the site where the diamonds are found or mined. Not to be confused with diamond broker who is sometimes miscalled a diamond buyer. Long.

Diamond chip. A fragment of a diamond crystal. Also called chip; chip; diamond Long.

Diamond cleaver. A cutting chisel having a diamond or V-shaped point. Fay.

Diamond cleavage. The plane along which a diamond crystal can be split easily. The four planes paralleling the faces of an octahedron are those generally referred to as the cleavage planes, or diamond cleavages. All crystalline diamonds are more or less brittle and will be fractured by a sufficiently violent blow, but the irregular surface of a fracture cannot be mistaken for the brilliant flat surface produced by cleaving. The carbon has no cleavage, and in ballas cleavage is absent or very poorly defined. Long.

Diamond chipping. The act or process of splitting diamonds into smaller pieces, which may be a single diamond or a set tool points, gems, or drill diamonds. Long.

Diamond concentration. The ratio of the area of a single-layer bit face covered by the inset diamonds or, in an impregnated bit, the bulk proportion of the crown occupied by diamonds. Long.

Diamond contact. The number of carats of diamonds inset in the crown of a diamond bit. Also called stone content; stone weight. Long.

Diamond core drill. A rotary-type drill machine using equipment and tools designed to recover rock samples in the form of hollow cylindrical cores from rocks penetrated by boreholes. See also core drill; diamond drilling.

Diamond coring. The act or process of obtaining a core sample of rock material using a diamond-bit or annular bit as the cutting tool. Long. This tubular bit and attached core barrel are rotated at a speed under controlled pressure by means of a water or water-oil or water-air mixture, through which water is pumped to cool the bit and remove rock cuttings. With the advance of the core the rock is cut up into the core barrel, where it is held by a core lifter or other device. Cumming, p. 17.

Diamond count. a. The number of diamonds set in the crown of a specific diamond bit. Also called bit count; stone count. Long. b. Sometimes incorrectly used to indicate the average number of diamonds inset in a specific bit. See also carat count. Long.

Diamond crown. The cutting bit in diamond drilling. It consists of a steel shell containing in its face and edges small cavities into which black diamonds are set. In some types of crowns the diamonds can be removed and reset; for further use. Grooves, called waterways, are usually provided in the face of the crown to allow the passage of the drilling fluid. For surface-set bits in diamond drilling, it is recommended that 2 to 20 stones per carat should be inset in the ground (see coarse); 10 to 80 stones per carat in medium ground (such as sandstone); and 20 to 130 stones per carat in hard ground (such as granite). See also burned bit. Nelson.

Diamond cubic. With respect to atomic arrangements, similar to the diamond in having the face-centered cubic arrangement of atom centers either of which is displaced with respect to the other by one-fourth of the diagonal of the unit cube. Henderson.

Diamond cut. See pyramid cut. B.S. 3618, 1964, sec. 5.

Diamond cutter. a. An individual skilled in the art of shaping diamonds as gems. Long. b. A tool in which a single diamond, shaped as a cutting point, is inset. Long.

Diamond cutting. One of the three processes by which diamonds are prepared for use as ornaments or in the arts, the others being diamond cleaving and diamond polishing. Fay.

Diamond dies. Industrial stones that have been pierced to permit their use for drawing wire of a constant diameter. I.C. 8200, 1964, p. 13.

Diamond drill. A drilling machine with a rotating, hollow, diamond-studded bit that cuts a circular channel around a core, which can be used to provide a more or less continuous and complete columnar sample of the rock penetrated. Diamond drilling is a common method of prospecting for mineral deposits A.G.I. Supp. Also called adammantine drill; core drill; diamond core drill; rotary drill; Drilling, diamond core. Long.

Diamond drill core. Boreholes drilled with a diamond drill and bits into rock surrounding an underground opening for the purpose of detecting water-bearing fissure or structures. Compare cover. Long.

Diamond drill crew. The men needed to operate a diamond drill. Long.

Diamond driller. One who sets up and operates a diamond drill that is used to obtain solid cores of rock or is drilled through so that the character of the ground, the wealth of ore, or strength of material for foundations may be determined. He may be called a core-driller in the bit as they become worn or chipped, or are lost (diamond-drill setter). Also called core-drill operator; core-drill operator; core-drill runner; core-drill operator. Long.

Diamond drill-bit helper. One who assists in the erection and operation of a core drill that bores into rock, earth, and other minerals to obtain core samples. Also called core-drill helper; core-drill operator helper; core-drill operator helper; core-drill operator helper; shot-core-drill operator helper; test-core-drill operator helper; test-core-drill operator helper; test-core-drill operator helper. Long.

Diamond drilling. The act or process of drilling boreholes using bits inset with diamonds as the rock-cutting tool. The bits are set by various types and sizes of mechanisms motivated by steam, internal-combustion, hydraulic, compressed-air, or electric engines or motors. See also diamond drill. Long.

Diamond-drill mcln. Members of a diamond-drill crew or persons trained to perform one or more duties connected with the operation of a diamond drill. Long.

Diamond-drill rod. Synonym for drill rod. Long.

Diamond-drill sample. Ti core brought to the surface in the core barrel. The cuttings in the uprising drilling fluid will also provide sampling material. See also core recovery. Long.

Diamond-drill setter. One who sets recesses in head of diamond drilling bit, with hand or powered drill, for the fastening diamond points. I.C. 8200, 1964, p. 13.

Diamond dust. a. Finely fragmented and powdered diamonds used as a cutting, grinding, and polishing abrasive or medium. Long. b. A diamond powder produced in the cutting of gems. Pryor, 3.

Diamond exposure. The proportional mass of a diamond protruding beyond the surface of a matrix metal in which the diamond is inset. Compare bit clearance. Long.

Diamond grade. The worth of a diamond as based on an individual sorter's interpretation of such standards of quality as presence of flaws, roundness, and shape. Long.

Diamond grooves. A groove of V-section in a roll. Fay.

Diamondiferous. Any substance containing diamonds; generally applied to rock or alluvial material containing diamonds but also may be used in referring to other diamond-impregnated substances, such as the crown of a diamond-impregnated bit. Long.

Diamond life. The amount of cutting a diamond will accomplish before being completely worn away by abrasion. In bits, diamond life usually is expressed in the number of feet drilled in a specific rock before the inset diamonds become too dull to continue cutting or are lost by roll out or completely worn away by abrasion. Long.

Diamond loss. The difference between the amount of diamond set in a bit and the usable diamond salvaged from the same bit when worn is considered the diamond
diamond loss. The loss may be expressed in carat per bit, carat per foot drilled, or in carat per 100 feet of borehole drilled in a specific rock. Long.
diamond patterns. A metal or metal alloy forming the material in which the diamonds inset in a bit crown are embedded. Also called metal bit matrix; bit matrix; crown metal; matrix. Long. b. The rock material in which diamonds are formed naturally and occur, such as kimberlite. Long.
diamond needle. A small-diameter hollow metal tube attached to a flexible rubber tube through which air is pulled by a suction or vacuum pump. The suction created at the tip of the metal tube enables a bit setter to pick up and place a small diamond in a bit mold with greater facility than with tweezers. Called a needle because the metal tube generally is made by using a discarded hypodermic needle. Also called diamond pickup needle; diamond pickup tube; diamond pipe. Long.
diamond orientation. The act or process of purposely setting a diamond in a bit or cutting tool in such a manner that the facets of the cut diamonds are small fragments of diamonds. Long.
diamond pattern. Manner in which the inset diamonds are arranged or distributed about the crown of a bit with or without conforming to some predetermined geometric arrangement. Long.
diamond pickup needle. Synonym for diamond needle. Long.
diamond pipe. a. Term used for an occurrence of kimberlite in volcanoclastic pipes large enough and sufficiently diamondiferous to be mineable. The size and shape of these pipes are controlled by the planes of structural weakness in the country rock through which the molten kimberlite passed. The pipes may be round, tabular, or irregular in shape and where mining is deep enough the diamond pipe is found to decrease in diameter. A diamond pipe is considered to exist until the diamond fragments have become rounded and are 40 diamonds having a total weight of 1 carat. Long.
diamond salvager. The recovery of fine diamond fragments that are present in the swarf and sludge from diamond grinding operations, as well as material from diamond dressing tools, wheel dressers, diamond-drill bits, and broken or discarded diamond wire drawing dies and grinding wheels. BinMiner Bull. 630, 1963.
diamond saw. A circular metal disk having diamonds or diamond dust inset in its cutting or peripheral edge. Employed to cut rocks and other brittle substances. Long.
diamond saw splitter. Synonym for core saw. Long.
diamond sawyer. In the stone industry, one who uses a saw in which block diamonds are inset in the teeth. D.O.T. 1.
diamond scale. Instrument on which diamonds are weighed with weight units calibrated in carats; scales vary from a folding 50-carat-capacity type, small enough to fit in a coat pocket when closed, to those large enough to hold several thousand carats at one time. Long.
diamondscope. An especially designed illuminator employing a gemstone holder of special chip-bit type; can be used with a binocular microscope, and a combination baffle which affords elimination of stones by either transmitted light, or by reflected light incident to all facets of the glass. It is sized for measurements of the facets on the crown so that inclusions imperfects) may be easily observed and identified. Used for both the identification of colored stones and the grading of diamonds. Shipley.
diamond setter. a. A person in the diamond-drilling industry—broken diamonds and diamond fragments deemed unfit for reuse in a diamond bit. In other industries using diamond-pointed tools, any piece of diamond salvaged from a tool and deemed unfit for reuse in the same kind of tool. Long.
diamond screen. A perforated metal or wire-cloth sieve used to sort diamonds or diamond fragments according to size. Long.
diamond-set bit. a. A rock-boring or rock-cutting tool, the cutting points of which are inset diamonds. Long.
diamond-set inserts. Small, shaped metallic slugs inset in diamonds designed to be brazed or welded into slots or depressions machined in a metal bit or reaming-shell blank. Long.
diamond-set ring. A powdered metal-alloy band encircling a reaming shell in which diamonds are inset mechanically. Long.
diamond setter. Formerly, persons skilled in the art of hand setting a diamond bit; also, persons trained to set diamonds in a mold to produce a so-called mechanically set bit. A few are being trained currently to hand set, but the technique is rapidly becoming a lost art. Long.
diagram. According to the diamond-drilling and dressing tool industry, the size of a diamond is always expressed in the number of nearly equal size diamonds having a total weight of 1 carat; hence an 8-diameter size means that there are 40 diamonds having a total weight of 1 carat. Long.
diamond with same as corundum. Fay.
diamonds per carat. The number of relatively equal size diamonds having a total weight of 1 carat. Also called stones per carat. Long.
diamond system. Synonym for diamond drill; diamond drilling. Long.
diamond tip. Large bright crystals of kimberlite. Fay.
diamond tools. a. Tools and equipment used to drill a borehole with diamond-set bits. Long. b. Any tool, the cutting point of which is a diamond, sometimes an inset whole stone or a shaped fragment of a diamond. Long.
c. A diamond, shaped or formed to the contour of a single-pointed cutting tool, for use in the precision machining of nonferrous or nonmetallic materials. ASM Gloss.
diamond-tooth saw. A circular saw for cutting stone with points of the teeth of pieces of diamonds. Merriam, 4th, p. 301.
diamond tweezers. Shaped pointed tweezers used to pick up and manipulate single diamonds. Long.
diamond wafer. An apparatus used for washing diamondiferous gravel. It has a bottom discharge with three coarse screens above it and a removable metal mesh. The shaker works in two bobs, hallowed out to suit, and is embroidered in the ground. The screens are copper, 0.5 and 1-millimeter mesh, the 8-millimeter screen being on top and the 1-millimeter screen at the bottom. The shaker is worked by a man standing on it at each end, and rocking it from side to side by a peculiar motion of the legs, the rocking motion being indexed each time by a sudden sharp jerk to one side. In West Africa the washer is commonly referred to as the shaker. Grietsk, S. I., pp. 8-10.
diamond wheel. a. A grinding wheel in which crushed and sized industrial diamonds are held in a resinoid, metal, or vitrified bond. ASM Gloss. b. Synonym for diamond set. Long.
diagoniferous. See diamondiferous. Long.
diaphanometry. The quality or state of being diaphanous. Specifically, the ability of a mineral to transmit light. Webber 3d. Compare transmit; semitransparent; translucent; opalescent. Fay.
diaphragm. Allowing light to show or to shine through. Webber 3d.
diaphraperite. A mineral like freieslebenite in composition. (Pb,Ag)₅Sb₂O₄ or (Pb,Ag)₅Sb₂Sn₃, but orthorhombic in form. Fay. b. Synonym for allagite. Hay 2d, 1953.
diaphragm. a. A porous or permeable membrane separating anode and cathode compartments of an electrolytic cell from other or from an intermediate compartment. ASM Gloss. b. Universal die member made of rubber or similar material which contains hydraulic fluids within the forming cavity and transmit pressure to the part being formed. ASM Gloss. c. A fluid partition between the mushrooms of Nicholos, 2 d. The crossthroat ring or metal piece holding the crossthroat or slipper line in a core saw. Also called a crossthroat. Long.
e.. In photography, a device for controlling the amount of light passed by a lens and
diaphragm

for cutting out such rays as would tend
to mar the perfection of the image. Also
diaphragm jig. In the gravity concentration
of minerals, a jig with a flexible diaphragm
deposited to pulse water. E.g., A.G.J. depo-
sition, Denver, and Conaet are exam-
diaphragm pump. A positive displacement
pump used for lifting small quantities of
water and discharging them under low
heads. It has a plunger arm operating
either on an eccentric shaft or a rocket-
arm thrusting on a rubber diaphragm
stretched over a cylinder. As the dia-
aphragm is depressed, the water and air
in the cylinder is forced out through the
diaphragm inlet port to form a vacuum in
the cylinder and water is forced in. Car-
diaphragm washbox. A washbox in which
the pulsating motion is produced by the
reciprocating movement of a diaphragm.
diaphanous. Synonym for retrogressive
metamorphism; retrograde metamorphism.
See also diaphanous. A.G.J.
diaphanose. A cataclastic schist with car-
acteristic minerals of upper deep magmas
which have developed at the cost of proto-
igneous minerals of lower deep magmas. Refer
to the text for more details.
diastole. Derived from a larger, parent
mineral, diphosphonate. A natural hydrous aluminum oxide,
dispersed as a fine, white, pearly; specific gravity, 3.35 to 3.45; Mohs'
lowish, and greenish; hardness, 3; and 3,28, depending on allotropic form; and
Mohs' scale.
diastem. A diastem represents an intraforma-
tion, with the same formation value. 4.01. c. A depositional
diastrophism. The process of deformation
that produces in the crust its conti-
nents and ocean basins, plateaus and
mountains, folds of strata, and faults. Con-
temporary or proterozoic. Webster 3d.
diathermanous. a. Transmitting infrared
radiation. Webster 3d. b. Allowing the free
diathermic. a. Diathermanous. Webster 3d.
b. Of or relating to diathermy. Webster 3d.
diathermy. The generation of heat in tissue
for medical or surgical purposes by the
application of high-frequency electric cur-
rents of various wavelengths by means of
electrodes and other instruments. Webster 3d.
diastroph. An event characterized by a de-
diastrophism. The process of deformation
that produces in the crust its contain-
ents and ocean basins, plateaus and
mountains, folds of strata, and faults. Con-
temporary or proterozoic. Webster 3d.
diagram. A microscopic unicellular plant
which has an envelope (frustule) or outer
skelton of hydrated silica, close to opal in
composition, and usually in two parts,
though some have a ring-shaped frustule
and some in chains. They inhabit both
fresh water and salt water, and their
frustules form masses of diatomaceous earth or
shale containing a thickness of thousands of
feet. Hess.
diastoeae. Formed from the silicious skel-
tons of diatoms. Shipley.
diagram. The process of deformation
that produces in the crust its conti-
nents and ocean basins, plateaus and
mountains, folds of strata, and faults. Con-
temporary or proterozoic. Webster 3d.
diastostaphic. A term describing a rock which breaks
simply, with faces and cleavage; applied to certain crystals. Stand-
dard, 1964.
diastrom. A volcanic vent or pipe drilled
through enclosing country rocks (usually
flat-lying sedimentary rocks) by the explo-
diastrophism. A volcanic vent or pipe drilled
through enclosing country rocks (usually
flat-lying sedimentary rocks) by the explo-
diastrophism. A volcanic vent or pipe drilled
through enclosing country rocks (usually
flat-lying sedimentary rocks) by the explo-
die lubrication

dielectric. a. A material which offers relatively high resistance to the passage of an electric current but may be made to conduct the electric lines of force may pass. Most insulating materials, for example, air, porcelain, mica, and glass are dielectrics and a perfect vacuum would constitute a perfect dielectric. NCB. b. An insulator. A term applied to the insulating material between the plates of a capacitor. HRC.

dielectric constant. The numerical expressions of the resistance to the passage of an electric current between two charged poles. It is the ratio of the attraction of two oppositely charged poles as measured in a vacuum to their attraction in a substance. Hess. The dielectric constant, which corresponds to permeability in magnetic materials, is a measure of the polarizability of a material in an electric field. This property determines the effective capacitance of a capacitor and consequently its static response to any applied electric field, either direct or alternating. The dielectric constant of a vacuum is unity. For most hard rocks it ranges from about 6 to 16 electrostatic units. For soft soils and clays it is somewhat greater than 1.0, extending up to 40 or 50 electrostatic units. Dobrin, pp. 341-342.

dielectric constant, Method of a high frequency heating in which the object to be heated, which must be nonconducting, is placed in a high frequency alternating field in which it is heated by the continually reversed polarization of the molecules. It has found application in the foundry for the drying of sand cores. Osborne.

dielectrics. Nonconductors of electricity may, under the influence of neighboring electric bodies, become electrically polarized by induction. Such materials are known as dielectrics. Their electromagnetic force is called dielectric polarization or dielectric induction. The strength of the electromotive force is determined by the dielectric constant. Hess.

dielectric separation, Method of ore treatment based on differences between dielectric constants of minerals suspended in an intermediate conducting fluid, when subjected to electric fields. Of limited use in laboratory work. Pryor, 3.

die lubrication. a. A solution that is used to facilitate the flow of plastic clay through a die or to prevent sticking of clay compositions of dies used in molds during the forming process. See also lubricant; mold lubricant. Bureau of Mines Staff, b. In powder metallurgy applied to the walls of the die and punches to facilitate the pressing and ejection of the compact. ASM Gloss.

die lubrication, Machine oils of a light variety or soap solutions are used for the lubrication of dies used in stamping or extrusion metal shapes. The procedure causes the strain on the metal and die and may prevent hair- lining in the subsequent forming operations. Tin oxides must be used to lubricate enamel ware blanks, due to difficulty...
diesel-electric locomotives. Diesel-electric locomotives are powered by diesel engines typically designed to run on high-speed, low-compression diesel oil, such as gas oil. Unlike single units, these locomotives are not self-propelled; they are hauled by another locomotive. Diesel-electric systems have been designed for both freight and passenger service, with capacities ranging from 10 tons up to the heaviest classes. Diesel-electric locomotives provide wide flexibility of control. Pit and Quarry, 53rd, p. 101.

diesel engine. A type of internal-combustion engine in which air is compressed to a temperature sufficiently high to ignite fuel injected directly into the cylinder, where the combustion and expansion actuate a piston. Thermodynamically, its operation approximately follows the ideal diesel cycle. Diesel engines may be of either the four-stroke-cycle design or the two-stroke-cycle design. The efficiency of the diesel engine (32 to 38 percent) is higher than that for other engines. Also called after Rudolf Diesel, a German mechanical engineer, who patented this type of engine in 1892. Webster 24.

diesel hammer. A pile driving drzhopper operated by a type of diesel engine. Ham. Diesel index. An expression developed to correlate aniline point and API gravity with cetane number. Diesel index = 100 where G is the API gravity of an oil, and A is the aniline point of the oil. Franci, 1954, p. 249.

dieselization. In a compressor, explosions of mixtures of air and lubricating oil in "c" compression systems or other parts of the air system. Nichols.

diesel locomotive. A locomotive driven by a diesel engine. N.w. used on roads of the New York Central and other diesel locomotives where 15 tons can give good continuous service. See also locomotive haulage. Nelson.

diesel oil. Fuel for diesel engines obtained from the distillation of petroleum. Its efficiency is measured by the so-called cetane number. It is composed chiefly of aliphatic hydrocarbons. Its volatility is similar to that of gasoline or jet fuel. C.C.D. 64, 1961. Diesel rig. Any drill machine powered by a diesel engine.

diesel squeeze. Pumping dry cement mixed with diesel oil through casing perforations to recement water-bearing areas and leave oil-bearing area unaffected. Wheeler.

diesel truck. In opencast mining, a powerful and robust diesel-engined vehicle carrying from a few tons to over 100 cubic yards of earth or rock. Also used in trackage transport in tristrate mines. Pryor, 3.

die set. A standardized tool or tool holder consisting of a die base and punch plate for the attachment of a die and punch, respectively. L. See also die (2).

die sinking. Forming or machining a depressed pattern in a die. ASM Gloss.

die steels. Steels of the plan carbon or the alloy types, which must be 0.004" high quality which is usually attained by special methods of processing. Essentially, they are usual in making tools for cutting, machining, shearing, stamping, punching and shipping. Bu Mines Bull, 536, 1956, p. 815.

die tryer. A device used for the direct reading of a Brinnell hardness after impression without the aid of magnification or conversion tables. After the impression is made, the reading is taken by pressing gently against the part so that the depth pin guides itself into the center of the impression. Brinnell hardness is read directly from the dial. The needle can be put back to zero by means of an exterior control if it becomes bent after long usage or when it has been subjected to shock. Osborne.

diethyl glycol diglycol ether. Practically colorless; liquid; characteristic odor; C5H12(OH)2C5H12; slightly soluble in water; and specific gravity, 0.8853 (at 20°C, referred to water at 20°C). A high boiling point, inert solvent with applications in extraction processes and an extractant for uranium ores. C.C.D. 64, 1961.

differential. The unit which provides the main transmission of power from the engine to the road wheels and determines the distance traveled by each rear wheel. C.C.D. 64, 1961. See difference be gage of drill bits. The difference in diameter of the bit when passing from one length (change) of drill steel to the next. See also difference in gage of drill bits.

differential flotation. Separating a complex ore into two or more valuable minerals and gangue by flotation. Also called selective flotation. ASM Gloss. The separate concentrates are made possible by the use of suitable depressors and activators. Newman, 1959.

differential grinding. Application of comminution in such a way as to accentuate differential breakage, usually by using various mineral species in the ore. Therefore,
differential grinding

in suitable cases, the relatively tough mineral particles remain coarse, while the more friable ones are finely ground. Pryor, 3.

**differential heating.** Heating that produces a temperature distribution within an object in such a way that, after cooling, various parts have different properties as desired. ASM Gloss.

**differential pressure.** The difference between twod absolute pressures. Roberts, 1, p. 18.

**differential pressure flowmeter.** An instrument for measuring water and water-oil slurries in one draining and coal dressing processes. It works on the principle that the rate of flow changes as the difference in pressure between the upstream and downstream sides of a constriction in the line carrying the fluid to be measured. The constriction is usually an orifice plate, a Venturi tube, or a flow nozzle. Thomas, 4.

**differential pressure sticking.** A problem occurring when the string comes in contact with the wall of the borehole in the presence of a high differential pressure into the tubing. The severity of sticking depends upon the magnitude of this pressure differential, the area of contact between drill pipe or filter cake, and the friction which must be overcome to move the pipe. American Petroleum Institute and Production Practice, 1963, p. 80.

**differential policy block.** A lifting tackle used by builders which comprises an endless loop of wire rope over two wheels, with a different diameter on each side, turning on the same shaft. As the diameters become closer to one another, the lifting power increases. The block prevents the chain from running back and permits one man to lift 1,000 pounds or more in suitable cases. Ham.

**differential pumping engine.** A compound direct-acting pumping engine, generally of the double acting type. Pryor, 3.

**differential relays.** These relays operate on current induction and are used to protect against certain kinds of currents that are reflected in the horizontal class. Fay.

**differential system or equipment.** When the rated percentage of unbalance is reached the relay operates a breaker and interrupts service to the system or equipment. When the rated percentage of unbalance is reached the relay operates a breaker and interrupts service to the system or equipment. Pryor, 3.

**differential weathering.** When rocks are not uniform in character but are softer or more soluble in some places than in others, an uneven surface may be developed in deserts by the action of the wind and in humid regions by solution. Columns of rock. This ratio is known as any way show the effect of differential weathering. A.C.I.

**differentiate.** One of the different kinds of igneous rocks formed as the result of magmatic differentiation. Bateam.

**differentiation.** A process in which two kinds of substances, such as dikes, laccoliths, batholiths, etc., that are made up of two or more rock types, are produced by the splitting of a parent magma. Hess.

**differentiated dike.** A dike that consists of more than one kind of rock because of magmatic differentiation of an originally homogeneous magma into two or more fractions. Billsing, 1954, p. 307.

**differentiated sill.** A sill that consists of more than one kind of rock because of magmatic differentiation of an originally homogeneous magma into two or more fractions. Billsing, 1954, pp. 295-296.

**differentiation.** A process by which two or more rocks of different composition are derived from a single body of magma. Bateam. b. In mineral processing, separation of successions of mineral species from mixture in ore by flotation. Pryor, 3.

**dissolved water** has been changed in direct by an obstacle or other nonhomogeneity in the medium by a mean other than reflection or refraction. Pryor, 3.

**diffraction.** a. A modification which light undergoes in passing through opaque bodies, or through narrow slits, or in being reflected from ruled surfaces, in which the rays appear to be deflected producing fringe patterns in transparent, liquid, or solid states. HBG, c. When seismic waves strike the corner, reflection takes place, this corner will in itself serve as a point source for radiating waves back to the surface. Dobrin, p. 27.

**diffraction grating.** An optical device used to analyze a beam of light or electromagnetic wave into constituent wavelengths. In one form, a pattern of equidistant fine lines is ruled on a glass plate (reflection) or on a metal (reflection) surface. Pryor, 3.

**diffraction meeting.** A diffuse diffraction pattern of light waves or X-rays. A method of analyzing a variety of minerals, especially clayey and other aluminiferous minerals. The method is based upon the fact that the application of heat to many minerals causes certain chemical changes, which are reflected in endothermic and exothermic reactions. By comparing the changes in temperature in test heats at definite rate with that of a thermally inert substance (alumina, for example) heated under the same conditions, a curve or pattern is obtained that is characteristic of the particular material under examination. Billsing, 1954, p. 307.

**diffuser chamber.** A chamber in a turbine pump consisting of a number of fixed blades. The water on leaving the impeller is guided outwards by these blades with the minimum of eddying and whirling. Nelson.

**diffusion.** a. The permeation of one substance through another, such as gas through gas, liquid, or solid; solute through solvent; liquid through liquid or solid; and finally solid through solid. The pressure corresponding to that exerted by dissolved material in its diffusion from a more concentrated to a less concentrated part of a solution is called osmotic pressure. Holmes, 1926. b. Spreading of a constituent in a gas, liquid, or solid, tending to make the composition of all parts uniform. ASM Gloss. c. The spontaneous movement of atoms or molecules from one phase to another. Nelson. d. Migration due to motion of particles of a given phase tending to increase volume of one material and to penetrate adjacent phases. Usually mutual across interfaces. Unlikem ossions which only affect one component of solvent molecules. Pryor, 3. e. Flow relative to each other of the constituents of a single-phase mixture. Such relative flow may occur when the different parts of the mixture are in disequilibrium. NRC-ASA N1.1-1957.

**diffusion coating.** a. An alloy coating produced at high temperatures by the inward diffusion of the coating material into the base metal. ASM Gloss. b. Composite electrodeposited coatings which are subsequently interdiffused by thermal treatment. ASM Gloss.

**diffusion coefficient.** A factor of proportionality representing the amount of substance in grams diffusing across an area of one square centimeter through a unit concentration gradient in one second of time. NRC-ASA N1.1-1957.

**diffusion discharge.** A flame whose rate is controlled by a diffusive mixing process. I.C. 1937, 1953, p. 76.

**diffusion of gases.** The property that all gases possess of diffusing or spreading one into the other. See also Graham's law. Nelson.

**diffusion pattern.** A dispersion pattern resulting from upward movement of ions in vadose water. Nelson.

**diffusion sticking.** Terms used for true solid state sintering by those who allow a wider meaning than this to the word sintering itself, when used without qualification. See also sintering. Dodd.

**diffusivity.** The relative rate of flow per unit area. In the particular constituent of a mixture divided by the gradient of composition, temperature, etc., used to study the diffusion. NRC-ASA N1.1-1957.

**dig.** a. To mine coal, applied to bituminous mining. See also gouge, c. Fay, b. To excavate; make a passage into or through, or remove by taking away material. Fay. c. Crushed strata. Nelson.
dig-down pit - smeken pit. A pit that is below the surrounding area on all sides. Nichols, 1933.

diglycol. A blue to black mineral associated with the buckwheat. Arkansas, 1956.

digger. a. One that digs in the ground; as, a digger for digging purposes. Webster 2d. b. A man who is paid by the ton for coal produced; a miner in the strict sense. Originally the digger mined or undermined the coal; now the term is applied to the man who merely shoots out the coal. Fay. c. A machine for removing coal from the bed of streams, the coal having washed down from cofferdams of culm banks above. Zern. d. In Butte, Mont., means the clothing miners wear underground; a pair of denim bib overalls and a denim jacket. Booth. See also miner. D.O.T. 1.

digger edges. The formed serrated edges of the buckets used for digging purposes on a buck? loader. SA Mine 1-1935.

digger tools. The formed tools, interchanged with the buckets of a bucket loader to aid in digging. ASD MHJ 1-1938.

digging residance. The resistance which must be overcome to dig a formation. This resistance may be caused by unstable conditions in the surrounding area on all sides. Nichols.

D.O.T. 1.

digging cycle. Complete set of operations a machine performs before repeating them. Nichols.

digging line. On a shovel, the cable which forms the bottom into the soil. Called crowd in a dipper shovel, drag in a pull shovel, and dragline and closing line in a clamshell. Nichols.

digging resistance. The resistance which must be overcome to dig a formation. This resistance may be caused by unstable conditions, or by coal, or by water underground or at the surface. Nichols, 3, 3-4.

digging. a. Applicable to all mineral deposits and mining camps, but as used in the United States applied to placer mining only. See also bar diggings. Fay. b. Superficial mining work. Pryor, 3.

digital computer. Machine which makes mathematical computations by methods in which digits are added or subtracted in accordance with the coding signals to which the machine is sensitive. Pryor, 3.

digital indicator. A device that indicates the magnitude of a measured quantity in digital numbers, usually in decimal or binary form. ASM.

diglycol monoesterate; diethylene glycol monoesterate. Small, white flakes; available in a diamond-shaped, spade-like dispenser. Gras COO C.H.C.H.OH. Used as a temporary binder for ceramics and grinding wheels. See also dielectric lubricant for die casting. CCD 6d, 1961.

diglycol stearate; diethylene glycol distearate. A white, waxy solid; faint fatty odor; 188° C, referred to water at 20° C, and specific gravity, 0.9333 (at 20° C, 55° C). Used as an emulsifying agent for oils, solvents, and waxes; as a temporary binder for abrasive and grinding wheels; and also as a binder for clays for ceramic insulation. CCD 6d, 1961.

dihedral. Having two sides, as a figure; having two facets, as a crystal. Fay.

dihedral angle. The angle of penetration of one phase or grain between two adjacent grains. V.V. See also angle, a.

dihydric alcohol; glycol. Alcohol containing two hydroxy groups; for example, GLH.OH.CH.OH. Bennett 2d, 1962.

dike. dikes. a. A discordant tabular body of igneous rock that was injected into a fissure when molten, that cuts across the structure of the adjacent country rocks, and which usually has a high angle of dip. It should not be confused with a vein. Bureau of Mines Staff. b. An embankment of earth constructed to prevent flooding by the sea or by a stream; a levee. Webster 2d. c. An embankment of earth around a drill sump or tailrace. d. An embankment to impound a body of water or mill tailing. Long.

dike bench; dike swale; polder. A tract of low land reclaimed from the sea or other body of water by dikes. Schiferdecker.

diked marsh. See diked land. Schiferdecker.

dike. dikes. a small colloidal or amorphous deposit. From a dike. Standard, 1964.

dike ridge. A wall-like ridge created when erosion removes softer material from along the sides of a dike. Stakes and Varnes, 1933.

dike truck. The solidified igneous rock, which, while molten, was injected into a fissure in older rocks. Not to be confused with rock, clod, or rashings. Arkell. c. A band of rock, clod, or rashings. Arkell. d. A self-acting incline handling light ore. Fay.

diking. a. Diking. To separate a tract of land or marsh with dikes. Schiferdecker.

diking. b. A depocentre with a netlike structure. Schiferdecker.

diking. a. Property of granular masses of expanding in bulk with change of shape. It is caused by the increase of space between the individually rigid particles as they change their relative positions. Fay. b. The expansion of cohesions soils when subject to shearing deformation. ASCE P1626. c. The property of a cill which, when a part is shaken vigorously in the palm of the hand, moisture will appear on the surface but can be worked back by pressing and squeezing. A clay does not exhibit this property. Nelson. d. Property of certain suspensions in which resistance to flow increases at a greater rate than the increase in rate of flow; for example, as in quick mud. Bennett 2d, 1962 Add. c. Behavior whereby there is an apparent decrease in the liquid content of a colloidal structure during mechanical agitation (increase increases). V.V.

dilation. See dilatation, a.C.G.I.

dilatation. a. An expansion of ice from the freezing of water in fractures. V.V. b. The widening process of an initial fissure concomitant with the injection of magma. V.V.

dilation value. One of the fat lenses in schists and thought to have been caused by the holding of the schistose rocks under pressure transmitted by the mineralizing solutions. Bateman, 1950, p. 111.

dilatometer. An instrument for measuring the expansion or contraction in a metal resulting from changes in such factors as temperature or allotropy. ASM Gloss.

diligence. To prosecute drilling with due diligence to succeed or abandonment means, that there must be a product capable of division between the parties in the proportions mentioned in the lease. Unless this is done, drilling is not prosecuted to success. The rule is that whatever, under the circumstances, would be reasonably expected of operators of ordinary prudence, having regard to the interest of both lessor and lessee, is what is required. Ricketts.

diluvial. An impure chrysoallata containing copper carbonate. Wedel, 1918.

diluvial. Corn. To separate (tin ore) by washing in a pan sieve. Webster 3d.

diluvial. The washing of small ore in a fine sieve. Nelson.

diluvial. Corn. A fine hair sieve for tin ore.

diluvial. Upgrading fine cassiterite by pan- ning it in water in a close-meshed sieve. Pryor, 3.

diluvial. One who rides a dilly or attends it. Fay. See also inhaler. Pryor, 3.

diluvial. hole. a. A small-diametercased hole along the borehole. A proper. The dilly hole is as deep as the kelly or grip stem is long and acts as receptacle in which the Kelly may be stored during round trips, casing, or other operations in which it is not used. Long. b. A small sludge-catchment basin placed between the collar of the borehole and the main drill sump. Long.

diluvial. rider. In bituminous coal mining a laborer who rides and attends a dilly (light wagon, truck, or water cart) used to haul coal or coal underground or at the surface of a mine, loading, unloading, and cleaning it. D.O.T. 1.

diluvial. a. That which dilutes or makes more fluid; a fluid that weakens the strength or consistency of another fluid upon mixing. Fay. b. Waste rock in a mull. Hoc. c. In solvent extraction, the inert liquid used to dissolve the extractant. This is usually practically immiscible with water; and the one that is almost universally used is kerosene. Nevins, p. 440. d. See carrier solvent.
diluent

Pryor, J. Diluent. Relatively weak in concentration; to lessen the strength of by adding more solvent.

dilute medium. Medium of specific gravity below that in the separating batch and usually occurring as a result of spraying the bath products for the removal of adhering medium solids. B.S. 2552, 1962.

dilution. The contamination of ore with barren wall rock in stopping. The assay of the ore after mining is frequently 10 percent lower than when sampled in place. Nelson.

