Mainstreaming

The HI-FI (Hearing-Impaired Formal Inservice) Program
is described as a set of inservice materials targeted for workshops
of regular classroom teachers and other school personnel concerned
with school district and classroom management of hearing impaired
(HI) children. An introductory section focuses on the design of the
program materials, characteristics of workshop leaders, inservice
programming, optimal time frames for presentation, the target
population, and a glossary of common terms. Mainstreaming is
explained with reference to the Cascade Model, multiple team
approaches to the management of HI children, educational options for
the HI, and alternative support services for school districts.

Material on the nature of HI address such topics as the human ear;
audiograms; the decibel; the impact of HI on psychosociological,
academic, and language development; and hearing aids. Training
methods are explicated in discussion of methods of communication,
factors in speech production, aural rehabilitation, and a
socialization curriculum. Aspects of successful mainstreaming are
considered, including the teacher's role, curriculum, language
arts-mathematics curricula, media, and the physical and educational
classroom environment. Guidelines are provided for orientation
programs for HI children and their normal peers. Included is
information on state administrations for special education, special
schools for the HI, selection organizations and publications,
instructional material centers for handicapped children, teaching
resources, vendors, and transparency masters. (GW)
HEARING-IMPAIRED FORMAL INSERVICE PROGRAM

NORTHEAST REGIONAL MEDIA CENTER FOR THE DEAF
HEARING IMPAIRED - FORMAL IN-SERVICE

PROGRAM

Linda K. Nober, NRMCD, Project Coordinator

Shirley Alves, NRMCD, Graphic Artist

Ann Clark, Tennessee School for the Deaf

Sheila Helfgott, NRMCD

Dulcie Hunt, Amherst Public Schools

Stanley Patric, NRMCD

Sharon Weiner, NRMCD

The materials included herein were developed by the Northeast Regional Media Center for the Deaf pursuant to a grant (OEG-0-73-0534-B) from the Bureau of Education for the Handicapped, United States Office of Education, Department of Health, Education, and Welfare.

Note: Opinions reflected by these materials do not necessarily reflect those of the Bureau of Education for the Handicapped.
ACKNOWLEDGMENTS

Many individuals contributed time and professional skills to the development of these materials. There were four principal groups to aid in the project at critical stages:

NRMD Staff

Raymond Wyman, Director
Tedd Lachus, Associate Director
Meredith Cadogan, Secretary
Jean Cordes, Operations Manager
Bob Dickinson, MST Student
Gaspar DiPasquale, Technical Assistant
Ann Eaton, Principal Clerk
Nanbetta Nixon, Senior Clerk/Typist
Jane Resnick, Senior Clerk/Typist
Glenn Keeney, Staff Associate
Corey Chan, Supervisor of Field Services
Audrey Elliot, MST Student

Planning Group

Leonard Goldberg, Boston School for the Deaf
Edward Sted, Teacher's College, Columbia University
Serdic Clay, Syracuse University
Florence Sieben, Teacher's College, Columbia University
E. D. W., State Department of Special Education

ERIC
Evaluation Group

Linda Cook, Holyoke, MA
Geraldine Frasier, Greenfield Public Schools, MA
Carlene Kallgren, Northwood School District, NH
Merle Green, Hamden Public Schools, CT
Dorothy Sage, Syracuse Public Schools, NY
Larry Sexton, York School District, PA
Marilyn Teitelbaum, Northport School District, NY
Roger Wallace, Worcester Public Schools, MA

Advisory Group

Vincent Aniello, Lexington School for the Deaf

Milo Bishop, NTID
Frank Caccamise, NTID
Marilyn Enders, NTID
Herbert Goldstein, Yeshiva University
Barbara Jackson, Boston Public Library
Fred Miller, NH Department of Special Education
Doris Naiman, NYU Deafness Research & Training Center
E. Harris Nober, University of Massachusetts
Roy Nonnemaker, University of Massachusetts
Richard Schietelbusch, Bureau of Child Research, Kansas
Ross Stuckless, NTID
Richard Thompson, EDCO Boston
Carol Tipton, NYU Deafness Research & Training Center
Omit the paragraph intended for the Deafness Research & Training Center, New York University, for the participation of Mr. Frank Rowe, Associate Director of Services, for his assistance with the section dealing with the condition of deafness.

FOREWORD

The Northeast Regional Media Center for the Deaf was established by the Bureau of Education for the Handicapped in 1966 to explore all possible ways to improve education of the deaf through the wide and wise use of educational media, technology and systems. At the same time three centers for the deaf and fourteen centers for all handicaps were established to be integrated into a network to serve the handicapped in a national program called the Special Educational Instructional Center Network (SEINC).

These centers have made a tremendous impact on education of the handicapped. Teachers of the handicapped now have better classrooms, better equipment, better materials and better training for applying instructional media and technology than any other group of teachers. Handicapped students in special schools and classes have far better learning conditions related to their special needs than ordinary students.

But now two important changes are occurring that will make new arrangements imperative. The network of Special Education Instructional Materials Centers is to be terminated, and there is a tremendous movement to get handicapped students out of special schools and classes and into regular classrooms. Unless new arrangements are quickly made, handicapped students will likely not have the media resources that have been important contributions to their success.

A new network of thirteen Regional Resource Centers and thirteen Area Learning Resource Centers is to be operational in the fall of 1974. The RRCs will make diagnoses and prescriptions and the ALRCs will assemble, where possible, the information about needed equipment, materials and techniques. A National Center for Educational Media and Materials for the
A center has been set up at Ohio State University in Columbus, Ohio, to deal with hearing impairment, visual impairment, and other handicapping conditions, as well as a depository for the Handicapped. This center is currently being negotiated for fall 1974 operation. Information regarding centers is available from the Bureau of Education for the Handicapped.

Even teachers in regular classrooms will be welcoming handicapped students for the first time. They will, in many cases, be ill prepared for the special needs of these students, particularly the deaf and the hard of hearing. Since severe hearing impairment is infrequent, and since it is generally meant immediate removal from regular classes, most teachers and students have never encountered such students, to say nothing of trying to integrate and educate them.

This handbook is the last major undertaking of the Northeast Regional Center for the Deaf. It is not a plea for "mainstreaming" of the deaf. It is a plea for understanding the handicapping conditions of these students and making the very substantial contributions to their social and educational success if they are to be successful in the regular school programs.

Many of the resources of our center were devoted to the creation and publication of this handbook during the summer of 1974, because it seemed important. We hope that all teachers who welcome the hearing impaired students in their regular classrooms will find this handbook of help.

Vincent G. Aignan
Director
NEURAL MEDIA CENTER
Introduction

Purpose of the Material

The in-service program, developed by the Northeast Regional Media Center for the Deaf, was designed to be used as the basis of an in-service education program within elementary public schools. These materials are targeted for workshops comprised of classroom teachers and school personnel, and as such, relate directly to school district management and classroom management of the hearing impaired child.

Design of the Materials

The materials provided for the workshop leaders are: a manual, transparencies, a 12 minute video tape (1/2 inch), a 7 minute audio cassette.

In order to present the materials, the following equipment is necessary:

1. An overhead projector
2. A tape recorder, cassette type
3. A 1/2 inch video tape recorder unit (new format) with monitor (optional).

Instructions for the duplication of the illustrated transparency masters are included at the back of the Hi-Fi manual.

The materials have been divided into several sections. The major sections are: (1) Introductory Materials, (2) Philosophy of Mainstreaming, (3) Hearing Impairment, (4) Educational Practice in Schools for the Deaf, (5) Public School Accommodations, (6) Orientation to Hearing Impairment, (7) Resources for the School. This design provides information concerning the most important problems of mainstreaming the hearing impaired child.

The materials...
these materials provide for flexibility in presentation. Decisions regarding inclusion, additions, time frames, credit systems and the like, could be approached on an individual school district basis. The needs of a particular district can best be determined by the district personnel and administration, along with representatives of state departments of education and alliances with neighboring institutions of higher education.

A hearing impaired child who shall now receive his/her education as close to the mainstream of public education as possible, may require special accommodation in planning and implementation of performance objectives.

These materials were designed to enhance the positive adjustment of the hearing impaired child to the regular public school. It was determined that this goal could best be attained by providing school district personnel (particularly classroom teachers) with information, alternatives, resources, references, and creative ideas which could then be evaluated and implemented on an individual basis.

Certain assumptions have been made regarding the school district and the child of the hearing impaired child. These assumptions include:

- The availability of trained personnel (within traveling distance) to provide additional information regarding hearing impairment.
- The guidelines for candidates to be integrated would have been established with flexibility for each child on an individual basis.
- These guidelines would have been established in consultation with the child, parents, child development centers, rehabilitation centers, or some other suitable source.
A variety of alternatives could be instituted within a school district or within neighboring school districts, so that adequate support services could be initiated for the individual child. Each school district could approach children with special needs with considerations which reflect maximum cultural involvement within the mainstream of public education without undue pressures on the child and his/her family.
These materials were designed to be used by a professional within a school district or a state department of education. The materials provide alternatives for presentation which are to be determined by the individual school district. Some considerations for the use of these materials by a school district are:

1. Availability of suitable trainers
2. Methods of in-service programming
3. Optimal time frames for presentation
4. Target populations.

Trainers

The intent of this project was to provide materials for a specially prepared workshop leader (trainer with experience in workshop presentations) to be used at the discretion of that person. In order to facilitate this flexibility, a variety of materials and content have been provided. Suitable trainers will be drawn from personnel who possess academic and exper-

...
The trainer is provided with specific references reflecting the most important writings on that topic. These references are divided according to the section to which they relate most closely.

In addition, a number of suggestions to the trainer are provided for each of the sections. These suggestions provide discussion topics or questions relevant to the section. The purpose of these suggestions is to personalize the materials for a particular school district. Large and small group discussion topics have been devised which relate the materials directly to the district levels. The trainer and participants are encouraged to generate additional suggestions for implementation and discussion.

Methods of In-Service Programming

Individual school districts utilize various formats for in-service education. At present, there is a nation-wide mobilization to provide adequate, interesting and productive in-service workshops on a school district basis. The materials provided within the program can equate to various record systems for teachers, either through alliances with local education or higher education or state department programs. Various training courses of materials and discussion topics have been devised. This information can be equated with the various courses available in in-service education programs.

It is possible for these materials to be used independently into an in-service program. Individual teachers may avoid themselves the problem prior to a new school term or during their required in-service period's interaction at a school district. In these cases, it is recommended that training be provided with available personnel in
In order to plan for the alternatives necessary to accommodate the severely hearing handicapped child.

**Optimal Time Frames for Presentation**

These materials can be presented in a number of different time sequences. Some general sequences are:

1. Four sessions of two hours duration
2. Two sessions of four hours duration
3. One session which spans an entire day.

Many other combinations are available depending upon the strategies of the particular school district. The materials are divided in such a way as to enhance their use sequentially.

**Target Populations**

These materials have been designed specifically for classroom teachers who will be responsible for providing educational alternatives for hearing impaired children. Ancillary school personnel, non-academic personnel, parents, rehabilitation personnel, and other groups have been targeted as well.

The workshop leader (trainer) can determine the most comfortable size for audience participation. Ideally, groups of 10-20 are most responsive to the techniques which are being described. Persons who represent a variety of teaching styles, educational backgrounds, disciplines, and experiences are preferable for group participation which is informative and constructive.
Terminology

The following list defines some terms used in the program:

Acoustics feedback - A high pitched squeal emitted from a hearing aid due
to excessive output, microphone receiver proximity, or loose earpiece.

Acoustics - The science of sound including the origin, transmission, and
effects of mechanical vibrations in any medium.

Adventitious hearing loss - The loss of hearing acquired through illness or
accident where occurred after birth. Time of occurrence may influence
language and speech patterns.

Amplification - A gain or increase in the intensity of sound.

Aphasia - A loss of the ability to use symbolic language due to injury,
disease or maldevelopment of the brain.

Audiologist - A professional specialist in the science of hearing who
typically deals with the assessment and rehabilitation of the hearing impaired.

Audiogram - A graph of the hearing threshold levels showing the number of
decibels lost at each frequency.

Auditory discrimination - The ability to differentiate among sounds.

Auditory sensitivity - Capacity to detect auditory signals. This informa-
tion is then plotted on an audiogram as the threshold.

Auditory training - Teaches auditory discrimination skills, identification
and recognition of speech and nonverbal sounds, and the development of
auditory memory to those who have residual hearing.

Aural oral - A method of speech and lipreading in communication.

Air conduction - The process by which sound passes through air in the outer
ear and to the inner ear.
Air-Bone Gap - The differences between a person's bone conduction hearing thresholds and his air conduction hearing thresholds as shown on his/her audiogram; it reflects the integrity of the middle ear.

Bilateral - Referring to the left and right sides.

Bilateral Hearing - Using both ears.

Bilateral Hearing Aids - A complete set of amplifiers, receivers, and microphones for each ear.

Bone Conduction - The process by which sound passes through the facial and cranial bones into the inner ear; it reflects the integrity of the inner ear.

Central Hearing Loss - Auditory impairment due to dysfunction of the cortex or central nervous system.

Cascade Model - A continuum of educational placements which provide alternative settings designed for children with special needs. These stages range from total integration to special hospitalization facilities.

Conductive Hearing Loss - Hearing impairment due to interference with the acoustic transmission of sound to the sense organ. This type of loss may be receptive to medical or surgical treatment.

Congenital Hearing Loss - Hearing loss present at the time of birth.

Deafness - Refers to a complete or severe loss of auditory sensitivity.

The severity of the loss makes auditory discrimination relatively nonfunctional.

Decibel (dB) - A unit of 1/10th of a bel is a unit of measurement of the relative intensity of a sound.

Inaudible - A sound, sound gliding continuously from one vowel to another in the same syllable.

Interface - The plastic piece which couples the hearer and - the talker.

Electroacoustic - That aspect of electronics which deals with the transformation of electricity into acoustic (sound) energy, and vice versa.
Fingerspelling - A form of communication using finger configurations to represent each letter of the alphabet.

Frequency - The measure of a sound wave in cycles per second vibration, referred to as Hertz (Hz). The average extended normal frequency range for humans is between 20-20,000 Hz.

High Frequency - Refers to frequencies above 1000 Hz; whereas Low Frequency refers to those frequency below 1000 Hz.

Hard of Hearing - Applies to persons possessing enough residual hearing to use his hearing aid as a primary form of communication.

Hearing Aid - An electronic device which amplifies sound.

Hearing Clinician - A professional specialist trained in the fields of speech, audiology, language pathology, and/or the education of the deaf who can be an aid in the placement and programming of hearing impaired children into the public classrooms, as well as provide support and information to the staff.

Hearing Impairment - The condition of hearing loss, ranging from mild to profound, which is depicted on an audiogram. This loss can be broken down into 5 categories: mild (21-30 dB), moderate (40-55 dB), moderate-severe (56-73 dB), severe (74-90 dB), and profound (91 dB and above).

Hearing threshold - that minimal level which produces an auditory detection sensation, usually 50% of the trials.

Hertz (Hz) - Named after Heinrick Hertz, a German physicist, designating cycles per second (cps) - a measure of frequency.

Intensity - Refers to the measure of the energy flow or the magnitude of the sound wave measured in decibels and interpreted psychologically as loudness sensation.
Interpretive Teacher - An educator (tide) who is utilized as an academic tutor, providing the hearing impaired child with more individualized or small group instruction.

Mainstreaming, Integration, Maximal Cultural Involvement or Fusing -
An effort to achieve equality of educational opportunity for hearing impaired children and other exceptional children attending public schools. The Cascade Model was adopted to provide guidelines for integration of students with special needs.

Manual Communication - A system of gestures, fingerspelling and body movement to convey meaning.

Mixed Hearing Loss - A hearing loss which is a combination of both conductive and sensori-neural impairment in the same ear.

Monaural - Relates to receiving sound through one source or ear.

Nasality - The quality of speech sounds the nasal cavity is used as a resonator.

Noise - Inanted sound as differentiated from the important signal (speech).

Racker or noise refers to continuous or sporadic unwanted sounds.

Otolaryngologist - A medical specialist in the field of diseases and surgery of the ear.

Otoacoustic Emissions - The study of diagnosis and medical treatment of the ear.

Phonemic - A group of family of closely related speech sounds which have the same distinctive acoustic characteristics.

Phonology - The psychological interpretation of frequency.

Progressive Hearing - Refers to the remaining hearing capacity in severe or profound hearing losses.

Private Part-Time Teacher - A certified teacher of exceptional children, in individual settings, hearing impaired who provides instruction for part of the day within the child's regular classroom.
Extraglucular hearing loss - Auditory impairment of the eighth cranial nerve or pathways connecting the cochlea to the brain.

