This report presents a study carried out in the near southside Chicago community of South Commons. The site was chosen because it was considered planned, heterogeneous, and located in the inner-city. The analysis is based on preliminary work carried out in the summer of 1973. This project focuses on the social and physical construction of community. It is suggested that people have spatial needs—patterned obstructions that transcend individual differences and are integrated into the social matrix' where they occur. The basis for analysis was said to be mostly culled from informal conversations, off-the-cuff remarks, and a sampling of interviews with adult residents of all income levels and ethnicities; this was complemented by observations of children at play in their home areas, the playground, etc.; and finally conversations with neighborhood Youth Corps boys and girls from Prairie Courts. It is concluded that the planned inner-city community must be considered as one element in the larger urban dynamic. There is a need, it is stated, which is documented in this report, for more adequate integration of human needs, physical or spatial needs, and human services in the planning and programming of a community. (Author/JM)
The Council for Community Services (formerly the Welfare Council of Metropolitan Chicago) proposed a demonstration study of the effects of living in a socio-economically and ethnically heterogeneous community on the development of primary school-age children. The site of the project is the community of South Commons, on the near South Side of Chicago.

The basic premises were two: 1) that no matter how innovative a programmed integration may be, such as education or recreation, the community environment will supersede it in developmental impact on a growing child. School programs are effective, as far as they go; ultimately, the classroom situation is a mere segment of the child's daily experience. It is also an artificial situation, insofar as it does create a separate reality. 2) that there is definite evidence of an interrelationship between spatial and architectural design and human behavior. Different classes, sub-cultures and cultures of people unconsciously structure their space differently; they are inculcated with culturally-conditioned and individually-specific spatial orientations.

A three year proposal was submitted to the Office of Child Development, HEW for $279,847 to complete the proposed study. After review of the proposal the Office of Child Development Review Committee recommended that an application for a research planning grant be made to further define the work proposed. A planning grant proposal was prepared delineating further work to be completed if such a grant were awarded. The planning grant proposal was accepted and funded from 6/1/73 through 11/1/73.

This work was funded by a grant from the Office of Child Development, U.S. Health, Education, and Welfare, CB-73-254.

This report was prepared by the Project Director, Deborah Pellow, Ph.D., and Jean E. Bedger, Research Director.
THE NEW URBAN COMMUNITY: MUTUAL RELEVANCE OF 
THE SOCIAL AND PHYSICAL ENVIRONMENTS

INTRODUCTION

Chicago was a place where people initially came to make money. But it must also have that element in it that makes living in it an experience. Slum clearance hasn't improved it. They have substituted a more sanitary type of squalor. It is not a shantytown any more, but possibly something worse. It is based on the mistaken premise that you can create a home environment if you give people all the "sanitary" necessities; that you therefore create an atmosphere in which they feel they can live. This is not true. While no one regrets the vanishing of the old slums, we also remember we once had neighborhoods. They have vanished too. Without them, there can be no such thing as a city to which one feels held. ... In modern life everything works against the neighborhood idea. We are now a race of nomads. (Terkel 1969:261)

Is it possible to build an inner-city community, with socio-economic and racial mix, and have it work? Formerly, immigrants and in-migrants gravitated to areas which were becoming populated by their own people. Nationality groups claimed their respective territories as they arrived, like attracting like. They established local networks of friends, neighbors, relatives; oftentimes, as in traditional towns, the three were coincident. (Keller 1968) Much of the homogeneity of life-styles, values and attitudes were fostered by the whole of the environment. Families amongst immigrants and Blacks tended to be extended in structure. The spirit of cooperation and sharing was engendered by mutuality of concern. Within this context, a child grew up as part of a whole system, into which his home life fed.

In recent years, there has been a renewed interest in a return to the old-style community, but with the new twist of heterogeneity, in both the human (social) and non-human (physical) environments. This report presents the findings from a study carried out in the Near Southside Chicago community of South Commons. The site was chosen because it combines the three attributes of being planned, heterogeneous and located in the inner-city. The analysis is based upon preliminary work, carried out in the Summer of 1973. The original objective was to investigate the possibility of doing a systematic, long-term project, which was not funded. Thus, the findings may be considered tentative in nature.
This project focuses upon the social and physical construction of community. It is suggested that people have spatial needs -- patterned obstructions that transcend individual differences and are integrated into the social matrix where they occur. The individual's relation to his immediate surroundings will influence his relation to the larger world. There is feedback between the physical and social environments.

Unless noted otherwise, the basis for analysis was culled from informal conversations, off-the-cuff remarks, and a sampling of interviews with adult residents of all income levels and ethnicities; this was complemented by observations of children at play in their home areas, the playground, Kiddie Kamp, etc.; and finally, conversations with neighborhood Youth Corps boys and girls from Prairie Courts.

If public living spaces are planned (and the bias here is that they should be), people with different needs and taste can be accommodated. This is a very important consideration if densely-populated, heterogeneous urban areas are to be manageable. For, when comfortable spaces are provided, people use them. William H. Whyte spent two years observing the use of playgrounds, parks and streets in New York City. His conclusion: "many people actually like the city ... and if they come together in the crowded areas it is often because they want to ... Whenever any sort of decent open space is provided, they will quickly make it into a very sociable place." (1972:20)

An inner-city community can be planned to fit into the local setting, or to function as an entity unto itself, closed-off from the surrounding population. Either situation is difficult, especially if there are significant differences in the racial and socio-economic make-up of the two populations. A third possibility is created when the planned community contains significantly different populations, physically-separated and creating (unplanned) sub-communities. South Commons embodies all three situations, not by design. The difficulties which have resulted have been exacerbated by the differences in physical design and territorial needs.

BACKGROUND

The interrelatedness of man and his environment was an interest of the Chicago school of human ecology. They formulated the concept of "natural areas", i.e., areas of population segregation which are not products of conscious design. (See Short 1971) Human communities come into existence as natural areas to perform a function. The natural community is bonded and bounded by a grass roots homogeneity. Its social configuration grows out of the interlacing of personal networks. In the old ethnic community, for example, people met and greeted on the streets; they patronized the same local merchants, maintained the same life-style. This induced a sense of cohesiveness. The network nurtured social and spatial identification with people and places. It functioned in ways which must now be fulfilled.
through imposed institutions; for example, eyes trained toward the streets out of mutual concern served as a mechanism of policing. (cf. Jacobs 1961)

Research very different from that of the human ecologists, but relating to the same general subject matter, has been coming out in recent years. Basic to current theoretical assumptions is the concept of territoriality. Territory has been defined by Hediger and following him Sommer as an area "which is first rendered distinctive by its owner in a particular way and secondly, is defended by the owner." (Sommer 1969:14, f.n. 5) Territoriality is a behavioral system characteristic of all living organisms. Sommer (1969) also suggests that adaptation to shared space is manifest in the complementary nature of territoriality and dominance. When each person possesses his own space, his reasons for dominating others disappears. The social order is maintained through the complex interweaving of individual ownership, communal ownership and status.

