This report, one in a series of three, is designed for elementary and secondary school teachers of the urban/disadvantaged to familiarize them with the field of environmental education. Following a general orientation, specific problems and needs are identified and research related to these is noted. Current practices concerning environmental education programs and materials are summarized together with recommendations regarding their development and implementation. Brief descriptions of selected programs and materials and case studies describing program development and implementation are included. Sources of information for supplementary materials are also listed. A copy of the Environmental Education Curriculum Analysis Instrument, along with a summary of learning approaches to environmental education, conclude the work. This publication is the result of a cooperative project by the ERIC Clearinghouse for Social Studies/Social Science Education (ChESS), Boulder, Colorado, and the Clearinghouse for Science, Mathematics, and Environmental Education (SMEAC), Columbus, Ohio. For similar documents related to elementary and secondary school teachers and school administrators see SE 013 489 and SE 013 491. (BL)
ABSTRACT

This publication designed for teachers of the urban/disadvantaged begins with a discussion which provides the reader with an orientation to the problems associated with environmental education. Specific problems and needs are identified and research related to these is summarized. Current practices concerning environmental education programs and materials are summarized. Recommendations concerning development and implementation of environmental education programs and materials are made. Included are brief descriptions of selected programs and materials. Case studies describing program development and implementation are also included. Sources of information for supplementary materials are listed. A copy of the Environmental Education Curriculum Analysis Instrument is included, along with a summary of learning approaches to environmental education.
A REVIEW OF ENVIRONMENTAL EDUCATION
FOR TEACHERS OF URBAN/DISADVANTAGED

FOREWORD

This report, one of a series of three, is the result of a cooperative project by the ERIC Clearinghouse for Social Studies/Social Science Education (ChESS) at the University of Colorado, Boulder, Colorado and the Clearinghouse for Science, Mathematics, and Environmental Education (SMEAC) at The Ohio State University, Columbus, Ohio.

This joint effort permitted bringing together the complementary specialty areas of Social Science and Science as they relate to Environmental Education for purposes of reviewing educational materials and programs. An undertaking of this kind requires the cooperation of many people. We would like to express our appreciation for the contributions of the many people involved and most especially to: Mary Jane Turner, Larry Singell, Ellen Schultheis, Stanley Kleiman, Karen Wiley, W. William Stevens, Jr., Irving Morrissett, James E. Davis, Robert W. Howe, Patricia E. Blosser, Robert E.Roth, John Disinger, Beverly Lee, Maxine Weingarth, Linda HemmeLe, Anne Spencer, Frances Haley, Nancy Vickery, O'dette Havel, Peter Helburn, Connie Maupin, and Kacy Fowle.

PART A: DISCUSSION

INTRODUCTION AND BACKGROUND

Environmental quality has become established as a national concern, prominent in the news media, in statements by government officials and in the lives of the public. A major focus of this concern is with the role of the schools in educating people to deal with the problems of a deteriorating environment. It is to this problem that this report is addressed.

The purpose of this project was to review materials and programs in environmental education to meet the expressed and identified needs of the target audiences: elementary and secondary school teachers, teachers of urban/disadvantaged, and school administrators. In so doing, the project undertook to review and summarize research related to environmental education; to identify, appraise, and describe promising programs and practices in light of the special needs of the target groups; to consider existing trends, gaps and weaknesses in educational materials and programs; and to present models of development and implementation.

Background of this Report

Considerable effort has gone into developing environmental education resources in this country in recent years. During the House Subcommittee hearings on the Environmental Education Act of 1970, both witnesses and committee members voiced the need for an inventory of these resources. Such an inventory would help us to avoid unnecessary duplication in future environmental education efforts, would indicate gaps and weaknesses in the field which need to be remedied, and would provide much-needed information to teachers, administrators, and other practitioners in need of help in selecting materials and building new programs.

In early 1971, the U. S. Office of Education commissioned the ERIC Clearinghouse for Science, Mathematics, and Environmental Education (ERIC/SMEAC) to conduct such an inventory of the environmental education materials produced under Title III of the Elementary and Secondary Education Act. Shortly thereafter, ERIC/SMEAC also undertook to survey existing non-Title III science education materials related to environmental education and the ERIC Clearinghouse for Social Studies/Social Science Education (ERIC/ChESS) began a survey of non-Title III social science materials containing environmental education components.
Content of the Report

Information needs of elementary and secondary school teachers were determined through interviews with representatives of that segment of educational personnel; through interviews with elementary school, secondary school, and college students, interviews with other persons involved in environmental education (such as state coordinators, teacher educators, etc.); and from an analysis of the literature (including research publications, program descriptions, articles regarding authors' opinions, conference reports, etc.)

Results of this data collection process were analyzed and are reported in the second section of this report, "Problems and Needs."

Section three presents a summary of research pertinent to the problems and needs identified. Section four presents a brief analysis of the current status of environmental education and identifies selected programs and materials which should be useful to the teacher concerned with environmental education. It is the intention of the authors of this report to supply information which will help teachers plan environmental programs and select environmental materials wisely and rationally and to direct them to sources of further information which may be useful in curriculum planning for environmental education.

Section five presents recommendations and suggestions for teachers regarding the development of environmental education programs. Recommendations identified are based on interviews with many people involved in environmental education, analysis of research related to environmental education, and analysis of literature related to environmental education, (both published and unpublished).

Part B of the report contains short analytic "data sheets" describing the operating programs and materials packages which were selected from those surveyed, a list on information sources related to environmental education, and a copy of the instrument used to analyze programs and materials.

Each program or set of materials analyzed has a separate data sheet. The identification at the top of each data sheet includes the name of the sponsoring institution, the name of the project, and the name of the program or the title of the materials. This is followed by a section giving data on the project directors or authors, the project address, the publisher and publication information, appropriate grade levels, and
dominant subject area orientation of the materials. The "Overview" provides an overall, "quickie" description of the materials. This is followed by more specific descriptive information on "Required or Suggested Time," "Intended User Characteristics," "Rationale and General Objectives," "Content," "Evaluative Data," and "Materials and Costs." The overall format of these data sheets was modeled after the format of the Social Studies Curriculum Materials Data Book (published by the Social Science Education Consortium, Inc., Boulder, Colorado), which has been found to be extremely useful by curriculum decision-makers.

A Framework For Environmental Education

In the last few years a number of problems have risen to the surface of national consciousness and have been discussed and worried about as though they were parts of one big problem, or were at least closely related to each other. These problems include pollution of many kinds, overpopulation, shortages and waste of natural resources, and deterioration in the environment and in the quality of life. We shall refer to this group of problems as "environmental problems," or "the environmental problem."

There is no one way to describe, analyze, and try to solve any particular problem or group of problems. This paper suggests a particular way of organizing our thinking about environmental problems, of analyzing their major causes, and of moving toward solutions. The purpose of suggesting such a framework is to simplify the study of these problems and their solutions--that is, to facilitate "environmental education."

The need for a framework for thinking about environmental problems seems clear. With the recent and current interest demonstrated throughout the nation in environmental problems, there is a bandwagon effect which tempts many individuals and groups to declare that their particular interest or program is at the heart of the environmental problem. It is true that "everything is related to everything," and it is also true that one of the great lessons to be learned from the current concern with environmental problems is that some human actions and decisions have consequences which, although indirect and remote, may be cumulative and disastrous for human welfare. Nevertheless, it is absolutely essential that any problem area that is to be studied seriously be limited in scope. No problem can be analyzed and solved unless it is well defined and thus set off from a multitude of other problems. No group of problems can be studied profitably as a group unless there is some good rationale for studying them as a group rather than in isolation from one another.
There are three possible reasons for grouping a number of very specific problems into a general problem, or for grouping a number of general problems into a broad problem area. One reason is that the various problems may be explained by causes that are common or closely related; the second reason is that the problems may have very similar consequences; the third is that the various problems may be solved by common or closely related solutions. Usually a problem or problem area is defined to some extent by all three—commonality of causes, commonality of consequences, and commonality of solutions.

As an example of commonality of explanations, problems such as "Why and how do oxygen and hydrogen combine to form water?" "Why and how does exposure of iron to the atmosphere cause rust?" and "Why do some substances react with others, and some substances not?" from a group of problems which, it has been learned, can usefully be studied together because the explanations are all related to the structures of atoms and molecules.

As an example of commonality of consequences, problems such as "Why are most urban transportation systems poorly run and in constant financial difficulties?" "How should allowable heights of buildings be determined?" and "How should urban land and buildings be taxed?" have often been grouped together because they bear on a common batch of consequences, sometimes referred to as "the urban mess." As an example of commonality of solutions, problems such as "What speed will maximize the car-carrying capacity of a highway?" "Which intersections should be controlled by traffic lights, stop signs, yield signs or no signs?" and "What are the appropriate identification signs for police cars?" are grouped together because they are focused on a common group of solutions—that is, methods of traffic control.

The reluctance of persons concerned with environmental problems and environmental education to define the area of their concerns has led to a diffuseness in the discussion of the problems which is unlikely to lead to useful analyses of the problems or to successful resolutions of them. Virtually the whole of science education and of outdoor education have been declared by some persons to be a part of—perhaps the major part of—environmental education. To a lesser extent, large portions of social science education and of morality and ethics have been declared to be a part of environmental education. Accompanying these declarations about what the content of environmental education is or should be, there have been extensive efforts to get certain solutions adopted, based on little or no analysis of the problem. Solutions, the wisdom of which seems obvious to the proposers, have often been pushed vigorously, without analysis of the causes of the problem or of the
repercussions of the solution. A certain amount of the literature on the environmental problem might well be called "eco-evangelism"—the ardent propounding of solutions accompanied by little or no analysis of causes of, alternatives to, or results of the solutions.

Definition of the Environmental Problem, Environmental Science, and Environmental Education

The study of any particular aspect of existence, as has been stated above, is usually delimited by a commonality of causes, a commonality of consequences, or a commonality of expected or proposed solutions—although the dividing line between these three is not sharp. If the emphasis is on the causality, the field thus defined is usually called a science. If the emphasis is on the consequences or solutions, the field is likely to be called a problem, a problem area, or an applied science.

We suggest here three definitions which are closely related to each other. The "environmental problem" is defined first, because the whole group of issues related to the three definitions arose first as a problem or group of problems having interrelated consequences and calling for solutions. Environmental science and environmental education have been defined, for the most part implicitly, with respect to "environmental problems."

An "environmental problem" can be defined as a problem or group of problems that involve consideration or reconsideration of human value systems and either (or both) natural resources (human, soil, minerals, plants, animals, water, air, etc.) or social, biological, biophysical, or biosocial interactions.

"Environmental science" is defined as the study of real or perceived environmental problems.

For the purposes of this report the definition used is that included in The Environmental Education Act (Public Law 91-516) which defines environmental education as:

the educational process dealing with man's relationship with his natural and manmade surroundings, and including the relation of population, pollution, resource allocation and depletion, conservation, transportation, technology, and urban and rural planning to the total human environment.
While no uniformly accepted definition of environmental education is currently in use among practitioners, the U.S. Office of Education (1970) notes that some agreement does exist concerning the basic characteristics of good environmental education which include:

- a multidisciplinary approach, with an emphasis on the interrelationships of man and nature;

- a focus on contemporary problems relating to the urban and rural environment—manmade and natural;

- incorporation of nonformal as well as formal education processes and utilization of resources outside the classroom;

- development of understanding and attitudes as well as information;

- involvement of all age groups; and

- a participant-centered design, involving each learner/participant in choosing priorities both as to the issues to be studied and the solutions that seem most appropriate. This design allows the participant to learn "how to learn" about new situations, how to weigh alternatives and how to test solutions.

Most good programs involve action oriented activities.
PROBLEMS AND NEEDS

Sources

A variety of sources provided input in determining the needs and problems of persons responsible for environmental education. These sources included information requests directed to the ERIC system, elementary and secondary teachers, State Department of Education personnel, and literature related to environmental education.

Queries directed to the ERIC system tend to reflect the questions being raised elsewhere and are concerned with all levels of education, K-12. Requests for information occur as letters or phone calls to the Clearinghouses and as questions from individuals at conferences where ERIC is represented. Approximately 45 percent of the people asking questions are teachers, about half of whom are elementary and half secondary school teachers; about 25 percent are people such as principals, curriculum specialists, or supervisory personnel who have administrative responsibility for environmental education programs; about 10 percent are persons with combined positions such as supervision and teaching; and about 10 percent have miscellaneous or unidentified responsibilities.

Specific concerns, needs, and constraints with respect to environmental education were solicited from teachers by both the Columbus and Boulder branches of the project. The teachers included persons from rural, suburban, and urban areas with teaching responsibilities at both the elementary and secondary levels. Representatives were included from virtually every state in the union with the largest number of people from the states of Colorado, Ohio, Illinois, Wisconsin, and West Virginia.

Concerns about the environment and environmental education were also obtained from elementary and secondary school students in urban settings, primarily Ohio and Oregon, and from a small group of college students from urban communities in California, Ohio, Pennsylvania, Michigan, Illinois, New York, New Jersey, Massachusetts, and Missouri.

State Department of Education supervisory personnel responsible for social science, science, and environmental education from over 40 states were involved in conferences with ERIC/ChESS or ERIC/SMEAC personnel. The environmental education
information needs identified by the State people were determined with respect to both the kinds of information requested of them and the persons making the requests. With some variations, the originators, in order of numbers, of queries to State personnel seem to be elementary school teachers, administrators, and secondary school teachers. This order does not differ significantly from requests to the ERIC centers.

Literature in the ERIC system was reviewed to determine whether other questions or concerns of educators related to environmental education could be identified. Included were documents from other environmental conferences; curriculum and program development in the disciplines such as PSSC, BSCS, and the Geography Project; journals in the disciplines, in education, and administration; information on attempts to develop information kits such as those by the Far West Regional Laboratory; and, references related to teaching in urban-disadvantaged areas.

The personnel of the Social Science Education Consortium, in Boulder, Colorado, contributed to the general assessment of the field in at least two ways. The files of the Consortium were searched in order to determine kinds of assistance requested from practitioners in the field, and the educational position of the people making requests. Individual staff members prepared analyses of the sorts of questions they are asked to answer in the course of conducting workshops, in-service training meetings, and Resource and Reference Center tours. Secondly, the Consortium utilized the feedback and evaluation instruments which have been applied to revise their own Curriculum Materials Analysis System and the Data Book, published by the SSEC in 1971, in order to produce a "requested information" profile. The tabulations in this instance again gave similar results to the attempts noted above.

The Urban Setting

During the past fifty years, the United States has become predominantly an urban nation. Over 70 percent of the population of the country currently live on less than two percent of the nation's surface. It is estimated that within the next 10 years between 75 to 80 percent of the people in this country will live in urban areas.

Man should have an awareness and understanding of his community and its associated problems, as well as his natural
environment. Urban citizens can directly influence the urban environment by their own activity and at the ballot box on community issues and in electing representatives. Urban citizens also influence the rural and suburban environment by direct activities and by voting on issues and for representatives.

The typical urban setting presents many environmental problems, often with contrasts from neighborhood to neighborhood. From an analysis of recent publications the following are presented as examples of current urban problems:

1. Air pollution due primarily to automobile and industrial emission is greater in most cases for urban areas than for rural or suburban. The problem is usually most critical in many core city areas.

2. Many urban dwellers in older buildings often have water pipes made with lead as well as walls covered by paints containing lead.

3. Access to recreation areas is limited. Many of the water recreation areas which are accessible are heavily polluted. In many cities, open space has decreased due to construction of roads and buildings.

4. Solid waste problems due to garbage, junk, and litter are usually much more serious in urban areas than in suburbs or rural areas. This is especially serious in inner city areas. Such conditions lead to various health problems including disease and rat infestation.

5. In many cities especially inner city areas, neighborhood deterioration is a serious problem. Problems of abandoned housing, lack of repair to occupied housing, and overcrowding affect the rate of deterioration.

6. Problems due to the construction and presence of highways and streets has a negative effect on many urban areas. Road construction often divides areas, encourages zoning changes which affect the neighborhood, and creates noise, congestion and pollution.
The inner city areas usually have the most obvious environmental problems, though many areas away from the inner city have similar problems. These conditions affect both the residents of the particular area, other residents of the city, people who work in the city, other residents of the state, and visitors.

For many city dwellers some of the traditional environmental topics of preserving wilderness areas developing national parks are not central concerns. Many of their concerns are related to the quality of life. While some action has been taken related to these concerns by city groups, environmental organizations, and Federal programs in a number of cities, much needs to be done to improve the urban environment.

Problems and Needs Regarding Environmental Education Programs (Curricula) and Materials

Interviews, analysis of the literature, and reviews of programs and materials provided considerable information about programs and program needs and materials and material needs.

1. It was generally felt that schools ought to develop environmental education programs. Status: In most urban schools environmental education programs have not been developed. Many of the teachers interviewed felt that there was a need for personnel to be assigned to the task of program development, that programs in operation in urban areas should be identified, and that materials (print and non-print) developed should be identified.

2. Environmental education programs should be developed on a curricular basis for grades K-12. Status: Some school systems have developed programs at the elementary school level and at the secondary school level, but have not coordinated the two programs. In other schools experiences are provided throughout the school system, but have not developed into a related program. Teachers, supervisors, and administrators interviewed desired examples of model K-12 programs which might be considered. They also felt information regarding the procedures used to develop other K-12 programs would be helpful.
3. Programs should stress broad concepts and problem solving, and be oriented toward action programs. Status: Most city school systems have not developed programs with these characteristics. Persons interviewed had questions regarding sources of programs with these characteristics, materials used in such programs, and procedures by which the programs were established.

4. Urban schools should utilize local environments and should stress local environmental problems. Status: Nearly all school personnel interviewed agreed that this was desirable. While some schools are making excellent progress in this direction, many are not. Analyses of existing school programs indicate more experiences in urban environments are being provided. Many programs, however, still are oriented primarily to the environment outside the city, rather than to the urban environment. Analyses of existing school sites at many locations throughout the country indicate little concern for the development of study areas around the schools. Most school sites observed, which were developed during the past year or being developed at the current time show little change in site design.

Teachers and Administrators requested information on programs and materials developed that did focus on the urban environment. They also requested information on site plans for school study areas and for modification of school buildings to improve environmental education programs.

5. Programs and materials should be interdisciplinary using concepts and methods from various disciplines to focus on environmental problems. Status: While many of the programs being developed are interdisciplinary,
most of the materials that have been produced have been primarily science oriented or conservation oriented and have not provided a broad consideration of many problems. Materials received in recent months at the ERIC Center for Science, Mathematics, and Environmental Education indicate more interdisciplinary materials and programs are being developed. It was felt by most persons interviewed that current information regarding such developments should be made available to all schools in the country.

6. Materials are needed which are flexible; that is, they should be modular in style, ungraded, and make use of a variety of media.
Status: Analyses of materials reviewed and information regarding materials being developed indicate examples of such materials are available and more will be available within the next year. While some urban schools have a few such units or modules, very few have the variety and number needed.

7. Materials should be available which are relatively easy to read. Selected materials should be made available in a second language, such as Spanish.
Status: While some materials indicate an effort to reduce the reading requirements of the materials, most do not. There is a definite need for materials which are designed for educationally disadvantaged students.

8. Environmental education programs should involve the total community.
Status: Most urban school programs have not obtained intensive community involvement. Several schools requested information regarding "models for involving the community." The teachers and administrators indicated a willingness to act as change agents, but they would prefer to be co-equal partners in the process, rather than defensive program leaders.
9. Evaluation of the effect of programs and materials on students and communities is needed.
Status: Reviews of programs and materials included requests for evaluative data. At the time these materials were collected (spring and summer, 1971) very few schools and material developers had "hard" evaluative data regarding the effects of their programs and materials. Instruments and techniques to use in such efforts were requested.

Summary

Generally speaking, students, teachers, and administrators in urban schools were quite explicit in their statements concerning the quality and kind of environmental education programs which they felt were most desirable for their school situation. School personnel and students felt that in the past most educational programs have been content-fact oriented, geared to middle-class suburban experiences, and perceived as dysfunctional by both students and parents in the ghetto arena. The request was, therefore, for community-based programs which are open-ended and problem or process oriented, rather than content or discipline oriented. The students, teachers, and administrators felt action or participatory activities have considerable merit, and many were concerned that positive self-image should be the result of exposure to any classroom experience. There was a number of requests for bilingual materials for urban programs.

A necessary corollary to appropriate content has to do with the teaching strategy incorporated in the curriculum. The most fruitful directions seem to have to do with problem-solving and conflict analysis approaches. Inquiry-discovery, intense observation, and group research in a non-authoritarian atmosphere were also considered useful techniques.

The urban materials certainly should be interdisciplinary, written at suitable reading levels using an idiomatic vocabulary, and there should be ample provisions made for the use of audio-visual non-print media.

The kinds of information about various curricula which urban teachers and administrators advised would be useful had to do with name of curriculum, publisher, availability, costs, and format. They were interested in the rationale and objectives outlined by the developer, the flexibility of the content, and indications of the kinds and extent of media employed. Other sorts of pertinent data which were requested had to do with
structure of the course, grade level, reading level, discipline orientation, topical breakdown of content, prerequisites to use, teaching strategies employed, and finally, evaluative data.

There was an interest expressed in all sorts of annotated bibliographic information such as lists of curricula, materials, films, records, books, articles, tested activities, kits, and experimental programs; lists of free or inexpensive materials; lists of resource materials to "educate" teachers; lists of community resources, such as government agencies, community organizations, private groups, and experts; lists of community on-site programs; lists of inservice opportunities; lists of colleges and universities with specialized courses; lists of funding agencies, both government and private. Many suggested that a newsletter or publication would be an excellent vehicle in assisting them to keep updated and current.

Two kinds of evaluative instruments were perceived as necessary to set standards for the field. One kind of evaluation that teachers want has to do with the problem of accountability. As community goals and objectives are made manifest, it is essential to have available mechanisms to test how well the school and its resources are implementing these objectives. The teachers and administrators would like instruments to evaluate what cognitive and affective achievement has been made.

A second sort of evaluative tool requested was one which could be applied to programs and materials themselves. As it becomes necessary to select materials, there should be some sort of standard mechanism with which comparable judgments can be made. A prototype which was suggested was the SSEC's Curriculum Materials Analysis System.
SUMMARY OF RELATED RESEARCH

Introduction and Identification of Generalizations

This section summarizes some generalizations regarding learners, instructional materials, facilities, and program organization that should provide guidance in the development of environmental education programs and development or selection of environmental education activities. Generalizations presented are selected from research reviews cited at the end of this section.

Listed below are selected generalizations with comments relative to programs and materials.

