The effects of Social Darwinism, eugenics, and contemporary political conservatism on the status of advocacy efforts for the mentally retarded are reviewed. Provided are historical sketches of Social Darwinism, which viewed the retarded as members of an inferior race, and eugenics, which argued for sterilization of the "genetically unfit". The author examines a resurgence of these two movements in the writings of A. Jensen and W. Shockley and in current conservative political thought. It is emphasized that advocates for the retarded should strive to go beyond notions of charity to influence social attitudes and political philosophy. (CL)
Political Philosophy and the Mentally Retarded

Today I would like to talk about the larger social and political atmosphere in which advocacy efforts are unavoidably embedded. I should perhaps mention here that the primary focus of my remarks will be mental retardation, but it will easily be recognized that many of the points apply equally well to other handicapped groups.

For special interest and advocacy groups to be effective, it is necessary that they understand the politics of the issues that concern them. As Knitzer (1971) has stated, "After a decade of experimentation with social change policies, the professional has come to appreciate that social priorities and programs are alternately beneficiaries and victims of a fundamental political process. Advocacy, in that it is inherently and unabashedly political, reflects a crystallization of this awareness and an attempt to create new strategies for social change (p. 699)." Recognizing this fact, the various special interest groups in our society have almost, without exception, all developed relatively coherent social and political philosophies to guide their actions. However, the professional and lay spokesmen for the mentally retarded have largely failed to develop a unified political philosophy for their movement.

This lack of a coherent political philosophy seems to stem from the tacit assumption that the issues of rights and treatment for the mentally handicapped are apolitical. This mistaken idea stems from a failure to come to grips with two important issues.

The first is that, historically, the treatment of the mentally retarded has been greatly influenced by the prevailing political and
social attitudes. Thus, it is essential that advocates maintain a historical perspective. The second point is that the spokesmen for the retarded who have recognized that patterns of social change affecting the mentally handicapped reflect the prevailing political attitudes have generally failed to be evaluative. Most individuals and groups have acted as if divergent political philosophies have similar implications with regard to the handicapped. On the contrary, it will be argued here that the various political views currently held in this society differ in their implications with respect to the welfare of the mentally handicapped, and that the different implications can be used to guide advocacy efforts.

It is to the former point that I would like to turn first. Restated in general terms, it is that the success of a particular social movement is dependent upon the attitudes prevailing in the given society. Thus, an aspect of advocacy that has heretofore been neglected is that of working to change the larger political and social atmosphere in which specific reforms will be accepted or rejected. That this particular aspect of advocacy is of crucial importance is suggested by any review of the history of the treatment of the mentally retarded. Sarason and Doris (1969) draw the connection most clearly, stating, "...at any point in time, society's attitudes towards its deviants are not shaped solely by the scientific theories or facts then available. The theories or facts will be seen to have different implications depending upon the general social matrix in which they occur (p. 227)." Taking the above as a premise, I would like to give a brief historical sketch of a particular social philosophy, both because it had profound
effects on the treatment of the mentally retarded and because its social and political antecedents still exert an influence on social policy affecting the retarded.

The intellectual movement I wish to discuss is the Social Darwinism of the latter half of the nineteenth century. Briefly, the adherents of Social Darwinism attempted to apply the ideas of natural selection and survival of the fittest to human social life. Thus, the fittest of a society (usually defined by the Social Darwinists as those having the most material wealth) were seen as the superior products of an essentially biological process. Similarly, those who were less successful in a given society (the poor, the mentally and physically handicapped, the diseased) were seen as inferior races of mankind. They were depicted as being what they were because of an inferior biological inheritance, rather than environmental deprivation. Thus, man should not tamper with the natural selection process which will allow mankind's inferiors to disappear from the face of the earth. Having these as their beliefs, it is not surprising then, that the Social Darwinists were opposed to social measures that would ameliorate the condition of the poor and handicapped. To quote Herbert Spencer, intellectual leader of the Social Darwinists, "...society is constantly excreting its unhealthy, imbecile, slow, vacillating, faithless members...unthinking, though well-meaning, men advocate an interference which...stops the purifying process (1851, p. 323)."

Social Darwinism occupies a place of importance in the history of mental retardation in that it had a considerable impact on the way the mentally handicapped and underprivileged members of society were perceived.
at the turn of the century. Instead of being thought of as victims of adverse environmental circumstances, the retarded were seen as members of an inferior race of mankind. In addition, Social Darwinism paved the way for, and is inextricably linked with, the eugenics movement of the first three decades of this century (Keller, 1963; Hofstaedter, 1959; Sarason & Doris, 1969). The eugenacists carried the doctrines of Social Darwinism one step further and argued for restricting the breeding of the "genetically unfit". The eugenics movement is important in the history of the treatment of the mentally handicapped because it was probably the primary advocate of the sterilization and segregation of the mentally retarded. Although their attempts at promoting effective sterilization laws were generally unsuccessful, the eugenicists did achieve success in getting society to accept the idea that the retarded should be segregated in large institutions away from the community. As late as 1976, we are still in the process of reversing this mistaken policy.