The need for territory, and which kind, is tied to the individual's need for identity. There are two germane aspects to territorial behavior: the first concerns what Hall (1966) calls "proxemics" -- the manner in which man structures his micro-space.* The individual's proxemic behavior occurs out-of-awareness. It is a combination of cultural conditioning and individual uniqueness. In different cultures (and, it turns out, sub-cultures), people relate differently to each other and to their surroundings in spatial terms -- for example, the choice of housing, the manner of arranging furniture, the more general orientation of planners who lay out streets and place buildings, the factor of physical proximity and/or ties to common spaces foster groupings. Architectural and interior design, in conjunction with the implementation of space, has been shown to affect interpersonal interaction. (Carey and Mapes 1972; D. Newman 1972) Robert Sommer (1967) has demonstrated that the furniture arrangement in a mental hospital can totally destroy the patterns of interaction that hospital therapy is supposed to promote. (See also Loring 1956; Parr 1966; Sivadon 1956) The community institutions, etc. need not have externally-imposed boundaries; they may be socially constructed, partially, through usage of space. (1966)

The second aspect concerns the individual, as a group member, as he relates to a more externally-defined space. It grew up out of the slum clearance schemes and the desire to document the apparent social disorganization and disorientation suffered by those relocated. There have been two disastrous after-effects: uprooted people suffer great angst, missing social and physical ties (Fried 1963: Gans 1962); and they are herded together into housing projects, where they share racial and socio-economic victimization. (Weaver 1963) The "neo-ecologists" are dealing here with local, sub-cultural differences. For example, Rainwater (1966) points out that an individual's self-image is reinforced by his surroundings. Residents in the new-style ghettos (housing projects) see filth and/or disparities, internalize them, and take them to reflect upon their self-worth. Moreover, orientations toward housing standards and the needs that the house fulfills vary along social and racial group lines. (See

*Hall's work is out of the mainstream of research and as yet in its early stage of development, thus it is often written off as irrelevant or theoretically unsound. (Viz., Edmund Leach's review in the New York Review of Books, 28 May, 1968.)
A considerable number of studies have been done to determine the relative importance of ecologically-local networks; the data show that they are significant among lower and working classes. (Demerath 1962; Fried and Levin 1968; Heberle 1960; Rainwater 1966; Wilner et al. 1962) "The presence or absence of a particular design should have a variant effect on the total social life of a particular group, depending on the interdependence of the architecturally-related behavior to other dimensions of the group's life. More specifically, we should find that the architectural relationships between dwellings and the effects of such spatial relationships on the social relationships that develop between families will have varying degrees of significance, depending on the importance of informal neighborhood relationships in a particular social group." (Yancey, 1971:4)

Furthermore, the range of people from different socio-economic backgrounds who can live together amicably is much lower than one would expect. (Gans 1972) Group territoriality is often expressed in national and local boundaries -- a segregation which reduces conflict. "Because social and spatial orders serve similar functions, it is not surprising to find spatial correlates of status levels and, conversely, social correlates of spatial positions." (Sommer 1969:17) For example, elites may have larger homes, more rooms, spatial mobility to escape.

Albert Scheflen, a psychiatrist at Bronx State Hospital, notes that one must "remember about ethnic differences in space planning, that these are limited by an original custom of land allocation and building, which was primarily Anglo-American and other people have to live in this. They can only change it so much. The fact is that peoples' 'special needs' are not in the main accommodated."* In his paper on urban renewal in Ibadan (a traditional, native urban center) and Sepele (a new town) Imoagene (1972) shows how renewal failed when experts did not take into account certain basic factors, such as family structure and ideology: that the people involved do not want to live separately (as opposed to living in extended family houses), or that they do not want to leave the site of the ancestral home or grave.

There are those who argue for the high rise and an equal number who condemn it just as strongly. Unfortunately, the question is usually seen almost solely in terms of density, and yet density turns into a chimera as soon as it is examined closely. ... The fact is that density cannot be taken out of its context or even adequately considered apart from such things as social organization, child raising techniques, the enculturation devices used by a group, discipline (internal and external) informal organization, sensitivity to materials, need for

*Personal communication
screening of the various senses and the
significance of the buildings themselves as a
communication to the people who live in them.

(Hall 1971:249)

High-rise living sometimes works. In the right location, and with
the right class definition, it is highly prestigious. "The major differ-
ence (between high-rise and single-family-home living) is you can't open
your back door and shove the kids in the back yard to play" remarks one
Chicago mother, which means taking the children out to play. "I find that
living in a high-rise actually brings a family much closer together. ... I
don't want the children walking around the neighborhood after dark or
running around the building, so we do a lot together" says another.

(Patricia Anstett Sun Times Sept. 26, 1972)

Ethnic or racial groups which continue to maintain the basic
ideology associated with extended family organization and living conditions,
in conjunction with mitigating economic circumstances (such as the need to
pool resources) have problems with housing which does not accommodate the
extended family and street ties. According to Hall (1971:428), "the high
rise apartment appears to reflect white family structure, and when it needs
to be built for other groups, it should be adapted to indigenous cultural
needs." The functions which a house serves -- other than the minimum of
providing a roof -- also appear to vary predictably. Rainwater (1966)
concludes that for the lower class, the house is a shelter from external
threats, and it satisfies the needs of its occupants if it provides nothing
more than enough room and a sense of safety. He postulates three related
interpersonal consequences: 1) the need to form satisfying interpersonal
relationships; 2) the need to exercise responsibility as a family member;
and 3) the need to formulate explanation for an unpleasant state of
affairs in one's world with a sense of home as a safe place, boundaries of
safety can be pushed further out; the measured degree of publicness in the
building also contributed to a sense of security.

It is this very notion which O. Newman (1972) refers to as "defensible
space": "... a surrogate term for the range of mechanisms -- real and
symbolic barriers, strongly defined areas of influence, and improved oppor-
tunities for surveillance -- that combine to bring an environment under the
control of its residents." It can be made to operate in an evolving
hierarchy "from level to level in the collective human habitat -- to extend
from apartment to street."

Newman's thesis fits into the burgeoning research on design and
human behavior. He believes that design alone will solve many of the
safety problems that beset inner-city living. For example, he points out
that "the introduction of a large grouping of new buildings of distinctive
height and texture into an existing urban fabric singles out these buildings
for particular attention. If this distinctive image is also negative,
the project will be stigmatized and its residents castigated and victimized."
(Newman 1972:102) It is here suggested that the opposite is also possible: building a sparkling new development in the middle of a depressed area singles out the former for extra (sometimes unpleasant) attention. The attractions of the new community for its residents may not outweigh the inconveniences imposed from the outside.

Neighborhood cohesiveness was said earlier to be a function of networks; and according to Whyte (1956), among others, children are pivotal. "There are so many of them and they are so dictatorial in effect that a term like 'filiarchy' would not be entirely facetious. It is the children who set the basic design. Their friendships are translated into the mother's friendships and these, in turn, to the family's." (Whyte 1956)

The South Commons situation shows children to be pivotal in another way. Many of the residents were attracted by the same general features, e.g., housing and location. Specifics varied according to income group, luxury features attracting the well-to-do, basic amenities the lower income group. For the families, particularly appealing were the child-related attractions, such as the school, play areas and bounded nature of the community. It is suggested that disparities in living conditions and life-style -- manifestations of socio-economic range -- within South Commons and between South Commons and the outside were too great. Dissatisfaction set in when mutual impingement became intolerable -- particularly affecting the children. The outsiders viewed the South Commoners as invaders in the school situation; the South Commoners viewed the outsiders as trespassers and vandals in their community. Accommodation to both sides -- improving the local school and instituting a swimming program -- backfired.

STUDY SITE

In 1924, the Chicago Community Research Committee formally sub-divided the city of Chicago into community areas. One such community area is known as Douglas. It is bounded to the north by 26th Street, to the west by the Dan Ryan Expressway (actually by Federal Street, which is the first street to the east), to the south by Pershing Road (3900 S.), from the western line to Vincennes and over to 35th Street, and to the east by Lake Michigan. (See Map 1) It is one of the oldest communities in the city, fully incorporated in 1863. Senator Stephen A. Douglas, after whom it was named, bought 70 acres in 1852; ten acres of this was donated to the University of Chicago, and another ten acres facing this to be developed as two residential parks. Douglas was primarily interested in developing a middle-class area, while housing for workmen at the local soap and rendering works was also erected.