1. If skills or information are learned in a context similar to that in which they are used, learning is more likely to transfer.

2. Students usually learn information or skills easier which are related to information or skills they have previously learned.

3. Other things being equal, the longer since an experience, the harder it is to remember. Ideas learned earlier can be reinforced by reuse.

4. The more concrete the concept, the more easily it is attained. Normally, children attain concepts in order of increasing abstractness and complexity.

5. Positive instances (examples of what the concept is) usually are more effective for learning than are negative instances.

6. Opinions and attitudes developed early in life tend to be influential during later periods in life.

7. The relationship between attitudes and opinions and cognitive achievement is not well supported.

8. Most opinions and attitudes are not developed during a short span of time.

9. Opinions and attitudes are influenced by the geographical region and the urban-rural location in which a person lives.
10. Opinions and attitudes can be changed, but it appears that once a person becomes committed to a position, that commitment itself becomes a barrier to change.

11. Activities and materials should be within the ability ranges of the students involved in the activities and using the materials.

12. People normally are more highly motivated toward involvement if they have had a role in determining the activity or action.

**Implications for Environmental Education Programs and Materials**

Activities and materials related to environmental education should be introduced early in the school program and continued emphasis should be provided throughout the program. Providing content emphasizing the areas in which the children live and expanding to other geographical regions beyond their first-hand experience would provide experiences that students can relate to psychologically. Concepts should also be more easily attained. Elementary school programs should include experiences to develop desired affective, cognitive and psychomotor outcomes. It should be noted, however, that there appears to be little relationship between cognitive achievement and opinions and attitudes.

Programs and materials for upper grade students should deal with the local environmental setting with more complexity, should provide experiences regarding other geographical regions, as well different community settings (urban-rural). These experiences should continue over time (more than one week or six weeks) and involve the student in using skills, information and attitudes in the settings that exist in society. This indicates the need for extensive planning and cooperation between the school, the local community groups, and other organizations and governmental agencies. In all grades, but especially the upper elementary and secondary school grades, students should be given considerable opportunity to help determine the problems and topics for study.

These suggestions indicate the need for a planned program that provides flexibility for students and teachers to make decisions regarding specific program components. A variety of materials are clearly needed, and it would seem that material needs would vary, both in terms of content and in terms of presentation, from urban to rural areas and among rural areas and among urban areas. Effective programs might use materials developed in other areas, but it would seem that adapting and modifying materials would be more effective than adopting materials.
Implications for Environmental Education Facilities

A considerable amount of the environmental education program should be conducted in real settings (urban, suburban, rural, natural, etc.). This suggests the need for selected sites to which the student can be taken, designed sites at the school setting, or (if the former two are not possible) simulations and media presentations which will provide a reasonable representation of the actual setting.

An inventory of available sites should provide a school with indications of what needs to be identified, developed, or purchased regarding sites or simulation materials. A review of school programs indicates that programs that inventory and use community resources are not as limited by facilities as are many programs which stay within the school building or which use a set facility (such as a nature center). Cooperation and coordination of governmental agencies, (city, county, state, and federal) local groups, and school personnel can often provide the diversity of facilities needed without the large capital expenditure and operating budget required by single school ownership and management.

LITERATURE CITED

SUMMARY OF SELECTED PROGRAMS
AND MATERIALS

Existing environmental education related programs and materials were reviewed to identify those which would be useful for others with programs and activities or desiring to develop programs and activities. Those identified in this report are representative of programs and materials which exist. This is not an inclusive listing, however. As might be expected there is a wide range of variation among them. Some are developed around a single problem or theme while others include broad areas of concern. Some show a discipline orientation while others are inter- or multidisciplinary. All identified in the report share these common characteristics.

1. An active role for the learner.
2. An inquiring approach.
3. Direct involvement with the environment whether in the community, an outdoor laboratory, or some other setting.
4. A flexible approach to environmental concerns.
5. Concern for the social, humanistic, and aesthetic aspects of the environment.
6. Concern for consideration or reconsideration of human values.

Most of the programs or materials cited are described in more detail in the appendix.

1-12 School Programs

While relatively few school systems have developed 1-12 environmental education and even fewer have 1-12 programs with urban emphasis, there are a few such programs which can offer alternative models for program development.

Ann Arbor, Michigan (Part B, p. 49) is an excellent example of a local school district which has developed a K-12 program. The program stresses the linking of subject areas, particularly science
and social studies, so that both social and scientific concepts which are important in understanding and solving resource problems can be developed. Attitudes rather than skills are stressed and the learner plays an active role in the learning process. Environmental problems of local, regional, and national concern are included in the program. Field experience is an integral part of most activities. Resource sites are available for each grade level theme, and in-service education is provided for district teachers.

Madison, Wisconsin (Part B, p. 47) has also developed a K-12 environmental education program for students based upon a logical conceptual framework involving all disciplines. Sites have been planned for this program, workshops are provided for teachers, and instructional materials have been developed which emphasize urban concerns.

A number of other cities are developing extensive programs. Among these cities are Green Bay, Wisconsin and San Diego, California.

Other School Programs - Elementary

A number of school systems and regional groups have developed programs at the elementary school level with an urban emphasis. Programs have been established in San Diego, California; Los Angeles, California; Bronx, New York; Portland, Oregon and several cities in Maine.

Two of the programs are listed in the program descriptions. These are the Wave Hill, Center for Environmental Education (Part B, p. 56).

The Wave Hill methods have been used successfully in a number of public schools in districts 10 and 12 of the New York Public School System. The approach is interdisciplinary. It stresses interrelationships of man and his environment and focuses first of all on the environment inside the classroom. This includes the psychological and physical environments. Emphasis is also placed on having the student experience as much as possible of life outside the classroom, including both natural and man-contrived environments. A strong effort is made to have students work on projects in groups or as individuals rather than as a class.

A second program which received high ratings from consultants who assisted the ERIC staff is the Regional Environmental Program (Part B, p. 54) developed by
Dean Bennett and his associates in Maine. This program is a comprehensive environmental program designed for grades K-6. The program focuses on developing attitudes toward study environments, their biological and physical elements and their associated environmental problems. At the kindergarten grade one level, the school environment is emphasized; at grades two and three, the neighborhood; at grades four and five, the community; at grade six, the region. The materials for the program are such that they could be used in a rather flexible manner. Suggestions for pre-field trip activities, field trip activities and post-field trip activities are given.

Other School Programs - Secondary

A number of city school systems have been involved in reorganizing parts of the secondary school curricula and even reorganizing major aspects of the total school program.

One of the more unique programs has been established in Philadelphia, Pennsylvania (Part B, p. 76). The Parkway Program is designed to use the total city environment as the classroom and the life of the city as the curriculum. This program emphasizes a humanistic philosophy and attempts to develop individuals who understand the community and its problems. It is further designed to develop individuals who are self-directed and self-reliant.

A second interesting program is the Chicago Public High for Metropolitan Studies (Metro), (Part B, p. 60). This experimental four year program (high school without walls) was modeled after the Philadelphia Parkway Program. The program is multi-disciplinary permitting students to study education in a community setting.

The Conservation and Environmental Studies Center at Browns Mills, New Jersey (Part B, p. 42) has developed an extensive environmental education program. In 1970 more than 70 schools were involved. The program of the Center includes development of K-12 curriculum materials, a field study program, a day study center, and a teacher education program. Extensive cooperation between school and university personnel has been achieved. The consortium plan permits the employment of specialized personnel and the development of special materials relevant to the local students. The teacher education program develops teachers who are competent to work with their own students in a variety of settings. Several publications of this center relate directly to urban environmental education and activities that can be used in urban settings. The materials are flexible.
The Environmental Science Center in Minneapolis, Minnesota (Part B, p. 33) has developed an extensive program for students and teachers in grades 1-12, as well as for adults. A series of 39 curriculum activities have been developed, and other materials are being developed. Inservice programs for teachers are available. A number of the publications produced by the Center relate to urban environmental problems and settings.

1-12 Programs Available to Urban Schools

A number of programs have been developed to provide opportunities for urban students to gain experiences and understandings regarding the natural environment and the man-made environment. Some of these sites are available within the cities, while others are located near cities.

The National Park Service is involved in a massive effort to provide sites in many states, The District of Columbia, Puerto Rico, and the Virgin Islands for environmental education. Sites intended for day visits by local schools are called National Environmental Study Areas (NESA), (Part B, p. 39). Sites equipped for overnight or longer stays are titled National Environmental Education Development (NEED) camps. (Part B, p. 36) The study areas include both natural and man-made locations. The areas have been selected to (1) introduce the student to his total cultural and natural environment, past and present and to help him realize he is part of it; (2) develop in the student an understanding of how man is using and misusing his resources; and (3) to provide the student with an opportunity to work directly with environmental problems. Materials are designed to provide pre-site, on-site, and post-site experiences. Six themes or environmental strands are stressed. These are variety and similarities, patterns, interaction and interdependence, continuity and change, evolution, and adaptation.

A number of cities are fortunate in having natural land areas available to students for environmental education programs. Such cities include Columbus, Ohio; Portland, Oregon; Washington, D.C., and New York City. An example of this type of site and program is High Rock Conservation Center in New York City (Part B, p. 45). High Rock provides a natural setting for schools to use and also has instructional materials related to the use of the site developed for teachers and students in grades 1-12. Materials provide pre-site, on-site, and post-site suggestions for the teacher and for the student. Self-guided tours can also be taken on the site.
Museums provide environmental education programs for schools and school age children in many cities. Among such agencies with environmental programs are the Oregon Museum of Science and Industry, Portland, Oregon and The Center for Science and Industry in Columbus, Ohio.

The educational value of involving students in the study and solution of real problems has long been known. Such activities are found with increasing frequency in environmental education programs. There are people who feel that the student involvement needs to be intense and provide a strong impact on the student.

Rather unique programs have been developed by related groups in Oregon, Colorado, Minnesota, Massachusetts and North Carolina. Outward Bound programs utilize natural or urban areas for their activity. Their fundamental purpose, however, is to develop better people. Among their sub-goals are (1) developing of people able to cooperate with others; (2) developing of leadership skills; (3) providing experience for people to make their own decisions and then to live with them; (4) developing compassion; and (5) providing experiences in which the individual faces a hard physical push. Many students from urban areas have been involved with these programs.

Outward Bound type programs include various age groups, though current programs are designed primarily for secondary school students, college students, and adults. Aspects of the Outward Bound program deserve consideration in the design of experience for environmental education programs.

Materials for Teaching Environmental Education

Introduction

Analyses of current school programs indicated that relatively few schools had environmental education programs or well defined plans for incorporating environmental topics into existing curricula. Teachers interviewed desired information about materials that would be useful for developing environmental education programs, courses, units and activities.

A number of selected items for use in developing environmental education experiences are briefly reviewed in this section of the report and are described in more detail in Part B. Most of the materials identified are print materials rather than non-print.
It should be noted that these materials are selected examples of material available.

Extensive annotated resource lists developed by the ERIC Center for Science, Mathematics, and Environmental Education in cooperation with the Center for Science and Mathematics Education at The Ohio State University are available. These bibliographies include articles, books, textbooks, units, filmstrips, films, games, and simulations. The following resource lists are available:

1. The Urban Environment
2. The Rural Environment
3. Water Pollution
4. Air Pollution
5. Energy
6. Solid Wastes
7. Land Use
8. Population
9. Recreation

Resource lists are $1.25 each for one or two publications and $1.00 per copy for orders of three or more publications, regardless of title. Resource lists may be ordered from

The Center for Science and Mathematics Education
The Ohio State University
244 Arps Hall
1945 North High Street
Columbus, Ohio 43210

Other related resource lists will be developed in the future.

Generalizations about Materials

Any appraisal of the world of environmental education immediately suggests some generalizations about the field. Although the quality is spotty and uneven, there is a reasonably large number of materials packages from which to choose. There are fewer good materials for early elementary grades than for grades four through twelve. Although much of the material might be useful for good readers in the inner city or have worthwhile content, it must be noted that low reading level and appropriate content may not always be found in the same package. In fact, most of the materials are not designed for pupils with low reading ability. Material to enhance the self-image of the ghetto child is also often difficult to find.

Much of the material is interdisciplinary in scope to the extent that it draws on the concepts and generalizations from most
of the social science and science disciplines. Anthropology and sociology are probably the least represented of the social sciences in the packages analyzed. There has been little balance achieved, however, among science, social science, and valuing in materials reviewed. Components of each of these aspects are available separately. A great deal of what is available can be utilized to supplement or enrich on-going courses, however.

While many of the projects reviewed are traditional in content and strategy, there is a fair number which utilize a wide range of multi-media and classroom strategies. Among the most useful are perhaps those that incorporate various modes of inquiry, discovery, participation, and group research. For the most part, the materials are school and classroom oriented and are not geared to action programs.

It is revealing to look at the developer's rationale and objectives for developing material. The detailed reports are often unavailable, but most of the materials did undergo evaluation and were revised on the basis of those evaluations. Most of the instruments used for evaluation were devised to test how well the stated objectives were being achieved, so it can possibly be inferred that the developer planned revisions in this light.

Materials for Elementary School Programs

A number of materials evaluated as especially useful for elementary school students in urban areas are described in detail in Part B. The materials are essentially print materials; other media are included only if they were a part of a package. The resource lists from the Center for Science and Mathematics Education at The Ohio State University include brief descriptions of both print and non-print materials.

Elementary materials listed in Part B include the following:

1. Educational Research Council of America
   Concepts and Inquiry (4-6) Part B, p. 80

2. Elementary Economics Project
   Industrial Relations Center
   University of Chicago
   Economic Man (6-8) Part B, p. 84

   Our Man-Made Environment, Book Seven (4-11) Part B, p. 87

4. Field Social Studies Program
   Working, Playing, Learning
   People, Places, Products
   Towns and Cities Part B, p. 96
5. University of Minnesota Project
   Social Studies: Family of Man (K-5) Part B, p.100

6. Colorado, University of
   Our Working World: Cities at Work
   Our Working World: Neighbors at Work (2-3) Part B, p.104

SUMMARY AND RECOMMENDATIONS

Introduction

As reported in Part B of this report, information about materials and programs for environmental education is in great demand today. Schooling in the United States, though not always responsive to the demands of the society at large, does for the most part involve itself in the crises of the community and the nation. We may question whether or not the society is willing to pay the cost of altering the environment, whether or not the current high level of interest in a better environment will be sustained, and whether or not all "environmental problems" are real problems. Nevertheless, it can be said with some confidence that demands are being made upon schools to engage children in programs dealing with environmental education. The passage of the Environmental Education Act, with increasing levels of appropriations anticipated, is a case in point. The everincreasing number of environmental education centers throughout the United States, efforts on the part of states to create comprehensive environmental education plans, the increasing number of applications to the National Science Foundation's Curriculum Improvement and Development Section and to the United States Office of Education, and a host of other indicators at both the state and federal level support the contention that environmental education is one of the "in things." Thus, the demand for environmental education programs is being generated at the federal level both within and without the traditional agencies associated with education, within state departments of education, by community groups, by school curriculum committees, and by teachers and students individually.

As the demand for such programs has grown, it is more and more important that administrators and teachers have ready access to available materials and sources of curriculum ideas. This report is such an effort--to inform those with needs for information about environmental education. Other sources should also be explored particularly for current information, including the resources of the ERIC system, educational journals such as Social Education, The Instructor, and The Journal of Environmental Education, announcements put out by industry, Congressional reports, federal agencies such as the Department of Agriculture and the Department of the Interior, and service organizations such as the Sierra Clubs.
To tap into these sources of information teachers and school administrators should ask to be placed on mailing lists and to subscribe to significant journals. The efforts to do so are slight compared to the rewards in knowing what is available.

**Summary**

**Programs - Curricula**

An analysis of environmental education programs indicates there are relatively few operational programs in the United States compared either to the number of school districts or more significantly to the number of school buildings. Programs designed for grades K-12 are very few while there are a greater number organized within an elementary school or within a secondary school.

The number of schools preparing courses or units related to environmental education is rapidly increasing and materials of many of these efforts are being made available through the ERIC system on a regular basis. The quality of these materials is also improving, though extensive development has been hampered by adequate resources, including qualified staff and money.

Adequate funding seems to be a major problem, not only for the development of many programs, but also for the continuation of programs. This appears to be especially difficult when a school plans a program involving extensive capital expenditures for sites and facilities and then must also obtain funds for maintaining facilities, sites, and staff. Most programs which have developed and have been continued over time (without extensive continued Federal funding) have been schools which have developed extensive community support and also have utilized many sites and facilities operated by other institutions or agencies. Many successful schools have cooperated with others and have pooled resources for supporting staff, facilities, and operations.

Analyses of most programs being developed and those which have been developed indicate that a single person often provided the drive to initiate the program and has provided the drive to continue the program. Successful programs which have continued over time have usually had more involvement of teachers, administrators, and citizens in the community. Most successful programs have also had some staff with time assigned for coordination of the program and for inservice work with teachers.
The analyses of the programs identified indicated that very few programs include balanced use and consideration of the sciences, social sciences, and other disciplines. Most early programs originated as outdoor education programs, conservation education programs, science programs, or recreation programs. In most cases they still reflect these characteristics, though there have been a number of changes in their programs. New programs currently being developed tend to reflect more interdisciplinary or multidisciplinary planning. The lack of staff, the dependence in many cases on one person for the program, and the organization of the "typical" school (one teacher responsible for much of the learning in many elementary schools; fragmentation of the school day into isolated periods with one teacher in many secondary schools) tend to reduce programs with a broad concern and which draw on many disciplines.

Many of the programs reviewed, including many excellent ones, had few or no student materials. At least three reasons were cited. First some schools lacked the funds for developing or printing instructional materials in adequate quantities for student use. Secondly, several schools were in the process of developing programs and did not want printed material to "establish" a program before various program ideas had been considered and tried. Finally, many good programs are emphasizing processes of learning, rather than factual learning. Staff members of these programs believed that printed student materials would rigidify the program and tend to make the student experiences less inquiry oriented. People associated with several of these projects emphasized, however, that teachers in these programs needed to be effective in working with inquiry techniques and in most cases needed inservice assistance regarding the program.

Analyses of urban schools indicated relatively few had developed environmental education programs with a strong focus on the urban area, which included community involvement, and which were action oriented. While these conditions are changing too few have considered and developed programs which demonstrate these characteristics.

Finally, a paucity of research and evaluation related to environmental education programs is available. While most programs have maintained descriptive notes on program development and operations, very few have much quantitative data regarding changes in attitudes, values, knowledge, and behavior.
Materials

The review of materials by the project staff identified many materials related to environmental education. Extensive amounts of materials are available in both print and non-print form; this report, however, was primarily concerned with programs and print materials.

Few of the materials reviewed are truly interdisciplinary. Most often lacking are concepts and concerns related to the social sciences. Also, many of the materials which do contain interdisciplinary content separate one content area from another. In some programs teacher guides have been developed which integrate concepts and concerns, while student materials are not integrated. Development of integrated materials or using different materials would seem preferable to this practice.

For students in urban settings, materials focusing on their concerns and which provide activities related to their environment are definitely needed. Relatively few of the publications reviewed at any grade level provided balanced consideration of urban environmental problems. Still fewer schools in major cities have developed materials relating to the particular environment of their city and to the environmental problems associated with their environment.

Reading levels of many of the materials reviewed would appear to be difficult for large numbers of inner city students. Reports from teachers who had used a number of the publications support this statement. Sample documents were also given to students with reading difficulties to read. Discussions with the students provided further evidence that the reading level of many materials were too difficult for inner city students.

Most materials reviewed would need to be adapted to local and individual conditions. That is, most of the materials will not fit easily into ongoing curricular programs within the typical elementary or secondary school. This presents two problems, not unrelated.

In the first case, teachers and administrators must make decisions about where within an ongoing program it is appropriate to place a particular unit dealing with a particular environmental problem. Secondly, most teachers and administrators will find that materials or programs lack particular components which they feel are essential to include. The first
problem can be defined as a problem of articulation and is solved when those who make curriculum decisions look closely at the conceptual scheme being followed by the teacher and logically find an appropriate place to insert the selected unit. The other problem is much more difficult to solve.

Curriculum adaption is not as difficult as curriculum development but it is nevertheless an arduous task. It requires an understanding of not only local needs—putting in those activities and ideas that are important to a particular group of students—but also a clear understanding of the subject under investigation. To alter a unit means to question the original developer's structure. If the unit has been carefully prepared, it often is a difficult job to change it without almost redoing the entire program. Curriculum ideas and materials can better be understood within an analytical framework that points up their most relevant dimensions and makes useful comparisons possible between different sets of materials.

Analytical categories can be developed from a district's own identified needs. If this is the case, individuals who must make decisions can devise their own instrument for analysis. However, this is time consuming and may prove highly inefficient. Analytical instruments which have already been designed for curriculum materials analysis do exist and deserve consideration. Three come to mind. They are (1) the Curriculum Materials Analysis System developed by the Social Science Education Consortium, Inc., (SSEC), Boulder, Colorado; (2) An Approach to Selecting Among Social Studies Curricula by Alan Tom, published by the Central Midwest Regional Educational Laboratory, Inc.; and, (3) the instrument included in the Appendix to this report, Environmental Education Curriculum Analysis Instrument. Decision makers may want to rely on analyses already completed by others. These include (1) the analyses found above; (2) analyses found in the Social Studies Curriculum Materials Data Book, published by the SSEC; and (3) analyses published by professional organizations such as the Association for Supervision and Curriculum Development and the National Council for the Social Studies. Also, an ERIC search for analytical documents may prove helpful.

Recommendations Related to Development and Implementation

Based on the analyses of programs and materials and the generalizations about them a number of recommendations can be made.
Programs - Curricula

We have identified three primary problems that may be encountered in developing programs or implementing new curricular ideas. First, there may be inadequate preparation on the part of teachers charged with implementation. Second, support mechanisms may not have been established which will enable successful implementation. These include support from community, administration, and colleagues. Third, it is often the case that the planned evaluation procedures are inadequate. Of course cost, too, is always an important factor in new program implementation.

P-sources to overcome the problems mentioned above may be available and visible, but still not used. Evidence suggests that a critical factor is the provision of attractive opportunities to seek and to use help. Some of the most effective solutions are: (1) conducting inservice institutes close to home which make users of innovations competent to carry out the program; (2) involving teams of colleagues from the same school building or neighborhood as well as others in the community in planning and conducting a program; peer support is considered the strongest support for utilizing resources for change; (3) planning and providing for evaluation and follow-up support; this includes the use of reliable and validated instrumentation and follow-up meetings which can be accomplished face-to-face or by telephone or tape. Often programs are accepted or rejected on the basis of total package costs. Other means of calculating costs may prove more desirable such as per pupil costing and planning materials use on a rotating basis.

