Colleague and student ratings were gathered on a group of 477 instructors and then compared to the instructor's research productivity and academic rank. Colleague and student ratings were not found to be significantly related to the instructor's research productivity. However, colleague rating was significantly related to academic rank, indicating that the reputation of the instructor could influence colleague ratings. An 8-item bibliography and appendices, a faculty poll form, and the Illinois Course Evaluation Questionnaire are included. (Author)
An Investigation of the Relationship between Colleague Rating, Student Rating, Research Productivity, and Academic Rank in Rating Instructional Effectiveness

Abstract

Colleague and student ratings were gathered on a group of 477 instructors and then compared to the instructor's research productivity and academic rank. Colleague and student ratings were not found to be significantly related to the instructor's research productivity. However, colleague rating was significantly related to academic rank indicating that the reputation of the instructor could be influencing colleague ratings.
An Investigation of the Relationship Between Colleague Rating, Student Rating, Research Productivity, and Academic Rank in Rating Instructional Effectiveness

Lawrence M. Aleamoni and Makonnen Yimer
University of Illinois

A plethora of research studies has been conducted in the area of teacher effectiveness. Domes and Tiedeman (1950) have cited over 1000 studies in this area, with a variety of interpretations and assumptions concerning what a "good teacher" is. As an example, according to Sister Long (1957) "a teacher is effective when he does things or behaves in ways that stimulate the learning of understandings, skills, desirable attitudes and habits, and adequate personal adjustment. Changes must include all-around pupil growth: intellectual, social, emotional, aesthetic, and spiritual" (p. 220).

If we accept Guthrie's (1949) contention that teaching performance is best judged by students and colleagues, then we would expect a positive relationship to exist between the two judgements. Guthrie also asserted that student ratings represent more valid judgements than colleague ratings due to the fact that students spend more time in contact with the particular teacher than a faculty member does. It is important to note that colleague rating may be affected or influenced by acquaintanceship, student hearsay, the effect of the ratee's instruction on the rater's students, and inferences based on the academic records of the ratee.

There are few studies that deal with the relationship between teaching effectiveness and publication (research productivity). For example, Guthrie (1949), and Voeks (1962) found that there was no significant association between research contributions and teaching effectiveness. More recently, Stallings and Singhal (1969) reported a statistically significant but small correlation between publications and student evaluation.

In determining effective teaching, therefore, researchers have used a variety of methods, most popular among which are peer (colleague) rating, administrator
(supervisor) rating, student rating, self-rating and rating by number of publications. This study deals with teacher effectiveness with respect to the relationship among student ratings, ratings by fellow teachers (colleagues), and research productivity.

**Method**

During the fall of 1969-70 a questionnaire (see Appendix A) was sent out to the University of Illinois faculty (Urbana-Champaign Campus) asking them to nominate or indicate three faculty members whom they felt deserve mention for good teaching. Individual faculty members are rated according to the frequency of nomination which ranged from 1 to 26. Therefore, this study does not include faculty members who were not nominated. Academic rank and sex of each nominee was also determined. Academic rank was defined as the academic rank held by the faculty member at the University of Illinois during 1969-70. The academic rank consists of teaching assistant, instructor, assistant professor, associate professor, and full professor with scale values of 1, 2, 3, 4 and 5 respectively.

Two student evaluation questionnaires which are used to collect student attitude data toward instructors and courses at the University of Illinois were used (see Appendix B) to obtain the student evaluation data for the nominated faculty members. The Illinois Course Evaluation Questionnaire (CEQ) is a 50 item questionnaire that is used to elicit student opinions about a course. It is composed of six subscales: (a) General Course Attitude, (b) Method of Instruction, (c) Course Content, (d) Interest and Attention, (e) Instructor, and (f) Specific Items (Spencer and Aleamoni, 1970). The student responds by indicating his agreement or disagreement on a 4-point scale where 1 represents least favored and 4 best favored with respect to teaching effectiveness. The second student evaluation questionnaire used was The Advisor, a 34 item questionnaire also used in evaluating courses. It is divided into four sections or subscales: (a) Overall
Evaluation of Course, (b) Instructor, (c) Quiz or Discussion, and (d) Laboratory or Language Lab. The two major parts of The Advisor (Overall Evaluation of Course and Instructor) apply to all types of courses. The scale values for The Advisor are the same as the CEQ.

The CEQ, composed of 7 variables (the six subscales plus a Total for all 50 items), and The Advisor, composed of 2 variables (Overall Evaluation of Course and Instructor), were collected for all nominated faculty members who had one or both student evaluations for the fall and spring semester of 1969-70. Due to the scarcity of the number of faculty members who had CEQ ratings, the collection of CEQ ratings was extended as far back as 1966-67. For those individuals who had more than one CEQ or Advisor rating, the average was computed.