The community of Douglas was close to the Lake, convenient to transportation, a major business street; it developed into a fashionable residential district. By 1900, however, it began to decline. Old residents moved, apartment buildings were built and Black residents began to move
into Douglas. By 1920, the community was 74% Black; and with steady influx of residents by 1950 it was 97% Black. The total population of Douglas jumped nearly 50% in the 1940's as a result of the Black migration (1940: 53,124 of which 49,804 were Negro; 1950: 78,745, of which 76,423 were Negro). Due to the revolutionary housing development, the Black proportion diminished slightly by 1960, while the white population doubled, concentrated within one housing development.

From the early 1940's to the present, there has been massive urban renewal in Douglas. Over the course of a century, it has gone from elegance to slum, to redevelopment. The schemes have been under the auspices of either Chicago Housing Authority or Chicago Land Clearance Commission. In the early 1940's Chicago Housing Authority erected a 1658-unit housing project (Ida B. Wells Homes), in the southeast corner, to replace deteriorated brownstones and Victorian mansions. Later in the decade, Illinois Institute of Technology and Michael Reese Hospital - both located in Douglas - began working for clearance and extension of facilities in their immediate surroundings. The 1950's saw the construction of three Chicago Housing Authority projects - Dearborn Homes, Prairie Courts and Stateway Gardens, and subsequent extension.

The Chicago Housing Authority project's residents are over 90% Black and low income housing, Chicago Land Clearance Commission's developments are primarily middle and upper income housing, and area redevelopment "is a mixture of residential, institutional, light industrial and commercial, and park land uses." (Kitagawa & Tauber 1963:84) Thus, Chicago Land Clearance Commission's Lake Meadows was built in the early 1950's as its first redevelopment project in Douglas and has ten apartment buildings, a shopping center, school, commercial buildings, and parks. Seventy-five percent of its residents are Black. Prairie Shores, built in 1962, along the lakefront, has three apartment buildings and a shopping center; twenty percent of the residents are Black. These two complexes have 3,825 rental units at a range of $85 to $400-plus, per unit. Many of the occupants of Prairie Shores are on the staffs of hospitals in the area. Illinois Institute of Technology includes in its complex 356 apartment units in four high-rise buildings.

In 1958, the Department of Urban Renewal began acquiring the 30.6 acres, which make up the site of South Commons. It is bounded on the north by 26th Street, on the east by Prairie Avenue, on the south by 31st Street, and on the west by Michigan Avenue. It is three miles south of Chicago's downtown area and less than one mile west of the lake. (See Map 1)

Two of the criteria for awarding a contract to develop the area were "the degree to which Proposal (sic) would result in a Balanced Residential Development with Integrated Neighborhood Shopping Facilities and with Harmonious Relationships to the Surrounding Community." (DUR 1964:6) As part of the bidding documents it was indicated that: "The objective of the redevelopment plans for these projects is to provide for predominantly residential use, with community facilities to allow development of a complete neighborhood environment for families of moderate
Four separate groups bid for the land, including an active group from Prairie Courts, the housing project just across Prairie Avenue, that wanted that land used as an extension of Prairie Courts; Fred Kramer, who built Prairie Shores, wanted it for expensive housing; and McHugh and Levin submitted their plan, for South Commons. The latter was accepted because, beyond the basics of financing and architectural soundness, it would provide housing for moderate and middle-income families in a variety of residential types.

At the time of purchase, the land contained 181 structures, housing 306 families and 224 single persons. Those families displaced by urban renewal would be balanced out by accommodating others of the same income group. Residents were relocated and ground was broken in Fall, 1966.

The plan incorporated both racial balance (60% white, 40% Black) and socio-economic mix (60% upper income, 40% moderate). It was a unique community in conception, design and composition. "It's an experiment and a marvelous one, says sociologist Morris Janowitz, of the University of Chicago, in that it involves planning not merely for physical but for social and educational purposes as well." (M. W. Newman 1969)

The shopping/community area is the focal point, from which the residential sub-areas extend. There are sequences of public and semi-public spaces, decorated with sculpture and flowers, as well as a variety of recreational and green areas. (See Map 2) Variety in types of residence were designed and built for further liveability and interest. There is limited access for motorized traffic; paths abound; and there is a pedestrian overpass to the community center. The community center houses the elementary and preschool, hence children need not cross major streets to and from the center for school or other activities.

There are three types of housing: 1) for rent: high-rise apartments for both upper and moderate income groups, 2) for rent: low-rise apartments for both upper and moderate income groups, 3) for sale: brick townhouses.

Sub-areas, or quadrants, have been designed for the rental and sale residences. There are four quadrants; they are separated socio-economically and geographically. The southeast quadrant, Oxford Mall, is luxury housing. It contains one 21-story high-rise, and two five-story apartment buildings, all grouped around a swimming pool. Windsor, the next quadrant north, contains a 24-story high-rise and two 5-story apartment buildings, and is also grouped around a swimming pool. Each of these quadrants contains a playing area for children, as well as benches along tree-lined walks.

Main entrances face into the focal area. Across Indiana Avenue is Dunbar Park, with playground, ball-field, tennis courts and benches.
The community mall, with convenience services, supermarket, drug-store, restaurant, cleaners, furnishing store, sitting/strolling area, and the community center, divides the southern section of upper-income housing from the northern sub-areas of townhouses and moderate income housing.

The first townhouses were built along the northwest part of the complex, across from the central mall. Each has its own enclosed garden and patio. There is a choice between 3 or 4 bedroom models. They are grouped in quadrants, with front doors facing in; each quad has sitting and playing areas. Backyards face on to the street.

Moderate income housing lies across Indiana Avenue from the first set of townhouses, and across 28th Street from the shopping mall. It consists of a 21-story building and 4 and 5-story maisonettes (2-story townhouses on top of each other, which are grouped around a central depressed courtyard/play area.) Apartment entrances are from the street; on the west facing the back-entrances of one row of townhouses.

The final sub-area, Stratford Mall, is in the north-east corner. It contains the 24-story subsidized apartment dwellings for the elderly, the newly-completed townhouses, and Stratford House, an upper-income 24-story apartment building. These structures are grouped around the third swimming pool. There are play areas for the children, and seating areas (ostensibly for the elderly) are off to the side.

Divided up into upper and moderate income housing, with population estimates, the picture looks a bit different. This is particularly so because the moderate income low-rise area includes many times more children than all of the other housing areas of South Commons put together. The population of the area is estimated at 3,664. "Stage" refers to the sequence of building within the time period of the entire complex; "parcel" refers to the set-off area -- such as the townhouses or Oxford Mall -- herein referred to as cluster. An insinuation one might draw, and which is the basis for one of the hypotheses of the study, is that an area designed as a "parcel" and built that way was conceptualized as distinct from any other, in terms of physical and social space.
### UPPER INCOME HOUSING

