The Tattletooth Dental Program (Covering the Field Test Phase, Second Year). Evaluation Report.

Educational Development Corp., Austin, Tex.

Aug 76

123p.; For related document, see ED 117 131

The Tattletooth program is a new dental health curriculum in which the students learn in the classroom to care for their teeth through brushing, flossing, and proper diet; and they receive needed support and encouragement to form good dental habits from their parents, dentists, and from community groups. Classroom materials for the Tattletooth curriculum impart an activity-oriented, humorous, positive approach to the teaching of preventive dental care. Separate lesson plan kits have been developed for each of nine grade levels: kindergarten, six elementary grades, junior high school, and senior high school. Tattletooth consists of a number of components in addition to the curriculum package. This report makes six conclusions: (1) teacher training was satisfactory; (2) curriculum materials were generally successful, and educational progress was made in all grade levels; (3) in all cases the field test groups made better dental progress than the respective control groups; (4) teachers used the curriculum materials with their own augmentations; (5) teachers liked the program; and (6) much regional variability was found. Recommendations in keeping with these conclusions are made. The report includes examination instruments, educational and dental procedural instructions, and educational statistics in appendices. (Author/RC)

which goes beyond the scope of most previous programs. Students learn in the classroom to care for their teeth through brushing, flossing, and proper diet; and they receive needed support and encouragement to form good dental habits from their parents, dentists, and from community groups. Characteristics of TATTLETOOTH make it an effective vehicle for improving dental health in students and in the community as a whole.

The idea for the program began in September 1973 with the organization by the Texas Dental Association of an Interdisciplinary Advisory Council of Dental Health. The curriculum was developed according to a systematic process of educational development which began with recognition and analysis of the needs. The field testing of the program in Spring 1976 included the involvement of more than 16,000 students from Kindergarten through High School and approximately 540 teachers across Texas. Earlier, the lesson plans were pilot tested twice in five regions of the state.

Classroom materials for the TATTLETOOTH curriculum, developed by teachers and curriculum specialists, impart an activity-oriented, humorous, positive approach to the teaching of preventive dental care for the benefit of the whole person. Separate lesson plan kits have been developed for each of nine grade levels: kindergarten, six elementary grades, junior high school, and senior high school. TATTLETOOTH consists of a number of components in addition to the curriculum package. They are to be used in training teachers, involving the dental and educational communities,
informing parents, and making the general public aware of the program and its aims. Formats of materials range from media releases and handouts for meetings to slide/tape presentations.

The report makes six conclusions: (1) teacher training was satisfactory; (2) curriculum materials were generally successful, and educational progress was made in all grade levels; (3) in all cases the field test groups made better dental progress than the respective control groups; (4) teachers used the curriculum materials with their own augmentations; (5) teachers liked the program; and (6) much regional variability was found. Recommendations in keeping with these conclusions are also made.

The report includes examination instruments, educational and dental procedural instructions, and educational statistics in appendices.

1. INTRODUCTION

General

The TATTLETOOTH program is a new and unique dental health curriculum, which goes beyond the scope of most previous programs. In concentrates not only on the physical well-being of students, but seeks to help them develop in social and psychological areas such as self-concept, conscience, and independence. In addition, the program is community-based in order to effect lasting behavioral change. Students learn in the classroom to care for their teeth through brushing, flossing, and proper diet; and they receive needed support and encouragement to form good dental habits from their parents, dentists, and from community groups. Characteristics of TATTLETOOTH make it an effective vehicle for improving dental health in students and in the community as a whole.

The idea for the program began in September 1973 with the organization by the Texas Dental Association of an Interdisciplinary Advisory Council on Dental Health. The Advisory Council brought together representatives of the Texas Education Agency, Texas Department of Health Resources, and a number of professional dental organizations to develop a new dental health curriculum for Texas public school students in Kindergarten through Grade 12.

The curriculum was developed according to a systematic process of educational development which began with recognition and analysis of the needs. Building on this research base, an educational model was developed; the program was conceptualized; and materials were designed, tested, evaluated, revised, retested, reevaluated, and again revised. The tests were conducted in classrooms across the state, and feedback was systematically collected to insure an accurate assessment of the program's strengths and to identify those areas which needed revision.

The field testing of the program in Spring 1976 included the involvement of more than 16,000 students from Kindergarten through High School and approximately
540 teachers across Texas. Earlier, the lesson plans were pilot tested twice in five regions of the state.