In addition, publications of the faculty were collected from a publication entitled "Publications of the Faculty and Titles of Doctoral Dissertations" (1966, 1967, 1968, 1969) put out yearly by the University of Illinois. Senior authorship was not distinguished in the collection of the data. The listing gives the author, co-author(s), title and bibliographic citation of all the books, articles, technical reports and bulletins, book reviews and doctoral dissertations published by the university faculty. Publications in the present analysis consisted of the weighted and unweighted sum of frequency counts of five variables (books, books edited, articles, reviews, and bulletins and technical reports). The weighting scheme used on the five publication variables was that suggested by Stallings and Singhal (1969) and is presented in Table 1. Four hundred seventy-seven different faculty members were nominated at least once. Of these, CEQ data were available for 43, Advisor data for 474, and publications for 362. A correlational analysis was used along with multiple regression on the variables of interest.

Results

A description as well as the mean and standard deviation of the variables are presented in Table 2. The distribution of rating by other instructors (Variable 3) was positively skewed, i.e., the majority of the faculty members had a nomination of 1, 2, 3 or 4. This was also indicated by the low mean (Table 2). For the same group of individuals the average academic rank (Variable 1) seems to fall between assistant professor and associate professor.

In Table 3 the data above the main diagonal represent the intercorrelations among the variables while the data below the main diagonal represent the corresponding sample sizes.

The average of the intercorrelations of the CEQ variables (6, 7, 8, 9, 10 and 11) excluding the Total CEQ variable (12) is about .85 and the average correlation of each CEQ subscale variable with the Total CEQ variable is .93. This high intercorrelation among the CEQ variables is an indication that variable 12 (CEQ Total) should account for most of the variance that variables 6, 7, 8, 9, 10 and 11 would account for separately. Hence, variable 12 may be used as a measure of teacher effectiveness without considering the rest of the CEQ variables.

The correlation between variable 4 (Advisor Overall Subscale) and variable 5 (Advisor Instructor Subscale) was 0.84. Unlike the CEQ, the Advisor lacks an Advisor Total scale that combines variables 4 and 5. However, due to the high correlation, variable 5 may be used to represent variable 4 in the measurement of teaching effectiveness.

Table 4 presents the intercorrelations of variables 1, 3, 5, 12 and 13. The correlation between variables 1 and 13 (Academic Rank and Publication) is 0.32 and is significant at p<.05. The correlation of variable 3 with academic rank, Advisor Instructor and CEQ Total is 0.20, 0.28, and 0.27, respectively, and all of them are significant at p<.05 level. In order to determine the contributions of Academic Rank, Advisor, CEQ, and Publication in predicting colleague...

Discussion

It is evident from the results presented that the academic rank of an instructor seems to be more highly related to publications than to student opinion, sex or colleague rating. Colleague rating as well as student evaluation failed to show a significant relation with publications, but colleague rating was significantly related to academic rank. One would conclude that an instructor's rating by colleagues is unrelated to the number of publication(s) that the instructor has produced and, therefore, that publication may not be an important factor in rating an instructor's teaching. Guthrie (1949) and Voeks (1962) also arrived at the same conclusion in their study. However, the
Stallings and Singhal (1969) results seem to disagree with the above conclusion. It is important to note that the sample size used for the correlation between CEQ Total and Publication (N=28) was about 1/4 of that of Stallings and Singhal’s report. But the sample size for the Advisor Instructor (N=360) is about 3 times that of Stallings and Singhal’s. As already indicated the CEQ and Advisor ratings are highly correlated, implying that the sample size differences between the present study and Stallings and Singhal’s may not be responsible for the different results.

Another implication is that teachers and students differ in the basis of their rating since instructors seem to take into consideration academic rank of the instructor in their rating while this is not the case for students. However, this relationship is explainable in terms of reputation, as an instructor is at a university longer and is apt to be known to more colleagues. On the other hand, students are rating the actual performance they observe and, hence, should not be affected by reputation.

**Summary**

Although the present study was able to provide data concerning the relationship of publications to instructional ratings and the instructor’s academic rank to his instructional rating, there are other related issues that need to be investigated. For example: (a) Would the relationship between an instructor’s academic rank, publication, and student rating be the same if all instructors rated by students were used? (b) Do raters at a particular academic rank tend to rate higher, instructors at that same rank? (c) Does the reputation of an instructor affect student ratings?

TO: Faculty Member Addressed
FROM: Richard E. Spencer
SUBJECT: Faculty Poll for Effective Teaching
DATE: November 25, 1969

In order to refine our measurement of effective teaching, we would like to compare student opinion of good teaching with faculty opinion. To this end we would like you to indicate below who you believe is a good teacher on this campus -- defined as you see fit. Please nominate or indicate three people who you feel are, in fact, good teachers and return this form in the enclosed envelope. Please print the names and departments (or courses) of one to three faculty members at the University of Illinois Urbana campus whom you feel deserve mention for good teaching.