#### STAGE 1, parcel 1

**Windsor:**
- High rise
- 2901 S. Indiana

**A1 building**
- Studios: 60
- 1-bedroom: 120
- 2-bedroom: 20
  - Total: 200 units
- 22 known children

**B1 building**
- Studios: 22
- 1-bedroom: 31
- 2-bedroom: 11
- 3-bedroom: 4
  - Total: 68 units
- 7 known children

**B2 building**
- Studios: 22
- 1-bedroom: 31
- 2-bedroom: 11
- 3-bedroom: 4
  - Total: 68 units
- 7 known children

#### STAGE 1, parcel 3

**Stuart Townhouses:**
- 42
- 2700 - mid-2800 S. Michigan Avenue

#### STAGE 2, parcel 6

**Stuart Townhouses:**
- 30
- 2600 - 2700 S. Michigan Avenue

#### STAGE 2, parcel 4

**Oxford Mall:**
- High rise
- 3001 S. Indiana

**A-2 building**
- Studios: 46
- 1-bedroom: 92
- 2-bedroom: 69
  - Total: 207 units
- 37 known children

**Oxford Mall:**
- Low rise
- 3021 S. Indiana

#### B-3 building
- Studios: 22
- 1-bedroom: 31
- 2-bedroom: 11
- 3-bedroom: 4
  - Total: 68 units
- 9 known children

#### B-4 building
- 3041 S. Indiana
- Studios: 22
- 1-bedroom: 31
- 2-bedroom: 11
- 3-bedroom: 4
  - Total: 68 units
- 12 known children

#### STAGE 3

**St. James Townhouses:**
- 18 (10 sold & occupied)
- 2600 S. Indiana Ave.

**Townhouse totals:**
- 3-bedroom: 76
- 4-bedroom: 14
  - Total: 90 units
- 87 known children

#### STAGE 3

**Stratford Mall:**
- High rise
- 2605 S. Indiana

**A-3 building**
- Studios: 46
- 1-bedroom: 92
- 2-bedroom: 69
  - Total: 207 units
- 26 known children

12
MODERATE INCOME HOUSING

STAGE 1, parcel 2

York Terrace: low rise
2700 block, S. Indiana
FHA 221-d-3 (Family Housing)

D1 (west) building
1-bedroom 5
3-bedroom 26
4-bedroom 14
45 units
(40 with children?)

D2 (east) building
1-bedroom 6
3-bedroom 28
4-bedroom 12
46
(40 with children?)

C-1 building
Studios 40
1-bedroom 120
2-bedroom 80
240 units
Rough estimate: 180 children
Total rough estimate: 350 children

STAGE 3

FHA 236 (elderly housing)

Cambridge Manor: high rise
2631 S. Indiana

Studios 208
1-bedroom 104
312 units
No children

The total number of units is 1619. The number of subsidized units, 221-d-3 and 236, is 643 or 40%; this is per agreement with the Department of Planning.

The unit breakdown is as follows:

- Studios 488 (30.0 %)
- 1 Bedroom 663 (41.0 %)
- 2 Bedroom 282 (17.5 %)
- 3 Bedroom 146 (9.0 %)
- 4 Bedroom 40 (2.5 %)

LEVELS OF INCLUSIVENESS

The Staff Report of the Department of Urban Renewal, in its review of the subsequently-accepted proposal for South Commons, stated: "...this developer has included two sociologists as consultants for the duration of the development of such a program who would consult on the development and maintenance of an interracial character in the community." (November 12, 1964:6)

The two consulting sociologists determined that the basic issue "centers on the degree to which a proposal would achieve a balanced
The immediate surrounding area cannot be called a neighborhood or a community at the present time, since there is not sufficient social vitality or social integration. Only by developing a balanced community with different age groups is it possible to have the human resources necessary for a viable community. With one recommendation, the South Commons project was designed with these objectives because it gives important recognition to family type arrangements."

(Unsigned, undated letter to Department of Urban Renewal, in anticipation of the public hearing for disposition of the sites for development.)

The stress upon the non-integrated character of the surrounding area made possible a policy of non-accountability; but this backfired. During the preliminary phase of this study, it has become increasingly clear that the impact of South Commons upon the surrounding communities and vice versa -- their interrelation and mutual antagonism -- is a burning issue. Differentiation of environmental design and social institutions between South Commons and its neighbors is as important to their respective functioning as is internal differentiation to the planned community. This has dictated the need to analyze South Commons as the focal point in an urban dynamic.

At its most complex, it includes the entire city of Chicago; at the next level, there is the Near South Side; the next level is the community area of Douglas; then the area of South Commons; and that is further broken down into sub-systems of mutually-exclusive neighborhood or clusters, such as the townhouses, moderate income housing, luxury apartment dwellings, community building, and shared mall.

The residents of South Commons fall along a continuum of these levels of complexity. This is evident in their perceptions of their respective places in the system, and their actual behavior. There is also the important consideration of the constraints placed upon both perceptions and actual behaviors by the environmental design. Thus, our focus upon South Commons is tempered by the recognition that there can be no exclusion of those other interacting elements, such as neighborhood, public housing, the larger community, and the impact of city-wide policies.

Within South Commons, territorial boundedness has become an issue. The architect/planner allocated territory -- moderate housing was put in one area, housing for the elderly is off by itself, upper income housing is quite separate from the above two, and in itself clearly distinguished as renters and buyers. The public at large was planned out. Management also determined how the territory would be parcelled out; and in certain cases, even forced structural changes in the architect's plan. For example, the original 221-d-3 (FHA moderate income housing) plan had two courts of low-rise maisonettes. These had been planned to accommodate larger families. After the first was built and the units leased, the plans were changed to build a high rise instead of the second court of maisonettes. This would reduce the number of family units (i.e. children)
while accommodating the same number of smaller units (i.e. adults). It is felt that management did this for the sake of ease of management.

The manner in which people use their space has become an issue. It is suggested that the differences in class are profoundly manifest in the assertion of territorial rights. Class differences appear to be more instrumental to the scheme of interaction than race differences, with the subordinate asserting his rights in making himself a real presence and scaring off the other. Time and again, the middle class architect-planner projects his ideology and bias into his plans for housing other people. "They have encouraged the development of extensive self-congratulation systems within the design professions. Rarely are design awards based on the experiences of the building's users, or even a site visit by the busy panel members. ..." (Sommer 1969:5) Thus, early in June, 1973, the St. Louis Housing Authority voted unanimously to close down Pruitt-Igoe, the massive public housing project. "The project, hailed as an architectural triumph and one of the most innovative and largest public housing complexes in the nation when it was built 18 years ago, today stands pockmarked with walls of broken and boarded windows. ..." (NY Times 6/10/73)

Furthermore, these same scientists-of-design transgress basic principles of turf, explicit to the old-style communities. Although referring to the general area as a "community", they assume that no spirit of identity inheres. After dividing the planned development up into parcels, they assume that the common name and facilities confer homogeneity upon it. The development of South Commons loses all similarity to the enclaves of 50 years past: it is comprised of physically, socially and aesthetically distinct sections; and it has been dropped into the middle of an already-existing area, with features significantly different a superior to the latter.

ATTITUDES TOWARD SOUTH COMMONS

South Commons is viewed by the outsiders as intrusive; the space may have been vacant, but it was not unused. This has created a dynamic of tension. A history of neighborhood use, particularly by the local youngsters, has made it difficult to cordon it off. Perceptions of what South Commons is to its residents run the gamut of possibilities. There are those who advocate accommodation to the surrounding people; there are those who want to maintain its position as an island-in-the-city. And there are those who are content to stay within their quadrant. It is a complex situation to foster stability within a racially and socio-economically heterogeneous community. And beyond that, given the location of South Commons, the experience of the residents does not reduce to interaction among themselves alone. There are the sentiments of neighboring people toward South Commons, as reflected in their own and their children's behavior, for example, "incursions." And this has been complicated by the compromises which management has extended to the outside population.
South Commons has brought together people from all over Chicago, urban and suburban. Many were already familiar with the area from having lived nearby -- for example, in Lake Meadows and Prairie Shores, both middle-class apartment complexes. Buying into the area, however, or renting at luxury prices is often a different matter. As one white townhouse resident said, most of her friends (who live in the Northshore suburbs) "think that I am crazy" for owning a home in such a bad neighborhood. She and her husband had lived in Prairie Shores; their family outgrew the apartment, but they wanted to stay on the Near Southside, since it is so convenient to downtown Chicago. And, they also thought that the racial mix would be beneficial to their two children.

