Providing a broad analysis of Colorado's rural problems, the body of this report enumerates rural development and growth management problems; describes remedies worth study; and suggests a policy making system. The Appendix presents supporting material, including comparative socioeconomic data on each Colorado county. Opportunities and threats generated by growth and decline are identified in view of the following goals: (1) to counter economic decline and foster growth to the extent desirable and affordable; (2) to limit locally unacceptable rates of growth, or that which fails to cover its public/social costs; (3) to assure governmental capabilities at all levels to deal with decline and growth; (4) to preserve choice of life style. An hierarchical display of goals, policies, and objectives for rural development and growth management is presented via figure outline. The section discussing concepts and implementation tools presents detailed analysis of the following: (1) Integrated Regional and State Planning; (2) Rural Development Corporation; (3) Preserving Agricultural Land; (4) The Export of Poverty; (5) The Costs of Growth; (6) Development Gains Tax; (7) Pay-As-You-Grow; (8) Zoning and Other Controls for Land Use Growth; (9) Police Power vs Market Process; (10) Implementation Tools for Rural Development and State Growth Management Policies. Proposed program packages are also presented: (JC)
HIGHLIGHTS

The present laws and the present market trends can give Colorado's non-metropolitan counties only more of the same:

- Over half of the counties are declining, stagnant or poverty-ridden.
- One sixth face unmanageable overgrowth.
- And the rest are stable or comfortably-growing.

To achieve adequate rural development, within a coherent state growth policy, consideration should be given to these concepts:

- Integrated regional and state growth management
- A Rural Development Corporation
- Preserving agricultural land
- Specified growth management objectives
- A Development Gains Tax
- Pay-as-you-grow public financing
- Growth management strategies: police power vs. improved market processes

APPENDIX A: County Data Sheets

APPENDIX B: Excerpt from Economic Growth and Environmental Decay
INTRODUCTION

This is the final report of a research project sponsored by the Colorado Rural Development Commission. Earlier project effort, on the nature and causes of decline in rural Colorado counties, was an input to the Commission report published in December 1972.

The Nature of the Report

This report takes a broad-ranging look at the nature of Colorado's rural (or non-metropolitan area) problems, and enumerates the sorts of tools needed to deal with them. It is divided into two parts: (1) the body of the report enumerates rural development and growth management problems, describes remedies worth study, and suggests a policy-making process or system, and (2) the Appendix contains supporting material, including comparative socioeconomic data on each Colorado county.

The policy analysis is demonstrated using objectives assumed by the researchers (in the absence of official objectives), and an assortment of tools and concepts selected or developed to meet these objectives.

This report is not a comprehensive examination of all of Colorado's rural development and growth-management problems, nor of all available solutions. It does suggest the range—and the interdependence—of these problems. In doing this it emphasizes the need for extensive analysis and planning, and for the integration of many different tools and efforts—if the problems are to be dealt with.

Throughout the report, rural development is treated as a part of state growth management—these are not readily separable concepts. This makes it difficult to define rural development. In this report it means policies seeking the best combination of actions and responses to the following goals for Colorado's non-metropolitan regions:

1. To counter economic decline and foster growth to the extent desirable and affordable.

2. To limit locally unacceptable rates of growth, or that growth which fails to cover its public and social costs.

3. To assure governmental capabilities at all levels to deal with decline and growth.

4. To preserve choice among life styles, including maintenance of existing rural and small town ways of life.

As the authors perceive Colorado's present situation of opportunities and threats generated by both growth and decline, substantial achievement of these goals would mean rural development.
Limitations of the Report

The economic fate of farmers and ranchers is an important aspect of the future of non-metropolitan Colorado. However, this lies largely in the hands of Federal farm policy makers and in national and international markets. As far as Colorado state policy and action is concerned, this study sees little to be done except preserving certain types of land for agricultural use.

Federal policies on rural development, land use, community development, revenue sharing and environmental protection will also affect Colorado rural development and growth management policy. These policies were in such confusion and flux at the time of writing (Winter 1972-1973) that they were treated only superficially (see Section V, Hierarchy).

Acknowledgments

This entire project depended on the assistance of the many knowledgeable people we interviewed, some 150 around the state, and many more in state and Federal government. We are grateful to all of them, and particularly to F. Kenneth Baskette, Jr., Director, Colorado Rural Development Commission, for his advice and support. The judgments and suggestions in this report, however, are solely the responsibility of the authors.
Section I. COLORADO IN 198?

Scenario: The Way Things Might Go

If recent trends continue, population along the Front Range will grow past 4 million by 1990, more than double the present population. On the other hand, most of the 33 Colorado counties with established trends of population decline may see their gross population decline even further.

Rural Decline

For the farming and mining counties, decline will be the same old story: fewer people needed to produce as much or more wheat or coal or whatever else. Overspecialized rural economies, dependent on a single product, are vulnerable. With ever fewer job slots in the single basic industry, the young will continue to leave for opportunities elsewhere.

Most of these rural communities are at a comparative disadvantage for attracting new economic activity. As they decline, the comparative disadvantage relationships (as compared to other potential locations) grow worse. In several counties, the state subsidy (state support of welfare, education, and other services) will continue to outstrip state tax revenues, increasing the state's poverty burden.

A few new rural area economic activities will develop and communities like Grand Junction and Fort Morgan may thrive, but their growth may reach the point of endangering the present life style many of their residents cherish.

Selective Recovery - Natural Resources Development

Oil shale development, as a reality, will bring thousands of construction workers to ill-prepared Western Slope towns. Demands for schools, roads, and other services will soar before new local tax revenues are generated; even later, the new tax base may be in different jurisdictions from the places where services are required. Land prices will be bid up, but property taxes will be no more adequate to let government share in the rapid appreciation of values than it has been in the sixties and seventies. Here again, rather fragile, specialized economies, based on ranching and tourism, are quite vulnerable to the construction boom and subsequent preeminence of oil shale mining and processing in the area's economy and society.

In a few rural counties, land speculation may continue to be an industry in itself, pouring filing fees into otherwise penurious court houses. However, little local economic benefit from these activities may be seen; there is great uncertainty as to how many 5 acre "ranchettes" will actually be built upon, or how much income and tax base their prospective residents
will generate—if indeed they move in. It is relatively certain that once ownership of the land is fragmented, reassembling the land for agriculture or new community development is almost impossible.

Rural Boom, and Rural . . . ?

A few formerly agricultural counties will have boomed with tourism and resort development and their associated early state construction splurges. Routt county will have followed the precedent of Pitkin and Summit counties in the late 60's and early 70's, converting most of its irrigated pastures to other uses. For several years, starting in the early 70's, Routt will have given up about 3000 acres a year of prime irrigated hay and pasture land.

Essentially, these counties will have turned into part-time mountain suburbs. They will be peopled substantially by upper middle and upper class condominium or second-home owners. The other major population group will be the transient and low paid trades and services employees drawn to resorts. The wealthier, with their buying tastes and life styles, will dominate local markets, including housing. There will be continuing shortages of low and moderate price housing for low paid resort employees, or for those working in other industries struggling to survive in the specialized resort atmosphere. The requirements for education and other public services will be high, even though many of the residents will be of erratic tenure in their mountain homes. Local taxes will be high, but local service demands will certainly outstrip property tax base capabilities and probably will go beyond acceptable levels of sales tax.

These resort area economies will become highly specialized, just as the local social structure will have become. These economies will be quite vulnerable to changing recreation fads, changes in the business cycle, or tax reforms damaging the attractiveness of condominium ownership and business related luxury travel. Ranching will have been effectively eliminated by the rise in land prices and taxes. Mining and other non-resort activity will suffer from seasonal labor availability, seasonal crowding, and employment problems from housing shortages and high retail prices. As such employees (of non-resort firms which do hang on) move away and become commuters, school district boundaries will separate public revenue sources from expenditure needs.

Finally, some of the bloom will be off the boom in the more mature resort bonanzas which have overbuilt and become overcrowded, in the slopes and on the streets. The massive injections of money into the local economies from construction of lodges, homes, condominiums, and public facilities will have tapered off—only then will it be realized that construction had accounted for half of the economic activity in the area. Prosperity will be less universal. Vacant buildings may appear and remain so for longer periods. At this point it will be difficult to introduce other economic
activity, to bring diversity into these communities. It may even be difficult to support the public establishments and services that have been created, or to pay off indebtedness. Economic stagnation will be present.

**Conclusion**

The present trends of economic and social development are disturbing, particularly for the rural counties. If the trends are extrapolated to 1997, they look very bleak. Yet under the present rules of the development game, that's the way Colorado is apt to be.
Section II. THE NATURE OF DECLINE

Thirty two of Colorado's 63 counties showed population decline in the 1950-1970 period. These were all non-metropolitan counties, and were predominantly rural by any definition. The declining counties almost invariably had been economically over-specialized, dependent on a single agricultural or mining activity that no longer needs so many employees. At the end of the period the counties were poorer in human and usually in material resources. Some areas of widespread poverty were found in counties which had leveled off after long declines.

Poverty is more than a local problem. In 23 counties the State's contributions to local educational and welfare services exceed the county's input to state income tax and sales tax revenues. These counties are importing these public support services (or at least the money to pay for them) which they can not furnish; in turn, they are exporting their poverty to the rest of the state (and the nation).

Since these deficit situations have gone on for years in some counties, the entire state has an interest in changing the situation—in keeping the deficits from continuing. These deficit counties usually are major beneficiaries of Federal programs, too. If the Federal programs are eliminated in favor of revenue sharing to the states, the state of Colorado will find itself picking up the tab for much greater exports of poverty. (See Concept D, The Export of Poverty).

Population decline is very visible, and easily measured by census figures, but other types of decline are important, too. Changes in the stock of privately held wealth and changes in the material welfare of families are also important measures of decline, worth examining county by county.

Forty-five counties have shown 1960-1970 declines in wealth per capita as measured by assessed valuation per capita (in constant dollars). Although there have been adjustments in assessment practices in that period (e.g., exemption of inventories), assessment in general has grown more rigorous, and this seems to be a useful indicator of changes in wealth.

An indication of general material welfare of Colorado families is available from census information giving the proportion of families with income below the poverty guidelines. In 1970 17 counties had over 15% of their families living in poverty. However, these figures are not available for comparison over time. One indication of the different counties' participation (or non-participation) in the state's growing affluence can be had by comparing each county's median family income with the state median family income for both 1960 and 1970. Twenty one counties showed declines of ten percentage points or more relative to state median family income during the sixties.
The four quantitative measures of decline described here are mapped on Figure 1. The supporting data are on the county data sheets in the Appendix.

Conclusion

As was noted before, the counties with sharp population decline were generally those with the most specialized (or least diversified) economies. These have all been quantitative indicators of decline. Subjective factors are also important: the failure of a community to generate opportunities to retain or attract young people, the even less measurable decline of the spirit of personal accomplishment and satisfaction. All of these are aspects of decline which can't be ignored.
Section III. THE PROBLEMS OF GROWTH

As suggested in the discussion of decline, some of the non-metropolitan counties (and their residents) are also suffering from growth troubles, along with the growth benefits of more money, more people, and -- usually -- more opportunities.