Synonym for contamination. Long.

diluvial. a. Pertaining to floods. Fay. b. Related to or containing diluvium. Fay.

diluvium. a. Sand, gravel, clay, etc., in surficial deposits. See also drift. Formerly, according to density, the effect of the ordinary, and diluvium was the effect of the extraordinary action of water. Fay. Forming a part of the unsorted and sorted deposits of the Glacial period, as contrasted with the later sorted alluvium. Compare alluvium. Fay.

dimensional analysis. In scale model analysis of the properties of water, the effects of flow of liquids, the principle of dynamic similarity applied to determine the relationship between variables, such as speed and density of fluid and the length of a scale model compared with that of its full size prototype. Ham.

Fey.

dimensional analysis. In scale model analysis of the properties of water, the effects of flow of liquids, the principle of dynamic similarity applied to determine the relationship between variables, such as speed and density of fluid and the length of a scale model compared with that of its full size prototype. Ham.

Fey.

Ham.

Fey.
**diorite-porphryrite**

blende porphyrite, the phenocrysts of which are primarily hornblende. Fay.

**diorite.** An igneous rock consisting of diorite-porphryrite, V. 3, 1937, p. 61.

**diorite ore.** A term which has been used somewhat casually in the western United States for porphyrite. Fay.

dip. a. The angle at which a bed, stratum, or vein is inclined to a horizontal plane. Lawes, p. 26. b. The angle of a slope, vein, rock stratum, or borehole as measured from the horizontal plane downward to the line of dip. Fay. c. W. A word not found in the mining act. The term there used is 'downward course', which is synonymous with dip. The direction of the vein or lode as it goes downward into the earth is called the dip. It may vary from a perpendicular to an angle perhaps only a few degrees below the horizon. The same vein or lode may have different dips. Rich.
dip angle. 137. p. 200. Air. The inclination of the reef or strata below the earth's surface to an angle downward into the earth is of the reef or strata below the gold lode may also be dip angle. An instrument to determine the dip. Fay. d. The slope of layers driven to the full rise underground way driven to slope. Fay. e. To slope or dip. Fay. f. Reflected dip. Mason.
dip coil. A joint that is dip-sloped. Mason.
dip compass. A dipping needle, dipping silt, or a dipping needle, dipping compass. Fay. 1. Eng. A. A downthrow, or a fault. Fay. 2. A device which unlashes the door of a shovel bucket to dump the load. Nichols. 2. dip core. Same as dip. Fay. b. In Scotland it is called a dook. Fay. c. The process of coating a metal shape by immersion in molten zinc or tin. Pryor. 3. dip core. Sonar equipment used by beluga and hydrofoils. Hr. dip core. See pick-up. ASTM C286-65.
dip core. Eng. Same as dip. 1. Fay. dip core. A device used to measure a dip. A heading taken in an inclined borehole by using one of several types of borehole-surveying devices or techniques.
dip curve. The distance between two parts of a disrupted bedding plane, measured in the fault plane parallel to its dip. Schieferdecker.
dip dip. The component of the shift (or slip) parallel to the strike. Mason. 2. Schieferdecker.
dip dip. Any system of seismic surveying where the primary concern, both instrumental and computational, is the registration and interpretation of reflections for dip values, with minor emphasis on correlation of records from shot point to shot point. Mason. 2. Schieferdecker.
dip dip. The lowest side of a room or wall. Also called ledge. Fay. b. The side dipping downhill away from the point of reference. Mason.
dip dip. The component of the dip in the direction of the true dip of the fault plane. Schieferdecker.
dip dip. A fault in which the net slip is practically in the line of the fault dip. A fault in which the dip is vertical. See also oblique slip fault. Nelson.
dip dip. A landform developed in regions of gently inclined strata, particularly hard and soft strata are interbedded. A long, gentle sloping surface which parallels the dip of the bedding planes of the strata below ground. C.T.D.
dip dip. A current of intake air directed into or down a dip. Fay.
dip dip. A. A fault in which the slip is practically in the line of the fault dip. A fault in which the relative movement is vertical. See also oblique slip fault. Nelson.
dip dip. A map that shows stratified formations in their original position before movement. Biddle.
dip cut. In cutting out blocks of stone, the cut is made at right angles to the strike and dip of the strike. Fay.
dip entry. An entry driven downhill so that water will not accumulate on the strike face. If it is driven directly down a steep dip it becomes a slope. See also entry; slope.
dip entry. A face proceeding towards the dip of the seam Briggs. p. 25.
dip face. A. A face proceeding towards the dip of the seam Briggs. p. 25.
dip fault. A fault that strikes approximately perpendicular to the strike of the bed or stratum. Billings, 1954, p. 141.
dip heading. In tunneling, a dip heading is one driven downward to the deep. Pryor. 3. dip heading. Leveling. In tunneling, a dip heading is one driven downward to the deep. Pryor. 3.
dip meter. a. An instrument used to record the magnitude and direction of tilt in strata. Mason. 3. A dip meter is a dip indicator. Mason. b. A detector of the dip of strata. Mason. 3.
dip switch

330
direct current. See also alternating-current generator. Nelson.
direct-cycle power system; single-cycle re-actor system. A nuclear power plant system in which the heat-transfer fluid circulates through the reactor and then passes directly to the turbine in a continuous cycle. L.B.I.
direct-dip-reading chart. See direct-reading capillarity chart. Long.
directed practical training. The scheme introduced by the National Coal Board of Great Britain to train miners for managerial and other responsible positions in the coal industry. See also ladder plan. Nelson.
direct expansion. An arrangement of a refrigerant evaporator where the refrigerant itself expands in an evaporator in the airstream. Stock, 10.
direct extraction. See extraction. ASM Gloss.
direct fire. A method of maturing porcelain, enamel or ceramic ware wherein the products of combustion come in contact with the ware. Stock, 10.
direct-fired kiln. A fuel-burning device in which the heat from the fuel is transferred through metal to air which is then introduced to the space to be heated. Stock, 10.
direct-fired unit. A heater in which the flame's heat is transferred to metal plates and thence directly to the air to be heated. A warm air furnace is direct fired; a boiler is indirect. Stock, 10.
direct firing. a. The combustion of coal effected by burning directly on a grate. Stock, 2. A method of firing wherein the products of combustion come in contact with the ware. ACBG, 3.
direct leveling. The system in which an engine with a single drum and rope draws loaded trucks up an incline. The empties run downhill dragging the rope after them. C.T.D.
direct-blast drier. A drier in which heat is received by radiation from floors, walls, and roof. ACBG, 1963.
direct initiation. The placing of the detonator in the last cartridge to be inserted in the shothole with the active end of the detonator pointing inwards. This position tends to minimize the risk of gas ignition. See also inverse initiation. Nelson.
direction. Angle to the right (clockwise) from an arbitrary zero direction. Used chiefly in triangulation. Sext. 2.
directions. a. The art of drilling a borehole wherein the course of the hole is planned before drilling. Stock, 2. b. Holes are usually drilled with standard equipment, and are useful in drilling divergent tests from one location, tests which otherwise might be inaccessible, as controls for fire and wild wells, etc. ACBG, 2. b. Drilling in which the course of a borehole is controlled by deflection or other means. See also orientation. The technique of directional drilling is used: (1) to deflect a deviation hole back on course and (2) to deflect a borehole off course, either to bypass an obstruction in the hole or to take a second core. B.S. 3618, 1963, Sec. 3. c. Curving a rotary drill hole to avoid obstacles or to turn side areas. Also called offset drilling. Nichols.
directional drilling engineer. In petroleum production, one who directs use of special oil well drilling techniques and tools to control direction of drilling and thereby overcome certain production problems. D.O.T. 1.
directional hearing aid. A device which is worn on the head or is built into a hearing aid and operates by a directional microphone. See direct sound field. Stock, 9.
directional hoist. A hoisting device which is used for the production and delivery of direct current. See also alternating-current generator. Nelson.
directional overcorrection relays. The difference between straight overcurrent relays in that they are primarily used for ground protection. They are designed to pick up current in one or two sections. Whether faults will cause flow in one or two directions is determined by system conditions. These relays provide directional as well as nonrecurrent protection. Other directional relays provide phase protection. Coal Age, v. 71, No. 8, 1966, p. 341.
directional properties. Properties whose magnitude varies depending on the relative phase angle between two alternating currents. ASM Gloss.
directional solidification. The solidification of molten metal in a casting in such a manner that feed metal is always available for that portion that is just solidifying. ASM Gloss.
directional work. See directional drilling. Stock.
directional drilling methods. Electromagnetic exploration methods in which one determines the direction of the magnetic field associated with the currents. Schiefer.
directional indicator. Any one of a number of geophysical devices used to determine the deviation of a borehole from vertical. A.C.B.
direction of irrigation. Direction of flow of irrigation water from the point of intake to the point of distribution. See also irrigation. Stock, 10.
direction of tilt. The azimuth of the normal to the axis of tilt. Sext. 2.
directions. See interference figure. C.T.D.
directionality. Sound energy which is confined to a beam by mechanical and/or electronic means. Stock.
directional properties. A measure of the directional properties of a transducer. It is the ratio in decibels of the average intensity of the specific condition of the transducer to the intensity of the free field in the same direction. Stock, 10.
directional properties. A measure of the directional properties of a transducer. It is the ratio in decibels of the average intensity of the specific condition of the transducer to the intensity of the free field in the same direction. Stock, 10.
direct labor

Nelson, M. 1957. Direct labor costs in coal mining, Part I. Mining Engineering, 10, 2, pp. 93-100.

direct labor. The labor required for the execution of work in the mine, excluding those services which are not a part of the direct process of mining. Diese. 331

direct controlled variable. In computer control, a variable whose value is sensed to originate a signal to correct the control loop. Fassett, p. 543.

direct method. A mouth-to-mouth method of artificial respiration in which the rescuer places his nose and mouth over the patient's nose and mouth and his air passages are cleared. A handheld device that is available to be placed over the patient's mouth and nose is also shown. New England Journal of Medicine, 24, 1937, pp. 322-323.

direct coal. A coal seam with thick partings of shale or slate; thin stringers; not a true fault. Fay, 242.

dirty finish. A finish with thick partings of shale or slate; not a true fault. Fay, 242.

dirty work. Inactitious term for work that may be gray-skinned or limegreen. Pettijohn, 24, 1937, pp. 222-223.

dirty work. Inactitious term for work that may be gray-skinned or limegreen. Pettijohn, 24, 1937, pp. 222-223.

dirty work. Inactitious term for work that may be gray-skinned or limegreen. Pettijohn, 24, 1937, pp. 222-223.

dirty work. Inactitious term for work that may be gray-skinned or limegreen. Pettijohn, 24, 1937, pp. 222-223.

discharge chute

direct material or objects from a conveyor. 

AS A MH1-1938.

discharge curve. A curve which relates the 
water flow of flowing water to its dis- 
charge. Ham.

discharge head. The sum of static and dy- 
namical frictional losses and the head 
intake and fire disposal of pump is static 
head. Allowance for friction, power loss, 
proportional slip, and main-lining is in- 
flected for calculating the overall discharge head. 

Pryor. 3.

discharge station. A place where bulk mate-
rials or objects are removed from a con-
veyor. AS A MH1-1938.

discharge valve. A valve used to retard or 
accelerate flow through a pipe, as distinct 
from a stop valve. Ham.

discharge velocity. The rate of discharge of a 
liquid (usually water) through a porous 
medium per unit of total area perpendicular 
to the direction of flow. ASCE P1896.

discharging arch. See relieving arch. ACSG.

discipline. Employee discipline implies sub-
pjection to authority or instructions given 
by a mine official. For management, it 
connotes the right to direct and control 
employees in an orderly, safe, and 
efficient way. Nelson.

discussion. space of. See space of discussion.

disc. Of, like, or producing a disk. Webster 
3d.

discoid. A diskoidal coccolith. Webster 3d.

discoid fracture. A fracture in which the 
planes of fracture are parallel to the 
surface of a solid and not to any other plane with which it may be dis- 
connected. A curve which relates the 
statics. 

discoidal. Of, like, or producing a disk. Web-

discorannous. a. An abrupt change in the 
head. Allowance for friction, power loss, 
water level of swings water to 
direct material or elements from a conveyor. 

ASA M114.1-1938.

discord. a. A fold in which abrupt changes in 
vertical distance from one bed to another, especially where alternat-
ions of plastic and rigid beds occur. A.G.I.

discordant folding. Folding in which 
individual beds are foreshortened and 
normal to a plane of foliation and 
with depth. Such changes may occur gradu-
ally or abruptly. Billings, 1554, p. 38.

discordant injection. An igneous mass injected 
across bedding planes. Fay.

discontinuity. An unconformable strati-
fication. See also discordance. Fay.

discovery. a. The term has a technical mean-
ing in mining which may be defined as knowl-
edge of the presence of the valuable min-
erals within the lines of the location or 
such proximity to them as to justify a rea-
sonable belief in their existence. But in 
all cases there must be a discovery of min-
eral, in both lode and placer claims, as 
distinguished from mere indications of 
mineral. In other words, in a lode location 
there must be such a discovery of mineral 
as gives to the miner an ownership of the 
fact either that there is a vein or lode of rock 
in place carrying the valuable mineral; 
or, if it be claimed as placer ground, that 
it is valuable for such mining. Ricketts, 
p. 346-347. b. Fac. The first finding of the 
mineral deposit in place upon a 
mining claim. A discovery is necessary be-
fore the location can be held by a valid 
claim. The opening in which it is made is 
called discovery, shaft; discovery, tunnel; 
etc. The finding of mineral in place as 
distinguished from float rock constitutes a 
discovery. See also mine, m, for discovery 
of a mine. Fay.

discovery claim. The first claim in which a 
mineral deposit is found, and when this 
is within a gulch or on a stream the claims 
are simply marked or numbered from the 
discovery claim either by letters or figures 
up or down the gulch or stream. Fay.

discovery vein. The mineral vein on which 
a mining claim is based. See also secondary 
vein. Nelson.

discovery well. The well that discovered oil 
or gas in a pool hitherto unknown. A.G.I.

discrepancy. The difference between results 
of duplicate measurements. Seelye, 2.

disintegration index. A measure of the dura-
bility of a hydraulic cement proposed by T. Merrimen. The test involves shaking 
with a line-sugar solution followed by 
titration of one aliquot against HCl with 
phenolphthalein as indicator and another 
with methyl orange as indicator. The dis-
integration index is the difference between 
the two titrations. The test was supervised 
by the test now known as the Merrimen 
test but gave slightly lower results. See also 
Merrimen test.

dispersant. A mill for comminuting or 
to a fine dry powder such as by impact 
breaker. Nelson. b. A machine for reducing 
the area being lane compared to the 
length. ASM Gloss.

distributing. One that forms oval dishes or 
other revolving tool with a forming tool (jigger) 
and an eccentric (a device causing the 
ominate to move back and forth in the pres-
to rotate, so an oval shape will be 

disch plate. Eng. A plate or rail conceived 

to receive the front wheels of a tub to 
secure it while teeming. Webster 2d.

dish wheel. A grinding wheel shaped like a 

dishwater. A gas, liquid, or solid used to 
destroy disease germs. Griswold.

disintegration. a. To break up the action of 
chemical and/or mechanical forces. A.G.I. 
b. To separate or decompose a material 
and an eccentric to destroy the 
wholeness, union, or identity of, Bellard.

distributing mill. A mill that reduces mate-

s in place carrying the valuable mineral; 
or, if it be claimed as placer ground, that 
it is valuable for such mining. Ricketts, 
p. 346-347. b. Fac. The first finding of the 
mineral deposit in place upon a 
mining claim. A discovery is necessary be-
fore the location can be held by a valid 
claim. The opening in which it is made is 
called discovery, shaft; discovery, tunnel; 
etc. The finding of mineral in place as 
distinguished from float rock constitutes a 
discovery. See also mine, m, for discovery 
of a mine. Fay.

discovery claim. The first claim in which a 
mineral deposit is found, and when this 
is within a gulch or on a stream the claims 
are simply marked or numbered from the 
discovery claim either by letters or figures 
up or down the gulch or stream. Fay.

discovery vein. The mineral vein on which 
a mining claim is based. See also secondary 
vein. Nelson.

discovery well. The well that discovered oil 
or gas in a pool hitherto unknown. A.G.I.

discrepancy. The difference between results 
of duplicate measurements. Seelye, 2.

disintegration index. A measure of the dura-
bility of a hydraulic cement proposed by T. Merrimen. The test involves shaking 
with a line-sugar solution followed by 
titration of one aliquot against HCl with 
phenolphthalein as indicator and another 
with methyl orange as indicator. The dis-
integration index is the difference between 
the two titrations. The test was supervised 
by the test now known as the Merrimen 
test but gave slightly lower results. See also 
Merrimen test.

dispersant. A mill for comminuting or 
to a fine dry powder such as by impact 
breaker. Nelson. b. A machine for reducing 
the area being lane compared to the 
length. ASM Gloss.

distributing. One that forms oval dishes or 
other revolving tool with a forming tool (jigger) 
and an eccentric (a device causing the 
ominate to move back and forth in the pres-
to rotate, so an oval shape will be 

disch plate. Eng. A plate or rail conceived 

to receive the front wheels of a tub to 
secure it while teeming. Webster 2d.

dish wheel. A grinding wheel shaped like a 

dishwater. A gas, liquid, or solid used to 
destroy disease germs. Griswold.

disintegration. a. To break up the action of 
chemical and/or mechanical forces. A.G.I. 
b. To separate or decompose a material 
and an eccentric to destroy the 
wholeness, union, or identity of, Bellard.

distributing mill. A mill that reduces mate-

s in place carrying the valuable mineral; 
or, if it be claimed as placer ground, that 
it is valuable for such mining. Ricketts, 
p. 346-347. b. Fac. The first finding of the 
mineral deposit in place upon a 
mining claim. A discovery is necessary be-
fore the location can be held by a valid 
claim. The opening in which it is made is 
called discovery, shaft; discovery, tunnel; 
etc. The finding of mineral in place as 
distinguished from float rock constitutes a 
discovery. See also mine, m, for discovery 
of a mine. Fay.

discovery claim. The first claim in which a 
mineral deposit is found, and when this 
is within a gulch or on a stream the claims 
are simply marked or numbered from the 
discovery claim either by letters or figures 
up or down the gulch or stream. Fay.

discovery vein. The mineral vein on which 
a mining claim is based. See also secondary 
vein. Nelson.

discovery well. The well that discovered oil 
or gas in a pool hitherto unknown. A.G.I.

discrepancy. The difference between results 
of duplicate measurements. Seelye, 2.

disintegration index. A measure of the dura-
bility of a hydraulic cement proposed by T. Merrimen. The test involves shaking 
with a line-sugar solution followed by 
titration of one aliquot against HCl with 
phenolphthalein as indicator and another 
with methyl orange as indicator. The dis-
integration index is the difference between 
the two titrations. The test was supervised 
by the test now known as the Merrimen 
test but gave slightly lower results. See also 
Merrimen test.

dispersant. A mill for comminuting or 
to a fine dry powder such as by impact 
breaker. Nelson. b. A machine for reducing 
the area being lane compared to the 
length. ASM Gloss.

distributing. One that forms oval dishes or 
other revolving tool with a forming tool (jigger) 
and an eccentric (a device causing the 
ominate to move back and forth in the pres-
to rotate, so an oval shape will be 

disch plate. Eng. A plate or rail conceived 

to receive the front wheels of a tub to 
secure it while teeming. Webster 2d.
disk. S. tappet. Pay.
disk grizzly. disk grinding. Grinding with the flat side of
disk filter; American disk filter. A continuous
fan. An axial-flow fan with a series of
disk main cutter. A coal cutter whose cutting
disk clutch. A coupling that can be engaged
didactic 333

disintegrator

disintegrator

disintegrator

which one is fixed while the other rotates.
One led centrally between the plates in
a vertical position in the direction of
the material being ground. Compare
hammer mill, a. D. odd

dishwasher. A machine for crushing
wet materials which consists of a large,
smooth face operated at a low speed and
at its periphery with cutters. The first disk
machine, with detachable pickets was pat-
ented in 1861. The disk coal cutter is

disk coupling. Consists of driving and driving
flanged hubs with projecting fingers or
lugs which mesh from alternate flanges
with holes in the disk. In some cases, the disk is replaced by a spider
which meshes between the jaws of
the driving and driven hubs. Pit and
Quarry, 53rd, See, D. p. 66.
disk fan. A fan for circulating a fluid with a series of
blades formed by cutting and bending flat
sheets or plates. When rotated the disk imparts to the air a motion along the axis
of the fan shaft. Sirocco, 10.
disk feeder. A feeder consisting of a rotat-
ing horizontal metal disk under the open-
ing of a bin such that the rate of turning
or opening of the gate governs the quan-
tity delivered. ACGS, 1963. b. See rotary
de-feeder. ASM MH4-1.1958.
disk filter; American disk filter. A continuous
dewatering filter in which the membrane
(filter cloth) is stretched over segments of a
disk. These disks rotate through a tank of
slurry. The vacuum inside the disk sucks
the liquid through the filter medium and
a dispersed phase, increases the dewatering
ability without appreciably changing
other properties. Encyclopedia Britannica.
dispersion-strengthened metal

*Dispersion* Book of the Year, 1961, p. 350.

dispersible. The power of a transparent medium to separate different colors; as, the power of a glass as measured by the difference in refractivity for two specified widely differing wavelengths divided by the length of the some specified intermediate wavelength. Webster 3d.

dispersed. A body that has been dispersed in a liquid state. Dodd.

dispersed ore body. An ore body which has suffered a disruption or displacement after initial deposition, such as folding, faulting, or igneous intrusion normally causes displacement. In some cases, secondary enriched ore deposits formed later at some distance from the zone of leaching of the primary ore zone and are often referred to as dispersed ore bodies. The direction of flow of the ground waters leaching the ore body are the displacing mechanisms in this instant. Bureau of Mines Staff.

dispersed outcrop. An outcrop that has moved downhill during a landslide or soil creep. Nelson.

dispersed seam. A coal seam which has been displaced by a fault. Nelson.

displacement. A sudden movement of a point, usually at the surface, during subsidence. Nelson. b. A general term for the closed-in position of any point on one side of a fault plane relative to any corresponding point on the opposite side of the fault plane. Ballard, c. The word displacement should receive no technical meaning, but is reserved for general use; it may be applied to a relative movement of the two sides of the fault, measured in any direction, when that direction is specified; for instance, the displacement of a stream along a drift in a mine would be the distance between the two sections of the stratum measured along the drift. The word "offset" will also be most useful in a general sense. Fay. d. For air compressors, the volume displaced by the net area of the piston of the compressor multiplied by the length of the stroke in feet and by the number of strokes made per minute. For multistage compressors, the displacement refers to the low-pressure cylinder only. Lewis, p. 653, e. The volume of liquid delivered by a single stroke of a pump piston. Long. f. Sometimes used as a synonym for offset deflection; deviation; dislocation; throw. Long. g. The capacity of an air compressor, usually expressed in cubic feet of air per minute (c.f.m.). Long.

dispacement pump. One in which compressed air or steam, applied in pulses, drives out water entering the pump chamber. If the pulses, a nonreturn valve preventing reverse flow. Pryor, 3. See also air displacement theory.

dispacement theory. In geology, continents originally formed one large land mass, which fractured and drifted to present day positions. Pryor, 3.

displacement-type float. A device for measuring the liquid level in sumps or vessels. It consists of a float, whose vertical height is greater than the level range being measured and whose weight is such that it would sink in the fluid if not supported. It is placed in the liquid and supported in such a way that as the liquid level rises, the float tends to sink in the liquid. The weight of the displaced liquid. This force is measured and since it is proportional to the area of the displaced liquid, the force and since it is proportional to the area of the displaced liquid, the force measurement becomes a level measurement. The device is used on sumps containing high gravity slurries. See also automation. Nixon.

displacement. stone in concrete, c. Then referred to as a plum. Ham.

displaceable. A large stone in concrete, often referred to as a displacement. Fay.

displaceable. A large stone in concrete, often referred to as a displacement. Fay.

displaceable. A large stone in concrete, often referred to as a displacement. Fay.

displacement. A coal seam intersected by a fault or whose continuity is essentially broken, Nixon.

displacement. Applied to that kind of force exerted by an explosive that tends to shatter the rock into fragments. Fay.

displacement. The failure stress under hydrostatic tension. ASM Gold.

dissected. Cut up into hills and valleys or into flat upland areas separated by valleys. Especially applicable to plains or peninsulas in the process of erosion after uplift. Fay.

dissection. The effect of erosion in destroying the continuity of a relatively even surface by cutting ravines or valleys into it. Fay.

dissector. A person employed to classify de- creased. Corn. To break the rock from the surface of the fault. Dodd.

dissemintated. a. Fragments of mineral dispersed in a rock. Statistical Research Bureau. b. To be scattered or diffused through; to be permeated with. Fay.

dissemintated crystals. Crystals which are found not attached to the mother rock. Long. c. With some well-developed faces and doubly terminated crystals. Fay.

dissemintated deposit. A type of ore deposit in which the ore minerals occur as small particles or aggregates of regular size. Pryor, 4.

dissemintated sulfide. Sulfide scattered as specks and veinlets through rocks and constituting less than 20 percent of the total rock volume. A.G.I.

dissolution. a. In ores, values fairly regularly scattered as minute particles through the gangue or other matrix. Pryor, 3.

dissolution. Applied to dispersed crystallization of early formed crystals of ore minerals in deep-seated magmas and to dispersed foreign minerals in a more general sense. Schieflerdecker.

dissociate. a. To resolve (a complex) into elements; to separate. Standard, 1964, b. To decompose gradually by the action of heat in a confined space (a substance, the constituents of which, when the temperature is lowered, separate to form the original body). Standard, 1964 c. To break to pieces, to decompose, fall apart. str. Mississippi, 4th, p. 2.

dissociation constant of dissociating or the state of being dissociated; as, the process by which a chemical combination breaks up into simpler constitut- ions usually capable of recombining under other conditions. Especially the action of heat or other forms of energy on gases and the action of solvents upon dissolved substances. Webster 3d.

dissociation constant. Equilibrium constant for a reaction proceeding in both directions, showing for stated conditions a state of balance between dissociation and reassociation. With great respect to ionization, ionization constant. Of very low solu- bility compounds, solubility product. In Ostwald's dilution law, dissociation K is m°

where a molar weight has been dissolved in V liters and m is the degree of ionization. C.T.D.

dissociation tension. A property associated with every oxide which measures the sta- bility of the oxide; for example, when equilibrium has been established at a given temperature, the dissociation tension of the oxide is numerically equal to the partial pressure of the surrounding oxygen. Newton, p. 148.

dissolution. a. The act or process of dissolving or breaking up; as, a separation into component parts. Webster 3d. b. The taking up of a substance by a liquid with the for- mation of a homogeneous solution. C.T.D.

dissolution, space of. See space of dissolution.

dissolution tank. A small tank used for dis- solving solid cyanide and preparing a con- centrated solution. Fay.

dissolute. Corn. To break the rock from the walls of a rich lode in order to move the ore without taking with it much gangue. Standard, 1964.

dissuing. Corn. Cutting out the selvage or gougé of a lode to facilitate the extraction of ore. See also cut; reserving. Fay.

distance blocks. Wooden blocks placed in the main sprints and the side pump rods by which the proper distance between them is adjusted. Fay.

distance lag. Velocity lag. In flotation, a de- lay attributable to the transport of materi- al or the finite rate of propagation of a signal or condition. Fuerstenau, p. 545.

distant admixture. Given by Udden to the grade or grades, in a sediment containing several size grades, most different in size from the dominant (maximum) grade. A.G.I.

disthene. Synonym for kyanite. Fay.
disthene. A rock composed almost entirely of kyanite (diasthene) associated with quartzite and amphibolite. Hess.
distillate. The liquid obtained by condensing a vapor. Nelson.
distillate oil. Gasworks coal tar or coke-oven coal-tar distillate, for example, creosote.
distillation furnace. A reverberatory heating furnace in which the charge is contained in a closed vessel and does not come in contact with the flame. It has a combustion chamber in which the gases are burned around the retorts containing zinc ore, the retorts resting on shelves inside the chamber. Fay.

distillation, of petroleum. The process by which heat is applied to the crude oil in order that its constituents may pass off in various liquid fractions according to their boiling points or boiloff ranges. A.G.J.

distilled, a. A process of decomposition whereby a combustible material of certain fossils has lost its nitrogen, oxygen, and hydrogen, and is now represented by a very dense, yellow, waxy mass. Synonymous with carbonization. A.G.J.

distilled. b. See diamond pattern. Long.
distillation loss. The mine-type distribution curve showing cumulative frequency as ordinate against variate value at various points of sample. ASTM C182-66.
distillation plant. A means for converting waste or lead into useful products. A.G.J.
distillation process. A process of evaporation and recondensation used for separating liquids into various fractions according to their boiling points or boiloff ranges. C.T.D. d.

