Following an introductory section outlining basic concepts of systems theory, this paper presents a model for the examination of the relationship between formalized teacher education and larger systems. These systems include the university system, the field of education as a system, and the societal system in general. The first part of the model is an input-structure-output matrix; the second is a similar matrix which focuses on goals and evaluation methods and criteria. The second matrix is designed to facilitate examination of the systems in question according to certain criteria for a type of intersystemic relationship called "synergy." Synergy is considered a desirable phenomenon since it results from similar subsystems functioning so closely that the total effect is greater than sum of the subsystem effects. Sample data is provided for each matrix based on a study of the literature. It is suggested that the model would be most useful in specific research performed within a given region or national subsystem. (RT)
The Interrelation of Systems: A Systems Look at Where Teacher Education Fits into the Whole of Education, University, and Society

FOREWORD

The model explicated in this paper was initially presented at a clinical workshop of senior professors and deans from teacher training institutions during the February 1971 convention of the American Association of Colleges for Teacher Education in Chicago.

The Clearinghouse has worked with the AACTE Committee on Studies to develop this publication. This cooperation is an example of efforts to collaborate with Clearinghouse sponsors in identifying significant topics and writers. Recognition is due Dr. Mark Smith, AACTE associate director who had staff responsibility for the functioning of the Committee on Studies.

A major contribution to this work was a Query search of ERIC documents by Mrs. Moira B. Mathieson, Clearinghouse information analyst. Mrs. Margaret Donley, Clearinghouse publications coordinator; Mrs. Lorraine Poliakoff, senior information analyst; Miss Christine Pazak, publications assistant, have converted the author's manuscript into this published form.

The accompanying bibliography may be updated by checking recent issues of Research in Education (RIE) and Current Index to Journals in Education (CIJE). Both RIE and CIJE use the same descriptors (index terms). Documents in RIE are listed in blocks according to the code letters of the clearinghouse which processed them, beginning with the ERIC Clearinghouse on Adult Education (AC) and ending with the ERIC Clearinghouse on Vocational and Technical Education (VT). The clearinghouse code letters, which are listed at the beginning of RIE, appear opposite the ED number at the beginning of each entry. "SP" (School Personnel) designates documents processed by the ERIC Clearinghouse on Teacher Education.

In addition to using the ERIC Thesaurus, RIE, CIJE, and various ERIC indexes, you will find it helpful to be placed on the mailing list of the ERIC clearinghouses which are likely to abstract and index as well as develop publications pertinent to your needs and interests. The newsletters are provided on a complimentary basis on request to the individual clearinghouses.

Users who become efficient in using ERIC searching tools and techniques can develop their own specific bibliographies. The indexing system can refine a search to the point where one reads only entries that meet his specifications. In many cases, reading the abstracts will be adequate for the needs; in other cases one may wish to use the information which ERIC provides to secure documents from either the original publishers or from the ERIC Document Reproduction Service. (See Ordering Information).

For readers uncertain how to use ERIC capabilities effectively, we recommend the following which are available in microfiche and hardcopy through the ERIC Document Reproduction Service: (a) How To Conduct a

THE INTERRELATION OF SYSTEMS: A SYSTEMS LOOK AT WHERE TEACHER EDUCATION FITS INTO THE WHOLE OF EDUCATION, UNIVERSITY, AND SOCIETY

By Francis J. Pilecki

INTRODUCTION

This paper presents a model, based upon concepts derived from general system theory, for the examination of the relationship between formalized teacher education and larger systems. These systems include the university system, the field of education as a system, and the societal system in general.

The model is in two parts. The first is an input-structure-output matrix used to delimit data and loci. The second is a similar matrix which facilitates examination of the systems in question according to certain criteria for the (desired) second order of intersystemic relationships—the "synergy." In addition, an attempt is made to classify these relationships and to identify the implications for teacher education systems. A preliminary section contains certain basic concepts of general system theory.

The magnitude of this task should be evident, as should the inherent difficulties, since each of the systems identified may be seen as a macro-system in itself. They are huge, complex systems which when placed on a continuum show similarities and differences within themselves. These apparent disparities are generally a function of social influence, demography, or traits peculiar to a given national sector. Moreover, the very existence of macrosystems of the sort being examined somewhat contiguously introduces the problem of spatial blur in which inputs, client-members, and overall spatiality are unclear in terms of boundaries. Thus, as will be seen in the model, a given input, such as "value system," tends to exist within each macrosystem as one becomes a suprasystem for a smaller system. Hopefully, the degree of specificity increases as a function of the scrutiny from suprasystems to subsystems. On the other hand, a systems-oriented model does permit an individual to apply the framework within the parameters of a delimited geographic or economic region—a feature whose utility is recognized by the more minute focus it offers a given region.