Many others not only overlooked the surrounding area in opting to move in; they also disregarded the rejuvenated ideal of "community." They were attracted by convenience and housing only. Individual needs for "a place to call one's own", for privacy and so forth, could be met. Upper and moderate income people all agree on this. For those in upper income housing, there are amenities, such as optional air conditioning, and the pool facility is included as part of the rent. For the well-to-do Blacks, living in an apartment or townhouse, these represent status among their reference groups. The options proved attractive to the middle-aged and retired whites as well. Although the moderate income residents do not have automatic access to the pools, the appeal of inexpensive housing in pleasant surroundings was an attraction.

All of this is part of the promotion of South Commons as a planned community: convenient shopping and services, community institutions, a racial mix, and that ambiguous sense of community esprit de corps, abetted by the community center and planned-in areas for social intercourse. It is different than many other inner-city neighborhoods, insofar as normal dangers are concerned, except that many people moved there because they wanted to remain in the city and saw South Commons as a panacea to problems of city-living. It remains unshuttered, by plan not to be shut off from the general neighborhood -- although the six lane boulevard on one side, a police station on the corner, and a moving wall of security men help. The irony of the situation is that those very reasons for moving in became causes for moving out. But just as the specifics of attraction differed often along class and racial lines, so has the investment of time and energy and commitment to living there.

SOUTH COMMONS WITHIN THE COMMUNITY-AT-LARGE

The South Commons acreage had been vacant for a number of years. It had not, however, gone unused. Local children abound, and they made good use of Dunbar Park and the empty adjacent spaces. They did not have to go out of their way to find this spot. To the west of the South Commons area are 2132 units of public housing (Dearborn, Ickes, etc.), to the immediately-adjacent east are 529 units of public housing (Prairie Courts). Just east of Prairie Courts is Dr....e Elementary School; just
west of South Commons is St. James School. Both of these are composed of children from both areas - east and west of South Commons. Thus, for a Prairie Courts child to go to St. James, he cuts west across the South Commons ground; for a Dearborn child to attend Drake, he goes east across the area.

In spatial terms alone, South Commons is not an island; it is a corridor between the west side of Michigan Avenue and Martin Luther King Drive, about five blocks east. It is also a territory which had come to be identified with a group of users, who in turn, saw it as their own. Before South Commons was built, the kids from Prairie Courts hung out at Dunbar School (on King Drive) or at Prairie Courts proper. There is a police station on the corner near the project, which has been held accountable for the lack of major problems with gangs or individual crimes. Others, such as one of the men who taught at the South Commons School, maintain that the guys in the area are just a different kind than those from other projects. He gives as a piece of evidence the fact that the youngsters from Prairie Courts identify with the housing complex as a whole, rather than as residents of a specific building or floor.

What in fact are the demographic characteristics of the neighboring project? There was a dramatic shift in the 1970's within Prairie Courts, the "model" of public housing, which is located across the street from South Commons. Previously, the population was carefully screened, giving it the reputation of one of Chicago's best public housing projects; more recently, the population of the one high-rise (Prairie Extension with 202 units) has been far less carefully screened. Prairie Extension has seen a sudden rise in assistance grants. By also increasing the number of single elderly and elderly couples in that building the C.H.A. has been able to give the appearance of keeping the ratio of children to adults down to 1:6 (after four years of ranging from 1:1.6 to 1:1.7). Today, approximately 70% of the families in Prairie Extension, one block from the Mall in South Commons, are families on Aid to Dependent Children (ADC).

This shift in the type of families at Prairie Courts, when coupled with a shift in the type of families who now live in the moderate income York Terrace of South Commons (families of which many other South Commons people seem to complain), has contributed to a child population in the schools which the adults in both projects tend to believe is, both academically and socially, inferior. In both instances, the shift in the type of family seems to have been primarily due to careless screening of tenant applications by management, both governmental and private business.*

The child/adult ratio gives the appearance of remaining fairly steady over the years at Prairie Courts, but detailed examination shows that the presence of additional large families was masked by the presence of a large number of elderly and single adults. The statistics are made to look normal by the simple expedient of adding up all the children and

*It is believed by those who have been involved in this study that the screening policies of the Chicago Housing Authority may have a profound and injurious effect on the children of South Commons and Prairie Courts.
dividing by the number of adults. When one considers that 39% of the project is made up of family units with no children, it is easily seen how this is manipulated. In fact, 29% of the "families" consist of one person and 18% of 2 persons, whether two adults or adult-with one child, giving a 47% of these small family units. Twenty-five percent of the family units have 4 or more children. Eleven percent of the total family units have six or more children in each family. (There are 37 families with 7 to 10 or more children.)

Two-parent families made up 36% of the population in 1967, and the one-parent family 44%. In 1972, only 19% of the families had two parents, while the one-parent families had risen to 67%.

In 1967, out of 202 family units, 114 received no grants-in-aid, while 88 did receive such aid, 119 grants in all. In 1972, 51 families or 25% received no grants, while 151 or 75% did receive some form of grant. In 1967 out of 119 grants 55% were assistance grants and 45% were benefit or earned grants. In 1972, out of 200 grants in aid, 141 or 71% were A.D.C. That is an increase of 236%, over 3-1/4 times as many in 1972 as in 1967.

The profile of Prairie Courts is quite different from that of the new complex. By the same token, the median income of Dearborn Homes residents (a few blocks west) is almost $1,000 less than that of Prairie Courts, even though both are below the poverty level. On the other hand, there is a significantly lesser percentage of A.D.C. to total occupancy at Dearborn than Prairie Courts. It is the children from both who plague the security guards at South Commons.

Brute force is not enough of an impediment to trespassing when opposed by curiosity, force of habit, and the questioning of territorial rights. For the sake of the residents at South Commons, the central mall, with its supermarket and stores, was included. It sits in the middle of the once vacant area, and has provided added incentive for Prairie Courts boys to come around. Indeed, they have taken over the front of the market and its surroundings as their turf. To patrons, they are a source of discomfort at best, and of thieving and verbal abuse at worst. Merely entering the store is aggravating.

The boys who hang around also come from the other side of Michigan Avenue, leaving a very clear track. They go to the market or the drugstore to buy candy and cut back across South Commons, discarding wrappers as they are finished with them. How does this affect the South Commons people? The central area has been disclaimed, and if people wish to sit around, they may choose to do so in their own quadrant sitting area. Some of those who moved in primarily for general convenience and good housing simply do not patronize the shopping area at all. They shop at the market at Prairie Shores, a few blocks away, which is more expensive but less of a hassle.

Beyond the problems outside of the store, the market's manager has chosen to stock the store according to a lower-income Black population's
tastes, this, despite a potentially large upper income population. One consequence is more of the poor neighbors are attracted for food-stuffs, and another is that young boys come to buy cheap wine and beer. Many residents do not take advantage of the clothes cleaners for the same reason. One young man from the Windsor high-rise complains that his wife has been accosted by "big boys" every step of the way.