Rubella (German Measles) - A disease which if acquired during the early stages of pregnancy may cause severe hearing impairment to the unborn child. Other consequences include blindness, cerebral palsy, cleft palate, mental deficiencies, learning disabilities, etc.

Sensorineural loss - Hearing loss due to abnormality of the sense organ either in the inner ear or along the auditory nerve.

Signal to Noise Ratio - The relationship between the intensity of speech and the intensity of noise in a particular communicational situation.

Sign Language - A form of communication using signs and symbols to convey a message.

Speech Pathologist/Speech Clinician - A specialist in the areas of speech, hearing and language disorders.

Speechreading or Lipreading - Refers to the ability to understand spoken language through observations of lip movement and facial expression.

Inter - A resource person who can provide individual or small group instruction for the hearing impaired child who is being integrated into the public school classroom.
Philosophy of Mainstreaming
PHILOSOPHY OF MAINSTREAMING

Introduction

History of Mainstreaming

During the past decade an intense national effort has been made to achieve equality of educational opportunity for children. Specific concern for the educational opportunities available to children with special needs is included in this national effort. Leaders in the fields of special education, education of the deaf, medicine, rehabilitation, speech pathology and audiology and others, began to focus on a national goal for children with special needs. This goal was the upgrading of educational alternatives, by achieving educational placement as closely associated with normal schooling as possible. Parallel to this educational movement, parent groups proceeded to foster similar public awareness through legal action in behalf of their children. Most court decisions favored or mandated upgrading of educational options.

The Cascade Formula

A model (Dean, 1973) for increased quality educational services for handicapped children was proposed and adopted by several national groups. This model, known as the Cascade model, provides guidelines for a continuum of services for children with special needs. This Cascade, or series of educational alternatives, is the motivating basis for the increase in the numbers of children with special needs being placed in regular public schools.

Federal and State Legislation

Organizations such as: United Cerebral Palsy, American Association for Mental Deficiency, American Speech and Hearing Association, and...
particularl)

The Council for Exceptional Children, encouraged legislation which would support the effort to upgrade educational facilities and programs. The federal government (Bureau of Education for the Handicapped, Department of Health, Education and Welfare) in concert with state departments of education supported legislation. Expanded services for handicapped children were encouraged, and the costs of the services were designated to be borne by federal and state support. This trend culminated in the proposed federal legislation (Senate Bill 56, House Bill, HR 70) currently under consideration by Congress. Several individual states have already passed such legislation (Arizona, Arkansas, Connecticut, Colorado, Florida, Massachusetts, Mississippi, New Jersey, Tennessee, and Texas.) Similar legislation is under consideration in many other states. The legislation purports to provide services for children with special needs which are as closely related to regular public school services as possible.

Hearing Impaired Mainstreaming

Children with hearing impairments constitute a large group of children with special needs who have been designated to receive expanded educational services. These children appear to be a target population for implementation of the carousel model. In order to effect these expanded alternatives, current groups of educators are encouraging more and more severely hearing impaired children to receive their education in regular public schools. As a result, the idea of hearing impaired children being a target population for expansion into mainstream public education has gained momentum in the correct trend appears to be the increased need for the

Mainstreaming for hearing impaired children can be an attainable goal. In order to reach this goal, several demands will be placed on school districts, administrators, state department of education representatives and teachers. A crucial responsibility appears to rest with the classroom teacher and her/his ability to prepare for and deal with the severely hearing impaired child.

Local Effects of Mainstreaming

For more specific information regarding individual state educational policy, State Departments of Education of each state should be contacted. A list of special education personnel by state are included in the reference section of this manual. State teacher organizations are also apprised of current legislative practice in individual states and their effect on classroom teacher responsibilities. Most central offices of individual school districts have lists of regional and state organizations serving their populations. These resources can be most helpful in guiding teachers and administrators to understand the implications and implementation practices which relate to an individual school district.
The Cascade Model

Purpose: This transparency depicts the guidelines of educational alternatives for children with special needs. Hearing impaired children are members of a target-group of children with special needs, who are encouraged to be placed educationally ("Entry Level") as high along the continuum of regular public school attendance as possible.

Implications/Hearing Impaired

The implications for the hearing impaired child by level of cascade are:

1. Attendance in a regular public school without special services for the hearing impaired child. The child participates as a member of a class without ancillary services beyond those available to other class members, i.e., speech therapy, remedial reading.

2. Attendance in a regular public school which provides necessary tutoring, itinerant teachers, resource room attendance, amplification modifications, buddy system, interpreters, or other support services.

3. Attendance in a regular public school, in special classes for hearing impaired children, with opportunities for interaction and participation with normal hearing children wherever feasible (special academic subjects, or non-academic subjects).

4. Attendance in a regular public school in special classes for hearing impaired children, with limited social non-academic interactions with normal hearing children.

5. Attendance in a special school for children with hearing impairments. Limited interactions in a nearby regular public school with normal hearing children are scheduled in order to
facilitate socialization.

6. Attendance in a special school for hearing impaired children with limited interactions with normal hearing children or adults.

Determining Entry Level

The primary goal for the education of children with hearing impairments, according to the philosophy of the Cascade Model, is the achievement of the maximum level of integration with the normal hearing population as possible both educationally and socially. This philosophy is currently supported by many educators of the deaf, school administrators, state department personnel, and parent groups; but is proposed on an individual basis, i.e., decisions regarding what "entry" level a particular child shall have are determined by the appropriate personnel for that individual child. Personnel from the child's school in conjunction with parents and personnel of the receiving school should jointly be responsible for determining entry level.
Transparency #2: Multiple Team Approaches to the Management of the Hearing Impaired Child

Purpose: This transparency depicts the significant number of people who can be involved in determining the educational environment for a hearing impaired child who is entering the mainstream of public education. Although many influences are similar to those which affect the normal hearing child, there are qualitative and quantitative differences.

It is possible to dichotomize the groups of people who aid the hearing impaired child into two sub-groups: (1) those whose influence is community-based, and, (2) those whose influence is primarily within the scope of the school. Hearing impairment implies both medical and educational diagnostic prescriptions, prosthetic devices, family decision-making and awareness, etc. It is due to the qualities of "hearing impairment" and not the child or his family, that the influence of such a vast number of people must be taken into consideration. These groups of people, community-based and school-based, function as "teams", or individuals, with the child the central figure.

Community-Based:

1. parents
2. extended family
3. physician
4. hearing aid dealer
5. speech and hearing center personnel
6. church officials
7. state agencies--bureau of mental/public health
6.1 uhs - organizations of hearing impaired persons

7. community activities - neighbors, friends, child-centered activities, (Girl Scouts, Little League, etc.)

8. educational organizations - serving hearing impaired persons, Volta, Exceptional Parents, etc.

9. Rehabilitation counselor - vocational services

Staff Related

1. classroom teacher
2. school principal
3. psychologist - guidance personnel
4. speech and hearing specialist
5. resource room teacher
6. ancillary personnel - bus driver, crossing guards, aides, interns, cafeteria personnel, and others with limited but frequent contact.
7. ancillary teachers - art, music, physical education, foreign language teacher, recreational personnel, librarian, media specialists.
8. school nurse
9. interpreters
Purpose: This transparency depicts the changes in options for the educational placement of the hearing impaired child both before and after the legislative and educational mandates for integration.

Factors Determining Educational Placement

A number of factors have remained relatively constant regarding the decision-making process for placement of the hearing impaired child. These factors are: the age of the child, the intellectual and academic performance of the child, parental attitudes, incidence of hearing impaired children within a community, quality of available services, social development of the child, distance to differing educational services, financial arrangements, philosophy of program alternatives, etc.

Previous Options

Previous to the current trend toward mainstreaming the educational options were:

1. Residential Schools for the Deaf - public or private boarding schools which provide complete services of varying design for hearing impaired children.

2. Self-Contained Day Classes - Day classes for hearing impaired children in large and/or metropolitan school districts which functioned as self-contained programs for the deaf. In some instances a particular school within a district was designated for classes for hearing impaired children, in other instances several classes were self-contained in a section of a particular school of a district.
Current Options

With the current trend toward maximum integration of hearing impaired children, several new options have become available. They are:

1. Full Integration
   a. Non-Special Programming - the hearing impaired child attends classes (academic and non-academic) with normal hearing children, receiving only those special services available to all children within the classroom, i.e., speech therapy, special reading programs, etc.
   b. Special Programming - the hearing impaired child attends classes (both academic and non-academic) with normal hearing children. Part of some or all days, he participates in additional programs such as resource room, itinerant teacher program, tutoring, interpreters, etc.

2. Partial Integration
   a. Traditional - the child is integrated into normal hearing classes from separate self-contained classes for the hearing impaired for those subjects in which the staff feels he can participate.
   b. Individual Non-Academic - the child is integrated into specific classes for non-academic areas such as: art, physical education, lunch, special programs, homeroom, free play, story time, etc.
   c. Group Non-Academic - the child is integrated for specific activities as noted above (by along with a group of his...
hearing impaired classmates. Sometimes the teacher of the hearing impaired class attends the specific activity with the group of hearing impaired children.

d. Informal Integration - the child is integrated individually or with a group of hearing impaired children for short term projects with or without the special teacher. These activities are temporary in nature and do not require structure.

e. Reverse Integration - normal hearing children are brought into the self-contained class for the hearing impaired in order to participate in academic or non-academic subjects which are short term, temporary and flexible in nature.

Responsibility of School Districts

These varieties of programming are presently available in most states. Individual districts, teachers, and parents, may wish to incorporate some of these alternatives in order to provide adequately for the child. Since a major concern of the decision-making personnel is to adopt a placement situation for the child which will provide for a "success experience," each school district that is contemplating placement for a child should be able to have a series of options for the individual child, without regarding the alternatives as "failure experiences".
Purpose: The purpose of this transparency is to depict some of the alternative systems which can provide special help for the hearing impaired child within the regular classroom or school. Some combination of these options may be necessary for individual schools. A variety of financial and educational considerations come into play; however, implementation of some of these approaches will probably enhance the hearing impaired child's adjustment and function in a regular school.

Resource Room - a special room of a school, staffed by a trained teacher of the hearing impaired, speech specialist, hearing clinician, special educator, or other specially trained professional. This room provides opportunities for hearing impaired children to receive counseling, tutoring, remedial work, and academic enrichment activities. The room is usually equipped with a variety of audio-visual equipment and materials which enable the hearing impaired child to make maximum use of residual hearing and primarily visual images often on an individual basis. The resource room approach is the most consistently referred to in the literature as helpful to the child who is meaningfully integrated but who receives full tutoring during a portion of the instructional day.

Interpreter - The introduction of an interpreter (hearing person) persistent in transmitting spoken information through the use of manual sign.
and/or fingerspelling) is relatively new in elementary school settings as an adjunct support service for hearing impaired children. The factors regarding the employment of interpreters are: number of interpreters available, number of hearing impaired children in a particular class, familiarity with signs and fingerspelling on the part of the children being integrated, parental attitudes, number of public school personnel interested in participating in the program, success of the orientation to deafness program for the normal hearing children and the hearing impaired children, etc. The interpreter-tutor functions as a professional tutor-aide in the classroom, sometimes on a one-to-one level with the hearing impaired child. This support service can be most effective with children who have previously been educated by one of the many manual-aural systems, since the basic structure of the teaching of language can be maintained for the hearing impaired child. The speechreading ability and residual hearing of the hearing impaired child are other factors to be considered. For academic presentations, movies, group discussions and the like, the interpreter functions as a language facilitator. For part of the day, the interpreter-tutor functions as a tutor for the child (difficult material, enrichment materials, etc.).

The Santa Ana School District, Santa Ana, California, has developed this system during the past decade and can be contacted regarding a feasible plan for implementation. Several other school districts are currently reporting on the success of such programs (Del., Miss.). The implementation of the interpreter-tutor system appears to be most successful when the interpreter functions as a verbatim translator of spoken English rather than narrator. This system fosters the learning of the grammatical, etymological and lexical structure of English.
Buddy System - the introduction of peer helpers, one hearing impaired, the
other normal hearing child, is currently used by many school districts.
A normal hearing child functions as the key person to the hearing impaired
child; sitting next to him, cueing the hearing impaired child into changes
in the schedule, P.A. system announcements, nuances of interpersonal
behavior, etc. This system appears to foster the "buddy" factor in social
relationships apart from the academic setting. Several buddies can be
selected for different portions of the day, in order to broaden the
hearing impaired child's interpersonal interactions during a transitional
period. Often the buddy is a volunteer, often recruited by the teacher.
Typically, the buddy system pairs children with similar interests, yet
differing abilities, to grasp and cope with academic material. The class-
troom teacher role in supporting each member of the team is an important
core.

Notetaker-helper - hearing impaired children who are integrated into upper
grade classrooms which require dictation, note-taking, written responses to
notes, etc., cannot speedread the teacher and take notes at the same
time. In order to compensate for the difficulty, the concept of notetaker-
helpers has been introduced by the National Technical Institute for the Deaf,
Columbus Center, New York. The materials developed at NTID include carbon
pens which provide the notetaker with multiple (3) copies of the
notes dictated by a teacher. A peer helper who volunteers to take notes
for a hearing impaired child does not have to reproduce the notes; the
carbon paper combination provides for this. It is typical that at some time
during the notetaker will "cover" the notes with the hearing
impaired child, thus functioning as a tutor for the child. The hearing
impaired child has the opportunity to review the material several times
(from the teacher and again from the tutor) as well as having a set of
valuable notes taken by a peer. Certain presumptions are clear for the
classroom teacher regarding the selection of the notetaker-tutor; similar
to those which apply to the Buddy System. The personality, responsibility,
interest, as well as the intellectual abilities of the peer helper are
critical to the hearing impaired child and the classroom teacher.
Suggestions for the Trainer

The following problems may be discussed within the context of each individual school district. The objective is to create an atmosphere which will provide the workshop with attainable solutions to the problems which are posed by mainstreaming.

Suggestions for large group discussion:

1. At the present time, what services is our district capable of providing to individual children with special needs, specifically hearing impairment?

2. What immediate alterations of services must be undertaken? What long-range plans should be instituted in order to meet the needs of children with severe hearing impairment?

3. According to the guidelines of the state department of education and our teacher organization, is our school district able to provide resources to the classroom teacher which are mandatory for facilitating integration of the hearing impaired child?

Suggestions for small group discussion:

1. What specific suggestions and support services can be provided by personnel within the departments of our school district (i.e., pupil personnel services, special education services, ancillary personnel, administration).

2. What administrative guidelines are required in order that classroom teachers can best provide prescriptive objectives for the hearing impaired child?

3. In a multidisciplinary approach to management of the hearing impaired child, which professionals are best suited to deal effectively with the parents of the hearing impaired child?

Hearing Impairment
HEARING IMPAIRMENT

Introduction

Approach to Hearing Impairment

Children who have sustained a hearing impairment cannot be approached independently of their status as children. Hearing impairment is but a part of their general physical characteristics, personality development, educational experiences, familial experiences, etc. The classroom teacher's awareness of individual differences in children and general principles of child development are relied on, and underlie the mass of information presented regarding hearing impairment.

Our understanding of hearing impairment is based on information provided by several fields of study. They are: acoustics, audiology, education of the deaf, engineering, medicine, psychology, rehabilitation, special education and speech pathology. It is indeed multidisciplinary in approach. In an effort to be concise and meaningful, we have intentionally synthesized the elaborate technical information provided by these fields of study. Additional information can be found in the sources listed in the reference section of this manual and we encourage additional reading in order to enhance understanding of the various aspects of hearing impairment.

It is very important to underscore the fact that, although all hearing impaired persons have some communication difficulties, not every person in this group is impaired in the same manner. The materials presented in this unit are not meant to be applied in a rigid and inflexible fashion. Each impaired person should be treated as an unique human being.
vast, complex interaction effect of the child himself and the hearing im-

Incidence

The generally accepted incidence figure for deafness in school age
children (K-12), is one tenth of one percent, or one person per one
thousand persons. Hard of hearing children represent three tenths of
one percent of the school age population. Generally, the accepted figure
for the incidence of hearing impairment in school age children is five
tenths of one percent, or five children per one thousand children. Although
this figure appears rather small, it is comparable to the incidence figures
for many other groups of children with special needs, such as: crippled,
partially sighted, emotionally disturbed, etc. In addition, hearing im-

The above figures apply specifically to children who do not evidence other combined handicaps.

Diagnosis

After describing the specific technological aspects of hearing impair-

ment, it is important to realize that such a diagnosis implies both educa-
tional and medical input. The family of the hearing impaired child has been
exposed to the pressures and influences of the educational-medical complex.