**Curriculum**

Classroom materials for the TATTLETOOTH Curriculum, developed by teachers and curriculum specialists, impart an activity-oriented, humorous, positive approach to the teaching of preventive dental care for the benefit of the whole person. Separate lesson plan kits have been developed for each of nine grade levels: kindergarten, six elementary grades, junior high school, and senior high school. Each kit contains:

- "People Facts" sheet explaining eight psychological and development traits the program seeks to enhance in each child
- "Dental Facts" illustrating correct methods of brushing and flossing and the use of disclosing wafers; and other technical information
- 10 lesson plans, many with transparency masters

Kits include all the materials and instructions the teacher needs to present the lesson. Ease and simplicity of presentation on the teacher's part is a significant feature of the program.

**Components**

TATTLETOOTH consists of a number of components in addition to the curriculum package. In order for the whole community to be involved in support of a program like TATTLETOOTH, community members must be informed about the program in a systematic manner. The TATTLETOOTH program includes informational packages designed for specific groups. They are to be used in training teachers, involving the dental and educational communities, informing parents, and making the general public aware of the program and its aims. Formats of materials range from media releases and handouts for meetings to slide/tape presentations.

One of each of the above

For use in Dental Schools, Colleges of Education, and by Regional Coordinators.

Organization

The TATTLETOOTH program represents a joint effort of three state level organizations: The Texas Department of Health Resources, professional dental Associations, and the Texas Education Agency. Their activities are coordinated on the state level through the Interdisciplinary Advisory Committee of the Texas Dental Association, a committee comprised of representatives from each state organization and other professions.

The Texas Department of Health Resources was the recipient of the HEW grant that financed the development of the program. It coordinates the program through its 10 public health regions.

The Texas Education Agency has primary responsibility for the educational aspects of the program. Working through the 20 regional Educational Service Centers, the Agency alerts the educational community to the program and provides for the training of teachers and other school personnel who will work in its implementation. The Education Service Centers are the primary vehicles for teacher training in each area.

The third state organization involved in the program is the Texas Dental Association and other dental professional groups. The professional groups contribute the services of dentists and dental professionals in the regions to assist in education of inservice leaders in the dental content of the program. Such activities will be carried on through Regional Advisory Committees in each of the 20 educational regions in Texas. Each of the
10 public health regions will have two persons (20 in all—one for each Educational Region) who will coordinate activities and push for action and improvement. These will probably all be dental hygienists.

Chronicle

Because the curriculum required a pilot test as well as a field test during the same school year, the scheduling was tight. The pilot test was conducted during the fall of 1975, and the revisions were underway by December.

The curriculum materials were printed during January, and a leadership training conference for the Educational Service Center coordinators was held in mid-February. The coordinators were given all the needed materials for teachers, and each was asked to conduct an inservice teacher training session in his region in the following two weeks. The field test was scheduled for March and April, and the closing date for posttesting was 7 May.

An earlier orientation meeting of the Educational Service Center coordinators had taken place in October 1975, at which the time schedule and the field test objectives were discussed. Because of the relatively autonomous position of Educational Service Centers as well as the varying degree and manner in which each was participating, a central field test plan was not prepared. However, the coordinators were given guidelines and parameters so they could write their own plans. It is uncertain whether they all wrote plans; few were received centrally.
2. EVALUATION DESCRIPTION

Product Description

The TATTLETOOTH curriculum has been designed for nine levels of instruction: kindergarten, grades 1 through 6, junior high school, and senior high school. Each curriculum package comprises 10 lessons of instruction, a package of information called "People Facts," and "Dental Facts" which gives information about brushing, flossing, nutrition, and dental health in general. Many of the 10 lesson plans include original artwork for transparencies or spirit masters. These accompany suggestions for bulletin board displays, ideas for games, for role playing, and suggestions for several modes of instruction.

As itemized in the introduction, there are several other components of the program in addition to the curriculum, which are designed to orient and instruct specific groups about TATTLETOOTH and how they can fit into the program. A few of these packages were not prepared in time for the field test, but the most important ones were complete and they were used. Also, for the field test, each classroom was provided with dental materials, including a toothbrush for each child, disclosing wafers, and dental floss.