Tax rates and tax costs per citizen are increasing rapidly in Pitkin, Douglas, Routt and similar counties, but the revenues and services never seem to catch up with the needs. Support services are strained (e.g., school crowding, delays in police response). Streets are inadequate for traffic and parking is limited. Water and sewer systems have trouble keeping up with demand, and user fees continually go up. Solid waste disposal is more difficult and expensive. Air pollution appears in rural communities, and clear streams are threatened.

These stresses occur particularly in the counties with recreation booms. The present tax structure -- a pay-after-you-grow-system leaves change in the economy a burden for residents. Housing prices, particularly rents, climb. Residents with moderate incomes may be forced out, damaging existing business and industry. If the new recreation industry is seasonal, welfare costs go up. The residents may find themselves with reduced say in decision-making. Relative median income usually falls with the influx of low-paid resort employees, it may fall even more when resort construction tapers off.

The greatest long-run stress may be the new specialization of the local economy. As specialized dependence on recreation grows, so does economic vulnerability. Vulnerability to changes in tastes, tax regulations, the business cycle, and other factors beyond anyone's control. Any of these might reduce demand for recreation services.

All of these strains and frictions impose changes in lifestyle on the residents of the rural areas -- whether they want change or not. And local government short of people, time, money and expertise in the new problems often has a very difficult time dealing with growth and the changes it demands.

Local governments in non-metropolitan areas, need more resources and help than they have been getting to deal with both decline and growth.
Conclusion

Growth usually brings more business, more opportunities, more people, and sooner or later, more tax base. If it brings these things in timely fashion, and in accord with the four policy categories or goals listed in the Introduction, growth is good, generally speaking.

However, growth now taking place and in prospect for the near future is not all good. It brings problems demanding serious attention by the government of the State of Colorado.
Section IV. HOW CAN THE STATE OF COLORADO HELP?

The State does a great deal for non-metropolitan counties and municipalities now. It furnishes money and administrative help through dozens of agencies and their various programs. One conspicuous lack however, is a set of growth policies that would clarify what the different agencies and levels of government should do to deal with decline and growth, policies that would tell each what they can expect of the others.

Bits and pieces of growth policy are contained in different statutes. These are generally statements of good intentions which don't offer much guidance for action. Others are in laws with little implementation and funding. Growth policy is more specifically enunciated in route decisions on the interstate highway system, or in expansion of two year colleges to four year status. However, these fragmentary, often unwitting statements of growth policy are hard to interpret and impossible to design program objectives around.

The bits and pieces approach to growth policy reflects a tendency to look only at individual separate parts of the problem. Or it defines the problem in terms of some favorite tool for dealing with a piece of the problem, e.g., land-use planning. Unfortunately, the whole of everybody's favorite solutions is less than the sum of the parts if the solutions don't fit together or if the entire problem (threat or opportunity) isn't addressed.

What is the right problem?

For policy making, the right problem is one that is comprehensively described--described understandably enough to guide the writing of clear objectives which, if met, handle the problem.

*S. B. 51, 1972 session of the Colorado General Assembly, amended the statute defining the purpose of the State Division of Commerce & Development. "to plan and promote the economic development of the state and particularly those rural and lesser populated areas of the state which desire to encourage such developments as well as neighborhoods with high chronic unemployment;" HB. 1076, same session, made this policy declaration (but only implemented it with an unpaid, unstaffed population advisory council): "that it is the policy of the state of Colorado to encourage population planning that will result in the balancing of economic activity throughout the various regions of the state; to discourage population patterns that will result in the excessive centralization of economic activity in one region of the state to the detriment of other regions of the state; to encourage population stability at levels that will not exceed the capacity of the state's natural resources; and to discourage growth in excess of the capacity of government to provide efficient and quality services essential for the health and welfare of its citizens."
Clear objectives are the crucial concept.

How clear? Clear enough so one can tell two things:

1. One can tell the degree to which programs are responding to the problem, or the threat or opportunity.

2. One can tell the degree to which programs have or have not achieved the objective.

The following Hierarchy of Policies, Threats and Objectives shows how policy and objectives may be expressed. Following this are concepts and tools which could be used as building blocks for programs to achieve the objective. The Hierarchy also suggests how those objectives may then be used for comparing alternative policy and program packages.

To facilitate this analysis the authors made working assumptions on Colorado growth policy, or what a Colorado growth policy might look like. These assumptions are expressed in the Hierarchy.
Section V. HIERARCHY OF GOALS, POLICIES, AND OBJECTIVES FOR RURAL DEVELOPMENT AND GROWTH MANAGEMENT

The Hierarchy is presented in Figure II. The left hand margin entries describe the levels of the Hierarchy. The boxes describe the goals, threats, policies and objectives, the descriptions becoming more specific at each lower level.

Based on the Hierarchy, Detailed Operational Objectives are proposed for each of the four classes of regions described in the State Operational Threat. These Objectives respond to the State Operational Threat and rural development goals (in this example, the authors' Operational Threat Response Policy Categories). These Objectives are based on the plans proposed by each region, and then synthesized by GMA and the regions. The Objectives should also respond to Federal rural development policies and programs affecting Colorado and its regions; but this will only be possible when Federal policies and programs are formed and clarified.

The Detailed Operational Objectives will be the basis for designing Program Packages to achieve rural development and growth management in Colorado. In the remainder of this report, major program concepts are described and a more detailed set of tools or program components is listed. (Section VI-J, Implementation Tools) Following that, the use of some of the tools in designing Program Packages is exemplified in Section VII, Program Packages.

Detailed Operational Objectives

As noted above, the management and planning regions of Colorado are divided among four classes, depending on the preponderance within each of decline, growth, or stability. Different qualities of growth are also classed separately, e.g., oil shale, recreation. An individual county within a region may be an exception to any classification.

Class I. Comparative advantage for location of economic activity should be augmented in Regions 1, 5, 6, 7, and 8 by state action to increase employment by at least 8,000 people, exclusive of Pueblo County, in the period 1975-1980 with maximum local participation in the employment gain. Constant dollar per capita personal income within these regions should be increased by 19 percent in the period 1975-1980 (an annual rate of 3-1/2 percent), and no county should have more than 15 percent of its families below the poverty level by 1980.

Agricultural land with a capitalized earnings value of $200 per acre or more should not be converted at a rate faster than 2 percent per year; irrigated land should not be converted faster than 1 percent, and not at all along the Federal Aid Highway System.
Growth Management Policy
A grand goal.

Threat
General statement of problem - of the activities generating the threat to the Grand Goal.

Threat Response Policies
General Policy Statement responding to specifically described threat, or otherwise authorizing response.

Operational Threat (State)
Actual or potential problem, more precisely defined, for which remedial policies are being sought.

State Operational Objective
Indicator of desired achievement - written to describe a desired state of nature where the Threat exists only at an acceptable level.

Operational Threat Response Policy Categories
Categories of remedial policies in response to Operational Threat and State Operational Objective.

Detailed Operational Objectives
Indicators of desired achievement by Class of region - written to describe desired state of nature where the Threat exists only at an acceptable level.

Program Packages
Sets of program implementation tools and projects (components) which together will meet the regional and Detailed Operational Objectives.

FIGURE II.
HIERARCHY OF GOALS, POLICIES AND OBJECTIVES FOR RURAL DEVELOPMENT AND GROWTH MANAGEMENT

To seek more balanced growth among places and over time in communities where reasonably possible in the face of and growth.

Too much concentration on Front Range, threatening strip of crowding, competition, crime, etc.; steady decline in rural poverty and wasted resources; extreme growth in threatening degradation of land (prime resource for income tourism).

To encourage the development and maintenance of viable rural and nonmetropolitan areas.

This TRP (rural development) is now the focus of state development portion of state policy.

Class I: Twenty-eight rural counties, with 210,621 people, in population, per capita wealth, and/or relative income; are having severe poverty problems. This involves declining real per capita income and often causes involuntary changes in lifestyle. These counties Region 8, 7, 6, 5 and 4.

Class II: Four rural counties are growing at very rapid rates with cost of growth not being covered even with rising per capita specialization and seasonability of their economies and rapid conversion of agriculturally and esthetically valuable income, and with involuntary changing of existing lifestyle with 85,000 people face an oil shale boom with accompanying growth beyond that covered by tax revenues, and involuntary change.

Class III: All other counties.

To encourage the Colorado population increment in the between 400,000 and 600,000 people; 40% of this population is directed outside the Front Range by rural development, state and local revenues. Real per capita income to property tax base (constant dollars) per capita to be desirable growth rates will be determined by each region. Assure no more than 1% conversion of irrigated land is the net result of 12 regional objectives.

Control locally unacceptable rates of growth or that which fails to cover social and public costs.

Countergrowth-efford.

Preserve choice of life style to include existing rural and small town way of life.

These goals constitute what the authors assume to be specified on pages 18-19.

ES AND OBJECTIVES
GROWTH MANAGEMENT

Over time, maintaining viable core face of threats from decline:

- Strip city with attendant problems declining in some areas of Eastern Slope for income from agriculture and
- Viable areas, now the grand goal of state growth plan.
- People, are continuing their decline income; or after a period of decline, declining tax base and relative income.
- These counties are largely in Plan-A counties with 22,940 population rates with the public (possibly social) per capita tax costs, with increasing and resulting instability threats, and
- Valuable land with dropping relative life styles.

Class III: Four counties accompanying economic specialization, voluntary changes in life styles.

In the period 1975-1980 to be this population increase to be
development programs financed from income to grow 3-1/2% per year;
- Costs of growth, now substantially borne by previous residents, will accelerate their increase as crowding, pollution, transportation remedies are required.
- Life styles are involuntarily changed.

Counter economic decline; foster growth to extent desirable and affordable.

Assure governmental capabilities at all levels to deal with decline and growth.

Disperse economic activity and population where concentrated to point of public and social costs not being covered; in the meantime public and social costs should be covered by those profiting from the activity.

This TRP (urban growth policy) would be followed down the hierarchy if a state growth plan was being developed and conflicts resolved.

The Front Range area will be further metropolitanized by 1990, with 2.7 million people being added to the existing population of 1.6 million. Public and social costs of growth, now substantially borne by previous residents, will accelerate their increase as crowding, pollution, transportation remedies are required.
- Life styles are involuntarily changed. This includes Planning Regions 2, 3, 4.
Communities should be given substantial choice in retaining present life
styles or seeking growth, tradeoffs between diversified growth and special-
ized growth should be made specific. Local and regional planning, public
management and development should embody maximum public participation,
and should be adequately supported by state and local funds.

Class 2. In Region 12, growth should be held to a rate locally accept-
able. The public and social costs of growth should be met by the benefici-
aries of that growth.

Involuntary changes in life styles should be minimized by permitting
local choice of growth rates. Overspecialization of the economy with total
dependence on tourism and resort construction should be avoided.

To preserve the esthetic values essential for maintaining the recreation
industry and to prevent irreversible commitment of agricultural resources,
there should be no conversion of viewable irrigated land along the Federal
Aid Highway System, and no more than 1 percent per year elsewhere.
Within five years, 60,000 acres of viewable land in Region 12 should be
purchased by the state for leaseback for ranching only, using condemnation
if necessary.