In pyrometallurgy, distillation involves the vaporization of metals or metallic compounds, and the subsequent recovery of the vapor in condensers as a liquid or solid. Distillation processes are used only for metals or metallic compounds which have relatively low boiling points, such as mercury, cadmium, and zinc. E.C.T., v. 8.
distillation residue. A. A. The residue remaining at the point where control must be exercised. Pryor, j.
distilled water. A. A. Any water that is free of all dissolved or suspended matter, as distinguished from water which is geologically abnormal. Pryor, 3. c.
distilled working. Workings which are no longer in operation but which are not classified as abandoned. B. 3618, 1963, sec. 1.
distillate, a. A drainage course in a mine, generally following a natural contour. E.C.T. b. An artificial watercourse, flume, or canal, to convey water for mining. A flume is usually of wood; a ditch, of earth. Fay. c. See flat. Fay. d.
The drainage gutter along gangways and openings in anthracite mines. Hudson. e. A water channel to carry mining water into control. Pryor. f. A slot cut in the earth's surface and left open. Comare trench. Carson, p. 146. g. An artificial channel, usually distinguished from a canal by its smaller size. Seeley, 1. h. Generally, a long narrow excavation. Nichols. 1. i. In rotary drilling, a trough carrying mud to a screen. Nichols. j. The artificial course or trough in which the drill circulation fluid is conducted from the collar of the borehole to the sump; also, a discharge pipe or waste contents of a bailer, without taking a sample, into a ditch leading away from the collar of a borehole. Also called canal; chute. Long. k. To throw away or discard. Long.
ditchdragger. A laborer who shovels dirt, rock, and rubbish from underground drainage ditches into mine cars to keep ditches open for flow of underground water. Also called dicht; ditchman; drainman. D.O.T. 1.
ditch drain. A gutter excavated in the floor of a gangway or airway to carry the water that drains into it. Fay.
ditched top. See sticky coal, b.
ditcher. A. A. A mobile tracked machine fitted with an endless chain of buckets used for shallow vertically sided trenching. Nelson. b. A drill mounted on a frame that rotates about a central axis. It is used to cut circular trenches for the production of large grinding stones. Also called circle cutting drill. Fay. c. See ditchdragger. D.O.T. 1.
ditching. A. The making of ditches. Standard, 1964. b. The digging or making of a ditch by the use of explosives. See also propagated blast. Fay.
ditching car. A car provided with derricks and scoops to excavate ditches, as in a railway cut. Standard, 1964.
ditch powder. A mixture of coal, sodium nitrate, sulfur, rosin, and about 10 percent nitroglycerin. Used as a low-grade dynamite for loosening of earth in farm ditch.
ditch powder

A flotation collector agent

Dillman et al. In mineral processing, a frother is used to reduce the surface tension of water and aid in the separation of minerals. The frothing agent is added to the flotation cell where the minerals attach to the bubbles produced and rise to the surface for collection.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divilization

A structure dividing the flow between two or more fluids. This is important in the design of pipelines and in the study of fluid dynamics.

diversity

The state or condition of being diverse. It is the quality of being different or varied. Diversity can refer to the diversity of species in an ecosystem, the diversity of opinions in a group, or the diversity of experiences in an individual.

diversity

The state or condition of being diverse. It is the quality of being different or varied. Diversity can refer to the diversity of species in an ecosystem, the diversity of opinions in a group, or the diversity of experiences in an individual.

divide

A. To separate into parts, sections, or portions. B. To distribute or allocate among two or more people. C. To perform the mathematical operation of division.

divide

A. To separate into parts, sections, or portions. B. To distribute or allocate among two or more people. C. To perform the mathematical operation of division.

dividend

The amount to be divided. It is the number or quantity that is to be divided by another number or quantity in a division problem.

dividend

The amount to be divided. It is the number or quantity that is to be divided by another number or quantity in a division problem.

divergence

The state or condition of diverging. It is the quality of being distant, remote, or separated from something else.

divergence

The state or condition of diverging. It is the quality of being distant, remote, or separated from something else.

diverse

Diverse has multiple meanings in English. It can refer to something being different or varied, or it can refer to the diversity of a group or population.

diverse

Diverse has multiple meanings in English. It can refer to something being different or varied, or it can refer to the diversity of a group or population.

diversity

The state or condition of being diverse. It is the quality of being different or varied. Diversity can refer to the diversity of species in an ecosystem, the diversity of opinions in a group, or the diversity of experiences in an individual.

diversity

The state or condition of being diverse. It is the quality of being different or varied. Diversity can refer to the diversity of species in an ecosystem, the diversity of opinions in a group, or the diversity of experiences in an individual.

diversity factor

The ratio of the sum of the maximum and minimum values to the range of values. It is used to calculate the ratio of the sum of the maximum and minimum values to the range of values.

diversity factor

The ratio of the sum of the maximum and minimum values to the range of values. It is used to calculate the ratio of the sum of the maximum and minimum values to the range of values.

diversity ratio

The relationship between the number of species in a community and the number of individuals in each species.

diversity ratio

The relationship between the number of species in a community and the number of individuals in each species.

diving bell

A watertight, bell-shaped steel device used in underwater exploration. It is equipped with air supply and communication equipment and is used to explore the ocean floor.

diving bell

A watertight, bell-shaped steel device used in underwater exploration. It is equipped with air supply and communication equipment and is used to explore the ocean floor.

diving board

A horizontal platform from which a person can jump into the water. Dive boards are usually located near the edge of a pool or other body of water and are used for swimming and diving.

diving board

A horizontal platform from which a person can jump into the water. Dive boards are usually located near the edge of a pool or other body of water and are used for swimming and diving.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.

divine

The state or condition of being possessed by or having connection with a god. It is the belief that one has a divine connection with a higher power or divine being.
dog iron

A short bar of iron with both ends driven into a log, the other end may be placed in a mine. Fay. h. Can. Slang. dog iron. A term used to haul on. Zern.

dog belt. A round iron band fitted into the reel of a head. Melton. i. A heavy duty latch. Nichols. j. To hold, grip, or fasten. Long. k. A non-standard or poorly made tool or piece of drilling equipment. Long. l. A round iron rod, with the pointed ends bent at right angles. Stauffer. m. A kind of nail with the top bent at right angles instead of having a head. Mason. n. A device attached to the workpiece by means of which the work is revolved. ASCG, 1963. o. A trigger which limits the advance of a traversing table. ASCG, 1963.

dog clip. Aust. Same as clip. Fay.
doghole. A small opening from one place in the ground to another; smaller than a breakthrough. Fay.
doghole mine. Name applied to small coal mines that employ fewer than 15 miners. The so-called dogholes are most numerous in Kentucky, but there are many in Virginia and West Virginia. Bureau of Mines Staff 1962-65.
dogholes. See doghole mine.
doghouse. a. A term used in Joplin, Mo., for a box or platform on which a can or bucket rests at the bottom of a shaft. Fay. b. A term used in Joplin, Mo., for a box or platform on which a can or bucket rests at the bottom of a shaft. Fay. c. The structure enclosing the drill platform and machinery. Long. d. A small shelter in which members of a drill crew change clothing. Long. e. See forechamber. Fay. f. A small boxlike vestibule on a glass furnace into which the batch is fed, or which facilitates the introduction and removal of floaters. ASTM C182-66.
dog iron. A short bar of iron with both ends pointed and bent down so as to hold together two pieces of working points are driven; or one end may be bent down and pointed, while the other is formed into an eye, so that if the point be driven into a log, the other end may be used to haul on. Zern.
dogleg

dogleg. a. An abrupt, angular change in the course of a borehole; also, the deviation from a straight line caused by boring through a feature that causes the borehole to deviate from a straight path. Long. b. An abrupt bend in a pipe or a cable. See also curvature. Long.
c. An abrupt bend in a path, piping system, or road. Long.
dogleg severity. Same as deflection angle; hole curvature. Long.
dog-leg. Scot. To put the hutch or cage on end. This term probably had its origin in the hooking of the bucket to the rope by means of a hook. Fay.
dog spike. A spike generally used to fasten rails to the sleepers when laying track. Their length should be one-half inch less than the depth of the sleeper into which they are being pounded. Sinclair, p. 263.
dog's teeth. A fault sometimes referred to as a dogleg severity. Same as deflection angle; dog's teeth; dragon's teeth. A fault sometimes referred to as a dogleg severity. Same as deflection angle; dog's tooth. Brick so laid that their corners are deflected. Long. 
dogstone. A rough or shaped stone used for dressing. Fay. d. A tool used to sharpen drills. Stauffer.
dohyaline. Suggested by Cross, Iddings, Firschein.
dogtooth spar. A variety of calcite that occurs as a variety of dish in the usual way. New South Wales, p. 19, 1939.
dogtooth. See dolly, b. Long.
dolly. a. Aust. An instrument used for breaking and mixing clay in the puddling tub. Fay. b. A heavy timber shod with iron, and hung from a tree or other support so that it may be used for crushing quartz. Fay. c. To break up quartz with a piece of wood shod with iron, in order to be able to wash out the gold. Fay. d. A trucklike platform, with a single roller attached, used in shifting beams, lumber, etc., and sometimes used in a hoisting shaft. Nelson.
dollar. A unit of reactivity in a reactor due to delayed neutron absorption. A.G.I.
dollie. See dolly, b. Long.
dollied. a. Called by English writers swallow-dole, dumblepole, or dumblepole. b. A rounded hollow ranging from 3 to 30,000 feet in diameter and from 6 to 330 feet in depth. Fay. c. An additional intersection of a vein or reef material that is expressed physically by the appearance of pores, cavities, and the MgCO3 content of the rock approximates the maximum percentage, the 45.7 weight-percent of MgCO3 in the mineral dolomite, considerable shrinkage occurs that is expressed physically by the appearance of pores, cavities, and fissures that may amount to as much as 11 percent by volume of the original rock. Bureau of Mines Staff.
dolomitic. Composed of or similar to dolomite. Long.
dolomitic limestone. A limestone containing 30 to 50 percent magnesium and 70 to 50 percent calcium oxide as contrasted with a lime containing less than 10 percent calcium oxide. ASTM STP No. 148-D.
dolomite. a. A fixed mooring in the open sea consisting of a number of piles, or a trucklike structure. Fay. b. A heavy timber shod with iron, and formerly used for crushing quartz. Fay. c. A tool used to sharpen drills. Stauffer.
dolomites. A variety of calcite or dolomite. New South Wales, p. 20, 1939.
dolomite, fused. A mixture of cubic crystals of calcium and magnesium oxide, MgO, fused in the electric furnace. CCD 6d, 1961.
dolomite marble. A crystalline variety of limestone, containing in excess of 65 percent MgCO3, fused in the electric furnace. A.G.I.
dolomite marble. A crystalline variety of limestone, containing in excess of 45 percent MgCO3, fused in the electric furnace. A.G.I.
dolomite, proposed by Struve for a sedimentary rock composed of fragmented, concretionary, or precipitated dolomite of organic or inorganic origin, a dolomite, fixed mooring in the open sea formed of a number of piles, or a guide for ships entering a narrow harbor mouth. Ham.
dolomite. b. See dolomite. An instrument used for breaking and mixing clay in the puddling tub. Fay. b. A heavy timber shod with iron, and hung from a tree or other support so that it may be used for crushing quartz. Fay. c. To break up quartz with a piece of wood shod with iron, in order to be able to wash out the gold. Fay. d. A trucklike platform, with a single roller attached, used in shifting beams, lumber, etc., and sometimes used in a hoisting shaft. Nelson.
dolomite. Composed of or similar to dolomite. Long.
dolomite. A rock composed of dolomite. See also dolomite.
dolomite. A rock composed of dolomite. See also dolomite.
dolomitization. dolomitization. The process by which limestone, CaCO3, becomes dolomite, CaMg(CO3)2, through the substitution of magnesium for some of the calcium. Fay. d. A heavy timber shod with iron, and formerly used for crushing quartz. Fay. c. A tool used to sharpen drills. Stauffer.
dolomite. Composed of or similar to dolomite. Long.
dolomite. A rock composed of dolomite. See also dolomite.
dolomite. A rock composed of dolomite. See also dolomite.
dolomitic limestone. A limestone containing 30 to 50 percent magnesium and 70 to 50 percent calcium oxide as contrasted with a limestone containing less than 10 percent calcium oxide. ASTM STP No. 148-D.
dolomite. a. A fixed mooring in the open sea consisting of a number of piles, or a trucklike structure. Fay. b. A heavy timber shod with iron, and formerly used for crushing quartz. Fay. c. A tool used to sharpen drills. Stauffer.

dolomitization. dolomitization. The process by which limestone, CaCO3, becomes dolomite, CaMg(CO3)2, through the substitution of magnesium for some of the calcium. Fay.
domain

A substructure in a ferromagnetic material within which all of the elementary magnets (electron spins) are held aligned in one direction by interatomic forces; it isolated, a domain would be a saturated permanent magnet. ASM Clon.

dome plug. Reel to a dome, a horizontal prism. Shipley.

dome. a. A symmetrical structural uplift having an approximately circular outline in a plan view, and in which the uplifted beds dip outwards more or less equally in all directions from the center, which is both the highest point of the structure and locally of the uplifted beds. Bureau of Mines Staff. b. A mountain having a smoothly rounded summit of rock that resembles the cupola or dome on a building. A.G.I. c. An open crystal form of two parallel faces that truncate the intersections of two sets of pinacoids and are astride a symmetry plane. Formerly, considered to be an open crystal form which parallels either one of the lateral axes, a or b, and cuts the other lateral axis, b or a, and the vertical axis. 3. Bureau of Mines Staff. See also salt dome.

dome theory. Fayol, a Frenchman, in 1885 stated that strata movements caused by underground workings are limited by a kind of dome which had for its base the area of excavation, and that the movements disturbed are extended upwards from the center of the area. This is known as the dome theory. See also harmattan depth theory; normal theory. Nelson.
domembrane. A refractory shape, usually made dome brick. A brick in which both the large domestic coke. Domestic coke is normally a dome. a. A mountain having a smoothly rounded summit of rock that resembles the cupola or dome on a building. A.G.I. c. An open crystal form of two parallel faces that truncate the intersections of two sets of pinacoids and are astride a symmetry plane. Formerly, considered to be an open crystal form which parallels either one of the lateral axes, a or b, and cuts the other lateral axis, b or a, and the vertical axis. 3. Bureau of Mines Staff. See also salt dome.

door steer

Fay
door tender. One whose duty is to open
closed doors before and after the
journey of a train of mine cars, a
trapper. Zero.
door traps. See door tender. Fay
doors. A tube or barrel equipped with
an auger-type cutting
shoe and made to be rotated to obtain
samples of sand, gravel, and other
depolar material. The body of the sampler is
effectively a tube in which a small opening
is a trapper.

Doppler effect. A shift in the measured fre-
quency of a wave pattern caused by move-
ment of the receiving device or the wave
source. The moving receiver will intercept
more or fewer waves per unit time, de-
dpending on whether it is moving toward
or away from the source of the waves. By
analog, in a reactor, since fission cross
sections depend on the relative velocity of
the neutrons and the uranium atoms (neu-
trons move at nearly the speed of light), the
frequencies are compared in order to obtain
the true
ground speed. The heading is
obtained from a special magnetic compass
and is maintained by a directional gyro
used as an integrating device. The distance
thus
determined has a precision better
than one part in a thousand, which is
sufficient for most geophysical surveys.

Dobrin, p. 323.

sections depend on the relative velocity of
the neutrons and the uranium atoms (neu-
trons move at nearly the speed of light), the
frequencies are compared in order to obtain
the true
ground speed. The heading is
obtained from a special magnetic compass
and is maintained by a directional gyro
used as an integrating device. The distance
thus
determined has a precision better
than one part in a thousand, which is
sufficient for most geophysical surveys.

Dobrin, p. 323.
dosing tank

double-bevel groove weld. A groove weld in which the joint edge of one member is beveled from both sides. *ASM Gloss.*
double-blade tool. a. A pair of multiple-sheave blocks reeved with rope or lines; a block and tackle. *Long.* b. Two pulleys or small sheaves mounted on a single shaft within a frame or shell. *Long.*
double bond. In organic chemistry, a double bond between two atoms of the same element; for example, ethylene, H₂C=CH₂. One link is frequently stronger than the other. *Cross.*
double-branch elbow. A fitting that, in a manner, looks like a tee, or as if two elbows had been shaven and then placed together, forming a shape something like the letter Y or a crotch. *Strock.*
double-brushed. Burned at a high temperature. This does not mean two firings. *AISI, No. 24.*
double cavity process. Any glass-forming process that uses two charges of glass and forms them simultaneously. *AISI C162-66.*
double clamping. Diagonally engaged and engaging the clutch twice during a single gear shift in order to synchronize gear speeds. *Nichols.*
double center bit. A roller-type bit having two serrated, cone-shaped cutting members. *See also roller bit.*
double core barrel. a. A core barrel with an inner tube to hold the core. The inner tube does not rotate during drilling, thereby giving a better core recovery. *Nelson.* b. Synonym for double-tube core barrel. *Long.*
double core-drill bit. A bit of specially-designed form to be used in a single bit. *Cross.*
double core-drill drill. A drill having an inner tube that is suspended on ball bearings and thus may remain still while the outer tube revolves. It is designed to bring out core material in a manner that will have a minimum of breaking or other damage. *Fay.*
double coupler. A fishing tool having a double set of sheaves mounted on a single shaft within a frame given to a chemical reaction in which two compounds take part, both are decomposed and two new substances formed by an interchange of radicals. Also called double replacement. *Cooper.*
double space. A space given to two articles of glass. *ASTM CI 62-66.*
double drum. Hoisting device having two cable spouts or drums rotating in opposite directions. *Long.*
double drum hoist. A hoist with two drums which can be driven separately or together by a clutch. *See also multi- and total haulage.*
double-duo. A pair of rolls, mounted in one stand, one pair of rolls being higher than, and in advance of the other. *Osburn, p. 337.*
double-ended. A term applied to any cutter loader which can cut both ways on a longwall face without turning at each end. It does not require cutting both ends of the machine and duplication of other essential parts. *Nelson.*
double-ended pick; reversible pick. A diamond-shaped coal-cutter pick which is held in a special holder and chain. Both ends of the pick are used and then discarded. The type is used widely in the United States. *See also coal-cutter picks.*
double-engine plane. Loads are raised or lowered on a slope by a stationary engine and wire rope, as in an inclined shaft. There is a single track, or three rails and turnout; the descending trip assists the engine to raise ascending trips, thus eliminating dead load, except rope. *Felt, p. 14, Sec. 11, p. 42.*
double entry. a. A pair of entries—left and gently dipping coal seam; such that only those rooms can be driven from both entries; twin entries. *See also entry, b. Fay.* b. A system of ventilation by which the air current is brought into the rooms through one entry and out through a parallel entry or air room. *See also thin entry, c. Fay.*
double Entry zone test. A test in which coal dust is paced in each of two connected parallel entries. *Rice, George S.*
double extra heavy. Synonym of double extra strong. Long.

double extra strong. A certain class of very thin, inexpensive dinnerware, which sometimes is used as a drivepipe; often incorrectly called double extra heavy or extra heavy pipe. Long.

double-face ware. Ware which has a finish cost on both surfaces. ASTM C286-65.

double-fogted iron. See spotted iron. C.T.D.

double-frit glaze. A glaze containing two frits of different compositions. As an example, a glaze may contain a lead frit and a leadless frit; the glaze is therefore rendered highly insoluble by the inclusion in the second frit of those constituents liable to release lead solubility. Dodd.

double glazing. A Glazing with two panes separated by spaces filled with a layer of unexpanded air other than a layer of a material that prevents molding. C.T. D. Supp. b. Two coats of glaze applied over the other. ACSG, 1963.

double-gob process. See double-cavity process. ASTM C162-66.

double hammer; duplex hammer. A forging device consisting of two hammers striking on opposite sides, as in a bloom. Standard, 1964.

doublehand drilling. Manual rock drilling with a long-handled drill rod requiring both hands. A second man holds the drill and turns it between strokes. Two or even three strikers may work together. Pryor, 3.

doubleheaded gear. Kec.w. Heavy drilling tools which require two men to use them. Fay.

doubleheader. Applied to quarry equipment consisting of two machines on a single truck, operated by one man. Fay.

double headings. The driving of two coal headings, parallel and side by side, for development purposes. Usually a pillar 10 to 20 yards wide is left between them. former was the practice at many coal mines to drive only one heading from which the stalls were turned off right and left. Two headings aid ventilation and prevent part of the charge blowing out at a seam or fissure, in which case the inert material is placed so as to include the seam. Fay.

double mast. See A-frame. Long.

double-men. See double-axes. Fay.

double meridian distance. The sum of the perpendicular distances from the two ends of any line of a map of the initial, or reference, meridian. Seeley, 2.

double packing. A form of strip packing which removes the localized high roof pressure from the vicinity of a roadway into a region in the goaf. It consists of two parallel packs adjacent to, and on each side of, the roadway, with the packs immediately at the roadsides built of such a width as to offer less resistance than wider and stronger packs (called buttress packs) more remote from the roadway. The principle of double packing was developed by Dr. D. W. Phillips in Great Britain. Compare single packing. Nelson.

double parting. A bypass for mine cars. See also junction. Fay. 1936.

double pearl. A pearl formed of two distinct pearls united under a nacreous coating. Shipley.

double-pick; double-men. Corn. Two men who use one pick, one during the day, and one at night, so that the pick is kept constantly at work. Fay.

double-pitch roller chain. A roller chain having double pitch on one side and standard roller chain, otherwise having standard pins, bushes, and rollers. J.G.M.

double-pulley-drive conveyor. A conveyor in which power is transmitted to the belt by two pulleys. Examples are (1) tandem-drive conveyor and (2) dual-drive conveyor. NEA MIB 1961.

double-reading theodolite. A theodolite with which it is possible to observe, from one position, the readings of the diametrically opposite points of both horizontal and vertical circles. C.T.D.

double reduction. Two sets of gears in series that both reduce speed and increase power. Nichols.

double-refracting spar. Same as Iceland spar. Fay.

double refraction. Refraction shown by certain crystals that split the incident ray into two refracted rays, polarized in perpendicular planes. See also birefringence. Standard, 1964.

double-roll breaker. A coal breaker which, in the main, relies on the impact of special teeth for the bulk of reducing, rather than on the compression of the rolls. An important feature is adjustment, which may be made during operation. The machine is flexible enough to produce top size ranging from 6 to 14 inches. Mitchell, pp. 200-205.

double-roll crusher. A machine for breaking hard ore, rock, or coal and to discharge the crushed material below. It consists of heavy iron or steel cylinders revolving toward each other, the surfaces of which may be smooth or toothed—usually the latter. The smallest type can deal with lumps up to 6 inches in diameter, and the largest will take 20 inches. The crushed material varies from about 6 to 1½ inches and under. It is often used for crushing coal for mechanical stokers or as a first step in preparing pulverized coal for firing boilers. See also spring-roll crusher. Nelson.

double-rolled roofing. Belgian press. A press in which pressure is applied by the mating of one or more pairs of indented rolls of equal diameters, revolving in opposite directions. B.S. 3552, 1962.

double-roll verge file. A single lap roofing tile having a roll on both edges so that verges on the two sides are similar. Dodd.

double-room system. See room-and-пillar. Fay.

double rose cut. Form of cutting consisting of two rose-cut forms joined along their bases. See also rose cut. Shipley.

double-screw cone. The cross-sectional view of the cutting face portion of a coring bit when its profile is in a full half circle, the radius of which is one-half the wall thickness or kerf of the bit face. Long.

double-round nose bit. See double-round nose. Shipley.

doubles. Som. The repeated folds or overlaps of the coal strata in the Radstock district. Fay.

doubly-ground refractory material. A refractory material that contains in its original gradation of particle sizes resulting from crushing, grading, or both, and from which particles coarser and finer than two specified sizes have been removed by screening. ASTM C71-64.

double-seal manhole cover. A manhole cover cast with two parallel flanges around its edges which fit into corresponding recesses in the supporting frame and into which they are bedded in green or similar sealing compound. Fay.

double setting. A leveling procedure whereby observations are duplicated by resetting the instrument to detect errors of measurement immediately. Also called dual setting. BS 3618, 1965, sec. 1.

double-shear steel. Steel that has been twice welded and drawn out. Standard, 1964.

double shift. a. Two sets of men at work, one set relieving the other. Fay. b. To employ two shifts of men, or to work double shift. Fay.

double-shift places. At collieries where there has only one recognized coal-winning shift in the 24 hours, it is a general practice to have double shifts (and sometimes treble) of workmen in development headings which require a speedy advance. Nelson.

double-sighting. The method of double-sighting consists in reading off the distance on the telescope normal and once with it inverted, and taking the mean of the two values thus obtained. It eliminates the effect of certain instrumental errors and reduces the personal error of observation. Ogurahiti, sec. 1, p. 27.
double sintering. A process of roasting rich ore in which the ore is sintered at a rapid rate to partially reduce the sulfur content, followed by further raising the temperature of the resultant mass and sintering again at a slower rate. Bennett et al. 1962.

double-thread method. A procedure for detecting the core material in a horizontal well which is the resultant material and sintering again at a slower rate. Bennett et al. 1962.

double-space neutron log. A technique for determining the coefficient of thermal expansion of the material being measured. Dodd, p. 149.

double-tube core barrel. A core barrel consisting of two nested tubes. The inner tube is threaded to connect to the drill rod, and the outer tube is rigidly coupled to a common headpiece. Long.

double-tube core barrel, rigid-type. A double-tube core barrel having the upper end of the inner tube coupled to the core barrel head by means of an antifriction device, such as a roller or ball bearing; hence, the inner tube tends to remain stationary when the outer tube is rotated. Long.

double-tube rigid barrel. Synonym of double-tube core barrel, rigid-type. Long.

double-U groove weld. A groove weld in which each joint is in the form of two T's or two half-U's, one from either side of the member. ASM Gloss.

double-unit conveyor. A longwall conveyor layout from 200 to 280 yards long, developed between two tailgates with a main gate in the center of the face. The main gate conveyor is served by two face conveyors and may act at an intake or a return airway. The tailgates may serve as supply roads. This form of layout is favored as it enables the maximum tonnage of coal being obtained with the minimum of roadway excavation and maintenance. See also double-double-unit conveyor. Nelson.

double-unit longwall face, N. of Eng. Two adjacent longwall faces, each of the same length, on either side of a main or mother gate. In northeast Durham, each face is usually about 30 yards making 100 to 100 yards in all. Trut.

double-V groove weld. A groove weld in which each joint is beveled from both sides. ASM Gloss.

double-wall cofferdam. A cofferdam consisting of two parallel lines of steel sheeting, in which the ore is sintered at a rapid rate to partially reduce the sulfur content, followed by further raising the temperature of the resultant mass and sintering again at a slower rate. Bennett et al. 1962.

double-working. N. of Eng. Two hewers (miners) working together in the same heading. Fay.

doubling. A Scot. Thickening of a seam sometimes due to its being folded over or doubled. See also doubles. Fay. b. A process for the treatment of antimony saldite or crude antimony containing the sulfide by fusing it with iron or other antimony containing iron so as to form a centron sulfide, the removal of which eliminates both iron and sulfur. Webster 3d.

double-wall cofferdam. A system of electric rails, a second insulated contact wire is used for the return or negative current. L&L.

douse

bearing water, oil, or mineral by use of a dowsing rod or other nonscientific contraption. Also called dowsing. Dow, e. a. To put out or extinguish a fire or jet of firewood. Also spelled douse; dow. Fay. f. To search for deposits of ore, for lodes, or by water, by use of a dowsing rod. Dow. f. To plunge into a liquid, as in quenching a piece of hot metal during a hardening process. See also douse.

douser. a. Synonym for douse. See also douse, a. Long. b. Commonly used by drillers as a name for a person skilled in the use of geophysical devices. Also called doddlebugger; douser; dowser. Compare douse, a. and b. Long. c. Commonly used by drillers as a name for a person supposedly having the ability to locate formations in which water, oil, or minerals occur by the use of "dining" rod or other nonscientific contraption. Also called doddlebugger; douser; dowser. Compare douse, b and c. Long.

dousing rod. Commonly used by drillers as a name applied to a wooden ward, rod, fountain, "umbrella," or twig (usually with hazel) supposedly useful in locating formations bearing water, oil, or minerals. Also called doddle rod; doddlebugger; dowser rod. Compare douser, a. and b. Long.

dow cell. The Dow electrolytic cell is a steel shell about 16 feet long, 5 feet wide, and 6 feet deep. The electrolyte contains about 60 percent NaCl, 15 percent CaCl₂, and 25 percent MgCl₂; it is maintained at a temperature of 700° to 750°C by controlled firing of the cell. Newton, p. 481.

dowels. a. Round, headless iron pins, inserted halfway into each of two abutting timbers to prevent slipping. Stauffer, b. Short rods, extending approximately equally into two abutting pieces of concrete, to increase the strength of the joint. Taylor.

dowex. Proprietary name (Dow Chemical Company) of ion-exchange resins, notably Dowex 50, an acid polystyrene cation exchanger, and Dowex -5, a basic anion exchanger. Pryor, b.

dow metal. Magnesium alloys (electron containing aluminum, magnesium, silicon, and possibly zinc. Pryor, b.

down. dowl. See dowk.

downcast. dowl. See dowk.

downbucking. A downbucking by lateral compression of the entire thickness of the crust, which causes the formation of a major growth joint. Dow, a. A downbuckle in a surfacing and the immersion of large masses of silicic matter into the substratum. Schriever, p. 531.

downcast. a. The shaft through which the fresh air is drawn or forced into the mine; the intake. b. That side of a fault on which the strata have been displaced downward in relation to the upthrow or upcast side. C.T.D. e. Ang. A fault, which allows a coal seam downcast. See also downcast.

downdraft. A downdraft of air or other gas (as in a mine shaft, kiln, or carburizer). Dow, c. A vertical drop, usually downward; such as (1) a pipe for leading the hot gases from the top of a blast furnace downward to the dust collectors and flue system, and (2) a tube larger in diameter than the water tubes in some water-tube boilers to conduct water from each too drum to a bottom drum under the influence of the gravity circulation. Webster 3d.

downdrafting. See climbing cut. Dow, a. Parallel to or in general direction of the dip of a bed, rock stratum, or vein. Dow, b.

downdrift. In a mine drift, the direction of predominant water movement. Bureau of Mines Staff.

downer. a. From r. a. To seek or search for substances bearing water, oil, or minerals. Also called dowser; dowser. Compare douse, b and c. Long.

downdrift. In a mine drift, the direction of predominant water movement. Bureau of Mines Staff.

downdrift. A downthrow in a fault, a. The wall of a fault that has moved relatively downward. Dow, f. The fault wall that has moved downward. Dow, g. Also called downdrift; downdrift. A downthrow in a fault, downward enrichment. A term which has displaced the strata downward relative to the workings approaching it. It would be an upthrow fault to workings on the opposite side. Nelson.

downthrow side. The lower side of a fault after displacement has occurred. B. S. 3618, 1964, sec. 5.

down-draw. a. Drilling time lost in repair, fishing, centering operations, or moving rig from one hole to another. Long. b. Applies to any piece of mining equipment which is nonoperative for any reason. Bureau of Mines Staff. Production time lost through mechanical breakdown, adjustment, maintenance, lack of power or fuel. Dow.

downdraft. Interpretation method in which the values of a component of the magnetic field at lower levels are computed from the values at the surface. Schrödereker.

downdraft course; course downward. In mining, the course of the vein from surface downward. Bureau of Mines Staff.

downdraft. A term which is synonymous with secondary enrichment, as the latter has applied to enrichment of ore bodies by the downthrow percolation of waters. Fay.

downdraft percolation. See sand leaching, downdraft. Opposite of upwarp. A.G.I.

downdrafting. See climbing cut. Dow, b. Dow.

downer. A person using a divining rod. See dowser.

dowser. A person using a divining rod. See dowser.

dowse. a. To search for deposits of ore, for lodes, or by water, by use of a dowsing rod. Dow. f. To plunge into a liquid, as in quenching a piece of hot metal during a hardening process. See also douse.

dowse. a. To search for deposits of ore, for lodes, or by water, by use of a dowsing rod. Dow. f. To plunge into a liquid, as in quenching a piece of hot metal during a hardening process. See also douse.

dowser. A person using a divining rod. See dowser.

Dowty hydraulic tub retarder

with attached rubber strips which operate on the face of the wheels above center. The action is controlled by a hydraulic cylinder opposing the movement of the section. The hydraulic pressure is supplied from an accumulator, in which pressure is maintained between the right angle upper valve and the lower diaphragm. The hydraulic unit is driven by a belt which is activated when the accelerator is pulled on the back of the retarding unit. Mason, p. 529.

Dowty prop. A propeller which, in effect, is a_small_ partially submerged hydraulic jack of tubular steel construction and consisting of two tubes, the upper one telescoping into the lower. The upper (or inner) tube acts both as a reservoir for the oil and as a container for the pump, yield valve, and other accessories. Nelson.

Dowty roofmaster. A self-contained, oil-operated steel support for use on a medium-size longwall face. It has support frames constructed of rigid roof and floor members supported by yielding hydraulic props. Two and three props are connected alternately to the armored conveyor by means of racks mounted in the floor members and short conveying roof beams respectively. See also self-advancing supports. Nelson.

dozer Abbreviation for bulldozer; shovel. Nichols, 2. See also bulldozer.
doz. shovel. A shovel equipped with a front-mounted bucket that can be used for pushing, digging, and truck loading. N. Apa.
dozle. See core. Dodd.

Draconels trachyte. A trachyte containing phenocrysts of sandstone and oligoclase in a groundmass of lath-shaped microlites of orthoclase with spangled biotite, hornblende, and magnetite. Holmes, 1928.

drudge. Corn. The inferior portions of ore separated from the best ore by cobbing. Fay.

drayly lode. Eng. A lode through which the mineral is so thinly disseminated as to be scarcely worth the expense of dressing. Such lode, ore stuff, or stone is called drayly Fay.

Drager breathing apparatus. A long-service, self-contained, oxygen-breathing apparatus with an entirely lung-governed oxygen feed. It will enable a man to do hard work for a period of 5 hours; in doing normal work, the apparatus will last for 7 hours. Also, in the event of a rescue being trapped, it will sustain the men for 18 hours if they were to sit and do no work. The apparatus proves more efficient than the wearer, because it is doubtful if rescue brigades could work for 5 hours under the conditions which exist after underground explosions or fires. It weighs 40 pounds, and is carried on the wearer's back; it is a light metal protective case with hinged doors. Medam, pp. 29-30.

Drager escape apparatus. A self-contained, oxygen-breathing apparatus that weighs 245 pounds and is carried on the back of the wearer. It provides protection for 1 hour against all poisonous gases or short term of the wearer. If it weighs more than 1 pound above the required 35 ounces, it is discarded. Medam, pp. 55-57.

draeger self-rescue. A German made apparatus that is well protected against mechanical damage by an elaborate covering of protection layers. The entire apparatus is enclosed by an outer steel case of two parts and secured by a steel band. When the red end of this band is pulled sharply, the two parts of the case fall apart and pull open the top of a rubber bag covered with layers of paraffin wax and aluminum foil. The wearer is then pulled out of this bag and is ready for use. Because of this protective covering, the respirator can be stored for several years without undergoing deterioration. Each month the filter is cleaned and its condition is checked by weight. If it weighs more than 1 pound above the required 35 ounces, it is discarded. Medam, pp. 69-70.

draft. a term used in Weights for allowance coal; about 300 pounds per week to every household. Fay, b. In general, the act of drawing, or the thing drawn. Webster 2d. c. A quantity of ore or drawn forward, up, or out, especially at one time. Webster 2d. d. A current of air in a closed-in space (as a room, ventilator, furnace, or chimney. Webster 3d. e. The area of an opening or group of openings for discharge of water; as, the draft of a turbine wheel. Webster 2d. f. A survey line in a traverse. Also called leg. B.S. 3616, sec. 1, 1963. g. The pressure of a moving fluid, usually applied to convection flow, such as chimneys, and usually measured in inches of water. Stock, J. h. Resistance to movement of a towed load. Nichols, 2. i. The angle or taper on the surface of a punch or die or the parts made with them which facilitates the removal of the work. ASM Gloss. j. The change in cross section in rolling or wire-drawing. ASM Gloss. k. Taper put on the surfaces of a pattern so that it can be withdrawn successfully from the mold. ASM Gloss.

draftage. A term used from the gross weight of mineral when transported, to allow for loss. Zern.

draft gate. An instrument used to measure the small pressure differentials below atmospheres; for example, an inclined manometer to measure the pressure difference between a flue and the atmosphere for combustion control. ACSG, 1963.

draft hole. An opening through which air is supplied to a furnace. Fay.

drafting. The act of consisting of drawing or attenuating slivers, reducing them to finer sizes. Phillips.

draftsmen. A term used in Petroleum production, one who performs the duties of a
draftsman but specializes in making maps, diagrams, profiles, and cross sections to represent geological stratigraphy and location of oil and gas deposits. He collates and interpreting data obtained from topographical surveys, from well logs, and from geophysical and geologic studies, compiling, and preparing maps and charts for exploration correspondent. D.O.T. 1.

draft stabilizer. A device to maintain a constant draft in a fuel-burning device. Stock, 10.

draft tube. The steel casing through which water leaves a turbine after having given up its energy. Ham.
drag. a A wooden or iron bar placed between the spokes of the wheels of trucks to check their speed upon an inclined way. A brake or sprag. Fay. b. An appliance to be attached to the rear of a loaded train of cars to prevent the cars from rolling down the incline or grade in the case the cable should break. Fay. c. The frictional resistance offered to a current of air to prevent the footfall from being obscured by an21. pounds, and is carried on the back of a miner. Fay. d. Fragments of ore torn from a lode by a fault. Such fragments are scattered along the line of the fault and are usually inclosed within crushed or brecciated pieces of the rock traversed by that fault. Secondary mineralization along these faults may obscure the true character of the drag in which case the difference in associated minerals may prove suggestive. Fay. e. A heavy blasthole cleaner; drag twist. Standard, 1946. f. A runnerless sled for drawing rough heavy stone, etc; a stoneboat. Standard, 1946. g. A heavy iron bar attached behind a trip of mine cars when ascending a grade to prevent them from running away in the event of an accident causing cars to become uncoupled. Hudson, h. Backstay; trailer; devil. Mason. i. A heavy bar hinged to a take off trucks, which fouls the track and derails the last one if they begin to run backward. Pryor, 3. j. The flexure of a strand associated with faults. In a normal fault, the coal seam often bends upwards on the downthrow side and downwards on the upthrow side. Thus, drag is an indication of direction of displacement of the beds. Also called terminal curvature. See also coal leads. Nelson, k. A haulage drag. See also backstay. Nelson, 1. Pulling a bucket into the digging, or the mechanism by which the pulling is done or controlled. Nicholas, 2. m. Resistance created by friction. Long. n. The uplifted or downfitted curve in rock beds or strata adjacent to a fault. Long. o. Distortion of beds adjacent to a fault. Ballard. p. Which part of a shall. The mold having been separated in the two parts of the flask, the cope is put upon the drag before casting. After casting, the flask is disassembled by removing the cope from the drag. If an inclined stope, the weight of the arch block is resolved into two components, one at right angles to the dip and one parallel to the dip, which tends to close the opening, and one parallel to the dip, which tends to produce movement of the hanging wall. Higham, p. 104. v. The re-
sistance to shrinkage during the firing proc-

drag; backstay. Aust. An iron bar fas-
dragade. See drag ladle. ASTM C162-66.
drag angle. The angle at which the leading

drag fault. In the stationary block, caused

drag fault. In the stationary block, caused

drag fault. In the stationary block, caused

drag fault. In the stationary block, caused

drag fault. In the stationary block, caused
drain. a. A conduit or open ditch for carrying

drag technique. A method used in manual

drainage area. a. A term applied to that area

drainage level. See water level. Nelson.

drainage hole. Synonym for drain hole. Long.

drainage head. a. The furthest or highest

drainage divide. A drainage divide is the rim

ess of removing surplus ground or surface

from mining operation. See also drain tun-

b. See basin, c. Fay.

drain casting; hollow casting. Forming ce-

ramic ware by introducing a body slip into

a machine through which oil or liquids

are hauled by

drain hole. a. A borehole drilled into a water-

bearing formation or mine workings through which water can be with-

drawn or drained. Long. b. Any hole pro-

vided in the base covering or housing on a machine through which oil or liquids

can be withdrawn. Long.

drain, drilling. a. The part of the dipping or flow-

coating process in which the excess slip

flows from suitably positioned ware. ASTM C286-65. b. The process of removing excess

slip from plaster molds in forming slip-coated ware; also the removal of excessive

glaze from bisque ware after dipping. Bu-

reau of Mines Staff.

drain line. A nonuniform thickness of coating

appearing as a line or streak in dipped or flow-coated ware. ASTM C286-65.

drainman. a. In metal mining, a laborer who

regulates flow of tailings, through flumes

and thus prevent it seeping down to ac-

tive workings at lower levels. A central

drainage tunnel may serve several mines

and thus prevent water from entering the soil and

cutting to it. Staff.

drainage tunnel. A tunnel constructed mainly

for drainage purposes. It may collect sur-

face water and water from old workings and

tissue of the fan blades, or by

variations in the pitch of the fan blades, or by

a chimney, while artificial

draught is produced by a chimney, while artificial draught is produced by fans and is con-

duced by the speed of the fan, variation

in the pitch of the fan blades, or by

mist. Staff.

drawbar. a. A bar that is used to connect a

metal subject to a drawing process.

drawability. A measure of the workability of

metal to which it is applied. See also angle of draw. Nelson. h. To wind

drawbar. Vertical. current

drawings. Pryor, 3. o. In metallurgy, to

remove broken ore by gravity from stopes, chambers, or ore bins by aid of chutes or conve-
yors. Pryor, 3. o. In metallurgy, to

remove pattern from foundry mold (flask).