Materials

1. While there are many environmental education materials that are both available and good, these represent only a small fraction of all the materials that have been produced under the heading of environmental education; there is still a need for production of many more good materials.

2. Materials are needed which balance and synthesize to a greater extent than do most existing materials the three basic elements of environmental education: natural science, social science, and values.
3. More materials are needed for early elementary grades, K-3.

4. Materials having sound content and suitable for poor readers are needed.

5. More films, games, and simulation devices need to be included in environmental programs and sources of these materials are available in the ERIC/SMEAC Resource Lists.

6. Despite the importance of slums and ghettos as a part of the environmental problem, there is a shortage of good materials for ghetto children, especially materials that will enhance the children's self-image and feelings of efficacy.

7. More materials oriented to involvement and action by students is needed. (Many programs that are exclusively or primarily science education or outdoor education are action oriented, but in many cases these do not provide social science experiences we feel are needed.)

8. Despite the generally-recognized importance of the concepts of systems, interdependence, and interaction in environmental science, they receive inadequate attention in most of the social science materials. Materials which explain and make use of these concepts are needed.

9. Although much of the concern about environmental problems centers on values and life styles thought to be inappropriate, there is a marked deficiency of materials which deal with these subjects. Materials which deal with values and life styles directly, and which incorporate the appropriate concepts in problems studies and activities undertaken, are much needed.
Implementation

Based on our analyses of effective programs several recommendations regarding the implementation of programs at the local school level are made. After identifying your program objectives you should:

1. Check to determine if your state has prepared a state environmental education plan. If it has, obtain a copy to become informed regarding what is planned and determine how your school program relates to the state plan. Phone or write your state environmental education coordinator indicating you are planning a program or have a program you want to develop further and request assistance.

2. Identify an existing successful program (if one exists) similar to the one you want to develop. Obtain materials from that program and if possible employ a person from that project as a consultant to help you plan the development of your program. A person who has had experience with a successful operational program can provide you with many helpful suggestions and recommendations. Visit the program if possible.

3. Form a local Advisory Committee. This committee should include teachers, students, administrators, interest citizens and representatives of environment-related government agencies. This committee can identify needs; review materials; provide advice with respect to procedures, direction, implementation, facilities, and funding. Members of the committee can also assist in identifying and obtaining resources such as sites and facilities for school use.
4. Obtain administrative and faculty support for the program concept and cooperation regarding possible modification of the school day (blocks of time), use of school or public transportation for field activities, modification of the school campus, etc.

5. Analyze resources (facilities, sites, staff, funds available). Use as many existing sites and facilities as possible.

6. Establish a general program framework which stresses interdisciplinary concepts and local and regional environments and problems. The program should emphasize student involvement.

7. Develop instructional objectives and assessment techniques.

8. Plan the instructional program.

9. Obtain or begin development of instructional materials needed. Materials should be interdisciplinary, flexible, and provide for different instructional approaches. If your school personnel have not had experience in this type of activity, consultant help should be obtained. Curriculum development is time-consuming and expensive.

10. Provide continuous inservice help for teachers involved in the program.

11. Organize a feedback system to provide continual improvement of the program.

12. Identify a teacher-leader in each building who would coordinate environmental activities in the building by:

   a. Assisting other teachers in interpreting printed material regarding the program.

   b. Providing orientation for new instructional staff.
c. Providing leadership for inservice workshops and conferences.

d. Assisting other teachers in selecting and obtaining needed materials. (both print and non-print)

e. Assisting other teachers in utilizing materials, facilities, and school sites.

f. Assisting other teachers and administrators with the organizational arrangements needed to install the program, such as modification of the school day, team-teaching, etc.
PART B: PROGRAM AND MATERIALS INFORMATION ANALYSIS INSTRUMENT

Included in this section are brief data sheets containing descriptive information for environmental education programs and materials that have been identified as containing promising practices or trends. In addition to these examples, there are many other units, courses, programs, and materials that persons interested in developing or implementing programs might find worthy of consideration.

The case studies included in this section are intended to provide examples of how other persons and school systems have approached the problems of program development and implementation. While no one description is likely to be appropriate for all interested parties, useful ideas may be gained for examining several cases of successful innovation.

The information sources list is intended to provide a quick reference to some agencies and organizations which are able to aid in making information available. In addition to sources, ERIC/SMEAC will provide a listing of materials available for each of the programs described in this section.

The analysis instrument is the shorter of two forms used in the review of materials and programs. Finally, some suggested learning approaches to environmental education which resulted from two regional Conferences sponsored by the National Science Teachers Association are included.
NATIONAL PARK SERVICE
NATIONAL ENVIRONMENTAL STUDY AREA (NESA) PROGRAM

Director: George B. Hartzog
Program Address: National Park Service
U.S. Department of the Interior
Washington, D.C. 20240

Grade Level: K-12
Subject Area: Interdisciplinary

Overview

The National Environmental Study Area (NESA) program is a cooperative undertaking of the bureaus within the Department of the Interior, the Department of Health, Education, and Welfare’s Office of Education, the National Education Association, and local education communities, using guide materials developed by the National Park Service and the existing curricula of participating schools.

Rationale and General Objectives

The NESA’s are intended to provide a different kind of learning experience making use of both the natural and cultural worlds, as they make up the study areas. The areas, along with the guide materials and regular school experiences are intended to help the students relate to their world by:

1. Introducing them to their total environment—cultural and natural, past and present.

2. Developing in them an understanding of how man is using his resources.

3. Equipping them to be responsible and active members of the world they are shaping and being shaped by.

Program Description

The Park Service has designated areas throughout the Park System and on other lands as environmental study areas for use by local school systems. Some of these sites are primarily natural and exemplify the elements and forces and balances in nature—out of which man is made and out of which he builds his cities and society and culture. Other sites are primarily cultural, a rise of ground that formed a logical battle site, or a landing area along a river that developed into a gateway.
into some interior region. In these places a youngster learns
to recognize how the environment has affected man's development
and how man, in turn, has affected the environment.

The program is developed around five environmental strands:
interaction and interdependence, variety and similarity, patterns,
change and continuity, and, adaptation and evolution. The NESA
guidelines, developed by the National Park Service and the
National Education Association, provide a framework within which
the local areas can adapt to its own needs. Teacher workshops
are set up through the sponsoring agencies and carried out with
the cooperation of the local school systems. At the workshops,
teachers are introduced to the NESA, provided resource materials
on the areas, and given suggestions on ways of adapting the
experience into the entire range of classroom activities.
Emphasis is placed on interpretation of the regular curriculum
through the five environmental strands.

Evaluitive Data

Approximately three years of field testing have been done,
including teachers and students. Revisions and modifications in
the programs have been made based on these tests.

CONSERVATION AND ENVIRONMENTAL STUDIES CENTER, INC.

Director: V. Eugene Vivian

Project Address: Box 2230, R. D. 2
Browns Mills, New Jersey 08015

Grade Level: Elementary and Junior High School

Subject Area: Science, Social Studies, Outdoor Education, Mathematics, Language Arts, Environmental Education

Overview

The Conservation and Environmental Studies Center, Inc. has grown into a regional center for southern New Jersey which provides week-long resident programs for elementary and junior high school students with their teachers, high school student assistants, and college student interns. Most materials developed have been for use with teachers and students in these week-long terms at the center. A few have been developed for use in the regular school situation before or after the resident program at the Center.

Rationale and General Objectives

The approach to environmental education is intended to "create a concern for all environments that leads to a commitment to preserve optimum environments and improve less desirable environments." Specific objectives of the program are to: 1. develop comprehensive teacher guides and children's tests and activity materials for environmental education; 2. train teachers to use environmental education curriculum materials and develop their own curriculum materials for environmental education; and, 3. conduct exemplary programs for teachers and children in environmental education.

Program Description

There are three major aspects of the program involving the Center with schools. On-Site Programs are conducted with scheduled visits by Center personnel to participating school districts to develop programs within the existing curriculum. Classrooms, school grounds, and areas adjacent to the school property are used. The emphasis is on training teachers rather than on direct classroom teaching.

Day-Trip Environmental Education Programs are designed for classes having a special purpose for visiting the Pine Barrens. These field
trips are to reflect an ongoing curricular concern rather than a casual visit, and which require a visit to a particular location to witness a seasonal change, observe a unique phenomenon, or contrast the area with areas previously studied.

Resident Environmental Education Programs are conducted at the project center and are usually five days in duration. Joint planning by Center personnel and teachers takes place prior to arrival at the center. Techniques for evaluation of objectives in the cognitive, affective, and psychomotor domains are also developed during the planning stage.

Teacher education programs, both preservice and inservice, are conducted as part of the program. This includes workshops of 2-3 days, summer institutes, evening classes for graduate credit at Glassboro State College, a course on Science and Environment, and the Headstart Supplementary Training Program. In addition, materials for educators to use in preparing teachers are available and consultant services are provided.

Much of the material developed by CESC understandably concentrates on the local environment of South Central New Jersey: history, ecology, geology and soil, agriculture and forestry, weather, hydrology. Others deal with perception, language arts, arithmetic and geometry through field experience. Still others could be used in urban settings almost anywhere.

Of the sixteen curriculum areas in the Teachers Workshop Handbook, the following fall within the environmental education scope:

Agriculture in the Pine Barren
Animals in the Pine Barren
Environmental Concerns
Exploring an Historic Site
Outdoor Observation Experiences
Pine Barrens Ecology
Public Lands, Development and Protection
Water Quality Study

While they include little analysis of problems, teachers may find the following separate teacher's guides useful:

Founding a New Settlement: Survival Skills
Inviting Involvement with History
The World Around Them: Environmental Education in the Urban Environment
A Cleaner World: Litter and Solid Waste Disposal
Main Street, U.S.A.
Evaluative Data

Direct feedback evaluation of an anecdotal kind is requested from teachers and students who use the facilities. Modifications in the program and materials are made on this basis.

Teachers Workshop Handbook
Teacher's Guides (see Description for specific titles.)
HIGH ROCK CONSERVATION CENTER

Project Address: Nevada Avenue
Staten Island, New York 10306

Grade Level: 1-12

Subject Area: Conservation, Environmental Education, Biology, Geology, Interdisciplinary

Overview

A unit of the New York Park System operated by the Staten Island Institute of Arts and Sciences. Educational activities at this natural habitat have been developed for students from grades 1-12. Teachers take classes to the Center. Self-guided walks are also permitted.

Rationale and General Objectives

This program is designed to develop an environmental awareness. Topics are taught to stress:

1. The importance of the environment in providing for our needs as well as those of other organisms.

2. An awareness of how man changes or destroys his environment.

3. A recognition of the need to correct these abuses to the environment.

4. The responsibility and the desire to protect and to improve the quality of the environment.

Description

The program involves a number of activities which have been developed for use by teachers and students at their school and while at the park. Each activity is designed as a discovery experience and to encourage maximum involvement of each child. Most activities provide material for study prior to coming to the park for activity at the park, and for follow-up studies after returning to their schools.

Teacher guides and student materials are provided. A newsletter including ideas on the use of the area is also available.
Materials Available

A materials list including a teachers guide and student materials is available from the ERIC Center for Science, Mathematics, and Environmental Education, 1460 West Lane Avenue, Columbus, Ohio 43221.

Evaluation

Activities have been used extensively with teachers and students and revised.
ENVIRONMENTAL EDUCATION PROGRAM
MADISON, WISCONSIN

Director: Marvin Meissen

Project Address: Madison Public Schools
545 West Dayton Street
Madison, Wisconsin 53703

Grade Level: K - 12

Subject Area: Interdisciplinary

Overview

This K-12 program originated as a result of the consolidation of many concepts concerning environmental education and effective learning experiences suggested by the Madison, Wisconsin, teachers. It is intended to provide a series of experiences for students at all levels and is based on a logical conceptual framework for environmental education involving all disciplines.

Rationale and General Objectives

The rationale underlying this project may be summarized by these generalizations: 1) each teacher must be responsible for assisting pupils to gain desirable concepts in environmental education, 2) children must be made aware that our way of living depends upon how we use and conserve our natural resources, 3) conservation and environmental education must be integrated with all subjects although some areas may be taught independently as environmental concepts, and 4) concept formation in environmental education occurs when pupils develop understanding, attitudes, and interests which make concepts become positive values.

Specific objectives are: 1) to develop a systems approach to environmental education using community and school resources and 2) to develop materials and facilities for use by students in instructional and recreational activities.

Program Description

The program employs 25 naturalists with part-time responsibilities for aiding teachers with learning activities, field trips, and utilizing facilities. Both preservice and inservice education programs are
Description (cont’d.)

available for teachers desiring to use the materials. The programs include workshops, evening classes, and inservice sessions held at the local schools. Consultant services are also available locally to teachers using the materials.

Materials produced include a Guide to Environmental Education for K-6 and, for the secondary level, Ecology Action Program and World Development Program. A Science and Society course incorporates science and social studies and is designed for students in grades 10-12. A similar approach is involved in an Ecocivics course for grade 9 students. At the Middle School level, teams of science and social studies teachers utilize a geography- anthropology approach to man and his environment.

The Leopold Elementary School was designed with planned outdoor nature areas on the school grounds which are landscaped with native plants such as shrubs, trees, and woodland flowers with these areas to be used in the elementary environmental education program.

Several filmstrips and guides are available to teachers for use with activities conducted at the facilities at the Madison School Forest and the Cherokee Marsh. Other outdoor areas and curricula for local school use are being planned and developed.

Evaluated Data

In 1971 a comprehensive survey of present practice was made, involving a randomly selected sample of all levels of 1700 teachers in Madison. The information obtained will be used in future planning and scheduling. Constant feedback and input are solicited from staff and students. Records of usage are kept and analyzed.

Materials and Cost

Representative materials are:

"What is a Tour through the Madison School Forest?"
"Three Layers of Green in the Madison School Forest" (upper elementary grades) and "Madison School Forest: Clues to the Past, Signs of the Future" (middle school) -- filmstrips and guide books.

(Contact ERIC/SMEAC for further information on availability and costs.)
ANN ARBOR PUBLIC SCHOOLS
CONSERVATION AND OUTDOOR EDUCATION PROGRAM

Directors:
John Rosemergy
William Browning

Project Address:
601 West Stadium Blvd.
Ann Arbor, Michigan 48103

Grade Level:
K - 12

Subject Area:
Science, Social Studies

Overview

The Ann Arbor Public Schools Program developed from experiences in school camping and outdoor education. In 1960 a nature center was established and opened to the schools. In 1961 a program coordinator was employed to direct and expand the Outdoor Education Program, which became an Outdoor and Conservation Education Program.

Rationale and General Objectives

The K-12 program was developed to present conservation understandings in a logical sequence at the time when the learners are most receptive to the material presented. It is intended to link together subject areas, particularly science and social studies, so that both the social and scientific knowledge important in understanding and solving resource problems can be developed. Understandings developed in one grade are expanded in subsequent grades. Attitudes rather than skills are emphasized. The learner plays an active role in the learning process.

Description

The program is integrated within the existing curriculum rather than being separate. It stresses the study of community natural resources under natural conditions. A specific theme together with sub-understandings is established for each grade level. Resource sites are available for developing each grade level theme and a "Teachers' Kit" is prepared to aid the teacher in obtaining background information, preparing the class, and extending the children's learning experience following a field trip. Materials can then be selected, adapted, or developed as appropriate. The presentation consists of three phases: orientation, field trip, and follow-up. Field trip guides aid in interpreting the site in relation to the grade level theme.

Kodachrome slides, approximately 25 per topic, were prepared for use with each of the conservation topics presented in science and social studies classes as part of the secondary phase of the program.
Description (cont'd.)

Inservice programs are conducted for both elementary and secondary school teachers. A series of grade-level field trips for elementary teachers is conducted during the school year. Additional inservice sessions provide interlevel presentations as well as providing opportunities to develop and distribute outdoor and conservation education materials. The inservice program for secondary school science and social studies teachers consists of classroom and field trip presentations as well as the preparation and distribution of additional conservation material.

Evaluative Data

A two-part evaluation was administered at the end of the first year of operation of the elementary and secondary phases of the program. The first part was an open-ended qualitative evaluation in which administrators and classroom teachers were asked to recall and record, in brief statements, those features of the program most helpful in approaching the instructional goals of the Ann Arbor School System. In the quantitative phase of the evaluation elementary teachers and secondary school science and social studies teachers were asked several questions as well as being asked to respond to a series of questions concerning the degree of helpfulness of certain aspects of the program. Data received indicated that elementary teachers as well as the secondary school science and social studies teachers reacted favorably to their experiences.

Materials and Cost

No materials are available as such. However, the development and implementation of the program are described in detail in "Integrating Conservation and Outdoor Education into the Curriculum (K-12)" by William B. Stapp, Burgess Publishing Company, Minneapolis, Minnesota, 55415, publication date 1965.
NATIONAL PARK SERVICE
NATIONAL ENVIRONMENTAL EDUCATION DEVELOPMENT (NEED)

Director: George B. Hartzog
Program Address: National Park Service
                U. S. Department of the Interior
                Washington, D.C. 20240

Grade Level: K-12
Subject Area: Interdisciplinary

Overview

The NEED program, funded by the National Park Foundation, is concerned with the development of teaching materials and a program of studies and experiences for levels K-12 to help enrich the existing curricula with environmental concepts. The materials are intended to help teachers develop ways to teach about the environment in every subject area.

Rationale and General Objectives

The goal of the NEED program is to foster an appreciative and critical environmental awareness in youth, through an understanding of natural and social processes illustrated in National Park areas. Further, the program aims to increase the will and capacity to improve the environment; to aid youth in developing an environmental ethic.

Program Description

The program is interdisciplinary in nature and based on the premise that environmental awareness requires outdoor implementation of classroom lessons. Organization of the program is developed around five major ideas, variety and similarities, patterns, interaction and interdependence, continuity and change, and evolution and adaptation. These form the strands that run through lessons in mathematics, art, social studies, communications, and science.

There are three phases to the program. Phase I, for K-6, emphasizes awareness, focusing on understanding and appreciating the natural and cultural environment. Phase II, for grades 7-8, is the technical phase and focuses on man's use and abuse of water, land, and other resources. Phase III, for high school students, is the ethical phase and stresses the need for environmental management and planning—an environmental ethic.
Program Description (cont'd)

As the program was originally conceived, the intention was to get inner city children out into a natural study area for an entire school week. As the program has developed, it has expanded beyond this beginning to include pupils from all areas and backgrounds. Throughout the program students may go on local field trips to supplement their classroom studies, and sometime during the fifth or sixth grade the children spend five days with their teachers in some natural area. While some NEED sites are in national parks, not all are. The NEED program is closely related to the National Environmental Study Area program (NESA) also developed by the National Park Service.

Evaluative Data

The program has been field tested on a nationwide basis for approximately three years. While no data are currently available, it has been reported that students show evidence of increased personal awareness, sharpened sense of the environment, and of the interweaving of self and world.

REGIONAL ENVIRONMENTAL EDUCATION PROGRAM, YARMOUTH, MAINE

Director: Wesley H. Willink
Project Address: McCarthey Street
Yarmouth, Maine 04096
Grade Level: K - 6
Subject Area: Environmental Education

Overview

Designed to develop a comprehensive program in environmental education, this project is modeled after the Conservation and Outdoor Education Program of the Ann Arbor, Michigan, School System. Funded from the monies available through the Title III Project, the program is designed to serve a regional area.

Rationale and General Objectives

This K-6 program focuses on developing attitudes toward study environments, their biological and physical elements and their associated environmental problems. The study environments were selected to provide for expanding both the scope and complexity of understandings to be developed. At the kindergarten-grade one level, the school environment is emphasized; at grades two and three, the neighborhood; at grades four and five, the community; at grade six, the region.

Although there is an environmental emphasis at each grade level, the study environments are treated with reference to the ways in which they relate to the other environments studied. Twelve environmental themes have been developed for those with each of the environments. Six of the themes deal with the natural environment: land, water, air, plants, animals, energy. Six concern the man-made environment: land and water development, structural design, transportation, utilities, recreation, pollution and pest control.

Description

The program involves 1) a classroom presentation by an environmental education coordinator relating to the study environment and providing a field trip orientation; 2) a field trip around the study environment with the students in small groups; and 3) follow-up investigations, environmental planning and activities with consultation provided by the coordinator when and where needed.
Description (cont'd.)

Teachers' guides are available for each of the grade levels and include the theme, teacher background information, suggested field trip interpretive technique, and suggested follow-up activities. An environmental education resource center has been established which contains additional teaching materials and special equipment for teachers and students. Consultants are also available to help teachers and students develop their school sites as outdoor learning centers. Inservice and preservice teacher education workshops are conducted for teachers interested in using the environmental education materials and program.

Evaluative Data

The materials and activities have been field tested and revised during development and implementation of the program. Data are not available at this time.

Materials and Cost

Teacher materials:

*Environmental Education Program - Organization and Operation,*
by Dean B. Bennett, 1969.  Price not known.
The purposes of Wave Hill include developing teachers with the "Wave Hill Method" of teaching, providing learning opportunities for children regarding the environment and environmental problems, and to develop teachers who will be able to teach others the "Wave Hill Method" which stresses teaching things in context.

The content included in the program is interdisciplinary and stresses capitalizing on the curiosity of children. The program stresses interrelationships of man and his environment and focuses first of all on the environment inside the classroom. This includes the psychological and physical environments. Emphasis is also placed on having the student experience as much as possible of life outside the classroom, including both natural and man-contrived environments. A strong effort is made to have students work on projects in groups or as individuals rather than as a class.
Evaluation

Activities used in the program and the methods used in the program have been tried and used successfully in several schools in New York.

Materials

The Center has facilities, both natural areas and classrooms, for use in the program. Arrangements can be made to visit these. For information regarding the program, contact the project director.
# PARKWAY PROGRAM

**Director:** Mrs. Lisa Strick  
Franklin Institute  
20th and the Parkway  
Philadelphia, Pennsylvania 19103

**Program Address:** Parkway Program  
School District of Philadelphia  
c/o The Franklin Institute  
20th and the Parkway  
Philadelphia, Pennsylvania 19103

**Grade Level:** Secondary  
**Subject Area:** All subjects

## Overview

Developed in 1969 as an alternative to traditional schools, the Parkway Program is a "school without walls." Supported by the Philadelphia Public Schools and cooperating institutions in Philadelphia the program has grown in size and has been a model for several other experimental city schools.