In a typical family situation, a suspicion of hearing impairment is usually
first determined by the parents. The infant fails to respond to sound ade-

quately, the ear stiffness response is inconsistent, the child develops a system
of gestures for communicating wants, the developmental stages of language
are often appear retarded, etc. It is typical that the suspicious parent
consults a physician, who may follow-up these observations with
more sophisticated diagnostic tests. Eventually, the parent and child proceed to the diagnostic sessions at audiological centers, otologists offices, speech and hearing centers, hospital clinics, psychological centers, hearing aid dealers, and state agencies. The diagnosis of deafness in a very young child can be complex and difficult in some geographic locations. The impact of this diagnostic process on the parents and child can be traumatic and long lasting. Many times parents are aware of the possibility of hearing impairment in their child due to pregnancy history, genetic factors, or the like. In those cases, the same evaluative and diagnostic procedures are usually followed. Only a few major centers in the country concentrate their efforts in providing a total diagnostic evaluation for hearing impaired children.

The family is faced with providing adequate diagnostic and educational planning for the hearing impaired child carries an unusually heavy burden.
The Human Ear

Purpose: This transparency depicts the functional hearing mechanism. Types of hearing impairment associated with disturbances of the anatomical or physiological mechanism are described.

Anatomy

We generally think of the ear as being divided into three parts: the outer, middle, and inner ear. These three parts are collectively known as the peripheral hearing mechanism, while the auditory pathways to the brain, as well as parts of the brain comprise the central hearing mechanism. This division has both diagnostic and educational implications.

Outer Ear

The outer ear is comprised of the auricle, or pinna, and the external auditory canal. These structures serve limited function in man. Certain congenital or traumatic problems can occur which block the opening or canal and cause mild to moderate hearing loss.

Middle Ear

The important structures of the middle ear are the tympanic membrane (eardrum), the three small bones which comprise the ossicular chain, and the round and oval windows. This portion of the ear is normally filled with air. The eustachian tube (from the naso-pharynx) has an opening into the middle ear. A significant number of medical problems can affect the middle ear which cause hearing loss of a conductive type. Impairment to this part of the ear is frequently medically or surgically treated. A hearing loss of up to 60 dB can occur from serious middle ear problems, i.e., chronic otitis
Inner Ear

The main structure of the inner ear which is directly related to hearing is the cochlea, or end organ of hearing. This complex structure contains numerous hair cells imbedded throughout the structure. It is believed that many of these hair cells are differentially responsive to different frequencies of the hearing spectrum and ultimately synapse with the neuronal fibers of the eighth cranial nerve of the nervous system. These stimulations are ultimately transmitted to parts of the brain where perception and cognition occur.

Damage to the cochlea causes hearing loss of a sensori-neural type. This impairment is usually uncorrectable medically. The causes of cochlea damage are: diseases during pregnancy, oto-toxic drugs, heredity, childhood diseases, encephalitis, Rh-incompatibility, etc. Severe and profound hearing losses are always of the sensori-neural type.

Additional Sources

Extensive information is available concerning the physiology and anatomy of the hearing mechanism. Classroom teachers who wish to include a "science unit" on the hearing mechanism should review additional materials. Third and fourth grade science text books often include materials appropriate for elementary grade children.
Transparency #6

Audiograms

Purpose: This transparency provides the teacher with basic knowledge of the audiological configuration of hearing sensitivity. Speech range, conductive and sensori-neural impairments are depicted.

Definition

An audiogram is a graphic chart which depicts the hearing sensitivity of the ear relative to a scale of normalcy. The chart has two acoustic parameters: frequency and intensity. The frequency dimension, expressed in Hertz (formerly cycles per second) can be measured precisely; it is perceived as pitch, although not synonymous to pitch. The intensity parameter, designated in decibels (bel, after Alexander Graham Bell) denotes the acoustic energy of the sound. The human ear perceives intensity as loudness, although it is not synonymous with intensity. The combined graphic depiction of the intensity and frequency factors, present the audiologist or otologist with an estimate of a person's ability to detect sounds.

Audiology

The audiogram reflects the response to sound as provided by the audiometer, an electroacoustic mechanism which is designed to produce accurate tones or speech at internationally standardized levels of frequency and intensity. Different categories or types of audiometers are commercially available; however, assessment of hearing should not be undertaken by an unskilled person. The American Speech and Hearing Association (ASHA), 1933 Old Georgetown Road, Washington, D.C., provides individuals and school districts with names and addresses of certified personnel and
centers capable of providing adequate professional services. Centers are evaluated and registered.

Purpose of Audiogram

Audiograms display the results of pure tone tests. These tests reflect a comparison of the integrity of the outer, middle and inner ear, and skilled audiologists can often determine the type and degree of loss based on the pure tone test results. Pure tone tests are referred to as air conduction tests and bone conduction tests. The common markings which are reflected on the transparencies are standardized internationally, therefore they can be interpreted from diagnostic center to diagnostic center.
In order to understand the most critical information on the audiogram, it is necessary to determine how well the ear performs for the frequencies which transmit the speech signal. It is common to think of the ear as capable of detecting frequencies of 20-20,000 Hz. However, audiologists are most concerned with the frequencies 250-4,000. This range includes most of the frequencies produced in conversational speech. A clear picture of the child's capacity to detect these frequencies provides the audiologist with important information. This means that although the average human ear can detect frequencies over a wide range, the information-bearing frequencies for speech are 250-4,000. Often, even this range is restricted to the frequencies 500, 1,000, and 2,000, for the critical speech range. The average decibel level for these three frequencies provides the most important information for the audiologist regarding candidacy for a hearing aid, ability to respond to conversational speech, ability to hear and therefore better monitor the sounds of the language (speech production).
Conductive Hearing Loss

Conductive Impairment

This graphic depiction of a conductive hearing loss provides the audiologist with information indicating the inner ear is not damaged. Any of several causative factors are possible: fluid in the middle ear, deterioration of the structures of the sound transmission system, trauma, hereditary disease. A child with this type of audiogram is referred to an otologist for medical treatment, drug therapy or surgery. The markings on the audiogram reveal that while the hearing levels measured by air conduction tests are not normal, those measured by bone conduction tests are normal. These differences (called the "air-bone gap") indicate middle ear problems.
The audiogram depicts hearing loss of a sensori-neural type. Both sets of markings coincide, indicating no differences between the functioning of the total hearing mechanism and the inner ear mechanism. Surgery or medication will not restore the hearing. The extent of the hearing loss is greater than that of the conductive type. More extensive tests are indicated, as well as psychological and educational assessment of the child's language abilities. Otological examination and extensive hearing aid evaluations should be performed. This audiogram, typical of a severely hearing impaired child, requires continued follow-up and referral. The notations of "diving arrows" indicate that no response was given on the part of the child, even with the audiometer at its maximum output (intensity) level.
The Decibel

Purpose: This transparency compares typical familiar sound levels with decibel levels. It is designed to help develop understanding of intensity levels, hearing loss, and amplification which is required by some hearing impaired persons in order to understand speech.

Noise Pollution

Frequently, the Environment Protection Agency, or some other local agency, will refer to noise pollution in terms of decibel levels. It is in this way, the average person begins to translate decibel levels and the psychological manifestations of loudness and noise.

Definitions

A decibel (1/10 of a bell) is a unit of measurement of the relative sound intensity. It is a logarithmic ratio of power or pressure and is expressed relative to an established reference. The chart on the transparency denotes common environmental sounds and their representative decibel levels. Individuals with impaired hearing, require amplification in order to hear some of the sounds around them. It is not unusual for hearing impaired children to have difficulty in different listening situations.

Audiograms

The information presented on the typical pure tone audiogram is basic and only reveals hearing sensitivity levels, but the problems of hearing impairment are quite complex, particularly when the hearing loss is severe.
one, the auditory only shows part of the person's ability to hear - the intensity of every which would be needed in order for that person to detect the presence of sound.

A major concern of professionals dealing with audition is prolonged exposure to sounds or noise which is so intense as to cause hearing loss. The federal government has established guidelines which, if followed, protect individuals from incurring hearing loss due to prolonged exposure to sounds of high intensity (Keller-Healey Act). Generally, prolonged exposure to sounds above 90dB in intensity can contribute to permanent hearing loss in certain frequencies. Children and adults should be aware of the dangers of prolonged exposure to noise. The implications for hearing-impaired children regarding continued exposure to high intensity levels are parallel to normal hearing children.
The Impact of Hearing Impairment
on the Psycho-Sociological, Academic
and Language Development of the Child

Purpose: This transparency compares degree of hearing loss with the possible psychological impact on the child. In addition, some guidelines for expected linguistic ability are related to the degree of loss.

Degree of Hearing Loss

Hearing loss, as measured in decibels, can be equated to probable difficulties in communication, psychological adjustment, and socialization patterns. The degree of hearing loss is typically interpreted as a scale of severity, from mild loss to profound loss. Although various scales of severity are available, the most commonly referred to has been prepared by Davis and Silverman, Hearing & Deafness.

<table>
<thead>
<tr>
<th>dB Loss</th>
<th>Level</th>
<th>Speech Reception Ability</th>
</tr>
</thead>
<tbody>
<tr>
<td>26-40</td>
<td>slight-mild</td>
<td>difficulty only with faint speech</td>
</tr>
<tr>
<td>50-55</td>
<td>moderate</td>
<td>frequent difficulty with normal speech</td>
</tr>
<tr>
<td>75-79</td>
<td>marked</td>
<td>frequent difficulty with loud speech</td>
</tr>
<tr>
<td>90-94</td>
<td>severe</td>
<td>restricted to amplified speech</td>
</tr>
<tr>
<td>95-99+</td>
<td>profound</td>
<td>little understanding with amplification</td>
</tr>
</tbody>
</table>

These ranges refer to hearing sensitivity as measured by pure tone audiometry. They refer only to one parameter of hearing - intensity.

All biochemical factors of hearing loss:

The impact of hearing loss can be related to degree of hear-
Individual differences are important. A variety of emotional responses are frequently associated with children with severe hearing impairment. Behaviors such as: feelings of inadequacy, anxiety in interpersonal relations, hyperactivity, depression and feelings of inferiority are referred to in the literature. The following descriptions have been developed by Helmer Myklebust (1964).

41-60 dB loss - This amount of loss generally affects the scanning and background functions of hearing. Conversation is difficult without amplification. Socialization is typically not affected adversely; however, levels of awareness and monitoring abilities can be disturbed.

61-85 dB loss - This degree of impairment imposes some difficulties with social intercourse. Since amplification is typically advised, foreground-background difficulties can occur. Conversation is usually restricted to one-to-one levels.

86-100 dB loss - When the loss is this marked, amplification is less satisfactory. Interpersonal/social contact can be impaired. There is a great reliance on tactile and visual stimulation. Frequently, socialization becomes more restricted to persons with similar hearing losses.

101 and above dB loss - The hearing impaired child must rely on visual and tactile stimulation in order to maintain his/her homeostatic equilibrium. Socialization is typically restricted to other children with similar losses. Amplification may only be useful for focusing attention to loud environmental sounds.

Any amount and hearing loss

The degree of loss and the psychosocial impact of the extent of the loss are somewhat related to the age at which the child suffered
the hearing impairment. Since the acquisition of language is the primary difficulty encountered by hearing impaired children, the age of onset of the hearing impairment is an important factor. Typically, two divisions are referred to: hearing impairment acquired prior to the acquisition of language (pre-lingual deafness), and hearing impairment acquired after the acquisition of language (post-lingual deafness).

Pre-lingual Hearing Loss

Children who suffer congenital difficulties which cause hearing impairment appear to mature with the characteristics of handicappedness. Isolation, emotional adjustment problems, etc. are frequently mentioned as factors associated with pre-lingual hearing impairment. However, the most important and consistent problems relate to the difficulty in the acquisition of language which is adequate for both socialization and vocational placement. The pre-lingually deafened child spends the greater part of his academic life striving to acquire normal language facility.

Post-lingual Hearing Loss

Children who are designated as post-lingually deafened appear to be able to retain effectively the structure of language. These children typically become leaders of the deaf community, do not suffer underemployment, appear to be psychologically "adjusted" to their hearing handicap and generally perform activities of daily living with ease. Educationally, they typically respond well to speech therapy, speechreading and auditory training techniques.

It appears that the formative years of language acquisition (0-3 years) play a critical role for the child with a hearing impairment. Although the results are not by no means universal, the age of onset of the hearing
loss plays a vital role in determining both the educational and psychological adjustment of the child with a hearing impairment.
Hearing Aids

Purpose: The purpose of this transparency is to help the teacher understand the parts and functions of typical types of hearing aids. Important aspects of hearing aids are emphasized in terms of teacher needs rather than electroacoustic design.

Parts of the Aid

A hearing aid functions like a telephone. It makes sound louder by picking up sounds in the environment, amplifying the sounds, and directing the sounds to the ear. Most hearing aids worn by hearing impaired children today are electronic in design. Although the external cases, brand names, and frequency responses may differ, all hearing aids consist of three basic parts. These are:

1. A microphone - which converts acoustic sound into electrical energy
2. An amplifier - which increases the strength of the electrical signal
3. A receiver, or earphone - which converts the amplified signal back into acoustic energy

The entire energy system is powered by a battery.

Types of Hearing Aids

Most people think of hearing aids as portable, and worn on part of the body. Personal hearing aids are of several types:

1. Monaural body (one aid) - worn on the chest, typically in a carrier called a harness
2. Binaural body (two complete aids, one for each ear) - worn in a
c. **binaural behind-the-ear** - a small, compact hearing aid which fits behind the ear, the earphone is connected by a small cord.

d. **binaural behind-the-ear** - two complete hearing aids, worn behind the ears or designed to be worn within the frame of eyeglasses.

Other combinations exist, however, children with severe hearing impairment, typically are fitted with the above types of hearing aids.

**Limitations of Hearing Aids**

1. **Lack of Corrective Ability**

   Hearing aids are not similar to eyeglasses in their corrective capacities. No hearing aid can completely compensate as eyeglasses usually can. The function of the hearing aid is to make sound louder, (increase the intensity), rather than accommodate for the variety of hearing losses. This means, hearing aids can only compensate rather than correct cochlear deficiencies.

2. **Other Auditory Problems**

   Sensori-neural hearing losses (the type most associated with children with severe hearing impairment), is typically accompanied by concomitant problems beyond the dB loss. Some of these problems are: head noises, abnormal loudness sensitivity, reduced auditory discrimination ability for perception of speech frequencies, distortion, and sound localization problems. While audiologic centers endeavor to prescribe a hearing aid which is best suited to the individual, total compensation for the variety of problems associated with hearing impairment is not always possible. Furthermore, the design of hearing aids has been restricted by the factors of cost, size and durability.
3. **Lack of Selectivity of Signal**

A further complication is imposed by the fact that the hearing aid is responsive to all sounds in the environment. Thus, all sounds are amplified, or made louder. Therefore, the child wearing the aid receives the background and foreground sounds with relatively equal amplification depending on the fidelity characteristics of the unit. Hence, the electric fan noise is made equally loud as the speech of the teacher and may "mask" it out. Normally people perceptually tune out to the unwanted noises, but many children have difficulty in discriminating between the important signals they hear from the less important background sounds, particularly when amplified.

4. **Upper Limits of Amplification**

Another serious limitation concerns those children whose hearing impairment is so severe as to be unable to receive much useful information from the hearing aid. Since the human ear has an upper tolerance level for pain, as well as susceptibility to damage, hearing aids cannot be constructed so as to permit intolerably loud sounds. This design feature is referred to as volume output control. Continued exposure to loud sounds or speech beyond the tolerance thresholds constrains the design of hearing aids. Therefore, severely hearing impaired children cannot be fitted with hearing aids which present speech or sound at levels beyond the threshold for pain.

**Problems with Hearing Aids**

The classroom teacher should be aware of common problems which arise with hearing aids and should be able to provide assistance to the hearing impaired child in the following ways:
1. since hearing aids are energized by batteries, the teacher should keep extra batteries, provided by the parent. In order to do this, the teacher should listen to the aid daily and determine whether the battery is functional.

2. Squal - the high pitched squealing noise which hearing aids frequently emit, is due to the receiver being placed too close to the microphone, excessive volume or a loose ear mold. The hearing aid is not functioning maximally during these squealing periods, and the teacher should be able to help the child adjust the aid in the harness or shirt pocket.

3. If the parents do not report that their child is scheduled for a recheck regarding the appropriateness of the aid, the teacher should suggest that this be scheduled. The classroom teacher is most capable of perceiving cues that the child is not functioning typically, not responding as s/he usually does, or having undue difficulty. These perceptions should warrant rechecks by the audiologic center, hearing clinician or other responsible agencies. It is not unusual for a child to periodically reject the use of hearing aids. Teachers may wish to communicate directly with the parents and/or audiology center regarding suitable methods for helping the child during these times.