Local and regional planning, public management, and development for
diversification purposes should embody substantial public participation and
should be largely supported from local revenues as long as rapid growth
continues.

Class 3. In Region 11, the public and social costs of growth should be
borne by the beneficiaries of growth. Choice of life styles and of growth
rates should be made available to individual communities.

Economic specialization and overdependency should be avoided; as oil
shale is developed one new non-oil shale basic job should be developed for
each two oil shale construction, production, and processing jobs.

In order to maintain agricultural and recreational resources, irrigated
land should not be converted. Non-irrigated land should not be converted
more rapidly than 2 percent a year, and this largely away from highways.

Local and regional planning, public management, and development for
diversification purposes should embody maximum public participation and
should be supported from local and state revenues.

Class 4. Individual counties in other regions may have problems of
either decline or growth which will require various remedies. Generally
speaking, however, Regions 9 and 10 are in more comfortable condition
and will require less effort to meet the guidelines of the State Operational
Objective.
Section VI. CONCEPTS AND IMPLEMENTATION TOOLS

A number of economic and regulatory tools are available for implementing rural development and growth management policy. These are listed in this section under the Operational Threat Response Policy Categories for which they seem appropriate.

Before listing the tools, however, several concepts are described. The concepts explain the need for and use of major new tools for achieving rural development goals.

A. Regional Planning Integrated to State Goals
B. Rural Development Corporation
C. Preserving Agricultural Land
D. The Export of Poverty
E. The Costs of Growth
F. Development Gains Tax
G. Pay-As-You-Grow
H. Zoning and Planning
I. Police Power vs. Market Process
J. Implementation Tools
   a. Assure Governmental Capabilities
   b. Control Locally Unacceptable Rates of Growth
   c. Counter Economic Decline and Foster Growth to Extent Desirable and Affordable
   d. Permit Choice of Life Style
A. Integrated Regional and State Planning

The Rural development and growth management process for Colorado should be the responsibility of regional councils and a State Growth Management Agency (GMA).

The regional councils should be regional councils of government (COGs), with statutory requirements that they be advised by planning commissions, economic councils of businessmen (including farmers) and consumers, and citizen advisory groups. They should be staffed by professionals in planning, public administration, engineering, and grantsmanship. The staff should carry out operational responsibilities for the council, and should advise and consult with counties and municipalities within the region who need expertise in these fields. The county and municipal planning and zoning functions should remain adequately supported by state and regional funds until they can be locally financed.

Each council, with its advisory groups and staff, should be responsible for identifying and coordinating the needs of individual counties and cities, and fitting them into the regional plans. They should be responsible for obtaining approval, and then for obtaining Federal, state or Rural Development Corporation (RDC) support for individual projects or programs (per Concept B).

Each council should maintain a 5-year plan of growth management which fits GMA guidelines for state growth management. Each regional plan should show goals for development (and diversification) in terms of: incremental employment; total capital needs for incremental economic activity, public sector support services, and housing; land availability and management methods, desired modifications of state zoning and other regulations, etc. The completed plan would include the Program Packages for action. (See Section VII, Program Packages.)

The regional councils should be the intermediary between state plans and local needs, the councils would coordinate planning and authority. They should also be the logical originators of Regional Service Authorities covering all or part of a region.

The GMA should be a small policy making and decision making commission appointed by and responsible to the governor (possibly six members with the governor ex officio) and confirmed by a legislative body. It should have its own staff, including a delegate staff member from each region, and a task force of staff from each appropriate department in state government. The staff should maintain close liaison with the Federal Regional Council and their staff on Federal planning, programmatic grants, and revenue sharing.

The GMA's responsibilities should be dual: (a) it should set state growth policy, within legislated guidelines, and maintain a statewide plan for
achieving its operational objectives for growth management, and (b) it should assist the regions both in fitting their plans into the state plan and in obtaining the resources to carry out their plans. The GMA would inevitably be negotiating with and among individual regions; to integrate their plans into the statewide plan, it should have final approval authority over each regional plan.

The GMA should have advisory groups assuring extensive citizen participation. It should be required to establish information gathering and hearing procedures, including environmental impact statements.
A Rural Development Corporation is needed to (1) counter economic decline and encourage desired growth, (2) preserve the current lifestyle, (3) assure local governmental capabilities to deal with decline and growth, and (4) control rates of growth that are locally unacceptable or that fail to cover their own public and social costs.

The Rural Development Corporation should be a free-wheeling enterprise with wide discretion to furnish capital and entrepreneurial help to businesses, joint ventures, local governments, and semi-governmental authorities (e.g., housing). It should be able to guarantee loans and subsidize interest on them, to make equity loans and grants, and— in rare cases— support manpower development programs or furnish operating subsidies. It could undertake turnkey establishment and construction of new industrial activities to be owned and operated by private firms or co-ops.

The Rural Development Corporation should be funded by the State of Colorado with $300,000,000 over a period of five years. The money should be raised by issuance of full faith and credit bonds (requiring constitutional revision), serviced from the state's general funds, including the state's share of the Development Gains Tax (see Concept F). Much of this money would be in revolving fund operations financing loans, but $100,000,000 should be available for grants and subsidies. It would be important to have some of these funds available as matching money for Federal programs, so mingling of any Federal rural revenue sharing moneys with these funds should be carefully reviewed. However, it is hoped that continuous flows of Federal special revenue sharing funds could be channeled into the Rural Development Corporation.

The Rural Development Corporation should work closely with the state's planning and integration agency (GMA) and with the regional organizations (see Concept A). It should be a major means of carrying out the parts of their development programs for which private capital was not available and for which management assistance is needed. It should also coordinate closely with the Federal agencies administering rural development or community development grant, loan, or guarantee programs (e.g., Farmers Home Administration, Department of Housing and Urban Development, Environmental Protection Agency, Department of Labor, and the Small Business Administration).

A Metropolitan Development Corporation may be desired by the Front Range counties as a counterpart to the RDC. This might lead to political conflicts. Another alternative would be a statewide Colorado Development Corporation. However, the latter the Colorado Development Corporation might not be single-mindedly concerned with rural development.

Regardless of title, the functions described for the Rural Development Corporation appear vital for achieving the Operational Objectives proposed in this report.
C. Preserving Agricultural Land

The state of Colorado possesses an estimated one million acres of irrigated hay and pastureland in mountain country. These lands, for both agricultural and esthetic use, are irreplaceable resources. Once the decision is made to change use - by subdivision, by resort development, or simply by fragmenting ownership - the resource cannot be replaced. The change in use comprises an irreversible commitment.

Colorado has a limited supply of such land. As the land is continually taken out of its present agricultural use, the supply becomes even smaller and the remaining parcels become increasingly more valuable.

Many people place a high value on esthetically pleasing locations in the Colorado Rockies. These people value and demand this resource in one of two ways: (1) as a public trust kept in its present use, to be enjoyed by all now and in the future, and (2) as private property developed for those who can afford to take some for themselves, lessening the amount for public consumption. The demand for Colorado mountain land for both of these purposes will increase. Thus, two conflicting pressures are increasing the demand for use of a decreasing supply of irrigated land - an irreplaceable resource.

Present economics dictate conversion of the land. To date the market system has worked to make private property demand (2) a more profitable, and thus more desirable use of the resource, than public trust demand (1). Because there is an absolute supply of such land, it has become vulnerable to monopolistic abuses. A relatively few land speculators have almost cornered the market in some mountain areas, and can exploit those wishing to use the land for any purposes: housing, agriculture, or esthetic experience.

Land speculators are making decisions in which the public is the primary party at interest. In so doing, they foreclose the right of the public not only to make present decisions, but also decisions based on future needs of future generations.

If present trends continue, the value of these lands for natural use will probably exceed their value for other purposes for these reasons:

- The growing realization of the important role open space and recreation play in preserving mental and physical health of individuals and communities.

- The increasing worldwide demand for agricultural products, particularly animal protein, and the role of American producers in meeting this demand by helping to balance our trade deficit.
Economic recognition of the diminishing physical supply and irreversibility of most changes in use of these lands.

Thus, it can be stated with some certainty that highest and best use - as determined politically - will move toward agriculture and esthetics, and away from commercial purposes. Included in this definition of highest and best use is the concept of "option value." As long as the land is kept in irrigated agriculture, both present and future generations have the option of determining their highest and best use. Although one may not even expect to see the land, one may want to preserve the "option" to see it for oneself, one's grandchildren, and perhaps unrelated future generations.

The essential reason for maintaining an active option demand is the threat of irreversibilities. Government, with its constitutional responsibility to posterity, is the logical intervenor in the present market to protect the public's options for future use.
D. **The Export of Poverty**

It is possible that welfare and education spending in such counties as Costilla and Conejos make local government the leading basic industry. This is, the counties import purchasing power through grants and programs funded by the state and Federal government.

This is often greater than the purchasing power brought in as a result of producing and exporting sheep, coal, wheat, or any other goods and services.

The import-export analogy becomes a little hazy here. If intra-governmental transfers are importing basic income, what is the export? The answer seems clear: where counties cannot support essential local service and where they and their residents must substantially depend on intra-governmental transfers, they are exporting poverty. The entire region, the entire state, and even the entire nation is concerned with such communities because of this general interdependence.

One rough indicator of poverty export comes from summing certain state tax collections from a county and comparing them with the funds returned to that county by the State of Colorado. (See Appendix A - County Data Sheets). The "deficit" between state tax collections and state contributions runs $150 - $175 per capita annually in Costilla and Conejos Counties. Although similar figures are not available for the Federal "deficit," it is estimated to be $500-$1000 per capita for those counties.

This suggests a massive, continuing drain on governmental finances, unless productive employment is generated to make the residents of such counties more economically self-sufficient.

Assuming, conservatively, a $750 per capita annual governmental deficit (State and Federal), Conejos County's poverty will cost government about $60 million over 10 years, plus social dislocation. The present value of that stream of costs, at a 10% discount rate, is $36 million. Capital investment of this amount, or a major part of it, might create a substantial amount of employment in the county, benefiting the residents and the state and Federal taxpayers. See the Program Package for Region 8 in Section VII, Program Packages.
E. The Costs of Growth

Growth and development cost money. They take more money from the community than they return to it, particularly in the short run. The difference between what growth and development cost in taxes, and what they generate in taxes, are the public costs that must be borne by all the citizens—including those living in the growth area before the growth occurs.

Most people living in a high growth area are not beneficiaries of that growth. They don't get greater net incomes, they don't hold much property that appreciates; they don't own expanding businesses. They may or may not find greater amenity values in their community.

In fact, for many people the quality of life goes down. They end up with longer driving-time to work and climbing housing costs. Communications services are degraded and pollution increased. People are more crowded together; in extreme cases they are forced from land, homes or jobs. All of these are involuntary changes in lifestyles, as described in Section III, The Problems of Growth. They are social costs— not listed on an income statement, but costs of growth just the same.