## Rationale and Objectives

The Parkway Program was established to change students' attitudes about learning to make them feel learning could be both enjoyable and profitable; to provide the student with the right to make decisions about his education; and to provide a curriculum with closer relationships to the community and to the problems of the current society. Further, the school was designed to maintain the identity of the student and close contact between teacher and student.

The school also was established to test the hypothesis that this type of education could be provided at a cost equal to or less than traditional education program.

## Description

The school is organized around units of students of approximately 180 students each. Each unit has its own staff and develops its own curriculum. Thus, as the school expands, additional units are added. While the school occupies no buildings, there is a central office headquarters.
The curriculum for the program is designed around five areas: (1) Faculty Offerings (Courses offered in interest areas of staff); (2) Institutional Offerings (Courses offered by participating institutions such as museums, companies, etc.); (3) Tutorials (Basic requirements which are taught by unit staff members to small groups of students); (4) Management Groups (Groups of students and staff formed to solve specific problems); and (5) Town Meetings (Meetings held with the entire staff and student body of the unit). These areas are designed so that a student would complete graduation requirements, but also have alternative educational choices and a role in deciding what these choices should be.

Materials

Information regarding materials developed or used in the program should be requested from the program director.

Evaluation

The program has received continuous evaluation by both staff and students. Formal evaluation by staff and students usually occurs three times per year. As a result of the evaluation, the program has been modified in at least two ways: (1) Procedures have been changed and (2) Courses have been added, modified or abolished. Student satisfaction appears high.

Program costs indicate the program being operated for no more than the cost of a traditional school in the same area.
Overview

This high school program was modeled after the Philadelphia (Pennsylvania) Parkway Program (Part B, p. 58). The program is multi-disciplinary and offers a great variety of learning opportunities.

Rationale and General Objectives

The school is designed to provide students with opportunities to learn throughout the city, in diverse settings, to permit students to be involved in decision making, to promote student identity, and to provide for close student and teacher contact.

It is also an experimental school to test the hypothesis that this type of school is feasible in Chicago.

Description

The students are selected from all parts of Chicago. They are involved in programs with three major components. One part of the program involves learning experiences in institutions such as museums, city government, and companies. A second portion of the program involves courses such as English taught by staff teachers. The third part of the program involves counseling groups of under 20 students which meet on a regular basis. Planning for programs includes all people involved, students, staff, and institutional groups.

Evaluation

Evaluation has been continuous during the project. Reports on planning and operations are available. Changes in the program have resulted from evaluation. Future expansion is planned.

Materials

Materials are being developed. Information regarding the program is available from the principal.
CASE STUDIES

The following case studies describe procedures followed by various persons in their approaches to the problems associated with developing and implementing environmental education programs. No single description is apt to be totally sufficient or appropriate to meet the needs of everyone concerned with program innovation. However, by selecting from among the various alternatives, some ideas should be available for dealing with most of the major problems encountered.

If at all possible, a site visit to an operational program is highly worthwhile. A far better understanding can be gained on-site than from simply reading descriptive information. This is particularly true for those programs that are highly process oriented and have relatively few materials.

Site visits to the described programs are permitted, and staff members will endeavor to aid visitors in finding solutions to problems. Advance arrangements should, of course, be made.
CASE STUDY*

Ann Arbor Public Schools
Ann Arbor, Michigan

ORIGINATION

In 1961 William B. Stapp accepted the position of Consultant in Outdoor and Conservation Education for the Ann Arbor Public Schools and began to develop a K-12 program in conservation education to be integrated into the existing school curriculum. Ann Arbor was one of the pioneer school systems in school camping. As early as 1933, junior high school teachers were encouraged to integrate field trip experiences into their courses of study. During the 1959-60 school year the local Audubon Society created a nature center on a private parcel of land 9 miles from Ann Arbor. The interest created when one elementary school served as a pilot for bringing classes on guided field trips through this center served as the impetus to open the center to all schools in the system the following year. In 1961 the local Audubon Society suggested that the Ann Arbor Board of Education employ a coordinator to direct and expand the outdoor education program initiated at the nature center. This chain of events resulted in the K-12 program which was ultimately developed.

UNDERLYING RATIONALE

After surveying publications by widely known authorities and writers in the field of conservation education, the program coordinator identified nine principles to be used in the development of a program in outdoor and conservation education.

1. The Conservation Program should span the curriculum, kindergarten through the twelfth grade, so that conservation understandings can be presented in a logical sequence at the time that the learner is most receptive to the material presented. Isolating conservation as a single course limits the scope of the program and the number of students exposed to conservation understandings.

2. The Conservation Program (K-12) should provide continuity and progression in the program, so that the understandings developed in one grade will grow and be expanded in subsequent grades.

3. The conservation program (K-12) should link the subject areas that relate most closely to conservation, especially science and social studies, so that both the social and scientific knowledge important in understanding and solving resource problems are properly developed.

*Material in this case study was adapted from Integrating Conservation and Outdoor Education into the Curriculum (K-12), William B. Stapp, Burgess Publishing Company, Minneapolis, Minnesota, 1965.
4. The conservation program (K-12) should be integrated and correlated with the existing curriculum in a manner that will enhance the instructional goals of the school system.

5. The conservation program should give the learner an opportunity to study some of our community natural resources under natural conditions. This provides certain learning experiences that cannot be duplicated within the school building.

6. The conservation program should stress attitudes and not vocational skills. The most important conservation impact that most of our urban children will have upon our natural resources will be through their action as community citizens.

7. The conservation program should emphasize local resource problems so that our future community citizens will have the incentive and tools to cope effectively with our current and future resource problems. However, the conservation program should not neglect regional, national, and international resource problems.

8. The conservation program should be handled in such a manner that the learner plays an active role in the learning process. The learner develops attitudes through personal experiences and thinking and not through the presentation of predigested conclusions.

9. The conservation program should provide a comprehensive inservice training program for teachers which would operate throughout the school year and would be directed at helping teachers increase their understandings, interest, awareness, and teaching skills in conservation.

PERSONNEL

The planning and developmental stages of the program were handled by the program coordinator. He developed the elementary (K-6) phase of the program in nine major stages, as follows:

1. Examined teachers' guides and textbooks in science and social studies for each of the elementary grade levels to become familiar with the purpose, objectives, and general scope and sequence of the programs already existing.

2. Met with the science coordinator and an elementary planning committee (elementary principal and representatives from the lower and upper elementary grades) to work out the most effective plan for integrating the outdoor and conservation education program into the existing curriculum.
3. Examined science and social studies curriculum guides for each of the elementary grades in order to develop themes, understandings, and subunderstandings appropriate for each grade level. Each grade level theme was supported by six understandings with subunderstandings also developed to provide desired continuity and progression in the total program.

4. Developed the structure of the program related to field work, teacher orientation, alternatives in case of inclement weather, and follow-up activities.

5. Located a resource site appropriate for the development of each grade level theme.

6. Contacted, oriented, and trained a group of assistant field trip guides. Guides came from the community and the university student population.

7. Oriented the secretaries in the Office of Instruction concerning orientation and field trip appointments and the confirmation of appointments.

8. Developed charts to help prepare the learner for the field trip experience. These charts are used in a classroom presentation prior to the field trip.

9. Prepared materials and developed an inservice program to orient the teachers for the field trip to the resource site and follow-up activities.

The development of the secondary phase of the program followed a similar procedure and was also divided into nine major stages. In the fourth major stage, the program coordinator met with junior and senior high school science teachers to discuss ways in which he could provide consultant help to them. The science teachers were asked to list conservation topics for which they would like to have assistance in integrating into their courses. A similar meeting was held, in stage six, with the social studies teachers.

In stages seven and eight, subject material on the conservation topics requested by teachers was developed and mimeographed for distribution to the teachers. In addition a series of approximately 25 Kodachrome slides was developed for use with the classroom presentation of the topics. The ninth stage was the development of an inservice program for the teachers.

RESOURCES

The nature center area was contributed by the local Audubon Society. Two of the resource sites chosen for the elementary phase of the program were controlled by the Board of Education. Additional sites were identified with the help of the district forester and local soil conservation service.
FINANCING

Financing was apparently handled by the Ann Arbor Board of Education with contributions such as the land for the nature center being made available to the schools through interested community and citizen groups.

MATERIALS

No materials were developed for publication other than the book Integrating Conservation and Outdoor Education into the Curriculum (K-12) by William B. Stapp.

EVALUATION

An evaluation of the program was made at the end of the first year of operation of the elementary and secondary phases of the program. The evaluation consisted of two parts: (1) an open-end qualitative evaluation in which administrators and classroom teachers were asked to recall and record, in brief statements, those features of the program most helpful in approaching the instructional goals of the Ann Arbor School System; and (2) a quantitative evaluation in which teachers (elementary and secondary) were asked to respond to a series of questions concerning the degree of helpfulness of certain aspects of the program.

Teachers were asked to respond to three additional questions: (1) one concerned the development of new kinds of attitudes and interests developed in the students as a result of the program, (2) a second related to ways the program helped the individual classroom teacher, and (3) one requested suggestions for improving the conservation program.

Analysis of the qualitative evaluation revealed that the program was very helpful in (1) approaching the instructional goals of the Ann Arbor Public School System, (2) helping to develop desirable interests, attitudes, and appreciations at all grade levels, (3) helping to develop desirable conservation understandings and concepts at all grade levels, and (4) helping teachers to be more effective in the presentation of conservation material.

Analysis of the quantitative evaluation revealed that:

1. Elementary teachers:
   a. rated the program high in approaching their instructional goals.
   b. rated the program high in the degree of helpfulness that the outdoor and conservation education written material was in approaching their instructional goals.
c. rated the program high in the degree of helpfulness the orientation period was in preparing their students for the field trip.

d. rated the program high in the degree of helpfulness the presentation on the school bus was in preparing their students for the field trip.

e. rated the program high in the degree of helpfulness the continuing activities were in extending the interest and attitude of their students.

f. (for kindergarten) rated the program high in establishing a "friendly" relationship between the child and the living world.

g. (for first grade) rated the program high in increasing the child's awareness of his environment.

h. (for second grade) rated the program high in increasing the child's understanding of the interrelationship between plants, animals, and soil.

i. (for third grade) rated the program high in increasing the child's understanding of the interrelationship between aquatic plants and animals and their nonliving environment.

j. (for fourth grade) rated the program high in increasing the child's understanding and appreciation of the interrelationship and interdependence between plants, animals, soil, and water.

k. (for fifth grade) rated the program high in increasing the student's understanding of man's impact on the environment.

l. (for sixth grade) rated the program high in increasing the student's understanding of how land management practices in a watershed influence the welfare of all people living in the watershed.

2. Secondary science and social studies teachers:

a. rated the program high in approaching their instructional goals.

b. rated the program high in the degree of helpfulness the conservation education written material was in approaching the instructional goals of their course.

c. rated the program high in the degree of helpfulness the program coordinator's classroom presentation was in approaching their instructional goals.
TEACHER EDUCATION

The program of inservice education that accompanies the Outdoor and Conservation Education Program of the Ann Arbor Schools operates throughout the school year. It is aimed at helping teachers increase their understandings, interest, awareness, and teaching skills. It consists of providing the teachers with an "Outdoor and Conservation Education Program Guide" containing the philosophy, organization, and operation of the program and informing the teachers of the procedure for making a class appointment.

Teachers' kits are prepared for each grade level. These kits are sent to a classroom teacher one week prior to the class orientation session for the field trip. The kit contains material designed to (1) broaden the teacher's background, (2) prepare the class for the program, and (3) extend the child's learning experience following the field trip.

During the school year a series of grade-level field trips are conducted to orient the elementary teachers to the resource sites. Additional inservice training sessions are also provided in the form of interlevel presentations and in the preparation and distribution of outdoor and conservation education material.

The inservice program for secondary school science and social studies teachers consists of classroom and field trip presentations and in the preparation and distribution of additional conservation material.
CASE STUDY*

A K-12 Program In
Yarmouth, Maine

Back in 1966, prior to the popularity of "ecology" and the "public outcry against pollution," the small coastal community of Yarmouth, Maine, took its first step on the direction of what was then commonly known as conservation education. It was also during that time that federal funds were being made available to local agencies through Title III of the Elementary-Secondary Education Act for the development of educational programs. As a secondary teacher with five years of teaching experience and a strong interest in conservation education, I approached the school administration with the idea of an elementary-secondary program in this field. With enthusiastic support from the superintendent and school committee, application was made through Title III for a K-12 program. The application, however, was not successful.

Soon after this I was fortunate to receive a Leadership Development Fellowship from the Ford Foundation. The purpose of this fellowship was to provide a year of study, travel, and internship in environmental education to enable me to return to my community and establish a program. The fellowship sponsors arranged for me to attend the University of Michigan and work in the conservation education program in the Ann Arbor Public Schools with Dr. William B. Stapp as my adviser. During the year I maintained close contact with the school administration in Yarmouth regarding plans to establish a program there the following year. Upon my return to Maine, the community, with a total student population of about 1,200, hired me to become a full time coordinator with the responsibility to plan and implement a pilot K-12 environmental education program. It is important to note that this program was financed by local funds.

An important point to be stressed here is that the initial idea and support for the program was generated from within the school system involving both the teaching staff and the administration. Throughout the planning phase, from the program's conception to its implementation, close communications were maintained between all parties. The budgetary details, in particular, were thought out and planned at least a year in advance.

Another important first step in the implementation strategy was an all-day workshop for all teachers in the school system at the beginning of the school year. The purpose of the meeting was to thoroughly acquaint all elementary and secondary teachers with the concept of environmental education. As those of you who have been associated with public education well know, the interest, confidence, and commitment of teachers are essential for the success of any educational endeavor. Therefore, I cannot stress strongly enough the importance of such a meeting for it did more to secure the initial support of teachers than any other single event. Because this approach was successfully used twice, a brief description may be usefully given here.

Not only were all teachers and administrative personnel in attendance at the workshop but also invited were town officials, key citizens from community organizations, superintendents from neighboring school systems, representatives from nearby colleges, and correspondents from the local news media. The meeting itself was carefully organized. Dr. Stapp gave the keynote address describing the concept of environmental education. A slide-tape presentation by the Natural Resources Council of Maine emphasized environmental problems in the state to accent the need for environmental improvement. The chairman of the local planning board then gave a short illustrated talk on the role of the citizen in helping the community to solve environmental problems. This was followed by Yarmouth's town manager who highlighted some of the specific problems facing the community. In the afternoon session I presented with slides the direction the pilot environmental education program might take to help youth to better understand the community's problems and help resolve them. Then all secondary teachers participated in a typical environmental education field trip, traveling through the community aboard a bus. Throughout the trip interesting aspects of the community's history, its geology and natural resources, and its environmental problems were observed and discussed. At the same time all elementary teachers were given practical techniques for using the school site as an environmental learning resource. A final summary session concluded the workshop. All teachers were asked to complete a brief questionnaire asking them how they felt their subject areas or classes could best contribute to the objectives of environmental education.

THE COMMUNITY IS THE CLASSROOM

I wish to stress that this kind of meeting is but one step of many which are necessary to keep the school and lay public informed and involved with a program of interest to both. The community is, indeed, the classroom for environmental education.
It is in this area of community and regional environmental studies that environmental education can make a most significant contribution to the total education of youth. And it is through this kind of orientation that opportunities are presented for drawing together the school and community.

Communication is a vital link in the process of implementation and an area which a coordinator must continually explore. Several avenues of communication have been pursued. Early in the program a monthly newsletter was established and it is still being sent to all teachers, administrators, and school personnel, including secretaries, custodians, bus drivers, and teacher aides. In addition, community program volunteers, town officials, and many others receive this newsletter. Also early in the program I met with the town manager, planning board chairman, and other officials to learn more about the community and to acquaint them with the program. Television, radio, and newspaper coverage were relatively easy to obtain due to the action oriented learning activities youngsters were engaged in. As coordinator, there were many opportunities to speak to local organizations. Slides of the program were very useful in this respect. Many members of these groups subsequently became involved in the program. Over a dozen volunteers were trained to lead field trips. A school site steering committee was formed, which included several community members, to develop a sixty-acre site in the center of town as an outdoor learning and recreation area. Two local organizations contributed scholarships to students and teachers for attendance at summer conservation camps. As coordinator, I worked with them helping to select candidates. Other groups have become interested in beautifying the school sites, and through the environmental education program, arrangements were made and supervision provided for student involvement in planning activities. These are real examples of the many ways environmental education programs may encourage community involvement—an aspect which should be a major point of consideration from the very conception of a program.

Following the introductory workshop meeting, the program structure and guidelines for its implementation were developed. Three broad areas of work were identified: (1) curriculum development and enrichment, (2) school site development, and (3) dissemination and public relations. Work was commenced in all three of these areas, and each will be described briefly.

The work of curriculum development and enrichment was begun immediately because this must be the central thrust of an education program. It was recognized at the outset that environmental education is not a separate discipline but an emphasis in
the curriculum-- a part of all subjects. It was also felt that successful implementation of a program depends upon it being logical, easily understood, and capable of being readily integrated into the curriculum.

As a starting point, the program accepted the definition that environmental education is an emphasis in education which aims to develop citizens who will have an understanding of their biophysical environment and associated problems, who will possess a knowledge of how they can help resolve problems, and who will be motivated to seek solutions (Stapp, et al., 1969). From this definition it was clear that the program should be organized to develop attitudes and behavior. A definition of an attitude was accepted which suggests that an attitude consists of three components: (1) cognitive or knowledge, (2) affective or feeling, and (3) action tendency or readiness to act (Katz, 1960).

On the affective side, three feelings were identified which were considered important to be developed through the program: (1) individual worth-- the idea of a self-image, (2) environmental sensitivity-- the idea of a land ethic, and (3) social responsibility-- the idea that one must work with others for the benefit of not only oneself but for the benefit of others and future generations.

On the cognitive side, six basic concepts were identified. Three dealt with the natural environment: (1) components of the environment differ in individual character, (2) they are inter-related, and (3) they are changing. Three more concepts dealt with man and his environment: (1) man is dependent upon his environment and affected by it, (2) man can alter his environment through institutional and technological systems, and (3) environmental problems result from neutral and man-made forces. These concepts were in turn broken down into sub-concepts. They formed an important conceptual framework upon which the program could be developed and integrated into the existing curriculum. It might be pointed out that the first three concepts are strongly related to the natural sciences and the latter three to the social sciences.

The concepts were related to twelve themes, six of which represent elements of the natural environment: land, water, air, plants, animals, and energy. The other six relate to the ways man interacts with his environment: land and water development, structural design, transportation, utilities, recreation, and environmental controls.

A scheme was developed whereby students could be exposed to each of these themes and related concepts at each grade level in an expanding and increasingly complex sequence. At kindergarten
and grade one the themes and concepts are related to the school environment, grades two and three--the neighborhood and home, grades four and five--the community, and grade six--the region. In grades seven through twelve, the themes become topics for presentation, student investigation, and problem solving within various subject areas. They are centered around not only local problems but state, national, and international concerns.

At the elementary level, workshops were held at each grade level for citizen volunteers and teachers. During these sessions they were introduced to the themes and concepts and trained to help lead the field trips. The workshops were followed by classroom presentations or field trip orientations, the field trips a few days later, and then follow-up activities. The field trips are, in most instances, partly by bus and partly on foot. The bus is utilized as a moving classroom with audio equipment for questioning, leading discussions, and directing attention to examples of themes and concepts along the way.

CURRICULUM ENRICHMENT

In addition to this more formal or planned curriculum contact with students and teachers each year, another important aspect involves curriculum enrichment. By this it is meant that the coordinator works to achieve the objectives of environmental education in a variety of ways as opportunities arise. For example, a resource center of teaching materials and educational aids was established. Special presentations, assemblies, and field trips are given at all grade levels. Individual and group consultations with both students and teachers are carried out. Teacher inservice workshops are conducted. I also had the opportunity to serve on both social studies and science curriculum committees.

A second major area of work is school site development. The school site offers opportunities for: (1) student environmental studies and learning experiences, (2) conservation or environmental improvement activities and projects, and (3) depending on the nature of the site, development as a school-community nature center. In Yarmouth a steering committee was formed to develop a master plan for developing a model site. The services of resource agencies, such as the Soil Conservation Service and Maine Forest Service, were tapped. A local landscape architect volunteered to serve as a consultant. At the time of this paper, a pond has been built with funds from several community organizations and the Agricultural Stabilization Conservation Service. Many trees and shrubs have been planted and a nature trail started. A sign has been constructed by the industrial arts department and two Boy Scouts as a merit badge project.
A third area of work involves communications and public relations and represents professional activities by the coordinator to expand the influence of the program. Many of these kinds of activities have already been mentioned. Several other examples may serve to illustrate the importance of this area of professional activity.

Early in Yarmouth's pilot program year, a presentation was given at a joint meeting of superintendents and school committee members from neighboring communities. These towns subsequently voted to share costs and participate in the present regional program now serving over 6,000 students in five communities. The cost is less than $4,000 per community per year, making the coordinator approach economically feasible in this situation.

The coordinator approach is perhaps an ideal way to implement environmental education programs in school systems. I have described the role that a coordinator can play in such a program. However, I believe that realistically many if not most school systems, facing rising costs and the pressure of budget cuts, will not likely adopt this approach. Instead a more feasible plan would seem to be to establish regional centers. Staffed by trained specialists, these centers could provide direction to teachers and environmental education committees within school systems. The regional coordinator could help plan units and core learning experiences around each school's curriculum. This approach, when augmented by state consultants and college and university undergraduate and graduate programs as well as inservice courses, workshops, and training programs, could begin to reach a large number of students on a relatively small per pupil cost basis.

A variety of methods for financing these regional centers should be explored. They might, for example, receive financial support from the state educational agency or the state resource agencies or both. Or they might be supported by contributions from several school systems or districts. Perhaps they could be tied to the regional planning office serving the area. Another source of support might be a college or university system. Private sources may also be able to help.

In Maine today such a regionally based program is being developed. Through Title III funding the Maine Environmental Education Project, sponsored by the Yarmouth, Maine, school system, has identified and selected four school systems which have agreed to finance environmental education programs with local funds. The four school systems are located over a wide
geographic area of Maine. From each system a teacher has been selected and is currently receiving a year's training in a master's degree program in environmental education at the University of Michigan. Upon the return of these coordinators to their school systems in the fall of 1971, they will implement regional programs.

The Yarmouth area regional program will serve as a model and resource center for these four. The program in the Yarmouth area is now under the direction of Mr. Wesley Willink. It will be my responsibility as director of the Maine project to give guidance and assistance to the four new programs. Two more school systems and trainees are scheduled to be selected for participation in the project during the next year. These programs, all based upon the coordinator concept, will provide the model programs so necessary if environmental education is to be expanded to other communities.