4. Other parts of the hearing aid requiring the teacher's attention are the cord, the ear mold and the case. Inspection of these parts can enable the child to make maximum use of the design of the aid.
Suggestions for the Trainer

The following problems may be discussed within the context of each individual school district. A major objective is to enhance knowledge about hearing impairment and its effects upon learning and development.

Suggestions for large group discussion:

1. In what context is hearing impairment similar to or different from the other handicaps children within the school district possess? How does the psychological impact of hearing loss affect general principles of child development?

Suggestions for small group discussion:

1. How can individual members of the faculty provide the most adequate input to classroom teachers regarding hearing impairment?
2. What techniques are available for the individual classroom teacher to broaden his/her knowledge regarding hearing impairment?
3. What community resources are available to the classroom teacher, the speech therapist, and the administration of the district which can enhance the general understanding of hearing impairment?
References

Audio Cassette Tape Recording

The materials on this tape recording are divided into three sections:

1. Samples of the speech of children with severe hearing loss.
2. Listening simulation of the audiogram configurations of children with severe hearing loss.
3. Listening simulation of the amplification of a high quality hearing aid, with and without background noise. These materials are included in order that classroom teachers who are unfamiliar with the problems of speech production of the hearing impaired, or speech perception by the hearing impaired, can have some introductory samples as models. In addition to these materials, a number of commercially available materials are recommended. "Getting Through," a disc recording available from Zenith Industries is an expanded explanation of hearing and hearing loss. Dr. Philip Bellfleur has produced a tape recording of hearing impaired children entitled, "How They Speak." Dr. Bellfleur's materials are available through the Northeast Regional Media Center for the Deaf. Several hearing aid companies also have materials which are available at very reasonable cost.

Section 1

The materials included in this section represent three different hearing impaired children reading sentences representing everyday American speech. The children represent average speech production ability of severely hearing impaired children. The children are between the ages of 11 and 13 years of age and have been exposed to speech therapy, auditory training and other remedial programs.
Sample I

1. Ken played with his puppy this afternoon.
2. Bill loves his baby sister very much.

Sample II

1. Jack went home on the train in June.
2. Betty saw her friend on the bus last week.

Sample III

1. We have ice cream every Wednesday.
2. Susan will go home by plane in November.
Section II

The following samples are included in order to simulate the way in which hearing impaired children perceive male and female speech without the use of a hearing aid. Several degrees of hearing loss are represented. The sentences were prepared by the Central Institute for the Deaf, St. Louis, Mo., to represent everyday American speech.

Condition I

Hearing loss with absence of thresholds above 2000 cycles.
1. Why should I get up so early in the morning?
2. Do you want an egg for breakfast?

Condition II

Hearing loss with absence of thresholds above 1000 cycles.
1. Fathers spend more time with their children than they used to.
2. If you don't want these old magazines, throw them out.

Condition III

Hearing loss with absence of thresholds above 500 cycles.
1. People ought to see a doctor once a year.
2. My brother's in town for a short while on business.

Section III

The following samples of speech are included to simulate the way in which a child with a severe hearing loss who wears a hearing aid is able to perceive male and female speech. (A band pass filter which permits 280-3000 cycles per second was used.)

1. I don't know what's wrong with the car, but it won't start.
2. I don't think I'll have any dessert.
3. Where can I find a place to park?

4. Do you have change for a five dollar bill?

The following samples are included to simulate the way in which hearing impaired children perceive male and female speech with the use of a hearing aid when typical classroom noise is added to the background. (The signal to noise ratio is 5 dB, indicating the speech signal is 5 dB more intense than the classroom noise background.)

1. I hate driving at night.

2. I don't want to go to the movies tonight.

3. Be careful not to break your glasses!

4. Don't let the dog out of the house!
Schools for the Deaf
SCROOLS FOR THE DEAF

Introduction

The purpose of this section is to describe some of the training methods most commonly used in schools for the hearing impaired. It is necessary for the teacher who is to work with a hearing impaired student to become familiar with some of these techniques in order to understand the prior academic experience of the hearing impaired student.

Goals of Education and Vocational Education

The goals of education of the hearing impaired are to guide the student into a self-adjusted, well-integrated, happy and fulfilling life. Education begins the moment the child's hearing impairment is diagnosed. Early fundamental training in speech, speechreading, auditory training, communication skills and behavior patterns enables the hearing impaired child to make the fullest use of his/her capacities. In residential schools for the deaf, provisions for vocational training are an integral part of the curriculum.

Teaching Techniques

To accomplish these goals the educators of the hearing impaired have developed special training techniques for teaching the students. These techniques are structured and definite. Therefore, when the student is integrated into the hearing classroom, s/he will have knowledge which has been taught systematically and sequentially. This student may have an adjustment period whereby s/he will be trying to sort all of his/her information into some workable order to himself/herself.
Observations

It is important for the receiving teacher to visit the hearing impaired student's classroom to get an overview of "the day in school".

Grade Placement

The receiving teacher should observe the student's grade placement, noting that what is called Level I in the hearing impaired school may not be equal to First Grade in regular school.

Class Groupings

The receiving teacher should observe the types of class groupings, noting that most groups are rarely more than seven or eight, except for group sports, clubs and special activities.

Textbooks

The receiving teacher should observe the types of textbooks being used, noting that many of them are teacher-made from experiences that the class has enjoyed through field trips, experiments, and units of study.

Sensory

Schools for the deaf rely on good visual materials as a teaching supplement. Often all of these supplies are located in a separate room in the school and can be utilized by all of the staff.

Teacher-Teacher Interaction

A teacher of the hearing impaired will have formal and informal learning situations. The receiving teacher should observe the methods she employs.

The purpose of this section is to present an overview of the techniques.
used within the residential school, day schools and day classes. The re-
ral teacher must be aware that differences occur within each school and
school rely on the personnel to provide specific information to be
used in program planning for the integrated hearing impaired child.
Methods of Communication

Purpose: The purpose of this transparency is to depict the differences in the methods of communication used by the hearing impaired. There are two major philosophical approaches: Manual/Aural and Oral/Aural.

Introduction

The most significant problem in the education of the hearing impaired is that of finding effective ways of teaching language and communication. The normal hearing child acquires the language system of his/her culture through auditory and visual sensory modalities. S/he acquires a language system which is spontaneous, fluent, and adequate for communication by the age of 3. The hearing impaired does not acquire language in the same manner. A specific structured teaching system must be instituted to assist in his/her developing communication skills. Basic to all methods of communication used by the hearing impaired is the maximum use of residual hearing.

Manual Methods

An estimated high percentage of deaf children (Furth, 1973) are not able to succeed in acquiring communication skills through speech and speech-reading alone. Therefore, manual communication (American Sign Language, Fingerspelling) is used as a means to establish functional communication with many deaf children. Those educators of the deaf who use manual communication with deaf students provide an effective language for children. The manual approach strives for early language and personality development.
facilitate the development of communication before the student learns to speak or read.

American Sign Language

The American Sign Language consists of a basic concept vocabulary employing both signs and fingerspelling. In addition, it relies heavily on face and body expressions for meanings. It has its own language rules which are sometimes incompatible with English grammar. This is the language which is well established in the deaf community. It should be noted that hearing impaired children of hearing impaired parents become proficient in American Signs very early in life.

Four Other Manual Forms

There are four similar forms of communication based on the American Sign Language. These systems employ word order or syntax compatible with English grammar:

1. "Signed English" uses signs and fingerspelling according to basic English syntax.
2. "Manual English" and
3. "SEE" (Seeing Essential English) have added morphemes or word parts which add meaning, such as word endings, verb tenses, prefixes and suffixes.
4. "Visible English" is a linguistically based system which uses the American Sign Language vocabulary. A more elaborate vocabulary of morphemes is added which take on a new meaning according to the context in which they are used.
Rochester Method

The Rochester Method uses speech, speechreading, writing and reading as means of communication between students and instructor and adds finger-spelling in English syntax as it is spoken. This method advocates that hearing impaired must see English to learn English.

Simultaneous Method

The Simultaneous Method is the addition of speech to any form of sign language. Just by adding spoken language to the manual presentation, the sentence flow will follow more acceptable English order.

Total Communication

Total Communication is not just adding spoken language to manual communication. It recognizes the hierarchy of learning to communicate from the use of the most primitive to the more complex and sophisticated symbol systems involving all sensory modalities, visual and auditory. It urges the wise use of hearing amplification and of speech. It also goes along with use of the child's natural gestures, pantomimes and homemade signs in order to encourage the spontaneous expressions of the child. In total communication the child expresses ideas primarily in sign language. These non-artificial instruments are recognized as normal means of communication for a person whose hearing is not functionally intact. Sign language is taught rather than used to encourage spontaneous communication for each child learned according to their needs and capabilities. Special emphasis is placed on the involvement of the family and the school to provide a consistent living environment in which the hearing impaired children can thrive.
Many hearing impaired adults agree that the most natural and effective way to make themselves understood is by the simultaneous use of writing and speaking.

**Cued Speech**

Cued speech is a phonetic system in which one (either) hand is used to supplement (never duplicate or replace) the information on the lips in order to make the spoken message clearly understood by the speechreader. Cued speech recognizes that the lips alone do not accurately identify many spoken sounds. It is done entirely according to the pronunciation, not spelling.

**Verbotonal Method**

A technologically based method such as the Verbotonal Method transmits visual cues associated with the sounds and rhythms of speech through the visual neural system other than the auditory channels. Special electronic equipment is employed to transmit within whatever hearing range is available to the child, along with a system of teaching body tension and relaxation in order with speech.

**Sign Methods**

A signed symbol system successfully for communication it would be

...
Oral/Aural Method (Definition)

The oral method as defined at the Clarke School for the Deaf (Northampton, Mass.) is the use of speech and speechreading in communication at all times without any use of manual communication. The method advocates the ability of the hearing impaired to communicate with the world around them. The oral approach utilizes the incomplete information on the lips and as much auditory information as the student is capable of receiving, and emphasizes speech and speechreading. Reading and writing are the primary means of teaching language.

There are three techniques for oral training:

1. "Auditory stimulation" is the most useful for young children in pre-school situations or at home. Between six and twelve months of age the child is fitted with a hearing aid. She is exposed to sounds and spoken language at every opportunity approximately what happens to normal hearing children when they are learning to speak, but stimulation must be carried out more deliberately and intensely with the hearing impaired. A parent education pre-school program such as the John Tracy Clinic, Los Angeles and the Bill Wilkerson Clinic in Nashville, Tennessee offer free correspondence and courses over this approach and have on-campus facilities for utilization of this method.

2. "Multi-sensory/syllable-unit method" uses sight and touch to teach sounds. The child watches the teacher make the sound, or she feels it being made by putting his hand on his/her face. Then the student tries to reproduce the sound by making the same vibrations in breath and tongue. "Units" are the basic units taught.
3. "Language associated-element method" teaches the student the smallest components of speech - phonemes. Then s/he learns to associate these with language.

The parents and the teachers begin to make optimum use of the student's ability to understand speech in order to use it. The parents and teachers begin a special auditory training program to develop any residual hearing which the student may have. They also employ methods designed to develop speech that is as normal as possible. Speech is presented in whole words, phrases and sentences that express ideas. Parents and teachers talk to the student about everything that is a part of his daily life. The student learns to watch speakers for cues and use voice in a certain way, thereby obtaining a more satisfying and prompt response.
Purpose: The purpose of this transparency is to depict the basic methods of teaching language to the hearing impaired student in schools for the deaf.

The language element must be given priority over all other academic or non-academic areas in the training of the hearing impaired. Language is the core of the curriculum in all subjects, and is emphasized in preschool programs. Creative activities are a means of expressing a language experience. Speechreading is the tool for receiving spoken language. Sense training (as a means of expression and of developing the ability to concentrate, observe, and think) is a language experience. Auditory training is a procedure for the development of better voice quality, and a broader concept of spoken language. It develops a consciousness of language in the environment. Proficiency in reading is based on language experience, and reading itself is a language experience. Language and every aspect of the child's development are inter-related. Educators of the deaf have devised special methods and techniques appropriate for teaching language to the hearing impaired. These special methods are introduced in early preschool and continued until formal education is completed.

Without adequate reading proficiency, any child is handicapped in the process of acquiring knowledge in any field. But, even a little knowledge, who has an understanding of the language or the ability to read, will learn a lot. It is taken for granted that hearing is an important part of language. However, a hearing impaired child cannot acquire the essential elements of language acquisition. The next slide will illustrate...
of teaching language are described below:

**The Fitzgerald Key**

The Fitzgerald Key is the most commonly used method of teaching language in schools for the deaf. This method furnishes visual patterns for correct word order. It also provides a set of symbols that make it possible to clarify constructions. Children are taught to "plug into" the key. Before the key is used, the students classify the words they have acquired through vocabulary study in a chart.

1. Who
2. What
3. How many
4. Where
5. Adjectives and verbs (are grouped under their respective symbols)

The key is developed with the children as new language principles are considered. Eventually word order and modifying elements of sentences are used through the use of this visual aid.

The symbols that are commonly used within the chart are:
Who  How many  What color  What
Linda  has  a  blue  dress.
Jerry  likes  candy.

The Natural Method

The natural method (Groht) is based on the development of natural language form, the situation itself, direct experience and usage. The student is expected to want to talk, to like to talk, and to try to talk. Speechreading is started at once in the home and in the preschool. It is felt that it is never too early in the child's life to begin speechreading skills. The teacher creates a stimulus environment which involves the child with his surroundings. The language which is taught emerges from and is dictated by the activity. The young hearing impaired student should think of experiences in terms of language and should be able, with the help of the teacher, to tell the class what was done that was funny, or what ate, or what breakfast, or found, bought, or discovered. As a group the students will construct a news story, or an experience story.

The student tells the experience the teacher or the student writes on the blackboard, overhead projector, or on an experience chart board in the addition of illustrations. The very young class starts by recognizing the name and a few other words. Eventually the whole sentence will be written, the objective being that the children will be reading what they wrote now. This "class news" is easily understood because the children are directly involved in the experience. Group items, as in the example below, can quickly be individualized and turned into a very personal story for each child.
Four children brought a black cat to our room.

We gave it milk.

We all held it.

We liked it.

Linguistic Approaches

The term linguistics refers to the scientific study of language. Like other fields of study, linguistics can be divided into many areas. Educators of the hearing impaired are interested in logical generalizations, complete and self-consistent explanations for the way language operates. In principle, a language program aims to teach the rules of transformational grammar.

As much as possible the child is allowed to make his/her own discoveries.

Once the discoveries are made, intensive drill will be a continuous reinforcement through writing experiences. The scope and sequence of the language children normally learn from ages 2 to 7 should be the basic part of the program for the hearing impaired. This is a step by step process where the student has mastered enough concepts, before he is ready to move on to the next step. The information provided by each sentence pattern.

The Daily Curriculum

Following the Rhode Island School for the Deaf, Inc., and

a similar program in New York and several other clay bases,

commonly used a transformational linguistic.

It is especially valuable vocabulary exposure.
context of ideas and concepts, s/he is presented with different patterns of sentence constructions.

Examples of patterns:

Subject followed by an intransitive verb.

Sheila fell.

The girl cried.

Joe barked.

Extended sentences using where and when.

We went to the store.

It rained yesterday.

The boys ran in the gym last night.

MIVR (Mutually Interacting Visual Response)

The mutually interacting visual response system (MIVR) or, its more complete counterpart, the optimum interaction learning laboratory (OILL), permits instruction on entirely new teaching and learning procedures based on correct learning theory, programmed learning concepts behavioral objectives, instructional management and performance based education.

It consists of a room (or laboratory) of individual overhead projectors in which a group of up to twelve students are prompted to actively respond in simultaneous manner to a series of teacher presentations.

The teacher writes, spells, solves, constructs, draws, etc., as the students write on their own overhead projectors.

These are the walls behind them. The MIVR offers the teacher a complete teaching tool kit and other hardware such as slide projectors,

tape recorders. In some cases it is equipped with a

medium for direct viewing, control light, student

100
In many ways the NIVR system capitalizes on the characteristics of programmed learning with its emphasis on breaking teaching down into many brief steps and exposing each step for student perceptions. It also provides a situation requiring observable student responses. The student and the teacher have immediate knowledge of success or failure on any set task. Immediate reinforcement techniques are built in and remediation in any area can be quickly supplied. When skill in using the laboratory is developed, nearly every behavior of almost every student can be positively reinforced.
Introduction

Intelligible speech production by hearing impaired students is a formidable task. In most cases the articulatory mechanisms of the hearing impaired student are intact and functioning. However, when the child’s hearing is impaired, other means must be implemented so that s/he can imitate the sounds s/he cannot hear. Consequently, speech development of the hearing impaired does not precisely follow the natural process of normal hearing children.

Speech Problems

The speech of the hearing impaired has been studied in depth. Nenninger and Nenninger (1942) have investigated the intelligibility of speech of the hearing impaired and have described some general and specific errors in the production of "deaf speech".

