## ABSTRACT

The program covers two public school districts, Harlandale and San Marcos, and Southwest Texas State University. This report, however, deals only with the San Marcos Bilingual Education Program, which provides bilingual education for pupils in grades K-5 who have limited English speaking ability. Due to parental requests, 19% monolingual English speakers were also accepted into the program. Objectives for Mexican American children are: to reduce their educational deficit by instructing them in Spanish while their command of English is being developed; to enhance their understanding and cognitive development in both languages; to give them the advantage of becoming literate in both languages; and to instill a knowledge of and pride in their bicultural heritage. Objectives for Anglos are to give them the opportunity to become bilingual and literate in two languages and to broaden their outlook on and understanding of languages and cultures. The project components are: (1) development of and revision of curriculum materials; (2) bilingual instruction in grades K-5; (3) staff development; (4) parental and community involvement, and (5) coordination of the cooperative efforts of the two school districts and the teacher training institution. In the 22 classrooms in the program, there are 625 children enrolled in the district's four elementary schools. Of these children 81% are Spanish surnamed. The eight recommendations cover such things as transferring pupils team teaching with monolingual and bilingual teachers, and test administration. Much of the data are presented in Spanish and English tests and tables.

Submitted To:

Mr. René González  
Project Director

and

The U. S. Office of Education as a report of the fifth year's progress, under the provisions of Title VII of P.L. 89-10, as amended.

Grant # OEG-0-9-530014-3480 (280)

by

Dr. Helene W. Harrison  
Internal Evaluator

## RECOMMENDATIONS

1. A letter from the superintendent to the principals apprising them of the problem created by shifting pupils into and out of the bilingual project is one possible way of attempting to eliminate this practice which is so detrimental to the pupils.

2. The elimination of team-teaching between monolingual teachers and bilingual teachers which is planned for next year should improve morale of project teachers a great deal.

3. Teachers whose pupils were successful on the Metropolitan Achievement Test and/or on the Spanish reading test (Prueba de Lectura) deserve commendation from the superintendent for their efforts.

4. Teachers whose pupils performed poorly on the Metropolitan or on the Spanish reading test need special counsel from the coordinator in attempting to improve their ability to help their pupils achieve more next year.

5. Fall Peabody results show that many pupils in this district enter school with a large vocabulary/concept disadvantage. The importance of this problem cannot be emphasized too strongly. Extensive work must be done to attempt to overcome this disadvantage, not only by kindergarten and first grade teachers but by teachers at all grade levels. The coordinator should do whatever is necessary to assure this.

6. Since balanced bilinguals are severely handicapped in both languages, it is suggested for these pupils that English be the major language of concentration since concentration in two languages may spread development

in each language too thin. For the Spanish-dominant child who is also severely handicapped in concept/vocabulary development, reading readiness and reading activities should be begun in Spanish; for the English-dominant child, the converse is true. The coordinator should take responsibility to see that teachers implement these suggestions.

7. Bilingual education in this project has succeeded quite well in all four of its major objectives for kindergarten through third grade. It is hoped this success will proceed upward another grade level next year.

8. Due to the low financial resources of this district, it is an absolute necessity that federal funding be continued in order for bilingual education to have its opportunity to help Mexican-American children achieve a quality education.

## INDEX OF TABLES

- I. Teachers, Schools, and Summary of Pupil Data
- II. Pupil Dropout Data
- III. Fall Grade Level Means for Peabody Picture Vocabulary Tests
- IV. Comparison of Bilingual Vs. Nonbilingual Kindergarten Concept Development
- V. Peabody Picture Vocabulary Tests--Percentage Attaining Objective
- VI. Peabody Picture Vocabulary Tests--Mean Increases
- VII. Peabody Picture Vocabulary Tests--Interquartiles and Medians
- VIII. Metropolitan Achievement Test--Percentage Attaining Objective--Kindergarten
- IX. Metropolitan Achievement Test--Percentage Attaining Objective--First Grade
- X. Metropolitan Achievement Test--Percentage Attaining Objective--Second Grade
- XI. Metropolitan Achievement Test--Percentage Attaining Objective--Third Grade
- XII. Metropolitan Achievement Test--Percentage Attaining Objective--Fourth Grade
- XIII. Metropolitan Achievement Test--Percentage Attaining Objective--Fifth Grade