The relevance of these two social movements for the primary theses of the present paper cannot be overemphasized. It is important to realize that Social Darwinism (and its stepchild - eugenics) arose not just as a neutral application of Darwinian principles to social life, but as a biological justification of specific political and economic doctrines. Social Darwinism was conceived as an attempt to find justification for laissez-faire economics in natural laws. Indeed, Spencer's seminal work, Social Statics, preceded publication of Darwin's The Origin of the Species by eight years. The term Social Darwinism is thus somewhat of a misnomer, since Spencer had argued against government interference in aid of the
poor long before Darwin's work was brought in as a justification.

That Social Darwinism was used to bolster laissez-faire economics and conservative political doctrine has been amply documented by several authors. Hofstadter (1959) has stated:

Darwinism was seized upon as a welcome addition... to the store of ideas to which solid and conservative men appealed when they wished to reconcile their fellows to some of the hardships of life and to prevail upon them not to support hasty and ill-considered reforms. Darwinism was one of the great informing insights in this long phase in the history of the conservative mind in America. It was those who wished to defend the political status quo, above all the laissez-faire conservatives, who were first to pick up the instruments of social argument that were forged out of the Darwinian concepts (pp. 5-6).

Hofstadter further states that Spencer's Social Statics was, "...an attempt to strengthen laissez-faire with the imperatives of biology (p. 40)."

Hofstadter, in considering why the Darwinian ideas were distorted in this particular direction, concludes, "The answer is that American society saw its own image in the tooth-and-claw version of natural selection, and that its dominant groups were therefore able to dramatize this vision of competition as a good thing in itself. Ruthless business rivalry and unprincipled politics seemed to be justified by the survival philosophy (p. 201)." In their historical review of Social Darwinism's affect on the treatment of the mentally retarded, Sarason and Doris (1969) also emphasize the link of Social Darwinism to laissez-faire economics, stating, "While the attitudes of the Social Darwinists were undoubtedly formed in large part by their reactions to evolutionary theory and the vivid analogies it suggested between life in nature and life in society, one must also recognize the fundamental influence of classical economic theory."
Spencer's argument needed no Darwin. The classical economists had set the premises. They can be seen in Adam Smith's advocacy of free competition in the market place... (p. 226)." Sarason and Doris also stress the attraction the eugenics movement had for political conservatives: "We can readily imagine that the politically and socially conservative elements in society that had so readily embraced the Social Darwinism of Spencer and Spencer...would readily have accepted a concept of organized action, like the Social Darwinism that preceded it, would advocate not change in the organization of society but the elimination of those who could not or would not successfully adjust to that society (p. 243)." Finally, Haller (1963) in his historical work on the eugenics movement, stated: "...many strands of eugenic thought were a scientific disguise for conservative, often harsh, indictments of classes and races, and eugenics became, for a time, predominantly a conservative creed (pp. 5-6)." In summary, a consideration of the intellectual movement of Social Darwinism illustrates the two major theses of this paper: first, that the treatment of the mentally handicapped is affected by current political and social attitudes, and secondly, that political philosophies differ in their implications for the mentally handicapped.

It is the second point which should be stressed since it seems to have been most neglected. That is, once advocates for the mentally handicapped realize that governmental policies affecting the retarded are dependent upon social attitudes, it becomes necessary for a judgment to be made as to which social and political philosophies have more positive implications for the mentally handicapped. Sometimes this judgment can be made by extrapolation from the past. I would like to argue that this
The resurgence of Social Darwinism has been a topic of interest among scholars and intellectuals for decades. The controversy is of importance because it has profound implications regarding the treatment of the mentally handicapped. The intellectual and social movement I am referring to is the resurgence of Social Darwinism (although not by that name) in modern American thought and politics.

In the intellectual sphere, the resurgence of Social Darwinism has been marked by the renewal of the nature/nurture controversy in recent years. The seminal paper in the renewed controversy was the 1969 Harvard Educational Review article in which Arthur Jensen suggested: 1. that the heritability coefficient of I.Q. was approximately 0.5; 2. therefore, programs of re-education for below average students were doomed to failure since I.Q. was primarily genetically determined; and 3. it was a reasonable hypothesis that the lower performance of black Americans on intelligence tests was due to genetic factors. The sequence of events subsequent to the publication of Jensen's paper, though compressed in time, was remarkably similar to that occurring in the earlier period of Social Darwinism discussed previously. Social reactionaries and racists of all stripes seized on Jensen's paper as scientific evidence for their political and social beliefs, even to the extent of vituperating Jensen's original work. Others, in a manner reminiscent of the writers at the turn of the century, have suggested genetic remedies for our social problems. Although posing as disinterested scientists, these individuals are ever so willing to suggest social policies that incorporate Social Darwinianism and genetics.