Critical errors in the production of vowels included:

1. Substitution of one vowel for another
2. Inversion of vowels
3. Shortening of the vowels
4. Inversion of the initials and finals
5. Inversion of the initial and final consonants
6. Omission of vowels
7. Lengthening of vowels
8. Insertion of vowels
9. Inversion of vowels
10. Lengthening of consonants

Critical errors were classified:
sounds. (p/b, t/d, k/g)

1. The substitution of one sound for another: sh for s, and w for r.

2. Inappropriate nasalization and denasalization.

3. The misarticulation of consonant blends: (ks, br, fl)

4. The omission of consonants at the end of a word: (as daw for dog, and coo for coat.)

5. The omission of consonants at the beginning of a syllable.

Phrasing:

speech is apt to be very slow and labored so that it loses its characteristic pattern.

Rhythm:

Incorrect rhythm in speech results in distortion of individual words and the context of the entire sentence.

Breathing:

The hearing impaired child often has irregular breathing patterns and therefore consumes considerably more breath while speaking. The nature of an excessive amount of breath on single sounds tends to lengthen the length of phrases and requires additional respiration.

Pitch and loudness:

A hearing impaired student must learn to monitor

pitch and be able to control the pitch and loudness of

voice so that peculiar inflectional patterns are avoided.

Using voice: too quiet, harsh or breathy is typical.
Methods

There are several methods used in teaching speech to the hearing impaired.

1. Phonetic-Kinesthetic
   The speech teacher relies upon phonetic placement and kinesthetic feedback.

2. Technical aids
   Visual reinforcements of articulations are made through the use of computers, oscilloscopes or other patterning devices.

3. Dictionary study
   This method utilizes the diacritical markings to emphasize stress and word patterning.
The purpose of this transparency is to depict aural rehabilitation problems. The hearing impaired require special consideration regarding maximal use of residual hearing.

Definition

This concept refers to technical or therapeutic techniques which are designed to enhance the use of residual hearing for hearing impaired persons. The literature confirms that totally unusable hearing is a rather rare phenomenon. Advances in the design of hearing aids and the design of auditory training units have encouraged professionals who work with severely hearing impaired children to develop techniques which could maximize the use of residual and/or impaired auditory processes. Schools for the deaf, day schools, or any programs typically include a core of aural rehabilitation programs within the structure of the services available to hearing impaired children. Typically these services consist of: auditory training, speechreading, speech therapy, and technological alterations of the learning environment.

Auditory Training

Personal hearing aids have fidelity limitations due to size and cost. Auditory training aids (auditory training units) can provide additional frequency response patterns which are not replicated in most personal hearing aids. Many commercial units are specifically designed for this purpose. These units or combinations of units permit the hearing impaired child to receive the speech (signal) of the teacher and/or the student better than do individual hearing aids. Schools or programs typically provide this method of instructional amplification.
their students. The individual child receives academic instruction while "listening" (earphones, earplugs) to the master unit within the classroom. The teacher wears a microphone which provides maximum efficiency and reduces distortion and external noise. Most schools for the deaf provide equipment for classrooms. Hearing impaired children are therefore provided with the most advanced technological equipment through which they can receive speech, instead of relying upon individual hearing aids.

**Speechreading**

Although language is redundant and visual, the vowel and consonant notation of English is relatively difficult to perceive without audition. Only 14-20% of the sounds of English are clearly visual or discernible in isolation alone. These figures fluctuate since individual speech varies in pitch, accuracy and discrete production of sounds and word patterns. The hearing impaired child is typically aided in learning to read speech patterns visually (words and thoughts) by instruction in attending to the lip movements of the speaker. Several instructional methods of teaching speechreading have been developed. At present, a synthetic rather than a phonetic approach is used in the teaching of speechreading. The hearing impaired child is taught to interpret lip movements, gestures, body movements, etc. Finally, through practice and context, s/he can determine that information.

Research on the ability of hearing impaired children to read speech easily is rather unspecific. It is difficult to predict a child's display skill in speechreading ability and s/he may not develop this skill. Speech therapists can provide assistance to the child so that
his for speechreading skills.

The classroom teacher should be aware of imposing communication limitations when dependence is solely on speechreading techniques. Visual light, individual speech production differences, consonant confusions, contextual cue, distance, size of group involvement and numerous other factors effect a child's ability to speechread effectively. Total dependence upon speechreading ability produces strain visually and physically for the child. Fatigue and mental difficulties are not unusual psycho-physiological results of extended reliance on speechreading for information processing. Several ideas can contribute to providing the child with a more acceptable climate in which speechreading techniques can be employed:

1. Distance (4-6 feet from the speaker)
2. Clear but unaccented articulation
3. Good visual light on the face of the speaker
4. Natural gestures and expression can be an asset to the child who is dependent upon speechreading.

Here, speechreading clearly has limitations for the classroom setting. As the teacher is mobile, conversation is not always a one-to-one relationship and may be less than ideal. Speechreading is most effective in a well-structured environment.

Therapy

A speech therapist who is specially trained in hearing impairment can work with the hearing impaired child in both speech production and speech reception. Various methods are used by different schools and therapists to ensure the hearing impaired child's understanding of aural rehabilitation. Some therapists may provide special equipment for use in auditory training.
Communication and language development. Individual schools or programs assess different components of aural rehabilitation for the hearing impaired. The speech therapist in a program designed specifically for the hearing impaired typically relates speech production and reception to a team perspective of language facility.

Technological Alterations

Schools for the deaf or other programs designed specifically for the hearing impaired provide a variety of technological devices which can enhance and maximize residual hearing. In addition to training units, induction loop systems, F.M. amplifiers and microphones, many schools provide audio-visual technology (hardware) which reduces extraneous noise, amplifies the visual elements of the teaching curriculum and generally enables the hearing impaired child to participate in an educational environment which no longer rely on the child being "plugged in" to a desk model unit. These advances have altered the climate of classrooms for the hearing impaired and the commercially available units can provide flexibility in scheduling and placement. A variety of equipment is available which varies in both content and design. Individual school districts faced with the prospect of retrofitting their physical plant to the hearing impaired child should investigate the numbers of systems currently available. The induction loop, which is currently one of the most widely used systems limits the teaching environment to a particular classroom. The new FM units bring added "shortcuts" but also mobility and flexibility beyond the constraints of the looped unit...
Purpose: The purpose of this transparency is to depict some of the important social behaviors that are taught by direct experience to the hearing impaired student.

Rationale for Socialization Curriculum

Parents and the residential schools for the deaf have designed programs to deal specifically with the personal and social adjustments of hearing impaired students. Students living in residential settings are often unable to return home every weekend due to long travel distances. It therefore becomes necessary for the schools to help the students bridge the gaps in social and behavioral maturity. Parents and teacher participation in the student's total development has reduced many of the differences that have set the hearing impaired child apart. Interpersonal adjustment of the hearing impaired often depends upon adequate means of communicating and understanding the abstract concepts as love, friendship, hate, dislike, sportsmanship and patriotism. In order for the student to learn that there is more than one answer to some problems, the schools share in helping the student develop a social behavioral pattern. Students need stimulating material to teach them to use their own active minds to see a situation through, and to think for themselves. The student must be lead from "taking turns" at age four, into "sportsmanship" at fourteen. He must be allowed to go see the school nurse at age six, buy a bus ticket and travel alone at nine or ten, in order to feel secure traveling in Europe at eighteen. The teacher must not isolate the child from reality. S/he must be given every tool...
Specific Techniques

Teachers must be alert to finding ways of teaching the relations between personal and events. Frequently the event as seen is not the whole picture and the teacher must keep in mind constantly that usually the student sees only the event. An exciting incident on television could prove disastrous when the student tries it the next day in school.

Abstract concepts place barriers to understanding certain religious and situations. The student must be taught that although "lying" is wrong, there are times when kindness outweighs truthfulness. "You look old," most is a statement that should be left unsaid. Honesty or perhaps bluntness can be most unkind and is one fragment of the student's training that is important. The student must not only know right from wrong, but how to analyze the inevitable choice between two wrongs and to choose the lesser.

Independence

To prepare the student for independence the educator starts early in guiding the student to make decisions for himself. If it looks like rain, the student decide to take his/her umbrella to lunch or take a chance on wearing it in soggy clothes for the rest of the day. What will be the outcome? For the grocery/variety store with the money that s/he may have earned through a behavioral modification contract during the week? Will it be a treat, candy, a food, or a small toy?

Encourage things in their proper perspective, to tell a funny story, to care and to respond pleasantly when the joke is on you; also to under
the category of good humor. There are the occasions when the teacher sets
up an environment where appropriate responses can be taught just as the
language that is needed for certain occasions is taught. Greetings,
responses to greetings, expressions of interest in what others are saying,
"ice breakers" at parties, how to be a gracious house guest, what to say
when given a prize or gift, what to say to the clerk, the bus driver, paper
boy, school nurse, librarian or any of the people with whom the student comes
into contact are just as important to teach as is humility through self
confidence.

Manners

Even as early as preschool, a heavy emphasis is placed on good table manners.
The correct use of the napkin, fork, knife and straw are almost as important
in his/her mealtime experience as being able to match the foods to a picture
chart or to say the names of the foods. Good manners are a part of the
nursery school curriculum just as ordering from a menu, quick tabulation of
prices to see if the pocketbook will support the stomach and proper tipping
is a part of the adolescent life.

Responsibility

Sharing and sharing of responsibilities is another area that starts
early in the student's life. Most classrooms have plants and animals that
need lots of care and attention. Love and care of plant and animal life
is a natural way to teach sharing. The nursery school child may hold the
kitten too tightly around the neck. The child will probably not be able
to hear the kitten's cry. The older students are often closely supervised
not only to teach sharing responsibilities in other creatures.
maintaining a fair student government. Elections are held, campaign speeches are made, buttons passed out, literature circulated and votes cast. All of this is done to prepare the young adult for the first day at the polls. The student is aware of the personal responsibility of citizenship and also learns the mechanics of marking the ballot or pulling the correct lever.
The following questions may be discussed in context of each individual school situation. A major objective is to provide a workshop atmosphere that will generate problem solving discussion.

1. How can the classroom teacher lend support to a social and behavioral curriculum?
   a) How can the classroom teacher help the student in decision making?
   b) How can the classroom teacher help the student with social skills?

2. Why is there a philosophical dichotomy between manual communication and oral communication?

3. How can the classroom teacher most effectively utilize the speech therapist concerning specific speech problems of the hearing impaired student?

4. Can comparisons be made between the methods for teaching language arts in schools for the deaf and our language arts curriculum?

5. Develop a check list for the receiving teacher to take when s/he visits the school for the hearing impaired.

6. What changes can be expected from the hearing impaired student who has attended a residential setting?

Public School Needs
PUBLIC SCHOOL NEEDS

Introduction

The successful adjustment of a hearing impaired child to a mainstreamed classroom is dependent on many factors. One important factor is the number of resources available within the school. The staff should include competent, qualified people who can provide for the specialized needs of hearing impaired children. The school should have the necessary facilities to accommodate these children and materials to provide adequate instruction.

Another factor influencing the success of a hearing impaired child in the new environment is the flexibility of the school curriculum. Language deficiencies attributed to hearing impairment will necessitate an individualized approach to instruction. Alternative levels of integration should exist to permit individualization for each hearing impaired child. In addition to special academic requirements, there will be a need to individualize goals for effective learning and social development.

The attitudes of relevant people are a third influential factor. Some degree of enthusiasm and commitment should be felt by the teacher who is to receive a hearing impaired child. Likewise, it is helpful if the child's parents feel enthusiastic about the project, show a continuous interest in the progress of their child, and support the school's effort. The people of the community, too, can have an impact on the program's success by offering assistance and support.
The task of providing an education which meets the special needs of hearing impaired children is a difficult challenge. However, if these factors are addressed, i.e., adequate resources are available, the school curriculum and staff are flexible and can provide alternative programs, and if the attitudes of participants are positive, the chances of success are greatly enhanced.

This section has been written with the classroom teacher in mind. Its purpose is to offer assistance and specific suggestions in the following areas:

1. Ways to develop responsibility
2. Ways to foster communication between hearing impaired and normal hearing children
3. Ways to understand the hearing impaired child's communication
4. The teacher's role in respect to ancillary personnel
5. General curriculum considerations
6. Specific considerations for the language arts and math curriculum
7. The use of media
8. The classroom's physical environment
9. The classroom's educational environment
The Teacher's Role

Purpose: The purpose of this transparency is to depict the importance of the teacher's role in the hearing impaired child's successful adjustment to a new learning environment.

The teacher is an important factor in the successful adjustment of a hearing impaired child to a mainstreamed classroom. His/her patience and understanding should provide a comfortable, secure learning environment. S/he should become aware of the child's individual needs, then make the necessary modifications in the classroom and provide additional help and support. It is the attitude and behavior of the teacher which sets the standard for the other children and adults.
Overlay #1 Developing Responsibility

Purpose: The purpose of this transparency is to give the teacher specific suggestions which help to develop a sense of responsibility in hearing impaired children.

Children with hearing impairments can be encouraged to participate responsibly and need not be overprotected. Here are some specific ways the teacher can work toward this goal:

1. Make sure the hearing impaired child is looking at you before you begin speaking.
2. Ask questions periodically to see that the hearing impaired child is comprehending what you are saying.
3. Provide praise and approval for student responses as they occur. Do not ignore any attempt to communicate by the hearing impaired child.
4. Encourage the hearing impaired child to ask questions when s/he does not understand. You may need to teach the child how to ask questions.
5. Assign a buddy to help the hearing impaired child by interpreting directions, answering questions and taking notes.
6. Encourage good study habits at home and in school.
7. Encourage the hearing impaired child to participate in class discussions.
8. Encourage good use of oral and written language.
9. Individualize assignments so that they can be successfully completed by the child. The use of contracts, (agreements made between the teacher and child as to what the child will do to learn) is a way of individualizing assignments without causing the child to feel "special". The child should be held accountable for assignments. The use of contracts helps to instill a sense of commitment in the child.

10. Expect the hearing impaired child to obey the rules which govern the classroom. Giving preferential treatment to the child would cause resentment by peers and would not prepare the child for situations outside of school.

11. Encourage the child to pursue interests through extracurricular activities.
Purpose: The purpose of this transparency is to give the teacher specific guidelines for developing and encouraging interaction between hearing impaired children and other children.

The teacher cannot assume that the hearing impaired child is going to seek out ways of interacting with other children, nor that other children are going to make successful attempts at including the hearing impaired child in their activities and relationships. To establish friendships will require repeated efforts on the part of both the hearing impaired child and the other children. The following suggestions should assist the teacher in encouraging natural, comfortable relationships:

1. Provide learning activities in the classroom which require group interaction. Small group work is facilitated through flexible seating arrangements made by moving desks, using chairs, or sitting around tables.

2. Encourage the hearing impaired child to participate in extracurricular activities, especially those which are attractive to children such as baseball, drama, music, etc. The interest range of hearing impaired children is the same as other children's.

3. Help build self-confidence in the hearing impaired child by reinforcing the successful attempts s/he makes in activities. Help build a positive self-concept by recognizing those activities s/he does well. A child who feels good about himself/herself is more apt to attempt relating to others.
4. Observe the hearing impaired child's interrelationships in both formal and informal settings. If the hearing impaired child is having difficulties, diagnose the problem and develop a strategy to solve it. Selecting a buddy to act as an interpreter may aid communication. Structuring informal play situations may help in initiating relationships.

Severely hearing impaired children often lack social skills which other children learn incidentally. You may wish to make the other children aware of this and to ask their assistance in helping the hearing impaired child learn these skills. You may need to alter the expectations and attitudes of the other children by making them aware of people with handicaps who have excelled. (Beethoven, Helen Keller, etc.) Remember, your expectations and attitudes will influence directly those of other children and of other adults.

5. Review instructions when playing games to insure that the hearing impaired child will have a positive experience.
Overlay #3 - Understanding Hearing Impaired Children

Purpose: The purpose of this transparency is to help the teacher to understand what the hearing impaired child is communicating.

The teacher may have difficulty understanding the speech of a hearing impaired child. It is important that the teacher tell the hearing impaired child when s/he does not understand and that s/he persist in discovering what is being communicated. The following list is a strategy to aid the teacher:

1. First, ask the hearing impaired child to repeat what s/he said. Watch the child’s lips and facial expression for clues.
2. Use an interpreter-tutor when available to assist in translating communications.
3. Ask the other children to help you.
4. If necessary, ask the hearing impaired child to write the message to you.
Purpose: The purpose of this transparency is to inform the teacher of his/her role in relation to ancillary personnel.