The Field Test

The state of Texas is divided into 20 Educational Regions, each with an Educational Service Center that functions as the hub. A diagram of the 20 regions is shown on page 7. These regions are semiautonomous in their educational authority, and although they receive some specific instructions and guidelines and a certain amount of funding from the Texas Education Agency, service center personnel are nevertheless permitted their own decisions on most subjects. Therefore, in the preparation of the field test, it was decided that representatives of each region should prepare their own field
test plans based on a set of guidelines provided by the Department of Health Resources.

The field test was planned for March and April, 1976. To this end, a conference was held in October, 1975, for representatives/coordinators from each educational region, and for a few dentists. At the conference, considerable explanation was given about the program as a whole, and informational handouts were distributed. These described the program and regional authorities and responsibilities. One paper explained the field test purposes and outlined the schema for a field test plan. Goals and objectives of the TATTLETOOTH program were discussed, and the goals and objectives of field testing were identified. Another conference was held in February for the Regional Coordinators of the field test. The purpose of this conference was to provide leadership training so that the coordinators, in turn, could conduct teacher inservice training classes before the field test program started. At this mid-February session, each of the representatives was provided inservice training materials so that they could immediately undertake the teacher training in their own regions.

The teacher inservice training within each region was to take place during the two-week period following the leadership training conference, and the actual field test was scheduled to start on the first of March. There were to be educational and dental pretests given at the start of the program.

The scope of the field test was statewide; each region was given three sets of curriculum materials for each level of instruction. Since there are nine levels of instruction, the field test included 27 classrooms in each region. There are 20 regions and approximately 30 students per classroom; thus, the total involvement for the field test was in the order of 16,000 students. Each student was given an educational pretest and posttest, and 2,142 students would also get a dental examination twice.
For the dental checks, it was decided, because of limited resources, that oral hygiene evaluations would be performed in only seven of the twenty regions. In each of the seven regions, one participating classroom for each of the nine levels would be selected for evaluation. These classrooms would be matched as closely as possible with non-participating classrooms in the same schools, for control purposes. Seventeen students would be selected from each classroom by including every other name on the class roster. This would yield a sample of 153 subjects and 153 controls in each of the seven regions. Therefore, a total of 2,142 children would be selected for pretest and posttest examination by seven dental examiners.

**Evaluation Design**

An educational pretest and posttest was given to all children participating in the field test. These two tests were exactly the same, although the teachers did not know this in advance. The educational tests included both cognitive and affective factors in an effort to collect information in both of these areas, although they are not easily separable. Thus, an appropriate test was prepared for each of the nine levels of curriculum materials. The tests and the instructions that went with them are listed and displayed in Appendix A.

The dental portion of the field test would be conducted by seven teams headed by qualified dentists. Two sessions were held by the dentists for purposes of calibration. Detailed instructions were prepared for each member of the examination teams so that examination procedures would be uniform. (See Appendix E.) Each team consisted of a dentist, a dental hygienist, a recorder, and a "student coordinator". In addition, volunteers were recruited to help with the disclosing solution and rinse. The Patient
Hygiene Performance method (PHP) was selected as the test instrument. This Index is used to evaluate oral hygiene by comparing surfaces of six teeth. The teeth and surfaces involved are the facial surfaces of the upper right first molar, the upper right central incisor, the upper left first molar, and the lower left central incisor, and the lingual surfaces of the lower right and left first molars. The specified surface of each of these teeth is divided into five segments and each segment is scored 0 or 1 depending upon the nonpresence or presence of plaque on that particular segment. Therefore, each tooth receives five evaluations. This Index has been shown to be sensitive enough to detect changes in oral hygiene behavior. Presumably, if the TATTLETOOTH program had an impact on the child, he or she might have reduced the amount of plaque during that period. There was some skepticism as to whether the field test was of sufficient duration to allow a significant improvement during a two-month period.

So that each dentist would keep an even level of judgment as to the plaque measurement, each tenth child went through the examination process a second time, not in any given order, and a separate record was kept of the dentist's second reading. The hygienist or person who did the scoring was aware of when the child went for the second time, but the dentist was not. Further details about the dental process and scoring are included in Section 3c of this report.