THE CONCEPT OF SYSTEM

A system may be defined as "a set of interacting units with spatial as well as temporal boundaries." In addition, systems exist with a definable orientation, that is, with a purpose. In the context of this

paper, it may readily be seen that with the exception of the smallest system, all systems contain smaller (sub-) systems. With the exception of the largest system, all systems are part of larger (supra-) systems. The following illustration will clarify.

One of the systems being considered in this paper is the field of education. In America there are included some 120,000 elementary and secondary schools and nearly 2,500 universities and colleges. There are also included about 55 million students, instructors, and administrators. The potential number of useful subsystems is a function of mathematical combinations. Not to be overlooked as subsystems would be an individual student or an individual instructor. On the other hand, the field of education exists within the suprasystem of the American societal system, and so forth.

The education system may be seen as a macrosystem because of the complexity of major subsystems within it. Marien includes the following:

1. Educating Institutions: higher educating systems of graduate, undergraduate, and junior college institutions;
2. Periphery: education as a part of corporations, the military, proprietary endeavors, correspondence schools, vocational training, anti-poverty programs, educational television, other adult education, and other child education systems;
3. Foreign Extensions: of (1) educating institutions, and (2) periphery;
4. Organized Beneficiaries: Institutions, academic and other professionals, and student, parent, and alumni clientele; and,
5. Selected Suppliers: Accrediting associations, testing organizations, educational research groups, and the educationally related components of governments, industry, publishers, foundations, and consultant organizations.2

Systems share certain commonalities. As "open" systems they exchange energies with their environments. This is done through the conversion of incoming energies (inputs) to products and/or effects (outputs) through a series of processes and controls (system structure). The key to system productivity in terms of outputs is the interrelationships within the system structure. Thus, the bases for the model to be presented below are in the input-output linkages and the subsystemic interrelationships.

Other commonalities exist. There is a tendency in all systems towards entropy or the states of disorder, randomness, chaos, and death. The tendency away from entropy (negentropy) may be induced through an adaptation in system action such as new goals, new strategies, or new outputs—all functions of relevant responsiveness to environmental thrusts. Similarly,

within systems there is at once a tendency for the system to break apart (progressive segregation) and to become more unified (progressive mechanization). An example of these phenomena is the frequent tendency towards individuality within the ranks of the states while working towards a stronger federal unity as a nation. Also, systems may achieve similar outputs despite disparate starting conditions (equifinality).  

There are essentially three types of intra- and inter-relationships between systems and subsystems.

First, there is the functioning of dissimilar subsystems toward a common goal. Such subsystems depend upon each other for their individual existence and survival. Next is the functioning of similar subsystems in such close relationship that the result is greater than any subsystem functioning independently. This is termed a 'synergistic' relationship. The third order relationship is identifiable when similar subsystems either duplicate or work in opposition to the others' actions. Hence, redundant or contradictory relationships.

The development of synergistic relationships is paramount to harmonious achievement of systemic goals since they maximize the effectiveness of the systems involved and minimize the potential for abuse of smaller systems, including individuals. The term "synergy" is derived from "synchronized energy," and its initial use in the social sciences is attributed to Benedict. The concept has special significance in terms of the scrutiny of ultimate functioning among the systems, indeed macrosystems, to which this paper is addressed.

THE MODEL

The first segment of the model attempts to present the basic input→structure→output schema in relation to the system of teacher education. To accomplish this, it is necessary to identify the inputs and other properties from each of the following systems: teacher training colleges, universities, the field of education, and society. Thus, a matrix is used so that major energies from each system can be identified if only they may be seen coming more from one system than the others. As stated

---

3A reader interested in pursuing the study of system properties and components may be interested in Glenn L. Irmeart and Francis J. Pilecki's Systems Theory for Educational Administrators (Reading, Mass.: Addison-Wesley, 1972).

4Pilecki, op. cit., pp. 51-52.

previously, the fact that each system may well be a macrosystem existing in yet larger systems would seem to preclude simple system-negasonic contrasts.

The basis for this model is derived from the research Immegart did in his attempt to formulate a taxonomy of organizational behavior in education.7 (Needless to say, the more generic "black box" depiction of system stems from the writings of Ashby.)