The teacher may be responsible for relating pertinent information to the ancillary personnel who come in contact with the hearing impaired child. These people might include supportive personnel (i.e. speech clinicians, interpreter, itinerant teachers, psychologists, counselors, school nurse), school personnel (i.e. bus driver, custodian, cafeteria staff), crossing guards, teacher aides, and teacher trainees. A small conference before meeting the hearing impaired child will aid these personnel in creating a comfortable environment and in alleviating any embarrassing situations. The following suggestions will clarify the teacher's role in relation to the specialized teacher and school psychologist.

1. The specialized teacher will be the person with whom the classroom teacher will maintain closest contact. His/her role will be to provide instruction in special skills such as speechreading, auditory training and speech therapy. So that this specialized teacher can coordinate his/her program with that of the classroom teacher, the classroom teacher should communicate to him/her what is being learned in the classroom. A systematic way of insuring that this be done with regularity is to submit to the specialized teacher a weekly lesson plan which includes key vocabulary words, concepts, and skills to be learned. This enables the specialized
teacher to reinforce what the classroom teacher is teaching and to supplement the experiences of the hearing impaired child in the areas to be studied. Further, the specialized teacher should be provided with a report on the activities used to accomplish given objectives each week and a report of the student’s performance. The classroom teacher and the specialized teacher should invite each other to observe the hearing impaired child in the classroom and the resource room setting.

2. The school psychologist will be responsible for administering standardized tests and interpreting test scores. This person should be made aware of hearing impaired children so that appropriate adjustments can be made. These may include: an individualized testing situation, a non-verbal test instrument, and the use of an interpreter.
Transparency #16  Curriculum Considerations

Purpose: The purpose of this transparency is to alert the teacher to the curriculum needs of hearing impaired children and to suggest ways to accommodate these needs within the existing curriculum.

Many needs of hearing impaired children are essentially the same as those of normal hearing children. However, some needs will be unique to hearing impaired children. The following list of recommendations may be applied to all curriculum areas:

Expectations

1. The teacher should become aware of the hearing impaired child's potentials. Given this information, learning activities should be designed to challenge and maintain interest, yet not frustrate or defeat the child. A level of expectation should develop from this information and should not be lowered because of the additional effort required by both the teacher and hearing impaired child to reach this level.

Curriculum Goals and Designs

2. The approach to learning should be consistent and systematic. That is, what needs to be learned should be defined clearly using measurable objectives which direct the child toward a predetermined goal. There should be a core philosophy, methodology and curriculum around which learning revolves. Before instruction the teacher should assess what needs to be learned. The next step is to set goals, state objectives and design learning activities.
Learning Activities

3. Learning activities should actively engage the hearing impaired child. A good question for the teacher to ask himself/herself is "What should the child do to demonstrate learning?" Some examples of activities which involve student activity are drawing, constructing, writing, listening, viewing, designing, comparing, telling, and creating.

Feedback Mechanisms

4. The teacher should provide regular feedback reinforcement to the hearing impaired child. Words and gestures of encouragement and praise are essential to the hearing impaired child who is often confused and unsure of how others perceive him/her. Offer suggestions to the hearing impaired child where improvement is desired and then give feedback in terms of progress made.

Thinking Skills

5. The teacher should design learning activities that develop higher level thinking skills.

PROJECT LIFE has identified the following skills as being important:

1. making associations
2. making comparisons and contrasts
3. making analogies
4. arranging in logical sequence
5. the ability to classify and make generalizations
6. detecting absurdities
7. matching
8. making discriminations
9. groupings
10. making inferences
11. drawing conclusions
12. extracting the meaning of a new word from context
13. reasoning
14. making a judgment
15. predicting the outcome of a given event
16. meaningful completion of pictures and situations

Reinforcement Techniques

6. Reinforce new skills, vocabulary and concepts until they become internalized. Much of what is learned incidentally by other children through verbal remarks must be taught to hearing impaired children. Provisions for teaching and reinforcing this information must be deliberately structured into the child's learning.

Multi-Sensory Approaches

Inter-Relationships in Learning

8. Interrelate skills, concepts, experiences and vocabulary between various subjects. Their repeated use in varying contexts provides reinforcement and helps the hearing impaired child sense the interrelation of all learning.
Creativity

9. Approach learning with creativity. Although instruction for the hearing impaired child will require many reinforcement activities, it should be creative so as to motivate the child. Learning activities should encourage and develop the child’s creativity.

Student Choices

10. Provide the hearing impaired child with opportunities to make choices in respect to his/her learning. Allow the child to pursue interests and to initiate projects or activities. One way of giving the hearing impaired child opportunities to make choices and develop interests is through learning centers. Another way to give both teacher and student input into learning is through the use of contracts. Making choices and following through on commitments made in regard to these choices help develop independence and responsibility in hearing impaired children.

Evaluation Processes

11. Evaluation of the hearing impaired child’s adjustment to the mainstreamed classroom should be an ongoing process. The child’s parents should be contacted early in the year so that goals for academic achievement and social growth can be established together. As a general rule, the number of parent-teacher conferences for hearing impaired children should be twice the number of conferences for other children. Regular meetings for goal setting and evaluation should occur between the teacher and supportive personnel. If possible, the teacher should try to visit the child in the special school for hearing impaired children before the child comes...
to the mainstreamed class. If this is not possible, it may be
helpful for the teacher to either contact the child's former
teacher to learn information about the child's earlier progress,
or to visit a special school for the hearing impaired to help
determine goals and measures of attainment.
Purpose: The purpose of this transparency is to offer specific suggestions for the language arts curriculum for hearing impaired children who are fully integrated. The following four areas will be discussed; each to be represented by an overlay.

a. oral-receptive language (listening)
b. oral-expressive language (speaking)
c. written-receptive language (reading)
d. written-expressive language (writing)

Note: Program manuals with transparency masters should note overlays #1-5 are included on transparency master #17. They should be revealed individually according to the manual's progression.
Overlay #1. Oral-Receptive (Listening)

Purpose: This overlay is to be used when giving the teacher guidelines for developing listening skills through speechreading and auditory training.

Hearing impaired children use both auditory and visual cues in listening. The following suggestions should aid the teacher in helping hearing impaired children receive auditory communication.

1. The hearing impaired child should sit four to six feet from where the teacher usually speaks. The child's back should be toward the windows so as not to be looking directly into the light. The child should have a "roving" seat so as to be able to face other students in class discussion. If a hearing aid is used, the aid ought to be directed toward the speaker. If there is frequent change of speaker, a seat at the side of the room will allow the child to do profile speechreading. When a microphone is used in large groups, reserve a front row seat to the side so that the lips of the speaker are visible.

2. The hearing impaired child must be looking at you before you begin speaking. Agree upon some standard signal for getting the child's attention. Having someone near the child call his/her name is preferable to tapping or poking which can become irritating or loud signals which can be startling. In a class discussion use gestures to alert the child to the location of the speakers before each person begins to speak.

3. When speaking, the teacher should take a position so that his/her face is well lighted; do not stand in front of windows or bright lights. Avoid obstructing the child's view of your lips.
with your hands or a book. Stand in one position; do not pace while speaking. Always face the class when speaking. If you are using the chalkboard, wait until you've turned toward the class before beginning to talk.

4. When speaking, try to establish eye contact as often as possible. Use facial cues and natural gestures that facilitate understanding but do not detract attention from your mouth. Sometimes hearing impaired children have difficulty discriminating between questions and statements. A facial cue or tracing a question mark in the air may help clarify your communication.

5. Speak slowly and enunciate clearly. Talk naturally, without exaggerating lip movement.

6. Many words and sounds "look" alike. If the child is confused by a word, use it in a familiar context.

7. Good speechreaders look for thoughts not just single words. Therefore, if a statement is not understood, rephrase it using new cues until the thought is comprehended by the child. You may need to simplify the statement by breaking it into smaller units.

Examples:

(Direction) "As each of you completes recording in your logbook, you may move to a learning center of your choice."

(Rephrased direction) "Johnny, first write in your logbook. Then you may choose a learning center activity."

(Question) "How was the economic situation of the country reflected in the personalities of the characters?"

(Rephrased question) "How were Judy and her father affected by the Depression? "What kind of people were they because of it?" "How did the Depression change their personalities?"
8. If the hearing impaired child is having difficulty comprehending language, address him/her using short sentences with simpler words and phrases. Gradually work to increase the ability of the hearing impaired child to understand more complex language structures.

9. Before a lesson, write new vocabulary on the board. Make sure each new word is understood by using visual clues or using it in context.

10. Reinforce new words and language structure through repetition.

11. An outline of the lesson given to the hearing impaired child to survey in advance or a simple outline on the board helps the hearing impaired child to follow the presentation.

12. If notes are to be taken, appoint a notetaker; the hearing impaired child will need his/her eyes to speechread.

13. The hearing impaired child may not be able to keep up in a conversation when there is a rapid change of subject. In group discussion you might aid the child's understanding by using verbal connectives such as, "Now we will go on to step 2." Monitor the pace of communication so that it does not become too rapid for the child to follow.

14. Alternate listening activities with other activities requiring less attention. Hearing impaired children can become easily fatigued because listening requires both their auditory and visual attention.
Purpose: This overlay is to be used when giving the teacher guidelines for helping hearing impaired children to use effective oral-expressive communication.

The speech difficulties of a hearing impaired child directly relate to the type and degree of hearing impairment. Sounds which are distorted such as s, f, b, d, m, n, etc. are often distorted in their speech. The speech specialist will work regularly with the child to attain as near normal speech as possible. The classroom teacher can provide the following assistance in working toward this goal:

1. Establish a comfortable, accepting environment. Offer encouragement and praise when appropriate to build the hearing impaired child's self-confidence.

2. Encourage the hearing impaired child to participate in oral recitations and class discussions by directing questions to him/her.

3. Attempts to make speech correction can cause embarrassment to a hearing impaired child. Note words needing correction and bring them to the attention of the speech specialist.

4. Hearing impaired children appreciate help in monitoring the volume of their voices. The teacher and other children can help by politely telling the child when s/he is speaking too loudly or softly. Remember to acknowledge the child when s/he projects well, using the appropriate volume.

5. Give the hearing impaired child opportunities to prepare in advance for a discussion by providing supplementary materials to study.
6. **Listen with intent when the hearing impaired child speaks.** At times this may be difficult, especially when speech is greatly distorted. However, it is important for the child to sense an interest in the listener to make continual attempts at speaking.

7. **Encourage the child to participate in activities which utilize speech skills.** (Examples: drama, taping, role playing, demonstrating, reciting, interviewing, oral reading, oral reporting, etc.)

8. **Teach the hearing impaired child to use the dictionary for word pronunciation.** (A game utilizing unfamiliar words and the pronunciation key could be used with a group of children.)

9. **Expect the hearing impaired child to speak in complete sentences.** This practice reinforces language patterns.
Purpose: This overlay is to be used when giving the teacher specific guidelines for helping the hearing impaired child to develop reading skills.

Reading is considered to be one of the most important skills learned by hearing impaired children because of its potential to provide continued learning. It is the avenue by which the hearing impaired adult receives most of his/her information about the world. Before being successful at reading, however, the child must have an understanding of language structure. The vocabulary and language structures learned informally through conversation by other children may be foreign to the hearing impaired child. Facts, concepts, or experiences essential to understanding a reading selection may be unfamiliar. The materials and methods employed by the teacher must compensate for these deficiencies and instill in the child a desire to read and to improve reading skills. The following list of suggestions can help the teacher work toward this goal:

1. Before presenting a reading lesson, the teacher should know what facts, concepts and skills are to be developed and what the lesson assumes the reader to know before instruction. The teacher then should assess the hearing impaired child's ability to succeed in the lesson. Additional instruction or alterations in the lesson may need to be provided.

2. Before presenting reading material, the teacher should check to see if the hearing impaired child's experience background is adequate to comprehend or enjoy the material. This is important because hearing impaired children are deprived of information ordinarily learned auditorily. If experience is lacking, provide...
enrichment through visual aids and other reading sources.

3. An intermediate reading lesson for hearing impaired children should be approached in a similar manner to how a primary reading lesson is approached. The child should be prepared before encountering new vocabulary and language structures. Idiomatic language and slang expression can be especially confusing if not taught. A helpful reference is *A Dictionary of Idioms for the Deaf*, compiled and edited by Maxine T. Bratner. Generally, do not depend upon the teacher's manual to point out adequately all that is important for the hearing impaired child. It is recommended that the teacher carefully read the material with the hearing impaired child in mind.

4. When discussing material, check to see that the hearing impaired child has sufficient language skills to understand the questions. You may need to rephrase questions into simpler language. Lessons might be developed to teach the language structure of questions.

5. Caution should be taken when aiding the hearing impaired child's comprehension by over-reducing the text to simplified language, pictures, or gestures. Although the child may comprehend the idea, his/her understanding may be largely non-verbal. Determine which language structures are causing difficulty and structure lessons so that they can be read successfully in subsequent readings.

6. Since the hearing impaired child's approach to reading will be primarily non-phonetic, s/he will need a strategy for encountering new vocabulary independently. Strong emphasis should be placed on skills in structural analysis of words. A good knowledge of suffixes, prefixes and inflectional endings will facilitate
pronunciation, meaning, and usage. Knowledge of Latin and Greek derivatives will strengthen the child's vocabulary power.

7. Hearing impaired children often have difficulty with the text in oral reading situations. It is helpful to have someone else look on with the hearing impaired child and use a piece of paper to guide down the page as it's being read. Remind the other children not to cover their faces with the book when reading orally.

8. Motivation is an important factor in the child's desire to read. Provide a purpose for reading to stimulate interest. Select materials which are interesting, attractive and colorful. Don't forget to give abundant positive feedback; a child who perceives himself/herself as a good reader enjoys reading.
Purpose: This overlay is to be used when giving the teacher suggestions for developing competency in writing skills for hearing impaired children.

The writing level of a hearing impaired child generally correlates to his/her development in the other language arts. What the child understands about language in one area should transfer to other areas. For example, if the child can speak in complete sentences it is probable s/he can write in complete sentences. If the child is successful in reading, his/her chances of being successful in writing are increased. Like other children, however, success in one area does not guarantee success in writing. The teacher can assume the child will need a good understanding of language before s/he can become a good fluent writer. The following suggestions are given to aid the teacher in helping the child to write.

1. The construction of sentences can be approached through a study of transformational grammar (linguistics).

2. Provide the child with assignments to write frequently. As a general rule hearing impaired children should write 3-4 times more than other students.

3. When making a creative-writing assignment, be cautious not to defeat the child with corrections. Place emphasis on imaginative, creative work. Take note of what language structures need more work without drawing it to the attention of the child.

4. Like other children, hearing impaired children enjoy writing about themselves and their own experiences.
Overlay #5 Mathematics

Purpose: This overlay is to be used when suggesting methods to the teacher for teaching mathematics concepts to hearing impaired children.

Hearing impaired children can be expected to reach the same competency in mathematics as other children. The recommendations made for teaching mathematics to hearing children can apply also to other children. The only time a hearing impaired child will be at a real disadvantage is when a math problem is put in the context of language. The following list of suggestions will help the teacher to develop the hearing impaired child's potential in mathematics:

1. Like other children, the hearing impaired child needs a visual, manipulative approach to mathematics so as to visualize numerical quantities and understand numerical relationships. Provide many experiences to use manipulatives such as beads, buttons, sticks, colored strips of paper, the flannel board games, and instruments for measuring. Capitalize upon the use of color as well as shape to teach numerical concepts.

2. The math curriculum can challenge the hearing impaired child by providing numerous opportunities for problem solving.

3. Problem solving in the context of language will probably pose the greatest difficulty for the hearing impaired child. You might approach problem solving using concrete visual clues. When using verbal cues try to use problems which are real to the child's experience. Ultimately, the language of a word problem should be taught.
Transparency # 18

Media

Purpose: The purpose of this transparency is to inform the teacher of the importance of the increased use of media, their appropriate usage, and its role in educating hearing impaired children.

Media Needs

The use of multi-media with hearing impaired children is important because other senses must compensate for the hearing disability. Dependence on vision and touch increase as the degree of hearing impairment increases. A multi-sensory approach through the use of multi-media is recommended to aid the hearing impaired child to learn information ordinarily learned primarily through the auditory modality.

The following suggestions are offered to the teacher to help implement a multi-sensory approach to learning:

1. There should be a variety of audiovisual equipment available to the teacher and the student. At least one means should be provided for each medium need. These needs are:
   a. a means to project still pictures for large group study (This need is met through the use of the overhead projector, the filmstrip projector, the slide projector, or the opaque projector).
   b. a device for use in auditory training (the language master, tape recorder, record player and an amplifying unit can provide this function.)
   c. a means to project motion pictures (16mm, Super 8mm, and film loop projectors serve this function.)

2. Special boards providing visual or tactile stimulation should be
available. A clean chalkboard, attractive instructional bulletin boards, and manipulative boards such as flannel and magnetic boards can meet this need.