An internal fissure in a casting, caused by

inadequate feeding during its solidification. Pryor, 3. p. To pull bit-blank metal toward

a common center-line, when hand-setting a diamond bit, Long. a. A small valley or a gulley. Nicholls. t. See pull. Long. b. By the term "troughlike" part of the land surface leading up from a stream valley to a gap between hills. Legrand.

drawability. A measure of the workability of a metal subject to a drawing process. This term is usually expressed to indicate the metal's ability to be deep-drawn. ASM Gloss.

b. Removing the coke from an oven. Zern.

drawbar. a. A bar that is used to connect a

steam locomotive and tender and is secured

by a drawbar.

Maynard Davies and developed at the Central Engineering Establishments of the National Coal Board of Great Britain. A shearer drum is carried on a vertical shaft in contrast to the horizontal shaft in the Anderson shearer. Nelson.

draper washer. Vertical. current separator

(obsolete) used to separate shale from coal. Pryor.
drawbar

In the drawhead of the locomotive by a pin. Webster, 3d. b. A bar or heavy beam upon which a railway car and projecting at the end for coupling cars. Some arrangement for coupling is placed at the outer end, to lessen recoil in starting, coupling, etc. Standard, 1964. c. In a tractor, a fixed or hinged bar extending to the rear, used as a fastening for lines and towed machines or loads. Nichols. d. In a grader, the connection between the circle and the front of the frame. Nichols. e. A submersed clay block used to define the position of sheet glass during drawing. ASTM C162-66.

drawbar power. The power available at the tractor drawbar for moving the tractor and its towed vehicles forward. It is generally between 80 and 85 percent of the power developed by the engine. Carson,

drawbar pull. a. The pull a tractor can exert on a load attached to the drawbar. Depends on pounds per ton of tractor weight and traction. Nichols. b. The effort exerted by the locomotive on the train; it is the tractive effort less the force required to move the train from its own resistance. The track resistance of the locomotive is ordinarily taken as 20 pounds per ton of locomotive weight. Consequently, the drawbar pull would be 500 — 20 = 480 pounds per ton weight for a locomotive with steel wheels. Lewis, p. 213.

draw bead. a. A bead or offset used for controlling metal flow. ASM Gloss. b. Riblike projections on draw rings or mold-drawn surfaces for controlling metal flow. ASM Gloss.

draw bench. The stand that holds the die and drawhead used in the drawing of wire, rod, and tubing. ASM Gloss.

drawer. a. Scot. A man or boy who takes ore or rock from the working face to the shift, or terminus of the horse or haulage road. One who puts trams or drives a horse underground. Fay. b. Dunr. A man who bulls ore or rock by means of a windlass, or otherwise, from a shaft. Fay. c. Putter; trammer; wagoner; a person who moves tubs either manually or with a machine. Mason.

draw firing. Removal of the load from the furnace for a short time prior to the completion of burning to equalize heating of all areas. Also called draw burning. Fry.

draw gang. A group of men employed to cut and handle glass as it comes from the lehr. ASTM C162-66.

drawglass. The term includes drawbars, chains, shackles, detaching hooks, etc., used in haulage, winding, and hoisting. Nelson.

drawhead. Set of rolls or dies mounted on a carriage or vertical bar for forming a section from strip, tubing, or solid stock. See also Turk’s-head rolls. ASM Gloss.

draw hole. An aperture in a battery through which the coal or ore is drawn. Fay.

drawing. a. Receiving the timber, chocks, etc., from the goaves. This work is commonly performed with the use of the dog and chain. The process of pulling away the sprags from beneath the coal after hoiling. Fay. c. Raising coal through a shaft or slope. Fay. d. In hydraulic mining, throwing the water beyond the dirt to be removed and causing it to flow toward the giant. Compare goosefoot. Fay. e. Removing or pulling out the crown bars in a tunnel. Stauffer, I. The term used in Lancashire, England, and Scotland for trawming, Nelson. g. The movement of tubs. Pryor, 3. h. Forming recessed parts by forcing the plastic flow of metal in dies. ASM Gloss. i. Reducing the cross section of wire or tubing by pulling it through a die. ASM Gloss. j. A misnomer for tempering. ASM Gloss. k. Continuous forming of sheet, tube, or forced glass from molten glass. VV.

drawing an entry. Removing the last of the coal from the face of the mine. Fay.

drawing chamber. The part of a tank furnace for flat glass from which the sheet of glass is drawn. Drawing compound. A substance applied to prevent pickup and scoring during drawing or pressing operations by preventing metal-to-metal contact of the work and die. ASM Gloss.

drawing lift. The lowest lift of a Cornish pump, or that lift in which the water rises by suction (atmospheric pressure to point where it is forced upward by the plunger). Fay.

drawing-machine operator. One who observes the progress of a continuous flat sheet of window glass from the glass-molding tank to the top of an automatic drawing machine (the sheet is in a continuous flow through a series of adjustable asbestos rolls), making adjustments to rolls to prevent warping and breakage of sheet. Also called flat-drawing-machine operator, window glass. D.O.T. 1.

drawing road. Scot. An underground passage along which ore is conveyed. Fay.

drawings. Diagrams made to a definite scale according to engineering principles of projection and so on. The drawings issued with the tender documents show the works to be carried out in accordance with the contract as accurately and in such detail as is possible. The drawings may be supplemented from time to time by the issue of general and detailed drawings. See also machine drawing. Nelson.

drawing small. When a winding rope, from a higher level is loaded into hauling units. Nichols. b. Heavy chisel cut across the face of a bit blank a short distance from a diamond to serve as a starting point for calking the metal toward and around a diamond being hawked. Long.

draw radius. The radius at the edge of a die or punch on which the work is drawn. ASM Gloss.

draw ring. A ring-shaped die part over the inner edge of which the metal is drawn by the punch. ASM Gloss.

draw sprocket. A small sprocket, or rock approximately 2 inches to 2 feet in thickness, above the coal, and which falls with the coal or soon after the coal is removed. Fay.

draw tongue. A bar hinged to a towed machine, fitted with some device for attaching it to a tractor. Nichols.

draw trials. Ceramic test pieces drawn from a kiln at various temperatures. Bureau of Mines Staff.

draw wood; draw trees. Scot. To extract and recover mine timbers Fay.

draw works. a. In rotary drilling, that part of the equipment functioning as a hoist to raise or lower drill pipe and in some types, to transmit power to the rotary table. A.G.I. b. In countershaft and driven sub- stituted in rotary drilling for the band wheel, cable, winch, bull wheel, and sand red used in the cable-tool method as a means of handling drill-string-equipment casing and drivepipe in the course of drilling a bore- hole. Hutton definitions provide gear for several speeds. Long.

dredge. a. Large floating contrivance utilized in underwater excavation for the purpose of developing and maintaining water depth in canals, rivers, and harbors; raising the level of lowland areas and improving drain-
dredge

age; constructing dams and dikes; removing
overburden from submerged ore bodies pro-
cessing of ores; mining; or to recover
subaqueous deposits, having commercial
value. Dredges exist in a variety of mod-
fications, from large clamshells, bucket
ladders, scrapers, and hydraulic systems as
means of excavation, and they may or may
not be self-propelled. Also called dredging
machine. Bureau of Mines Staff. Any
apparatus used for excavating underwater.
C.T.D. a large raft or barge on which
are mounted either a chain of buckets or
suction pumps and other appliances, to
elevate and wash alluvial deposits and
gavel for gold, tin, platinum, diamonds,
etc. C.T.D. a type of bag net
used to apply powdered porcelain enamel
to the application of dry, powdered frit
to ware, Fay. dredging. See dredge, a. Fay.
dredging claims. The bed of an unnaviga-
table stream. A heavy-duty-type pump with
impeller gravel sizes are being handled, casing
and impellers. In
a millstone face, Webster 2u. g.
dredging claims, The bed of an unnaviga-
table stream. A heavy-duty-type pump with
impeller gravel sizes are being handled, casing
and impellers. In
a millstone face, Webster 2u. g.
dredging conveyor. A scraper partially im-
mersed in a vessel containing liquid and
used for removing any solids which may
have left off work, Fay. d. The separation
of sulfides or other minerals distributed in
a coarse and irregular manner in the
vein. It may also be used in a gold or
silver mine if the seller is familiar enough
with the difference between high- and low-
grade ore. In a mine, it is a lack of straight lines which is in itself
suggestive. The back or top of a drive or stop is will have a billowy appearance,
which is the result of gouging out the low-
grade places. Hooe, p. 80.
dredging floor. The floor, place, or ya d where
dredge ore is removed continuously by
means of a scraper chain or scraper buck-
ets. Also called drag tank; smudge sum-
p. B.S. 3552; 1962.
dredging machine. See dredge, a. Fay.
dredging machine. See dredge, a. Fay.
dredging pump. A pump for drawing up silt,
dredging machine. See eredge, a. Fay.
dredging pump. A pump for drawing up silt,
dredging machine. See eredge, a. Fay.
dredging pump. A pump for drawing up silt,
dredging machine. See eredge, a. Fay.
dredging pump. A pump for drawing up silt,
dredging machine. See eredge, a. Fay.
drier feeder. a. One who places wet ceramic ware under the sun, or dries it. b. One who lifts freshly enameled parts, to place them in a drier. c. One who wraps damp burlap around refractory blocks in drying operations. Bureau of Mines Stall.

drier man. In salt production, one who tends operations of rotary dryers through which crushed salt is run to drive off contained moisture prior to grinding, examining the salt discharged from the dryers to see that evaporation of moisture is complete. D.O.T. 1.

drier tender. One who wraps damp burlap sacks around refractory blocks in drying room to prevent drying of the block centers before the outside. D.O.T. 1.

drier white. A term given to superficial discoloration of clayware during drying; the most common cause is advance of soluble salts to the surface of the ware. See also) till white. ACSG, 1963.

dries. Seams in the rock, which are usually invisible in the freshly quarried material, but which may open up in cutting or on exposure to the weather. See also dry, b. Fay.

drift. a. A horizontal passage underground, usually driven from a crosscut, which intersects it, or a level or gallery, which may do either. Fay. b. In coal mining, a gangway or entry, at a given level and generally on the slope of a hill, driven horizontally into the coal seam. Pay. c. A horizontal opening driven through an ore body and parallel to the course of the vein or the long dimension of the ore body. Beerman, a. A passageway driven by compressed air, for driving down coalface. Fay. d. A horizontal passageway driven by compressed air, for the purpose of transporting miners through various glacial and fluvioglacial deposits, as the depth at which deviation occurs. Zern.

drift angle buildup. The rate of the increase in the drift angle which is generally expressed as the number of degrees increase in the drift angle which is generally expressed as the number of degrees increase in the drift angle as the number of degrees increase in which the airplane is heading. Seelye, 2.

drift angle; drift angle buildup. The rate of increase in the drift angle which is generally expressed as the number of degrees increase in the drift angle as the number of degrees increase in which the airplane is heading. Seelye, 2.

drift angle; drift line. Line of drifted material left on the strike of the coal seam. Fay.

drift bed. In geology, a layer of drift of relatively small cross section, larger sections of which may be designated as drift strata. Fay.

drift bed. In geology, a layer of drift of relatively small cross section, larger sections of which may be designated as drift strata. Fay.

drift bolt. A. A metal rod or pin used for securing timbers resembling a spike bolts or pins. Webster 3d. b. A metal rod or pin used for securing timbers resembling a spike bolts or pins. Webster 3d. c. A horizontal piece of drift timber, generally of an ore body and parallel to the course of the vein or related structure. Long. d. A horizontal piece of drift timber, generally of an ore body and parallel to the course of the vein or related structure. Long.

drift angle; drift angle buildup. The rate of increase in the drift angle which is generally expressed as the number of degrees increase in the drift angle as the number of degrees increase in which the airplane is heading. Seelye, 2.

drift bed; drift bedding. A term proposed to replace inclined bedding, Pettijohn.

drift drill. a. The coal mining term for the boring of a borehole; the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift ice. Any ice that has drifted from its place of origin. Hy.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.

drift mine. a. A borehole, the course of which may be distinguished from the original seam. Beerman, a. A borehole from vertical and/or its intended course. Long. b. See also deflection angle. Long.
drift mining, a. A term applied to working alluvial deposits by underground methods of mining. The paystreak, varying from 2 to 10 feet or more, is reached through an adit or a shallow shaft. Wheelbarrows or small cars may be used for transporting the gravel to a sluice on the surface. If relatively large, the deposit is removed in a system of regular cuts or slices taken across the paystreak, working generally in a retreating fashion from the inner limit of the gravel. Drift mining is more expensive than sluicing or hydraulic mining; consequently it is used only in rich ground. Lewis, p. 390. b. The working of relatively shallow coal seams by drifts from the surface. The drifts are generally inclined and may be driven in rock or in a seam. Drift mining may be viewed as intermediate between open-cast coal mining and shaft or deep mining. See also development drift, Nelson.

drift net. In oceangraphy, a form of gill net used for fishing at or near the surface; allowed to drift with the tide; used especially by beating boats or drifters. See also gill net. C.T.D.

drift peat. A peat deposit associated with or embedded in glacial drift. Fay.

drift salt. Fluffy, flaky salt particles due to wind and wave action which produce a mist over the surface of solar salt ponds. Tomkeieff, 1954.

drifts. a. A deposit of solid or gravelly material deposited between the ledges of rocks, supposed to have been produced by the grinding action of masses of soil, gravel, and rocks, during glacial movement. Fay.

drift set. A strong timber set in a drift which may form the anchorages for the timber sets of the stope above. Nelson.

drift sheet. A sheetlike body of glacial drift, composed of fine-grained, unstratified, continuous or discontinuous bodies, resulting from a single glaciation (for example, Carey drift sheet) or during a closely related succession of glaciations (for example, Wisconsin drift sheet). A.G.I.

drift slabs. Slabs of more than ordinary length, used especially for holding back dikes and water from a shaft. Fay.

drift stope. The excavation of the development drift together with the stope in overhand stoping. Employed in cases where the nailing wall is strong. Nelson.

drift stopping. See sublevel stoping. Fay.

drift theory. That theory of the origin of coal which holds that the plant matter constituting coal was washed from its original place of growth and deposited in armorial deposition where coalification then came about. See also allochthonous coal. A.G.I.

driller. See. a. A. C.T.D. Also called a drifter. See also drifter. C.T.D.

drilling. Coring. The lower pump in a tier or tier; the working piece. Also called drigger. Fay.

drilling or core (ice. Pryor, 3.

drill. a. Any cutting tool or form of apparatus using energy in any one of several forms to produce a hole in rock, metal, wood, or other material. See also calyx drill; churn drill; core drill; diamond drill; rock drill; rotary drill; shot drill. Long. b. To make a circular hole with a drill, or to cut a hole. Long. c. Types of drills include singlehead, double-hand (worked manually); percussion drills (jacket, or jacketed), which are operated using compressed air; and rotary drills (diamond, shot, calyx) powered by air or electricity. All the drills include Banks (hand) and churn (power). Pryor, 3.

drillability. a. The relative speed at which a material may be penetrated by a drill bit. High drillability denotes easy penetration at a fast rate. Long. b. The specific value of the drilling properties of a rock expressed in terms of the drilling rate under certain technical conditions. Freasekel.

drill area. Drilling area. To sink a borehole into solid or unconsolidated rock material, such as overburden or glacial till, to a considerable depth below the bottom of the casing or drivepipe. Long. b. To restart or resume drilling operation. Long. c. To drill boreholes in advance of mine workings to explore or locate old mine workings or a water-bearing formation. Long.

drill bar. A drill column that is set horizontally instead of vertically in an underground workplace. Long.

drill base. Metal or wood framework on which a drilling machine is mounted. Long.

drill bit. One of a number of different types of detachable cutting tools used to cut circular holes in rock, wood, metal, etc. Also called drill bit for use in iron and steel. Tomkeieff, 1954.

drill boom. An adjustable arm projecting from a drilling carriage to carry a drill and hold it in position. B. S. 3618, 1964, sec. 6.

drill bort; drilling bort. Synonym for drill bit, Long.

drill bortz; drilling bortz. Synonym for drill bort or bortz. Long.

drill bortz. A drill column that is set horizontally instead of vertically in an underground workplace. Long.

drill bortz; drilling bortz. Synonym for drill bortz. Long.

drill cradle. The metal channel on which a heavy drill is fed forward as drilling proceeds. B. S. 3618, 1964, sec. 6.

drill crew. Men needed to operate a drill machine properly. Long.

drill crow. A person who has acquired enough knowledge and skill to enable him to operate a drill machine properly. Long.

drill cutting. A. G. I. Supp. See also cuttings; fudge; drill slurry; drilling derrick. See derrick. Long.

drill derrick. See also derrick. Long.

drill diamonds. Long.

drill; drilling. Fay.

351

driller. a. A person who has acquired enough knowledge and skill to enable him to operate and to assume the responsibility of operating a drilling machine. Also called drill operator, drill runner, and drill hand. B. S. 3618, 1964, sec. 6. b. The man in charge of the rig and crew during one tour and who handles the control of the drilling controls. Bronger, 12. c. A drilling machine. Standard, 1969, d. Can. Property being diamond drilled as compared to
driller

one underground underwater development. Hough, e. N. of Eng. Uses an electric or pneumatic twist drill to make shotholes in the ground. The points where the shotholes are usually put on the stone to be crushed are call holes. Trit. I. See cable driller. D.O.T. 1.

driller helper. See prospecting driller helper. D.C. I.

driller, machine, a. In anthracite and bituminous coal mining, one who operates a compressed-air or electric rotary drilling machine in working places in a mine to drill holes into the working face of coal so that the mass may be broken up by blasting with explosives that are inserted and set off in the holes. Also called drill engineer; drillman; power driller. D.O.T. 1. b. In the quarry industry, one who operates a heavy, mounted, compressed-air, percussion machine. See also cable driller. D.O.T. 1.

Compressed-air or electric rotary drilling machines are extensively used in large tunnels and for sinking shafts or openings in rock or rock in the working place to facilitate setting up and operating drill. Also called drill operator helper. D.O.T. 1.

drill hole; drill hole. See borehole. Compare borehole. Long.

drill-hole counter. A device for counting the number of holes drilled or holes that have to be drilled. Shell Oil Co. b. A device for counting the number of holes drilled or holes that have to be drilled. Shell Oil Co.

drill-hole pattern. A plan showing the location, direction, length, and firing sequence of the drill holes in a round. Frenkel. b. The overall rate of advance of the borehole. B.S. 3618, 1963, sec. 3.

drill drill; drilling drill. A linear-laden fluid used as a circulating medium when drilling a borehole with a diamond- or rotary-drilling machine. See also mud. Long.

drill fitting. Devices, parts, and pieces of equipment used downhole in drilling a borehole. Also called downhole equipment. Long.

drill floor; drilling floor. A planked-over work area around the collar of a borehole at the base of a drill tripod or derrick. Long.

drill fluid; drilling fluid. Usually water or water and salted water (sometimes applied to compressed air, natural gas, or oil) circulated through a drill string to keep it cool and to wash cuttings produced away from the bit face. Also called circulation fluid; fluid circulation. Long. See also circulation fluid.

drill footage. The number of linear feet of borehole drilled, usually expressed in number of feet per bit. Long.

drill frame. A drill frame is usually constructed of three or more arch girders strapped together to form a replica of the tunnel shape but smaller in size. The structure is mounted on wheels and provision is made for clamping the drills to various parts of the frame according to the drill-hole pattern in use. It contains a control system to allow the passage of the loading machine, cars, or conveyors. Nelson. b. The structure is mounted on wheels and provision is made for clamping the drills to various parts of the frame according to the drill-hole pattern in use. It contains a control system to allow the passage of the loading machine, cars, or conveyors. Nelson.

drill free; drilling free. A condition occurring when the bit is being suspended above the bottom of the borehole by the drill rods or by a blocking of cuttings at the bottom. Nelson. b. A condition occurring when the bit is being suspended above the bottom of the borehole by the drill rods or by a blocking of cuttings at the bottom. Nelson.

drill gear. The width across the cutting bit or bit tips of a rock drill. With tungsten-carbide bits it is possible to drill long holes without the loss of gage. Nelson. b. The width across the cutting bit or bit tips of a rock drill. With tungsten-carbide bits it is possible to drill long holes without the loss of gage. Nelson.

drill head. a. The assembly which applies the drilling pressure and rotation to the drill rods. Also called boring head. B.S. 3618, 1963, sec. 3. b. Obsolete synonym for drill bit. Long.

drill hole; drill hole. A hole in rock or coal made with an auger or a drill. Bureau of Mines Staff. b. Technically, a circular hole drilled for any practical purpose; loosely and commonly, the name applies to a circular hole drilled in any manner. Long. c. Used by diamond drilling operators to denote a borehole. Compare borehole. Long.

drill-hole pattern. The number, position, depth and angle of the shot holes forming the complete round in the face of a tunnel or sinking pit. A good drill-hole pattern will ensure the maximum possible pull and the fragmentation for any loading without excessive scatter of material. Nelson.

drill head; swivel head. A device very accurately made to fit the drill and clamped to the frame. The use of a jig makes it possible to obtain a reproducible hole. Nelson. b. A device very accurately made to fit the drill and clamped to the frame. The use of a jig makes it possible to obtain a reproducible hole. Nelson.

drill iron. a. The act or process of making a circular hole with a drill. See also drill a hole. Long. b. The overall rate of advance of the borehole. B.S. 3618, 1963, sec. 3.

drill log; drilling log. The record of the events and the type and characteristics of the formations penetrated during drilling a borehole. Also called boring log. Compare log. Long.

drilled machine, power. A machine operated, or power-driven machine for boring shot holes or boreholes in, or on, ore, mineral, or rock. See also auger drill; percussive drill; rotary drill; rotary-percussive drill. Nelson.

drilling machine operator helper. In metal mining, one who operates a rock drill or long-throw rock drill to assist the driller in operating the drill. Also called drill operator helper. D.O.T. 1.

drilling mud. A suspension, generally aqueous, used in rotary drilling and pumped down through the drill pipe to seal off porous zones and to counterbalance the pressure of oil and gas; consists of various substances in a finely divided state among which bentonite and barite are most common. Oil may be used as a base of water. A.G.I. Supp.

drilling mud weighting materials. Class name given to materials which are added to drilling mud to control gas, oil, water, or formation pressures and to aid in maintaining the walls of the open hole. C.D. 64, 1961.

drilling platform. Auxiliary equipment for drilling at heights above head level. The drilling platform is generally assembled and dismantled to suit each series of drilling operations. Frenkel.

drilling pressure; drill pressure. See bit load. Long.

drilling rate. a. The depth of penetration achieved per unit of time with a given type of rock drill, bit diameter, air pressure, etc. Also called penetration rate. Frenkel. b. The overall rate of advance of the borehole. B.S. 3618, 1963, sec. 3.

drilling tools. An assembly of tools including the bit, drill pipe, etc., used in well drilling. Shell Oil Co.

drilling tower; drill tower. Synonym for derrick. Long.

drilling up. Preliminary digging out the clay in the taphole of a furnace. This is done usually by hand, air, or electric drill. Fay. b. Incorrectly used as a synonym for derrick. Long. c. Incorrectly used as a synonym for derrick. Long. d. Incorrectly used as a synonym for derrick. Long.
drill machine; drilling machine

A portable mechanism used in drilling boreholes, drill holes, or wells. Also called drill; drill rig.

drill mounting; drilling rig. An arrangement to provide feed pressure and a support for the drilling machine usually in tunnels. Four main types of drill mountings are in use, namely, the post, the air leg, the drill frame, and the drill carriage. Nelson.

drill mud; drilling mud. Water mixed with clay (usually bentonite) and sometimes other material such as ground barite, oil, etc., used as a rotary and/or diamond-drill circuit. Compare circulation fluid; drill fluid. Long.
drill off; drilling off. Used by rotary and diamond drills as a synonym for drill free. See also drill free. Long.
drill operator, pneumatic. In stonework in- dust. a. One who drills holes in slabs or blocks of building stone for the insertion of wire or rods in mounting or fastening the stone. b. One who drives a compressed air driven drill. D.O.T. 1.
drill out; drilling out. a. To penetrate or drill through or completely empty; b. To bore or dig out; drilling out. a. The act or process of drilling. Long.
drill platform; drilling platform. Synonym for drill floor; drilling floor. Long.
drill press operator. In the stonework in- dust. b. one who drills holes in slabs or blocks of building stone for the insertion of wire or rods in mounting or fastening the stone. Also called drill press operator; Long.
drill press; drilling press. A portable machine complete with various controls and accessories for making hole holes, and used in a wide variety of work. Nelson. b. See drill rig. Long.
drill press. a. A machine consisting of a cast iron base, a table to work on, one or more spindles or spindles, a headstock and tailstock, and a driven belt; b. A machine tool for drilling, boring, reaming, and making other similar operations. Nelson. b. See drill rig. Long.
drill rig; drilling rig. A machine designed to drill holes in the earth or rock. The term "drill rig" is applied to the equipment used to perform this work. Long.
drill rig bits. a. A coring bit, usually designed to be coupled to a reaming shell and used to obtain a core sample. b. The term "drill rig bit" is generally used when the core bit is coupled to a reaming shell and used to obtain a core sample. Long.
drill rig floor. a. The top floor of a drill rig. b. See drill rig, d. See drill rig, b. Nelson. b. See drill rig. Long.
drill pipe; Diamond drill pipe; drilling pipe. a. In standard drilling, a cylindrical steel tube or pipe,-usually 2 1/2 inches in diameter, used to transport fluids and in the transport of drill cuttings. Also called steel pipe, drill pipe, Diamond drill pipe, etc. Nelson. b. See drill rig. Long.
drill pipe drive quill. Synonym for drive quill. Long.
drill rig steel. a. Steel made either by the crucible process or the Bessemer process. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.
drill rig steel. a. Steel made by one of the crucible processes. b. Steel used in the manufacture of drills. Nelson. b. Steel used in making drills. Long.

353

drip feeder

A device used to feed water or other liquid at a controlled rate into a borehole. It is often used in connection with a derrick or other lifting device to feed water or other liquid into a borehole at a controlled rate.

for boring in coal, ore, or rock. It consists of a pipe, a steel pipe, and a valve connected to a water supply. The pipe is inserted into the borehole and the valve is opened to allow water to flow into the borehole. The water is then circulated through the borehole using a pump or other device.

Drip feeders are used in a variety of applications, including mining, construction, and drilling. They are particularly useful in situations where water or other liquids need to be fed into a borehole at a controlled rate.

Drip feeders are available in a variety of sizes and configurations, depending on the specific application. They are typically made of steel or other strong, durable materials.