When adults are bothered by such occurrences, their children are not unaffected. Child remarks that there is indirect evidence "... that the status of the main socializer is an important determinant of behavior toward other persons and objects." (1954:687) According to Porter (1961), norms, values and behavior patterns may be transmitted directly (through instruction) or indirectly (overheard conversation, behavioral cues). Of equal importance to the family's role are "the comments of peers; exposure to stereotypes in mass media and literature; spontaneous color associations; and observation of role occupancy. ... Although the mechanisms which transmit attitudes are similar for all children, the extent of these feelings and the reaction to them is affected by the child's psychological and sociological environment and his racial membership." (1971:21)

South Commons was designed with children in mind; it is not problematic for a child to cross over to the market or drugstore or even the playground. But they too have been accosted -- and they either become wise in "the ways of the street" or they go into hiding. For example, one townhouse woman reports that for a year or so, her then nine-year old daughter refused to meet her at the market because "there are too many Black kids." She has, however, developed toughness and now she will go to the store, saying "I'm going to hide this" meaning her money. Another townhouse child of the same age when complimented by her mother on "becoming so dark" (from sunning herself) burst into tears and said she does not want to be Black.

Both of these girls are from white, liberal families who moved to South Commons because they were interested in a heterogeneous community. And the mothers of both agree that if anything, their children are growing up far more intolerant than any child reared in the suburbs.

Frustration among children in the neighborhood is mirrored in those living in York Terrace (221-d-3 housing), when they see what play equipment and swimming facilities are available to residents of townhouses and luxury apartments. One such facility is the swimming pool. Merely as a piece of space, with common appeal, it provides the place for casual socializing. But because it is only accessible to upper income residents, it in fact promotes a kind of segregation. There is no opportunity for members of different income levels to come together on this common ground.

Due to FHA regulations, pool privileges are not included in subsidized rents. Children hang around the fences surrounding the pools, often trying to sneak in. The pools are a perfect example of semi-public space: they are open only to those who live in the luxury apartments. They are, however, very public with respect to visibility and consequently attract on-lookers.
The York Terrace children's sense of deprivation is mirrored by that of the public housing children. In addition to their turf being confiscated, it has been enhanced, so that it proves to be that much more appealing. The York Terrace and public housing children are continually involved in feuds with the security guards.

There are only three guards on each shift; so outsiders can sneak in, committing acts of vandalism in the parking areas and the York Terrace courtyard. This in addition to the petty thievery and general aggravation in the central mall prompted the local police community workers to meet with the management company of South Commons and present a compromise arrangement: namely, that the pool at Windsor Mall be opened to children aged 8-18 of the outside community, from 2 to 4:30 PM daily during the summer months.

The program went into effect in June, 1973, and the subtleties of the pecking order became more evident. Ten minutes before the public swim, the socio-physical transition took place. The children would begin to congregate on the grass, while residents using the pool gathered up their belongings. White and Black vacated the area. Once empty, extra chlorine was put in the pool and all of the bench mats collected and put away. The reasoning for both was not the type of kids, but the masses of them.

In such a case, those looked down-upon become aware of the situation. The public housing children are no more destructive during their hours of swim than the upper income children. But there are many more of them at any given time, and they use the privilege to its fullest. It was left to the police to advertise the pool program to the neighborhood at large, and to provide lifeguards, as well as community service aides, to oversee the pool area. On their side, management sent around letters to occupants of 221-d-3 housing, inviting them to participate in the open-pool program - but neglecting to add that the program was for neighborhood children as well.

There were waves of displeasure on all sides. Many of the dwellers at Windsor Mall (and assorted others from other luxury buildings) were upset, because they had to give up 2-1/2 hours a day of a pleasure they paid for (in their rent) and which had been an attraction for living there in the first place. Many did not want their children exposed to the lower classes. The public housing people had been suspicious from the time ground was broken at South Commons; while many of the moderate income people viewed themselves as a cut above the latter and did not want their children associating with them.

Furthermore, the pool program became an excuse for the ease-up in residents' use of the facility later in the day. One older woman remarked, "People have lost their appetite for a swim." Yet, to the contrary, others believe that the construction that year of a third swimming pool was responsible. People were complained that they would go to the pool and not see their friends. It is not clear that South Commons had outgrown
the two pools. The construction of the third pool near Stratford not only diffused sociability; it fostered a further separation between the north and south ends of South Commons.

THE CLUSTERS WITHIN

The problems of mixing occur not only between public housing residents and South Commoners, but also within the Commons. Even within the planned community, there is a pecking order; socializing, to a large degree, follows class lines. According to some, the townhouse people look down upon luxury apartment dwellers, who look down upon moderate income dwellers and senior citizens, who in turn look down upon the project dwellers.

Many moderate and luxury families alike moved in for what this exciting new community could and would provide: good housing, a chance to bring up children within the reality of integration (seen in racial terms); and for adult involvement in community life. However, South Commons is a community distinctly segregated along socio-economic lines. The bulk of residents are upper class, and the developer gives as the primary indicator of success the continued occupancy of the townhouses and a rise in their value - despite the fact that they are situated just opposite moderate income housing and across the green from public housing. To a certain degree this is possible, because socializing takes place along class lines.

The turnover in population has been racial, rather than economic, given the division between subsidized and nonsubsidized housing. As more Blacks move in at both income levels, resistance to their (or particularly their children) crossing economic lines seems to become even stronger among the more advantaged.

Community spirit is not encouraged by management policy, which asks that people vacate the public spaces by about 10 P.M. Thus, street vitality is lacking - a fact which leads committed city-dwellers to regard the place as sterile. It is not prohibited, but a pallor is cast on the planned public meeting spots. In Jane Jacobs' terms, one does not have the sense of people watching out over the street - except within individual quadrants. One mistake was putting all of the elderly in one house, off in a corner. As with the cordonning-off of York Terrace, this was a function of government policy for FHA housing. If otherwise, the elderly (as in the old-time neighborhoods) could play the part of guardians of the open spaces, the play areas, the children. All stimuli have been filtered out of their environment. They have the most well-organized building, with tenant's organizations on all of their floors. But many are bored and find something to complain about, because they have been taken out of the street network and put into a 24-story building.

A major reason for turnover in population is basic upkeep. The townhouse people formed their own management company so that they would have control over their own property; this was brought on by dissatisfaction with
the way things were originally handled. No one likes to live in shabby surroundings; however, lower income people have lower expectations and are willing to put up with more than those accustomed to better. One of the management personnel has pinned down the situation simply: moderate income housing has to be controlled, upper income housing has to be serviced.

The people in moderate income housing have become aware of the emerging pattern of a discriminating system. At both the high-rise and low-rise of York Terrace, there are very few places to sit. Building managers insist that there are no company rules against sitting around. Yet, the chief of security maintains that there is a rule against people sitting on their door stoops. He has a lot of trouble (especially with the moderate-income dwellers) because they feel that since they paid their rent as tenants, they should be allowed to sit wherever they want. This is reminiscent of any ethnic neighborhood where people have traditionally sat out on the door stoops, feeding into the street network.

The need for visibility may be one aspect of their territorial imperative. Unfortunately, York Terrace accommodates many more people than any of the other sub-areas and gets that much more wear and tear. One new tenant, in describing her living situation, said "York Terrace is nothing but a glorified project." There are maintenance problems with basic house functioning; it is not unusual that smashed hall lights go unreplaced, elevators left jammed, and air conditioning units broken. Some tenants complain that there are few limits placed on behavior; for example, a rough element who are loud and throw things out of the windows are not controlled.