3. Self-instructional devices should be available to the hearing impaired children to operate independently. Devices designed for individual use include filmstrip viewers, cartridge projectors, cassette recorders, reading racers, listening stations, programmed learning machines, etc.

4. A variety of colorful, attractive print materials should be employed by the teacher and made available to the hearing impaired child. Each curriculum area should have a clear, concise textbook or another comparable source of information. Other print materials should include supplementary books, reference books, periodicals, newspapers, programmed materials, etc.

5. Materials designed especially for visual learning or tactile learning—such as charts, maps, globes, photographs, games, specimens, models, etc.—should be available to the child.

The Use of Media for Presentations

Hearing impairment poses problems when using some media. Familiarity with the advantages and disadvantages of each piece of equipment will help the teacher to obtain maximum usefulness. The following list should help the teacher in selecting media and in making adjustments for their effective usage.

1. Overhead Projector - The overhead projector is considered to be valuable for group instruction because it has two distinct advantages. One advantage is that when using the overhead projector, the teacher stands at the front of the room facing the students. The back
1. Overhead Projector - Special lights for speechreading should be used. The use of a pointer helps direct attention to the point in the picture being discussed.

2. Filmstrip Projector, Slide Projector - Captioned filmstrips and slides are most meaningful to hearing impaired children. To make sure the child has read each caption, you may ask him/her to change each picture. If a cassette tape or record, supply the child with a script and a special light to be used during the viewing. If the teacher speaks during the filmstrips or slide presentation, arrange for the use of special lights to illuminate his/her mouth. In situations where the child must read a script or lips, allow enough time so that the child can also view the picture.

3. Motion Picture Projector - A topic outline, summary or script should be made available to the child in advance of viewing a film.
5. Tape Recorder, Record Player - When employing these devices for auditory training, use headphones or appropriate amplification to minimize extraneous sounds. When a group is listening to a recording for informational purposes, the hearing impaired child should be provided with an alternative activity to meet the same objective.

Media in Individualized Learning and Self-Expression

The function media performs in relation to the hearing impaired child will help determine its impact on learning. Traditionally, media have functioned as tools employed primarily by the teacher to enrich instruction. To reach optimum potential for providing individualized learning, the use of media should be expanded so as to become tools for the student. The student can learn from using and producing media in the following ways:

1. The hearing impaired child should be able to use media in self-expression. Reports, presentations and creative projects might take any of the following forms: student-produced films, filmstrips, video-tape programs, transparencies, magazines, newspapers, picture boards, bulletin boards, displays and models.

2. The hearing impaired child should have available media for self-instruction. Opportunity to select instructional media and to use them independently should be given to the child. The use of contracts can help give direction and purpose to the child when selecting media. Self-instruction in specific skills can be accomplished through the use of programmed learning materials.
The Physical Environment of Classrooms

Purpose: This transparency depicts some of the environmental conditions which should be considered when a severely hearing impaired child is mainstreamed.

Architectural Design

Classroom environments differ in numerous ways depending upon age of construction, philosophical design, size, location of school, etc. There is little universality in the design of classrooms. In addition to these factors, there is a general lack of standardization in architectural aspects of classrooms, especially regarding the acoustic environment. While guidelines for the visual climate of classrooms have been established, no such guidelines for the acoustic environment have been designated. The hearing impaired child is affected by the physical environment of the classroom in two major parameters: vision and acoustics.

Visual Environment

An adequate light source must be made available to the hearing impaired child in order that the visual sensory modality can be effective as an alternative to the auditory-sensory modality. In order to speak, read, interpret signs, attend to stimuli etc., a very good light source must be present. Most schools have been designed to provide adequate light sources. Special consideration must be given the hearing impaired child so that his visual environment permits him to accommodate for his impairment.

Many children respond poorly to heightened visual stimuli, i.e., distraction, foreground-background problems, hyperactivity and poor
attention span. Special consideration may be given to the hearing impaired child regarding responses to heightened visual stimulation. In some instances, a carrel or restricted desk can be afforded the hearing impaired child in order that at certain times in the day the visual stimulation can be reduced. Resource rooms can provide such a visual atmosphere for the hearing impaired child. Classroom teachers should be aware of this need to the child who is usually very reliant upon visual input.

Acoustic Environment

It is particularly important that optimum acoustic conditions be provided for the hearing impaired child. Classroom noise, street noises, and noise (band practice), are amplified for the hearing impaired child who wears and uses a hearing aid. Auditory discrimination and speech perception become difficult tasks for the child who receives noise as loudly as speech. The literature in psychoacoustics attests to the need for adequate psychophysical acoustics, background noise levels, speech production levels, reverberation time, and distance between speaker and listener. Research indicates that a favorable signal-to-noise ratio must be present in order for speech reception to be accomplished. For the hearing impaired child the effects of noise are detrimental. Locating the sound source, its separation between the important signals and the less important ones, and minimizing a cost residual hearing and others, require a favorable acoustic environment.

A number of provisions can be considered in order to improve the acoustic environment for the severely hearing impaired child. These provisions are as follows:
Sound Absorptive Materials

1. Additions of sound absorptive materials to the classroom—carpets, curtains, sound-treated panels, acoustic tiles and the like enhance the acoustic environment for all children. A general consideration might be to reduce the "hard" surfaces present in the classroom, i.e., tile floors, glass, chalkboards, etc.

Amplification Units

2. Amplification units which provide for greater fidelity and reduce extraneous noise are advised. A variety of amplification units are available commercially which enhance the acoustic signal for the hearing impaired child. Specialists in the design of auditory equipment should be consulted regarding optimum units for a particular school and classroom. Hearing aid dealers on a local level, audiology centers, schools for the deaf and architectural consultants can provide sources of equipment and consultation services.

Use of Microphone

3. The consistent use of a microphone designed for the child's amplification system by the teacher and other children can assist the hearing impaired child within the classroom. The use of the microphone can be facilitated for the teacher by specially designed carriers and holders.

Classroom Noise Levels

4. Maintaining a classroom noise level which rarely exceeds
65-70 dB as measured by a sound level meter is helpful to all students within the classroom. Normal hearing children are also affected in their auditory discrimination ability by classroom noise levels which exceed these figures. Children with reading and language difficulties typically perform more adequately in noise-reduced environments with noise levels beyond 70 dB. Sound level measures can be performed in individual classrooms by personnel within the school district, or on a consultant basis from audiologic centers, state agencies or federal noise pollution offices.
The purpose of this transparency is to depict the environmental changes the hearing impaired child will experience when making a transition from a special class to the mainstreamed class.

Certain environmental changes will be encountered by all hearing impaired children who enter the mainstreamed classroom. These changes are identified as the following:

1. The child will move from a classroom with few children to one with many children.
2. The child will move from a classroom with a small pupil-teacher ratio to one with a larger pupil-teacher ratio.
3. The child will experience communication problems in the new classroom.
4. The child will have less contact with other hearing impaired children.

The extent to which the hearing impaired child adjusts to these changes depends upon the type of classroom environment established by the teacher and the modifications s/he makes to accommodate the child. In an attempt to offer suggestions to the teacher to make accommodations, two types of classrooms have been identified: the formal classroom and the informal classroom, with the understanding that there are many variations of each type extending along a continuum.
The Formal Classroom

The formal classroom is primarily teacher centered, i.e. learning revolves around the teacher, who is responsible for determining what and how the children will learn. Generally, the teacher is accountable for accomplishing specific curriculum goals and objectives which have been formally defined. The school day is typically divided into periods during which given subjects are studied. The children are assigned desks which are often arranged in rows facing the area where the teacher addresses the class. Because most of the day is consumed by either formal instruction from the teacher or paper-pencil activities designed to reinforce instruction, there is a minimum amount of visual distraction and noise.

Given this environment, the following suggestions are offered to help provide a comfortable, advantageous learning environment for the hearing impaired child:

1. Provisions for flexible seating are needed to facilitate optimum speechreading conditions and to provide for peer-group interaction.
2. Provisions for individualized remedial instruction are needed to compensate for deficiencies attributed to hearing impairment.
3. The teacher should ask questions frequently to insure that the child is following and understanding.
4. Special effort to encourage the hearing impaired child to participate in class discussions is needed to overcome the insecurity which the child will probably feel in a large group of people.
5. Activities designed to work toward affective goals and to provide for social learning need to be structured into the day. Affective goals include the formation of a value-system and the identification
and expression of feelings. Social learning goals are directed at helping the child to learn behavior which is socially desirable.

5. Learning activities are needed which are designed specifically to help the hearing impaired child develop independence and responsibility, and to learn decision-making.

The informal classroom

The informal classroom is child-centered. The teacher's role is that of a learning facilitator who is responsible for providing stimuli to help the child develop interests, to provide materials needed by the child to pursue interests, to help the child establish learning objectives, to help the child select appropriate learning activities and to guide the child toward mutually agreed upon goals. The school day is flexible in that each child determines what s/he will study and how much s/he will accomplish. The classroom is composed of numerous learning centers or activity stations scattered throughout the room with tables and chairs informally placed for children to use throughout the day. Generally, the child will have a special place to put personal belongings but s/he will not have an assigned seat at a table. Interactions in the classroom are usually personal and informal. Noise and visual distraction are greater than in the formal classroom because of the number of activities and the amount of informal communication.

When mainstreaming a hearing impaired child into an informal classroom, the following needs should be addressed in order to provide a comfortable and academically productive environment:
1. Provide a systematic approach to learning basic skills. It is important that the teacher evaluate regularly the child's needs in the language arts and that formal instruction be given to meet these needs.

2. Provide a study carrel or a visually and sound-restricted desk for the hearing impaired child to use.

3. Encourage the use of the resource room which might function in the following ways:
   a) a place for formal instruction
   b) to provide the comfort and security
   c) a place to bring friends or associate with other hearing impaired children.
   d) to provide for physical needs such as new batteries.

4. Observe the hearing impaired child closely to see that s/he is adjusting socially and is being included by other children in the activities.
Suggestions for the Trainer

The following questions are intended to help your staff apply this information to their specific needs. They may be used at the discretion of the group leader. Some questions may apply primarily to fully integrated children whereas others will apply to all integrated children.

In order to help the group leader select questions most appropriate for your situation the questions have been grouped into four categories:

1. Questions concerning academic curricula
2. Questions concerning social adjustment
3. Questions concerning the use of media
4. Questions concerning physical environment

Some questions might be used in a large group setting; others might be more effectively discussed in small groups.

Questions Concerning Academic Curricula

1. How are you going to determine the severely hearing impaired child's ability?
2. How are you going to assess the child's academic needs?
3. Does your curriculum take a systematic approach to learning basic skills? If not, how can you provide for this?
4. Does your curriculum stress a variety of thinking skills? If not, how can you modify the existing curriculum to include them?
5. How will you reinforce new skills, vocabulary and concepts which ordinarily would be reinforced incidently for the normal hearing children?
6. How will you determine what facts, concepts, skills, experiences, vocabulary and language structures are lacking in the hearing impaired child's background before presenting reading material?
How will you compensate for any deficiencies if the other children are more adequately prepared?

7. How can you work to increase the hearing impaired child's mastery of language structures without discouraging the child's creativity?

8. Is your curriculum one which emphasizes the interrelationships between skills, concepts, and experiences? If not, how can you modify it to integrate learning?

9. How will you provide a multi-sensory approach to learning?

Questions Concerning Social Adjustment

1. What criteria will you use in selecting a buddy or peer tutor?

2. What approach will you take in establishing affective learning goals? (i.e., How will you help the child to enhance his/her self-concept and instill in him/her a consideration for others?)

3. How will you approach teaching social behaviors which the child may be lacking?

4. How will you help the child to participate in community activities?

Questions Concerning Media

1. Can your media adequately meet the needs of a hearing impaired child? If not, how will you provide for those needs?

2. How will you accommodate the hearing impaired child when using auditory media?

3. How can you involve the hearing impaired child in the use and production of media?
Questions Concerning Physical and Educational Environment

1. What specific problems would the physical environment of your classroom pose for a hearing impaired child? How can you modify the environment to solve these problems?
   (Consider the following factors:)
   1. noise
   2. visual distraction
   3. integrated learning
   4. affective goals and social learning
   5. flexible seating to facilitate speechreading and small group work
   6. systematic approach to learning basic skills

2. What will be the function of your resource room?

Orientation to Hearing Impairment
ORIENTATION TO HEARING IMPAIRMENT

Introduction

This section of materials deals specifically with two target groups which may benefit from an orientation program. The materials are divided into: (1) orientation information directed to the hearing impaired child regarding a "new" school environment, and (2) orientation information directed to the hearing children which is designed to enhance their acceptance of the hearing impaired child.

Personnel to Perform the Orientation

These materials have been designed to be implemented by the classroom teacher. This teacher is viewed as the central figure in the coordination of services between the previous school setting, the new school setting, the parents, the community personnel and other interested persons. Each teacher will be able to assess the needs of the particular child in terms of parental values, educational strengths, interpersonal (social) skills, and adaptation to new environments. Some teachers may choose to present these materials after observing the child and his parents for a time. Other teachers will elect to present the peer orientation materials during the hearing impaired child's transition to the new school. Individual decisions concerning appropriate information will be required by the teacher.

The Role of the Parents

The family of a hearing impaired child may present some specific assets to the classroom teacher in providing experiences and information regarding orientation of both target groups. It is not atypical for parents of children with special needs to participate frequently and regularly in the
Decision-making process of education for their child. Parents may appear to display unusual anxiety regarding these decisions. However, the classroom teacher may be able to deal constructively with these feelings by providing parents varied channels for input regarding peers and the child himself/herself. Parents who are included in these processes appear to be responsible contributors to the teacher and the school.

Occasionally parents of children with special needs appear to require a great deal of guidance in order to provide familial support for their child. Parents who display this tendency can be encouraged to participate in the educational setting in many ways which are constructive to the child.

The following suggestions are directed to the classroom teacher for consideration when attempting to assist the parents of the hearing impaired child:

1. Schedule an initial conference during which some educational program can be defined for the child. A letter to the parents, the assistance of appropriate school personnel, and a comfortable arrangement for the child himself/herself, can enhance this initial contact.

2. Arrange an on-going communication system between the parents and the teacher which the child understands, in order to provide for review materials at home, up-dated progress reports and special problems and achievements.

3. Encourage both parents to participate in school-wide activities as room mother, field trip assistant, library volunteer, etc. etc.

4. Impart the parents with materials available at the teacher's
the parents locally, such as: The Volta Review, The American Annals of the Deaf, Exceptional Parents Magazine and Ideas for Parents - a newsletter from the Lexington School for the Deaf.

5. Arrange for expanded educational activities in the form of tutoring, summer school programs, recreational programs affiliated with the school, etc. to be suggested to the parents in order to provide them with additional information which they may request.

Materials for Hearing Impaired Children

It is possible that the hearing impaired child will participate in an orientation program designed by the school for the deaf which he has attended, designed by his parents, or designed by an external agency. Suggestions are included which may provide additional resources for the classroom teacher, or which may be used in addition to or in the absence of such an orientation program. In addition to the suggestions listed, a video tape recording is included in these materials. This video tape recording presents Mr. Frank, a hearing impaired adult, who has experienced integrated education. The recording (script included) is directed to the hearing impaired child.

The following suggestions are directed to the classroom teacher as procedures which may be helpful to the hearing impaired child. Some consideration should be given to those children who do not possess the verbal or speechreading skills necessary to engage in teacher-student conferences. Alterations of these suggestions may be necessary.

1. Discuss the rules and privileges within the new classroom.
2. Show the student the school facilities (bathroom, school nurse, bus and coat room).
3. Discuss with the student his/her seating arrangements.

4. Encourage the student to discuss freely with the teacher any problems that arise.

5. Encourage the student to rely on the teacher to help him/her in uncomfortable situations.

6. Encourage the student to ask questions when s/he does not understand the assignment or the task.

7. Encourage the student to participate in the selection of his/her own "buddy".

8. Encourage the student to actively join his/her classmates in group centered activities.

9. Encourage the student to share his/her own experiences with his/her classmates.

10. Explain to the student that parent-teacher conferences will be held to insure the student communication with the family.

11. Encourage the student to continue interacting with hearing impaired students.

Materials for Peer Orientation

These materials are designed to be implemented by the classroom teacher in conjunction with other school personnel and parents. The purpose of an orientation program for peer usage is to enable the hearing impaired child to be more readily accepted by his "new" peers. The attitude and understanding of other children will affect the social and academic adjustment of the hearing impaired child. The classroom teacher may assist the other children in the following ways:

1. Present materials regarding hearing impairment to the children.
which provide them with accurate information.

2. Provide the children with information regarding the effects of hearing impairment on communication skills, social and behavioral skills.