## SAN MARCOS FINAL EVALUATION REPORT

This program comprises two public school districts, Harlandale and San Marcos, and a university, Southwest Texas State University. However, since separate evaluations are being performed for the two school districts this year in accordance with the U. S. O. E. directive, this report deals only with the Bilingual Education Program of San Marcos Independent School District. This program is primarily designed to provide bilingual education for pupils in grades K-5 who have limited English-speaking ability. However, due to parental requests, approximately 19% monolingual English-speakers have been accepted into the program. The objectives for Mexican-American children in the program are these: (1) to reduce their educational deficit by instructing them in Spanish while their command of English is being developed; (2) to enhance their understanding and cognitive development in both languages; (3) to give them the advantage of becoming literate in both languages; (4) to instill in them knowledge of and pride in their bicultural heritage. Objectives for Anglo-American children in the program are these: (1) to give them the opportunity to become bilingual and literate in two languages and (2) by introducing them to another language and another culture, broaden their outlook and enhance their understanding of other peoples.

The project embodies several components: (1) development of and revision of curriculum materials for bilingual classes, (2) bilingual instruction in grades K-5, (3) staff development of bilingual teachers, aides, student interns and prospective teachers; (4) parental and community involve-

ment; and (5) coordination of the cooperative efforts of the two school districts and the teacher training institution.

In the twenty-two classrooms involved with the program, there are 625 children enrolled in grades K-5 in the four elementary schools of the district. (See Table I.) Eighty-one percent of these children have Spanish surnames. However, 26% of the pupils in grades K-5 and 12% of the pupils in grade 5 are not Mexican-American. That a majority of the Spanish-surnamed children speak Spanish as the dominant home language has been established by questionnaires completed by parents in previous years of the program.

The project is managed by a director and an evaluator from Southwest Texas State University, a coordinator from the district, and a curriculum specialist. There have been no changes in management personnel this year. Harlandale acts as fiscal agent for the project. Although the director administers the project, major policies are determined by the Consortium. (See Appendix for Organizational Chart.)

A major change in the program is the assumption of financing for kindergarten as well as for the first and second grades by the local district. Title VII is contributing funding for only grades 3-5 this year. Since this means that 50% of the total program is now funded by the local district itself, this appears a strong manifestation of support for the bilingual education concept and a promise of hope for its future after federal funding ceases.

#### Bilingual Instruction for Grades K-5

The federal guidelines which advised curtailing of evaluation to the instructional component will be followed and other aspects of this

E = English-language teacher.

program will not be discussed. Again in accordance with federal directives, standardized tests constitute a significant part of the evaluation this year.

One problem which has been prevalent in past years of the program is the shifting of pupils into and out of the program from one school year to another. There have been two main reasons for this situation: (1) pupil transfer into and out of the district and (2) assignment of pupils to non-bilingual classes by principals in order to equalize teacher-pupil loads.

Various measures have been tried to alert the principals to the need to retain pupils in the program once they have begun, but that none of these have been particularly successful is evident from a look at Table II. Grade level figures indicate the number and percent lost between the previous grade and this year's grade level. Figures showing number and percent by school indicate quite a range of difference. In one school the pupil transfer out of district rate of 10% accounts for a large amount of the dropout proportion. Overall, however, the reduction from 27% last year for the district to 24% this year is not a substantial improvement. It is suggested that a letter from the superintendent to the principals clarifying the problem and stressing the importance of reduction of the dropout rate might improve the situation next year.

