ABSTRACT

This guidebook to a self-study course in practical mathematics contains: (1) the course description; (2) directions for testing and training; and (3) lesson progression sheets, quizzes, quiz answers, and lesson answers. The 25 quizzes cover multiplication and division of whole numbers, operations with fractions and decimals, understanding math symbols, solving equations, percent problems and applications, measurement problems, rates and average problems, and ratios and proportions. The student self-study book is bound separately as book II.

FOREWORD

Introduction

One might expect that professionals in the field of education would be able to assess with some accuracy the relative merit of training materials. Rothkopf (5) has conducted an intriguing study which puts this notion to experimental test. Teachers and principals were asked to estimate the relative effectiveness of several different sets of training materials, each of which had been designed to cover the same content. Because achievement data had previously been gathered, comparisons of actual and predicted effectiveness could be made. In general, those materials judged most effective by educators were the ones found the least effective in terms of student achievement.

This anecdote illustrates the importance of validating the effectiveness of instructional materials in terms of student performance. The mathematical training materials presented in this manual were developed and validated on a basis of repeated tryouts with Navy students followed by diagnostic evaluations of their performance (3). Whatever worked was retained; whatever did not was discarded or modified.

These materials, under the title of The Practical Arithmetic Self-Study (PASS) Course, were developed as a by-product of research conducted by the Navy Personnel Research and Development Center (NPRDC). The research represented an effort to identify effective methods for training Navy personnel whose pre-induction test scores indicate low levels of competency in various academic skills. Such personnel typically perform poorly in Navy Class A schools.

Although designed for use with marginally-qualified personnel, the instructional materials developed in conjunction with NPRDC's research program have been found effective for students with a wide variety of backgrounds and qualifications. Experimental courses involving recipe conversion (4) and circuit-board-soldering skills (2, 6) have already been developed into training packages which have been utilized by Navy training commands.

The PASS Course materials presented in this manual are based on an experimental course developed to provide individualized remedial training in basic mathematics. Indications of interest in individualized mathematics instruction and requests by naval commands for copies of the experimental course led to the decision to publish these materials as a training package.

Course Description

This text was planned and developed by the Navy Personnel Research and Development Center. It is designed for use, in part or whole, in
Navy training programs that require some level of skill in performing basic mathematical operations. In consideration of those who wish to determine whether the content and orientation of this course are suitable to their particular needs, the following course description has been prepared.

1. Content. The course is designed to cover mathematical operations from the sixth to ninth grade level of difficulty. Course content is based on the Arithmetic Computation portion of the USAFI Achievement Test III. Types of mathematical operations include: calculations with whole numbers, fractions, decimals, and percentages; computations that involve units of measure (e.g., time, rate of speed, length, area, volume); solutions that involve formulas, linear equations in one unknown, ratios, and averages. Addition and subtraction of whole numbers are not covered, partly because very few Navy personnel appeared to find these types of problems difficult, and partly because an excellent Navy text is already available which covers these operations (1).

2. Administration. The course is designed for self-study with minimal assistance. However, the presence of an instructor for providing direction, encouragement, and evaluation is believed to be beneficial. Trainees need cover only those types of mathematical operations that are difficult for them. Course work is sectioned into a series of lessons, each of which may be worked as a unit. For each lesson there is a corresponding diagnostic quiz provided. Complete instructions for administering course work can be found in Section I, Part B of the manual.

3. Orientation. The course was developed in order to provide remedial training to Navy enlisted personnel. With this goal in mind, efforts were made to relate computational processes to practical applications which would be relevant to a Navy man's experiences. Course work is performance oriented. Unnecessary theory and jargon are eliminated wherever possible. Terms such as "numerator" or "subtrahend" are replaced by expressions which are commonly used in everyday life. Explanations are brief, simply worded, and typically illustrated with examples. Content is organized from the student's point of view and extensive use of underlined headings is made to clarify content organization and to simplify location of particular processes. Written responses are frequently required of the student in order to maintain involvement and to provide immediate application of training.

I. Directions

A. Testing

If achievement testing is desired, the Arithmetic Computation portion of the U. S. Armed Forces Institute (USAFI) Achievement Tests III provides a relevant standardized criterion with raw scores that can be directly converted into school grade levels. The PASS Course content was designed specifically to cover the level and orientation of the items contained in this USAFI test.