3. Permit the children to participate in the implementation of the alterations of the classroom environment, specifically, noise reduction alterations, seating plans, etc.

4. Assist the children in determining appropriate behavior toward their new classmate.

The following activities are suggested to the classroom teacher in order to assist in meeting the four goals stated above:

1. Include units on the ear and general problems in communication in the school curriculum.

2. Give the other children an opportunity to perceive the effects of a hearing impairment through simulation experiences.

Examples:

a) Ask the children to cup their hands tightly over their ears while the teacher proceeds to read softly the directions for an assignment.

b) Play the children's favorite records at a low volume and ask them to identify the songs.

c) To show that there are differences in the hearing capacity of all people; station a clock or watch with audible ticking at one place in the room. Each child should then walk away from the clock and stop at the point where the ticking is no longer audible.
d) Call the class roll silently using only your lips. Have each child signal when s/he recognizes his/her name.

e) Impose barriers to effective communication by speaking with your hand in front of your mouth, chewing gum, mumbling, and turning your back.

3. Encourage the hearing impaired child to offer a learning center on manual communication if the child possesses such skills. This might be integrated into a unit of non-verbal communication (codes, signals, braille, etc.)

4. Arrange a class trip to local programs affiliated with hearing impairment.

5. Direct the children to literature about people who have been pioneers in the education of the deaf or who have personally experienced hearing handicaps. (See References - Peer Bibliography)

6. Encourage the children to watch TV programs which include hearing impaired persons, i.e. Sesame Street (segments with stars of National Theatre for the Deaf), Zoom (segment on camp for deaf children), Mister Rogers (segments on manual communication).

7. Invite a member of a local "deaf club" to visit the class and interact with the children.
Rationale for the Video Tape Recording

These materials have been produced in order to provide school districts with materials targeted for the hearing impaired child who is being mainstreamed. The video tape recording presents Mr. Frank Bowe, Coordinator of Services, Deafness Research and Training Center, New York University, speaking to an 11 year old hearing impaired child, Peter Cook. Mr. Bowe, a hearing impaired adult, prepared these materials which are based on his personal experiences. His method of communication combines speech and signs.

The suggestions for the use of this video tape recording are as follows:

1. School personnel must preview the video tape recording.
2. If possible, the parents of the hearing impaired child should be present during the preview.
3. During the presentation to the hearing impaired child, a teacher or parents should accompany the child.
4. Hearing impaired children who are unfamiliar with signs can rely on speechreading ability or the use of the script which is included.
5. Individual classroom teachers may wish to present this video tape recording to their classes as part of the orientation to the hearing impaired program.
Hi! my name is Frank Bowe and this is Peter. I came here today to talk with Peter and with you. I can't hear, Peter. When I was your age, I went to school with children who could hear. I remember that I thought the other children were very smart because they seemed to learn so much easier than I did. I remember thinking that those kids were better than I was. And, it wasn't until much later, that I found out that the reason learning was harder for me, was not because I wasn't smart, but because so much learning happens through the ear. I was just as good as the other kids. It's just that I never heard the words that they heard, so I didn't learn many of the things that they learned. I know now that I am just as good a person as the other kids were. It's just that I had to use my eyes more to get what they got through their ears.

For example, I remember we had vocabulary and spelling tests. The other kids, they got almost all the words right, but I got maybe half right.

Why?

Why? Because I never heard the words that they heard. I had to go home and look them up in the dictionary, but the words in the dictionary... they were just as strange as the words on the test. So I had to learn strange meanings for strange words. And that's why I got about half right -- not because I wasn't smart -- but because the other kids could hear and I couldn't. With the spelling tests it was much the same.
Another thing I remember was that the kids would always tease me about my hearing aid. Maybe they tease you too. They would tell me a story, and they would laugh when I got the story mixed up. Many times they would not let me play with them, and I had to play by myself. And again, I thought I was not as good as the other children. But, that’s not true. And it is not true for you either. I was different from them, and people, especially young children, they found it hard to be with people, around people, who were different.

When I went to school with those children, they didn’t understand what it meant not to be able to hear. So sometimes, I had to try a little harder to help them. I would introduce myself to them: "Hi, I’m Frank Bowe." I would teach them how to spell their names. Many children enjoy learning how to spell their names -- P E T E R, F R A N K, D E B B I E. They enjoyed learning. Sometimes, I invited children home to go to a movie or to play some tennis. I think that you will find too, that a real friend will stay with you and will help you, if you will stay with him and help him.

What does this mean to you and to you? Like me, you will go to school with children who can hear. And sometimes, it will be hard for you, not because you are not smart, but because you can’t hear as well as the other children. Maybe you could do what I did. I sat in the front row. I read as much as I could. And I wore my hearing aid every day. My parents helped me after school. You can wear your hearing aid every day, and you can lip-read the best you can. If you don’t understand something, ask and ask again until you understand.

You are just as good and just as smart as the other kids. You have just as much right to learn as they do.
Peter, what can you do when the other children tease you? You can tell them that you can't hear. You can show them your hearing aid and explain how it works. You can tell them that you are just the same as they are. You have two eyes, one nose, one mouth, two arms and two legs. The only thing that is different about you is that your ears don't work.

Most important, don't give up, because you are an important person. There is no one else in the world exactly like you or you. Don't you ever forget that you are good and you are smart, and with a little bit more effort, you can do just about anything you may want to do.

And make sure that your teacher knows that you can't hear very well. If you don't understand what your teacher says. Ask, don't let it go.

If another child says something that you don't understand, say so. Say: "I don't understand." They can speak clearly for you. They can write. They can look at you when they talk to you. And you can help them by telling them: "Don't shout." and "Say it again, when you don't understand."

If there is an interpreter in your room, what he or she will do is to interpret in signs or finger spelling what the teacher says and what the other children say. Be sure you watch the interpreter carefully. If you miss something, don't let it go, ask! If you want, the interpreter will speak for you and will tell the teacher what you say.

Don't try to take notes and watch the interpreter at the same time. You can't do that. Let someone else do that because you can't watch the interpreter and take notes at the same time. Now how do you get a notetaker? Maybe your teacher will ask someone to take notes for you.
or maybe you will have to ask someone. Just pick someone who seems friendly, and ask: "I can't hear. Will you take notes for me?"

There will be problems from day to day and sometimes you will fall behind in something - reading, writing, spelling - something. And sometimes you will have a teacher you can't understand, or a kid will pick on you. These are times to talk with your teacher and with your parents. That is what they are for, to help you if you have a problem.

I got through school. I did OK, and you can too, and so can you.

Thank you.

I. Biography

Pioneers in the Education of the Deaf

A. Alexander Graham Bell

Burlingame, Roger
Out of Silence into Sound: The Life of Alexander Graham Bell
A well documented account, many photographs included.

Shippen, Katherine, B.
Mr. Bell Invents the Telephone
N.Y., Random House, 1952. 2.95 Grades 4-5.

Stevenson, O.J.
The Talking Wire: The Story of Alexander Graham Bell
N.Y., Messner, 1947. 3.64 Grades 5-6.

B. Thomas Gallaudet

DeGering, Etta
Gallaudet: Friend of the Deaf
N.Y., McKay, 1964. 4.50 Grades 5-6.

C. Samuel Gridley Howe

Meltzer, Milton
A Light in the Dark: The Life of Samuel Gridley Howe
N.Y., Crowell, 1964. 3.50 Grade 6.

D. Anne Sullivan Macy

Brown, Marion, M.
The Silent Storm
N.Y., Abingdon Press, 1963. (also in paperback: Archway, 60c)
Grades 5-6.

Malone, Mary
Annie Sullivan
N.Y., Putman's, 1971. (A see and read, beginning to read biography)
Grades 5-6.

Waite, Helen, F.
Valiant Companions
N.Y., Macrae, 1959. 4.75 (Also in paperback: Scholastic Book Services, 1959) Grades 5-6.
People Who Conquered Deafness

A. Ludwig van Beethoven

Jacobs, David
Beethoven
Handsomely illustrated.

Kaufmann, Helen, L.
The Story of Beethoven
N.Y., Grosset & Dunlap, 1957. 2.95 Grades 4-6.

Wheeler, Opal
Ludwig Beethoven and the Chiming Tower Bells
N.Y., Dutton, 1942. 4.75. Grades 3-5.
Contains examples of his music.

B. Laura Bridgman

Hunter, Edith
Child of the Silent Night
Boston, Houghton, 1963. 3.95. Grades 3-5.
Also in paperback: Dell, 1971, 75¢.

C. Helen Keller

Bigland, Eileen
Helen Keller

Peare, Catherine, O.
The Helen Keller Story
N.Y., Crowell, 1959. 3.95. Grades 5-6.

Wilkie, Katherine
Helen Keller, Handicapped Girl
Indianapolis, Bobbs-Merrill, 1969. 2.95. Grades 3-4.

Keller, Helen
Story of my Life
Her autobiography.

II. Fiction

Cunningham, Julia
Burnish Me Bright
A mute boy, outcast from a small French town, learns to communicate
when he makes friends with a mime.
Cunningham, Julia
Far in the Day
A sequel to Burnish Me Bright. Auguste joins the circus as a mime.

Robinson, Veronica
David in Silence
David is deaf and new in town. The children react to him with suspicion and hostility. Only one boy makes the effort to understand.

Spence, Eleanor
The Nothing Place
Tyndall, a bossy leader type, decides her deaf friend, Glen, should have a hearing aid and organizes a project to earn money for it. She learns, however, that pity is a poor substitute for real understanding and friendship.

Wojciechowska, Maia
A Single Light
Deaf from birth, forsaken by her father, Anna searches for love. Set in Spain.

III. Nonfiction

Charlip, Remy
Hand Talk
Chicago, Parents, 1974.

Warszonsky, Fred and Stevens, S. Smith
Sound and Hearing

IV. Wordless Picture Books - Non-verbal Communication

Adoff, Arnold, Ma NDa Ia, N.Y., Harper-Row, 1971. 3.95.

Anne, Mitsumasa, Dr. Anno's Magical Midnight Circus, N.Y., Weatherhill, 1972. 3.95.

Aruego, Jose, Look What I Can Do, N.Y., Scribner's, 1971. 4.95.

Alexander, Martha, Bobo's Dream, N.Y., Dial, 1970. 3.50
Out, Out, Out, N.Y., Dial, 1968. 3.50.
Barton, Byron, Elephant, N.Y., Seabury, 1971, 2.95.

Fromm, Lilo, Muffel & Plums, N.Y., Macmillan, 1973. 3.95

Goodall, John S., Adventures of Paddy Pork, N.Y., Harcourt, 1968. 3.95.

Hoban, Tana, Look Again, N.Y., Macmillan, 1971. 4.95.

Hutchins, Pat, Changes, Changes, N.Y., Macmillan, 1971. 4.95.

Mayer, Mercer, A Boy, a Dog, and a Frog, N.Y., Dial, 1967. 2.50.

Mordillo, Guillermo, The Damp and Daffy Doings of a Daring Pirate Ship, N.Y., Quist. 4.95.

Olschewski, Alfred, Winterbird, Boston, Houghton, 1969. 3.25.

Basic Needs of Deaf People and Life Problems of Deaf People (articles)
By: Boyce R. Williams, Director
Office of Deafness and Communicative Disorders
Department of Health, Education, and Welfare
Social and Rehabilitation Service
Washington, D.C. 20202

Rossett, Allison, A Mediated Program to Facilitate Communication Between Hearing Parents and Deaf Children, Northeast Regional Media Center for the Deaf, University of Massachusetts, Amherst, MA, 1973.
Suggestions for the Trainer

The following topics are suggested for discussion in order to provide teachers with ideas for orientation which are personal and productive to the school situation. It is hoped that additional orientation materials will be generated by the discussion. A transparency is designed to stimulate discussion. (21)

Large Group Discussion:

1. What community resources are available to the district so that our children can be exposed to a variety of hearing impaired children and adults?

2. What specific additions to the library (both school and community) appear necessary in order that adequate resources and references are available to children and school personnel?

3. Are there parents of children with other special needs in the community who can lend support to teachers and parents of hearing impaired children during the transitional adjustment to the new school setting?

Small Group Discussion:

1. What activities in addition to those discussed can be implemented in our curricula in order that children better understand hearing impairment?

2. Can liaisons be developed with the parents of hearing impaired children which provide for better communication between parents and teachers, parents and hearing impaired children?
3. What guidelines can be set in order to evaluate the hearing impaired child regarding his comfort in participating in orientation activities, amount of participation, embarrassment, interest, etc.?
State Administrators for Special Education

Each state department of Education has designated personnel responsible for special education programs. These departments can furnish information relative to the hearing impaired child.

Alaska
Mr. John Antonen
Special Education

Selected Organizations and Publications Related to Hearing Impairment

The Alexander Graham Bell Association
1537 35th. Street, N.W.
Washington, D.C. 20007

This organization was founded by Alexander Graham Bell in 1890. It publishes the Volta Review, a monthly publication on deafness, which promotes the teaching of speech and lipreading to the deaf.

The American Annals of the Deaf
5034 Wisconsin Ave., N.W.
Washington, D.C. 20016

A national professional journal for teachers, specialists and school administrators concerned with education of the deaf.

The American Speech and Hearing Association
9030 Old Georgetown Road
Washington, D.C. 20014

This national professional organization publishes several quarterly journals devoted to speech and hearing disorders.

Council for Exceptional Children
1411 S. Jefferson Davis Highway, Suite 900
Arlington, VA 22202

The Council is a national professional organization devoted to educational, clinical and research development for children with special needs.

Media Services and Captioned Films
Division of Emotional Services
Bureau of Education of the Handicapped
U.S. Office of Education
Washington, D.C. 20202

This organization provides captioned films for the deaf on a wide variety of educational topics. A catalogue of films is available.

The National Association of the Deaf
847 New Jersey Ave.
Silver Springs, Md. 20910

The National Association of the Deaf, organized in 1880, is a national organization of, for and for the deaf. It publishes "The Deaf American," a bimonthly.
The national Registry of Interpreters for the Deaf, Inc. certification program was established to identify qualified interpreters for deaf persons.
Instructional Material Centers for Handicapped Children

Special Education Instructional Materials Centers (SEIMCs) and Instructional Materials Centers (IMCs) have been designated throughout the country. These centers provide a wide variety of materials and equipment for use in schools in their areas. Address inquiries regarding Instructional Materials Centers to:

National Center on Educational Media and Materials for the Handicapped (NCEMMH)
Ohio State University
220 West 12th Street
Columbus, Ohio 43210

## Teaching Resources

### Auditory Training

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Int.</td>
<td>Workbook and Guide, (Teacher's Kit). A Structured Training and Remedial Program for the development of attention, listening and memory skills. Materials range from simple recall to naming of abstractions in sequence. $5.50 per kit.</td>
</tr>
</tbody>
</table>

Designed to present in a sequential manner, 5 areas of auditory perception, each containing 3 levels of activities. The 5 basic areas are: auditory memory, auditory motor, auditory figure-ground, auditory discrimination and auditory imagery. All activity capitalizes on student's interests and educational development while focusing on skill being developed. For students with minimal brain dysfunction, auditory perception deficits and those in regular school readiness program. Can be used with individual students, small groups or classes; student progress as his skills improve. Each of 5 areas consists of 4 different, progressive levels, each containing various sets of spirit masters and cassette tapes. Each area of program may be purchased separately: Memory, $62.00; Motor, $74.00; Figure-Ground, $45.00; Discrimination, $70.00; Imagery, $37.00. Total program, $260.00. Replacement tapes available at $3.50 each. Replacement spirit masters available at $2.00 each.

<td>Primary</td>
<td>Two-year program. Level 1 - first grade; Level 2 - after level 1 completed. Also valuable with older children. Teaches inter-relationships of sound, order and sense, on individual, group or class basis. Teacher's Guides contain specific plans for daily lesson. Two pupil response books for each level. Unique crayon affects color of paper when answer correct. 160 activity cards for each level provide activities in awareness, focus, figure-ground discrimination, sequencing, scanning and meaning. Level 1 (96-page Teacher's Guide, 160 activity cards, 5 records, 66 crayon markers) $26.00. Pupils' Response Books 1 and 2, each $1.32. Level 2 (96 page Teacher's guide, 160 activity cards, 6 records, 36 crayon markers), $26.00. Pupils' Response Books, 3 and 4, each $1.32.</td>

List of Instructions

Duplicate each transparency master by using a thermal copy machine. A transparency marker may be used on the reverse side of the transparency to color in certain sections. The diazo process may also be used to duplicate each transparency master.

At the bottom of each transparency master appears a number or numbers in combination with a letter. The number corresponds to a section of the text. The number in combination with the markings O.L. indicate the order of the overlays. The number in combination with a letter or letters indicate that these individual masters should be joined together to form the transparency.