The costs of growth, i.e., the difference between the public and social benefits of growth and the public and social expenses (or damages), seem to vary with three factors:

a) the increasing concentration of people in one location, particularly sprawled concentration. (Mass transportation in the Denver area will be particularly expensive because of sprawl.)

b) the rate of growth, which—when fast—requires more services with less time in which to plan for and furnish them. This emphasizes the gap in time between supplying public services and collecting growth-derived revenues to pay for them.

c) the increasing demand for public services that are people-based instead of capital based. That is, there is increasing demand for education, welfare, policing, manpower development, housing assistance, and health services. These get more expensive in larger or faster growing communities. Providing these people-intensive services contrasts with the conventional wisdom of economies of scale where the expense of delivering water and fire protection and removing sewage would, hopefully, go down as the community grows bigger.

The costs of growth should be borne in timely fashion by the people who benefit from growth: the land developers, the builders, the retailers who directly profit. This seems like simple equity. It also offers a means of making services available sooner, better meeting service needs.
At the moment, these costs can't be accurately figured. Developing information and methods for (a) calculating these costs, (b) identifying whom they fall on, and (c) determining how much the beneficiaries gain from growth, will be essential for state growth policy in general and for rural development policy in particular. This is a first priority undertaking for the State of Colorado, if it and its local governments are to deal with decline and growth.
F. **Development Gains Tax**

A Development Gains Tax would be a new source of public revenues, generated from one of the major classes of growth beneficiaries—those who benefit from appreciation in land values.

Benefits—gains—from appreciation in land values result from obtaining land and then selling it for more than the costs of obtaining, holding, improving, and selling it. This generally results from the beneficiary having investment capital available, having some degree of good luck, and—often—benefitting from the efforts of others to make the land or the locality more attractive.

However, as growth and development take place, the beneficiary (investor, speculator, developer) pays little of the costs of growth to the community. He benefits—others pay, e.g., already-present residents, buyers of land. Furthermore, the non-beneficiaries pay for services through the existing tax structure which is not designed to pay for rapid growth. They also pay increasing social costs by accepting crowding and poorer services (double sessions in schools, delays in telephone service).

A Development Gains Tax would remedy this. It would put more of the burden of paying for the costs of growth on the beneficiaries of that growth (and their customers). It would also alter the comparative attractiveness of the investment in different parts of the state. The fast-appreciating, boom-area land would become relatively less attractive. Land in the static or declining areas would become more attractive for investment.

The Tax would be a tax on the net capital gain from selling real estate and improvements in Colorado. The basis for figuring the gain would be the sale price of the appraised value at the time of acquisition. The basis would be adjusted for inflation during the period the land was held, either by the consumers price index or the deflation factor used in calculating change in gross national product. The basis also would include improvements made during the holding period, also adjusted for inflation up to the time of sale. Finally, the legitimate costs of sale could be subtracted from the difference between sale price and the adjusted basis. The remainder would be the development gain.

For example, assume a county in a steady state of growth with 2500 acres of irrigated ranch land being converted to second home and resort sites a year.

1. Ranchers own 2500 acres with a basis (estimated or appraised value) of $300 per acre. This establishes a basis of $750,000.

2. The ranchers sell the 2500 acres and receive $1500 per acre, a price of $3,750,000. The gain here is $3,000,000.
3. If the development gains tax is set at 30%, the tax revenue would be $900,000 from this cycle of sales.

4. In the same year, 2500 acres just purchased at $1500 (no inflation factor allowed in this example) per acre is being developed and resold. The basis for figuring gain on it is $3,750,000. Improvements and costs of sale come to $3000 per acre or $7,500,000, and the improved land is sold in lots at $10,000 per acre, for $25,000,000.

5. With a 30% tax rate, the tax will be levied on the gain of $13,750,000 (sale price less improvements and sales costs, less basis) for tax revenues of $4,125,000.

Thus, the tax on those sales alone would yield $5,025,000 in a year. This covers only two cycles of land development; no attempt is made to estimate the tax return from sales of land and buildings already in place. In a metropolitan context, the tax might generate $50-75 million a year in the Denver metro area, assuming $2 billion worth of conveyances a year (with widely varying basis and gain factors).*

The proceeds of this tax should be divided among the county (where the land is located), the region, and the State of Colorado. A 50-30-20 split might be found appropriate, and the tax would be earmarked in each jurisdiction for covering the public and social costs of growth. At the 30% rate mentioned above, it might generate $100,000,000 annually under present economic conditions.

The tax would be particularly significant in areas where there is rapid gain in property values because of monopolistic conditions in the property market. The market for land may be theoretically competitive, simply reflecting expectations of the present and future productivity of one piece of land which is similar to many other pieces. In practice, however, Colorado has limited supplies of land with unique characteristics (e.g., located near Roxborough Park, irrigated valley land with a scenic mountain view located near a growing resort). This land is often priced with monopolistic abandon by its sellers. Public policy in the United States has long frowned on monopolistic practices, and the Development Gains Tax might deter such practices in the land markets. In any case, it would let the broader community (which is paying the costs of developmental growth) share in the gains.

*One uncertainty is the effect of the tax on rates of development. The announcement effects of the tax would probably speed up the sale of land--maybe compressing two or three years' sales into the period before the tax's effective date. Land bought with high interest money will probably be developed more quickly than it would be without the tax; but such land may be less likely to be bought with high interest money. The whole question of tax incidence requires study, but obviously much of the burden, where it exists, will fall on the final or residential buyer.
The tax and its rationale should be carefully studied, and might be adapted or applied in other ways. As a modification, it might be used as a tool to encourage maintenance of land in agricultural production by waiving the tax when such land is sold but kept in the same use. However, the tax might be charged back to the buyer if the use were changed within five or ten years.

Regardless of the modification, the philosophy would be the same: The beneficiaries of growth and their customers would pay more of the costs of growth than the bystanders and the victims. The Development Gains Tax is a means of internalizing the costs of growth into the transactions which translate growth into private gain. Furthermore, state and local government would receive growth-related revenues sooner, in time to meet the requirements for services. Finally, it would make the counties not yet experiencing rapid land appreciation comparatively more attractive places for investment.
G. **Pay-As-You-Grow**

Growth costs money as far as public and social costs are concerned; but it does make money for some people (per Concepts E and F). The Development Gains Tax is one means of letting the beneficiaries of growth pay more of growth's costs. It also provides more timely generation of tax revenues needed to service growth, property and income taxes. How else may the costs of growth be covered in timely and equitable fashion?

Growth generates both capital costs and operating costs. Pay-as-you-grow financing, supported by the beneficiaries of growth—would be desirable for both instead of burdening non-beneficiaries with most of these costs.

New water and sewage systems, new schools, new public transportation—all involve substantial capital costs. Water and sewage tap fees large enough to cover construction costs are already being considered. Provision of school buildings adequate to serve large subdivisions may be a logical extension of the idea of requiring school building sites from the subdivider. Capital costs of other public services might be included in building permit fees for both homes and commercial and industrial construction proposed for high growth regions. Since this approach to setting building permit fees would increase housing costs, special effort would be required to fund adequate low and medium income housing programs.

The operating costs of furnishing growth-required public support services are also major expenses which might be more directly borne by those involved in generating the growth. Education, public assistance, policing, public transportation, manpower development, and low income housing are all needs aggravated by growth. None of these needs is comfortably supportable within the present tax structure.

If the costs of growth were better identified, the present value of the stream of future costs of these support services also could be levied as building permit fees. The discount rate might reflect expected inflation rates. This would be particularly appropriate in areas whose rate and quantity of growth exceeds present resources for equitably paying for these support services.

Social costs might also be reflected in building permits. Such growth-produced costs as double sessions in previously-adequate schools, or congestion of highways causing major time losses, or investment in mass transit, have already been mentioned. Pollution costs, overcrowded recreation areas, and increasing private policing costs because of overloaded public police systems are other examples of social costs which should be calculated for possible inclusion in a pay-as-you-grow system of permits and taxes.

The same rationale might be applied in a new severance tax on Colorado fuel minerals. It could be levied after their production is under way.
sufficiently to determine that the price for the minerals is highly inelastic. Then it would be certain that tax costs would be passed on to the eventual customers, and that possibly desirable rural area development would not be discouraged. The severance tax, earmarked and distributed like pay-as-you-grow fees and the Development Gains Tax, would still be devoted to covering the public and social costs of growth.

The distribution of new revenues—Development Gains Tax and pay-as-you-grow—among county, region and state would reduce the present state and local dependence on Federal programs and regulations. They would spread the costs of growth more equitably. The first consideration, however, is good information on the costs of growth (per Concept E).
Zoning and Other Controls for Managing Land Use and Growth

Land use controls have traditionally included zoning, sub-development regulations, annexation requirements and laws, and building codes. These, along with capital improvements planning, transportation planning and renewal programming, represent the traditional approach, the conventional wisdom of planning.

Zoning, and the rest, are necessary but not sufficient means of dealing with growth problems in general and rural development in particular.

Zoning, regulations, and codes are authoritarian statements, based on the police power, of what can and can't be done on the land. In a democratic government, responsive to legitimate popular pressures, authoritarian statements are constantly subject to modification. Private interest economic forces are generally quite legitimate; however, they are sometimes the only interests organized enough to bring a response. They, then, lead to continual modification of existing zoning and other police power approaches to growth control. As long as the concept of "highest and best use of land" is based on maximum economic returns from the land, zoning continues to be a weak basis for long-run expectations about how a given piece of land will be used in the public interest (per Concept C).

There are, of course, innovations in zoning. It has been suggested that changes in water use or point of diversion might be required to conform to land use plans to be deemed "beneficial."

"Agriculture only" zoning has been advocated to protect open space and esthetic values. This is certainly an open use of police power to achieve social ends; it is a zoning that will certainly lead to intense pressure on those responsible for changing the map. If development rights on such land were severed and bought by local government, then the zoning might be less vulnerable.

Even in rural areas some high density zoning might be desirable. Particularly for low income housing, it could minimize rural sprawl and hold public costs down.

Planned unit development is a less rigid approach in which planning authorities and developers can negotiate the final outcome on large bodies of land. The establishment of very large zones for "planned unit development only" may evolve from this, with development on such areas held up until a developer or a consortium of owners and developers agree on a satisfactory approach to areas of thousands of acres each.

If zoning as a tool of growth control is vulnerable to economic pressures, there is no use in ignoring the fact. Instead, it may be more productive to try to modify those pressures (see Concept I).
I. Police Power vs. Market Process: Which Way To Manage Growth?

"Faced with growth unprecedented in Colorado's history, our citizens have been looking with an increasingly jaundiced eye at the results of the free market system," according to Governor John Love in January 1973. He went on to ask the legislature for a state plan for land use and growth, with the means of carrying out the plan yet to be determined.

Determining the means (or tools) raises basic philosophical questions. Do we give up the market system because it seems to have failed in equitably assigning costs and distributing resources? Do we move toward more police power, with inevitably more regulations and more administrators or enforcers? Or can we improve the market system so that Adam Smith's "unseen hand" again functions in the public interest?

Presently, public policy encourages land owners, speculators, and local taxing officials to do the wrong things with land. Property tax and inheritance tax laws push the owners of irrigated pasture land to sell it for development. Income tax regulations encourage land speculators to seek loans with which to leverage their own money into large capital gains. These gains return low tax rates to Federal and State governments, and none at all to the localities which must deal with the eventual developments. And local dependence on property tax revenues pushes commissioners and councilmen to rezone land to more lucrative uses regardless of impacts on community, future productivity or future needs. Annexations are approved regardless of long-run costs.