The possibility exists that these programs may eventually become regional centers serving a wide geographic area. In the meantime, the coordinators for these programs will be establishing programs suited to the educational needs of their respective communities and regions.

Through a workable strategy, such as the one outlined in this case study, environmental education can become a real force in education for developing citizen responsibility and environmental improvement.

A SELECTED BIBLIOGRAPHY

CASE STUDY*  
Using Resource People to Improve Environmental Education

Resource people can make significant contributions to environmental education. One important function is forming local environmental education committees. With other resource agency and community organization people, teachers, and administrators, they can evaluate existing programs and establish new ones, and they can put together guidelines for the development and use of nature trails as environmental study areas. They can plan and develop schoolyard laboratories that involve students and adults in community improvement programs. Environmental education committees can contribute to urban planning, to insure adequate environmental study areas for urban children. Some examples of action projects for committees include:

1. Developing Schoolyard Classrooms.  
2. Develop a soils pit.  
3. Develop an arboretum of native plants.  
4. Develop habitat for small animals.  
5. Develop landscaping around school buildings.  
6. Developing Environmental Study Walks.  
7. Developing Curriculum Teaching Aids.

Environmental education committees can also plan and coordinate field trips in a wide variety of environments, such as high school geology field trips, or visits by teachers to seed orchards. Teachers and students then have the opportunity to collect data about the management of resources and make their own interpretations about those data, on the desert, in seed orchards, range grasslands, wildlife management areas, or urban environments.

The resource person's role might also include planning instructional strategies with teachers and administrators, identifying important concepts, big ideas, and themes that are important to an understanding of the environment. They can help develop specialized activity-oriented teaching aids for local areas so that kids don't always have to stay inside the classroom to develop understandings in different disciplines.

One of the most important roles of the resource person is in teacher training. This might mean putting on courses over educational television or conducting one-day in-service workshops for teachers to gain the skills and competencies of going beyond the four walls of the classroom. The resource person can also train teachers to conduct their own in-service workshops. (Teams of educators and resource people, have been formed throughout the Northwest to conduct intensive teacher training courses.)

Working subcommittees of local environmental education committees can also be formed. They might include:

1. Teacher training subcommittee
2. Outdoor Classroom development subcommittee
3. Curriculum integration subcommittee
4. Education tour subcommittee
5. Coordination of requests subcommittee
6. Information dissemination subcommittee

If a resource person is going to do these things, he needs training in processes and involvement. At resource training sessions at Sitka Bay, Alaska, the resource people gave up the standard "lecture, show-and-tell trip" down the nature trail (where you stop at a numbered stake and the interpreter interprets everything for you). Instead, the resource people developed self-directed activities to involve people in making their own interpretations about the cultural and natural environment.

Resource people evaluated the Forest Service's 1970 Environmental Education Training Conference for Resource People in this manner:

"I will now trade in my 'show and tell' techniques for 'exposure and involvement' processes."

"The approach of direct contact with the subject, based upon observation, using all the senses, questioning, relating, and self-expression, opens up a whole new aspect to the problem of exposing school children (through their teachers) to the exciting world of their environment."

"The multi-agency participation demonstrated that, working as a team with educators, we can provide the most effective learning experiences for the students' benefit."

Environmental education experiences that must be composed of significant and relevant experiences that make every person successful in interacting and communicating with other people and the environment. Resource people can contribute to quality environmental education experiences by working toward total commitment and involvement of all segments of the community.
CASE STUDY

Parkway Program
Philadelphia, Pennsylvania

ORIGINATION

The Parkway Program was established in 1969 by the Philadelphia Public School, with the aid of a Ford Foundation Grant to provide an alternative to traditional schools. A number of institutions including institutes, museums and companies cooperated in the venture. The school provided a model which has been copied in several cities. This model includes the concepts of public education, no formal school building, and selection of students (by lottery) from several parts of the city and local area.

RATIONALE

The Parkway Program was established to change student attitudes about learning, to permit them to be involved in decision making regarding courses they would be taking, to provide for student identity, and to maintain close contact between students and teachers. The model also was to provide learning in the setting of the community rather than in a formal building.

PERSONNEL

Personnel involved in the organization of the school included public school personnel institutional representatives, students, and interested citizens. The development of the program was and is dependent upon continued cooperation of these groups. Courses are taught by both public school teachers and other non-certified persons, primarily people teaching courses at institutions such as art museums, courts, auto shops, etc. Planning also involves all groups. The school is organized around units of students of approximately 180 students each. Each unit has its own staff and develops its own curriculum.

FACILITIES

The Program was originally established with the concept of no formal school. While a central office is maintained, classes are taught in many locations throughout the city. Most of the locations used for instruction are accessible on foot.
FINANCING

Established with the aid of the Ford Foundation, the Program now is funded primarily with public money. Cooperating institutions, however, do contribute in various ways to the operation of the program. Without their cooperation cost of the program would be considerably different.

MATERIALS

Materials have been developed for various courses and offerings. Information about these can be obtained for the program director.

EVALUATION

Evaluation of the program has been both formal and informal; data have been used in modification of the program. Students have had a significant part in decision making and appear to like the program. Costs are equal to or less than traditional school operations.

TEACHER EDUCATION

Extensive planning and evaluating is done by the staff in cooperation with each other, with students, and with institutional instructors. Hence, inservice education is built into the Parkway Program.
MATERIALS

Included in this section are brief descriptions of selected materials related to environmental education. Because it is not possible to include all of the materials available, these are intended to serve as examples containing some promising trends and practices. Persons interested in developing learning experiences in environmental education need to consider carefully how these materials will fit into their curriculum and examine a wide variety of things, including nonprint as well as print materials in making their selections.
Overview

The materials in this social science program developed by the Educational Research Council of America are structured around the basic concepts, skills, and learning processes of all the social science disciplines. The program is sequential and cumulative with specific concepts introduced at lower levels developed with increasing sophistication as the student progresses. The teacher's guides clearly indicate the general philosophy of the program, discuss the overall objectives, and demonstrate how the individual units fit into the whole. Some of the units are more directly related to areas of environmental concern, but in almost every year's program some attention is paid to concepts which have importance in environmental education.

Required or Suggested Time

Each program is designed as a one-year course for a particular grade; however, the student materials are not labeled so that they can be used flexibly in an ungraded situation.

Intended User Characteristics

The developers state that although the program offers a variety of optional materials and activities to reach most student populations, it may not be satisfactory in reaching the needs of students with poor
reading skills or from disadvantaged backgrounds. The teacher's guide is clear enough and explicit enough so that any teacher could implement the course without further training.

Rationale and General Objectives

The educational philosophy of the curriculum emphasizes the transmission of culture and the analysis of values in human societies through the acquisition of a usable, coherent body of social science skills, knowledge, and attitudes. It is felt that by exposing students to a discrete body of knowledge and skills, they will be able as adults to make informed decisions in matters affecting them and the world.

Content

Environmentally sound concepts such as "Man and His Environment"; "The Nature and Importance of Values"; "Norms and Relativity"; "The Nature of Man"; "Specialization"; "Agriculture, Manufacture, and Services"; "Cultural Differentiation"; and "The Nature of Law" are considered at all grade levels. "Earth sciences in relation to social science" and "spatial interconnections" are taught in grades one through six; and "economic growth," "social harmony and disharmony," and "demography" are treated in grades two through six.

Teaching Procedures

The focus of the materials is on inquiry strategy although they provide for a variety of techniques. The students are encouraged to become actively involved in the learning process and to apply the skills of problem solving.

Evaluative Data

Not available.

Materials and Cost

Kindergarten:
First Semester: Learning About the World
Student Text: none
Teacher's Guide: 267 pp., 8" x 10", paper-bound
Teacher's Kit: pictorial materials for bulletin board and transparency masters in 8" x 10" manila envelope $ 4.68
Second Semester: Children in Other Lands
Student Text: Children in Other Lands. 44 pp., 8" x 10", paper-bound
Teacher's Guide: 275 pp., 8" x 10", paper-bound; full color photographs and paintings $ 4.68
Teacher's Kit: pictorial materials for bulletin board and duplicator transparency masters in 8" x 10" manila envelope $ 1.32
Grade One:
First Semester: Our Country
Student Text: Our Country, 75 pp., 8" x 10" paperbound
Teacher's Guide: 435 pp., 8" x 10", paperbound
Second Semester: Explorers and Discoverers
Student Text:
14 texts, each dealing with different explorers, 8" x 8", paperbound; each
Teacher's Guide: Explorers and Discoverers.
322 pp., 8" x 8", paperbound
Sound filmstrips:
3 sets, each dealing with several explorers

Grade Two:
First Semester: Communities at Home and Abroad
Student Text:
3 titles, 134-170 pp. each, 8" x 10", paperbound; each
Teacher's Guide: Communities at Home and Abroad.
367 pp., 8" x 10", paperbound
Second Semester: American Communities
Student Text:
An Historical Community: Williamsburg, Virginia. 122 pp., 8" x 10", paperbound
A Military Community: Fort Bragg, North Carolina. 66 pp., 8" x 10", paperbound
An Apple-Growing Community: Yakima, Washington. 58 pp., 8" x 10", paperbound
A Forest-Products Community: Crossett, Arkansas. 71 pp., 8" x 10", paperbound
A Steel-Making Community: Pittsburgh, Pennsylvania. 119 pp., 8" x 10", paperbound
A Rural Community: Webster City, Iowa. 162 pp., 8" x 10", paperbound
Teacher's Guide: American Communities, 367 pp., 8" x 10", paperbound

Grade Three:
Student Text:
First Semester: The Making of Anglo-America.
282 pp., 8" x 10", paperbound
Second Semester: The Metropolitan Community.
184 pp., 8" x 10", paperbound
Teacher's Guide: The Making of Anglo-America and The Metropolitan Community. 419 pp., 8" x 10", paperbound; for both semesters
Grade Four:
First Semester:
Student Text: Agriculture: Man and The Land.
250 pp., 8" x 10", paperbound $ 2.25
204 pp., 8" x 10", paperbound $ 2.25
Second Semester:
249 pp., 8" x 10", paperbound $ 2.55
The Indian Subcontinent. 124 pp., 8" x 10", paperbound $ 1.65
178 pp., 8" x 10", paperbound $ 1.35
The Indian Subcontinent. 108 pp., 8" x 10", paperbound $ 1.50

Grade Five:
The Human Adventure
Student Texts:
4 student texts, 154-170 pp., 8" x 10", paperbound; each $ 1.92
Teacher's Guide for each of above; 121-131 pp., 8" x 10", paperbound; each $ 1.35
Student Text: Lands of the Middle East. 157 pp., 8" x 10", paperbound $ 2.25
Teacher's Guide: Lands of the Middle East. 112 pp., 8" x 10", paperbound $ 1.50

Grade Six:
The Human Adventure
Student Texts:
4 student texts, 169-171 pp., 8" x 10", paperbound; each $ 1.98
Teacher's Guide for each of the above; 98-149 pp., 8" x 10", paperbound; each $ 1.35
Student Text: Lands of Latin America. 186 pp., 8" x 10", paperbound $ 2.25
Teacher's Guide: Lands of Latin America. 124 pp., 8" x 10", paperbound $ 1.50
Overview

These materials for 6th- through 8th-grade students were developed by the Industrial Relations Center at the University of Chicago with a grant from the Charles Stewart Mott Foundation. They are intended as a supplement to a 6th-, 7th-, or 8th-grade course or as a self-contained year-long course in economics. The materials are designed to lead the students to establishment of an economic system on a simulated South Pacific Island, a study of the market, a hypothetical trade situation between the United States and Canada, and a changing trade pattern between Malaysia and Brazil. The simulation game, Market, is an integral part of the course but is also sold separately.

Required or Suggested Time

These materials were designed for an extensive 24-week course in economics. If the market game is omitted, the course of study will take approximately 20 weeks. Some, but not all of the parts of the course, can be taught separately and out of sequence.

Intended User Characteristics

These materials were designed for students in grades 6 through 8. Students of diverse abilities should do well with these materials in a regular social studies classroom situation. The ability of the teacher to pose and sequence questions will be a major factor in determining the success of the program. In addition, the teacher needs to be flexible
and resourceful. The teacher should also have a general social science background.

Rationale and General Objectives

In the Teacher's Resource Guide the director states, "We believe the eleven-or-twelve-year-old child is capable of and interested in grappling with abstractions, provided he can detect their resemblance to reality. At this age, children want to better understand their world; they want to be challenged by their educational experiences."

The general objectives of the materials are for students: 1) to learn small group skills; 2) to be sensitive to what constitutes economic behavior; 3) to view economic behavior with more concern; 4) to retain some economics concepts and generalizations; 5) to have an awareness of how the social scientist creates knowledge for his own use; 6) to have an awareness that practicing economists use data which is organized in tables and graphs; and 7) to improve their ability to read graphs and tables.

Content

The basic structure of the economic content of these materials is the premise that unlimited wants versus limited resources make choice-making necessary. Decisions have to be made as to how to effectively use resources and determine the priority of wants. This choice-making role must be played in using the natural resources of the environment. While the content is primarily economics, the materials introduce such concepts as the management and use of resources (both human and natural), man-land relationships and the allocation of scarce resources.

Teaching Procedures

Unit One serves as a general introduction to the three types of economic behavior discussed in the program: production, exchange, and consumption. It contains a story about two shipwrecks on an imaginary island. Written exercises, small group activities, and role playing are woven into the study. In Unit Two the students are involved in a simulation game called Market. Some students buy goods while others sell goods, discovering economic concepts of price theory. It shows how the market mechanism controls production. Unit Three presents two case studies in international trade which help the students learn to apply economic concepts to real world situations.

Evaluative Data

Several field tests have been carried out to date. The last one (1969-1970) included rural, urban, and suburban children and investigated the feasibility of using the program in all of the upper elementary grades. These reports are available from the project.
Materials and Cost

The Economic Man program includes Teacher's Editions of the student texts, Student Texts, a Teacher Resource Unit, Teacher's Guide to Daily Lessons, and the Market game.

Student Text:
Economic Man: Producer and Consumer: Book I. By Katherine Esch Chapman et al. 122 pp., 8½" x 11", stapled paper cover $1.96
Economic Man: Buyer and Seller: Book II. By William D. Rader et al. 136 pp., 8½" x 11", stapled paper cover $1.96

Teacher's Editions:
Economic Man: Book I. 122 pp., 8½" x 11", stapled paper cover $1.96
Economic Man: Book II. 136 pp., 8½" x 11", stapled paper cover $1.96

Teacher's Resource Unit:
Economic Man: Teacher Resources. 77 pp., 8½" x 11", stapled paper cover $1.96

Teacher's Guide:
Economic Man: Teacher's Guide to Daily Lessons. 83 pp., 8½" x 11", stapled paper cover $1.96

Market Game materials:
Coordinator's Manual, Retailer and Consumer Envelopes, Food Cards, Paper Money, Coins, Score Sheets, Lists. $48.00

Supplementary Coordinator's Manual: 56 pp., 8½" x 11", paperbound; for use with game if game is used separately $ .80

Supplementary Student Manual: 32 pp., 8½" x 11", paperbound; for use with game if game is used separately $ .48
Overview

Book Seven of Our Man-Made Environment was developed in cooperation with the Division of Art Education, School District of Philadelphia, and the Philadelphia Chapter of the American Institute of Architects. The unit is an attempt to help children begin to become aware of the man-made environment—that is, to understand what constitutes a man-made environment, for what purposes this environment has been created, and how we could, in the future, improve upon it. In short, the emphasis is on sensitizing the observer to the influences of the man-made environment on his life and, if he is dissatisfied with it, helping him to understand his responsibility in changing the situation.

Required or Suggested Time

This program is designed for use as a unit within an environmental education course. It may be used in language arts, fine arts, social studies, or mathematics courses. There are seventeen complete exercises, each taking about 25 minutes of classroom time to accomplish.

Intended User Characteristics

The materials are most suited to the urban, poverty-area youth of mixed ethnic background. However, the materials have been successfully used with upper-middle-class suburban children as well. It has been very successfully used with slow learners, particularly in the higher elementary grades. It has also been successfully used in junior high, high school, and college classes.
Rationale and General Objectives

The authors of this kit were concerned that students have not developed feelings of efficacy in influencing the man-made environment, and because of this, the students have felt little or no responsibility for it. In order to change the man-made environment, man must understand his role as both a creator of it and a controller of it. The general objective of the kit is to sensitize the student to the man-made environment and help him reach rational judgments about how it should be changed to be more closely attuned to his value systems. The four basic questions noted below under Content are intended to guide the student in becoming a concerned observer of the man-made environment. It is hoped that his ability to generate some well thought out responses to the good and bad points of the built environment will be increased.

Content

Book Seven encourages students to cope with four overall questions: (1) What is the man-made environment? (2) Why do we build our environment? (3) What determines the form of our environment? and (4) How do we change our man-made environment? It is divided into four sections, each emphasizing one of these questions. Each section is composed of a series of problem-solving exercises for the student. The techniques necessary to solve some of the problems posed encourage the student to think in terms of architectural structure; cost of building materials; the relationship of the building to the surrounding community—both man-made and natural; the problems of engineering; and the social attitudes which affect the problem.

Teaching Procedures

Problem-solving exercises are offered throughout the four sections of the kit; "punchout" models of shapes, designs, and configurations are provided; several simulations are suggested; and short readings deal with each of the four basic questions. The kit suggests that teachers not limit themselves to the activities provided, but expand both the content and teaching strategies. The relationship between the "punchouts" provided and the narrative description is carefully developed and will motivate students to investigate the relationship between design and the man-made environment.

Evaluative Data

The materials were tested in the Philadelphia public schools in Grades 6, 7, and 8. They were revised according to the data gathered and Book Seven now represents a second revision.

Materials and Cost

The kit contains three components—a set of readings to be used by both teacher and student, 10 "punchout" cards and seven sheets of tracing paper.
Student and Teacher Materials:
Our Man-Made Environment: Book Seven. 80 pp.,
9 1/2" x 11 3/4", stapled paper cover.
25 booklets or more
25 sets of replacement "punchouts" and tracing paper

$1.50 each
$12.50 per set
The Harvard Social Studies Project has developed curriculum materials, teaching approaches, and evaluation devices based on the conviction that the analysis of public controversy should command primary attention in the teaching of social studies in public secondary schools. The project has gone through five phases in producing these materials: 1) development of materials; 2) experimental trial of materials; 3) evaluation; 4) revision of materials for publication; and 5) systematic statements of concepts upon which the project is based.

Required or Suggested Time

The unit books each require one to three weeks, depending on the amount of discussion and emphasis placed upon them by the teacher and class.

Intended User Characteristics

The materials are intended for use as supplementary materials and can be included in any social studies course to which they apply. They are intended for all students of average ability in grades 7 through 12. Effective use of the "Socratic method" of discussion requires some thought and practice by the teacher, as well as a willingness to deal frequently with emotion-laden issues in an open and energetic manner.
Rationale and General Objectives

The most broadly stated objective is to train students to examine and analyze, through discussion and argument, the kinds of disputes which give birth to social conflict. The project developers state that by considering a variety of situations throughout history and across cultures, by viewing the situations in terms of various social science concepts and theories, and "by examining and weighing various methods for reaching and justifying positions, students will hopefully gain certain powers of analysis that will aid them in discussing value dilemmas on which public controversy thrives.

Content

Two of the unit books produced by the project, Municipal Politics and Science and Public Policy, deal with environmental issues.

Municipal Politics is designed to show that conflict is a fact of life in every American city. Whenever there is a public problem, interested groups and individuals propose different and often antithetical solutions." The student material is a fictionalized case study in which community decision-makers grapple with the important concept of land use. Students are expected to understand and deal with such concepts as expertise, authority, political strategy, self interest, community interest, majority of citizens, interest groups, and power elite.

Science and Public Policy contains a series of short readings, each followed by questions, which serve as the basis of class discussion. The readings describe a variety of situations, both real and fictional, in which the relationships between scientists and public decision-makers are called into question. The case studies include:

1) Galileo, the Church, and Copernican theory;
2) fluoridation of municipal water supplies;
3) Oppenheimer, nuclear research, and national security;
4) chemical-biological warfare research; and
5) genetic research.

Teaching Procedures

Emphasis is placed on continuing dialogue with students, simulation and moderation of discussion and argument. Taking a Stand, the unit book which the project suggests classes use before any others in the Public Issues Series, introduces students to the elements of discussion of controversial issues. Cases and Controversy: Guide to Teaching the Public Issues Series provides guidelines to the teacher for conducting discussions of controversial issues, using the "Socratic method." In addition, both Municipal Politics and Science and Public
Policy are accompanied by short Teacher's Guides offering specific suggestions for discussion of the two unit books.

Evaluator Data

The Project has conducted two major types of evaluation: informal clinical evaluation of the ongoing teaching, and systematic evaluation of the program at its termination. The results of the first are reflected in the revised teaching and testing materials in the Public Issues Series. Results of the second are in the Final Project Report. The summary of results is rather inconclusive and the question of whether it is possible to teach average high school students to carry on intelligent discussions about social issues remains essentially an open one, subject to further examination and testing.

Materials and Cost

Student Materials:
24 unit books by Fred M. Newmann and Donald W. Oliver; each is 5" x 8", stapled, paper covered; priced at $ .35 per copy in quantities of 10 or more of one title; available from publisher.
The two unit books which deal with environmental issues are:
- Municipal Politics, 47 pp.
- Science and Public Policy, 47 pp.
A list of other unit books may be obtained from the publisher.

Teacher's Guide:
4 pp., 8 1/2" x 11", printed leaflet with specific suggestions for teaching strategies for the issue and 2 possible objective tests; free with order of 10 or more.

Additional Guide:
Cases and Controversy. 15 pp., 8 1/2" x 11", stapled paper cover; describes suggested discussion techniques; 1 copy sent with each order of 10 or more copies of one title of the student materials.
Overview

High School Geography Project materials were developed by the Association of American Geographers during a ten-year period which ended in 1970. Funds were obtained from a variety of sources including over $2 million from the National Science Foundation. Unit 5, "Habitat and Resources," should be included among the best material available in environmental education from the social sciences. It contains good social science tools and content designed to foster student involvement with real world problems. Other units from High School Geography Project could be utilized for concept development, but they do not focus as directly on environmental problems. The multidisciplinary program was designed primarily as a one-year geography course for tenth graders; however, it has been used successfully at all secondary levels. "Habitat and Resources" is a 5-7 week unit which contains a vast array of student activities and educational media. Evaluation of High School Geography Project indicates significant cognitive and affective growth is attained with its use.