The most prominent exponent of the new Social Darwinism movement is William F. Sloan. Although not trained in biology or social science (he won the
It is clear that in the two cases, Shookley points to changes in the social environment with the result that it is unlikely that the implications are not overwhelming. He concludes that there is an understanding [sic] that results from the analysis of the data which is both meaningful and practically determinate. He did not call for sterilization or other intervention.

Using similar analyses of population and educational characteristics of their adaptability to intellectually retarded and effective lives can easily be made ... (p. 103). Shookley has proposed (as an "intellectual exercise") that people who are below 150 on the intelligence test be sterilized. Specifically, he suggests that the IQ be given priority for each patient in line, but below 150 he would recommend several successful and fail in an early intervention projects with the mentally retarded. Incredibly, Shookley's argument against the program is that they are too costly. The inference left to the reader is that eugenics is more cost effective and is disturbing to myself and others in the wide circulation. Shookley has been given in reputable journals, professional publications, at large conferences, and in lectures at leading universities. Let this not be mistaken as a call for censorship. I am not advocating that Shookley not be heard. However, I do find it surprising that in these days of information explosion and 80% journal rejection rates that Shookley's ideas are published widely when other researchers studying such important topics as children's learning, individual differences, and educational intervention find it hard to get published. This is especially disconcerting since little in Shookley's work is new and much of it is eugenics propaganda.
Perhaps more important to the security of social order are the handiwork of the institutional forces in our society. These forces are the advocates, and protectors of the established social order. We have seen that the political implications of the great social movements have been profound. The political participation currently held by our groups differs greatly in their attitudes toward the social order, and in their willingness to defend this order. It is the schism that is the result of these two attitudes which is the key to understanding the nature of our society.

In the previous discussion we demonstrated the fact that Social Darwinism is a philosophy that is remarkably consistent in the individual and in the collectivity. It is this fact that gives rise to a continued influence on political thought. It is clear that the nature of major political philosophies in this country have been characterized by solutions emphasizing free competition in the market place as a solution to unemployment, recognizing governmental programs as effective in our social and economic problems. The point to be made is that conservative political philosophy has always contained a strong component of Social Darwinism. Throughout modern American history Social Darwinism has been intertwined...
and costs of help. It took strong federal action to guarantee economic and civil rights to non-white Americans. Similarly, parents of the retarded were traditionally found wanting "good will" to be inadequate when it came to creating educational services for their children. It has taken strong federal action on the state level to guarantee mandatory special education.

In an excellent article entitled "What Price Charity?", Dierer (1975) described the difficulty of relaxing in large charity efforts on behalf of underprivileged children. She states a position similar to that of the present author in urging for direct political action, rather than charity. She states that the article published in The Exceptional Parent, "must be...understanding and redirected with a view to..."

I have had my share of the disadvantages and privileges of this world, but never has it been suggested that I am to support the cost of my son's education. Such a schedule of higher education does not exist, such a schedule of public education does not exist, such a schedule of private education does not exist, such a schedule of financial aid does not exist. Many of my neighbors in this community have had the privilege of public education for five years, for the cost of providing free public education for five years is not to be assumed as a burden of the public.
It seems to me that now is the time to rechannel that incredible energy that goes into telethons and door-to-door drives to change public opinion, legislators' votes and the very morality and economic structure of this country. For if the end it really does will come to what it now and it seems we're going to work toward (p. 35, The Exceptional Parent, February, 1976).

Hopefully, it will be recognized that charitable organizations working on behalf of the mentally retarded have a crucial weakness. Since their financial support comes from a broad spectrum of the populace, they are forced into a neutral philosophical position so as not to alienate any segment of the political continuum. Thus they are unable to lobby effectively for the retarded when the issues involved have political implications. This is a severe problem since the plight of the retarded is similar to that of a disenfranchised minority group such as black Americans. Like blacks, the mentally retarded are asking for previously denied jobs, housing, and education. They can best be helped toward these goals by a society that supports progressive social change. Awareness of this fact among the citizens who speak for the retarded will lead to increased political clout for this group.

Perhaps a brief discussion of a contemporary problem in the field of mental retardation will illustrate the point. The creation of community homes for the retarded has become an issue fraught with political implications. In dozens of cities, these homes have been opposed by city councils, ad hoc "citizen's committees." These groups have used zoning laws, largely designed to prevent well-to-do property interests, to block the creation of community homes in their neighborhoods. These same people would gladly give a dollar to a charity for the retarded, but would
simultaneously deny them the basic human right to live independently in society. What the retarded really need is to have the city zoning laws changed so that community homes for the mentally handicapped can be organized. A recent study by Sigelman (1976) is relevant to this issue and to the points argued previously. She found that people who identified themselves as political liberals were more favorable toward group housing for the retarded in residential districts. In addition, liberal respondents were more likely to favor equal opportunity employment for the retarded.