There is also a disparity in landscaping and decorative statuary -- both for sitting and play areas. The York Terrace low-rise accommodates many more children than any other housing cluster. (See map of distribution) The courtyard where the children play has a large sign with instructions on proper use of the space. There is no play equipment for the small children. Day-care facilities are provided in the community center. It is not, however, free. All of the mothers there work and there are many single-parent families. Consequently, there is little supervision and much rough behavior - too many kids and not enough room. The real problem, according to one woman, is within the 14-17 year old range of children, for whom nothing has been provided. They congregate - sometimes as "stoop-sitters" or at a concrete wall on the south side of the York Terrace court. This further upsets neighbors and shoppers. They play music, cards and horse around in general.

The community center would be the obvious answer, but rooms there must be rented. There is the YMCA. In 1971, the director invited the outside community to join forces with interested members from South Commons and the program blossomed. No one at South Commons was willing to work with the York children, except for the Y. The director's feeling was that these people are separate from the rest of South Commons and feel it. It is not dissimilar from the situation with Prairie Courts - those people know they are unwanted. Children pick up on their parents' feelings, wander over to the market area, see a white child and taunting commences.
Many South Commons residents have been very much opposed to the outreach program of the Y, because it has encouraged outsiders to come over. And not a few parents (upper and moderate income alike) have taken their children out, with the excuse that the program has gone downhill.* For advantaged families, this is less of a problem; children can be taken elsewhere. For York families, whose means are limited, it is a problem. It is a perfect example of the snobbism which exists between one economic level and another. Black middle class aspirants at York do not want their children associating with public housing children. Across the street, townhouse parents (not least of all, the Blacks) do not want their children associating with either. One York resident - a white woman married to a Black - maintains that the situation at York is quite different from when she first moved in. She is surrounded by non-articulate people and her children as well. But when they go to play with other South Commons kids, for example, in the townhouse play area, they are often asked to leave. But, she adds bitterly, it is alright for townhouse residents to use her children as babysitters.

It is difficult to foster a community spirit when there is so much division among the ranks. An observation made in the Department of Urban Renewal report derives from reports on other urban areas:

New or rehabilitated 221-d-3 housing should be located in an area where the surrounding environment is such that moderate income families will not only be attracted to it but also will desire to remain. (p. 16)

At York, the people are fighting to get 'out; many, just as in upper income housing, expected "their own kind of people." They expected a paradise, having been told untruths, and now they trust few.

THE COMMUNITY: ITS INSTITUTIONAL BASIS

There is the impingement of South Commons upon its surroundings, and commitment of South Commons residents to their own community. Another observation, germane to the situation, is that 221-d-3 housing tends to take on the same racial occupancy as the area adjacent. (DUR 1964) At first, the ratio of white to Black was 65:35. One of the untruths which had originally attracted the population was the promise of a good school.

The appeal of built-in institutions is great when children are involved; and this is particularly so for moderate income occupants.

---

*In December 1973, the Management threw the YMCA out of the center, charging them with responsibility for vandalism due to lack of supervision.
Schools are a very important factor. One of the first considerations of moderate income young parents appears to be the quality of schooling offered. If a rough element attends the local school, young families are reluctant to move into the moderate income housing. If they do move in they soon move to another location if they perceive some real or imagined unpleasantness.

(DUR 1964:16)

The elementary school situation at South Commons has been singled out as perhaps the single most important factor in the functioning of the complex. It has been pivotal to the shift in sentiments of South Commons residents, as well as the shift in the racial make-up, away from the original plans for an ideally integrated community.

At the very outset of the planning and design of South Commons, the architects and developers knew that the school situation would be a key issue in the success or failure of the development. A well known sociologist was brought in to prepare an analysis of the school situation and make recommendations that could possibly be implemented by the Chicago Board of Education. His team studied the population of the Drake Elementary School, which services the immediate area of Prairie Courts and Prairie Shores, Dearborn Homes, Longgrove and other housing developments in the area. A thorough survey was made. They tested levels of learning for comparable levels elsewhere. The intention was to create a crash program of federal aid and university assistance to upgrade the quality of teaching and raise the level of class achievement. This would bring Drake School up to par with average or better schools in the rest of the Chicago area. The South Commons school population was estimated to be 710 of elementary school age, 120 of high school age. At that time, the local Drake school was 98% public housing Black children.

A number of conclusions were made by the study team, before the building of South Commons: one was that the initial school at South Commons should be built in, or at least be part of the community center, and serve children of the primary grades of kindergarten through third grade, and that it be understood that a grade would be added each year until there would be a full eighth grade school; secondly, there was talk of running the South Commons School as an extension of the Laboratory School of the University of Chicago with University of Chicago personnel; and third, that new programs and equipment should be put into the Drake School to raise its scholastic level, so that the children transferring there at the end of third grade would not suffer a drop in the quality of their education. The forced transfer of children after third grade was rationalized thusly: it would not be a "lonely decision" since a whole class of children would be transferring from the South Commons branch of Drake over to the Drake Proper, and, hopefully, carrying one's friends would ease the transition. And fourth, the inclusion of children from other projects in each class of the South Commons School would be a useful device easing the transition as well.
The study team's letter of support for the South Commons project to the Department of Urban Renewal was worded thusly:

Drake School, with 560 vacancies and with a present capacity of 1,225 students, supplies an important asset if proper school community relations are developed. The plans of the South Commons developers and the Chicago City Missionary Society are bold and unique in this regard. Integration of the Drake School must be accomplished on a group basis, rather than by the decision of individual families. This requires developing a large enough pool of white families and white children who will, on a group basis, make use of the Drake School. To this end, the developers and the associated voluntary groups are planning to conduct and subsidize a nursery school in the community building. This enterprise will make possible attracting on a grade by grade basis a balanced and integrated school population which can transfer at the appropriate time to the Drake Public School. If necessary to bring about this type of integration, the developers are prepared to extend the age level of their community school in order to increase the number of white students available for entrance into the public school. (p. 6 of undated, unsigned letter to the Department of Urban Renewal, in staff report of DUR: 1964)

One of the consulting firms in Washington, D.C., sent recommendations on to Mr. Edwin G. Callahan, Acting Assistant Commissioner for Multifamily Housing at FHA in Washington, D.C., after the South Commons bid had been accepted and was underway:

9. Sponsors' Intention as to Temporary Character of School Use. As explained at the meeting, it is the expectation of the sponsors that the use of the community space for elementary school purposes will be of temporary duration. (our underlines) The plan contemplates the development of integrated classes in the first four grades, so as to attract families with children to reside in the projects on an integrated basis, both racially and economically. The plan contemplates that when children complete their initial four grades of elementary school education, the entire integrated class would move into a nearby public school. There is physical space available in that school now, but at present it is exclusively a Negro school for underprivileged children. Through the process of moving such integrated classes into that school, there will be a gradual integration of that school as a whole. As a result, it is anticipated that, in time, there would be no need for the nonprofit elementary school operation in South Commons. At that time, the daytime use of the
community space for such school purposes could be discontinued and the community space would then be fully available during the daytime for other community purposes. (David L. Krooth, of Krooth and Altman, August 11, 1960:4)

These facts of the original plans and the facts told to prospective residents and community people did not mesh. In the original plans, the day care center facilities were allocated to a basement area of York Terrace. This is currently being used as a maintenance office. Those community activists who are pushing for extension of grades suggest the day care center be removed from the community center, and put where originally planned, to make room for more grade-school classes. Others, however, favor using the community building for the day-care program, because they object to the alternative of relegating it to moderate income territory.

None of the aid and equipment for Drake, promised to parents and school personnel, ever materialized; this has fed the fire of distrust of all subsequent school studies proposed. Furthermore, parents of children under observation interpreted the situation to their discredit—that they and their children were not good enough to associate with children from this new private development going up next door.