An evaluation form prepared for teachers is in Appendix B. The teachers were asked to answer all the questions on a mark-sense sheet, and in addition, to add any comments they might like to make by writing on another sheet to be attached. Qualified educators and dental professionals made site visits to a number of classrooms during the field test, and information was obtained via an observation checklist. Also, a checklist for teacher interviews was developed. These checklists are shown in Appendix C.
As the field test ended, letters were sent to the coordinators at the Regional Educational Service Centers, to the site visitors, and to the dentists who had conducted the dental surveys. These persons were asked for their overall views (somewhat with hindsight). These letters are included in Appendix D.

In summary, it was felt that if there was a demonstrable change in the knowledge and attitude about dental hygiene, and if there was a change in the level of dental health and cleanliness by the children, and if, in fact, the control group remained unchanged during this period, then the program could be considered successful. It should be noted that although heavy emphasis necessarily was placed on the curriculum materials, strong consideration also was given to other components, so that the program as a whole was given appropriate consideration.
3. EVALUATION DATA

a. **Inservice Training**

The main sources of evaluation data for the field test inservice training efforts were the Teacher Evaluation Sheet (Appendix B), the Checklist for Teacher Interview (Appendix C), and communications from ESC coordinators and TEA observers. The inservice training approach and materials had been extensively evaluated during the pilot testing, and the importance of the training phase was thoroughly understood.

In the field test, as in the previous year's pilot, a training session for Regional Educational Service Center personnel and dentists was conducted in Austin. These trainers were then responsible for training the participating teachers in their respective regions. The large scale of the Austin training session, the limited time available, and the unexpectedly large volume of supplies and materials distributed at that session led to some frustration and confusion, but most problems were worked out satisfactorily through personal telephone contacts.

One expected source of confusion involved the evaluation procedure. Because of the sheer size of the sample, computer approaches were necessary, especially in the upper grades (where the students would be capable of using standard scanning sheets), and for teacher input. The necessity for pretest and posttest matching, both in the educational and dental aspects of the evaluation, together with privacy requirements, made a fairly complex coding numbering system mandatory, and this led to many questions and problems. The tight field testing schedule necessitated a decision to handle all evaluation data gathering through the ESC coordinators, which placed a further burden on them and added to the possibilities of confusion in the original trainer-training session in Austin. It is fairly obvious that
these particular problems were specific to the field test situation and would not occur in operational utilization of the Tattletooth program.

In the Teacher Evaluation Sheet, questions 17, 18, and 19 dealt with the inservice training the teachers themselves received. Question 17 dealt with the dental-technical portion of their training. Statewide, 68% of the responding teachers felt it was realistic and sufficient; 23% said it was not understandable; and 03% found it misleading. (06% answered an "other" category, mostly to express a need for more information.)

Question 18 asked for opinions about the educational component. A total of 70% found it realistic and sufficient; and 20% said it was too sketchy; 02% felt it was not understandable; and 01% reported that it was misleading. (The "other" category was chosen by 07%).

Question 19 asked about the level of instruction in the inservice training, considering the grade taught. 62% stated that it was just right; 18% found it too childish; 09% felt it was too mature; and 02% said it was too repetitious. (08% chose the "other" response, mostly reporting a desire for separate training groups. Responses to these three questions, region-by-region, are depicted in Table 3a1.)

In the Checklist for Teacher Interview, the first four questions dealt with inservice training. Question 1 simply asked "Were you satisfied with the inservice training?" Of the 153 teachers interviewed, 88% answered "yes" while 12% answered "no." Question 4 asked whether the teacher, in view of the actual experience of implementing the curriculum program, found the inservice directions clear and adequate. Of the 146 teachers responding, 79% answered "yes," and 21% answered "no." These four questions are summarized in Table 3a2.

TABLE 3a2

STATEWIDE TOTALS FOR QUESTIONS 1 - 4
CHECKLIST FOR TEACHER INTERVIEW
(N = approx. 150)

1. Were you generally satisfied with the inservice training session? %
   A. Yes. 88
   B. No. 12

2. What was the strong point of the inservice training?
   A. Organization 38
   B. Presentations 43
   C. Brevity 3
   D. Discussion 11
   E. Other 5

3. What was the weak point of the inservice training?
   A. Organization 19
   B. Presentations 14
   C. Lengthiness 27
   D. Foolish questions 9
   E. Other (including lack of follow-up) 31

4. Now that you are implementing the curriculum program, and using hindsight, were the inservice directions clear and adequate?
   A. Yes. 79
   B. No. 21

21
At the close of the field test, the Regional Educational Service Center coordinators and TEA observers were asked to comment on the program by letter, and several excellent communications were received. One recurrent theme involved the importance of the inservice training to the acceptibility and success of the TATTLETOOTH program. A repeated suggestion was for a follow-up inservice after the program is started, because teachers "do not know enough to ask questions" during a single initial inservice training session.