Required or Suggested Time

The course is designed for a one-year course in geography. Units can be purchased and used separately in the following time periods:
Unit 1: 5-7 weeks; Unit 2: 6-8 weeks; Unit 3: 3-4 weeks; Unit 4: 4-5 weeks; Unit 5: 5-7 weeks; and Unit 6: 3 weeks.

**Intended User Characteristics**

Although the materials were written for the average tenth grader, they have utility for grades 7 through 12. Any secondary social studies teacher can successfully implement the course, although background in geography might be helpful.

**Rationale and General Objectives**

The basic premise of the course is that geography has special ways of looking at the world and at the growing accumulation of facts which help students understand relationships according to a different order and perspective. The major goal of the program is to provide an appropriate educational experience so that students will gain both cognitive and analytic skills.

**Content**

The four major geographic content approaches (spatial, area studies, man-land tradition, and earth science) are combined throughout and amplified with concepts from all social science disciplines. After working with the content of Unit 5, for instance, students should be able to categorize habitats according to ways in which they have been modified by man, explain why habitats are used differently by people with cultural traditions and technological capabilities, and recognize and interpret the conflict over resources.

**Teaching Procedures**

Inquiry methods which lead students from evidence to hypotheses are skillfully articulated through the mix of student-teacher interaction which includes collection and evaluation of data, analysis, generalizing, decision-making, and role playing games.

**Evaluative Data**

The program was evaluated both formatively and summatively in numerous school settings. The data indicates that there was significant student attainment in both the cognitive and affective domains.

**Materials and Cost**

Unit 5: "Habitat and Resources"

Student Materials:
- 1 Resources book; 85 pp., 8 1/2" x 10", paperbound $1.20
- 1 Manual workbook: 20 pp.; in sets of 10 $2.40 per set
Teacher's Materials: kit contains
1 Teacher's Guide, 78 pp.; 1 transparency packet; 1 set of role profiles; 3 sets of readings; 15 sets of maps

$39.75

NOTE: A copy of The Local Community: A Handbook for Teachers, developed as a supplement to the High School Geography Project materials, was received by the ERIC/ChESS staff too late for entry into this report. It appears, however, to be of great use for high school classes wishing to investigate man-environment relationships in their home communities. The volume contains detailed guidelines for planning, preparing, and conducting a variety of learning activities drawing on many local resources, from telephone books to people.
FIELD SOCIAL STUDIES PROGRAM
WORKING, PLAYING, LEARNING (Grade 1)
PEOPLE, PLACES, PRODUCTS (Grade 2)
TOWNS AND CITIES (Grade 3)
regions AROUND THE WORLD (Grade 4)

Directors: Richard E. Gross, Professor of Education
Stanford University
John U. Michaelis, Professor of Education
University of California at Berkeley

Publisher: Field Educational Publications, Inc.
2400 Hanover Street
Palo Alto, California 94304

Publication Date: 1970
Availability: From publisher
Grade Level: 1-4
Subject Area: Multidisciplinary social sciences

Overview

The Field Social Studies Program is a K-12 program in social studies/
social science education based on what the directors describe as an in-
quiry-conceptual approach to learning. Each of the textbooks reflect
the Field Program's basic belief that students must be involved in an
inquiry process in order for effective learning to take place. There-
fore, each textbook combines inquiry, concept, skill, attitude, and
value objectives in structuring the instructional program. Although
there are materials available for grades K-12, only those in grades 1-4
deal, to a degree, with environmental education. Working, Playing,
Learning is the first-grade component and is based on the premise that
first-grade children are able to learn from their daily experiences.
Pictures are used extensively to provoke student inquiry. People,
Places, Products is the textbook for grade 2 and uses pictures to stimu-
late inductive investigation of five different types of communities--
fishing, grain-farming, cattle-raising, lumbering, and cotton- and
garment-producing communities. Towns and Cities, the third-grade
component, is structured to attain conceptual, inquiry, skill, and
affective objectives. The major content emphasis is on urban communities
and how they change. Regions Around the World is a textbook for fourth-
grade students which emphasizes the earth as the home of man and the
interrelationships between man and his physical-biotic environment.

Required or Suggested Time

Each level of the Field Social Studies Program is designed to form
the basis for one year of study in the curriculum. They may, however,
be used independently from other components of the Program.
Intended User Characteristics

The materials are intended for average students in these grade levels. The Teacher's Guides provide background reading to accompany each chapter; therefore, no special teacher training is required. Some general background in social science might prove helpful.

Rationale and General Objectives

The directors of the Field Social Studies Program believe that it reflects the very latest research on how children best learn social studies. The basic premise of the program is the inquiry-conceptual approach in which three components--inquiry processes, concepts, and settings--are interlinked to make significant contributions to social studies instruction. The materials constantly stress the interrelationships between concepts from the various social sciences because the directors believe a single-subject approach gives too narrow a view of most areas of concern today. Each part of the Program has four types of general objectives for students to accomplish. Conceptual objectives are concerned with knowledge and understanding of people. Inquiry objectives focus on competence in understanding and using various processes of inquiry. Skill objectives stress language and study abilities related to the social sciences. Affective objectives consist of values, attitudes, and interests inherent in the development and future of society.

Content

The Field Program utilizes concepts from the social sciences throughout the program and is designed to reflect the needs of most school systems in social studies instruction. The specific content emphasis differs at each grade level with the first four levels taking a dominantly multidisciplinary approach to increase the students' sophistication in study and awareness and understanding of themselves and the people around them. The concern with environmental education is particularly felt with the materials for grades 1-4. The first-grade materials, Working, Playing, Learning, include the study of schools, families, and communities, with a resource unit on the study of the earth as a place where people live and interact with the environment. People, Places, Products, the second-grade textbook, deals with the five major types of communities mentioned above by using six lessons for each. The first lesson of each unit deals with the primary industry involving raw materials. The second lesson presents contrasts in secondary industries concerned with product development, while the third lesson shows the lives of people in contrasted countries. The fourth lesson points out problems affecting industrial productivity and the fifth lesson illustrates how science was used to solve problems and improve products. The final lesson in each unit reinforces ideas about similarity and diversity in industry around the world. The resource unit included with the second-grade material is used to develop the students' understanding of the diversity of the earth's regions, both geographically and in relation to man's dependence upon them. The first three chapters of Towns and Cities, the grade 3 textbook,
introduce students to important characteristics of modern American cities. The chapters which follow examine the historic growth of cities and the changes which have taken place in the development of urban areas. The book concludes with an overall examination of problems faced by cities today, aiming at having students feel knowledgeable and responsible for improving cities in the future. The fourth-grade program, Regions Around the World, is based on three broad categories of concepts from the social sciences: learning about the earth as a planet in space; learning about the earth as a variety of physical and biotic landscapes; and learning about the earth as a variety of cultural landscapes. Resource utilization and conservation are examined. Students are encouraged to respect the complexity of the earth and its structure, with a view toward solving its problems.

**Teaching Procedures**

Each level of the Program includes a Teacher's Guide which offers suggestions for implementation of the materials with a general instructional format. Units are usually initiated by an activity designed to provoke curiosity and provide a focus for inquiry and learning. This activity is followed by developmental activities aimed at involving students in the inquiry process. Students are encouraged to raise questions for themselves and for discussion, and to pursue answers to their questions. Units usually conclude with review or synthesizing activities and suggestions for further individual and group inquiry. The materials can easily be adapted by the individual teacher according to his own teaching preferences. According to the directors, the teacher, regardless of the activity, functions as a catalyst and a co-inquirer in the learning process of the student.

**Evaluative Data**

Not available.

**Materials and Cost**

**Working, Playing, Learning (Grade 1)**

*Student Text:* Working, Playing, Learning. By Ruth H. Grossman and John U. Michaelis. 144 pp., 8" x 10\(\frac{1}{4}\)" hardcover $2.97

*Teacher's Guide:* 176 pp., 8" x 10\(\frac{1}{4}\)" hardcover $2.97

**People, Places, Products (Grade 2)**

*Student Text:* People, Places, Products. By Ruth H. Grossman and John U. Michaelis. 160 pp., 8" x 10\(\frac{1}{4}\)" hardcover $3.85

*Teacher's Guide:* 192 pp., 8" x 10\(\frac{1}{4}\)" hardcover $3.15

*Multimedia Package:* 5 color filmstrips each with a 33 1/3 rpm record; paper posters; 1 Teacher's Guide, 64 pp., 13\(\frac{1}{2}\)" x 10", stapled paper cover; all contained in cardboard box 17\(\frac{1}{2}\)" x 13\(\frac{1}{2}\)" $67.50
### Towns and Cities (Grade 3)

Grade Level: K-5

Subject Area: Interdisciplinary
Anthropology, Sociology, History, Economics, Geography, Political Science
Overview

Family of Man is a multi-media, elementary sixteen unit series which is part of a K-12 curriculum developed by the University of Minnesota Project Social Studies. Each unit, which is packaged in a kit, constitutes a learning system which includes an elaborate media package of filmstrips, audiotapes, printed originals for making student handouts, artifacts, and a teacher's resource guide. Through study of families and communities, students learn to understand concepts and generalizations from the social studies.

Required or Suggested Time

A set of three or four of the kits may be used interchangeably to make up a one-year social studies program. Single units can also be utilized to enrich and supplement existing courses.

Intended User Characteristics

In order to enhance the adaptability of the materials, the units are not labeled by grade so that they can be used at higher or lower levels or in non-graded or open classrooms. Any competent social studies teacher can teach the program, although he is encouraged to utilize the teacher's guide and read the "Rationale and Overview." Information about inservice training and consultants is available from SEE, Inc.

Rationale and General Objectives

One of the major features of this curriculum is the provision for continuity and early development of content, generalizations, skills, and attitudes with culture as the cornerstone and unifying theme. Values which are sought are curiosity about social data, respect for human dignity, tolerance of diversity, appreciation of other cultures, and understanding of how varying value systems modify and shape the use of the environment.

Content

The content of Family of Man is drawn from all the social science disciplines. The students deal with concepts relating to culture, social organization, social process, and site (which is defined as cultural adaptation to the environment) by comparing families and communities in many societies. For instance, the Hopi Indian Family, the Japanese Family, and the Family of Early New England deal explicitly with societal values which foster positive interaction between man and his environment. The Kibbutz Family in Israel is illustrative of productive ways in which man can modify an overtly hostile environment, while the Soviet Family in Moscow deals with the impact of technology.

Teaching Procedures

Inquiry is emphasized as a teaching strategy, but it is also recognized that other methods may be more appropriate in reaching certain
goals or developing specific skills. The Resource Guides contain "Suggestions for Teaching" each activity, and an array of informational material. Each of the suggested activities is related to the content.

Evaluative Data

The Family of Man multi-media units have not been objectively evaluated; however, the prototype units from Minnesota were studied in a number of schools. Standardized test results showed that the students using the material did as well or better, with respect to content, than control groups in regular courses.

Materials and Cost

**Hopi Indian Family Kit:**
- 9 children's books
- 30 study prints (11" x 14")
- 2 color filmstrips: Traditional and Contemporary Hopi Life
- Audio tape cassettes: Hopi legends and music
- 3 magnetic compasses
- 4 artifacts: yucca sifting basket, Katchina doll, pottery bowl, Hopi toy
- Ear of corn
- 3 printed originals for duplication: family structure sheet, Hopi song lyrics, and chart
- Teacher's Resource Guide: 91 pp., 8 1/2" x 11", paperbound
- "The Rationale and Overview." 38 pp., 6" x 9", paperbound

Materials come in a 20 1/2" x 14" x 6" carrying/storage case

**Complete Kit**

$ 174.00

**Japanese Family Kit:**
- 11 children's books
- 11 study prints (11" x 14")
- 3 color filmstrips: Village and City Life in Japan
- 1 audio tape cassette: Japanese children's stories and music
- 3 magnetic compasses
- 1 Japanese flag
- Wall map of Japan
- Rice seed
- Origami paper
- 17 artifacts: teapot, teacup, rice bowl, rice paddle, small dish, 36 pairs of chopsticks, child's Kimona sash, geta, slippers, Buddha statue, incense burner, abacus, calligraphy set
- 7 printed originals for duplication
"A Rationale and Overview." 38 pp., 6" x 9", paperbound
Teacher's Resource Guide. 124 pp., 8 1/2" x 11", paperbound
Materials come in two 10 1/2" x 17 1/2" x 5", and 15" x 10" x 4 1/2" carrying/storage case
Complete Kit $ 174.00

Family of Early New England Kit:
4 children's books
General reference book
20 study prints (11" x 14")
2 color filmsgrips: Early New England Life
1 audio tape cassette: Early New England Songs and Stories
3 magnetic compasses
Ear of Indian corn
10 artifacts: churn, broom, slate and pencil, quill pen and ink well, tin candle-stick, bayberry candle, corn husk doll, toy top
7 printed originals for duplication
"A Rationale and Overview." 38 pp., 6" x 9", paperbound
Teacher's Resource Guide: 120 pp., 8 1/2" x 11", paperbound
Materials come in a 36" x 18" x 4" corrugated cardboard carrying/storage case
Complete Kit $ 174.00

Ashanti Family of Ghana Kit:
17 children's books
20 study prints (11" x 14")
2 color filmstrips: Ashanti Life in Ghana
1 audio tape cassette: Ashanti Songs and Legends
3 magnetic compasses
Cocoa beans
6 artifacts: Ashanti stool, Kente ceremonial cloth, go d weight, an Akuaba doll, Oware board and beads
5 printed originals for duplication
"A Rationale and Overview." 38 pp., 6" x 9", paperbound
Teacher's Resource Guide: 115 pp., 8 1/2" x 11", paperbound
Materials come in a 36" x 18" x 14" corrugated cardboard carrying/storage case
Complete Kit $ 174.00

Available Separately:
A Rationale and Overview. 38 pp., 6" x 9", paperbound $ 2.00
Additional Teacher Resource Guides with set of originals $ 8.00
Price lists for individual replacement items are available on request.
The Our Working World series is designed to introduce children to the fundamental principles which underlie the functioning of the social world and to relate children's experiences to these principles. Although economics is the core discipline, the other social sciences are an integrated part of the program. The program is designed to introduce children to the analytical tools of the social sciences, their use in discovering cause-effect relationships in society, and the order that underlies our seemingly chaotic world. The child's experiences with the real world are used as points of departure. In the 2nd-grade materials, the children study many kinds of neighborhoods, populated by real people who have likes, dislikes, problems, and hopes. A wide variety of materials and activities is available.

In the 3rd-grade program, children are involved in studying the problems of the city. The intent of these materials is to motivate the children to discover the causes of the major problems that cities face. The children learn what individuals can, what individual volunteers can do, what volunteers working in groups can do, and what citizens working through the political process can do to solve urban problems.
Required or Suggested Time

The course is intended to furnish a full year's work in the social studies. Individual lessons may, however, be taught separately and out of sequence.

Intended User Characteristics

These materials are intended to be used with 2nd-and 3rd-grade students. These students need to have listening skills and be able to read at a 2nd-grade level or above. For inner-city pupils the materials can be used at upper elementary grades. It would be beneficial for the teacher to have a background in economics or the social sciences and to be able to direct discussions in these areas.

Rationale and General Objectives

The purpose of social science education, the author believes, is to develop analytical thinking and problem-solving ability. Students should learn to analyze and understand the structure and processes of society, so that as adults they can participate intelligently in the decisions of a free society.

The rationale for studying the neighborhood in the 2nd-grade from the point of view of the social sciences is that although the neighborhood is small, it presents in microcosm the major forces in our society. For the 3rd-grade materials the author states that because seven out of ten persons in this country live in a city, it is important to introduce the children to the realities of urban life. The general objective is to help children develop modes of analytical thinking useful in understanding the structure and processes of cities.

Content

The materials presented in this series use economics as a core around which the other social science disciplines are clustered. In order to teach something about all the social science disciplines in each year of study, the author has developed the idea of "orchestration" of the disciplines. Under this concept each unit emphasizes a different area of the social sciences. Senesh has also developed the idea of the "organic curriculum," meaning a well-articulated structure of concepts and relationships that are presented in increasing depth and complexity as the child progresses from grade level to grade level.

In the 2nd grade the pupil becomes acquainted with neighborhoods and their many social aspects. The children study the scarcity conflict and how the neighborhood tends geographically, technologically, and occupationally to specialize in order to solve this problem. In one unit the students explore the question of changing neighborhoods by examining how land use, natural disasters, man-land relations affect the neighborhood.
In the grade three materials a multidisciplinary approach is used. The discipline of economics helps the children understand why cities are located where they are, how people earn their livelihood, why and how cities trade, and why some cities grow and others decline. Political science helps the children understand how cities are governed, how use of the land is controlled by rules and laws, and why city governments must worry about such things as poverty, discrimination, and the education of children and adults. The analytical tools of sociology help the children discover what brings people together and what drives them apart in the city. Anthropology helps their understanding of urban life by showing them how tradition hinders the acceptance of new ideas and how science and technology challenge traditional ways. Finally, the analytical tools of geography, including maps, helps students understand how geographic forces dictate the location and trade patterns of cities.

Teaching Procedures

The materials stress the use of a wide variety of techniques and strategies for teaching a given concept. There are many stories and poems included in the student's text of readings and in the teacher's resource unit. Many simulations, dramatizations, role-playing activities, and other activities are suggested in the resource unit, to be used to reinforce and enrich the case studies presented by the recorded lessons in grade two and in the text for all grades.

Records are an integral part of the 2nd-grade materials, and records and coordinated filmstrips are supplementary to the 3rd-grade materials. In grade two it is suggested that the teacher open the lesson by playing the appropriate record while the pupils look at the two-page illustration. Then the children take an imaginary trip while looking at two pages of sequential photographs. Next a short story is read by the children, and finally consideration is given to what has been learned. The suggested procedure in the 3rd grade is to have the children first read a concept unit to get an idea of important aspects of a city. After they have read the unit, the teacher raises questions for discussion. Next, in order to help the children discover characteristics of cities in real life situations, the teacher has the pupils read a case study. An inquiry into the nature of the city follows. After that the teacher reads a poem or short story to the children and concludes with a discussion. If the teacher so desires, he can reinforce what was learned in the sequence with role-playing activities, games, plays, and other exercises from the resource unit.

  $90.00
Overview

This K-12 curriculum represents an interdisciplinary approach to social studies utilizing geography (1-8) and history (9-12) as the organizing disciplines. Primary reliance is placed on commercially available texts, pamphlets, and audio-visual aids, etc., which are coordinated to the resource units which the project has prepared. The curriculum is based on a new-world view of society in which the students are expected to examine the human condition from a broad global perspective.

Required or Suggested Time

Each curriculum guide provides firm suggestions for the timing of individual units; however, a school system could use and adopt selected portions of the curriculum.

Intended User Characteristics

The materials have been designed particularly for the inner-city disadvantaged child. They do not seem appropriate for the slow learner. Teachers would benefit if given inservice training.

Rationale and General Objectives

The developers feel that the inner-city child often has been presented irrelevant materials which encompass values which are substantially at odds with the values of his own subculture. He is also often taught by teachers with negative attitudes toward him. After an extensive appraisal of the demographic characteristics of Providence, materials were designed which have high motivational impact because they are reflective of the students' needs and interests.
expected to gain in both the cognitive and affective domains. Examples of stated objectives are to develop an understanding of the world, democratic values, and worth of the individual. Students are also expected to develop adequate social studies skills.

Content

Teaching Procedures

The concepts, aims, and skills which the curriculum intends to develop are stated for the teacher along with suitable questions to assist the students in reaching what are considered to be the important generalizations. Teachers are cautioned to treat the materials openly and to answer student-generated questions as fully as possible. The pace of the class and the particular materials and activities chosen are left to the discretion of the teacher, depending on the needs of the class.

Evaluative Data

The data indicates that students in the Providence schools who used this material had much more positive attitudes toward social science than students in a control group. There is some evidence that the curriculum works better with above-average students than with slow learners.

Materials and Cost

All of the materials are mimeographed and staple-bound, with a paper cover.

Social Issues Resource Series
"Population"
"Pollution"

Director: Eleanor Goldstein

Project Address: Exotech Systems, Inc.
525 School Street, S.W.
Washington, D.C. 20024

Publisher: Same as project

Publication Date: January 1972

Availability: From project

Grade Level: 10-12 (7-9)

Subject Area: Problems of Democracy

Overview

These volumes are two of ten projected looseleaf volumes on social issues; each volume will have semi-annual supplements. Other volumes of interest for environmental education will include "Transportation" and "Urbanization." Careful selection of articles gives a broad coverage of the topic and of opposing viewpoints. The materials are designed for flexible classroom use, stressing student initiative and teacher support in the selection of topics, formulation of questions, and analysis of data and issues.

Required or Suggested Time

Each volume is designed to take from 3 to 6 weeks, depending on the teaching methods employed, if used daily in a single class. Single articles or selections of articles can be used independently in social studies or in other courses.

Intended User Characteristics

Designed particularly for senior high students, the materials may also be used at the junior high level. If suggested teaching procedures are followed, the teacher must be willing and able to assume a role that is supportive to and facilitative of student inquiry.

Rationale and General Objectives

The author's premises include the beliefs that "the study of socially significant issues should be a central, rather than peripheral, part of the school curriculum," that periodicals "fulfill an important function in selecting, distilling, interpreting, placing in perspective, and presenting a balance of ... subjects," and that high school students can
be motivated to select and formulate their own learning activities, with the assistance of an open and supportive teacher. The major goals of the program are to develop student initiative in formulating important social questions, in analyzing and weighing data and conclusions of others, and in participating intelligently in discussions of the issues.

Content

The volume on pollution contains articles dealing with various kinds of pollution (air, water, noise, thermal, etc.), the effects of pollution (on health, wildlife, etc.), the dangers of underestimating as well as overestimating the consequences of the problem, cost of pollution and pollution control, case histories, and government policies.

The volume on population deals with the problems of both overpopulation and underpopulation, migration, the relationships of population policy to imbalances in the power and position of minorities, food and hunger, Zero Population Growth, population history and census data, futurism, and government policies.

Teaching Procedures

Student initiative with teacher support is suggested in selection of topics and articles, formulation of issues and questions, construction and use of models, class discussion, handling data, research, and evaluation.

Evaluative Data

The method and materials were developed and tested over a 5-year period in the author's classroom. No further evaluative data are available.