Drip feeders are an important tool in the mining and drilling industries, as they allow for precise control of the amount and rate of water or other liquids fed into a borehole. This ensures that the drilling process proceeds smoothly and efficiently, and reduces the risk of damage or other problems.
drip feeder

lubricant at steady rate in drops per minute. Pryor, 3. b. Reagent feeder sometimes used in flotation process to meter chemicals into the pulp. Henderson. c. Incorrectly used as a synonym for drive shoe; drive hammer. Long.
drive. A type of force fit. ASM Gloss.
drive gear; drive gears. a. The gear at the end of a diamond-drill motor drive shaft, which engages and rotates the diamond-drill swivel-head bevel gear; the latter in turn rotates the swivel-head drive rod. Long. b. Equipment used primarily in driving pipe or casing. Long. 
drive hammer. A heavy sleeve-shaped weight used as a hammer or pindlever for driving pipe or casing to overburden or other soft rock materials. Also called anvil; anvil block; drive block. Long. See also casing drive hammer.
drive hammer extension. An annular-shaped piece of heavy steel, which is made to be attached to the bottom end of a drive rod before installation of the drive block is needed. Also called drive-block extension. Long. 
drivehead. a. The driving mechanism for a conveyor. The expressions head-end drive, intermediate drive, and tail-end drive, indicate the position of the drivehead or heads. Nelson. b. A heavy iron cap or annular coupling fitted to top of pipe or casing to receive the casing from the blow delivered by a drive block when casing or pipe is driven through overburden or other material. Also called drive cap; driving cap. Long. c. The swivel head of a diamond- or rotary-drill machine. Long. 
drivehead yoke. A heavy steel ring fitted around a jar rod and resting on a drivehead attached to rods connected to a drive sampler used in soil-sampling operations. The ring is equipped with two links to which the pulldown lines can be attached and by means of which the sampler is forced slowly and steadily downward into the material being sampled. Long. 
drive jack. See drive head jack. Long. 
drive jack (pipe) head extension. See drive-hammer extension. 
drive cap; driving cap. See drive head, b. Long. 
drive casing. Heavy, thick-walled casing, which is stronger than standard casing. Long. 
drive chain. The chain used to convey power and motion between the speed reducer of the drive unit and the head shaft on a drive chain. Long. 
drive chuck. Mechanism at lower end of a diamond-drill rod for connecting the head shaft by means of which the movements of the drive rod can be imparted to the drill string. Also called chuck. Long. 
drive coupling. A heavy coupling fitted on a chuck drill string to enable it to be used as a hammer to drive casing pipe. Nichols. Long. 
drive drill. a. A heavy, thick-walled pipe or casing against which the blow of a drive block is delivered when driving or striking pipes or casings. An oversize rod or casing coupling on which the blows of a drive block are delivered when casing is being driven or an attempt is being made to jar loose stuck casing or a drill-rod block. Long. b. Incorrectly used as a synonym for drive shoe; drive hammer. Long.
drive fit. 
drive gear; drive gears. a. The gear at the end of a diamond-drill motor drive shaft, which engages and rotates the diamond-drill swivel-head bevel gear; the latter in turn rotates the swivel-head drive rod. Long. b. Equipment used primarily in driving pipe or casing. Long. 
drive pulley. Applied to the pulley or drum driven through gearing by some source of power and which, through contract friction, drives a conveyor belt. Drive pulleys are frequently placed in tandem to provide a greater surface contact with the belting. The term driving rolls is also used for such pulleys. Jones. 
drive quill. a. The sleeve fitting around and imparting rotational movement to the drive rod in the swivel head of a diamond-drill machine. Long. b. A term sometimes incorrectly used as a synonym for drive rod. Long. 
driver. a. A person who drives a horse or mule in a mine. Fay. b. One who controls the movements of a locomotive motor car, or the like. Webster 2d. c. Eng. A bit of iron for forcing the wood into a baling hole. A tamping iron. Fay. d. Eng. A bit man who breaks down the coal in the state with hammers and wedges, after the hoisting is finished. A miner. Fay. 
driver boom. A person in charge of the drivers in a mine. See driver, a. Long.
drive rod. a. Threaded hollow shaft in the swivel head of a diamond-drill machine through which the energy supplied by the drill motor is imparted to the drill string. Also called drive spindle; spindle rod. Long. b. Synonym for jar rod. Long. 
drive rod bushing. A metal sleeve used to fill the annular space between a drill rod and the inside of the upper end of a drive rod or feed screw on the swivel head of a diamond-drill machine. The sleeve steadies the drill rod and reduces its tendency to wobble or vibrate inside the drive rod. Long. 
drive sample. A dry sample of soft rock material, such as clay, soil, sand, etc., obtained by forcing, without rotation, a short, tubular device into the formation being sampled by hydraulic pressure or the pindlever action of a drive hammer. Long. 
drive sampler. A short tubelike device designed to be forced, without rotation, into soft rock or rock material such as clay, sand, or gravel, by hydraulic pressure or the pindlever action of a drive hammer to procure samples of material in as nearly an undisturbed state as possible. Long. 
drive sampling. The act or process of obtaining dry samples of soft rock material by forcing, without rotation, a tubular device into the material being sampled by pressure generated hydraulically, mechanically, or by the pindlever action of a drive hammer. Long. 
drivescrew. The threaded drive rod in a gear-feed swivel head on a diamond drill. Long. 
drive section. That section of a belt conveyor which transmits power to the drive pulleys. In the case of frac tanks, the driving pulleys or rolls, and the gearing necessary for driving the pulleys. Jones. 
drive shaft. A heavy steel rod on which the drive and conveyor sprocket wheels or pulleys are mounted. This shaft is connected to the elevator sprocket or auger sprocket, sprocket wheel, gear, or other form of mechanical power transmission. ASA
drive shaft

MH 4-I-1958. b. A shaft used to support the end of a conveyor screw in a trough end. All conveyor screws have this driving connection between a conveyor screw and the power transmitting mechanism. ASA MH 4-1958.

drive. The arrangement of a casing wall sleeve or coupling of rolled, cast, or forced steel, not set with diamonds, attached to bottom end of drive pipe or casing to act as a cutting edge and protector for pipe or casing being driven into overburden or other rock material. Long. b. Incorrectly used as a synonym for casing shoe bit and/or pipe-shoe bit. Also called casing shoe, pipe shoe. Long. See also casing drive shoe; drivepipe shoe.

drive sleeve; driving sleeve. Synonym for drive hammer. Long.

drive spindles. Synonym for drive rod; drive sampler. Long.

drive unit. The mechanism which imparts drive to the driving cap; drive shoe. a. A sharp-edged, heavy wall drive wedge. A metal wedge, driven into a borehole, that acts as a fixed point on which the means of a deflection wedge may be set and oriented. Long.

driving arch. An auxiliary arch brick projecting from the general inner surface of the arched roof of a furnace, brick conduit or like structure. Dodd.

driving bolt. A method of breaking oversize stones left after quarry blasting. The balls weigh from 30 hundredweight to 2 tons (many use old cones from gyratory breakers) and are dropped from a crane on to the oversize stone. The drop height varies from about 20 to 33 feet. The method is economical and adds secondary blasting. Nelson.

drop. No. of Eng. A chute down which coal is run into keels or boats. Fay. d. To allow the upper lift of a seam of coal to fall or drop down. Fay. e. Eng. The quantity of coal brought down at one cutting. Fay. f. Scot. The portion of a mineral deposit which can be dropped down a shaft to a lower level. Fay. g. Scot. To work the upper portion of a thick seam after the lower portion has been worked. Fay. h. Scot. To stop work. Fay. i. The vertical displacement in a downthrow fault; the amount by which the head of a timber pile to prevent brooming from the cope or other overhanging section of the mold. ASM Gloss.

drop arch. An auxiliary brick arch projecting below the general inner surface of the arched roof of a furnace, brick conduit or like structure. Dodd.

drop bottom bucket. A bottom-opening container used for placing concrete. Ham.

drop-bottom cage. A cage so designed that the middle section of the floor drops a few inches when the cage is lifted from the keels. The mine car is thus kept stationary and secure. Nelson.

drop bottom. The driving mechanism of a belt conveyor. It consists of an electric motor or compressed-air turbine connected through an efficient, smooth reduction gearing to the drum or drums. Motion is imparted to the belt by the frictional grip between it and the drums. The whole unit is mounted in strong covers. Sinclair, V. p. 286.

driving belt. See driving cap. Ham.

driving on line. The keeping of a heading or breast accurately on a given course by means of a compass or transit. In Arkansas, called driving on sights. Fay.

dravings. See clipper. Ham.

drop. a. Large, funnel-shaped masses of rock hanging from the roof down into a coal seam. They usually occur in numbers, and are often arranged in rows in some general direction. They often have a flange on one side suggesting they are casts of hollows connected by a large crack. Slight bedding parallel to the sides and horizontal in the center gives the appearance of the hinges. Bore holes are drilled from quicksand running in, as in the case of infilled sandblows in many earthquake areas. Raitzick & Diller, p. 94. b. To lower the cage to receive or discharge the car when a cage of more than one deck is used. Fay.

c. No. of Eng. A chute down which coal is run into keels or boats. Fay. d. To allow the upper lift of a seam of coal to fall or drop down. Fay. e. Eng. The quantity of coal brought down at one cutting. Fay. f. Scot. The portion of a mineral deposit which can be dropped down a shaft to a lower level. Fay. g. Scot. To work the upper portion of a thick seam after the lower portion has been worked. Fay. h. Scot. To stop work. Fay. i. The vertical displacement in a downthrow fault; the amount by which the head of a timber pile to prevent brooming from the cope or other overhanging section of the mold. ASM Gloss.

drop chark. See prepared calcium carbonate.

drop check. A valve made to drop into the lower end of a working barrel of a lifting pump when, from any cause, the lower valve ceases to act and the upper device is underwater. Standard, 1964.

drop cut. The initial cut made in the floor of an open pit, for the purpose of developing a bench at a level below the floor. Bureau of Mines Staff.

drop doors. Feet. For forcing the bottom of the cupola furnace which drop down to allow the furnace to be cleaned. Merceus, 8th, p. 479.

dropping. c. No. of Eng. A chute down which coal is run into keels or boats. Fay. d. To allow the upper lift of a seam of coal to fall or drop down. Fay. e. Eng. The quantity of coal brought down at one cutting. Fay. f. Scot. The portion of a mineral deposit which can be dropped down a shaft to a lower level. Fay. g. Scot. To work the upper portion of a thick seam after the lower portion has been worked. Fay. h. Scot. To stop work. Fay. i. The vertical displacement in a downthrow fault; the amount by which the head of a timber pile to prevent brooming from the cope or other overhanging section of the mold. ASM Gloss.

dropping stones. a. A forging hammer that depends on gravity for its force. ASM Gloss. b. A pile driving hammer that is lifted by a cable and that obtains striking power by falling freely. Nichols. c. Synonym for drive hammer. Long.

drop gate. A timber which in an emergency can be dropped by a remote control across a mine track at the top or bottom of an incline to derail cars. Bureau of Mines.

drop of water. A rounded (waterworn), colorless, and transparent pebble of topaz. Schaller.

drop doors. See car runner; car dropper. D.O.T. 1.

drop hammer. Brick formed by dropping a clot or plug of a prepared mix considerable distance (approximately 15 feet) into a mold after which the extra material is slacked off the top. AISI, No. 24.

drop mold brick. Brick formed by automatically dropping a quantity of a prepared mix a considerable vertical distance into a mold. A.R.I.

drop mold brick. See drop machine brick. AISI, No. 24.

drop molding. The process of forming brick by dropping a clot or plug of a prepared mix a considerable distance (approximately 15 feet) into a mold after which the extra material is slacked off the top. AISI, No. 24.

drop penetration test. See dynamic penetration test. Ham.

dropping. Molding by heating in a mold without the use of pressure. ASTM C162-66.

dropping bottle. Laboratory reagent bottle so constructed as to deliver contents one drop at a time. Funnels and pipettes can be similarly equipped. Pryor, 3.

dropping pillars and top coal. Aust. The second working, consisting of drawing the pillars, and in thick seams breaking down the upper portion of the seam that was left temporarily in position. Fay.

dropping point. A test made on greases which will show their heat resisting qualities. Also called melting point. AISI, No. 24.

droppings. Drops of water falling from the roof into a gangway or breast. Korsm.

drop pit. A shaft in a mine, in which coal is lowered by a brake wheel. Fay.

droop shot. A drop shaft of 12 inches or more in a line of sluices which are formed by allowing the discharge end of one box to rest on the floor of the succeeding sluice, instead of telescoping into it. This method insures a drop of 12 inches or more (depending on the depth of the sluice box) at the end of each sluice, which usually is sufficient to disintegrate fairly stiff clay. Griffith, S. F., p. 61.

drop shaft. A monkey shaft down which earth and other matter are lowered by means of a drop (that is, a kind of pulley with brake attached); the empty bucket is brought up as the full one is lowered. Zern.

drop shaft method. This sinking system consists in the use of a cutting shoe on the bottom of a shaft lining which is being continually augmented as the shoe descends, the material inside the lining being excavated. Sinclair, II, p. 299.

drop sheet. N. of Eng. A door made of canvas, by which the ventilating current is regulated and directed through the whole ventilation current. Fay.

drop shot. Shot made by dropping or pouring melted sulfur into water. Standard, 1964. c. The scum that forms on the surface of molten metals largely because of oxidation but sometimes because of its being admixed with too much water. Long. b. To flood or mix with an excessive amount of water. Long.

drowned; drowned out. Flooded; said of mines underwater. Fay.

drowned coast. See shoreline of submergence. Schieferdecker.

drowned level. A level that is underwater. Hess. See also blind level, c. Fay. b. Part of a drainage drift which, being below both discharge and entry levels, is constantly full of water. Also called inverted siphon. B. S. 3618, 1963, sec. 4.

drowned valleys. Valleys of a dissected land surface, the lower parts of which have been inundated by the sea as a result of submergence of the land margin. A. G. I.

drowned waste. Old workings full of water. Fay.

druggon. 5. Staff. A square iron or wooden box, used for conveying fresh water for horses, etc., in a mine. Fay.

drudical stone. Synonym for graywether. A. G. C.

drud stones. Eng. Saren stones, so called because used in Stonehenge and other supposed Druid temples and circles. Arkell.

drum. a. The large cylinder or cone on which the rope is coiled when hoisting a load up a shaft. b. A cylindrical or polygonal rim of wheel around which cable, chain, belt, or other linkage may be wrapped. A drum may be driven or driving. The face may be smooth, grooved, fluted, or flanged. ASA MH4.1-1958. c. Eng. In the Lancashire coalfield, a brick, iron, or wooden cylinder, used when sinking a shaft through sand. Fay. d. See running the drum. Fay. e. A metal case for shipment of oil, gasoline, etc. Fay. f. The spool-like part of a hoisting mechanism on which the cable or wire line is wound. Long. g. A drum for holding a liquid capacity of 55 gallons. See also barrel. d. Long. h. In a conical mill, the cylindrical central projection. Pryor, 3, i. Winding drum used to hold cages and skips through mine shafts. Pryor, 3. j. A general term for a roller around which a belt or conveyor is lapped. It may be a driving, jib-, loop-, tension-, or a holding-down drum. Nelson. k. See haulage drum; winding drum. Nelson. l. Term sometimes applied to the mouth of a port in a glass-tank furnace. Dodd. m. A wooden former of the type that was used in making the side of a sagger by hand. Dodd.

drum curb. See curb, c. Hess.

drum counterweight rope. Balance rope direct from drum drive. Ham.

drum filter. Cylindrical drum, which rotates slowly through trough-shaped bath fed continuously, or intermittently at one or more purl. Segments of drums are successively connected to vacuum tank, low-pressure compressed air, etc., to consolidate and discharge of filter cake and removal of filtrate. Pryor, 3.

drum gate. Spillway gate, in the shape of a sector of a circle, which is opened or closed by means of valves arranged to admit or release water. Ham.

drum head. N. of Eng. A short heading formed by the rise of a level, or bank head, in which the working area is being driven in a direction parallel to the inclined plane is fixed. Fay.

drum-head process. A process used in Europe for the shaping of flattwars; it was developed on account of the shortness of the flatdaspeth porcelain body. A slice of the pugged body is placed on a detachable drum-head which fits on the battling-out machine. The drum-head, with the shaped disk lying on it, is then removed and inverted over the jigger-head, the bat then being allowed to fall on the mold for its final jiggering. Dodd.

drum horns. Wrought-iron arms or spokes projecting beyond the surface or periphery of stope drums, between which the rope coil or lap. Fay.

drumlin. Oval-shaped hill composed of glacial drift, with its long axis parallel to the direction of movement of a former ice sheet. Mather.

drumman. See slope engineer. D.0.T. 1.

drumming. The process of sounding the roof of a mine to discover whether rock is loose. Fay.

drummy. a. Loose coal or rock that produces a hollow, loose, open, weak, or dangerous sound when tapped with any hard substance to test condition of strata with especial care of a mine roof. Fay; B.C.I. b. The sound elicited when bad (loose) roof is capped. Fay.

drum or drop shaft. See caisson sinking. Nelson.

drum pulley. A pulley wheel used in place of a drum. See also Koepe system. Fay.

drum rings. Cast-iron wheels, with projections, to which are bolted the staves or laggings forming the surface for the hoisting cable to wind upon. The outside rings are flanged, to prevent the cable from slipping off the drum. Abel.

drum runner. See incline man. D.0.T. 1.

drum screen. A screen in the shape of a cylinder or truncated cone, turning on its own axis, used in sewage treatment. Ham.

drum separator. A slowly rotating cylindrical vessel which separates run-of-mine drums, between which the meat is wound.

drum separator. A slowly rotating cylindrical vessel which separates run-of-mine coal into clean coal, middlings, and refuse. It consists of different and adjustable specific gravities. The low gravity medium in one compartment separates a primary float product (clean coal), the sink material being lifted and sluiced into the second compartment where middlings and true sinks (stone) are separated. Nelson.

drum shaft; drop shaft. See caisson sinking. Nelson.

drum. a. A cavity lined with crystals, particularly if a rather small cavity; it may be in a vein or rock, such as a small solution cavity, a steam hole in lava, or a lithophysa in volcanic glass; in mining, it is known as a vug, especially the larger ones; it is not a gossan, which is a hollow nodular concretion that can be separated from the enclosing rock. Hess. b. The crust of crystals lining a small cavity in a rock. Hess.

drury. a. Cavities in mineralized veins or lodes. Nelson. b. Covered with minute crys-
dry

**dry castings.** A method of casting in which the mold is made of sand and afterwards dried. Fay.

**dry cell.** A primary cell which does away with the liquid electrolyte so that it may be used in any position. Crispin.

**dry cleaned coal.** Coal from which impurities have been removed, locally without the use of liquid media. B.S. 3323, 1960.

**dry cleaning.** The cleaning of coal or ore by air currents and agitation to a layer of feed of controlled depth on the table surface. B.S. 3352, 1962. See also Kirkup table. Nelson.

**dry cleaning table.** An apparatus in which drycleaning is achieved by the application of air currents and agitation to a layer of feed of controlled depth on the table surface. ASTM D121-62. See also Kirkup table.

**dry-coal.** Coal containing but little hydrogen. Fay.

**dry copper.** Undercooled copper from which oxygen has been insufficiently removed when refining, so that it is undextragil britle when worked cold or hot. Pryor, 3.

**dry coke.** A laboratory term applied to coke which has been dried to constant weight in accordance with definite prescriptive methods. In the case of lump coke, the temperature shall be not less than 104° C., nor more than 200° C; in the case of coke passing a 250-micron (No. 60) sieve, the temperature shall be not less than 104° C., nor more than 105° C. for a period of 1 hour. ASTM D121-62.

**dry criticality.** Reactor criticality achieved without a coolant. L&L.

**dry-cyaniding.** Same as carbonitriding. ASTM.

**dry density.** The weight of a unit volume of dry sample of soil, after the latter has been heated at a temperature of 105° C. ASTM.

**dry density/moisture ratio.** The relationship between the density of a sample of soil in a dry state and its moisture content for a given degree of compaction. Such relationship can be determined from a curve which will reveal the optimum moisture content. Fay.

**dry digging.** a. Placers not subject to overwashing, where water currents have been removed and which has been dried and its moisture content determined from a curve which will reveal the optimum moisture content. A.C.S.G., 1963.

**dry distillation.** See destructive distillation. Fay.

**dry dock.** A dock into which a ship is waterborne. After the dock gates have been closed, the water is pumped out of the dock, allowing the ship to rest on keel blocks in readiness for maintenance and repairs to hull and superstructure. See also graving dock. Ham.

**dry drilling.** Drilling operations in which the cuttings are lifted away from the bit and transported out of a borehole by a strong current of air or gas instead of a fluid. Long.

**dry drier.** Compressed-air drill which traps and removes drilling dust instead of sludging it with added water. Pryor, 3.

**dry evaporation.** A condition often appearing in wires and may be caused by shock loads in winding. These shock loads are produced by picking up the cage from the pit bottom with slack chains or by lifting heavy pithead gates or covers. Sinclair, V., pp. 12-13.

**dry fines.** The fineness of a sample of foundry sand from which the clay has not been removed and which has been dried at 105° to 110° C. Osborn.

**dry-ink.** Ware with no glaze on the foot. A.C.S.G., 1963.

**dry friction damping.** See cumboll damping. Fay.

**dry gage.** See drag ladle. ASTM C162-66.

**dry galvanizing.** A process in which steel is fluxed in hot ammonium chloride and subsequently dried by hot air before being passed through a bath of molten zinc. Ham.

**dry gas.** A natural gas consisting principally of methane (CH₄) and ethane (C₂H₆), and devoid of the heavier hydrocarbons. Usually produced from a natural gas field that does not contain petroleum or condensate. Also applied to gas that has been produced and from which liquid components have been removed. A.C.G.T.

**dry grinding.** Any process of particle size reduction carried on without the use of liquid media. Enamel frits for the dry process industry are ground dry, whereas water millings, containing clay and other additions, are used in the wet process. Enam. D.14.

**dry hole.** a. A drill hole in which no water is used for drilling, as a hole driven upward. Standard, 1964. b. A well in which no oil or gas is found. Fay. c. Blasting hole driven without use of dust-allaying water. Pryor, 3.

**dry hole contribution.** a. Payment, by someone not financially interested in an oil lease, to aid in the drilling of a test well, that is due whenever a specified depth is reached without the use of water in paying quantity. Benefit is derived from the geologic information so obtained. A.C.S.G., Supp. b. Cash contribution usually on a footage basis in support of a test well payable if venture is a dry hole. Wheeler.

**dry house.** An artificial room in which the sharpening crystals or grains are so blended with the bond that good results can be obtained without the use of lubricants. Fay.

**dry house.** See changehouse. b. Long.

**dry ice.** Solid carbon dioxide. Pryor, 3.

**dry ice test.** A test for the detection of glass inclusions. If a crystalline substance such as a gem mineral be placed in contact upon a piece of dry ice (solidified carbon dioxide, CO₂), a squeaking noise can be heard. This is not true of noncrystalline substances, such as glass and plastic. Ship.

**dry iced.** A. The removal of water from ores, concentrates, or fluxes and in some cases from air by heat. Drying of solid material is commonly accomplished by bringing the hot solids in direct contact with hot air or gases and exposing them to drying by heating. B.P. 5787. Removal by evaporation,

drying cream. A defect characterized by a film or a porcelain enamel bisque. ACSG, 1983.

drying-machine operator. One who dries new or remolded ware or greenware in the process of drying ware in drying machines. Also called dryer man; pot drier. D.O.T. I.

drying off. The process by which an amalgam of gold is evaporated, as in gilding. Fay.

drying shrinkage. a. The shrinkage of concrete caused by evaporation. More precisely, it is the difference between the length of a specimen cut from concrete, which has been matured and subsequently saturated, and its length when dried to constant length, the shrinkage being expressed as a percentage of the dry length. Taylor, b. Ceramic ware (and particularly clayware) that is shaped from a moist batch shrinks during drying; the drying shrinkage is usually expressed as a linear percentage, for example, the drying shrinkage of china clay is usually 6 to 10 percent, that of a plastic ball clay is 9 to 12 percent. To produce ware (for example, electroceramic or refractory bricks) of high dimensional accuracy, the drying and firing shrinkages must be low; this is achieved by varying the proportion of raw clay and increasing the proportion of nonplastic material in the batch, which is then shaped by dry molding, for example. Dodd.

drying-tunnel man. One who tends a number of drying tunnels in which moist brick and tile products are dried several hours or as much as 2 or 3 days prior to their being baked. Also called drying-room man; drying-pan operator. D.O.T. I.

dry joint. Positive separation at the plane of contact between adjacent structural components to allow relative movement resulting from differences in temperature or shrinkage. Ham. b. One made without gasket, packing, or smear of any kind, as a ground joint. Stock. 3.

dry kraft cooling power. A measure of the rate of heat loss from the bulb of the kraft thermometer. Although the cooling power as obtained by this instrument is not a measure of the capacity of an atmosphere to cool the human body, nevertheless, it is useful for comparing different atmospheres and provides a convenient index of the comfort condition of a working place in a mine. Experience indicates that a face will be relatively comfortable for working if the dry kraft cooling power is above 7 and the air velocity above 200 feet per minute. See also effective temperature. Nelson.

dry kiln. A kiln used to dry greenware at lowest possible heat. ACSG, 1963.

dry-kiln burner. See kiln burner. D.O.T. I.

dry-mill operator. See drying-tunnel man. D.O.T. I.

drymaw. A man in charge of the building in which the clay is dried before use. Fay. See also changehouse man. D.O.T. I.

dry-milled fire clay. Fire clay ground in a dry pan and passed over a screen. Bureau of Mines Staff.

dry mill man. See dry-pan operator. D.O.T. I.

dry mineral matter free basis. An analysis expressed on the basis of a coal sample from which the total moisture and the mineral matter have in theory been removed. B.S. 3322, 1960.

dry mixing. In dry mixing every effort is made to prevent the ventilating air picking up moisture, and throughout the ventilation circuit there is a wide range between wet- and dry-bulb temperatures. Dry-bulb temperatures are therefore comparatively high. Spalding.

dry mix. a. A mix containing little water in relation to its other components. Taylor, b. See dry process. ASTM C242-60T.

dry ores. A slime given at lead and copper smelters to ores which contain precious metals (gold and silver) but insufficient lead or copper to be smelted without the addition of richer lead or copper ores. Newton, Joseph. Introduction to Metallurgy, 1936. pp. 205-207. See also natural ore.

dry pack. Concrete or mortar which is just dry enough to be consolidated only by heavy ramming. Taylor.

dry pan. A pan-type grinding machine, equipped with heavy steel rollers or millstones which do the grinding, and having sloped plates in the bottom through which the ground material passes out. HW.

dry-pan charger. One who assists dry-pan operator by dumping dry shale, clay, or other dry material in the dry-pan mullers which do the grinding, and having the metal. See also wet process. Fay. b. A type of building brick (the moisture content for pressing is in this case 19 to 20 percent), and many articles in the electroceramic industry. The process is also sometimes referred to as semi-dry pressing. Dodd.

dry process; dry mix. a. A method of treating ores by heat as in smelting; used in opposition to wet process where the ore is brought into solution before extraction of the metal. See also wet process. Fay. b. The process of making Portland cement, in which the raw materials are ground and dried. Dry process cement contains less water (5 to 6 percent) or, with some materials, eliminated by the use of a plasticizer, for example, a stearate. Dry pressing is used in the shaping of wall and floor tiles (when it is often referred to as dust pressing), most high-grade refractories, abrasive wheels, the Fletton type of building brick (the moisture content for pressing is in this case 19 to 20 percent), and many articles in the electroceramic industry. The process is also sometimes referred to as semi-dry pressing. Dodd.

dry-pressing. The shaping of ceramic ware under high pressure (up to 14,000 pounds per square inch), the moisture addition being kept to a minimum (5 to 6 percent) or, with some materials, eliminated by the use of a plasticizer, for example, a stearate. Dry pressing is used in the shaping of wall and floor tiles (when it is often referred to as dust pressing), most high-grade refractories, abrasive wheels, the Fletton type of building brick (the moisture content for pressing is in this case 19 to 20 percent), and many articles in the electroceramic industry. The process is also sometimes referred to as semi-dry pressing. Dodd.

dry-pressing. The shaping of ceramic ware under high pressure (up to 14,000 pounds per square inch), the moisture addition being kept to a minimum (5 to 6 percent). See also wet process. Fay. b. The process of making Portland cement, in which the raw materials are ground and dried. Dry process cement contains less water (5 to 6 percent) or, with some materials, eliminated by the use of a plasticizer, for example, a stearate. Dry pressing is used in the shaping of wall and floor tiles (when it is often referred to as dust pressing), most high-grade refractories, abrasive wheels, the Fletton type of building brick (the moisture content for pressing is in this case 19 to 20 percent), and many articles in the electroceramic industry. The process is also sometimes referred to as semi-dry pressing. Dodd.

dry-pressed brick. Brick formed in molds under high pressures from relatively dry clay (5 to 7 percent moisture content). ACSG, 1963.

dry-puddling. The shaping of ceramic ware under high pressure (up to 14,000 pounds per square inch), the moisture addition being kept to a minimum (5 to 6 percent). See also wet process. Fay. b. The process of making Portland cement, in which the raw materials are ground and dried. Dry process cement contains less water (5 to 6 percent) or, with some materials, eliminated by the use of a plasticizer, for example, a stearate. Dry pressing is used in the shaping of wall and floor tiles (when it is often referred to as dust pressing), most high-grade refractories, abrasive wheels, the Fletton type of building brick (the moisture content for pressing is in this case 19 to 20 percent), and many articles in the electroceramic industry. The process is also sometimes referred to as semi-dry pressing. Dodd.

dry press. A mechanical press for forming brick from slightly moistened granular material. A.R.I.

dry-pressed brick. Brick formed in molds under high pressure from relatively dry clay (5 to 7 percent moisture content). ACSG, 1963.

dry pressure. A pressure of 10 atmospheres.

dry return. A condensate line in a steam heating system carrying both water and air, usually located above the boiler water.
dry return

line. Strock, 10.
dry rods. Scots. Pump rods outside the de-

cylinder. Fay. dry rot. A rapid decay of timber which
causes its substance to be reduced to a fine
powder. Fay.
dry rotary drilling. See dry drilling. Long.
dry-rubbing test. A test to determine the
degree of attack of a vitreous enameled
sample by acid resistance test. Dodd.
dry rubble. Rough stone laid into a wall
without mortar. Crispin.
dry running. To unknowingly or knowingly
charge a machine. Fay.
dry-rubbing test. A test to determine the
weight of soil solids.

dry unit weight. The weight of soil solids
per unit of total volume of soil mass. Also
defined as density. ASCE PI
dry wall. A rock wall set up without ce-
mortar. Crispin.
dry sample. A sample obtained by drilling
procedures in which water or other fluid is
not circulated through the drill string and sampling device; hence the in situ charac-
teristics of the sample have not been altered by
being mixed with water or other fluid. C286-66.
dry-sample barrel. Short, tubular devices used
to obtain dry samples of soil and other
soft rock material. See also dry sample.
dry sampler. a. Various auger and/or tubu-
lar devices designed to obtain unwetted
samples of soft rock material, such as clay,
sand, soil, etc., by drilling procedures
wherein water or other fluid is not circu-
lated through the drill string and sampling
device. Compare dry sampler. Long. b. A person skilled in the
art of dry sampling. Long.
dry sample process. The process of obtain-
ing dry samples of soft rock material with
various auger or tubular devices utilizing
dry drilling techniques. See also dry sample;
dry sampler. Long.
dry sand. a. A stratum of dry sand or sand-
stone composed of wind-ripened sand. A non-
productive sandstone in oilfields. Fay. b. Green sand dried in an oven to remove
moisture and strengthen it (a dried-sand
mold is a mold of green sand which is
used as above). Freeman.
dry sand mold. A mold made of sand and
then dried. ASME Gloss.
dry screening. The screening of solid ma-
terials of different sizes without the aid of
water. B.S. 3532, 1962.
dry season. In tropics, period characterized
by low rainfall. Pryor, 3.
dry separation. The elimination of the small
pieces of shale, pyrite, etc., from coal by a
process of separation in which part of the
material is not important, but variations
thickness are not important, but variations
in the two determines the average thickness
of the shell. Local incidental variations in
accurate. Sand, treated with the bind-
er! by a transverse 'strength tc.i. Dodd.
dry strength. See dry strength. Fay.
ts of steel have no chance to fill the pores
of the stone. Sandstone and coarse gritted
stone are good examples. Fay.
dry spalling. A defect of a cast-iron piece
manufactured by itself in the fired porcelain
core. A rough, sandy texture. ASTM
C86-66.
dry steam coal. Coal of rank just below an-
dry steam coal. the core of stones not cementsed
with mortar, as a drystone wall. Fay.
dry strength. The mechanical strength of a
coal, which has been shaped and dried
but not fired. It is commonly mea-
sured by a transverse strength test. Dodd.
dry-stone masonry. Masonry in which the
blister copper is expected to long oxidizing
duck-nest tuyere

dual haulage. In strip mining, the use of two
haulage at the same mine for
transporting coal from the face to the prepara-
tion plant. Usually, coal is transported
from the loading shovel to a transfer sta-
tion at the motorized unit, and rail haulage
is used to haul the coal from this point to the
preparation plant. "Annu. R. I. 3416, 1938,
p. 19.
dualin. A variety of dynamite consisting of
4 to 5 parts nitroglycerin, 3 parts sawdust,
and 2 parts potassium nitrate. Webster 2d.
dual-purpose reactor. A nuclear reactor de-
signed to achieve two purposes; for ex-
ample, to produce both electricity and fission-
able material. LSL.
dual rope. York. A hemp capstan rope,
available in black, buff, or color.
dual setting. See double setting. B.S. 3618,
1963, sec. 1.
dubbers. Corn. In clay mining, men who
keep the strakes or guillres clear. Hess.
Dubb's asphalt. See sulfurized asphalt. Ben-
nett 24, 1962.
Duchчин's formula. The wind pressure per
square foot (N) on an inclined surface is
L

N = 2 sin a

wherein water or other fluid is not circu-
lated through the drill string and
procedures in which water or other fluid is
handled by normal core-blowing equip-
ment. Such a mixture can be
premixed by sand and a special oil which serves
to prevent clogging of the blow-
der. Hess.
duck. A fabric material, usually of woven

fiber, but of synthetic fibers also, used to
construct conveyor belts and filter clothes.
Pryor, 3. Duck is manufactured in several
strengths, expressed in terms of weight, as
28 oz. duck etc., which is the weight of a
linear yard of 42-inch-wide fabric. Gener-
ally increased longitudinal strength is pro-
voked by having a heavier yarn and greater
count in the longitudinal warp threads than
the transverse filler threads. ASA
M2-1928.
duckbill. The name given to a shaking-type
combination loading and conveying de-
vice, so named from the shape of its load-
ing end which generally receives its
motion from the shaking conveyor to which it is
attached. B.C.I.
duckbill loader. See shaker-shovel loader.
Nelson.
duckbill operator. In bituminous coal mining,
the man who operates a small power shovel
that has a round-nosed scoop, called a
duckbill, to load coal into cars in a mine.
D.O.T.
duckbill pick. A duckbill-shaped coal-cutter
pick which is forged by the roller type of
machine from dies and is the type largely
used today. The machine shaping the
pick ensures uniformity. It gives a constant
clearance as the point wears down and is
particularly suitable for fused-cartridge tip-
ning. Nelson.
duckfeet. A pipe bend at the bottom of a
shaft column or rising main fitted with a
horizontal base sufficiently strong for the
weight of the rising main to rest upon it.
Also called duckfoot bend. B.S. 3618, 1963,
sec. 4.
duckfoot bend. See duckfoot. B.S. 3618, 1963,
sec. 4.
duck machine. A. An arrangement of two boxes,
one working within the other, for forcing
air through mines. Zern.
duck’s-nest tuyere. One having a capping
ducktownite. A term used in Tennessee for ductile iron, which is a type of iron that is used as a substitute for cast iron. It is known for its ability to be easily cast and machined. Ducktown is the name of a town in Tennessee where this type of iron was produced.

Ductile iron. A type of iron that is used in the production of cast iron. It is known for its ability to be easily cast and machined, and is often used in the production of cast iron. Ductile iron is produced by adding graphite to the iron, which results in a more uniform structure and improved mechanical properties.

Ductile iron. A type of iron that is used in the production of cast iron. It is known for its ability to be easily cast and machined, and is often used in the production of cast iron. Ductile iron is produced by adding graphite to the iron, which results in a more uniform structure and improved mechanical properties.

Ductile iron. A type of iron that is used in the production of cast iron. It is known for its ability to be easily cast and machined, and is often used in the production of cast iron. Ductile iron is produced by adding graphite to the iron, which results in a more uniform structure and improved mechanical properties.

Ductile iron. A type of iron that is used in the production of cast iron. It is known for its ability to be easily cast and machined, and is often used in the production of cast iron. Ductile iron is produced by adding graphite to the iron, which results in a more uniform structure and improved mechanical properties.

Ductile iron. A type of iron that is used in the production of cast iron. It is known for its ability to be easily cast and machined, and is often used in the production of cast iron. Ductile iron is produced by adding graphite to the iron, which results in a more uniform structure and improved mechanical properties.

Ductile iron. A type of iron that is used in the production of cast iron. It is known for its ability to be easily cast and machined, and is often used in the production of cast iron. Ductile iron is produced by adding graphite to the iron, which results in a more uniform structure and improved mechanical properties.
duplex pump

side and geared so that the piston strokes in the cylinders alternate. Such a pump may be either single or double action, depending on the number and placement of intake and discharge valves on the cylinders, or designed so as to deliver a low volume of liquid at high pressures. Compare centrifugal pump; rotary pump; triple pump. Long.

dumping. A mass of ground left undisturbed until the final stages of excavation, when it is removed. In the intermediate stages it may be used as a support for timbering to the excavation. Ham.

dump moraine. A kind of terminal moraine consisting of material dropped either from the surface or from the interior of the glacier. Standard, 1964.

dump motor. In bituminous coal mining, one who operates a mine locomotive (motor) to haul cars of dirt, rock, slate, or other refuse to the dump at the surface of an underground mine. Also called dirt-dump engineer; refuse engineer. D.O.T. 1.

dump room. See available for disposing of waste from a mine. Bureau of Mines Staff.

dump skip. A skip with an attachment that dumps automatically. Fay.

dump truck. A truck or semitrailer that carries a box body with a mechanism for discharging its contents at its destination. Fay.

dump wagon. A large-capacity side-, bottom- or end-discharge wagon (or skip) on wheels, used by a crawler track; usually tractor towed. Nelson.

dumpy level. A surveyor's level with a short movement in a horizontal plane. Webster.

duns. Glouc. Argillaceous shale. See also clift, a; bind, a. Fay.

dunt; dunting. A crack, or the formation of cracks (with or without a fine dust in the interstices), in waste that has been cooled too rapidly after it has been fired. Dodd.

dunted. Said of ware which cracks after firing in the biscuit oven. C.T.D.

dunting. See dunt. Dodd.

duo mill. A mill used in the manufacture of seamless steel tubes. It consists of a number of stands, each containing one pair of rolls. The rolls have a semicircular groove cut in each; the size of these grooves diminishes as the tube passes from one stand to the next and thus gives the required reduction. Successive roll axes are set at 90° in order to roll out any fins which may be formed. The whole series of rolls is driven through gearing from one main motor. Osborne.

duo mill. A mill used in the manufacture of seamless steel tubes. It consists of a number of stands, each containing one pair of rolls. The rolls have a semicircular groove cut in each; the size of these grooves diminishes as the tube passes from one stand to the next and thus gives the required reduction. Successive roll axes are set at 90° in order to roll out any fins which may be formed. The whole series of rolls is driven through gearing from one main motor. Osborne.