B. Training

1. Overview. In Figure 1 an illustrated flow chart is displayed to indicate how course materials are to be presented. The student progresses through a series of course lessons, alternating between quizzes and course work. He begins by taking a lesson quiz to determine which operations he needs to study. He is then directed to the sections of the lesson where examples of the items he missed are covered. He studies the specified portions of the lesson, making written responses where required. Upon completion of the indicated course work, he checks his written response against an answer key and corrects any errors, reviewing explanations and examples when necessary. When he has completed the required course work and is satisfied that he understands how to work the problems, the student reworks the quiz items he missed. This process is then repeated until all quiz items have been answered correctly. When all answers are correct, the student goes on to the next lesson quiz.

2. Administering Diagnostic Quizzes. The PASS Course consists of 25 lessons and, for each lesson, there is a corresponding quiz. Course quizzes are located in Part B of the Auxiliary Materials section. Each quiz is coded with a letter identification representing the type of mathematical operations being covered (A-Multiplication, B-Division, etc.). The quizzes are ordered alphabetically. Some types of operations have been subdivided into several lessons, each with a separate quiz. Hence, under C-Fractions are lessons C-I, C-II, C-III, and C-IV, each to be worked as a unit.

The first administration of the quiz is given before the student starts a lesson. The instructor corrects the results and indicates which items were missed, but does not specify the correct answer. (Quiz answers are presented in Part C of the Auxiliary Materials section.)

1 Test forms and instructions may be obtained through the U. S. Armed Forces Institute, Madison, Wisconsin 53713.
no items are missed, the student skips that lesson and goes on to the next quiz. If errors were made, the student is directed to appropriate portions of the lesson. After completing the required course work, the student reworks the quiz items that he missed. The entire process is repeated until all items are correct.

3. Assigning Course Work. Exactly which lessons should be administered to the student will depend upon the goals and requirements of the individual training activity. Whatever course work is covered, the order in which it is presented should be carefully considered. A suggested ordering of lesson presentation is displayed in Part A of the Auxiliary Materials section. While alternate orderings may be equally effective, care must be taken to be certain the student has the necessary background knowledge before he starts any given lesson.
Once the student has taken a lesson quiz, he should be assigned to corresponding course work. The parts of the lesson he covers will depend on the quiz items he misses. The quiz answer key, located in Part C of the Auxiliary Materials section, not only provides the correct answers to the quiz problems but also indicates which parts of the course work the student should cover before repeating the lesson quiz. While it is possible for students to correct their own quiz answers and direct themselves to appropriate course work, it was found that having the instructor carry out these functions reduced cheating and increased student motivation.

4. Administering Course Work. Course lessons are separately located in Book II. Lessons are coded alphabetically and ordered according to their letter designations. Course work is designed for individual study so that each student may work at his own pace. It may be expected that the rate of progress will vary considerably from student to student. Following completion of a lesson the student may check the accuracy of his responses to the numbered questions presented in the lesson. Answers to numbered questions in the lessons are provided in Part D of the Auxiliary Materials section.

In general, it is probably better for the student to learn to work on his own as much as possible. However, the instructor should carefully monitor the student's progress. From time to time, it may be necessary to give encouragement, direct attention to a particular portion of instruction, or clarify an explanation that has been misunderstood. Students should be discouraged from proceeding through the lesson so quickly that they have to repeat course work several times.

Once the student has completed the parts of a lesson to which he has been assigned, he should check his written responses. Answers to numbered lesson questions are located in Part E of the Auxiliary Materials section. If he finds he has made errors he should review the portions of the course work that gave him trouble and correct his wrong answers. At this point, the student is ready to go back to the lesson quiz and rework the items he missed.

MEASUREMENT FORMULAS

Triangles

(24) The triangle below is half of a 4" by 3" square. What is the area?

\[ \text{Area} = \frac{1}{2} \times 4'' \times 3'' \]

\[ \text{answer} \]

(25) The area of the triangle shown below can be found with the formula:

\[ \text{Area} = \frac{1}{2} \times b \times h \]

\[ b = 8'' \]
\[ h = 6'' \]

What is the area? \[ \text{answer} \]

Circles

(26) The formula for finding the area of a circle is: \( A = \pi r^2 \) where:

\[ A = \text{area} \quad \pi = 3.14 \quad r = \text{radius (distance from the center to the edge)} \]

If: \( r = 10 \text{ in.} \) Then: \( A = ? \text{ sq. in.} \)

\[ \text{answer} \]

(27) If the area of the end of a piece of pipe is 6 sq. in. and the pipe is 10 1/3 in. long, then the volume of the pipe is \( ? \text{ cu. in.} \)