Many Regional Service Centers routinely carry out evaluation of any training they present, and there is evidence (from comments and letters) that most reactions were favorable, though such data were not available for this field test. One comment that was made many times involved the timing of the inservice. The extremely crowded pilot-test-field-test-schedule, necessary under grant requirements, forced a "telescoping" of what should have been a year-long process into just four months, and many teachers and trainers mentioned the pressure of initial inservice followed immediately by implementation, with a rush to complete and evaluate.
b. **Educational Progress**

Pretests and posttests covering cognitive and affective areas were administered to all students in classrooms field-testing the program. For the early grades (K-3) it was necessary to use fairly simple tests that combined knowledge and attitude questions which, since no separate answer sheets were used, were scored by hand. For grades 4-12, answers were recorded on scannable answer sheets, and computer analysis was possible. However, it was desirable to compare results with those for lower grades, so a similar combined cognitive-affective score was used.

The design involved a pretest/posttest comparison of mean scores, by grade and by region, with a statewide summary by grade. Since the pretest and posttest were identical, the t-test formula for correlated means was used to test significance of the differences. Because of the difficulty of obtaining pretest/posttest correlation coefficients for grades K-3, a "low" estimated correlation coefficient of .60 was used for this correction, based on data from the higher grades. Though there are Regional and grade variations, most of the t-tests are significant, and the conclusion would be reached that the "difference" scores show real progress. The test instruments used in all grades are found in Appendix A, and it should be noted that item 12 (grades 2-12) and 14 (grades 3-12) were not scored. (The same test was used for both pretest and posttest, but teachers were not advised of this in advance.) Numbers of students taking the pretest and posttest differ slightly because of absences. The lower number was used to establish degrees of freedom for estimating significance of the t-test.

The statistical results, whether scored manually or by computer, are shown in the following tables:
APPENDIX F, TABLES XF1 - FX17 present the data by grade, by Regions I - VI, IX - XVI, and XVIII - XX. (Regions VII, VIII, and XVII did not participate.)

TABLE 3b1 is a statewide summary of the regions composited.
TABLE 3b2 is a statewide summary of significance estimates.

The results suggest that the TATTLETOOTH program can improve knowledge and attitudes about dental health. Though there are Regional variations, the educational aspect of the program appears to be effective in all grades from kindergarten to high school.

Legend:

- ** = t ratio significant at the .01 level.
- * = t ratio significant at the .05 level.
- = t ratio not significant at the .06 level.
- = t ratio not obtainable; lack of statistics.
- = t ratio not obtainable; region did not participate.
c. **Dental Progress**

The evaluation design included dental pretests and posttests in seven regions, along with control group testing to check for possible bias. The test data were entered on scannable answer sheets, and the entire analysis was carried out by computer. A decision was made to derive plaque index scores for both the entire mouth and for specific groups of teeth and specific segments.

The control groups and the experimental groups were matched and were from same schools. The choice had to be made whether they could be from the same schools, even from the same localities. If their proximity is close, then the risk is present that the enthusiasm or know-how of the experimental group (including teachers) could rub off on the control group, and bias their measurements. Further, parents might complain if one child is in the program another is not.

On the other hand, if the groups are kept apart, the risk is run that the cultures would be dissimilar and that water flouridation would be different. Even worse, each dentist would always know which group he was examining, and the inevitable bias would enter.

It was decided to mix the control and experimental groups in a stream of children to the dental examination point, such that the recorder would know the difference, but the examiner would not. Students for each group were selected by taking alternate names from the class roster, and control children were mixed randomly with the field test children.

The objective was to examine 17 students in the experimental group and 17 students in the control group at each grade level in each of 7 regions. This totals 2142 students being examined, and they would get a prefield test examination and a posttest test examination at least seven weeks apart.
The dentists conducting the examinations are Public Health employees, each from a different Medical Region of Texas. Furthermore, each was assigned an examination location not in the region of his employment. The following table shows the dentists, their assignments for examinations in this field test, and data about the locale:

</tbody>
</table>

As a validity check of dental accuracy, every 10th child was run through the line a second time. The recorder kept track of this, and the child's score was placed on the same marking sheet as his first examination. The dentist knew this process was in effect, but had no positive way of ascertaining which
children were on the second run. Even if he recognized a child, he could not view his initial scoring. (With so many mouths to examine in short a time, he certainly could not remember scores.) Correlations between the examinations and re-examinations varied between .77 and .99, suggesting acceptable reliability of the procedure. It is believed that this process, more than just validation, serves to motivate dentists toward precise judgments.