$ 30.00
approximately $ 10.00
Overview

The materials for "People and Their Environment" were prepared by the Conservation Curriculum Improvement Project, administered by the South Carolina Department of Education in cooperation with the School of Education, University of South Carolina, and the South Carolina Advisory Council for Conservation Education, and funded by the Belle W. Baruch Foundation. The materials, which are primarily curriculum guides, suggest an approach to the teaching of conservation as an integral part of various subject matter areas at all levels of education. The material is designed for use by teachers and curriculum workers. These teacher's manuals include suggestions for lesson topics, suggested readings, and suggested instructional materials. They are directed to stimulate teachers to improve instructional procedures so as to provide experiences for students which will create interest and concern for their future interaction with their environment.

Required or Suggested Time

The lessons suggested in these guides are very flexible in time use. They vary from one day to activities which can be used throughout the year.

Intended User Characteristics

All of the guides have been designed to supplement existing curricula in a variety of subject areas from primary through high school grades. Teachers are encouraged to adapt the materials to meet their needs and
the needs of their students. Since most lessons are in bare outline form, teachers will have to do considerable work to utilize the "average" lesson.

Rationale and General Objectives

This series of guides is an attempt to provide a program of action—a series of curriculum experiences—with the interdependence of all living things with one another and with their environment as the underlying conceptual scheme. The major goal of the materials is man's recognition of his interdependence with all of life and his environment. The guides are designed around three major concepts: 1) living things are interdependent with one another and with their environment, 2) organisms (or populations of organisms) are the product of their heredity and environment, and 3) organisms and environments are in constant change.

Content

The basic organizer of these multi-disciplinary materials is conservation or the judicious utilization of resources. The concepts apply equally well for any subject area. The science concept "an organism is the product of its heredity and its environment" becomes "the family or the community is the product of its culture (heredity) and the rules under which it must operate (environment)" in the social studies. The three major concepts in the materials are developed to increasing complexity in the upper grade levels.

Teaching Procedures

The teaching strategies outlined in these guides include a wide variety of student activities and learning experiences. There are many suggested outside readings for students and audio-visual materials for teachers. There is much cooperative group work suggested as an important part of the learning experience.

Evaluative Data

Not available.

**Overview**

*Americans in Cities* is a one-year urban studies course which has been designed for the ninth grade slow learner. The program emphasizes the affective domain and concentrates on improving a healthy self-concept, while strengthening study and analytic skills. Primary sources, newspaper accounts, maps, etc., are utilized to teach necessary concepts and various aspects of urban life.

**Required or Suggested Time**

The materials are designed for a one-year course in ninth grade urban studies. The course is divided into 18 chapters, each requiring approximately 2 weeks of class time. The lessons are ordered chronologically and should be taught sequentially.

**Intended User Characteristics**

The materials were written for the ninth grade slow learner between the ages of 14 and 16 with a reading level between the 4th and 7th grades and an I.Q. between 75 and 90. The teacher needs a background in social studies and a sympathetic attitude toward slow learning students who are alienated from learning and school.

**Rationale and General Objectives**

The developers feel that slow learners can learn when learning tasks are appropriate to their abilities and aspirations. These learners have special characteristics which become clearly apparent when they must
Rationale and General Objectives

The Environmental Studies Project represents an effort to create teacher materials which permit the student to express himself about his immediate environment. "It operates on two premises: (1) every student in an environment, and (2) the student can learn from this environment." The Environmental Studies Project represents an educational philosophy which approaches learning from the standpoint of the learner himself in his own environment.

Content

Since the immediate environment of a human being appears to be the most difficult for that human being to study, these materials endeavor to create instructional tactics and strategies that will enable students to use this resource. For example, instead of asking a student to respond to a textbook abstraction of his environment, the materials ask the student to invent the abstractions that describe what he finds around himself. "Thus, the students are more capable and sensitive to their environment." The materials are written specifically for the teacher and contain assignments, guidelines, and descriptions helpful in studying the environment. Because of the nature of the materials, they may be used as a supplement to existing courses of study or to provide a course in themselves. The materials focus upon four major areas, Change, Mapping, Counting, and Judging. "Change is a phenomenological approach that is involved with cause and effect. Mapping is a spatial approach and is primarily concerned with where things are in one's immediate environment. Counting is a statistical approach and is focused on determining how the environment can be better understood by counting certain qualities of it." Judging is the evaluative set of materials designed to get students to make value decisions about the environment.

Teaching Procedures

The assignment cards contain ambiguous suggestions for student action. They are vague because they want "kids to invent an understanding of the problem and to invent a solution." The teacher is to give the assignment on the card to the student or "let the kids choose the assignments they want to do." Some examples of these assignments are: Go outside and collect something that you could use as a tool to create some art, then create some art; find something in the environment that is increasing in number and something that is decreasing in number—and prove it!; Go outside and find two things—one of which is responsible for the other; Go outside and find a million of something and prove it; Go out and map something beneath the earth's surface. Class discussions follow.

Evaluative Data

Not available.
Overview

The Environmental Studies Project is one part of the American Geological Institute's Earth Science Educational Program. It is funded by the National Science Foundation with additional grants from the Polaroid Corporation. "The content of the Environmental Studies materials is strongly multi disciplinary representing a many faceted involvement with the environment including its artistic, scientific, social, and mathematical aspects." The materials were developed for teachers at all grade levels as invitations for student exploration of the immediate environment. They give motivation to further examine the environment and learn to appreciate it. The materials attempt to give the students an awareness of the environment which surrounds them. The materials are being used successfully in a variety of ways in many different types of school districts.

Required or Suggested Time

The materials in Set I consist of two packets, each containing 25 assignment cards which can be utilized in a variety of ways in varying amounts of time from one day to one year.

Intended User Characteristics

These materials can be used with students on almost any grade level (they "are currently being used from first grade through college") in almost any school setting.
Rationale and General Objectives

The Environmental Studies Project represents an effort to create teacher materials which permit the student to express himself about his immediate environment. "It operates on two premises: (1) every student in an environment, and (2) the student can learn from this environment." The Environmental Studies Project represents an educational philosophy which approaches learning from the standpoint of the learner himself in his own environment.

Content

Since the immediate environment of a human being appears to be the most difficult for that human being to study, these materials endeavor to create instructional tactics and strategies that will enable students to use this resource. For example, instead of asking a student to respond to a textbook abstraction of his environment, the materials ask the student to invent the abstractions that describe what he finds around himself. "Thus, the students are more capable and sensitive to their environment." The materials are written specifically for the teacher and contain assignments, guidelines, and descriptions helpful in studying the environment. Because of the nature of the materials, they may be used as a supplement to existing courses of study or to provide a course in themselves. The materials focus upon four major areas, Change, Mapping, Counting, and Judging. "Change is a phenomenological approach that is involved with cause and effect. Mapping is a spatial approach and is primarily concerned with where things are in one's immediate environment. Counting is a statistical approach and is focused on determining how the environment can be better understood by counting certain qualities of it." Judging is the evaluative set of materials designed to get students to make value decisions about the environment.

Teaching Procedures

The assignment cards contain ambiguous suggestions for student action. They are vague because they want "kids to invent an understanding of the problem and to invent a solution." The teacher is to give the assignment on the card to the student or "let the kids choose the assignments they want to do." Some examples of these assignments are: Go outside and collect something that you could use as a tool to create some art, then create some art; find something in the environment that is increasing in number and something that is decreasing in number--and prove it!; Go outside and find two things--one of which is responsible for the other; Go outside and find a million of something and prove it; Go out and map something beneath the earth's surface. **Overview**

The Planning for Change curriculum is designed primarily for use in inner-city schools. Its purpose is to produce an awareness that the urban environment is a result of human decisions and can be influenced by human action. The Center for Urban Education hopes to make schooling more relevant to inner-city youngsters by using a multi-media approach to the study of the immediate neighborhood, by encouraging participation in action programs aimed at changing the neighborhood, and by relating both the affective and cognitive domains in their learning activities. Though Planning for Change is based on New York City, the Center staff intended the suggested program to be viewed as a model or guide which can be adapted to a variety of neighborhoods and cities.

**Required or Suggested Time**

The entire Planning for Change curriculum is designed for a full year or 32-week sequence. However, it is intended to be a flexible program, with Units I and II providing the essential core sequence. The other six units may be shifted around, deleted, or elaborated as fits the needs of the particular class.

**Intended User Characteristics**

The materials were originally developed for use at the junior high level, but in their present form have been adapted for higher elementary. They are particularly appropriate for urban poverty area and working class students of mixed ethnic background, but might be used with some adaptation to help students from more fortunate neighborhoods understand the problems of the inner city. The curriculum is particularly designed for use in New York City, but can be adapted for other urban areas. This,
of course, would require well above-average preparation time on the part of the teacher.

Rationale and General Objectives

The developers feel that the study of planned change should start as early as possible since many potentially useful but controversial remedies for our urban problems lie in a vastly increased urban renewal and social service operation, and these cannot be implemented without effective understanding and participation of knowledgeable citizenry. The overall objectives of the Planning for Change curriculum are to develop the skills necessary for "effective involvement in planning and rehabilitating neighborhoods," and to increase the student's sense of self-worth as an effective member of his community.

Content

The curriculum includes eight units, the first two of which are considered essential, and the last six which may be used selectively and in various sequences. The major sequence is Unit I, "The Neighborhood," and Unit II, "Neighborhood Problems." The minor sequence includes Units III and IV, which deal specifically with New York City; Unit V, "What Does a Big City Have to Offer?"; Unit VI, "History of Your Neighborhood"; Unit VII, "Urban Design"; and Unit VIII, "Future Planning." The units deal with a variety of urban problems, both physical and social, and the emphasis, of course, is on planning.

Teaching Procedures

The curriculum employs a wide variety of teaching strategies and resources, and to an unusual degree stresses student participation in action programs to effect desired changes in the neighborhood. The instructional guidelines for each activity include a general description of the aim(s) of the activity; specific statements of aims in the categories of attitude formation, skills and knowledge; a list of the materials needed for the activity; a suggested motivational technique for opening the activity; and detailed procedural instructions.

Evaluative Data

Not available.

Materials and Cost

The Planning for Change curriculum includes a Teacher's Manual, a Student Workbook, and a variety of resources, including slides, pamphlets, tape recordings, maps, and newspapers. Many of the resources are not furnished by the project and must be collected by the teacher for they will differ from city to city.

Student Materials:
Planning for Change: A Book about New York City and How to Change It, 213 pp., 8½" x 11", mimeographed. New prices not yet available.

Teacher's Guide:
UNIVERSITY OF CALIFORNIA AT LOS ANGELES
COMMITTEE ON CIVIC EDUCATION
Voices for Justice

Director: Charles N. Quigley and Richard P. Longaker
University of California at Los Angeles

Project Address: Committee on Civic Education
University of California at Los Angeles
School of Law
Los Angeles, California 90024

Publisher: Ginn and Company
Lexington, Massachusetts 02173

Publication Date: 1970

Availability: From publisher

Grade Level: 9 (10-12)

Subject Area: Civics, Government, Problems of Democracy

Overview

All materials which have been developed by the Committee on Civic Education have been designed to assist students in developing those analytical and evaluative skills with which to understand and cope with conflictual situations. Students are expected to develop mature, complex notions about reality and consequently become better prepared to predict the consequences of alternative courses of action by exploring actual issues and their proposed solutions. The instructional strategy centers around an "inquiry/discovery" approach which is controlled by the technique of the teacher.

Required or Suggested Time

The materials comprise a full year's course. However, some of the content is not appropriate for environmental education.

Intended User Characteristics

Voices for Justice was written for the 9th grade. It has been used throughout the secondary grades and upper elementary grades, however, depending on the reading abilities of students. Any qualified social studies teacher who is prepared to deal openly with controversial issues can implement the program.

Rationale and General Objectives

The developers feel that it is the responsibility of the school system in a democracy to prepare analytical and knowledgeable decision makers.
Content

The program is made up of eight case studies chosen to provide classroom experience in discussing issues and participating in decision-making. The content of one of the cases, "Storm King Mountain," is particularly appropriate for environmental education. It is the format--role playing--rather than the content which makes this material attractive as a possible supplement for an environmental education course. The Teacher's Guide elaborates the techniques and strategies necessary to implement the approach. Students learn to identify and describe conflicts of interests and values, to determine what kinds of information is needed to understand the problem, to develop viable alternative solutions, to appraise possible consequences, to choose among solutions, and to utilize a variety of negotiating procedures.

Teaching Procedures

It is suggested that the Socratic method, case studies, discussion, and role playing activities are suitable ways to implement the materials. No answers are given to the many controversial questions raised. The objective is to help students understand the issues, discover values and considerations that are relevant, and arrive at their own conclusions.

Evaluative Data

The program has been extensively evaluated; however, the results have not been completely analyzed.

ECONOMICS IN SOCIETY (Formerly ECON 12)

Co-Authors: Suzanne Wiggins Helburn, Associate Professor of Economics, Denver Center, University of Colorado

John Sperling, Professor of Humanities, San Jose State College

Robert Evans, Social Studies Consultant, Sonoma County Department of Education, Santa Rosa, California

Publisher: Addison-Wesley

2725 Sand Hill Road
Menlo Park, California 94025

Publication Date: Fall, 1972

Availability: Final Report: ERIC ED 028 093
Unit I Student and Teacher' Materials: ERIC ED 040 100 and ED 040 101

Grade Level: High School, Junior College

Subject Area: Economics, Problems of Democracy, American Government

Overview

Economics in Society provides student and teacher materials for a one unit to one year economics course. Originally developed as a part of USOE's Project Social Studies, with additional funding by the Joint Council on Economic Education, the authors sought to implement the recommendations of the 1961 National Task Force Report, Economic Education in the Schools. Taken together, the materials comprise a teaching system with behaviorally stated objectives and a variety of teaching procedures.

The system is built around a conceptual structure which defines the study of economics and links it to the study of society. Other course organizers which students are required to learn include a set of theories (the want-satisfaction cycle, cybernetics, curricular flow systems, the multiplier) and three methods of analysis (procedures for analyzing controversies, making decisions, and building models).

Required or Suggested Time

Unit I will require from 12 to 18 weeks to complete. Units II, III, and IV can be completed in 4 to 8 weeks each.
Intended User Characteristics

The course is designed for use in a variety of school situations. No special facilities are needed. Because students work in small groups, chairs should be movable; tables or desks would be useful. If possible, the library should acquire books, periodicals, newspapers, and government documents suggested in the Teacher's Guide.

The course is written at the tenth-grade reading level and reading assignments are kept short. No previous knowledge of economics is necessary on the part of the student; nor are there any other prerequisites.

The course was designed specifically to aid inexperienced and inadequately trained teachers of economics. However, teachers with a significant background in the subject will be able to make more imaginative use of the materials. Inservice training in course implementation is useful but not mandatory.

Rationale and General Objectives

The authors believe that economic literacy is essential if an individual is to function usefully in society. Carefully prepared materials can introduce students to the power of economic analysis.

The primary emphasis is on learning the skills of economic reasoning and applying them to current public policy issues. By the end of the course, students should be doing the following without prompting from the teacher:

1. using the course conceptual structure to explain or explore topics related to economics;

2. building models describing different aspects of economic organization (the models might be presented in words, graphs, tables, diagrams, equations, pictures, etc.);

3. using models, either their own creations or models introduced in the course:
   a) to study and compare economic systems, ideologies, and political issues;
   b) to evaluate economic policies;

4. using the conflict analysis procedures introduced in the course and the conceptual structure to identify major issues of fact, definition, and values in discussing or writing about economic controversies;
5. making decisions about economic issues which they can justify as being consistent with verifiable generalizations about the economy and with their own values, and which show the use of alternative cost calculations.

Content

Below are listed Unit and Part titles:

Unit I: Economics in Society

Part 1: Economics: Its Subject and Importance
Part 2: Organizing Production for Economic Growth
Part 3: Money, Credit, and Exchange
Part 4: Financing Economic Growth
Part 5: Markets: The World of Pure Competition
Part 6: U.S. Markets: The Real World of Imperfect Competition with the U.S.
Part 7: Work, Income, and Welfare in the U.S.
Part 8: The Economy as a System
Part 9: Predicting Changes in GNP
Part 10: Monetary and Fiscal Policy
Part 11: Price Determination in a Competitive Market
Part 13: Structure, Conduct, and Performance of Real Markets

Unit II: National Goals and Priorities

Unit III: Communist Economies

Unit IV: Third World Economies

In the course there are a number of activities and readings devoted to environmental issues. For example, there are activities on defining Gross National Product and Net National Amenities, Unit I, Part 9; Growth and Change in the U.S. Economy, Unit I, Part 2; and Limiting U.S. Population Growth, Unit I, Part 2. In addition, there are readings from Thomas Malthus, the Conservation and Natural Resources Subcommittee of the Committee on Government Operations (U.S. House of Representatives), and other important documents on natural environment, resource use, pollution, national priorities, and environmentalist value positions.

Teaching Procedures

The instructional theory is based on Richard Suchman's thinking-learning model which draws from both field and stimulus-response theory. The use of organizers to select, group, and order experiences is stressed. A variety of suggested teaching strategies and materials is used, depending on the learning objectives to be achieved. Programmed instruction,
in short units aimed at specific learning tasks, can be pursued at the student's own pace. Other materials provide topics, questions, and problems for class discussion and small group work. Materials are provided for role-playing, survey research, and debates. Some mini-lectures for presentation of new information and for summing-up or setting-up are suggested. There are self-evaluation tests for student use.

**Evaluative Data**

All project evaluation was formative evaluation—feedback to the development team to help them in making the many curriculum and materials decisions. The project staff did not undertake any summative evaluation.

**Materials and Cost**

Materials for the course will include student materials, a teacher's guide, and an inservice training kit. Cost of these materials has not been determined.
The Man Made World was developed as a result of work by the Engineering Concepts Curriculum Project, a joint effort of the Commission on Engineering Education and the Polytechnic Institute of Brooklyn, with support from the National Science Foundation. Designed to help students develop an understanding of the complexity of technological problems and the methods being used to solve them, The Man Made World looks at problems of pollution, population, health services, computers, and traffic control in terms of decision making.

Required or Suggested Time

Intended for an academic year of study.

Intended User Characteristics

The materials for the course have been designed to attract those high school students who do not now take a science elective beyond the 10th grade.
Rationale and General Objectives

The ECCP course has been developed as an alternative to other science courses, not as a replacement. It is based on technological concepts that have broad relevance and significance for society and is designed to provide "science shy" college preparatory students with an opportunity to understand certain principles in engineering, science, mathematics, and social studies which pervade the students' daily lives. Laboratory and computer facilities provide the students the opportunity to experiment and to translate abstract concepts into concrete situations.

Content

The course materials emphasize searching for, and exploring, ideas in terms of the study of significant, current problems. The material included is drawn from concepts in engineering, science, mathematics, and social studies. The course is independent of high school biology, physics, chemistry, and mathematics, although a background in mathematics is a prerequisite.

The textbook has three parts: Part A: Logic and Computers is concerned with logic and digital computation; Part B: Models and Measurement serves to introduce the student to models as tools for aiding human thought and understanding and for predicting; Part C: Energy and Control introduces the concept of feedback as a means of achieving a specific goal.

Teaching Procedures

The text material is supplemented by laboratory experiments performed by the students and by several demonstrations.

Overview

This set of materials is a part of the Social Studies Curriculum Program of the Education Development Center, Cambridge, Massachusetts, and is designed for use in the upper elementary grades. The materials are based on three questions: What is human about human beings? How did they get that way? and How can they be made more so?

Required or Suggested Time

Intended for an academic year of study.

Intended User Characteristics

The materials have not been designed for any specific target group. However, the materials are available only after teachers have participated in workshops.

Rationale and General Objectives

This innovative set of materials is written to help students explore some basic ecological considerations about man and animals in the web of their relationships to their environment.

Content

Exploratory materials concern the roots of man's social behavior through the study of selected animal groups and an intensive examination of a remote society very different from our own. Several weeks' work is devoted to the Netsilik Eskimos. The direct dependence upon
the Arctic animal life for food, tools, clothing, and shelter; the hazards of exposure; and the variables beyond man's control come through to students. Comparisons with the students' more remote dependence on and greater protection from the environment are encouraged. Questions and activities on the quality of life, the quality of the environment, the effects of industrialization and urbanization could be designed to follow the Netsilik activities effectively.

*Man: A Course of Study* depends heavily on motion picture films with printed materials in support.

**Teaching Procedures**

Special teacher training in the use of the materials is recommended. The materials are elegant and exciting, but the approach is overly prescribed.

**Materials and Cost**

Information on materials and prices can be obtained from:

Education Development Center, Inc.
55 Chapel St.
Newton, Massachusetts 02160
Overview

By presenting an interdisciplinary approach to environmental education, this booklet is intended to help teachers expand their classrooms to include all of man's environment. Through the use of environmental study areas selected for their environmental potential, a student is encouraged to develop an awareness of his environment that will lead to a personal sense of involvement and the shaping of an environmental ethic.

Required or Suggested Time

No time specifications are indicated. The activities may each be used for a period from one to several days.

Intended User Characteristics

The materials were designed for use with the NEED and NESA programs which were originally intended for use with inner city children. However, the materials are appropriate for use with students K-12 and for a wide range of programs.

Rationale and General Objectives

The stated objectives are those indicated by the National Park Service as the principal objectives of an environmental study area program: 1) To introduce the student to his total cultural and natural environment, past and present, and help him realize that he is a part of it. 2) To develop in the student an understanding of how man is using and misusing his resources. 3) To provide an opportunity for the student
to work directly with environmental problem solving. 4) To equip the student to be a responsible member of the world that he is shaping and that is shaping him.

Content

The booklet provides the teacher with information on the background of environmental study area programs, suggestions for selecting sites and planning programs, aids to identifying the educational possibilities of a site and preparing lessons related to them.

Sample learning activities using the five strands - Variety and Similarities, Interaction and Interdependence, Continuity and Change, Evolution and Adaptation - are included for Art, Mathematics, Science, Social Studies, and Communications. Lesson suggestions and discussion questions are presented for each activity.

Teaching Strategies

The developers recommend the strand approach, utilizing the five strands noted above, which incorporates both the specific, or taxonomic, and the investigative approaches. This requires identification and classification but on a modified basis, and also requires open ended investigation leading to problem solving.

Evaluative Data

The materials were process-evaluated by trial testing with the NEED and NESA programs and by expert review. Evaluative data are currently not available.

Materials and Cost

Teacher's materials:
Man and His Environment. 58 pp., 7" x 10";
stapled paperbound booklet $1.75
Overview

This textbook has been developed as a series of life science investigations designed to help students develop insights about themselves, their biological environment, and real-life problems involving biology, technology, and society.

Required or Suggested Time

Intended for an academic year course, meeting five days a week for 40 minutes a day.

Intended User Characteristics

The materials were intended for junior high school students but not for any specific target group within this population.