Successive roll axes are set at 90° in order to roll out any fins which may be formed. The whole series of rolls is driven through gearing from one main motor. Osborne.
Durain. The term was introduced by M. C. Duporthite. A fibrous, hydrous magnesium-durangite. An orange-red, duralumin. An aluminum-base alloy containing durite. In 1955, the Nomenclature Subcommit-tee of the International Committee for Coal Petrology resolved to use this term for the microlithotype consisting principally of the following groups of macerals: inertinite, exinite, semifusinite, and involutinite. Duritic contains at least 95 percent inertinite and exinite. The proportions of these two groups of macerals may vary widely, but each must be greater than the proportion of vitrinite and neither must exceed 95 percent. Durite E and durite I contain durite rich in exinite and inertinite, respectively. It is found in many coals in a fairly thick band or vertically in durains and the durtier type of clarodurain, generally common. IHCP, 1963, part I.

Durville process. A casting process that involves rigid attachment of the mold in an inverted position above the crucible. The mold is poured by tilting the entire assembly, causing the metal to flow along a connecting launder and down the side of the mold. ASTM. 

dusserite. A member of the jarosite group, BaFe$_2$(AlO$_4$)$_3$(OH)$_3$.  

Dust collecting buckets. Portable buckets are supported by the U.S. Bureau of Mines for overhead drilling operations using fluted augers. The unit consists of a collecting bucket, a hanger assembly, and a power hoist. The auger is placed through the bucket and the unit is held to the mine roof by the hanger assembly. The bucket, when full, provides a discharge line between the bucket and the mine roof. The bucket can be disassembled easily after each operation and the auger is returned to the auger hoist.  

Dust collection. Removal of atmosphere dust particles from the air by physical and chemical means.
dust collection

of mill or from transfer points where dust is thrown up. Partially closed ventilating systems are used, which incorporate bag filters, cyclones, dust collectors, and spray towers. Pryor, 3.

dust collector. An apparatus for separating solid particles from gas or dust laden air and accummulating them in a form convenient for handling. B.S. 3552, 1962. Used in conjunction with local-exhaust systems for auxiliary ventilation and for this purpose is occasionally mounted directly on loading and unloading machines. Also used for cleaning recirculated air in the main ventilation system. It removes contaminants of the particulate type from an air stream before discharge into the main atmosphere. It is designed to clean the air of dusts, smoke, mists, fumes, pollen, etc., but is employed in mining mainly for dusts. Hartman, p. 67. See also velocity reducing collector; fabric-type dust collector; dust catcher; dust trap. Nelson.

dust consolidation. The binding of coal dust on roadway surfaces to prevent it becoming airborne by any disturbance. One method is to spread calcium chloride over the dust so that it absorbs water and forms a paste which does not rise into suspension when men travel on the roadway. See also stone dust. Nelson.

dust counter. A portable apparatus (as the Kolotz luminiferous tube, etc.) used to measure dust concentration in a mine or mill, as a health precaution. Pryor, 3.

dust counting microscope. The microscope is especially equipped and adjusted for the quantitative analysis of dust samples. Typical models magnify 100 times and include a substage lamp for correct illumination and counting cells to hold samples. Also available are microscopes with sampling pumps and sample slides all combined in one assembly. Useful for quick, on-the-spot surveys or for tentative checking of exhaust removals. Bests, p. 570.

dust devil. A small whirlwind containing sand or dust seen especially in tropical deserts. Also dust whirl. Webster 3d. See also dust storm. Fay.

duster. a. In Wales, a man employed in cleaning tramways of dust and dirt in and about mining areas. An underground borehole drilled in the hope of discovering economically useful amounts of water, mineral, oil, or gas. Long d. A drill crew member who-drifts from job to job and stays at any one place for such a short period of time that the dust kicked up by his feet when he first started to work has hardly settled before he quits and drifts on to another Mining job. Compare boomer; drifter. Long d. See also dust storm. Brantly, 2.

dusting. An explosion which consists of a sudden pressure rise caused by the very rapid combustion of airborne dust. Ignition of suspensions of combustible dusts can occur in the following ways: (1) initiation by flame or spark, (2) propagation by a gas explosion or blasting, (3) transportation of hot dust. Little is known about the last-mentioned mechanism, which is relatively rare in mines. The most frequent causes of coal mine explosions in the United States today are electric arcs, open flames, and exothermic reactions. Bests, pp. 46-49. See also dust explosion.

dust extraction. The removal of solid particulates suspended in gas or ambient air. B.S. 3552, 1962.

dust extractor. An appliance to collect or precipitate dusts. Dust extraction is often necessary at coal-preparation plants, loading stations, and also underground. The appliance may be a cyclone, fabric filter, spray tower, scrubber, or an electrostatic separator. See also dust precipitator; dust trap. Nelson.

dust firing. The burning of coal dust in the laboratory of the furnace. Fay.

dust-free conditions. In Great Britain, the arbitrary standards laid down by the National Coal Board in 1949 as representing comparative dust-free conditions in coal mines. These are as follows: stone dust, 450 particles per cubic centimeter (size range, 0.5 to 5.0 microns); anthracite, 650 particles per cubic centimeter (size range, 1 to 5 microns); and coal, 850 particles per cubic centimeter (size range, 1 to 5 microns).

dust gold. Pieces of gold under 2 to 3 pennyweights; very fine gold. Fay.

dust hopped. Refers to the discomforts that may result from constant exposure to dust, particularly those of a siliceous nature. Enam. Dist.

dust hood. a. A cover for any receptacle (for example, bunker) or apparatus (for example, screens) designed to prevent the escape of dustaceous fall, 1962 b. The flared inlet end of a system of trunking erected to remove dust by air suction to a point where it can be collected. B.S. 3552, 1962.

dust hopper. A hopper placed underneath the scraper, tamping roller, or other belt cleaner, to collect the dust and dirt as it is removed from the belt; any tank or vessel to receive and retain dust. Nelson.

dusting. a. Spontaneous falling to a powder, so that a quantity of dust, an extender in the preparation of inorganic vitreous enamel slip after it has dried, prepared to firing. Dodd d. In dry-process vitreous enamelling, synonym for dredging. Dodd c. In wet-process vitreous enamelling, a defect occurring in the alpha crystal form. Sometimes erroneously called slaking. A.R.I.

dust devil. A small whirlwind containing sand or dust seen especially in tropical deserts. Also dust whirl. Webster 3d. See also dust storm. Brantly, 2.

dust gold. Pieces of gold under 2 to 3 pennyweights; very fine gold. Fay.

dust hopped. Refers to the discomforts that may result from constant exposure to dust, particularly those of a siliceous nature. Enam. Dist.

dust hood. a. A cover for any receptacle (for example, bunker) or apparatus (for example, screens) designed to prevent the escape of dustaceous fall, 1962 b. The flared inlet end of a system of trunking erected to remove dust by air suction to a point where it can be collected. B.S. 3552, 1962.

dust hopper. A hopper placed underneath the scraper, tamping roller, or other belt cleaner, to collect the dust and dirt as it is removed from the belt; any tank or vessel to receive and retain dust. Nelson.

dusting. a. Spontaneous falling to a powder, so that a quantity of dust, an extender in the preparation of inorganic vitreous enamel slip after it has dried, prepared to firing. Dodd d. In dry-process vitreous enamelling, synonym for dredging. Dodd c. In wet-process vitreous enamelling, a defect occurring in the alpha crystal form. Sometimes erroneously called slaking. A.R.I.

dust devil. A small whirlwind containing sand or dust seen especially in tropical deserts. Also dust whirl. Webster 3d. See also dust storm. Brantly, 2.

dust gold. Pieces of gold under 2 to 3 pennyweights; very fine gold. Fay.

dust hopped. Refers to the discomforts that may result from constant exposure to dust, particularly those of a siliceous nature. Enam. Dist.

dust hood. a. A cover for any receptacle (for example, bunker) or apparatus (for example, screens) designed to prevent the escape of dustaceous fall, 1962 b. The flared inlet end of a system of trunking erected to remove dust by air suction to a point where it can be collected. B.S. 3552, 1962.

dust hopper. A hopper placed underneath the scraper, tamping roller, or other belt cleaner, to collect the dust and dirt as it is removed from the belt; any tank or vessel to receive and retain dust. Nelson.

dusting. a. Spontaneous falling to a powder, so that a quantity of dust, an extender in the preparation of inorganic vitreous enamel slip after it has dried, prepared to firing. Dodd d. In dry-process vitreous enamelling, synonym for dredging. Dodd c. In wet-process vitreous enamelling, a defect occurring in the alpha crystal form. Sometimes erroneously called slaking. A.R.I.

dust devil. A small whirlwind containing sand or dust seen especially in tropical deserts. Also dust whirl. Webster 3d. See also dust storm. Brantly, 2.

dust gold. Pieces of gold under 2 to 3 pennyweights; very fine gold. Fay.

dust hopped. Refers to the discomforts that may result from constant exposure to dust, particularly those of a siliceous nature. Enam. Dist.

dust hood. a. A cover for any receptacle (for example, bunker) or apparatus (for example, screens) designed to prevent the escape of dustaceous fall, 1962 b. The flared inlet end of a system of trunking erected to remove dust by air suction to a point where it can be collected. B.S. 3552, 1962.

dust hopper. A hopper placed underneath the scraper, tamping roller, or other belt cleaner, to collect the dust and dirt as it is removed from the belt; any tank or vessel to receive and retain dust. Nelson.

dusting. a. Spontaneous falling to a powder, so that a quantity of dust, an extender in the preparation of inorganic vitreous enamel slip after it has dried, prepared to firing. Dodd d. In dry-process vitreous enamelling, synonym for dredging. Dodd c. In wet-process vitreous enamelling, a defect occurring in the alpha crystal form. Sometimes erroneously called slaking. A.R.I.
dust-sampling impinger

sampling fields by manual, compressed air, or electrical suction devices. Dust counts are made from the collected air at laboratory microscopes and counting cells. Best, p. 579.

dust sand. All grains from .025 to .04 millimeters in diameter which are carried by a stream having a velocity of 1.5 millimeters per second. A.G.I.

dust storm. Any wind which picks up and fills the air with dust. In the drier regions, such storms may pick up and carry sand (sand storms) and fine gravel. The loesses of China and the Missouri River region have been formed by dust storms that carried the dust long distances. Hess.

dust suppress. The prevention or reduction of the dispersion of dust into the air, for example, by water sprays. B.S. 3532, 1962.

dust suppressor jib. A coal-cutter jib designed to conduct water through ducts, or other arrangement, to the back of kerf, to wet dust and reduce the gas ignition hazard. See also whale-type jib. Nelson.

dust suppressor man. A man employed in coal mines to apply measures to allay coal dust. His tasks would become airborne. A series of nozzles discharge a chemical compound in a fine spray to materially reduce the amount of water or other liquids necessary to saturate fly ash and eliminate dust. The compound also aids in the diffusion of the liquid dust suppressant, allowing it to penetrate deeper into the material. This system can be used at any point in the handling of bulk materials, wherever dust is a hazard. Best, p. 579.

dustlight. A case so constructed that dust will not enter the enclosure. ASA MD1, 1963.

dust trap. An appliance for the dry collection of dust during drilling in rock. The rock chips, dust, and air are sucked from the borehole through a rubber hose to a dust trap and vacuum cleaner. The dust is discharged and the filters are renewed periodically. In the newer types, the dust is extracted through the hollow drill rods. See also G.P. Hemborn dust extractor; Holman dust extractor; wet drill, Nelson.

dust well. a. Perhaps the most interesting feature of the surface of the glacier (Igloolik, Nunavut, Canada) is its numerous dust wells, a phenomenon which has been reported from the skibold brought pointed to public attention some years since. They are cylindrical tubes, penetrating the ice to a depth of 6 to 8 inches, or occasionally a little more. They range in size from teabags which would scarcely more than admit a lead pencil up to wells a foot or more in diameter. A.G.I.
b. A pit in glacier or sea ice produced when small dark particles on the ice surface are heated by sunlight and sink down into the ice. A.G.I.

dust wetting agent. Chemical compounds which can be used on the surface of coal as coal and silica help prevent explosions and respiratory injury to workers. These compounds were developed to deal with the fire risk of coal and to control the dust. One is used in a dry state and controls dust by

absorb: moisture from the air. The second type is an agent for increasing the wetting effectiveness of water by breaking the surface tension and permitting the water compound mixture to thoroughly cover the treated area. Best, p. 597.

dust blanket. A blanket of dust from a gun so that it does not produce a wet film. Bryant.

dust plate. A plate from which the dust has been completely removed. Osborne.

dutch bond. The arrangement of brick forming a modification of Old English bond, made by introducing a header as the second brick in every alternate stretching course, with a three-quarter brick beginning the other stretching course. This gives alternate stretcher and header courses with alternately spaced vertical lintels. A.S.I., No. 24.

dutch drop. A haulage term used at Anaconda, Mont., for flying switch. Fay.

dutch kiln. A kiln with an updraft intermittent kiln for the firing of bricks; it had a number of small chimneys in the roof. Dit. 5.3.5.

dutch mattress. A mattress constructed of timber and red to protect a riverbed or the banks. Fay.

dutch metal. Low brass, especially in the form of foil; imitation gold leaf. Also called Dutch leaf; Dutch leaf. Webster 3d.

dutch wall. Walls or partitions which do not extend to the ceiling; also, interior walls between the uppermost ceiling level and the finished roof level. A.S.G.

dwarf Brinnell tester. A portable ball hardness tester in which the load is applied by means of a vice or lever. It can be used as a special tool for measuring the diameter of the impression and from which the Brinnell hardness value can be read directly. Os.

dwarf wall. Walls or partitions which do not extend to the ceiling; also, interior walls between the uppermost ceiling level and the finished roof level. A.S.G.

dwarf wall. Walls or partitions which do not extend to the ceiling; also, interior walls between the uppermost ceiling level and the finished roof level. A.S.G.

dutch oven. A combustion chamber built outside and connected with a furnace. HW See also forehearth.

dutch twill. A type of wire cloth weave; a pattern used for the weaving of damask and holland. Hemborn, p. 15.

dutch oven. A combustion chamber built outside and connected with a furnace. HW See also forehearth.

Dy
duty of giants. It is usually stated that 1/2 cubic yards of gravel per 24 hours for every cubic foot of water per minute used, or in other words, 1 cubic foot of water per minute will treat 1/2 cubic yards of gravel per 24 hours. The duty of giants varies considerably under different conditions, such as the height of the gravel beds, the nature of the gravel bedrock, head of water available, size of jet, etc. Griffith, S. V., p. 95.

duty of the miner's inch. The number of cubic yards of gravel that can be broken down and sent through the sluice by 1 miner's inch of water for 24 hours. It depends upon the height of the bank, the character of the gravel and the bedrock, the grade of the bedrock, the type of sluice, and the pressure of the water. In well-rounded gravel without large stones, the duty of the miner's inch is from 1/4 to 6 cubic yards of gravel for 24 hours. Under less favorable conditions, the duty may range from 2.8 to 4.6 cubic yards for 24 hours. Lewis, p. 367.

duty of the corn. The landlord's share of the crop. Fay.

dustite. A dark brown, opaque resin from the lignite at Dux, Bohemia. Similar to mucilaginous, lacking in volatiles. A.G.I.

d-valve. A valve used to control the admission and exhaust of steam in the cylinders of locomotive engines. API Glossary.

d-Vm creep limit. Stress producing a creep rate not exceeding 10^-6 millimeters per minute per hour in the 25th to 35th hour. Osborne.

d-Vm test piece. An impact test piece designed for use at low temperatures. It is 55 millimeters times 10 millimeters times 10 millimeters and carries a rounded notch 3 millimeters deep and 2 millimeters in diameter. Osborne.

dwarf wall. Walls or partitions which do not extend to the ceiling; also, interior walls between the uppermost ceiling level and the finished roof level. A.S.G.

Dwight-Lloyd machine. Sintering machine in which feed moves continuously on articulated grates pulled along by chains in belt-conveyor fashion. Controlled combustion of these grates causes the minerals to sinter. Pryor, 3.

Dwight-Lloyd process. Blast roasting in which air currents are drawn downward through the ore mass. Resett 5d.

Dwight-Lloyd roaster. A multileathered circular furnace, through which horizontal rabbles move and the feed across each hearth, so that it falls peripherally to the one below and then works inward to the central discharge for next hearth below. Rising heat and air provide the roasting conditions. Pryor, 3.

DVM creep limit. Stress producing a creep rate not exceeding 10^-6 millimeters per minute per hour in the 25th to 35th hour. Osborne.

d-y. dyt. dytor. dytord. Swedish name for redish sprawling (organic oozes) formed by precipitation of iron compounds in situ from brown-colored water. It is characterized by a flocculent colloidal structure. Tom.

Dyers. The Permain series of strata in part of Texas and New Mexico, where it comprises two well-marked subdivisions. Fay.

dye absorption; dye penetration. A test for porosity in ceramic materials or nonporous metals. It is applied, for example, to porcelain insulators for which British Standard 137 stipulates that there shall be no sign of dye penetration after a fractured specimen has been immersed for 24 hours in a 0.5 percent solution of fuchsite in alcohol under a pressure of 2,000 lb per square inch. Dodd.

dyed stones. Minerals which are artificially dyed to improve their color or to imitate a more valuable stone. Usually fade or disolor. Shipley.

dye line print. A contact print which has largely replaced the blueprint. Pryor, 3.

dye penetrant. Penetranent with dye added to make it more readily visible under normal lighting conditions at night. ASM Glot.

dye penetrant inspection. Used for detecting surface porosity or cracks, more particularly in magnetic substances. The part to be examined is cleaned and coated with a dye which penetrates any small cracks or openings. The surface is then wiped clean and coated with a white powder. The dry powder soaks up the dye which is still held in the defects and thereby indicates their position. Ham.

dye penetration. See dye absorption. Dodd.

dyestone. See Clinton ore. Fay.

dyestone ranges. Applied to the outcrop of Clinton iron ores extending through Maryland, Virginia, West Virginia, and into Tennessee. Fay.

dying out. Applied to veins that gradually get narrower and narrower until they completely disappear, as called tailing out. Fay.

dying shift. The graveyard or night shift. Fay.

dyn. See Clinton ore. Fay.

dyne balance. A condition of rest created by equal strength of forces tending to move in opposite directions. Nichols.

dyne balance. A condition of rest created by equal strength of forces tending to move in opposite directions. Nichols.

dyne braking. A method of retarding an electric winder or haulage in which a direct current is injected into the alternating-current winder motor stator during the deceleration period; the motor then acts as an alternator and the negative load of the windling cycle is absorbed as electric power both as heat in the controller. Compared with reverse current braking, it saves power, but the energy dissipated in braking is again recovered in the form of electricity as heat in the controller. Compared with reverse current braking, it saves power, but the energy dissipated in braking is again recovered in the form of electricity as heat in the controller. Compared with reverse current braking, it saves power, but the energy dissipated in braking is again recovered in the form of electricity as heat in the controller. Compared with reverse current braking, it saves power, but the energy dissipated in braking is again recovered in the form of electricity as heat in the controller.

dyne creep. Creep that occurs under conditions of fluctuating load or fluctuating temperatures. Pryor, 3.

dyne damping. Usually found in seismographs or seismometers where damping of motion is desired that is in proportion to the velocity of the moving mass. A.G.I.

dyne electrode potential. The electrode potential measured when current is passing between the electrode and the electrolyte. Longton.

dyne geology. Dealing with the causes and processes of geological change. A.G.I.

dyne load. a. An alternating or variable load. Osborne. b. See live load. Long.

dyne loading. Loading from units (particularly machinery) which, by virtue of their movement or vibration, impose stresses in excess of those imposed by their dead load. Taylor.

dyne magnification. Factor indicating the magnification as a function of \( V \), the indicator magnification, \( T \), and the periods of vibration of the ground and the pendulum respectively, and a factor related to the damping. This factor is not constant as it depends on both periods of vibration (the resonance effect). Schiefferdecker.

dyne metamorphism. Metamorphism produced exclusively or largely by rock deformation, principally folding and faulting. Synonym for dynamometamorphism. A.G.I.

dyne method. See Young's modulus of elasticity. Lewis, p. 566.

dyne meter. The specific work unit, dyn, in the metric system. Bennett 2d, 1962.

dyne pile formula. A formula by which the safe load on a pile is calculated from the energy of the hammer blow and the penetration of the pile under each blow. Hiley's formula is of this type. Ham.

dyne positioning. A deep water drilling method. In this method, a series of outboard engines are mounted on opposite sides of the vessel to give it extreme maneuverability. Position is maintained by automatic centering in a circle of sonar reflectors placed ahead. Also called tailing out. Fay.

dyne strength. Resistance to impact or vibratory stress. Osborne.

dyne stress. Stress which is suddenly applied and thus tends to produce motion in the pile under test, as in the Izod test. Osborne.

Dynamite. a. An industrial explosive which is used for cutting rock caps. The principal explosive ingredient is nitroglycerin or specially sensitized ammonium nitrate. Diethylhydrazine dinitrate, which is also explosive, is often added as a freezing point depressant. A dope, such as good pulp, and an antacid, as calcium carbonate, are also essential. See also blasting gelatin. CCD 6d, 1961. b. A general term relating to explosives in which the principal constituent, nitroglycerin, is contained within an absorbent substance. B.S. 3618, 1964, sec. 6. c. Nitroglycerin absorbed in kieselguhr, a powerful blasting explosive. Originally contained 75 percent nitroglycerin. Pryor, 3. d. A composition of detonating character containing nitroglycerin. Detonating character is used with intention, because nitroglycerin enters into the composition of mixtures which are propellants, and which are not dynamite. There are other compositions of matter containing nitroglycerin which are not dynamite, but we cannot have a dynamite which does not contain nitroglycerin. The strength varies according to the percentage of nitroglycerin contained. At present the absorbents are fibrous organic materials; oxygenating compounds added to nitroglycerin also have some absorbive power. Frequently called giant powder. Fay. e. To charge with dynamite. Webster 3d, l. To blow up or shatter with dynamite. Webster 3d.

dynamite gelatin. Dynamite made by gelatinizing the nitroglycerin with colloidion cotton before the addition of the absorbent. Bennett 2d, 1962.

dynamite. One who uses, or is in favor of using, dynamite or similar explosives for unlawful purposes. Fay.

dynamometer. a. A machine for converting mechanical energy into electrical energy by magnetoelectric induction. A dynamo may also be used as a motor. Webster 3d.

dynamothermal. A powerful explosive usually operated by a vertical rack, which, on a downward movement, drives an armature into a pile. A rack bar an internal short-circuiting device opens and the current generated by the rapidly revolving armature passes into the shot-firing circuit. Two expanders in common use, Nobel's 30-shot and the Army Mk VII, operate in this way. See also exploder. Nelson.

dynamogrante. Augen gleise containing much mica, talc, and orthoclase. Fay.

dynamometamorphism. Same as dynamothermal metamorphism. Fay.

dynamometer. Appliance used in engineering for measuring power either as output, input, or transitional. Pryor, 3.

Dynamon. A permissible explosive of the ammonium nitrate and an antacid, as calcium carbonate, are also essential. See also blasting gelatin. CCD 6d, 1961. b. A general term relating to explosives in which the principal constituent, nitroglycerin, is contained within an absorbent substance. B.S. 3618, 1964, sec. 6. c. Nitroglycerin absorbed in kieselguhr, a powerful blasting explosive. Originally contained 75 percent nitroglycerin. Pryor, 3. d. A composition of detonating character containing nitroglycerin. Detonating character is used with intention, because nitroglycerin enters into the composition of mixtures which are propellants, and which are not dynamite. There are other compositions of matter containing nitroglycerin which are not dynamite, but we cannot have a dynamite which does not contain nitroglycerin. The strength varies according to the percentage of nitroglycerin contained. At present the absorbents are fibrous organic materials; oxygenating compounds added to nitroglycerin also have some absorbive power. Frequently called giant powder. Fay. e. To charge with dynamite. Webster 3d, l. To blow up or shatter with dynamite. Webster 3d.

dynamothermal metamorphism. Pertains to processes within the earth involving pressure and heat that bring about changes in rocks. Fay.

dynamothermal metamorphism. Metamorph-
dynamothermal metamorphism

phism resulting from combined effects of heat and directed pressure. A.G.I.

dynebel No. 2. A high strength, low density permitted explosive; no water resistance. It is used for coal blasting in a machine-cut seam of medium hardness in dry conditions. Nelson.
dyscrasite. A natural antinodite of silver, Ag2S; color and streak, silver-white; luster, metallic; usually tarnished; Mohs' hardness, 3.5 to 4; specific gravity, 7.97; found in Germany, France, and Canada. Arsenic, 654 C, 656, 1961.
dyscrystalline. Descriptive of igeous rocks whose mineral grains are too small to be seen without a microscope. A.G.I. Supp.
dysprosium. A rare earth element or lanthanide having atomic number 62, atomic weight 162.50; specific gravity, 3; density 17.33; centimeter-gram-second (cgs) system; the force exerted by 1 gram of matter when acted upon by an alternating voltage. Zimmerman, p. 145, 155, 169. b. Symbol for the base of the natural (Naperian) system of logarithms, being the xth root of the expression 1 + x, as x approaches the limit 0, and having the approximate numerical value 2.7182818+. Zimmerman, p. 155, 156, 157. i. Symbol for single electrode potential. Zimmerman, p. 171. f. Abbreviation for single electrode potential. Zimmerman, p. 171. g. Symbol for sound-energy density. Zimmerman, p. 187. d. Symbol for kinetic energy; Young's modulus; modulus of elasticity. Zimmerman, p. 165, 167, 366. e. Symbol for kinetic energy. Zimmerman, p. 171. h. Symbol for kinetic energy. Zimmerman, p. 165, 167, 366. f. Symbol for electric intensity; and with the subscript 2, as E2, the symbol for electric intensity. Zimmerman, p. 171.
dysprosium oxide; dysprosia. A rare earth oxide; white; D2O; isometric; specific gravity, 7.81 (at 27 C); and melting point, 2,340 °C. Used as a nuclear-reactor control rod component and a neutron-density indicator. Lee; Handbook of Chemistry and Physics, 5th ed., 1964, p. B-108, B-174.

dynobel No. 2. A high strength, low density permitted explosive; no water resistance. It is used for coal blasting in a machine-cut seam of medium hardness in dry conditions. Nelson.

dynebel No. 2. A high strength, low density permitted explosive; no water resistance. It is used for coal blasting in a machine-cut seam of medium hardness in dry conditions. Nelson.
or by hand, or which can be loosened and removed with a power shovel. A.G.I. d. See soil. e. Soft shaly or clayey ground which can be loosened through the use of the coal measures. Fay. f. See ground.

earth amber. A term rarely used to distinguish amber from sea amber. Also to describe amber, the outer portion of which has deteriorated in luster, transparency, and color. Shiplay.

earth anchor. A. A hand-boring tool for testing clays, soils, or shallow deposits. See also auger. Nelson. b. A dry-sampling device consisting of a hollow-fluted rod encased by a cylindrical tube. The fluted rod is equipped with cutting edges, and the cuttings collect and are retained within the tube. Long.

earth borer. An auger for boring into the ground, working in a cylindrical box to retain the earth until the tool is withdrawn. Standard, 1964.

earth color. A pigment of mineral origin; for example, lead iron oxide. Bennett 2d, 1962.

earth current. A light electric current appearing partly traversing the earth's surface but which in reality exists in a wire grounded at both ends, due to small potential differences between the two points at which the wire is grounded. Standard, 1964.

earth dam. One built of gravel, earth, broken rock, etc., with impervious clay core or facing. Pryor, 3.

earth drill. A. An auger. Nichols.

earthed. Means connecting to the general mass of earth in such a manner as will ensure at all times an immediate discharge of electrical energy without danger. Nelson. See also grounded.

earthed system. Electrical, one with a neutral point or pole connected to earth. Pryor, 3.

earthenware clay. A plastic, fine-textured clay, nearly free from lime and gypsum (as they cause blathering); air shrinkage less than 8 percent; takes in a few minutes or remaining hard which is usually too expensive; no cracking in air; tensile strength, 125 pounds per square inch, or more; incipient vitrification reached between cones 10 and 05; vitrification at least two cones higher; color, burned usually, not important unless very bad; fire shrinkage, 8 percent maximum. Hess.

earthfill. A landside. Webster 3d.

earth fault latchout. A feature of an earth fault protective system which requires the circuit breaker to return to the base of the current passing through the earth and thereby encountering a low resistance. Earth fault relays. See also grounded.

earth fault tester. An apparatus used to prevent or reduce leakage of the ground when blasting in conducting ore bodies, in wet shale or clay, and in underwater blasting, especially in salt water. The apparatus has no battery and can be used when loading the hole to check if the conducting wires have become damaged during this operation. Langefors, pp. 143-146.

earth fax. An early name for asbestos. See also amiantus. Fay.

earthflow. A combination of slump and mudflow. Last.

earth fault protection. A system of protection for preventing a current passing through the earth and thereby encountering a low resistance. Earth fault relays. See also grounded.

earthed system. Electrically, one with one

earthplug. A. A landslide. Webster 3d.

earth pillar. Synonym for hoodoo; pillar. A.G.I.

earthquake. a. A local trembling, shaking, or undulation of the ground; a sudden disturbance of the earth's crust. The external part of the earth, sometimes accompanied by earthquakes. Fay.

earthquake period. The period during which a district is subjected to earthquake shock without any long pause. Earthquake proof constructions. Buildings of sufficiently strong construction to withstand even heavy shocks. Schlieder.

earthquake proof constructions. Buildings of sufficiently strong construction to withstand even heavy shocks. Schlieder.

earthquake region. A zone in which the earthquake is observed. Schlieder.

earthquake sounds. Sounds in air generated by earthquake waves of audible frequencies. Last.

earthquake waves. The wave motions, in the materials of the earth, originating at the seismic focus; seismic waves. Challinor.

earth return circuit. A telegraphic circuit using one transmission wire, the return current passing through the earth and thereby encountering a low resistance. Earth fault relays. See also grounded.

earth return circuit. A telegraphic circuit whereby a circuit is monitored to ensure that the neutral point or pole connected to earth. Earth fault relays. See also grounded.

earth sculptures. See land sculpture. Fay.

earth satellite. petre vert. Collective name for various pale bluish-green earths formed by the disintegration of minerals, principally those of the hornblende type. Used as pigments. They are somewhat deficient in body and intensity of hue and are now largely manufactured by chemical processes. CDC 6d, 1961.

earth slide. A. A term applied to the downslope movement of part of an earth embankment when the distance moved is sufficient to break up the blocks and pulverize them so that the major part of the moving mass moves in a somewhat fluid manner. Compare earth slump. Bureau of Mines Staff.

earth slope. The angle of superficial face of the earth, sometimes accompanied by earthquakes. Fay.

earth stone. A term sometimes applied to mineral to distinguish it from sea amber. Shiplay.

earth tide correction. There are two methods of correcting for the tidal effect. One is to construct daily charts of the tidal variation in gravity with time from readings on a stationary instrument and to correct all readings in the field by means of such charts. The other method is for the observer to return to the base station so often that earth-tide effects will be fully incorporated into the instrumental drift curve. Dobrin, pp. 234-235.

earth tilting. A slight movement or displacement of the surface of the ground as in some forms of earthquakes. Fay.

earth wave. Any elastic vibration of the earth, either from natural causes such as earthquakes, landslides, or storms, or created artificially by traffic, blasting, seismic exploration, etc. Seismologists recognize two main
groups of earth waves: (1) body waves which are propagated in all directions through the elastic body of the earth, and (2) surface waves, which require discontinuities such as the rock-air interface at the earth's surface for their propagation. Body waves are of two types, P (for primary) compressional or longitudinal waves, and S (for secondary) transverse or shear waves. Among the surface waves are a variety of transverse and rotational types, such as Rayleigh (R), Love (Q), hydrodynamical, and coupled waves. Stokes and Varnes, 1955.

Earth wax. See cerosite.

Earthwork. An excavation or an artificial banking of ground. Ham.

Earth yellow. A brown, friable mineral, sometimes forming layers in beds of lignite. In general, it is not a true coal, for a considerable part of it is soluble in ether and benzol, and often in alcohol. See also leucopetrite; bathvillite. Fay.

Earthy calamine. An early name for hydrozincite. Fay.

Easement. a. An incorporeal right existing in another's land and/or to allow borehole-drilling operations; a right-of-way. Fay. b. A legalized consent by the owner to allow another's land without profit or compensation; a right-of-way. Fay. c. Recognition, which affects ownership of land, for example, a right-of-way. Pryor, 3. d. In surveying, an easement curve is a transition curve. Pryor, 3.

Easement curve. Commonly known as a transition curve. Ham.

Easer. One of a number of holes surrounding the cut and fired immediately after it. 3618, 1964, sec. 6.

Easer holes. Holes drilled 'around the cut to enlarge the cut area so that the trimmers may realign the ground to the required dimensions. The positioning and number of the easer holes will depend upon the pattern of the cut shots. McAdam II, pp. 124-125.

Easing. In the air that is admitted through the feed holes of an annular kiln at one stage in the firing of fletfon bricks; the purpose is to check the rapid rise of temperature consequent on the ignition of the organic matter present in such bricks. Dodd.

Eastern method. See pick and dip.

Eastman survey instrument. Various models of a particular make of mechanical and photographic borehole-drafter indicators; the single-shot models are small enough to be used in EX diamond-drill holes. See also drill indicator. Lang.

easy fired. Clayware, particularly earthenware, is said to be easy fired if it has been fired at a low temperature and/or for too short a time. Dodd.

East. Out. a. N. of Eng. To turn a heading orholing to one side in order to mine the coal on the other side of a fault v.:diout altering the level course of the heading. Fay. b. Said of a seam when the drift or tunnel reaches a fault, or the boundary of old workings, or any other barrier part of a mine. C.T.D.

eaves courses. Waves file. A course of special size roofing tiles, eave tiles, for use at the eaves of a roof to obtain the correct lap. Dodd.

eaves tiles. See eaves course. Dodd.

Ebanho. Trade name for a residual pitch from Mexican petroleum. Fay.

Eb. Gr. Brit. Shallow; for example, a coal seam is ebb when near the surface; the shaft is ebb which is sunk to it. Webster 3d. Fav.

Ebb and flow. Movement of tidal current in which the ebb currents are stronger than the flood currents. Schieferdecker.

Ebb current. The movement of the tidal current away from shore or down a tidal stream. Schieferdecker.

Ebb tide. A nonsynchronous term referring to that period of tide between high water and the succeeding low water; falling tide. Compare flood tide. A.G.I.