Obviously, some changes in public policy are needed. Which kinds of policies are needed, police power or improved market processes? Both kinds, probably. Zoning, codes, regulations and prohibitions are probably needed now, and quickly. But these authoritarian measures generate bureaucracies, and their effectiveness decays as they inevitably respond to economic pressures (per Concept H). In the long run, many of the decisions for growth management could and should be made through a market process.

Some of the tools for growth management are compared below in lists of police power tools and market strengthening tools. These are tools particularly appropriate for augmenting the comparative advantage of Colorado rural areas versus other locations for economic activity:

<table>
<thead>
<tr>
<th>Police Power Tools</th>
<th>Market Strengthening Tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zone for industrial and nonindustrial areas, with no new industrial zoning in high growth areas</td>
<td>Pay-as-you-grow building permit fees</td>
</tr>
<tr>
<td>Establish &quot;agriculture only&quot; zoning</td>
<td>Environmental impact and economic impact reports and hearings on major plants and subdivisions in high growth areas</td>
</tr>
<tr>
<td>Forbid annexations</td>
<td></td>
</tr>
</tbody>
</table>
### Police Power Tools
- Stop issuing building permits in high growth areas.
- Sever development rights from agricultural land and condemn them.
- Legislate tax concessions.

### Market Strengthening Tools
- Improved access by telecommunications and transportation.
- Loan guarantees and interest subsidies for plant construction and equipment in declining areas, with affirmative action programs benefiting local residents.
- Development Gains Tax.
- Buy irrigated land and lease back to agricultural users.
- Manpower development and housing programs in declining areas.

The point is that a mix of both kinds of tools is needed to augment comparative advantage in declining areas. Without market strengthening tools, however, the police power tools will probably wear out, become corrupted, or become too elaborate and expensive to use.

The selected tools listed below are economic and regulatory mechanisms that can be used to implement rural development and growth management policies. A few are now in use, but they will be most effective when integrated as components of Program Packages responding to several goals.

Tools To Assure Governmental Capabilities

It should be noted here that regional agencies, presumably councils of governments (COG's), are considered by the authors as an essential part of any successful rural development or state growth management effort. Regional planning bodies acting as intermediaries between state and local governments form the basis on which other efforts depend. They would be organized as per Concept A, with maximum participation from professionals and citizens.

a. Regional and local planning operations should be well supported and well staffed, with their work integrated to fit state objectives. (Most of the agencies would probably need to be subsidized initially.)

b. The use and efficiency of Regional Service Authorities (covering either the entire region, or parts thereof) should be explored.

c. Regional agencies should seek resources and participation from nearby community and state college faculty and students.

d. Regional agencies should offer expertise in grantsmanship, planning, public administration and engineering to nonmetropolitan communities. The state should lend representatives to regions needing them until the regions could afford their own.

e. Regional agency offices should be housed together with representatives of state agencies or at minimum in the same town.

f. Regional agencies should require economic and social impact statements on all proposed projects, holding open hearings to let citizens determine the desirability of new developments.

g. Regional agencies should receive a 30% share of the Development Gains Tax proceeds for operating and investment capital.

h. Regional agencies should be responsible for their region's five-year growth management plan.
State Assurances

Assistance Tools

1. A State Growth Management Agency (GMA, per Concept A), should co-
ordinate state policy. One representative from each region, and one
staff member from each of the following state bodies should be repre-

tented: Land Use, Local Affairs, Commerce and Development, Local
Government, Planning, Comprehensive Health, LEAA, Highway, Game,
Fish and Parks, Housing, Education and Budget. Close liaison would be
maintained with Federal Agencies such as Forest Service, HEW, HUD,
Agriculture, FHA, SPA, and EPA, and with the Colorado General Assem-
bly and its Legislative Council.

2. A State Rural Development Corporation should offer financial, entre-

prenurial, and management assistance.

3. An affirmative action program for employing local residents--including
manpower development--should be required of new industry assisted in
locating in rural areas.

4. A State Housing Authority would finance low and moderate income hous-
ing needs.

5. Dispersal of state governmental agencies would create new employment
and better communication.

6. One representative from each appropriate state office should be loaned
to regional COGs until they can afford to staff their own adequately.

7. Statewide or countywide zoning should be established.

8. Changes in water use or point of diversion should be limited to those
compatible with regional or state plans.

9. Restoration of any lands degraded by mineral exploitation should be
required.

10. A county manager and planner should be required in each county. (Some
may be shared within a region.)

11. The state (or region) should have authority to establish agricultural dis-
 tricts with zoning and taxation based on agricultural use.

12. The state should prepare guidelines to assist regions in determining plan
acceptability, needs, and costs of growth.

13. State Division of Commerce and Development, regions, and RDC would
link entrepreneurs, communities, capital, manpower programs, etc.
14. Wage differentials might be paid to professionals as an incentive to locate in rural areas (public administrators, planners).

**Funding Tools**

1. A constitutional amendment should authorize the state to incur bonded indebtedness raising $300,000,000 for RDC; additional bonding for the Department of Natural Resources would permit purchase of irrigated land.

2. A Development Gains Tax would give the state a 20% share in the proceeds; this amount should be put back into the RDC revolving fund.

3. State pension fund money diverted to poorer counties by deposit in local banks and savings and loans would create capital investment funds.

**County Assurances**

**Assistance Tools**

1. Counties should have more flexibility to change their management/administrative organization with the coming of growth. The efficiency of merging some counties should be considered.

2. Counties should have more flexibility to change welfare residential eligibility requirements in order that residents of popular tourist areas are not burdened unduly. This would require change in Federal administrative regulations.

3. Cities have the option of vetoing economic activities. New jobs would be limited to not more than 3-5% of the population per year, unless they would primarily employ women, or the city had determined their support capacity is sufficient.

4. Counties, regions, and the state should have authority to establish moratoriums in high growth areas on building permits, land sales, taps, annexations and rezonings for both residential and industrial projects.

5. Counties and regions should have their rights of eminent domain expanded to include acquisition of land for development or open space (agriculture or esthetics).

6. Counties or regions should be empowered to predevelop annexable land for both residential and industrial purposes either by themselves or as a joint venture with the developer or the present owner.

7. Counties and regions should be encouraged to require forced joint ventures on developments with PUD planning.
Funding Tools

The counties and regions should share in the profits from growth, and maintain and improve their support structure.

1. Development Gains Tax proceeds should be split 50/30 between county and region, with the remaining 20% going to the state RDC revolving fund.

2. Pay-As-You-Grow mechanisms (per Concept G).
Tools To Control Locally Unacceptable Rates of Growth and That Which Fails To Cover its Public and Social Costs

Assistance Tools

1. The state should prepare guidelines to assist regions in calculating the costs of growth - kind, magnitude, and incidence.

2. Regional agencies with their planning and review committees should set goals and implementation plans on growth rate and mix.

3. Regional agencies should require economic and social impact statements from subdividers and large new employers in high growth areas. The COGs would hold public review hearings for citizens to determine the desirability of all new projects, where they should be located, and standards to be met in conforming to community needs.

4. The state, regions and counties should be empowered to buy irrigated pasture and haylands and lease them back to farmers and ranchers.

5. All levels of government should have the authority to employ these prohibitory measures when necessary:
   a. Zone for industrial and nonindustrial areas with no new industrial zoning in high growth areas.
   b. Forbid changes in zoning and use of agricultural land, or alternatively, form agricultural districts.
   c. Forbid any conversion of valley land along the Federal Aid Highway System. This might be extended to include any state highway.
   d. Changes in water use or point of diversion should be limited to those compatible with regional or state plans.
   e. Authorize moratoriums on building permits, land sales, taps, annexations, and rezoning applications.
   f. Authorize moratoriums on new housing until low and moderate housing needs are met. This might also be employed to assure sufficient school facilities.
   g. Limit the number of total dwelling units in a city or county, or the rate of growth. For instance, a city should have the option of vetoing economic activity by limiting the creation of new job opportunities to 3-5% of the population.

6. Restoration should be required for any lands degraded by mineral exploitation.
7. An affirmative action program for employing local residents—including manpower development—should be required of new industry assisted in locating in rural areas.

8. Counties should have flexibility in reorganizing their administrative/management structure with the coming of growth.

9. County managers should be required in all counties and county zoning should be instituted, especially zoning to guard against rural sprawl.

10. Forced joint venture Planned Unit Developments should be encouraged. Additionally, counties and regions should be empowered to condemn and predevelop annexable land.

11. Land (or partial construction) for schools, low and moderate income housing and open space, as well as road, water and sewer development should be a precondition for building permits and subdivision rights.

**Funding Tools**

Pay-As-You-Grow techniques should be employed where needed to assist in covering the public and social costs of growth.

a. The Development Gains Tax. The proceeds should be split 20/50/30 between the state, county and region.

b. Deferred tax payments. The Development Gains Tax might be waived when the sale of prime agricultural land does not comprise a change in use. However, whenever the use is changed for development purposes, this tax would be levied. In addition taxes based on the new assessment should be required for the past seven years.

c. Minnesota dual tax assessment system. This system should be instituted for agricultural lands to ease the burden on present ranchers and farmers.

d. Building permit or tap fees for new subdivisions and major industrial and commercial buildings should reflect the calculated present value of a 20-year deficit for covering public and social costs (per Concept G). Alternatively, these fees should reflect net capital costs.

e. A severance tax in addition to the present ad valorem tax on mineral fuels production should be levied and shared 60/40 between the county and region. The concept of a severance tax or use change tax on the conversion of open land should also be studied.
Tools for Countering Economic Decline and Fostering Growth To Extent Desirable and Affordable

Assistance Tools

1. Direct capital and operating subsidies to firms would provide an incentive to locate in rural areas. Particular emphasis should be placed on attracting agricultural related industries. Alternatively, short-term tax exemptions could be given to locate in Class I areas.

2. Loan guarantees, interest subsidies, equity grants, capital subsidies, or operating subsidies should be used for:
   a. Industrial site development
   b. Plant construction and equipment
   c. State purchase contracts
   d. Materials assembly
   e. Manpower assembly
   f. Processing subsidy
   g. Distribution subsidy
   h. Output subsidies

3. The State Division of Commerce and Development, regions, and RDC would link entrepreneurs, communities, capital, manpower programs, etc.

4. A state Homestead Act II should be considered to train and resettle urban dwellers in rural areas, matching skill needs and capabilities.

5. An affirmative action program for employing local residents--including manpower development--should be required of new industry assisted in locating in rural areas.

6. State investment in a telecommunications system would provide educational, employment, and cultural opportunities not now available in rural areas.

7. "Contribution to present and future regional development" should be added as a criterion for state highway improvement planning.

8. Locally initiated co-ops should be encouraged with low-cost loans and subsidies.

9. A State Housing Authority would finance low and moderate income housing needs.

10. Counties should be encouraged (possibly subsidized) to predevelop annexable land. Additionally, joint venture Planned Unit Developments should be encouraged.
11. The state, regions and counties should be empowered to buy irrigated pasture and haylands and lease them back to farmers and ranchers. (Leasing might be done with competitive bidding, or possibly subsidized lease rates.)