The testing team, which is under the evaluator's supervision, is composed of twenty bilingual student interns of junior or senior rank from Southwest Texas State University. These student interns, who are preparing to be bilingual teachers, carry a full course load at the University and also work ten hours a week as teacher aides in bilingual classrooms. They receive a stipend to cover tuition, books, and supplies and are paid at an

\*Rate of pupil transfer out of district is 10%.

hourly rate for their work in the classroom. In addition, during and after fall and spring testing they are paid at an hourly rate for administering the Peabody Test and scoring all test instruments administered. They are trained by the evaluator beforehand and are supervised during testing and scoring. Their work has been conscientious and capable. In addition, the teachers for whom they are aides have stated that they are quite good in that capacity because of their college background and career interest.

Testing in bilingual classrooms has proceeded on schedule. In September and again in March the testing team administered the Peabody Picture Vocabulary Test to all project pupils in kindergarten and first grade under the evaluator's supervision. These student interns established good rapport with the pupils and did an excellent job of administering both a Spanish and an English version of the test (Form A of the Spanish and Form B of the English version in the fall and the converse in the spring) to each pupil individually. The advantages of such individualized testing on these two grade levels is immense. Following administration, the testing team scored the tests, and immediate feedback in terms of mental age was given teachers by the evaluator. As soon as possible the evaluator sends feedback on all test scores to project teachers in order to aid them in diagnosing pupil weaknesses and beginning corrective action. Then the scores for all evaluation instruments are put on cards and electronically processed.

Separate grade level means were computed from fall Peabody scores for Anglo-American and Mexican-American pupils. Additional criteria were set up by which grade level means for several groups of Mexican-American

bilinguals were derived: those pupils whose scores on the two language versions were no further than eleven months apart were considered balanced bilinguals, and means were derived on both languages for this group; those pupils whose scores differed twelve months or more on the two languages were considered dominant in one language, and means were derived only for the dominant language for these pupils. These means are presented in Table III. These figures present significant evidence as to the nature of the handicap Mexican-American children in this project area bring with them upon entering school-- a vital concept deficit.

The balanced bilinguals are the most handicapped in concept development, being approximately three years behind. The Spanish-dominant bilinguals are also handicapped, being almost two years behind. The English-dominant bilinguals are the least handicapped, with kindergarteners being equal to the norm and first graders being only a year behind.

A t-test was run to determine whether or not the difference in scores between children who were dominant in one language and children who were balanced bilinguals was significant. The difference between English-dominant and balanced bilinguals proved to be significant at the .001 level of confidence on both kindergarten and first grade levels. The difference between Spanish-dominant and balanced bilinguals also proved to be significant at the .001 level of confidence on both grade levels. The kindergarten English-dominant proved to be significantly different from the Spanish-dominant at the .001 level, as well.

Various explanations could be ventured as to why the balanced bilinguals are the most severely handicapped group.\* However, the reasons will not be guessed at here. The important factor is the need for teachers to implement extensive measures to reduce this deficit.

\*That this situation is chronic is confirmed by similar findings in two prior years of the project, 1971 and 1972.

TABLE III

PEABODY PICTURE VOCABULARY TESTS\*  
 FALL GRADE LEVEL MEANS  
 (These figures show mental age in months.)

<u>Grade</u>	<u>English Dominant</u>	<u>Spanish Dominant</u>	<u>Balanced Bilingual</u>	
			<u>English</u>	<u>Spanish</u>
K	64.71 (17)	43.00 (3)	30.29 (23)	30.29
1	65.68 (38)	56.13 (8)	42.16 (38)	40.61

Monolingual English-Speakers

Since kindergarten and first grade in San Marcos have 30% almost monolingual English-speakers, the mean mental age for these children is given below.

	<u>English</u>
K	73.53 (17)
1	83.77 (35)

\*Pupils who have less than 11 months difference in mental age between English and Spanish scores are considered balanced bilinguals, and both language scores are used. Pupils whose scores in English and Spanish differ as much as 12 months are considered dominant in one language, and only the score for the dominant language is used.

( ) = No. of pupils.