Echelon. Fr. Adapted from the French for sudden rock falls and earth slips in mountainous regions. Fay.

Echeloscope. An instrument for observing the boiling point of liquids, especially for determining the alcoholic strength of a mixture by the temperature at which it boils. Obscura.

Echellon. The act, process, or state of boiling or bubbling up. Webster 3d.

Eating. The vaporizing and/or melting down an oblate size of casing. See also Mesabi E casing. Lang.

Eccentric. a. A device for converting continuous circular into reciprocating rectilinear motion, consisting of a disk mounted out of center on a driving shaft, and surrounded by a collar or strap connected to a rod. Rotation of the driving shaft gives the rod a back-and-forth motion. Standard, 1964. b. A device used on engines for changing the rotary motion of the crankshaft into a reciprocating motion on the slide valve.

Eccentric bit. A modified form of chisel used in drifting, in which one side of the cutting edge is extended further from the center of the bit than the other. The eccentric bit renders underdrilling unnecessary. It is very useful in hard rock. Fay.

Eccentric-bit load. A bit subjected to a load unevenly distributed and concentrated on one part of the perimeter of the bit face. Also called eccentric-bit pressure; eccentric load; eccentric thrust. Long.

Eccentric-bit pressure. See eccentric-bit load. Long.

Eccentricity. A load or component of a load normal to a given cross section; of a member is eccentric with respect to that section if it does not act through the centroid. The perpendicular distance from the line of action of the load to the principal central axis is the eccentricity with respect to that axis. Ro.

Eccentric load. A load imposed on a structural member at a point distant from the center of the member, whereby a bending moment is created equal to the load multiplied by the arm. Ham.

Eccentric pattern. A mode of arranging diamonds set in the face of a bit in such a manner as to have rows of diamonds forming eccentric circles so that the path cut by each diamond slightly overlaps that of the adjacent diamonds. Compare concentric pattern. Lang.

Eccentric press. A mechanical press in which the eccentric and strap are used to move the slide, rather than a crankshaft and connection. ASM Gloss.

Eccentric signal. Triangulation: Signal placed at some point other than directly over the triangulation station, and not in line with the station and the instrument. Seeley, 2.

Eccentric station. Triangulation: Point where an instrument is placed for the measurement of horizontal angles when it is not practicable to set up directly over the actual station. Seeley, 2.

Eccentric thrust. See eccentric-bit load. Long.

Ecevalne. A bright yellow to green lead chlorarsenite, perhaps PbAsO3:2PbCl6, occurring as a mineral in crystal or massive form and as an incrustation. Also called heliohylite. Fay.

ECE coal classification. This system utilizing approximate analysis was devised by the Coal Committee of the Economic Committee for Europe. It is based partly on the National Coal Board Code system and partly upon the ASTN coal classification. The parameters used are caking and coking properties, four-foams containing less than 33 percent of volatile matter, and calorific value on the moist, ash-free basis (30° C, 96 percent humidity) of 30 percent or more, more than 33 percent of volatile matter. Francis, 1965, v. 1, p. 36.

Echelon. Mex. Level place near a mine, where ore is cleaned, piled, weighed, and loaded. Also called patio of the mine. Fay.

Echar pinilla. Mex. Gobbing; packing; filling.

Echelon; en echelon. An arrangement of faults, veins, etc., in which the individuals are staggered like the treads of a staircase. Ballard.
echelon cell

Echelon cell. Wedge-shaped glass cell used in absorption spectroscopy. Fryer, J.

Echelon faults. Separate faults having parallel planes; the group having one more or less general direction but with the individuals parallel to each other and at an angle to that direction. The theory of the minimum economic grade varies according to quality and workability. Nelson.

Echinodermata. The echinoids, such as starfish, sea urchins, and sea urchins. These creatures have a nervous system as well as a sort of stomach. Mason, V., p. 26.

Echinodermata. One of a group of invertebrates (a class of echinodermata) which includes the sea urchins and their close allies. A.G.I.

Echo. An acoustic signal which has been reflected or otherwise returned with sufficient magnitude and time delay to be detected at a signal distinct from that directly transmitted. Hy.

Echogram. A graphic recording of various ranges. Pryor, 3.

Eclogite. A variety of soda-amphibole near arfvedsonite in its optical characters but containing Na2Fe(Al02)(OH,F)2; monoclinic. A variety of the mineral hornblende. Dana 17.

Edge bowl. A hollow bowl about 7 inches deep and containing the body of glass is drawn in the Pittsburgh process. See also Pittsburgh process. Dodd.

Edge Coal Group. A subdivision of the Lower Carboniferous rocks of the Midland Valley of Scotland. So named from their steep dip where they plunge underground, off the Pentland anticline, to form the East Lothian Field. Now frequently known as the Limestone Coal Group. C.T.D.

Edge joint. A joint between the edges of two or more parallel or nearly parallel members. A.S.M. Gloss.

Edge lining. The painting, by hand or machine, of a colored line around the edge of a potter's body. Hy.

Edge mill. An ore-grinding machine of the Chili mill type. Webster 3d. Also called edge runner and chaser. Fay.

Edgerunner. The trimming of plate edges by mechanical shearing or flame-cutting equipment in preparation for welding. Hy.

Edger. a. The long piece of timber in a wooden pillar or crib. See also crosspiece. Fay. b. In forging the portion of a die which generally distributes the metal in portions required for the shape to be forged, usually a gathering operation. A rougher shape shapes the stock into various solids of revolution; a ball edger forms a ball. A.S.M. Gloss.

Edge runner. Scot. Rails of rolled iron or steel on the upper edge of which the wheels run. Fay.

Edgerunner mill. A crushing and grinding unit depending for its action on heavy rollers, usually two in number, that rotate horizontally and press against the base; the pan bottom may be solid or perforated. Compare end-runner mill. Dodd.

Edge seam mining. Highly inclined coal seams, many features of which are comparable to metal mining. See also stope. Nelson.

Edger. Skew. A brick modified so that one side is inclined at an angle other than 90° to the ends. A.G.I.

Edgestones. A sandstone used for curbing, sills, caps, and coping. A.I.M.E., p. 333.

Edgewater. The water surrounding or bordering a pool. Edgewater usually encroaches on a field after much of the oil and gas has been recovered and the pressure has become greatly reduced. A.G.I.

Edge well. A well so located as to be at the edge of oil or gas accumulation or at the edge of a lensed reservoir; a well at or near the contact of oil and/or gas and water. A.G.I.

Edge wheel. See edge mill. Fay.
or less tabular pebbles set at varying and steep angles to the bedding; some such arrangements have been attributed to sliding.

edge. a. In forming, reducing the flange radius by retracting the forming punch a small amount after the stroke but prior to releasing the pressure. ASM Gloss. b. In forging, removing flash that is directed upward between dies, usually accomplished in a lathe. ASM Gloss. c. In rolling, working metal where the axis of the roll is parallel to the thickness dimension. ASM Gloss. d. Gridding the edge of flat glass to a desired shape or size. See also centering. ASTM C162-66. e. An operation in enamel work that improves the appearance and utility of edges of porcelain-enamel parts, such as brushing the edges or applying black overspray on edges. This operation is used for removing dried overcoat from the edge of a piece of ware to expose an underlaying enamel. Edging may also denote the application of colored enamel to the edge after brushing. Enam. Dict.

eductor. A device for utilizing the cavitation of water which is discharged by a sump, a pump that is able to pump air as well as water, using water as an operating medium. The eductor consists of a pipe ori-

Eddy, Howard. British. a. Titanic acid, rutile, occurring in sections of a hypothetical system which satisfies two requirements: (1) over its assigned frequency band it has a uni-}

eddy current. a. Effective breaking force. A product of the weight, strength and the degree of pack-}

eddy current loss. a. The effective size of an excavation is the size of that excavation within its stress ring; it includes not only the actual hole in the rock but the desiccated loose and semiloose rock which surrounds it. Spalding. b. Particle diameter corresponding to 10 percent finer on the grain-size curve. Also called effective size. ASCE P1826.

eddy eductor. A device for utilizing the cavitation produced at a pipe constriction. It is a pump that is able to pump air as well as water, using water as an operating me-}

eddy flow. a. The effective diameter of an excavation is the size of that excavation within its stress ring; it includes not only the actual hole in the rock but the desiccated loose and semiloose rock which surrounds it. Spalding. b. Particle diameter corresponding to 10 percent finer on the grain-size curve. Also called effective size. ASCE P1826.

eddyless flow. a. The effective diameter of an excavation is the size of that excavation within its stress ring; it includes not only the actual hole in the rock but the desiccated loose and semiloose rock which surrounds it. Spalding. b. Particle diameter corresponding to 10 percent finer on the grain-size curve. Also called effective size. ASCE P1826.

eddy current loss. a. The effective diameter of an excavation is the size of that excavation within its stress ring; it includes not only the actual hole in the rock but the desiccated loose and semiloose rock which surrounds it. Spalding. b. Particle diameter corresponding to 10 percent finer on the grain-size curve. Also called effective size. ASCE P1826.

eddy current loss. a. The effective diameter of an excavation is the size of that excavation within its stress ring; it includes not only the actual hole in the rock but the desiccated loose and semiloose rock which surrounds it. Spalding. b. Particle diameter corresponding to 10 percent finer on the grain-size curve. Also called effective size. ASCE P1826.

eddy current loss. a. The effective diameter of an excavation is the size of that excavation within its stress ring; it includes not only the actual hole in the rock but the desiccated loose and semiloose rock which surrounds it. Spalding. b. Particle diameter corresponding to 10 percent finer on the grain-size curve. Also called effective size. ASCE P1826.
effective screen aperture

Effective size. See effective diameter. ASCE P1826.

effective sound pressure. The effective sound pressure at a point is the root-mean-square value of the instantaneous sound pressures over a time interval at the point under consideration. In the case of periodic sound pressures, the interval must be an integral number of periods or an interval which is long compared with the length of the beam or slab, the lesser value being taken. Taylor.

effective temperature. A measure of warmth in terms of effective throw of a jet should be 34 feet. Nelson.

effective throw. The distance between the nozzle and the point where the jet reaches a maximum height of 5 feet above the nozzle and begins to break up into drops. The effective throw of a jet should be 34 feet. Sinclair, I, pp. 278-279.

effective unit weight. That unit weight of a soil which, when multiplied by the height of the column of soil, yields the effective pressure due to the weight of the overburden. ASCE P1826.

effervescence. To bubble and hiss (as of fermenting liquors or carbonated water). Webster 3d.

efficiency. a. Mechanical efficiency is the ratio of work output to work input. Nelson. b. Labor efficiency is measured in terms of output per hour or per shift. Maximum efficiency is attained by a worker when he uses the least physical exertion. Nelson.

efficient at any size. For a given air quantity, the appearance of the ash above which further enlargement would not produce a significant reduction in pressure absorbed per unit of length. See also volumetric efficiency. Nelson.

efficient structure. A structure in which the load-bearing members are arranged in such a way that the applied forces are transmitted to the foundations by the cheapest means consistent with safety and permanence. Air.

efflorescence. To change on the surface, or throughout to a whitish, mealy, or crystalline powder from the surface of mineral deposits. See also scum; sintering. ACSG. d. To dry or crystallize into the dry state. Today tends to be absorbed into Work Study Group, doing operational research. Pryor, 3.

efficiency. a. Mechanical efficiency of a luminous source is the ratio of the total luminous flux emitted to the total power consumed. In the case of electric lamps, it is expressed in lumens per watt. Sinclair, I, p. 200.

efficiency engineer. A technical officer who examines processes, methods, and operations in a mine, mill, or smelter, and connecting entities with a view to their improvement in maintenance at an agreed operating standard. Today may be absorbed into Work Study Group, doing operational research. Pryor, 3.

efficiency miner. A term frequently applied to a boss miner, or a contract miner. Pay.

efficiency of a rectifier. The ratio of the power output to the total power input. Coal Age.

efficiency of screening. The ratio of the total weight of material below the reference size in the feed. B.S. 3552, 1962.

efficiency of separation. In coal washing this may be expressed as a percentage of the total yield of clean coal x 100. Theoretical yield at the ash content of the clean coal.

efficiency of sizing. The weight of material correctly spaced above or below the reference size, expressed as a percentage of the weight of corresponding material in the feed. B.S. 3552, 1962.

efficiency, organic; efficiency, recovery. The ratio (normally expressed as a percentage) between the actual yield of a desired product and the theoretically possible yield (based on the reconstituted feed), both actual and theoretical results having the same percentage of ash. B.S. 3552, 1962.

efficiency of crystallization from water solutions brought to the surface by capillarity. Efflorescence is of considerable importance in arid and semiarid regions where crystals of gypsum, calcite salt, mirabilite, natron, etc., form in cracks beneath surface of the ground and areas of the surface of ceramic ware after a period of exposure to the weather. Bureau of Mines Staff, C. This phenomenon sometimes is found on the surface of marble by deposition of soluble salts. See also scum; sintering. ACSG. d. To dry or crystallize into the dry state. Today tends to be absorbed into Work Study Group, doing operational research. Dodd.

effluent test. A test for the likelihood of the formation of efflorescence on a clay building brick. A cylinder, made by shaping and firing a clay known to be free of soluble salts, is allowed to absorb any soluble salts dissolved by distillate water from the crushed sample to be tested; the dry cylinder is then dried and examined for efflorescence. Dodd.

effluent. a. Applied by Dana to those igneous magmas which discharge from a volcano by way of a lateral fissure. See also superfluvial; interfissural. Pay. b. A liquid, solid, or gaseous product, frequently waste, discharged or emerging from a process. ASTM STP No. 148-D.

effluent cave. A cave to be entered at the lower end where a stream issues or is known to have issued. Schiffrederker.

effluent seepage. Seepage out of the lithosphere. A.G.I.

effluent stream. A stream or reach of a stream is effluent with respect to ground water if it receives water from the zone of saturation. A.G.I.

effusion. The goddess of one who uses a gaseous fluid which allows the water to flow through porous bodies, that is, the flow of gases through larger holes than those to which diffusion is strictly applicable. Osborne.

effusive. In petrology, poured out or erupted from a volcano and allowed to fall or to be blown away by the wind. Hess. b. White to gray, soluble salt deposits which have a crystalline appearance that resembles lichens or dried leaves; not uncommonly due to loss of water of crystallization. Pay.

effusive. In Volcanology, forming an incrustation or deposit of grays or powders that resemble lichens or dried leaves; not uncommonly due to loss of water of crystallization. Pay.

effusive. In petrology, poured out or erupted from a volcano and allowed to fall or to be blown away by the wind. Hess. b. White to gray, soluble salt deposits which have a crystalline appearance that resembles lichens or dried leaves; not uncommonly due to loss of water of crystallization. Pay.
extensive. Fay.

egg coal. a. In anthracite coal which passes through 3 3/4- to 3-inch round holes and over 2 3/4-inch round holes. See also anthracite coal sizes. Jones. b. In bituminous coal, pieces which pass through 4-inch round holes and over 1 1/2-inch round holes (sizes are not uniform but vary with the coalfield). Jones.

egglette. See briquette. Fay.

egg-shaped sewer. An ovoid-shaped sewer which placed with its smaller radius down, this shape and speed of flow when the sewer is nearly empty. Ham.

eggshell finish. A practical matte surface texture in glass or enamel surfaces. A desired feature in some ground coats. Shipley.

eggshell mottle. A practical method of matte surface texture in glass or enamel surfaces. A desired feature in some ground coats. Shipley.

eggshell texture. The texture of a fired glaze similar in appearance to the surface of an eggshell. ASTM C242-60T.

eggstone finish. A finish similar in appearance to eggshell finish for stone. ASTM C242-60T.

eggshell turquoisite. Turquoisite with a cracked appearance due to a fine, irregular arrangement of matrix, which appears like cracks in an eggshell. Shipley.

egg stone finish. A finish similar in appearance to eggshell finish for stone. ASTM C242-60T.

elephantine. A hexagonal mineral, Na8O4MgO·2CO3; from an oil well in Utah. Spencer Bibig, 1965.

ejecta. ejectamenta. Material thrown out by a volcano, such as ash, lapilli, and bombs.

ejecta. Synonym for ejecta. A.G.I.

ejected blocks. The larger fragments of a volcanic breccia, generally from the internal or subjacent rocks of a volcano, and often highly metamorphosed. Hess.

ejector. a. A device which is mounted in such a way that it removes or assists in removing a formed part from a die. ASM Gloss. b. A cleanout device, usually a sliding plate. Nichols. c. A device in which a high velocity jet acts to entrain mechanically a second fluid to withdraw it from some region of like pressure and to deliver with low turbulence the mixture to a region of higher pressure. Strack. 10.

ejector half. In die casting, the movable half of a die containing the ejector pins.

ejector rod. A rod used to push out a formed piece. ASM Gloss.

eka. A prefix denoting the element occupying the next lower position in the same group in the periodic system. Used in the naming of new elements and unstable radionuclides. C.T.D.

eklite. An arfvedsonite granite comparatively poor in quartz, containing soda microcline and microperthite, with arfvedsonite and aegirine. The rock is normally equigranular, but pautsa marginally into ekerite phrypophy. Hess.

eka. A Ceylonite term for a drain, as around a sem pit. Bureau of Mines Staff.
ekeleite. It is best known by the rock name ekleite syenite, a synonym for nepheline syenite, but the latter is preferable. See also nepheline syenite. Fay.

elephantine. A large mass of the most stable isotope known, 254. Discovered in 1952. Produced by the bombardment of uranium 238 by nitrogen nuclei. Symbol, Es; mass number of the most stable isotope known, 254. Discovered in 1952. Produced by the bombardment of uranium 238 by nitrogen nuclei. Symbol, Es; mass number of the most stable isotope known, 254. Discovered in 1952. Produced by the bombardment of uranium 238 by nitrogen nuclei. Symbol, Es; mass number of the most stable isotope known, 254. Discovered in 1952. Produced by the bombardment of uranium 238 by nitrogen nuclei. Symbol, Es; mass number
elastic axis

line, lengthwise of the beam, along which transverse loads must be applied in order to produce bending only, with no torsion of the beam at any section. Strictly speaking, no such line exists except for a few conditions of loading. Usually the elastic axis is assumed to be the line which passes through the elastic center of every section. The term is most often used with reference to an airplane wing of either the下单 or multiple-spar type. Compare torsional center; flexural center; elastic center.

elastic bimene. See elaterite.

elastic boundary. The boundary of an underground opening which requires no support. The material around this boundary may be considered to be in the elastic state and no pressure need be exerted against the boundary to prevent the material from fracturing and falling into the opening. Woodruft, v. 1, p. 38.

elastic center. The elastic center of a given section of a beam is that point in the plane of the section lying midway between the flexural center and center of twist of that section. These three points may be identical and are usually assumed to be so. Compare flexural center; torsional center; elastic axis.

elastic constants. a. Certain mathematical constants that serve to describe the elastic properties of a material. A.G.I. b. Modulus of elasticity, either in tension, compression, or shear, and Poisson's ratio. ASM Gloss.

elastic curve. The curve assumed by the axis of a normally straight beam or column when bent by loads that do not stress it beyond the proportional limit. Ro.

elastic deformation. A nonpermanent deformation, after which a body returns to its original shape when the load is released. Often limited to that deformation in which stress and strain are linearly related in accordance with Hooke's law.

elastic design. Design of a structure based on working stresses which are about one-half to two-thirds of the elastic limit of the material. For redundant frames, this method of design is replaced by the plastic design. Han.

elastic energy. See strain energy. Ro.

elastic flow. Flow which decreases logarithmically with time. Lewis, p. 579.

elastic hysteresis. Erroneously used for mechanical hysteresis. The effect is inelastic. ASM Gloss.

elasticity. The property or quality of being elastic, that is, an elastic body returns to its original form or contour after a displacing force is removed. A.G.I. See also Hooke's law.

elasticity of bulk. a. The property possessed by all substances by which they tend to recover their original volume after being compressed or extended. Han. b. The elasticity for changes in the volume of a body caused by changes in the pressure acting on it. The bulk modulus is the ratio of the change in pressure to the fractional change in volume. See also elasticity. C.T.D.

elastic limit. b. a. Of rock, yield point; maximum stress from which it can recover apparently unchanged. Also called its elastic deformation. If stressed beyond this point there is disruption or permanent deformation. Pryor, 3. b. That point or amount of force at which a material will not return to its original length when subjected to a straight pull. When a string of drill pipe is pulled beyond a point at which it will not return to its original length, it may be said to have been pulled beyond its elastic limit. Brundage, 2. Compare proportional limit; apparent elastic limit; yield point; yield strength. c. The greatest stress an elastic solid can sustain without undergoing permanent deformation. Webster 3d. d. The greatest stress for which the strain of an elastic body is proportional to the strain. Webster 3d.

elastic mineral. A mineral which yields to a bending stress, but when released, it returns to its former position (a plate of white mica). Stokes and Varnes, 1955, p. 149.

elastic mineral pitch. Elaterite, Fay. See also modu- lus. Modulus of elasticity. Webster 3d.

elastic rail spike. A form of rail fastening, of which many designs are available. Han.

elastic ratio. The ratio of the elastic limit to the ultimate strength. Ro.

elastic rebouche. The recovery of elastic strain. A.G.I.

elastic rebound theory. Faulting arises from the sudden release of elastic energy which had slowly accumulated in the earth. Just before the rupture, the energy released by the faulting is entirely potential energy stored as elastic strain in the rocks. At the time of rupture the rocks on either side of the fault spring back to a position of little or no strain. This theory was proposed by Harry Fielding Reid. A.G.I.

elastic scattering. See scattering. LBL.

elastic solid. A solid that undergoes further force by changing shape or volume, or both, but returns to its original condition when the force is removed. The amount of strain is proportional to the force. Lest.

elastic state of equilibrium. A state of stress within a soil mass when the internal resistance of the mass is not fully mobilized. ASCE P1826.

elastic strain. Deformation per unit of length produced by a load on a material, which vanishes with removal of the load. Ham.

elastic strain energy. See strain energy. ASM Gloss.

elastic surface waves. Waves which travel only on a free surface where the solid elastic materials transmitting them are bounded by a fluid or water. Lest, 2, p. 69.

elastic waves. Mechanical vibrations in an elastic medium. ASM Gloss.

elaterite. Elatite bimene. A massive, amorphous, dark-colored hydrated silicate of aluminum. It occurs in soft and elastic to hard and brittle. It melts in a candle flame without de- crepitation, has a conchoidal fracture, and gives a basaltic reaction. Is obtained from Colorado and Utah. Sometimes known as mineral caschotchou. See also wurtzite. C.T.D.

Elata type E lamp. This lamp is now in use in France and North Africa. It includes a three-cell nickel-cadmium battery of volta- bloc type of 10 ompere-hours capacity, and it represents a radical change in the alkaline cap lamp design in that the bat- tery is hermetically sealed. No topping-up or flushing-out of battery is needed and maintenance is thereby eased. Roberts, II, p. 264.

ebowa. A. A fitting that makes an angle between adjacent pipes. The angle is always 90°, unless other angle is stated. Also called ell. Fay. b. An acute bend in a lode. Fay.

ecl conveyor. A trough-type roller or wheel conveyor consisting of two parallel rows of rolls or wheels set at a 90° included angle, with a row providing a sloped carrying surface and the other acting as a guard. See also roller conveyor; wheel conveyor. ASA MHA 14-56.

electric air drill. A type of tripod drill operated by compressed air supplied by a portable motor-driven compressor that accompanies the drill. Fay.

electrical conductivity. The numerical equal of the reciprocal of resistivity. The unit of conductivity in mhos per centimeter. Hy.

electrical dipole. Displaced center of positive and negative charges. VV.

electrical discharge machining. Machining in which metal is removed by an electrical spark in a dielectric fluid. ASM Gloss.

electrical disintegration. Metal removal by an electrical spark acting in air. It is not subject to precise control, the most common application being the removal of broken tools, such as taps and drills; hence, the shop name tap buster. ASM Gloss.

electrical double layer. Helmholtz layer. Zone which surrounds a particle in aqueous suspension or other electrolyte. Transition zone between the mobile central zone of an ion and the zone of shear immediately coupled ionically to the discontinuity lattice at the particle's surface. This zone is 50 to 5,000 angstrom away. This zone of change contains a superconcentration of ions drawn from the normal population of the liquid phase. See also zeta-potential. Pryor, 3.

electrical energy. The energy of moving electric charges. ASM Gloss.

electrical engineer; electrician. An engineer in charge of all electrical plant and associated labor at a mine or complex. If not in charge of all the underground electrical equipment, operations
and labor. The electrical engineer is under the authority of the colliery manager. Nelson.

electrical heat. When a current flows in a circuit, it generates heat. A device or contact in a circuit, such as a light bulb, may be designed to convert electrical energy into heat. The filament of a light bulb is a good example of this. When a current flows in a filament, the filament quickly heats up, emitting light and heat.

electrical interlock. A device or contact incorporated in the control circuit and actuated by some other device to cause or prevent a function under certain predetermined conditions of operation. IC, 8149, 1963, p. 19.

electrical line splicer. In petroleum production, one who splices single or multiple conductor cables used in lowering electrical testing or surveying instruments into oil or gas wells or bore holes. Also called line splicer. D.O.T. 1.

electrically suspended gyroscope. Foil-wrapped coils around the gyro create a magnetic field used to bring the rotor up to operating speed and then are de-energized, allowing the rotor to operate in the coasting condition. Abbreviation, esg. Hy.

electric field. A field of constant polarity, especially self-potential. The electric field is a vector field that describes the interaction between electric charges. It is characterized by its strength and direction at each point in space.

electric Gins. A method of geophysical prospecting which depends on the electrical characteristics of rocks. There are two main methods, namely, measurement of natural potentials, resistivity methods, and inductive methods. Measurable natural potentials are mainly found in association with sulfide ores. The resistivity and inductive methods both measure the electrical resistance of a section of the earth. See also geophysical prospecting. Nelson.

electrical plan. A plan, drawn to the same scale as the working plan, which shows the position of all electrical apparatus installed underground except signals and telephones. Nelson.

electrical porcelain. A hard fired whiteware designed to act as an electrical insulator, as in spark plugs, power terminals, etc. Enam. Dict.

electrical potential. Energy required to carry an electric charge, and it must be taken into consideration when high-frequency alternating currents are introduced into the earth, as in inductive prospecting techniques. Electrical methods are more frequently used in searching for metals and minerals than in exploring for oil or gas, mainly because most of them have proved effective for only shallow explorations. Dobrin, pp. 339-340.

electrical prospecting engineer. In petroleum production, one who designs and develops electrical and electronic instruments and equipment used in petroleum prospecting with the seismograph, magnetometer, or other instruments which detect and measure various physical properties of the earth's crust. Also called electrical engineer, geophysical prospecting. D.O.T. 1.

electrical protection. A protection is provided by fuses or other suitable automatic circuit-interrupting devices for preventing damage to circuit equipment, and personnel by abnormal conditions, such as overcurrent, high or low voltage, and single phasing. AM, 1963.

electric prospecting. A rock fracturing technique widely applied to secondary fragmentation in quarries. Puncturing, which is similar to arcing in a gas, is characterized by an almost instantaneous action and is accompanied by a mechanical weakening of the dielectric and lowering of the resistance of the puncture path. If, after puncturing, a high frequency current continues to pass between the contacts, the action of the conduction current and electric field will rapidly heat the rock, leading to thermal puncturing in which the dielectric is transformed into a good conductor along the puncture path. Further intensive heating will give rise to thermal stresses sufficient to fracture the rock. Mining, and Minerals Engineering, v. 1, No. 5, January 1965, p. 185.

electric resistance inclinometer. An instrument to indicate when a long hole in a coal seam is deviating into the roof or floor. It may be used in underground gasification and pulsed-infusion shotfiring. It uses, inter alia, a pellet of mercury to indicate the gradient by its position along a tube. Nelson.

electrical resistance strain gage. An appliance for measuring strain and may be employed in roof-control research. It makes use of the change in electrical resistance of a thin wire when stretched under the influence of strata strain. See also acoustic strain gage; mechanical extensometer. Nelson.

electrical rock fracture. A rock fracturing technique in which electrical energy is used directly in fracturing the rock either by heating it in a conductive or an electromagnetic field set up in the rock by a high-frequency electric current, or by the direct puncture of the rock by an electric current. Mining and Minerals Engineering, v. 1, No. 5, January 1965, p. 182.

electrical slate. Slate principally of the mica variety. It should have high mechanical and dielectric strength, be readily machinable, and have low porosity. BuMines Bull, 630, 1961.

electrical steel. A special steel used for making sheets for motors, dynamos and transformers. The steel has carbon, sulphur, phosphorus and manganese contents, with content ranging from 0.3 to 4.3 percent, depending on the particular application.

Electrical steel sheets are sold with guarantees of electrical properties and are made in acid open-hearth furnaces. Calcium silicide is used to reduce sulfur contents to the low limits specified for the steel. Nelson.

electrical system. A system in which all the conductors and apparatus are electrically connected to a common source of electro motive force. Nelson.

electrical twinning. A type of twinning in quartz in which the two or more intergrown parts are related as by a rotation of 180° about the common Z or c axis. The separate individuals of the twin are either all right-handed or all left-handed. Electrical twinning cannot be detected by optical tests but can be recognized by etching, X-ray study, pyroelectric tests, or by the distribution of the + (5161) or - (1121) faces. Also known as Dauphine twinning or orientational twinning: 180° twinning. AM, 1.

electrical well logging. The process of recording the formations traversed by a drill hole, based on the measurements of two basic parameters observable in uncased holes; namely, the spontaneous potential (S.P.) and the resistivity of the formations to the flow of electric currents. The detailed study in situ of the formations penetrated by a drill hole, based on measurements made systematically by lowering an apparatus in the hole responding to the following physical factors or parameters:

1. the resistivities of the rocks
2. their porosity
3. their electrical anisotropy
4. their temperature;
5. the resistivity of the drilling muds. A.G.T.

electric arc furnance melter. In the iron and steel industry, one who supervises the operation of a battery of electric arc furnaces in which metal is melted and purified. D.O.T. 1.

electric axis. See piezoelectric axis. Hess.

electric battery. See galvanic cell. H&C.

electric blasting. The firing of one or more charges electrically, whether electric blasting caps, electric squibs, or other electric igniting or exploding devices are used. Fay.

electric blasting cap. a. A device for detonating charges of explosives electrically. It consists essentially of a blasting cap, into the charge of which a fine platinum wire is stretched across two protruding copper wires, the whole fastened in place by a composition sulfur plug. The heating of the platinum wire by the electric current ignites the explosive charge in the cap, which in turn detonates the high explosive. Fay, b. Detonator fired electrically. Pryor, 3. c. See electric detonator. Nelson.

electric boosting. An auxiliary method of adding heat to the glass in a gas or oil-fired tank by passing electric current through the molten glass. ASTM.

electric braking. A braking action applied to an electric motor...
electric braking by causing it to act as a generator. Nelson.

electric cable. The conducting wires through which a low current is conveyed to points in and about a mine, where it is required for lighting or motive power. See also wires.

electric cable reel mine locomotive. See electric mine locomotive.

electric calamine. Zinc silicate, or calamine; so called on account of its strong pyroelectric properties, and to distinguish it from smithsonite. See also calamine. Webster 2d.

electric cap lamp. This lamp consists of a flat portable battery that is strapped around the miner’s waist and is connected by an insulated cord to a small electric light and reflector that is fastened on the front of his cap. With this lamp, the miner’s hands are always free and the light is directed on the spot where he is working. There are two types of electric cap lamps: those with the lead or acid battery and those with the alkaline or Edison type battery, both of which have been approved by the U.S. Bureau of Mines.