12. The Minnesota dual tax assessment system should be instituted for agricultural lands to ease the burden on present ranchers and farmers.

13. Wage differentials might be paid to professionals as an initial incentive to locate outside the metropolitan areas.

Funding Tools

1. Diverting some Highway Trust Funds to building rapid transit between metro and nonmetro areas, and among nonmetro areas would increase accessibility and comparative advantage.

2. State pension fund money diverted to poorer counties by deposit in local banks and savings and loans would create capital investment funds.

3. The proceeds from a Development Gains Tax would allow the county, region and state to share in the proceeds of growth. However, this tax might not apply initially to declining areas, thus increasing their comparative advantage.

4. A Rural Development Corporation is an essential tool in achieving this particular objective. Large sums of money will be needed to bring some of these counties to a competing position with other counties.
Tools To Permit Choice of Life Style (Including Preserving Small Town and Rural Ways of Life)

1. Regional COGs with planning and review committees should set goals and implementation plans on growth rates and mix. They have the option to request or reject developmental support from the state and from RDC.

2. Economic and social impact statements should be required of all new developments. The regional COG would hold public review hearings for citizens to determine the desirability of all new projects, where they should be located, and standards to be met in conforming to community needs.

3. The regional COG should use the state, RDC or Development Gains Tax resources to maintain the present mix of employment, or to diversify in the face of overspecialization. Overspecialization is a particular threat to preservation of life style. Each county and region should plan diversification efforts when one basic form of employment begins to exceed 25%.

4. State and industry joint venture development of new towns should be examined for feasibility.

5. Locally initiated co-ops should be encouraged with low-cost loans or subsidies.

6. State Department of Natural Resources, with the approval of the GMA and regional COGs, would have the authority to condemn land and lease it back to individuals or to co-ops of families who desire to farm or ranch it. This might also be done with a buy, lease-back program designed to preserve the agricultural life styles.

7. A state Homestead Act II to train and resettle urban dwellers in rural areas would provide needed services and give urbanites another choice.

8. The state, through Denver Opportunity School and Colorado vocational schools, should consider training and placement programs for skills needed in rural towns—plumbers, TV repairmen, shoe repairmen. Guaranteed placement and housing might be used as an additional incentive.

9. A statewide telecommunications system would permit relocation of clerical employment and additional educational and cultural opportunities for rural residents. (This might be financed by RDC and industry in a one-town demonstration project; if successful, it might become self liquidating.)
10. A State Housing Authority would finance low and moderate income housing needs.

11. State pension fund money diverted to poorer counties by deposit in local banks and savings and loans would create capital investment funds.

12. Wage differentials might be paid to professionals as an initial incentive to locate outside metropolitan areas.

13. Agricultural Districts should be established, using the New York State Model.

14. When an agricultural sale does not comprise change in use, Deferred Tax Payments would encourage farmers and ranchers to continue production. Another incentive, the Minnesota Dual Tax Assessment System, should be used in conjunction with the Deferred Payment System.

15. Pay-As-You-Grow techniques would assist any residents of a threatened area to preserve their present life style.
Section VII. PROGRAM PACKAGES

The Detailed Operational Objectives would be used by the GMA for developing proposed employment growth (or population growth) objectives for each region. For instance, the objectives for the Class I regions might initially be proposed like this:

Region 1 - 1400 basic jobs, 2000 local service jobs
Region 5 - 400 basic jobs, 300 local service jobs
Region 6 - 800 basic jobs, 100 local service jobs
Region 7 - (excluding Pueblo County) 1000 basic jobs, 1000 local service jobs
Region 8 - 600 basic jobs, 600 local service jobs

This is a proposed distribution of the 8000 additional jobs required by the Detailed Operational Objective for Class I counties. The allocations are judgmental, with criteria including each region's needs, resources, and capabilities for absorbing jobs and people.

First approximation program packages for achieving these objectives are then prepared and worked back and forth between GMA and the regions until they are detailed, feasible, and mutually acceptable.

A Program Package is essentially the set of program components which together will meet the regional objectives. The program components are the combination of tools (as described in Section VI, Concepts and Tools) and projects which will achieve the objective. For instance:

The Program Package for Region 1, Lower Platte River Valley, might include these components:

A. Develop additional feed lot and packing plant operations furnishing 500 basic jobs.

B. The Colorado State Department of _______ would relocate a 400 employee clerical unit (basic jobs) to Ft. Morgan, using 1975 broadband communications technology to link this with Denver and other offices by video conferencing, high speed facsimile, and audio and computer links.

C. Miscellaneous manufacturing would be encouraged in Logan, Sedgwick and Yuma counties to add 500 basic employees.

D. Long-range planning emphasizing high speed ground transportation and urbanization.
The Program Package for Region 8, the San Luis Valley, might include these components:

A. Miscellaneous manufacturing employment would be developed to generate 200 basic jobs in Conejos county, and 100 basic jobs in each of Costilla and Saguache counties.

B. Livestock raising and agricultural resources would be enhanced to generate at least 100 basic jobs.

C. Local service industry would be assisted in developing in Costilla, Conejos and Saguache counties.

Conventionally, small manufacturing operations are not deliberately established in a given location "on call," or even over a five-year period. This is not the usual situation however. In Region 8, and to some extent in Region 1, the availability of 50-100% of plant and start-up capital will present a different sort of problem: the selection of the best entrepreneurs with the best ideas and capabilities.

These Program Packages are described in more detail on the following Program Component Impact Sheets. They vary considerably between these two regions. Region 1's might be called a diversified growth package, that for Region 8 would be considered an economic turnaround package.

The differing conditions in the regions are reflected in widely varying costs of dealing with their problems of decline. The RDC costs tentatively estimated for Region 1 are at a rate of $4,000 per job, or $13 million total. The roughly comparable Region 8 costs are $21,000 per job for a total of $25 million. Considering the deficit figures cited under the Export of Poverty concept in Section VI, the Region 8 investment might be the better risk on the chance that it can turn around the existing social malaise and the continuing drain on government funds in the region.

The treatment of costs, impacts, and benefits on the Program Component Impact Sheets is extremely superficial. They are merely examples of the analysis approach recommended for rural development and growth management policies. They suggest the initial procedural steps, but they lack needed cross-checking. Cross-checking identifies (1) parties-at-interest to implementation of the various projects, and (2) program conflicts or reinforcements with other government programs.

* The description of each component assumes that all of the tools described in Section VI, Concepts and Tools, have been made available by legislative or constitutional action. It particularly takes as given the tools listed under Assure Government Capabilities. They (or their equivalents) seem essential for serious efforts at rural development and growth management.
This cross-checking would be particularly important relative to Federal programs for rural development and community development. These Federal programs are now in a state of uncertainty and transition. For instance, the Congress is considering several bills requiring state planning and control of some types of development. The Environmental Protection Agency is reported considering demanding similar state action under the Clean Air Act of 1970.

The Rural Development Act of 1972 vests authority and spending authorization in the Department of Agriculture. The President's proposed executive reorganization would merge many programs, including rural development, into a new Department of Community Development—probably dominated by the present Department of Housing and Urban Development.

The future of special revenue sharing (as opposed to programmatic grants) is unresolved, and from it comes much of the impetus for the New Federalism and strengthened state governments. Assuming that special revenue sharing will come into being alongside some retained programmatic funding, there will probably be a mix of Federal moneys available.

Regardless of the outcome of these uncertainties, it does seem important that Federal rural development funds, including those appropriated under the Rural Development Act of 1972, come fully into the state's rural development and growth management process.
## Program Component Impacts

### Economic Costs
- Higher demand for feed, feeder stock, slaughter stock; higher prices - not much effect except for feed.

### Social Disruption
- Negligible, unless over rapid growth in community.

### Political Resistance
- Would be attractive project unless competitors and their unions complained.

### Administrative Complexity
- RDC should handle easily if loan guarantee and interest subsidy is adequate.

### Environmental Impacts
- Feed lot runoff and slaughterhouse effluents would require disposal.

### Secondary Effects
- Odor could be problem without careful siting.

### Summary Comment
- This is low-cost rural development. RDC costs are $4.2 million for 500 basic jobs. It appears compatible with all four rural development goals, Section V.
### PROGRAM COMPONENT IMPACTS

**Class 1 Counties Program**

**Region 1 - Lower Platte River Valley**

<table>
<thead>
<tr>
<th>Component B</th>
<th>Economic Costs</th>
<th>Social Disruption</th>
<th>Political Resistance</th>
<th>Administrative Complexity</th>
<th>Environmental Impacts</th>
<th>Secondary Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Colorado State Department of _______ would relocate a 400 employee clerical unit to Ft. Morgan, using 1975 broad-band communications technology to link offices with video conferencing, high speed facsimile, and audio and computer links. This system would be put up for competitive proposals, with RDC investing $1 million and $50,000 per year for 4 years. RDC would recapture cost if extra capacity could be rented to other private corporations.</td>
<td>Some additional agency travel costs.</td>
<td>Denver employees would be offered transfers; it is estimated only 150 would go, netting 250 job opportunities for local residents.</td>
<td>Denver legislators may be critical of public investment moving jobs out of Denver.</td>
<td>Selection of unit to move and establishment of new administrative procedures would be difficult.</td>
<td></td>
<td>The new communications link may focus much development attention on Ft. Morgan, at expense of other localities. GMA-to-COG relations (if located in Ft. Morgan) could be uniquely close. Similar links might be demanded by other COG's.</td>
</tr>
</tbody>
</table>

- Additional housing needed.  
- Regional counties east of Ft. Morgan may feel excluded from Program benefits.

- Improved Denver to outlying area government relationships.
- Less traffic density in Denver's Capitol area.

**SUMMARY COMMENT**

Ft. Morgan is a logical site for this innovation, with easy auto access supplementing telecommunications. The costs of the experiment are low with RDC costs estimated at $1.2 million.
### PROGRAM COMPONENT IMPACTS

#### Region 1 - Lower Platte River Valley

<table>
<thead>
<tr>
<th>Component</th>
<th>Economic Costs</th>
<th>Social Disruption</th>
<th>Political Resistance</th>
<th>Administrative Complexity</th>
<th>Environmental Impacts</th>
<th>Secondary Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Capital investment for new public support services, including highway links.</td>
<td>Yuma county might have trouble accommodating growth. Phillips and Washington counties would resent non-participation.</td>
<td>Region would have difficulty in allocating plant sites, among different communities wishing them.</td>
<td>Increased demands for domestic (municipal) water.</td>
<td>Communities not selected for new enterprises would face further decline, and would in turn be less eligible for support resources.</td>
<td></td>
</tr>
</tbody>
</table>

**+** Affirmative action program would encourage hiring local residents.  
+ Permit people to continue living on farms and in small towns while working in plants.  
+ More stability to Wray and Julesburg, and to entire region.