Extensive concentration on oral language and on experiential concept/vocabulary development in both English and Spanish is needed before reading readiness activities are begun. In addition, it is apparent that there must be continued concentration on this language development not only for one year but for several years if the language disadvantage these children suffer from is to be alleviated. The interrelatedness between oral language proficiency and reading comprehension and other language activities makes it imperative in terms of future educational achievement for these children that this problem be given cognizant attention by teachers. This situation was discussed thoroughly with the coordinator by the evaluator.

From the fall Peabody scores, separate means were derived for this year's first grade pupils who had been in bilingual kindergarten classrooms and for those who had been in nonbilingual kindergarten classrooms last year as well as for those who had not been in kindergarten at all. (These scores are shown on Table IV.) Those pupils who had been in the bilingual kindergarten were ahead of the other two groups from 22 to 45 months in English and behind the other two groups from 6 to 7 months in Spanish. It is evident that there was little Spanish taught in the bilingual kindergarten. However, it is also evident that concentration on English language teaching was extremely effective.

A  $t$ -test was run to determine whether or not the difference in English scores for these three groups was significant. The difference between scores for those who had been in the bilingual kindergarten

TABLE IV

A COMPARISON OF BILINGUAL VS. NONBILINGUAL KINDERGARTEN  
CONCEPT DEVELOPMENT: FALL PEABODY FIRST GRADE MEANS  
FOR PUPILS FROM LAST YEAR'S KINDERGARTEN

	<u>Number of Pupils</u>	<u>English</u>	<u>Spanish</u>

Nonbilingual	72	59.21	36.96
Nonkindergarten	7	36.00	35.71

and scores for the other two groups was significant to the .01 level of confidence. This presents striking evidence that the bilingual kindergarten program is one successful means of helping to overcome the vital concept deficit in English which many of these children suffer from.

The objective of a normal six-month gain during the six-month interval between pre- and post-tests was fulfilled in English by approximately two-thirds of both kindergarten and first grade pupils and in Spanish by approximately half of the kindergarten and first grade. (See Table V.) Table VI showing mean increases from fall to spring is more revealing of differences between classrooms. All kindergarten classrooms succeeded in making good gains in English; only one of three did the same in Spanish. All first grade classrooms made approximately two-times the normal gain in English. Three of four had high gains in Spanish. Breaking these increases down into mean gains per grade level for Mexican-American and Anglo-American pupils shows that both ethnic groups did well in English but that only the Mexican-Americans learned much Spanish, particularly in first grade.

Table VII shows grade level fall and spring Peabody interquartiles and medians. All quartiles in both kindergarten and first grade reflected normal or above-normal gains in English. The first quartile showed only one or two months gain in Spanish; however, other quartiles showed normal or better than normal gain.

The Metropolitan Readiness Test, Form B, was given in kindergarten by the teachers in February. The kindergarten objective was that half of the pupils should reach the 40th percentile. This percentile rather than

the 50th was picked because the test was given twelve weeks before the end of school, and 33% of the school term remained. Seventy-one percent of the pupils reached this objective (See Table VIII). Interquartiles which were computed for this test (Table XIV) for comparison with national norms reveal that more than three-fourths of the pupils performed above the 29th percentile; more than half, above the 75th and one fourth, above the 95th. This is an outstanding accomplishment by the kindergarten teachers.

Metropolitan Achievement Tests, Primary I B, were administered by first grade teachers the last week in February. (See Table IX for results.) Overall, better than 90% of the pupils attained the 1.6 grade equivalent in word knowledge, word discrimination and math; 77% attained it in reading comprehension, a problem area at most grade levels. No classroom failed to succeed. Interquartiles based on percentiles were computed and reveal that the upper three-fourths of the class far exceeded the national norm in each category with the exception of reading comprehension. (See Table XV.) Even here, the upper half of the class far exceeded national norms.