Lewis, p. 733. See also flame safety lamp; safety lamp.

electric charge. A property of matter resulting from an imbalance between the number of protons and the number of electrons in a given piece of matter. The electron has a negative charge; the proton, a positive charge. Like charges repel each other; unlike attract. Leet.

electric coal cutter. A coal cutter operated by an electric motor; used in coal mines. C.T.D.

electric coal drill. An electric motor-driven drill designed for drilling holes in coal for placing blasting charges. ASA C42.85:1956.

electric controller. The device used for starting and controlling an electric motor of a mining belt conveyor. NEMA MB1-1964.

electric crab reel mine locomotive. See electric mine locomotive.

electric detonator. In the electric detonator, a fusehead assembly replaces the safety fuse and, when an electric current is passed through the fusehead, it ignites a flashing composition which, in turn, initiates the explosive charge in the detonator. A typical modern electric detonator consists of four main components, namely: (1) the detonator tube containing the explosive charge; (2) the fusehead; (3) the neoprene plug closure; and (4) the leading wires. McAdam II, p. 53.

electric drill. A mechanically operated drill employing neither compressed air nor steam, but driven by an electric motor. Used chiefly in mining operations. Fay.

electric fax. System used to control grinding rate in a ball mill; a microphone uses the grinding sound and maintains this by varying the rate of new feed to the mill. Pryor, 3.

electric emerald. A glass imitation of emerald.

electric exploder. A former designation for electric blasting cap. Fay.

electric explosion-tested mine locomotive. An electric locomotive equipped with explosion-tested equipment. ASA C42.85:1956.

electric eye. electric ear. The former is a photoelectric eyethe device in connection with monitoring flow, turbidity, height of material in ore bin, etc.; the latter is a microphonic signal using noise level to check loading. Pryor, 4.

electric-eye method. A method of finding large diamonds in which the dry crushed ore is screened to remove minus 1½-inch material and passed in a thin layer on a moving belt. The belt passes through a band of intense polarized light which, if reflected from a large diamond, actuates a photoelectric cell. The impulse can stop the belt, sound an alarm, or otherwise call attention to the presence of a large diamond. It is expected that this device can also be used for separating smaller diamonds. I.C. B200, 1964, p. 74.

electric furnaces for melting and refining metals. Several types of electric furnace are used in the metallurgical industries, with ferrous and nonferrous; all these furnaces are lined with refractory materials, the larger furnaces generally being bricked, the smaller furnaces usually having a monolithic refractory lining which is rammed into place. The chief types of such furnaces are: direct arc, in which the electric current passes through the charge; indirect arc, in which the arc is struck between the electrodes only; induction furnace, in which the electric charge is heated by eddy-currents induced in it. Induction furnaces may be operated at high frequency (i.e. induction furnaces) or at low frequency (i.e. induction furnaces). Dodd.

electric fuse. A metallic cup, usually containing fulminating mercury, in which are fixed two insulated conducting wires held by a plug, the latter holding the ends of the wires in which the arc does not touch each other. At this plug is a small amount of a sensitive priming. When an electric current is sent from the battery through these conductors, the resulting spark fires the priming, then the fulminate and the charge of the fuse. Steuffter.

electric gathering mine locomotive. An electric mine locomotive, the chief function of which is to move empty cars into, and to remove loaded cars from, the working places. ASA C42.85:1956. See also gathering locomotive.

electric haulage mine locomotive. An electric mine locomotive used for hauling trains of cars, which have been gathered from the working faces of the mine, to the point of delivery of the cars. ASA C42.85:1956.

electric hoist. See electric winder.

electric horsepower. Equal to 746 watts. Crispin.

electrician. A person appointed in writing by the manager of the mine to supervise the working and maintenance of electrical apparatus in the mine. See also electrical engineer. Nelson.

electric ingot process. A continuous method of melting and casting metal with progressiv solidification. The molten metal is completely protected from the atmosphere. There is minimum segregation, and as no refractory linings are used there is no contamination. Sound ingots with high yield and no pick are produced. The method possesses extreme flexibility it is possible to make small as well as relatively large ingots. Osborne, 376.

electricity. A material agency which, when in motion, exhibits magnetic, chemical, and thermal effects and which, whether in motion or at rest, is such a nature that when it is present in two or more localities, within certain limits of association, a mutual interaction of force between such localities is observed. Recent investigations indicate that it is discrete or granular in nature and that there may be two kinds, positive and negative. In general, its effects differ according to whether it is at rest or in motion. At rest it is called static; its usually produced by friction; manifests itself chiefly in attractions and repulsions and in violent discharges like lightning; does not produce currents; and has no use in the arts. In motion it is called dynamic or current electricity. S. Standard, 1964.

electric lamps. See cap lamp; hand electric lamp.

electric locomotive. a. A locomotive in which the driving power is supplied by electric motors, supplied either from a battery (battery locomotive), from a self-driven generator mounted on a vehicle (diesel electric locomotive), or from a central station (track fed). C.T.D. Also called a motor and used in mine haulage. Fay. See also electric mine locomotive. b. The electric locomotives used in pit and quarry service are arranged to operate from an overhead trolley wire, from a third rail alongside the running rails, from a storage battery mounted on the locomotive chassis, or even the combination of trolley or third rail and battery. Pit and Quarry, 53rd sec. A, p. 114.

electric log. The log of a well or borehole obtained by lowering electrodes in the hole and measuring various electrical properties of the geological formations traversed. Electrical current is introduced by a number of methods. A.G.I. See also microlog.

electric logging. a. A technique originally devised by the Schlumberger brothers, in which electrical measurements are made, and recorded at the surface, while a series of electrodes or coils is caused to traverse a borehole. The resulting curves can be used for purposes of geological correlation, and under favorable circumstances also for the recognition of some rock properties and for indicating the nature and extent of the fluids in the pores of the rock. Institute of Petroleum, 1961. b. The act or process of taking resistivity, porosity, or other electrical measurements in a borehole using an electromagnetic teleclinometer or other electrode device. Also called electric log. See also logging.

electric master fuse. See multifuse igniter. Nelson.

electric mine locomotive. An electric locomotive designed for use underground; for example, in such places as coal, metal, and salt mines, tunnels, and in subway construction. The principle is recognized by the American Standards Association: (1) combination type—a locomotive which receives power either from
electric mine locomotive. A trolley wire distribution system or from a storage battery carried on the locomotive. The batteries are of two types—lithium-type—lithium-type which receives its power supply from a storage battery mounted on the chassis of the locomotive; and alkaline-type—alkaline-type which receives its power supply from a trolley wire distribution system; (4) permanent tandem type—two locomotive units permanently connected together and provided with one set of controls so that both units can be operated by a single operator; (5) separate tandem type—two locomotive units which can be coupled together and operated as a single unit, or else separated and operated as two independent units; (6) crane reel type—a locomotive equipped with an electrically driven winch, or crane reel, for the purpose of hauling cars by means of a wire rope from places beyond the trolley wire; and (7) cable reel type—a locomotive equipped with a reel for carrying an electric or conductor cable which could be used for conduct power to the locomotive when operating beyond the trolley wire. See also locomotive; electric locomotive; mine locomotive; electric haulage mine locomotive; electric permissible mine locomotive; electric gathering mine locomotive. **ASA C42.85:1956**.

**electric motor.** See motor. **Nelson.**

**electric mule.** Electric motor. **Korson.**

**electric permissible mine locomotive.** An electric locomotive, as approved by the Department of the Interior. **ASA C42.85:1956.**

**electric powder fuses.** These fuses were designed so that electrical short-circuiting methods could be used for initiating blasting powder.

The powder fuse consists of a thick paper tube containing a small charge of blasting powder, with an ordinary low-tension fuse fixed at one end. Upon passing electric current through the fuse-head it flashes and sets off the blasting powder in the tube, which can then initiate the main charge of blasting powder in the shot hole. **McAdam II, p. 265.**

**electric precipitator.** The collection of suspended dust by causing the particles to become electrically charged in such a manner, as to attract each other and to form aggregates so large as to cause them to settle. **Bureau of Mines Staff.**

**electric prospecting instruments.** Geophysical prospecting instruments which measure the electrical characteristics of rocks. **Nelson.**

**electric resistance.** The opposition of an electric circuit to the flow of current. **Kentucky, p. 265.**

**electric resistance strain gage.** This gage consists essentially of a grid of fine wire cemented to a paper membrane which can be attached to the surface under investigation. The ends of the wire grid are spot welded to a metal strip for the terminals. The resistance of the gage depends upon the fact that certain alloys show a linear relationship between the change of strain and electrical resistance, so that if a wire constructed from one of these alloys is fixed to the surface of an object subject to variable strain, the change of resistance in the wire will be a measure of the change of strain in the object. **Innesson, pp. 209-210.**

**electric rotary drill.** A hand-held rotary drill driven by an electric motor and may be of the Ward-Leonard type. It may be of fan-cooled design with several rod speeds to suit different rocks. The use of aluminum or aluminum alloys is not favored where methane is liable to be present. This drill produces considerably less dust than the percussive drill. **Nelson.**

**electric shock.** Accidents from electricity are common and around mines. Electricity causes shock by paralyzing the nerve centers that controls breathing or by stopping the regular beat of the heart. Some symptoms of electric shock are sudden loss of consciousness, absence of respiration or respiration that cannot be detected, weak pulse, and probable burns. **Kentucky, p. 116.**

**electric shovel-crate man.** See shovel-crate man. **D.O.T. 1.**

**electric shovels.** Most of the larger modern machines are electrically driven and are equipped with the Ward-Leonard system of control. This allows alternating current machines to be used in rock or coal. It may be of the most common for winders because it provides a uniform driving torque which minimizes the possibility of rope slip. **Nelson.**

**electroacoustic transducer.** A transducer for receiving waves from an electric system and delivering waves to an acoustic system or vice versa. **Hy.**

**electroanalysis.** Use of electrolysis or conductometry in instruments, such as a polarograph, or a spectrograph (sorption or emission) in quantitative and qualitative analysis. Also, deposition of metal on a lighted cathode in the gravimetric method of electroanalysis. **Pryor, 3.**

**electrobrightening.** A process of reversed electrodeposition which, in certain conditions, results in anodic metal taking on a high polish. **C.T.D.**

**electrobronze.** To electroplate with bronze. **Standard, 1964.**

**electrocast brick.** A refractory material made by fusing refractory oxides in an electric furnace and pouring the molten material into molds to form finished shapes. **A.R.I.**

**electrocast process.** A method of producing refractory materials in the desired form by mixing the raw materials in the requisite proportions, heating to fusion in an electric furnace, and casting. **Osborne.**

**electrochemistry.** Chemical action employing a current of electricity to cause or to sustain the action. **Crispin.**

**electrochemical equilibrum.** Corrosion which occurs when current flows between cathodic and anodic areas on metallic surfaces. **ASM Gloss.**

**electrochemical equivalent.** The weight of an element, compound, radical, or ion involved in a specified electrochemical reaction during the passage of a unit quantity of electricity, such as a faraday, an ampere-hour, or a coulomb. **Lounsbury.**

**electrochemical analysis.** See as electrochemical force series. **ASM Gloss.**

**electrochemistry.** A technique that uses electrical action to promote chemical
electrochemistry

electrode. a. Conducting body electrode deposidoe. The weight of electrode force. The force between electrodes electrode lesd. The electric conductor be-

electrode melting rate. The rate at which an electrode is consumed by an arc in units of mass per time per arc power. BuMines Bull. 625., 1965, p. VII.
electrode burn-off rate. The rate at which an electrode is consumed by an arc in units of mass per time per arc current. BuMines Bull. 625, 1965, p. VII.
electrode cabling. Same as electrode lead. ASM Gloss.
electrode configuration. Pattern in which the electrodes are set up. Schieftecker.
electrode consumption rate. The rate at which an electrode is consumed by an arc in units of mass per time per arc current. BuMines Bull. 625, 1965, p. VII.
electrode that leaves an electrolyte when subjected to an externally impressed potential. H&G. c. A conductor (as a metallic substance or carbon) used to establish electrical contact with a nonmetallic portion of a circuit (as in an electrolytic cell, a battery, an electron tube, or an arc lamp). See also anode; cathode. Webster 3d. d. In arc welding, a current-carrying electrode which supports the arc between the rod and work, or between two rods as in twin-carbon-arc welding. It may or may not furnish arc energy. See also bare electrode; electrode carbon electrode; coated electrode. ASM Gloss. e. In resistance welding, a part of a resistance welding machine through which current is passed. In most cases, pressure are applied directly to the work. The electrode may be in the form of a rotating wheel, or in the form of a small circular electrode which supports the arc. BuMines Bull. 625, 1965, p. VII.
electrode melting rate. The rate at which an electrode is consumed by an arc in units of mass per time. BuMines Bull. 625, 1965, p. VII.
electrode deposition. The deposition of a substance upon an electrode by passing electric current through a metal. ASM Gloss.
electrode reaction. The chemical reaction taking place at an electrode in contact with a solution; the reaction consists of the addition of electrons from the electrode to a substance in the solution, or the removal of electrons by the electrode from a substance in solution. A.G.I.
electrode ring. A set of re-entrant shapes, in the roof of an electric arc steel furnace, forming an opening through which an electrode is inserted. See also bull-eye. Dod.
electrode skid. In spot, seam, or projection welding, the sliding of an electrode along the surface of the work. ASM Gloss.
electrode spacing. Distance between successive electrodes. Schieftecker.
electrolysis. Dialysis accelerated by an electric current. The electrolysis of applied to electrodes adjacent to the membranes. Useful in removing electrolytes from naturally occurring colloids. Webster 3d.
electrolyte. a. A nonmetallic electric conductor, a substance in solution. A.G.I.
electrolytic. Of or relating to electrolysis or an electrolyte; produced by electrolysis. Webster 3d.
electrolytic brightening. Same as electropolishing. ASM Gloss.
electrolytic cell. a. An assembly, consisting of a vessel, electrodes, and an electrolyte, in which electrolysis can be carried out. ASM Gloss. b. A voltaic cell to which an external electromotive force greater than the electrostatic force developed by the voltaic cell is impressed across the electrodes. H&G.
electrolytic cleaning. Removing soil from work by electrolysis by the oxidation being one of the electrodes. The electrolyte is usually an alkaline. ASM Gloss.
electrolytic conductors. The conductors of an electrolytic cell accompanied by the actual transfer of matter (migration of ions), which is shown by the occurrence of chemical change at the electrodes. C.T.D.
electrolytic copper. Copper which has been refined by electrolytic deposition, including cathodes which are the direct product of the refining operation, refinery shapes cast from melted cathodes, and, by extension, fabricator's products made therefrom. Usually, when this term is used alone, it refers to electrolytic tough pitch copper without elements other than oxygen being present in significant amounts. ASM Gloss.
electrolytic corrosion. Galvanic action caused by electrolytic contact of two different metals in the presence of an electrolyte so that an electromotive force is set up. Pryor, 3.
electrolytic deposition. a. The production of a metal from a solution containing its salts by the passage of an electric current through the solution. In electrorefining, the operation is carried out in an electrolytic cell in which the metal is deposited upon the cathode or starting sheet. Henderson, b. Same as electrodeposition. ASM Gloss.
electrolytic dissolution. Disassociation in a solvent of molecules of the dissolving substance as cations and anions. Pryor, 3.
electrolytic disintegration. The act or process of dissolving the diamond matrix metal in the crown of a bit utilizing the chemical discompositional effects of a direct electrical current on a metal object submerged in an acidic solution. Long.
electrolytic iron. A very pure iron produced by an electrolytic process. It has excellent magnetic properties and is often used in magnet cores. Crispin.
electrolytic lead. Lead refined by the Betti process; has purity of about 99.999 to 99.99 percent lead. T.B.
electrolytic machining. A combination of grinding and machining where a metal is abraded away where the anode is inserted as the cathode in physical contact with the anodic workpiece, the contact being made underneath the surface of a suitable elec-
electromagnetic machining

troltye. The abrasive particles produce grinding and act as nonconducting spacers permitting the machining through electrolysis. ASM Gloss.
electromagnetic breaking. Breaking is used for stopping aConditions (including the field of electromagnetic waves at the earth's surface; when the waves penetrate the earth and impinge on a conducting or conducting body, they induce currents in the conduc-
tors which are the source of new waves radiated from the conductors and detected by instruments at the surface. A.G.I.
electromagnetic damping. Commonly found in electrolytic cells. It must be an element during chemical processes. The electron is thought to reside wholly as energy in the atom and determine the chemical properties of the particle. Webster 9d. Electrons surround the nucleus of the atom and determine the chemical properties of the atom. L.O.W.
electromagnetic detector. Used to measure the position and polarity of the X-ray image and to determine the position and polarity of the element. Webster 3d. Abbreviation, emf.
electromagnetic field. The magnetic field is proportional to the current and inversely proportional to the distance from the wire. This principle is important in magnetic prospecting insofar as it forms the basis for certain types of electromagnetic instruments. Dobrin, p. 266.
electromagnetic geophone. The simplest and most widely used type of geophone. It consists of a coil and a magnet, one rigidly fixed to the earth and the other suspended with a support by a spring. The relative motion between the coil and magnet produces an electromagnetic force across the coil's terminals which is proportional to the velocity of the motion. Dobrin, p. 41.
electromagnetic induction. A cutting line through a magnetic field has induced in it an electromagnetic force. Crispin.
electromagnetic insulation. A wire carrying a current in a magnetic field has induced in it an electromagnetic force. Crispin.
electromagnetic methods. Group of electrical exploration methods in which one determines the magnetic field that is associated with the electromagnetic current through the earth. Scherhag.
electromagnetic prospecting. A geophysical method employing the generation of electromagnetic waves at the earth's surface; when the waves penetrate the earth and impinge on a conducting or conductors which are the source of new waves radiated from the conductors and detected by instruments at the surface. A.G.I.

386

electronation

electronation

brations not requiring any known material medium for their propagation, for example, X-rays, X-rays, X-rays. Nelson.
electromagnetism. Every electric current generates a magnetic field which is in a plane perpendicular to the current. The strength of the field is proportional to the current and in the case of a long, straight wire is inversely proportional to the distance from the wire. This principle is important in magnetic prospecting insofar as it forms the basis for certain types of electromagnetic instruments. Dobrin, p. 266.
electromechanical transducer. A transducer for receiving waves from an electrical system and delivering waves to a mechanical system or vice versa. H.y.
electrostalloy. A term covering the various electrical processes for the industrial working of metals; for example, electrodeposition, electrorefining, and operations in electrolytic cells. Webster 3d.
ele-trorometer. An instrument for measuring small quantities of electricity. Used to determine the position and polarity of the X axes in blanks, etc., by measurement of the electric charges released by slight pressure. Also known as a squeegee meter; polarity indicator, A.M. 1. b. A calibrated electroscope. H.s.
electromagnetic filtration. A hydrogen electrode is immersed in a hydrogen gas mixture and placed in dark, dry en crushed ore, wet on ore pulps. Pryor, 3. b. The use of electromagnets to remove ferrous products or tramp iron from ore as ore is by motion of coil in the magnetic field. Dobrin, p. 41.广泛应用 in mechanical seismographs by touching a number of the elements to a charge, or a generator.

electrostalloy. A term covering the various electrical processes for the industrial working of metals; for example, electrodeposition, electrorefining, and operations in electrolytic cells. Webster 3d.
electron beam melting. A melting process in which heat is supplied by a beam of electrons directed at the metal in a high vacuum.

electron capture. A type of radioactive transformation in which an electron from one of the inner shells of an atom is captured by the nucleus; especially important in the transformation $^{37}$K$^+ \rightarrow ^{37}$Ar$^+$. A.G.J.

electron compound. A term used to describe intermediate phases of metal systems that have both a common crystal structure and a common ratio of valence electron to atom. Thus, Cu$_3$Zn$_4$, CuAl, CS$_6$, and FeAl all have the body-centered cubic structure and an electron-to-atom ratio of three to two. ASM Gloss 1960.

electron diffraction. Registration of scattering of stream of electrons due to their impact on nuclei or on a grid of metal lattice. The beam is directed slantwise on the surface examined, in high vacuum. Pryor, 3.

electron-diffraction pattern. A descriptive of element or group which ionizes negatively, or acquires electrons and therefore becomes negatively charged anion. In electrophoresis moves to anode.

electrons are derived from the solid anode.

electro-negative potential. The potential of an electrode that is positively charged in an electrolytic cell. It is usually solvated on the surface of the liquid. In an electrochemical cell, the potential of an electrode is defined as the potential difference between that electrode and a standard reference electrode, usually a hydrogen electrode. The potential of any electrode is given by the electromotive force of a cell of which it is a part. The potential of the electrode is said to be the potential of the cell with respect to the standard hydrogen electrode.

electrical ceramics. Inorganic, nonmetallic conductors, such as glass, and certain other substances, used as insulators, or in the manufacture of electronic devices.

electrical conductivity. A measure of the ability of a substance to conduct electricity. The conductivity of a material is determined by its resistivity and its cross-sectional area.

electrode. A conductor, usually metallic, which forms one terminal of an electrical circuit. It may be positive or negative, depending on the direction of current flow.

electrode, anode. The electrode at which electrons are attracted.

electrode, cathode. The electrode at which electrons are released.

electrode, graphite. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, gold. Special preparations for conducting electron microscope examination.

electrode, mercury. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, silver. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, silver oxide. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, lead. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.

electrode, platinum black. A material used as an electrode in a galvanic cell. It is characterized by high electrical conductivity and low electrical resistance.
electrostatic cleaning process. A method of cleaning small sizes of coal, namely, 2 millimeters to 0.1 millimeter by passing the material over a slowly rotating roller through an electrostatic field of high voltage existing between the earthed roller and the collecting wire. The coal and impurities are electrified to relatively the same extent, but the coal has its charge more slowly neutralized by the roller than the impurities and separation is effected with reasonable efficiency. Nelson.
electrostatic dust and fume sampler. An accurate means of collecting even very fine particles for analysis. Dust, fume, or mist particles, including metallic fumes, are drawn into the portable sample, sieved, and precipitated electrostatically in a collecting cylinder. This equipment permits precise quantitative and qualitative analysis so that proper measures for safeguarding workers and processes can be taken. These units should never be used in explosive atmospheres. Betts, p. 519.
electrostatics. Science of electric charges captured by bodies which then acquire special characteristics due to their retention of such charges. In electrostatic separation, dry mineral particles acquire charges as they pass through a high-voltage field. They are then deflected from their natural falling in accordance with the attraction or repulsion due to the influence of their retained charge as they pass other charged bodies. Electrostatic bunching is particle cling during the laboratory screening of dry material in which frictional electric charge is set up. Pryor, 3, p. 68.

electrostatic precipitation. a. A process of ore concentration based upon the electrostatic principle that like charges repel and opposite charges attract another. Henderson.
b. A method of separating materials by drooping feed material between two electrostatically charged plates in opposite directions. Nonrepelled materials drop in a vertical plane; susceptible material is deposited in a forward position somewhat removed from the vertical plane. ASM Class. Another name for high tension separation. Pryor, 3, p. 208.
electrostatic precipitator. A precipitator fitted with positively and negatively charged conductor tips and may be used for extracting dust from flue gas or for separating mineral dusts from gases. Nelson.
electrostatic spraying. A process in which particles that are to be sprayed are given an electrostatic charge opposite to that on the ware to be sprayed; this attracts the sprayed particles to the ware. Although technically applied in enamelling, this method of spraying has so far been little used in the ceramic industry. Dodd.
electrostatic strength. As applied to electric blasting caps, a measure of the detonator's ability to withstand electrostatic discharges without exploding. Franklin, 2d, 3, Art. 16:10, p. 5.
electrostatic transducer. A transducer which converts a capacitor and depends upon interaction between its electric field and the change of its electrostatic capacitance.
electrostatic balance. The deposition of metals in capillary pores of diaphragms when solutions of the metals are electrolyzed. Hess.
electrostatic deflection. A. A deformation caused by electrical stress. Standard, 1964, b. The phenomenon wherein some dielectric materials experience an elastic strain when subjected to an electric field, this strain being independent of the polarity of the field. HGC.
electrostatic trap; microdust. A phase comparison base line measuring system similar to tellurometer and depends upon interaction between its electric field and the change of its electrostatic capacitance.
electrostatic precipitator. A device using an electrostatic field for dust collection. These units should never be used in explosive atmospheres. Betts, p. 519.
electrostatics. Old name of amber, a fossil gum; elektrostatik. Recovery of a metal from an ore. Engel.
electrovalent bond. Valence bond created between atoms by transfer of one or more electrons. The atom losing an electron (donor) becomes positively charged. The receiving atom becomes negatively charged and they are combined (compounded) by the resulting electrostatic attraction. Pryor, 3.
electrowinning. Recovery of a metal from an ore by means of electrochemical processes. ASM Gloss.
electron. A subatomic particle. See tungsten direct-from-ore process.
electron. Old name of amber, a fossil gum; also, a gold-silver alloy, occurring naturally with up to 26 percent silver. Pryor, 3.
electron. An alloy of gold and silver; contains from 55 to 88 percent gold. Pryor, 3.
electron. A Porter, 3.

building, etc., above the level of the ground. A.G.I. b. In the United States, the term "elevation" generally refers to the height in feet above sea level. A.G.I. c. Altitude above sea level of the following elements: (1) point of reference of a drilling location; (2) derrick floor; and (3) top of rotary or Kelly bushing (i.e., the elevation at the bottom of the hole, if it is a cased hole). Wheeler, d. In an air lift, the distance the water is raised above the surface. Lauti, p. 687.

**Elevation correction.** In gravity measurements, the corrections applied to observed gravity values because of differences of station elevation to reduce them to any arbitrary reference or datum level, usually sea level. The corrections consist of (1) the free-air correction, to take care of the vertical decrease of gravity with increase of elevation, and (2) the Bouguer correction, to take care of the attraction of the material between the reference datum and that of the individual station. In seismic measurements, the correction applied to observed reflection time values due to differences of station elevation in order to reduce the observed times to an arbitrary reference datum or fiducial plane. A.G.I.

elevator. a. A device for raising or lowering bulk material (e.g., coal, ore, or abrasive sand) from one level to another. See also casing elevator. Fay, b. An endless belt or chain conveyor with cleats or other means to limit or prevent the lateral movement of bulk material. Webster 3d. c. A cage or platform and its hoisting machinery, as in a hoist for raising material. Webster 3d. d. A vertical or nearly vertical conveyor. Long. Set also hydraulic dredge; Tomkeieff, 1954.

elevator bucket. A vessel generally rectangular in plan and having a bottom suitably shaped for attachment to a derrick or derrick, or a frame or platform on which it is attached, and which provides a shoulder that can be grasped by an elevator. When each stand of rods is raised by an elevator, the bucket is in use and the hoisting plug, the handling of rods is facilitated and a rod trip can be made in less time. Also called rod plug. Long.

elevator rope. A rope used to operate an elevator. Zern.

elevite. a. A variety of pyrope found in small garnet-like grains in the trap tuff of L'incraig Point, near Elie, in Fife, Fay. b. In the topographic map of the United States, the term "elevite" generally refers to the height of the highest point of an area or region. The elevation of this point is measured from the average of all occupied points of the surrounding area. ASMA 14.1-1988.

elevator drogue. A drogue fitted with a bucket ladder. Ham.

elevator kiln. A kiln into which a setting of ware is raised above the kiln floor and then lowered below; the ware is set on top of the kiln. The kiln is made of a refractory paste which is subsequently elevated by jacks into the firing position. In this position, for example, in the firing of abrasive wheels, Dood.

elevator plug. A short steel plug provided with a pin thread by means of which it can be coupled to the upper end of a stand of drill rods. Its diameter is greater than that of the drill rod with which it is attached, and hence, provides a shoulder that can be grasped by an elevator. When each stand of rods is raised by an elevator, the bucket is in use and the hoisting plug, the handling of rods is facilitated and a rod trip can be made in less time. Also called rod plug. Long.

elevator rope. A rope used to operate an elevator. Zern.

Ella ruby. Scot. A variety of pyrope found in small garnet-like grains in the trap tuff of L'incraig Point, near Elie, in Fife, Fay.

Elliott Thompson process. A. Method of electro welding of iron. Fay.

Elliptical polarization. Manner in which a plane wave is propagated in the vertical direction and direction of an electrical or magnetic field change as a function of time, that results from the superposition of two alternating fields that differ in direction and in phase. Schieferdecker.

ellulial. A term used by British geologists to indicate residual deposits as distinguished from alluvial- or stream-moved deposits. ASMA 14.1-1988.

Ellmore jig. A plunger-type jig of either single or multiple compartments. Its distinguishing features are: (1) an automatic control in the form of a cylinder that measures the specific gravity of the mixture of coal and refuse; (2) the refuse draw is a star gate under the overflow lip in each compartment, which extends the full length of the jig; (3) the batch is commonly collected with a screw conveyor and discharged through the refuse elevator. Used both for treating the huge black slacks of bituminous coal. Mitchell, pp. 423-424.

Ellmore process. This inventor's bulk-oil process (1902) mixed finely ground pallid ore with equal quantities of oil in a vessel with some crude surface-active agent, and then overheated the mixture with loaded with the valuable mineral. These were then separated by centrifuging and washing. In the Ellmore process, the smooth aqueous mixture was mixed with a little oil, diluted and subjected to vacuum which caused air to be released and the solution to go into a crystallized rod which overflowed from the separating vessel. Pryor, 3.

electronbeam. A device which the ratio of electronbroadening to the width of its circumscribing polygon is greater than a specified value. ASTM C125-66.

Executive. Elongate, elongated, or an elongated term that is both general and specific. Generally, the extension of a material in the tension test at any specified point is measured. Pryor, 3.

Elongation elongate. Liquid used to displace a product of a semiaxis; usually 45° or 60° are available. Kentucky, p. 92. Schieferdecker.

Elongated piece. One of whose sides, generally 60° are available. Kentucky, p. 92. Schieferdecker.

Elongation elongate. Liquid used to displace a product of a semiaxis; usually 45° or 60° are available. Kentucky, p. 92. Schieferdecker.

Elongation elongate. Liquid used to displace a product of a semiaxis; usually 45° or 60° are available. Kentucky, p. 92. Schieferdecker.

Elongation elongate. Liquid used to displace a product of a semiaxis; usually 45° or 60° are available. Kentucky, p. 92. Schieferdecker.

Elongation elongate. Liquid used to displace a product of a semiaxis; usually 45° or 60° are available. Kentucky, p. 92. Schieferdecker.

Elliptical polarization. Manner in which a plane wave is propagated in the vertical direction and direction of an electrical or magnetic field change as a function of time, that results from the superposition of two alternating fields that differ in direction and

Elliptic polarization. Manner in which a plane wave is propagated in the vertical direction and direction of an electrical or magnetic field change as a function of time, that results from the superposition of two alternating fields that differ in direction and in phase. Schieferdecker.
elutriate. To subject to elutriation. Webster.

eluvial ore deposit. A residual ore deposit.

eluvial gravels. Those gravels resulting from the disintegration in situ of the rocks which have contributed to their formation, in contrast to those deposited by wash, not by stream action. Pryor, 3.

elutriator. An appliance for washing or sizing solid into parts according to their weight.

elutriation. a. Purification or sizing by washing down to lower levels. A.G.I.

elutheromorphic. Relates to new minerals formed during metamorphism and which are independent of pre-existing minerals as regards to their shapes.

eluate. In the ion exchange process, pregnant solution eluted from loaded resins. Pryor, 3.

eluvia. The movement of soil material through a liquid or gas phase caused by surface tension, gravity, or pressure. A.G.I.

elviviation, mechanical. The removal from soil of the finer fractions of its mineral content by washing down to lower levels. A.G.I.

embankment. a. Artificial ridge of earth and materials emitted from volcanoes, fumaroles, or lavas at the earth's surface, usually consisting of a crown and pavilion of rock. A.G.I.

embankment, embolbolitkic. A mineral deposit consisting of fume emissions, volcanic. Volatile or nonvolatile materials emitted from volcanoes, fumaroles, or lavas at the earth's surface, usually consisting of a crown and pavilion of rock. A.G.I.

embankment, emaaatioas, snagmatk. A combination of volcanic and the hydrothermal fluids. S. also mineralizer. A.G.I.

emanation. a. The escape of radioactive gases from the materials on which they are held; also, in ion exchange processes, solution eluted from loaded resins. Pryor, 3.

emerald triplet. Same as emerald glass. Shipley.

emerald glass. Same as green glass, such as a dike or railroad grade across a valley. A.G.I. Swp b. A fill whose top is higher than the adjoining surface. Nichols.

emerald copper. Same as dioptase. Fay.

emerald cot. A rectangular step-cut faceted gem with corners beveled and all surfaces covered by a series of rectangular facets or steps. Sinkankas.

emerald filter. Same as emerald glass. Shipley.

emerald glass. a. Any green glass, such as used in the manufacture of imitation stone. Shipley. b. A glass of a beryl color made by fusing beryl; specific gravity, 2.5; refractive index, 1.52. Shipley. c. The usual trade name for a color filter through which genuine emeralds and some other genuine stones appear reddish to violetish while glasses imitations and some genuine stones appear green. Same as berylscope. See also Walton filter; detectoscope. Shipley.

emerald. A coined name for green-dyed chalcedony. Also, a name for a green-dark dye for fabrics, of no gemological interest. Shipley.

embossed. A decoration in relief, or excised on the ware surface. ASTM C242-60T.

embossing. Raising a design in relief against a surface. ASM Gloss.

embossing die. A die used for producing embossed designs. ASM Gloss.

embracement. A migmatic in which the structural features of the usual crystalline schists are still preserved, although often partly obliterated by metasomatism (recrystallization and growth of prefered minerals or mineral groups). Includes augen gneisses, bands of gneissed phyllices, and others. A.G.I.

embryo namer. Variation of the Fesse with inclined deck and end shake. (Obsolete). Pryor, 3.

embrillaments. Reduction in the normal ductility of a metal due to physical or chemical change. ASM Gloss.

emeralda. A trademark name for a yellowish-green synthetic spinel. Shipley. C.T.D.

emerald. A trademark name for a yellowish-green synthetic spinel. Shipley. C.T.D.

emerald, emerald triplet. A plutonic dike; an elvan dike, an elvan course. A plutonic dike; an elvan dike, an emerald triplet. A plutonic dike; an elvan dike, an
emerald triplet

triplet. See also triplet, b. A triplet consisting of (1) a thin plate of red garnet for the table, (2) rock crystal for the body, and (3) green glass for the lower part. Rio de Janeiro is in the former, as opposed to the latter, which is incorrectly used to designate green doublets.

Shiplap.

emeraldrine. Dioptase. Schaller.

emerandine. A light-green emerald winding. An arrangement to wind emery rock. A rock containing corundum and cortical tissues lacking vascular tissues, for example, rose prickles. A.G.I.

emianite. A variety of strontianite in lathlike granular; massive; probably identical with mutmannite. In thin yellow-green scales.

emietra. A polishing process in which a polishing wheel, a plummet cage, or emery And clay used for emery and iron ores. See also corundolite.

emietrite. In thin yellow-green scales.

empties. Empty mine or railroad cars. Empty railroad cars are called "flats" in Arkansas. Fay.

empties hitter. A track for storing empty mine cars. Fay.

empties. Empty mine or railroad cars. Empty railroad cars are called "flats" in Arkansas. Fay.

emptys. Empty mine or railroad cars. Empty railroad cars are called "flats" in Arkansas. Fay.

emptys hitter. A track for storing empty mine cars. Fay.
эмulsionification

Shell Oil Co. b. In metal cleaning, the suspension of fine divided matter, for example, mineral oil or grease, in an alkaline solution assisted usually by agitation and heating. P.W. b. A clay, clayey soil, or other agent added to water to form an emulsion. Long. c. A suspending or other agent added to water or oil or water and resin causing them to form an emulsion. Long. d. In penetrant inspection, a material that is added to some penetrants, after the penetrant is applied, that permits a water-in-oil emulsion to form. ASM Gloss. emulsifying agent. A material in small quantities that increases the stability of a dispersion of one liquid in another. ASM Gloss. emulsifying agent. a. Emulsification. A liquid mixture in which a fatty or resinous substance is suspended in minute particles almost equivalent to molecular dispersion. Fay. b. A combination of water and oil material made miscible with water through the action of a soap or other agent. Long. c. A suspension of one finely divided liquid phase in another. ASM Gloss. d. The mud-laden fluids used in oil well drilling often contain substances that are emulsified; hence diamond drillers often refer to mud used in diamond drilling as an emulsion. Long. emulsions breaking rate. In uranium technology, rate of disengagement of phases (aqueous and organic carrier). ASM Gloss. emulsion cleaner. A cleaner consisting of organic solvents dispersed in an aqueous medium that is an aid of an emulsifying agent. ASM Gloss. emulsion injection. An artificial cementing agent. See headways. SMRB, Paper No. 61. emulsion injection. Artificial cementing agent. See headways. SMRB, Paper No. 61. emulsion injection. A process of breaking slurry by adding a chemical, thus producing a fluid of small droplet size. Typical emulsions are those found in dewatered coal slurries, in which a water-in-oil emulsion is produced. Bence. emulsion injection. A process of breaking slurry by adding a chemical, thus producing a fluid of small droplet size. Typical emulsions are those found in dewatered coal slurries, in which a water-in-oil emulsion is produced. Bence.
large faces are inclined towards each other in such a way that one of the end faces is smaller than the other. Dodd.

end arch. A roof of the charnockite series composed of quartz, plagioclase, hypersthene, and accessory magnetite and zircon. A medium-grained, gray phalutonic rock with conspicuous blue quartz. Hess.

eend arch. A coal face that is at right angles to the main cleats in the seam. Nelson.

eend arch. See feather brick. Dodd.

eend-fired furnace. A furnace with fuel supplied from the end wall. ASTM C162-66.