Inputs are seen to be of two types: operand inputs are those energies acted upon; operator inputs are those which act to effect further system action. The structure of the system is similarly subdivided into processes—decision making, communications, and other actions which convert inputs to outputs—and controls—system monitors on processing. Finally, outputs are divided into productivity, affectivity, and feedback. Productivity is the tangible results or substantive outcomes of system action, affectivity is the sensed impact or intangible outcomes of system action, and feedback is evaluative information resulting from system action.

The following matrix illustrates the foregoing.

<table>
<thead>
<tr>
<th>SYSTEM: Teacher Education</th>

</tr>
</tbody>
</table>

In Matrix 1.1 an attempt has been made to provide certain data appropriate to the related system and the specific properties of the teacher education system. These data are general in nature and would seem to be valid for various national locations.

It would now seem appropriate to examine the suggested relationships in terms of the systemic relationship order. Since the symbiotic relationship is a mutual linkage vital to the continuation of involved unlike systems, it would seem that such a linkage need not be dealt with in great detail. Rather, careful scrutiny should be given the criteria for synergistic relationships as well as the converse, that is, the contradictory or redundant relationships. There are several criteria for establishing synergy:

First, the final or overall objective of the system must be understood and accepted by (all) . . . and consequently, must direct that system. Redundant and contradictory relationships occur when the anticipated and desired output is vague, misunderstood, and not totally accepted.

. . . Within any social system, apart from the final goal or desired output, there are subgoals and more immediately attainable objectives. These are the steps to be accomplished during the overall pursuit of reaching the final goal. To achieve synergy, these subgoals must be coordinated and contiguous tangential goals which do not fit into the total design tend to lead to contradictory effects.

. . . At all levels goal achievement is a function of coordinated strategies known and agreed to by all affected subsystems. When each subsystem chooses an independent posture, there results a failure in the total system plan.

Lastly, the criteria for assessing the achievement of goals must be measurable within defined ranges. . . . Redundancy of subsystem action is inevitable when the reliance is placed on achievement of the sub-goal only, if indeed any criterion is used at all.8

The four criteria cited above are shown in Matrix 2.0. The question being asked regards the anticipated output, the forces, the means, the assessment criteria of the teacher education system from the perspectives of society, the field of education, universities, and teacher training systems.

IMPLICATIONS

In the foregoing section data were provided to complete each of the two matrices. These data were generated from a cursory review of the literature along with a consideration of the responses by clinical workshop participants referred to earlier. It is presupposed, however, that the real utility of this model would be found in its employment within a delimited geographic or regional boundary. Thus, one might seek to identify inputs from the various macrosystems as they exist in New England, the Northwest, or the Southeast. An array of responses from a cross-section of members from specific systems might well provide more precise and useful data.

These responses would then be scrutinized for similarities and dissimilarities both within each system and among systems. Data regarding the latter would be the basis for further scrutiny in terms of synergy-redundancy conflict. Data regarding the former may be useful in examining systemic progressive segregation and mechanization and might also allow at least conjectures, if not quantifiable information, regarding entropic-negentropic balances.

Merrimack-Andover Assessment

Using one facet of the foregoing model, the Merrimack Education Center9 of Chelmsford, Massachusetts, in conjunction with the Andover, Massachusetts, Public Schools developed an instrument (see Matrix 3.0). The objective was to assess inputs from parents, students, educators, and the community regarding educational goals. A list of goals was presented, and members of each group (or system) were asked to rate each particular goal in terms of their perspective (actual responses). In addition, they were requested to rank each goal according to what they thought were the perspectives or priorities of other groups (perceived responses). A comparison of actual and perceived priorities was made, and it proved a useful method for identifying and, subsequently, for resolving inter-group conflicts— or, attempting to develop synergy.

In terms of the matrices presented in this paper, similar ranking procedures could be utilized, and chi-square formulae used to identify similarities and differences.

SUMMARY

Two matrices have been presented as a model for examining inter- and intra-systemic relationships between the system of teacher education and the systems of society, the field of education, universities, and teacher training colleges. The matrices were completed with generalized data derived from a literature search and a limited uni-occupational, though multi-geographical, population.