**SUMMARY COMMENT:**  
Attracting manufacturing employment to smaller towns would be major challenge to rural development and growth management process; but could maintain some viable small towns.  
RDC costs: $6.1 million for 500 basic jobs.
<table>
<thead>
<tr>
<th>Component D</th>
<th>Economic Costs</th>
<th>Social Disruption</th>
<th>Political Resistance</th>
<th>Administrative Complexity</th>
<th>Environmental Impacts</th>
<th>Secondary Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long-range planning, with emphasis on problems of high speed ground transportation and urbanization, as communities along the South Platte River face rapid development.</td>
<td>Programs to preserve agricultural land and present life style. (Predeveloping annexable land; buy lease-back programs.)</td>
<td>Prospect of urbanizing Ft. Morgan to Sterling area; disrupting present life style.</td>
<td>Metro legislators may be concerned.</td>
<td>Long-range planning must include potentials of new technology and social change.</td>
<td>Maintaining EPA air quality standards may be difficult with increased auto access, particularly if nondegradation clause is strictly enforced.</td>
<td>Could lead to Denver-Ft. Morgan-Sterling strip city; however, if agricultural and recreational land were preserved in river valley, the area could benefit from weekend tourist activity from Denver.</td>
</tr>
<tr>
<td>Conversion of prime agricultural land should be controlled and agricultural activity and lifestyle preserved. (No more than 2% per year conversion of agricultural land; no conversion along the Federal Aid Highway System; formation of agricultural districts.)</td>
<td>Support services for increased population.</td>
<td></td>
<td>Environmentalists may resist urban sprawl.</td>
<td>Regional COGs established and well staffed; county cooperation.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Pay-As-You-Grow and Development Gains Tax revenues should be anticipated.</td>
<td>+ Increased retail sales, income and tax base.</td>
<td>+ More service and retailing opportunities with growth.</td>
<td>+ Effective planning would legitimate and strengthen regional COG.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>+ Development Gains revenues and Pay-As-You-Grow.</td>
<td>+ More diversity in choice of life style; improved schools, housing, hospitals, etc.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SUMMARY COMMENT**

Communities facing rapid growth should prepare to profit from it and to control it with open space and other amenities. A strong and well prepared regional COG would do this.
<table>
<thead>
<tr>
<th>Component A</th>
<th>Economic Costs</th>
<th>Social Disruption</th>
<th>Political Resistance</th>
<th>Administrative Complexity</th>
<th>Environmental Impacts</th>
<th>Secondary Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>Miscellaneous manufacturing would be developed in San Luis Valley with 200 basic jobs in Conejos county; 100 basic jobs in Costilla county; 100 basic jobs in Saguache county. RDC would furnish 100% capital grant, plus contributions toward affirmative action and manpower development programs. RDC grant cost: $10 million. RDC contribution to 3 years of manpower programs: $5 million.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Possible need for public support services: day nurseries; low-cost housing near plants; school upgrading; road improvement.</td>
<td>Factory employment might change life style of residents.</td>
<td>Employers of low-cost labor might resent plants bidding up wages.</td>
<td>Considerable managerial support needed from RDC.</td>
<td>Increased demand for municipal water supplies and other services.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>+ Larger retail sales and tax base.</td>
<td>+ Forced out-migration reduced.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>+ Greater economic stability.</td>
<td>+ Greater opportunity for upward mobility and retaining youth.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SUMMARY COMMENT**

This is high-cost rural development. RDC costs are $13 million for 400 basic jobs. However, it would greatly expand opportunities for local residents and augment comparative advantage for the region.
## Program Component Impacts

### Livestock Raising

<table>
<thead>
<tr>
<th>Economic Costs</th>
<th>Social Disruption</th>
<th>Political Resistance</th>
<th>Administrative Complexity</th>
<th>Environmental Impacts</th>
<th>Secondary Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capital and operating costs.</td>
<td>Power relationships might change.</td>
<td>Some livestock operators and land developers would see their futures threatened.</td>
<td>Extensive Agriculture Extension work needed; particularly for organizing and managing co-ops.</td>
<td>+ Condemnation would recreate large tracts from present speculative land developments.</td>
<td>+ Smaller ranchers and farmers could expand and become prosperous.</td>
</tr>
</tbody>
</table>

Livestock raising and agriculture resources and capabilities would be enhanced by Department of Natural Resources purchasing (by condemnation if necessary) $8 million worth of grazing land and irrigated land for subsidized leaseback to farmers and shepherds. Stock growing cooperatives would be organized, using both owned and commons-type grazing. Another $2 million would be granted to rehabilitate existing small livestock operations facilities. Livestock purchase loans would be guaranteed and subsidized for 4 years at a cost of up to $20,000 (40,000 sheep).

+ Greater security for existing agricultural operations.
+ Some return of refugees now living in Denver and Albuquerque.
+ Compatible with traditional life style.
+ Would encourage locally initiated co-ops.

### Summary Comment

This is high-cost rural development. RDC and Department of Natural Resources costs: $10.7 million for 100 basic jobs. It would be the least disruptive transition for local residents and is compatible with all rural development goals, Section V.
Local service industry would be assisted in developing in Conejos, Costilla, and Saguache counties. RUC would guarantee and subsidize interest on loans, and grant up to 50% of capital for activities employing 200-300 people. Manpower development programs would be supported for 3 years. The total cost of this would be $3 million. (This component's success would depend on the other components designed to increase basic employment.)

Federal Aid Highway money would be diverted to building interstate quality highway through southern Colorado (after completion of I-70).

### PROGRAM COMPONENT IMPACTS

<table>
<thead>
<tr>
<th>Component C</th>
<th>Economic Costs</th>
<th>Social Disruption</th>
<th>Political Resistance</th>
<th>Administrative Complexity</th>
<th>Environmental Impacts</th>
<th>Secondary Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Some private capital would be required.</td>
<td></td>
<td>Established trades and services suppliers, particularly in Alamosa and Monte Vista, may resent subsidy of rivals.</td>
<td>Identifying or attracting entrepreneurs and managers, even with subsidies.</td>
<td>Risk of sites fostering rural sprawl along highways (could be countered by COG).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>State portion of highway funds.</td>
<td></td>
<td>Metropolitan areas and other rural areas wanting new roads.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

+ Increased income, retail sales and tax base.

+ Better prospects for upward mobility.

+ Forced out-migration reduced.

+ Wider choice of goods and services locally available.

+ More active community participation.

+ A few residents employed for construction of highway.

### SUMMARY COMMENT

Components A, B and C combined are a high-cost rural development. They are compatible with rural development goals, Section V. Together they comprise turnaround planning. With or without the new highway, they would maintain viable communities and create an atmosphere of hopefulness for the future.
EXPLANATION OF COUNTY DATA SHEETS

1. The 1970 population per the U.S. Census of Population.

2. Relative income, or this county's median family income as a percent of median family income for Colorado, per Census of Population.

3. The percent of families with income below the poverty level per the 1970 Census of Population.

4. Labor participation rate, or percent of population employed, per Census of Population.

5. Total employment of residents of the county per Census of Population.

6. Unemployment as a percent of total civilian labor force per Census of Population.

7. Per capita tax income to the State of Colorado is represented by the county sum of state income tax liability plus state sales tax collections divided by the population.

8. Per capita welfare costs to the state are the state's contribution of state funds (only) divided by population.

9. Per capita education costs are total payments to school districts of state funds divided by population.

10. This figure shows the surplus (S) or deficit (D) of state taxes collected compared with education and welfare expenditures.

11. The percentage of employed residents of the county in each of 10 sectors of the economy. (The parenthetical numbers are absolute numbers, in addition to the percentages.)

12. This is a subjective statement of the first order determinants of change in population and economic activity: Agricultural employment almost invariably shows substantial decreases over the 1950-1970 period because of greater economic efficiency in agricultural production. This increased productivity was such that, given a constant production level between 1950 and 1970:

   employment in raising meat animals would have halved;
   employment in raising feed grains would decrease to one fifth;
   employment in raising hay would have halved;
   employment in raising feed grains would decrease to one third;

according to Changes in Farm Production and Efficiency, USDA.

In the same period, coal mining employment would similarly have dropped to about a third of its original level, with constant output.

These increases in productivity have greatly affected employment and population in Colorado farming, ranching and coal mining counties.
ADAMS COUNTY

County Seat: Brighton; population: 8,309

1. 1970 population: 185,789
   la. Percent change 1960-1970: 54.4

    transportation 4.2   3.7
    trade        15.3  18.3 14.7
    services, including
                  lodging and finance 6.1 12.3  7.4
    health, services and
                  other professions  4.1 1.0  0.9
    education     4.3   7.2  3.0
    public administration 12.3  7.2  3.8

12. Agriculture declined abruptly in the 1950's as fewer sheep were sold and
    as productivity in livestock ranching increased. Manufacturing, mainly
    sawmills, increased between 1960 and 1970. Relative income increased
    substantially and unemployment decreased although it remained high,
    probably because low-paying agricultural employment was partially replaced
    by better-paying lumber operations.

12. The most rapidly declining population in Colorado has seen a 67 percent decline 1950-1970 in its agricultural employment. This has resulted from two court decisions forbidding traditional grazing access to small sheep operators, and declining potato-related employment. The labor participation rate has increased, but is still very low, and relative income is low.

    public administration 4.0 3.6 2.9

12. A diversified agricultural economy's employment dropped to less than half
    of its 1950 level. Manufacturing employment, based on agriculture in-
    creased, and coal mining held steady. The county's decline eased.
DENVER COUNTY

County Seat: Denver

1. 1970 population: 514,678
   1a. Percent change 1960-1970: +4.2
       Percent change 1950-1960: +18.8

2. Median income as percent of state average:
   1970: 101.0
   1960: 110.1
   1950: 115.8

3. Percent families below poverty level: 9.4

4. Percent of population employed:
   1970: 41.3
   1960: 39.8
   1950: 40.2

5. Actual employment:
   1970: 212,695
   1960: 196,383
   1950: 167,218

6. Percent of labor force unemployed:
   1970: 4.1
   1960: 3.7
   1950: 4.1

7. Tax income to state: $165.65

8. Welfare costs to state: $17.51

9. Education costs to state: $26.37

10. Per capita surplus or deficit: $121.77 S

11. Percent employed by industry:
    | 1970 | 1960 | 1950 |
    |      |      |      |
    | agriculture | 0.7 | 0.8 | 0.9 |

    | services, including lodging and finance | 18.0 | 16.8 | 17.5 |
    | health services and other professions | 14.2 | 9.4 | 8.0 |
    | education | 8.0 | 5.1 | 3.9 |
    | public administration | 6.7 | 7.7 | 7.1 |

12. Growth has been physically constrained by contiguous incorporated suburbs. There has been substantial white out-migration to suburbs, and in-migration by blacks and browns. Relative income dropped, 1950-1970. However, Denver is the core of the fast growing Denver Metropolitan Area, a beneficiary of the national trend toward urbanization and of the area's attracting power for in-migration.
DOLORES COUNTY

County Seat: Dove Creek; population: 619

1. 1970 population: 1,641  
       Percent change 1950-1960: +11.7

2. Median income as percent of state average:  
   1970: 80.6  
   1960: 94.1  
   1950:

3. Percent families below poverty level: 9.9

4. Percent of population employed:  
   1970: 33.3

</table>

12. Manufacturing employment increased fourfold. Public administration and government-supported education (including the Air Force Academy) tripled, largely reflecting intensive military-related activity. The labor participation rate appears possibly because of a substantial number of retired people living there.
FREMONT COUNTY