The implication that local children were scholastically inferior to the newcomers, coupled with the preemption of territory, have remained as the two primary factors for the antagonism towards South Commons by local residents. The time came for the first group of fourth graders to make the change from the South Commons School to the Drake Elementary School. A supportive group of thirty to forty youngsters entering a strange territory had been envisioned. Instead, the children were split up and scattered throughout the number of fourth grade classes at Drake by the well-intentioned principal, who hoped to keep the situation democratic rather than give the appearance of fostering an elite group by letting the South Commons students stay together. The South Commons youngsters were physically victimized by aggressive students at Drake; the latter's hostility had been exacerbated by the resentment of their parents. At one point, the situation was so bad that York Terrace women, whose children attended upper grades at Drake, had to form a human chain to escort the South Commons children to school and home.

The results of this abrasive school situation were evidenced in the population change in South Commons. It was most dramatic in the 221-d-3 housing when the 65% white tenant population began to move out rapidly, to be replaced by moderate income Black families. These latter families also felt the school pressures, and far from feeling they must send their children to Drake for economic reasons, scrimped on budgets to send their children to parochial schools or managed to house children with relatives in other school districts, rather than have their children face the harassment of an aggressive and hostile minority of the Drake School children.
The upper income tenants in rentals and townhouses with children of school age reacted in a number of ways. Parents who had a child going into the fourth grade would enroll that child in a private school, if possible, and if a younger sibling was about to enter South Commons School, the tendency became that of not even starting in that school, but enrolling the younger sibling in the private school as well. The added financial strain caused a number to come to the decision to simply move out or sell: other who had hoped to stay became discouraged and followed them shortly.

Administrative personnel of the Board of Education in 1971 were pushed into the addition of more grades to the South Commons School. In the Fall of 1972, fourth grade and in 1973 fifth grade were added. The plan called for a school through eighth grade, the balance being added one per year. The Advisory Council of the Drake School--South Commons School (duly composed of community people, with roots in the South Commons Community Council of Concerned Parents) was influential in obtaining a Wieboldt Foundation Grant to study the problems and make recommendations to the Board of Education.

Some white middle-class families have moved out because of the school situation; Black middle-class renters or townhouse owners are facing the same problem. There are 450-500 children in moderate income housing, 135-200 children in upper income housing; an as-yet-unknown number are of school age. But a significant picture emerges from the May, 1973 figures: of the 198 children at Drake-South Commons, only 95 were from South Commons. At the Drake School (fifth to eighth grade) only 31 were from South Commons. And at St. James, a parochial school two blocks away, there were 41 South Commons children. Thus, out of about 650 children, only 167 plus 25 preschoolers (i.e., one-third of the children) are accounted for. The large balance is sent to private schools—Francis Parker, University of Chicago Laboratory School, Howard, St. George, and others.

Mrs. Jesse Harvey is a Black who moved into moderate income housing six months after South Commons opened. Interviewed recently by a reporter, she said:

The developers did a beautiful public relations job in attracting people here, promising them everything.... But somewhere along the line the bottom fell out and Blacks and Whites started moving out. Many things management promised were not forthcoming. They promised a school for the residents, and when they arrived, they found it only went up to third grade. A community of this type must have its own elementary and high school. (Mary Dedinsky "Urban Idyll That Hasn't Jelled?" The Sun-Times, 9/1/74:30)

Thus, not only are the neighborhood people embittered; the 221-d-3 residents feel like they have been sold a bill of goods. When the interests of their offspring are at stake, parents become far more actively involved and vocal. Their vibrations do not go unnoticed by the children, who then have another bit of information to process.
CONCLUSIONS AND IMPLICATIONS

On the basis of this preliminary exploratory five months study the following conclusions and implications are suggested.

I. South Commons is composed of autonomous, though inter-connected, fields of relationships. The fields within South Commons are segregated along socio-economic lines. Thus, their intra-connection is as loose as the inter-connection between those of South Commons and those outside.

The construction of South Commons has created two parallel situations: one is the incorporation yet very distinct separation of upper and lower income within the bounds of South Commons; the other is the incorporation of South Commons into the neighborhood of Douglas (e.g., not erecting apparent walls which would close it off as distinct and separate) while applying stringent methods to bar the outside from entering. Territoriality and dominance are two major elements of the situation.

A child growing up in South Commons is exposed to children and adults from both within and without. The outsiders are poor. They live across the street in buildings which are noticeably different (i.e., subsidized). The children outside South Commons run with their own; the children within do so also. The further complicating factor within is that there is also a noticeable difference, and physical separation between rich and not rich. The moderate housing is a small proportion of the whole, with far more people (especially children) accommodated. The amenities are noticeably absent.

Conclusion: Inner-group conflict is a function of class differences rather than race, and physical space, design and landscaping also reflect differences and exacerbate them.

II. The lower income children are unwelcome in the upper-income area; their counterparts across the street (in public housing) are similarly unwelcome in the moderate, or public, area. The dominance/subordinance became manifest in territorial claims: the subordinate group (the poor) have asserted themselves by making claims, particularly of public spaces (Prairie Courts residents re-claiming the once-vacant mall area) and semi-public spaces (the moderate people "hanging out" in the court) and scaring away people who moved there, prepared for a positive experience.

A large number of neighborhood children, or at least their older siblings, were accustomed to using the open space on which South Commons now stands as their own territory; the building of the planned development then dispossessed these children of what they regarded as rightfully theirs. In addition, they have been exposed to the fears and hostilities of their parents vis-a-vis the newcomers at South Commons. Thus, to a certain extent, the neighborhood children return to their former territory both out of habit and antagonism, and, also of course, curiosity. Thus, for example, they pilfer food at the Jewel Tea Company market in the mall, they snatch purses from residents, and they borrow and do not return bicycles. The children
of South Commons then generalize from their experience with this behavior, and become more intolerant (not prejudiced) than their peers in middle class suburbs.

Conclusion: The total environment (or experience) must be taken into account in planning such "new towns" or especially inner-city communities. In building within an already-established neighborhood, one must be cognizant of the limits of tolerability that populations have for each other.

III. The subordinate groups, those from outside (Prairie Courts) and those from York Terrâçe in South Commons became disturbed and hostile primarily around the school issue which they interpreted as another example of the rich taking advantage of the poor. As parents became more and more involved, tensions grew and children's incidental exposure to their parents' hostility, affected their behavior and relationships. These tensions and hostilities were observed on both sides, among all groups.

As the subordinate group asserted itself, territorially at least, it made itself more dominant. Parents became concerned for their own children's safety, and their children sensed this.

Conclusion: The school became fundamentally pivotal to interaction and community organization, because as a mere socio-physical institution, it has the quality of bringing together rich and poor. It would provide the territory for otherwise segregated fields to come together, forming a school network (of activity). The school has withered. Thus, there is no catalyst for initiating ties across class lines.

MAJOR IMPLICATIONS

1. Persons moving into a community for reasons of integration (racial, ethnic, socio-economic, etc.) are more likely to move out if integration is not successful than those who moved into the community for other reasons (convenience to employment, facilities, etc.).

2. Institutions directly affecting children are fundamental to the community stability and cohesion.

3. Physical symbols of differentiation must be considered as barriers to cohesion, both between sub-areas within the community and between the planned community and its immediate surroundings.

4. The role of members of the outside community in influencing children's attitudes is an important form of second-order effect (c.f. Bronfenbrenner 1973)
In summary the planned inner-city community must be considered as one element in the larger urban dynamic. This preliminary exploration of the interactions between the populations in the South Commons and surrounding area, the study of the physical planning, and the role of institutions, provides sufficient, though limited, documentation of the need for more adequate integration of human needs, physical or spatial needs, and human services resources in the planning and programming of a community.