A t-test was run to determine whether or not the performance of first grade pupils who had been in bilingual kindergarten would be significantly higher on the Metropolitan than that of those who had been in regular kindergarten and those who had not been in kindergarten at all. In both reading and math, scores of ex-bilingual kindergarten pupils were significantly higher than scores of the other two groups at the .005 level of confidence. This is another proof of how very much a bilingual kindergarten program can accomplish for pupils and how vital bilingual education is at this grade level.

Teachers in grades 2 and 3 administered Form B of Primary II and Elementary levels of the Metropolitan Achievement Test in September and Form A in February. Teachers in grades 4 and 5 administered Form G of Elementary and Intermediate levels as the pre-test and Form F as the post-test. Forms G and F are machine-scorable and from<sup>are</sup> the newer, 1970 editions of the test. This edition is five months higher in order of difficulty than the old edition.

The objective was that half of the pupils should attain the 6 month gain in grade equivalent expectable between fall and spring testing. (See Tables X - XIII.) In second grade 48% succeeded in reading comprehension; 55%, in math; 44%, in word knowledge; 33%, in word discrimination. Of the third graders 51%, 74%, and 58% succeeded in language, math computation, and problem solving/concepts respectively; however, approximately one-third attained the objective in word knowledge, word discrimination, and reading comprehension. Less than one-fourth of the fourth graders succeeded in reading, language and math. Approximately 40% of the fifth-graders accomplished the objective in reading, language and math. Only 20% and 32% succeeded in science and social studies. In noting the decrease in achievement between grades 2-3 and grades 4-5, the higher order of difficulty of the tests administered in grades 4 and 5 must be remembered.

Metropolitan interquartiles and medians based on percentiles were computed for grade levels 2-5 and are shown on Tables XVI-XIX. The second grade shows excellent gains in all subject matter areas. Also all quartiles far exceed national norms except for the lower three quartiles in reading comprehension. Third grade reflects excellent gains in all areas except reading. Fourth and fifth grades reflect little difference between pre-

and post-tests except for fifth grade math computation where small gains prevail throughout.

Kindergarten, first and second grade performance on the Metropolitan was above national norms this year, substantiating the hope raised last year that increased academic achievement which had begun on kindergarten level in 1972 and had continued through first grade in 1973 would progress through second grade in 1974. The excellent gains in percentile made by third grade also seem indicative. This laudable achievement proves that this bilingual education project is now succeeding in its objectives from kindergarten through third grade level. This statement will be further substantiated by pupil accomplishment on the Spanish reading test (Prueba de Lectura), BEP Test in social studies and science, and the inferred self-concept scale which will be discussed later in this report.

Comparison of percentages of pupils fulfilling the objectives on the Metropolitan at all grade levels is suggestive. There is a large variability between classrooms as to the percentage of pupil success. It is recommended that the coordinator take a very careful comparative look at percentages of success for the teachers at each grade level. Then teachers whose pupils did unusually well can be consulted with in an effort to determine reasons for their expertise and to lead to a sharing of this expertise with their fellow teachers. Teachers whose pupils performed very poorly should be counseled with, supervised closely, and possibly even directed to college course work which may serve to alleviate their shortcomings. Commendations from the coordinator or the superintendent for teachers whose pupils performed exceptionally well might encourage further efforts.

In September and again in March teachers administered the Inter-American Spanish reading test, the Prueba de Lectura, Form DEs in the fall and Form CEs in the spring. Level 1 of the test was given in second grade, level 2 in third grade and level 3 in fourth and fifth grades. This is a rather difficult test, but it was the only one available at the commencement of this project and is still the best test available for this particular area.

Only raw scores are available for this test. Total possible raw scores on vocabulary and comprehension for second grade are 40 and 40; for third grade, 40 and 70; for fourth and fifth grade, 45 and 80. The objective of a gain in raw score in vocabulary and in reading comprehension between fall and spring was fulfilled by approximately three-fourths of the pupils in grades 2 and 3 and almost two-thirds of the pupils in grades 4 and 5. (See Table XX.)