9 The Merrimack Education Center is an educational broker, funded from state, federal, and local monies.

10 The source of this instrument is The Merrimack Education Center, 101 Mill Road, Chelmsford, Massachusetts, Dr. Richard J. Lavin, Executive Director; and The Andover Public Schools, Andover, Massachusetts, Dr. Kenneth Seiffert, Superintendent.
This paper showed the utility of the model for more specific research which could be performed within a given region or national subsystem. A brief statement regarding concepts basic to general system theory was offered as an explanation and a rationale for both terms and methodology. This model may be useful for future research of a more intense nature.
BIBLIOGRAPHY

ERIC DESCRIPTORS

To expand a bibliography using ERIC, descriptors or search terms are used. To use a descriptor: (1) Look up the descriptor in the SUBJECT INDEX of monthly, semi-annual, or annual issue of Research in Education (RIE). (2) Beneath the descriptors you will find title(s) of documents. Decide which title(s) you wish to pursue. (3) Note the "ED" number beside the title. (4) Look up the "ED" number in the "DOCUMENT RESUME SECTION" of the appropriate issue of RIE. With the number you will find a summary of the document and often the document's cost in microfiche and/or hardcopy. (5) Repeat the above procedure, if desired, for other issue of RIE and for other descriptors. (6) For information about how to order ERIC documents, turn to the back pages of RIE. (7) Indexes and annotations of journal articles can be found in Current Index to Journals in Education by following the same procedure. Periodical articles cannot be secured through ERIC.

ABOUT ERIC

The Educational Resources Information Center (ERIC) forms a nation-wide information system established by the U.S. Office of Education, designed to serve and advance American education. Its basic objective is to provide ideas and information on significant current documents (e.g., research reports, articles, theoretical papers, program descriptions, published and unpublished conference papers, newsletters, and curriculum guides or studies) and to publicize the availability of such documents. Central ERIC is the term given to the function of the U.S. Office of Education, which provides policy, coordination, training, funds, and general services to the 19 clearinghouses in the information system. Each clearinghouse focuses its activities on a separate subject-matter area; acquires, evaluates, abstracts, and indexes documents; processes many significant documents into the ERIC system; and publicizes available ideas and information to the education community through its own publications, those of Central ERIC, and other educational media.

TEACHER EDUCATION AND ERIC

The ERIC Clearinghouse on Teacher Education, established June 20, 1968, is sponsored by three professional groups—the American Association of Colleges for Teacher Education (fiscal agent); the Association of Teacher Educators, a national affiliate of the National Education Association; and the Division of Instruction and Professional Development, National Education Association. It is located at One Dupont Circle, Washington, D.C. 20036.

SCOPE OF CLEARINGHOUSE ACTIVITIES

Users of this guide are encouraged to send to the ERIC Clearinghouse on Teacher Education documents related to its scope, a statement of which follows:

The Clearinghouse is responsible for research reports, curriculum descriptions, theoretical papers, addresses, and other materials relative to the preparation of school personnel (nursery, elementary, secondary, and supporting school personnel); the preparation and development of teacher educators; and the profession of teaching. The scope includes the preparation and continuing development of all instructional personnel, their functions and roles. While the major interest of the Clearinghouse is professional preparation and practice in America, it also is interested in international aspects of the field.

The scope also guides the Clearinghouse's Advisory and Policy Council and staff in decision-making relative to the commissioning of monographs, bibliographies, and directories. The scope is a flexible guide in the idea and information needs of those concerned with pre- and inservice preparation of school personnel and the profession of teaching.
ORDERING INFORMATION

Documents cannot be ordered without an "ED" or order number. The "ED" number is listed with each citation. Once the reader has the "ED" number, he must order the document directly from the ERIC Document Reproduction Service (EDRS), P.O. Drawer 0, Bethesda, Maryland 20014.

To determine the cost of a document, the reader should look at "EDRS Price" or "Publisher's Price" in the citation. Information such as "EDRS Price: MF-$0.65; HC-$3.29" means that the document may be obtained from EDRS in microfiche (MF) for 65 cents or in "hardcopy" for $3.29. A microfiche is a 4 by 6-inch form containing images of the pages of the documents, as many as 60 pages per fiche, each image representing a standard-sized sheet of paper. Microfiche readers, available from many manufacturers, are required to enlarge the images for reading purposes. Hardcopy prints are black and white 6 by 9-inch pages.

Payment to EDRS must accompany orders totaling less than $10. A special handling charge of 50 cents must be added to all orders. Applicable local state sales tax should be added to orders or a tax exemption certificate should be submitted.

If an individual or institution would like to subscribe to RIE, a check or money order should be sent to the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402. The domestic rate is $21 per year; foreign, $26.25. Single issues sell for $1.75.