Each dentist examined six teeth in each child's mouth:

- #16 Upper Right First Molar--Facial Surface
- #11 Upper Right Central Incisor--Facial Surface
- #26 Upper Left First Molar--Lingual Surface
- #36 Lower Left First Molar--Lingual Surface
- #31 Lower Left Central Incisor--Facial Surface
- #46 Lower Right First Molar--Lingual Surface

All examinations included the same teeth in the same order. Furthermore, each surface was mentally divided into five segments, and each segment was scored separately, as clean or dirty.

A = Distal (rearward) Surface
B = Occlusial (biteward) Surface
C = Mesial (frontward) Surface
D = Gingival (gumline) Surface
E = Central (mid) Surface
As each of five segments was scored on six teeth, a child could have as many as 30 marks for a very dirty set of teeth. The design for this test was adapted from an article in *Public Health Reports*, describing the Patient Hygiene Performance (PHP) method of dental evaluation.* Instruction sheets and methodology descriptions are contained in Appendix E.

The results of the total examinations, by Region by grade, are shown in Tables 3c2 through 3c8. Scrutiny of these tables indicates considerable variability, both among and within Regions, and it is obvious that in many cases, the examiners found teeth in worse condition at the close of the program. It should be noted, however, that in most cases the field test group shows either more improvement than the control group (41%) or less deterioration (16%). Also in many cases (22%) the control group scores are "worse," while the field test group scores show improvement. Overall, 79% of these differences would suggest a positive result for children experiencing the TATTLETOOTH curriculum, while 19% were unfavorable, and 2% showed no difference between the field test and control groups.

When all Regions were combined, every grade total shows a difference between the field test and control groups that indicates superior results with TATTLETOOTH. These data are found in Table 3c9. When all grades and all Regions are combined, as in Table 3c10, both field test and control groups show improvement, but the children that were exposed to the TATTLETOOTH

| Grade | Dental Criterion | Pretest | | | Posttest | | | | Difference between means |
|-------|------------------|---------|---|---|---|---|---|---|
|       | N    | Mean | Standard Deviation | N    | Mean | Standard Deviation | |

-33-
Because incisors undergo a different regimen in both eating and brushing, a further study involved consideration of these teeth (numbers 11 and 31) separately from all others. Also, since the "E," or center, segment is most easily cleaned by a novice toothbrusher, it was felt that slight progress would show more clearly if it were handled separately. Thus an analysis of covariance was carried out in which the main effect involved the difference between the field test and control groups on the posttest, with the pretest difference treated as the covariable. (This was necessary because, in many cases, there were differences between the experimental and control groups found in the pretest--differences which were completely unplanned and unforeseen, but which were significant. The analysis of covariance procedure corrects for these differences.)

Table 3c11 shows f-ratios, by grade, which indicate the significance of differences between field test and control group posttest scores (with pretest differences held constant) for

1. the total group of teeth and segments examined;
2. the E-segment only;
3. tooth #11 only;
4. tooth #31 only; and
5. a combination "incisor" score for #11 plus #31.

The values in this analysis suggest that both total scores and the "incisors" scores show significant improvements, but that dental progress in the higher grades (junior and senior high schools) was more the exception than the rule, and that most cleaner mouths were found at the fifth grade or below. The E-segments were generally not significantly better for the field test group than for the control group.

d. Site Visits

An important aspect of the evaluation involved visits by education consultants who had served as leaders of the curriculum writing teams and Texas Education Agency consultants as observers to classrooms participating in the field test. This step was seen as essential, because experience during the previous year's pilot testing phase strongly indicated that observation both provided useful insights for improving the materials and presented a viewpoint slightly different from teacher reports.

Eight observers who were thoroughly familiar with the philosophy and development of the TATTLETOOTH program carried out site visits, covering the Regions active in the field test. These observers, and the Regions they worked with, are presented in Table 3d1, as follows,

A brief eight-item check list was provided, and most of the observers used these instruments for their report (Appendix C, Checklist for Classroom Observation). The statewide results, covering approximately 120 classrooms, are summarized in Table 3d2.