County Seat: Canon City; population: 9,206

1. 1970 population: 235,972

   1a. Percent change 1960-1970: +8.6

    | public administration     | 5.5    | 6.5    | 4.5    |

12. Livestock raising and sawmill employment declined while recreation-related trade and services increased. The ranching decline was reflected in population decline in the 50's; the 60's saw growth from recreation. This county has an unusually high labor participation rate.
GUNNISON COUNTY

County Seat: Gunnison

1. 1970 population: 7,578
   1a. Percent change 1960-1970: +38.4
       Percent change 1950-1960: -4.2

2. Median income as percent of state average:
   1970: 78.5
   1960: 86.7
   1950: 94.3

3. Percent families below poverty level: 10.7

4. Percent of population employed:
   1970: 33.4
   1960: 38.8
   1950: 35.5

5. Actual employment:
   1970: 2,589
   1960: 2,126
   1950: 2,027

6. Percent of labor force unemployed:
   1970: 6.6
   1960: 4.4
   1950: 3.3

7. Tax income to state: $94.21

8. Welfare costs to state: $6.86

9. Education costs to state: $46.63

10. Per capita surplus or deficit: $40.82

11. Percent employed by industry:
    
    | Industry                  | 1970   | 1960   | 1950   |
    |---------------------------|--------|--------|--------|
    | agriculture               | 10.0 (261) | 13.2 | 21.4 (395) |

12. A forty percent drop in agricultural employment, resulting from increasing efficiency in small grain farming (wheat production in Kiowa was more than ten times as high in 1970 as in 1950), caused the decline in population. It, and generally declining wheat prices, also caused a steep drop in relative income. This was a problem in many of the eastern plains counties during the mid and late 1960's.

12. The diversification of the economy was lost when the AS&R smelter closed in the 1950's, but the 75 percent increase in relatively highly-paid molybdenum mining employees in Lake County has sustained substantial growth in the economy. School employee numbers have grown with population growth and with the founding of Colorado Mountain College.
PLATA COUNTY

12. An oil exploration boom occurred in the 1950's and fell away in the early 1960's. The VCA uranium mill closed with the completion of AEC-subsidized uranium production in the early 1960's. The county's economy has since been sustained by its lower paying tourism industry and by the growth of Ft. Lewis College.

12. Employment dropped steeply in a diversified agricultural economy (wheat, feed crops, beets, livestock), although the cattle population almost tripled 1950-1970. An oil boom occurred in the 1950's and has since tapered off. Food processing, including meat packing, has grown; health services and education have both roughly tripled their employment. Relative income has declined slightly over the 10 years.

12. Mesa County's diversified agricultural employment has declined to half its 1950 level. A 1950's uranium boom has dwindled. Railroad employment has halved. Notwithstanding this, there has been solid growth in manufacturing and in regionally-sold health and educational services to maintain a healthy economy.
PERSONS OF SPANISH ORIGIN IN THE UNITED STATES: MARCH 1975
(Advance Report)
ACKNOWLEDGMENTS

This report was prepared by Edward W. Fernandez, Chief, Spanish Statistics Staff with the assistance of Arthur Cresce, Carmen Denavas, and Emily Vecellio. General direction was provided by Charles E. Johnson, Jr., Assistant Division Chief, Demographic and Social Statistics Programs, Population Division.

SUGGESTED CITATION

This report presents advance data, collected in the March 1975 Current Population Survey, on a variety of social, economic, and demographic characteristics of persons of Spanish origin. Specifically, such characteristics as age, sex, marital status, educational attainment, major occupation, family income, and low income status are presented for persons who identified themselves as being of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish origin.

In March 1975, there were about 11.2 million persons in the United States who reported they were of Spanish origin. Most of these persons, about 6.7 million, or 60 percent were of Mexican origin. Persons of Puerto Rican origin constituted about 1.7 million persons, or 15 percent of the total Spanish origin population. In addition, there were about 750,000 persons reporting themselves as Cuban origin, 760,000 reporting as Central or South American origin, and 1.4 million who classified themselves as of other Spanish origin (Table 1).

The population of Spanish origin in March 1975 was a younger population than the overall population of the United States: persons of Spanish origin had a lower median age, 20.7 years old, than the overall population, 28.6 years old. About 13 percent of all persons of Spanish origin were under 5 years of age, but the proportion of the total United States population under 5 years of age was 8 percent. Only about 4 percent of all persons of Spanish origin were 65 years old and over in March 1975 compared to 10 percent for the total population (Table 2).

Since women in general marry at younger ages than men, there was a larger proportion of single Spanish origin men than of single Spanish origin women: about 36 percent of Spanish origin men 14 years old and over in 1975 were single, but only about 27 percent of Spanish origin women were single (Table 3).

Younger persons of Spanish origin have achieved, in recent years, higher levels of educational attainment than their elders. For example, about 52 percent of Spanish origin persons 25 to 29 years old had completed 4 years of high school or more, but only 24 percent of Spanish persons 55 to 64 years old had done...
so. Only 8 percent of all persons of Spanish origin 25 to 29 years old had completed less than 5 years of school, but about 27 percent of Spanish origin persons 55 to 64 years old had completed less than 5 years of school (Table 4).

In March 1975, there were about 2.2 million employed men of Spanish origin 16 years old and over in the United States, but only 10 percent of these men were working in professional and technical fields as compared to 15 percent for all employed men 16 years old and over in the United States. Among employed men of Spanish origin, those of Mexican origin had the highest proportion, 8 percent, employed as farm workers (Table 5).

Family income in March 1975 was lower for Spanish origin families than for all families in the population. Specifically, median income of families with head of Spanish origin was $9,600, as compared with $12,800 for all families. Also, the proportion of Spanish origin families with incomes of under $4,000 was 15 percent, but the proportion of all families with incomes under $4,000 was 9 percent (Table 6).

In 1974 there was a marked difference between the individual incomes of men and women of Spanish origin. For example, about 16 percent of Spanish origin men with income had incomes of less than $2,000, but about 35 percent of Spanish origin women with income had incomes of less than $2,000. At the higher income range, about 27 percent of men of Spanish origin had incomes over $10,000, but only about 4 percent of women of Spanish origin had incomes at this level in March 1974 (Table 7).

There were about 2.6 million persons of Spanish origin in 1974 below the low-income level, or about one of every 4 persons of Spanish origin. There was, however, a noticeable difference in the proportions of low-income persons between the subcategories of Spanish origin. For example, although only 14 percent of persons of Cuban origin were below the low-income level, about 33 percent of Puerto Rican origin persons were below the low-income level in March 1974 (Table 8).

In this report, information on persons of Spanish origin was obtained from response to the following question:

In March 1975, there were about 2.2 million employed men of Spanish origin 16 years old and over in the United States, but only 10 percent of these men were working in professional and technical fields as compared to 15 percent for all employed men 16 years old and over in the United States. Among employed men of Spanish origin, those of Mexican origin had the highest proportion, 8 percent, employed as farm workers (Table 5).

Family income in March 1975 was lower for Spanish origin families than for all families in the population. Specifically, median income of families with head of Spanish origin was $9,600, as compared with $12,800 for all families. Also, the proportion of Spanish origin families with incomes of under $4,000 was 15 percent, but the proportion of all families with incomes under $4,000 was 9 percent (Table 6).

In 1974 there was a marked difference between the individual incomes of men and women of Spanish origin. For example, about 16 percent of Spanish origin men with income had incomes of less than $2,000, but about 35 percent of Spanish origin women with income had incomes of less than $2,000. At the higher income range, about 27 percent of men of Spanish origin had incomes over $10,000, but only about 4 percent of women of Spanish origin had incomes at this level in March 1974 (Table 7).

There were about 2.6 million persons of Spanish origin in 1974 below the low-income level, or about one of every 4 persons of Spanish origin. There was, however, a noticeable difference in the proportions of low-income persons between the subcategories of Spanish origin. For example, although only 14 percent of persons of Cuban origin were below the low-income level, about 33 percent of Puerto Rican origin persons were below the low-income level in March 1974 (Table 8).

In this report, information on persons of Spanish origin was obtained from response to the following question:
Persons of Spanish origin were persons who reported themselves as Mexican-American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Spanish origin. However, all persons who reported themselves as Mexican-American, Chicano, Mexican, and Mexicano were combined into the one category: Mexican.

The estimated number of persons of Spanish origin presented in this report is comparable with the estimates of persons of Spanish origin previously published from the March 1974 CPS and the March 1973 CPS.

It is important to note that the estimates in this report are taken from a sample and therefore are subject to sampling error. The sampling error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. However, all the statements of comparison in this report are statistically significant; this means that there are at least 19 chances out of 20 that a specified difference in the text of this report indicates a true difference in the population.

The numbers in this report are in thousands and were rounded to the nearest thousand without being adjusted to group totals; hence, the sum of the parts may not exactly equal the total shown. Also, because of rounding, the figures may differ slightly from table to table. Similarly, individual percentages were rounded and parts may not always add to 100 percent.

    health services and other professions 4.3 3.7 2.4
    education 11.3 (288) 9.0 4.5 (141)
    public administration 4.3 3.8 2.9

12. In the 50's, coal mining employment fell sharply, as did that from agriculture (predominantly livestock). Relative income also fell sharply. In the 60's, tourism-related trade and services and - more recently - construction all grew, and so did education. In the early 70's, a full-fledged tourism and construction boom was on, accompanied by intensive land development.
SAGUACHE COUNTY

County Seat: Saguache

1. 1970 population: 3,827
   1a. Percent change 1960-1970: -14.4
       Percent change 1950-1960: -21.0

    education 7.6 (94) 6.2 4.2 (77)
    public administration 3.1 5.1 3.4

12. The sheep and potato-raising agricultural employment dropped 45%, and an already low relative income dropped further. One possible reason for the decline in relative income may be the decreasing employment of local residents for potato harvesting, compared with 1950 (this was reported, but not verified by us).
SAN JUAN COUNTY

County Seat: Silverton; population: 797

1. 1970 population: 831
   1a. Percent change 1960-1970: -2.1
       Percent change 1950-1960: -42.3

2. Median income as percent of state average: 1970: 95.3
   1960: -
   1950: -

3. Percent families below poverty level: 2.7

4. Percent of population employed:
   1970: 42.0
   1960: 29.9
   1950: 34.5

5. Actual employment:
   1970: 298
   1960: 254
   1950: 507

6. Percent of labor force unemployed:
   1970: 1.3
   1960: 4.7
   1950: 6.5

7. Tax income to state: $89.65

8. Welfare costs to state: $6.79

9. Education costs to state: $63.17

10. Per capita surplus or deficit: $19.69 D

11. Percent employed by industry:
    1970 1960 1950

    agriculture - - 0.2
    mining 56.3 (168) 60.6 63.5 (322)

    trade | 22.6 (154) | 12.0 | 10.2 (106) |

12. In 1970, mining was a quarter its 1950 level (uranium had risen and fallen, and nonferrous metal mining required fewer men), and agriculture (livestock) employment was halved. Trade employment had stayed up during the decline, and tourism was growing in the early 70's. Relative income was down substantially, 1970-1950, with the decline in mining.