The tables showing fall and spring means and standard deviations (XXII) and mean increases in scores (XXI) are more revealing as to the difference in performance between classrooms. Mean increases vary from a -1.15 to a +14.10. Good improvement is evident in every second grade classroom and in all but one classroom each on grade levels 3-5. The most substantial improvement occurred on second grade level. The variability in scores indicates that the coordinator should take a careful look at this table, determine which teachers are failing to help their pupils achieve significant success in this area and arrange that remedial measures be instituted, whether these be college coursework, in-service training or personal conferences.

In order to compensate for the lack of inclusion of social studies and science on the Metropolitan in grades 1-4, those particular portions (previously, validity and reliability on these portions had been established) of the locally-developed Bilingual Education Program test were administered in grades 2-4 in September by project teachers and in grades 1-4 in March. Half of the classrooms were given the English version of the test; half were given the Spanish version. (Copies of both versions are found in the appendix.)

Data is in raw scores, with total possible scores being 10 in each area for first grade, 20 for second, 30 for third, and 40 for fourth. The objective for first grade pupils was to attain 60% correct in each area and for grades 2-4 an increase between fall and spring scores in both areas. Better than 80% of the pupils in each first grade classroom attained the objective in social studies and better than 90% in science. Approximately two-thirds or more of the pupils in classrooms on the second, third and fourth grade levels attained the objectives with only 1 exception at each grade level. (See Table XXIII.) Performance on this test by bilingual classes as a whole was quite good.

In order to ascertain whether accomplishment would be higher in English or in Spanish, means and standard deviations were derived for fall and spring scores (see Table XXV), and mean increases between fall and spring were computed for pupils in grades 2-4 (see Table XXIV.) In first grade means were the same for both versions. Means were somewhat higher for the English version in third and fourth grade but higher for the Spanish version in second grade. Mean increases were higher for the Spanish version at second and third grade levels and higher for the English at fourth grade level.

A t-test was run to determine if spring scores for first grade were significantly greater for either language version. There was no significant difference in these scores. T-tests were also run to determine if increases in scores were significantly different for either language version at second, third and fourth grade levels. No significant difference was found for third grade. However, second grade gains in both social studies and science were significantly greater in Spanish to the .005 level of confidence, as were fourth grade science gains in English. The .00 gain in Spanish science on fourth grade level is in striking contrast to the English gain of 15.77. From this it appears that in these subject matter areas San Marcos teachers in grades 1-3 are doing at least the half of their teaching in Spanish which was specified in the proposal. It is suggested that the coordinator give advice and, if necessary, help to assure that fourth grade teachers follow project guidelines on teaching these two subject matter areas in both languages.

Project teachers filled out inferred self-concept scales\* for each pupil in their classrooms in October and again in April. The scale consists of thirty items and is based on an ordinal scale continuum from 1 to 5. Research with lower socio-economic level pupils in the traditional school program (which had been done by Dr. McDaniel in 1968, 1969) indicated a decrease in self-concept for pupils during the school year and a succeeding lower self-concept level in each progressively higher grade level. Due to measures designed to create a more positive self-image in pupils

\*Developed and field-tested by Dr. Elizabeth McDaniel at University of Texas, 1969, and published by San Felipe Press in 1970.

being implemented by teachers, an increase between fall and spring scores was predicted for the pupils in this project. In 59% of the classrooms 40% or more of the pupils made a gain. (See Table XXVI.) In addition, there was a mean increase between fall and spring scores on every grade level but second and fourth. (See Table XXVII.) This presents creditable evidence that the bilingual education program is indeed helping many Spanish-surnamed pupils to achieve a more positive self-image.

The achievement of this self-concept objective in the affective domain is balanced by achievement of instructional objectives in the cognitive domain in kindergarten through third grade. That these accomplishments have now reached upward into the third grade is most encouraging as to the success of the bilingual education project in this district. If the program receives at least partial funding by the federal government again next year, this program should continue to be able to improve the educational opportunities of Mexican-American children. If the district does not receive any federal funds for this program next year, since this district has low financial resources, it will be extremely difficult for it to continue the program on an expanding scale.