Rationale and General Objectives

Two basic assumptions underlie Man and the Environment: one, that the essence of science includes the "how" as well as the "what"—that students must learn how scientific information is acquired as well as information itself; two, general ideas in life science have personal and social relevance.

These assumptions are translated into four general goals: 1) that students should demonstrate an inquiry approach to biology and be able to design and carry out simple experiments with living organisms; 2) students should understand the interaction between living organisms and their physical environment, recognizing the complexities of ecological situations; 3) students should be able to separate fact from opinion in a controversial ecological problem and state what social responsibilities
are involved; 4) students should be aware of individual variation in man and other organisms and recognize the uniqueness of each living thing.

Content

The book is divided into four units: 1) investigating living things, 2) the environment affects living things, 3) living things affect each other, and 4) man's effect on the environment. Students are presented with a series of problems, questions or issues to study, with each group of activities being entitled an "investigation." The amount of student freedom provided varies with the investigations, with early activities being the most structured.

Each investigation is composed of an introduction, objectives to be achieved, the problem or problems, and mastery items. Students as well as teachers are given the rationale and behavioral goals for the investigations.

In addition to the textual material, four "games" are suggested for use: "The Mouse in the Maze," "The Planet Management Game," "The Pollution Game," and "The Redwood Controversy." These must be purchased separately from, and are more expensive than, the book. The textbook could be used without the games, however.

Teaching Procedures

No specific training for teachers is involved in the use of these materials. A teacher's edition of the book is available and contains suggestions for teaching as well as annotations on the textual material.

Overview

Current developments in the field of environmental education have made it clear to most educators that some basic rethinking and restructuring of the curriculum is very much in order if we are to help students develop the skills, attitudes, and knowledge they will need to participate intelligently in the decision-making process concerning the environment and its resources. The State of California is well into such a process, and has prepared a publication titled "Ekistics-A Guide for Conservation and Environmental Studies Curriculum Development" which has been developed under the direction of Dr. Paul Brandwein. The need for the new curriculum guide was officially recognized in 1968 when the California Legislature mandated that "wise use of natural resources and man's relations to his human and natural environment" be taught in appropriate grade levels and subject areas in grades one through twelve in California schools. In 1969, the Report of the Conservation Education Advisory Committee to the State Board of Education recommended that the State Department of Education develop a curriculum outline showing California educators how this legislative-mandate could be implemented.

In mid-1970, arrangements were made enabling Brandwein and a carefully selected project team to develop a first draft of the publications. This first draft has been printed and distributed on a limited basis for review and comment. A final publication version will be produced as soon as possible for printing and distribution by the Department of Education.

The draft version runs some 251 pages and includes a statement of rationale, conceptual outlines, together with explications of the concepts, performance objectives, a discussion of instruction and teaching, and a bibliography.
Rationale, General Objectives, and Description

What behavioral changes are to result from this new curricular approach? "The aim is to produce those changes in human concepts and values," Brandwein states, "which will result in behavior which demonstrates recognition in word and deed by the student that he is interdependent with his environment, and that he supports a culture which sustains a sanative (healthy) environment." In order to develop these behavioral patterns, Brandwein and his team have developed a conceptual guide for the elementary grades involving three cognitive affective schemes:

1. Man is interdependent with his natural and physical environment.
2. Man's social behavior is basic to maintaining, altering, adapting, or destroying the environment.
3. Man utilizes his symbolic and oral traditions to maintain or alter the environment.

In terms of traditional subject matter areas, it will be noted that, although the areas of (1) science, resource technology, and health, (2) the social sciences, and (3) the arts and humanities are principally concerned, there are vast implications for other subject areas, and environmental studies could well become the community of discourse for the entire elementary curriculum.

Moving on to the junior high level, it is suggested that a unit of work based on four cognitive-affective schemes be included in these four curricular areas: (1) social science, (2) science, (3) humanities, and (4) health. Environmental education implications in other subject areas would also be stressed. The cognitive-affective schemes for junior high are: (1) Societies perceive environmental issues of their time on the basis of past experience, (2) the interaction of the culture with available technology determines the nature of the environment which is planned and developed, (3) social issues and decisions alter the environment, and (4) social issues and decisions determine the utilization of all resources.

At the high school level, the interdisciplinary effort would continue, and a one-year course would be introduced to bring together, refine, and extend all of the skills, attitudes, and knowledge developed earlier and apply them to the solving of contemporary environmental problems. The high school cognitive-affective schemes include: (1) in any given environment, organisms are linked within an ecosystem, (2) issues and decisions affecting the world ecosystem reflect the pressure of population upon resources, (3) wise utilization of the environment is dependent on the organization of shortage, and (4) the concepts and values man accepts as guides to his future behavior determines the quality of his life, if not his survival.

Evaluation

None available

Materials Available

Information on current materials can be obtained from the ERIC Center for Science, Mathematics, and Environmental Education, 1460 West Lane Avenue, Columbus, Ohio 43221.
MATERIALS AND ACTIVITIES FOR TEACHERS AND CHILDREN (MATCH)

Project Address: MATCH Program Director
The Children's Museum
Jamaicaway
Boston, Massachusetts 02130

Publisher: Americans Science and Engineering, Inc.
20 Overland Street
Boston, Massachusetts 02215

Grade Level: Elementary

Subject Area: Environmental Education, Social Science

Required or Suggested Time

Each MATCH Unit contains enough materials for a class of 30 children to use for 2 or 3 weeks.

Intended User Characteristics

Materials are designed on the idea that much of learning is nonverbal, through activity with things rather than with words. Hence, they are effective with all ability ranges of elementary school pupils including slow readers and many pupils who are not motivated in traditional classes.

Rationale and General Objectives

Each unit is designed as a unique self-contained system of materials and activities which the teacher uses to produce a series of interrelated learning experiences on a particular subject. Emphasis is placed on learning through the use of real materials, on the child as the agent of his own learning, and upon an essentially collaborative and nondirective relationship between teacher and child.

Content

Sixteen units have been developed. Three units are available on a commercial basis. Content emphasizes people from various lands including one unit titled The City which relates to environmental education. Models, photographs, records, and films are included in the kit, The City.
Teaching Strategies

The teacher is to use primarily a non-directive technique with pupils. The pupils' ideas are to emerge from working with the materials.

Evaluative Data

All materials have been tested in schools. Data indicate students learn effectively with the materials and enjoy the materials.

Materials

Three units are available commercially from the publisher - The City, A House of Ancient Greece, and Japanese Family. A list of publications available through ERIC is available from the ERIC Center for Science, Mathematics, and Environmental Education, 1460 West Lane Avenue, Columbus, Ohio 43221.
This is a set of three booklets written for students with suggestions to teachers. Designed to help teachers guide the development of ideas, skills, attitudes, and processes of scientists and science in junior high school students, these booklets present information and suggested activities for the study of pollution problems.

No time specifications are indicated. Each of the booklets provides sufficient information and activities to be used for a period of weeks, if sufficient student interest develops.

The materials do not appear to have been designed for any specific junior high school student population. Although they are aimed at the junior high school level, these materials could also be used with upper elementary school classes.
**Rationale and General Objectives**

These materials are designed to promote the development of the scientific enterprise in junior high school students while also making them aware of pollution problems in their environment.

**Content**

Each of the three booklets is organized into four chapters in the following format. Chapters one and two present the problem to be studied (air pollution, water pollution, or noise pollution) and background information. Chapter three contains suggested student investigations. Chapter four lists additional questions to be answered and supplementary investigations.

Many of the suggested student investigations in the booklets on air pollution and water pollution will be familiar to teachers of general science. The student activities in the noise pollution booklet appear to have been developed or adapted for this area although some activities, on sound and pitch, come from general science textbooks.

**Teaching Strategies**

In a page of "notes to the teacher," the authors suggest that the teacher decide upon the most effective use of the booklets. They do present an alternative strategy to that of proceeding through the booklet chapter by chapter. This is to move immediately to chapter four, using chapters two and three as data sources while the students conduct their investigations.

**Evaluative Data**

None are available at present. These materials have just been put on the market.

**Materials and Cost**

Student materials, with teachers' editions:

- **Air Pollution**, 94 pp., 6½" x 9", stapled paperbound booklet  
  $1.68

- **Water Pollution**, 94 pp., 6½" x 9", stapled paperbound booklet  
  $1.68

- **Noise Pollution**, 94 pp., 6½" x 9", stapled paperbound booklet  
  $1.68
Overview

SCIS was established in 1962 by Karplus as a result of his work with the Elementary School Science Project (ESSP); that experience led Karplus to the conclusion that science had to be simplified for the elementary school and organized on a different basis from traditional logical subject matter presentations. Using the groundwork of Piaget, Bruner and others, SCIS concluded that the elementary school years should provide:

1. A diversified program based heavily on concrete manipulative experiences.

2. These experiences in a context that helps to build a conceptual framework.

3. A conceptual framework that permits children to perceive phenomena in a meaningful way.

Thus, SCIS has considered cognitive, affective, and psychomotor domains.

Required or Suggested Time

No specific time dimensions are given for the various units, though guidelines recommended for various studies encompass time dimensions from one to several weeks. Recommendations are made for sequencing and grade-level placement.

Intended User Characteristics

Materials are designed for the full range of elementary students. No particular suggestions are given for varying ability levels.
Rationale and General Objectives

Among the objectives of SCIS are intellectual development, scientific literacy, decision-making and development of favorable pupil attitudes toward science. The belief that the concept of literacy is the principal objective of teaching science in the elementary school permeates the entire program.

Content

As indicated above, SCIS is primarily an elementary science program which might, if completely implemented, comprise the total science program through the elementary years. The concepts around which the materials have been developed are representative of the "big ideas" of science, including organism, ecosystem, matter and energy, property, reference frame, system, and model. Thus a conceptual framework is organized, cutting across traditional disciplines and forming a structure that illustrates the unity of the sciences. Physical and Life Science Sequences are developed in parallel modes.

With respect to environmental education materials, the last four segments of the Life Science Sequence are of interest. They are:

- Populations
- Environments
- Communities
- Ecosystems

For each, both student booklets and teacher guides are available, along with materials kits for student use in carrying out activities— as might be suspected, stress is laid on psychomotor approaches to develop both concepts and attitudes. Specific activities are recommended and well-developed to "fit" into the total scheme.

Teaching Procedures

As indicated above, the normal approach to learning is through student activity. Use of the teachers' guides becomes essential; it may be possible to design other student guides and/or laboratory materials to replace those designed by the program, though not without considerable effort.

Evaluative Data

A number of studies have been conducted, some of which have resulted in modifications of program and materials. Generally, the studies indicate positive results of SCIS with respect to the meeting of its objectives.
Materials and Cost

Population. 1967, 8½" x 11";
   paperbound, stapled; Teacher's Guide $2.00

Environment. 1968, 8½" x 11";

Selected Sources of Information on Urban Affairs

Urban Affairs

Director
HUD Clearinghouse Service
Urban Management Assistance Administration
U.S. Department of Housing and Urban Development
451 7th Street, S.W., Room 8210
Washington, D.C. 20410

Serves as the clearinghouse for sources of information as well as publications on the various aspects of urban development, urban renewal, housing, etc. Refers requesters to other programs.

Information Center
U.S. Department of Housing and Urban Development
451 7th Street, S.W., Room 1202
Washington, D.C. 20410

Answers questions and refers requests to the appropriate offices with the Department of Housing and Urban Development. Answers questions on on-going projects administered by the Department.

National League of Cities/U.S. Conference of Mayors
1612 K Street, N.W.
Washington, D.C. 20006

Answers inquiries, provides advisory and consulting services, and permits on-site use of its collections on materials on public administration, urban government. Publishes Nation's Cities, monthly.

National Urban League
55 East 52nd Street
New York, New York 10022

Answers inquiries and provides reference and literature searching services on those subjects clearly related to the urban areas. Sells bibliographies on urban problems, housing, etc.
Urban Planning

American Society of Planning Officials
1313 East 60th Street
Chicago, Illinois 60637
Tel: 312 324-3400

Answers inquiries and provides research information and advice on planning, zoning, land use, and allied subjects. Provides consulting services on a contract basis. Publishes Planning Advisory Service Reports, monthly, and Zoning Digest, monthly. Extended services available to subscribers only.

American Institute of Planners
917 15th Street, N.W., Room 800
Washington, D.C. 20005
Tel: 202 783-0666

Provides information and reference services on a limited scale primarily to members, but to others when time and staff permit. Refers inquiries to other specialists or organizations. Publishes AIP Journal, bimonthly.

International City Management Association
1140 Connecticut Avenue, N.W., Suite 201
Washington, D.C. 20036
Tel: 202 293-2200

Provides advisory and consulting services free of charge. Provides reference services in all aspects of urban planning, development, and other subjects related to urban affairs and public administration. Publishes Urban Data Service, annually.

Downtown Ideas Exchange
555 Madison Avenue, 7th Floor
New York, New York 10022
Tel: 212 980-3840

Provides consulting services for a fee and publications by subscription. Publishes Downtown Ideas Exchange, semi-monthly, and other periodicals and miscellaneous materials in this subject area. Consulting services are provided under the firm name of Alexander and Moskowitz, Inc.
Urban Development and Urban Renewal

Architecture and Urban Studies Library
202 B Taylor Hall
Kent State University
Kent, Ohio 44242
Tel: 216 672-2854

Answers inquiries, provides abstracting and indexing services. Maintains an automatic urban and regional bibliographical information system (URBIS) which now contains approximately 13,000 abstracts. URBIS services are for a fee to customers.

The Non-Profit Housing Center, Inc.
1717 Massachusetts Avenue, N.W., Room 403
Washington, D.C. 20036
Tel: 202 265-2224

Answers questions, and provides referrals to other organizations. Holds conferences on urban questions, including urban development and renewal. Publishes City, bimonthly, and Chronicle, monthly supplement to City.

Urban Land Institute
1200 18th Street, N.W., Room 306
Washington, D.C. 20036
Tel: 202 338-6800

Provides answers to technical inquiries, furnishes advisory and consulting services, and refers inquirers to other organizations or specialists. Publishes Urban Land, monthly, Land Use Newsletter, monthly, and numerous others. Also prepares short lists of literature citations.

Housing

National Association of Housing and Redevelopment Officials
2600 Virginia Avenue, N.W.
Water Gate Building, Suites 404 and 206
Washington, D.C. 20037
Tel: 202 333-2020

Provides information on housing and urban renewal and development. Publishes the Journal of Housing, monthly, and the Housing and Urban Renewal Directory, every 2 to 3 years. Brief questions answered free, more extensive consultation for members only.
Small Home Council—Building Research Council
University of Illinois
1 East St. Mary's Road
Champaign, Illinois 61820
Tel: 217 333-1801

Collects information on construction methods and materials, design and space utilization for single family housing. Answers questions and gives information concerning current research and development projects. Advisory and consulting services are provided for a fee.

Library
U.S. Department of Housing and Urban Development
451 7th Street, S.W., Room 8141
Washington, D.C. 20410
Tel: 202 755-6370

Has consolidated with the Federal Housing Administration Library and the Housing Assistance Administration Library to form a single HUD library. Permits on-site reference and makes interlibrary loans. Answers brief inquiries and provides literature searches for a fee. Publishes Housing and Planning References, a monthly index to urban literature which is available by subscription from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

International Federation for Housing and Planning
43 Wassenaarseweg
The Hague, The Netherlands

Maintains information, documentation and library services which are available to public authorities, professional organizations, and individual specialists concerning housing and town planning.
Selected References on Urban Affairs

Directory of Governmental, Public and Urban Affairs Research Centers at American Colleges and Universities, available from the Institute of Governmental Affairs, University of California, Davis, California 95616. 1968. $2.00.

9.0 APPROACH:

9.1 Multi- (inter-, cross-, non-) disciplinary approach:

| Draws from several of the natural-physical sciences (specify which) |                      |
| Draw from several of the social sciences (specify which) |                      |
| Draw from both natural-physical and social sciences (specify which) |                      |
| Based on a single discipline (specify) |                      |

9.2 Instructional Strategies

| Laboratory | Independent study |
| Field trips | Role playing |
| Exposition | Games |
| Stories | Simulations |
| Demonstrations | Group discussions |
| Questions | Debates |
| Tests | Surveys and polls |
| Case studies | Other (specify) |
| Seminars | |

10.0 TEACHER PREPARATION:

10.1 Desirable education background (discipline concentrations)

10.2 Amount of inservice training needed to implement:

| None | |
| 1-2 day workshop | |
| Longer workshop or institute | |
| Series of workshops | |
10.3 Kind of inservice training needed:

______ Content
______ Philosophy
______ Skills

10.4 Team Teaching: ______ Required ______ Helpful

10.5 Other: ____________________________________

10.6 Amount of daily preparation time needed:

______ More than 2 hours
______ 2 hours
______ 1 hour or less

Reviewers judgment of the adequacy of evaluation done:

_________________________________________

Description (where tested, results, design of research, etc.):

_________________________________________

_________________________________________

11.3 Availability of evaluation instruments for use by teacher:

Are methods suggested for determining whether stated objectives are met?
Describe the suggested methods or instruments.

__________________________________________________________________________

Are means provided for the learner to evaluate his own progress?

__________________________________________________________________________

Describe them. __________________________________________________________________

__________________________________________________________________________

Are diagnostic instruments suggested? __________________________________________________________________

__________________________________________________________________________

Describe them. __________________________________________________________________

__________________________________________________________________________

12.0 OVERALL JUDGMENT AND COMMENTS OF THE REVIEWER

12.1 Overall rating of the materials/program by the reviewer:

12.2 Explanation of overall reaction to the materials/program by the reviewer:

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________
12.3 Unique characteristics of materials/program not covered in previous sections:

13.0 INFORMATION DISSEMINATION:

13.1 Site visits permitted: ____

13.2 Provide consultants: ____

____ At program site

____ Will travel

13.3 Provide materials

____ Samples

____ Complete set

____ Descriptive only
Suggested Learning Approaches

The group at Riverside and the group at Bowling Green placed slightly different emphasis when consideration was given to the learning approaches to be used. One group emphasized suggestions for elementary levels, and the other group considered approaches for junior-senior high school students. The two viewpoints show a striking similarity, and general agreement. Both are included here to show the close resemblance of thinking that existed between the two groups, widely separated geographically but exceptionally similar in their thinking.

LEARNING APPROACHES AT ELEMENTARY LEVELS:

1. INTERDISCIPLINARY APPROACH. Because man's relationship with his physical environment is so directly dependent upon the social, political, and economic values of his culture, any environmental education program requires the involvement of all disciplines, particularly the social studies. So, too, however, must the arts and humanities be actively involved, for man's affective domain must also be touched. "We have to understand that we live our lives affectively but explain them cognitively."

If programs are to be interdisciplinary, we must establish a common language, to transcend the difference between disciplines and to establish the interrelatedness of environmental problems, social and physical.

2. INTEGRATIONAL APPROACH. Not only is it usually impossible to add another subject to the elementary curriculum, it is not always desirable to do so. In the case of environmental education, we would focus on relationships and problems which are closely related to subjects already being taught. Environmental education can function as a natural synthesis of other subjects. And the existing facilities and surroundings can be used. Perhaps in some situations it might be more desirable at the secondary level to offer environmental education as a distinct and separate unit or course.

3. RELEVANCE TO THE INDIVIDUAL. The program will be man-centered. Because the human ecosystem differs so greatly from other ecosystems, with the inclusion of culture and technology, man's own unique characteristics should be the focus.

Environmental problems must be made real to the experience of each student. Just as it is educational suicide to speak to a black student in Detroit about the rebellious Bostonians killed in the Boston Massacre of 1770 while not mentioning the relevance of the people of his own race killed during recent riots, so also is it folly to dwell on the removal of a bird sanctuary in Florida with a class of students whose central city park is being bulldozed for new freeway construction. People must learn about their own surroundings first.

4. STUDENT INVOLVEMENT. Students learn best through their own real life experiences. "If a person is to grow up, he needs first of all access to things, to places and to processes, to events, to records. He needs to see, to touch, to tinker with, to grasp whatever there is in a meaningful setting." All these needs demand "doing" in the classroom and also demand that teachers promote processes that will facilitate self-directed learning. Teachers and students must have a choice of activities, not just one, in order to capitalize on timely events and on student excitement. Students must be allowed free discovery and be encouraged to "show the teacher a few things."

5. COMMUNITY AND PARENT INVOLVEMENT. Because attitudes and values are formed primarily outside the classroom, and because parents and community members may also be interested in the issues of environmental problems, active participation of parents and others in the community will be encouraged.

6. **FOCUS ON CONFLICT OF INTERESTS.** Environmental education must allow students to see all options to fully comprehend conflict of interests behind many environmental problems and their solutions. The complexities of economic, social, and political interests require that we become aware of what we must give up to gain something else. At every level then, students should be involved in informal "cost/benefit" or systems analysis.

**LEARNING APPROACHES FOR JUNIOR-SENIOR HIGH SCHOOL STUDENTS:**

1. **THE APPROACH SHOULD BE INTERDISCIPLINARY.** Suggestions: Bring the different disciplines together in the treatment of a problem, rather than breaking the problem down into subject areas. The most effective learning will occur when the information and skills needed to solve a problem are brought together to achieve the specific goal.

2. **THE APPROACH SHOULD BE LEARNER CENTERED.** The teacher should be a facilitator, resource person, leader, and advisor, and learning should be individualized.
   
a. Each student should work at his own pace.

b. Learning activities should be adapted to the learner's needs and interests.

c. There should be a variety of learning activities, including large group, small group, and individual tasks.

d. Students should be involved in selecting the problems and in planning the procedures and techniques for solving them.

3. **THE APPROACH SHOULD BE PROBLEM ORIENTED.**
   
a. Problems, rather than a content outline, should form the basis for designing the course. This does not eliminate the usefulness of a course outline, however, as a means of identifying the ideas and concepts to be included in the course.

b. Basic principles and facts should be introduced when needed, rather than "taught" in a rigid sequence.

c. Problems must be well defined and understood by all, and related to the students' concerns.

d. The end product should include proposed alternatives for action. Students should learn that many problems have no known solutions and be aware of the necessity for "trade-offs"—every alternative has a cost.
e. There should be reasonable balance in the choice of problems to be studied.

4. THE APPROACH SHOULD RESULT IN BEHAVIORAL CHANGES.

a. Effective behavioral change is a life-time process. It cannot be completed in one semester or even in one year. The course should be considered as a segment of the total process of behavioral change, and provision should be made for continuing activities with the students, long after the termination of the formal course.

b. Affective and psychomotor aspects of learning should be considered along with cognitive aspects, to provide balanced learning experiences.

c. The need for student involvement is imperative at every stage of the learning process.