Modern American conservatism, in short, which is rooted in the Social Darwinism of the nineteenth century, emphasizes charity because its tenets are fundamentally opposed to social change. However, the welfare of the retarded greatly depends on some needed social change. Advocates for the retarded should recognize this fact and support the liberal reforms that will provide a more conducive environment for the mentally handicapped.

One policy traditionally supported by conservatives has been a balanced national budget. Interestingly enough, the same people who advocate a balanced national budget simultaneously endorse large expenditures on the Defense establishment. Obviously, larger military spending means smaller expenditures in other parts of the budget. The implications of this policy are obvious. The mentally retarded have nothing to gain from subsidies to Lockheed Aircraft, but have a great deal to gain from federal health or education programs. Why then, have professionals, parents, and advocates of the retarded not protested more vociferously against the destruction of education and poverty programs by the Nixon and Ford administrations? Have they hesitated for fear of involving the cause of the retarded in a "political" struggle? If so, and the author is inclined to believe so,
opposite social philosophy, determined to maintain a large military apparatus at the expense of social programs, has clear implications for the mentally retarded. The sooner those concerned wake up to that fact, the better.

One need not look far to see the conservative trend in modern political rhetoric. On the one hand we have seen Ronald Reagan campaigning in the primaries on a platform of increased military expenditures and drastic cuts in health, education, and welfare budgets. On the other hand, we observe President Ford reluctantly signing the "Education for All Handicapped Children Act" and then charging that the bill’s supporters are "falsely raising the expectations of the groups affected by claiming authorization levels which are excessive and unrealistic...the funding levels proposed in this bill will simply not be possible if Federal expenditures are to be brought under control and a balanced budget achieved over the next few years (White House Statement, December 2, 1975)."

A recent study by the present author clearly demonstrates the link between political philosophy and support of programs for the mentally handicapped. It was found that Congressmen who were primary supporters of legislation of benefit to the handicapped tended to be significantly more liberal on other issues (as measured by the A.D.A. liberal quotient) than other Congressmen.

The above discussion touches on just a few of the areas where a conservative social and economic philosophy has proven detrimental to the retarded. As the mentally handicapped assume their full and equal place in society, it is inevitable that controversy will occur. The issues of resource allocation, treatment of deviants, individual versus group rights,
and human sexuality all touch the retarded and are fraught with political implications. Fortunately, a few professionals have recently begun to recognize the implications of social philosophy for policy decisions regarding the retarded. In an excellent article, Morgenstern (1974) has described the three prevalent community attitudes toward the retarded. The first is the primitive belief that the retarded are a sub-human class that should be segregated in institutions so as not to be harmful to the community. Another belief held is that the retarded are "child-innocents" or "God's chosen children." The implications of this attitude are clear to Morgenstern, who states that, under this philosophy, "Assistance to the retarded takes the form of charity and in return, the retarded are expected to be grateful and conforming (p. 159)." The third attitude toward the retarded is that they are "developing persons" whose potential can best be realized by full participation in community life. Morgenstern is essentially in agreement with the present author when he states that, "Attitudes in this category originate from the enlightened and progressive elements in our society, the same elements that have given impetus to the movement for civil rights for all minorities (p. 160)." Lippman (1972), in his review of attitudes and programs for the handicapped in several countries, essentially concurs with this opinion, stating, "...programs for the mentally retarded in Europe are better than in the United States - in part because attitudes are different (p. 68)." The attitudes that Lippman feels contribute to the development of beneficial programs are "libertarianism, liberalism, and an acceptance of government responsibility for reeducating social institutions."

In summary, there is ample documentation for the fact that the social
and political philosophies of a society affect the types of programs and treatment that are afforded the mentally retarded. Thus, it must be recognized that we are creating the intellectual climate in which new developments for the retarded will be accepted or rejected; and that we create the climate in part by the political leaders we elect and the ideas we support. A recent editorial in The Exceptional Parent proposed that every national organization concerned about people with disabilities publicize to their memberships the platforms of political candidates on issues of health, education, and welfare for disabled Americans. Although this is a laudable proposal, following the line of argument presented in this paper I would suggest that it does not go far enough. Why not openly endorse and support chosen candidates as do other special interest groups, with much success? The directions in which long-term advocacy efforts should be focused have been alluded to previously. It has been argued that more explicit and aggressive attempts by advocates to influence social and political psychology will be of long term benefit to the retarded and other handicapped groups. The day has finally arrived for the slogan of the handicapped to be, "No more charity, give us our rights."