These data indicate that, for the most part, the participating teachers were applying the model conscientiously, but that most of them slightly modified the materials, which was an option offered. These materials, as provided or modified, were used successfully and smoothly in a majority of cases, but about one-third of the results were less than completely satisfactory. The students evidently participated actively in most of the classrooms visited, and their attitudes were strongly positive. The prevailing classroom atmosphere was "interesting and keen," and teacher attitudes were enthusiastic and supportive. Ninety percent of the observations found the objectives of the lesson plan either wholly or nearly all met.

These data suggest that the TATTLETOOTH program, at least from the point of view of individual classroom involvement, was given a field test that was largely appropriate and fair. There were exceptions, of course, and indications of non-standard applications of the model will be discussed in Section 3f.

| 2. | The teacher was using the prepared materials and using them with what success? |
| A. | Everything fell into place and worked out right. | 57% |
| B. | Mostly good - but a few turkeys. | 25 |
| C. | Moderate success. | 13 |
| D. | Teacher wasn't using the materials well and was having trouble. | 5 |
| E. | Teacher did very well; materials were faulty. | 0 |

| 3. | The teacher was given the option of using the materials as prepared, or she could modify them as she chose. She: |
| A. | was using them exactly as designed. | 16% |
| B. | used the materials with slight changes. | 76 |
| C. | found it necessary or desirable to change most of them. | 3 |
| D. | changes them completely. | 2 |
| E. | obviously was not prepared, and wasn't sure of what she was doing. | 3 |

| 4. | The teacher was applying the model (using the lesson plan) in teaching the less. |
| A. | Yes. | 74% |
| B. | No. | 5 |
| C. | Partially, and with good reason. | 16 |
| D. | Partially, but willy-nilly. | 4 |
| E. | Not observed. | 1 |

| 5. | To what extent were the objectives of that particular lesson plan met? |
| A. | Wholly. | 36% |
| B. | Nearly all. | 53 |
| C. | Slightly. | 6 |
| D. | Couldn't see any closure. | 4 |
| E. | Not observed. | 1 |

| 6. | What was the teacher's attitude toward the lesson during the class? |
| A. | Enthusiastic and supportive | 75% |
| B. | Positive but halfhearted | 20 |
| C. | Indifferent | 3 |
| D. | Mildly negative or condescending | 2 |
| E. | Opposed and destructive | 0 |

---

44
7. What was the collective attitude of the students?
   A. Joyous and receptive.  
   B. Accepting and passive.  
   C. Similar to other routines.  
   D. Hostile.  
   E. Bewildered.
   
8. What was the atmosphere in the classroom?
   A. Warm, zealous, and electrifying.  
   B. Interesting, keen.  
   C. Mediocre, usual.  
   D. Hum-drum, dull.  
   E. Boredom.
e. Teacher Opinions

The evaluation design sought teacher input in two ways. First, the site visits included a teacher interview (Checklist for Teacher Interview, Appendix C), and second, the Teacher Evaluation Sheet (Appendix B) was made available to each teacher using the curriculum during the Field Test phase. Items 1-4 in the Interview Checklist involved inservice training and are covered in section 3a of this report. The remaining questions involved teacher attitudes and opinions about their experience with the program, including, especially, evaluation of support from various dental and community sources. The statewide responses to questions are reported in Table 3e1.

Probably the most meaningful results here involve the answers to questions 11 and 12. Question 12 simply asked whether the teacher would voluntarily use the program material again next year. The response was overwhelmingly positive, with 92% answering "yes," less than 3% answering "no" and about 5% feeling that it is too early to tell. Question 11 asked for an over-all attitude about the program—"How do you feel about the TATTLETOOTH Program at this point?" Approximately 45% said "extremely good," 51% said "okay, but it has gaps," about 3% said it was "just like any other program," and only 1% said they had "seen many better dental programs." These answers show excellent teacher acceptance of the program materials and philosophy.

The questions involving support from other groups suggest that, from administration, dentists, ESC personnel, and school nurses, the support received was generally "good." PTA support was mostly non-existent, though many teachers personally reported considerable interest on the part of individual parents.

46
Responses to the Teacher Evaluation Sheet were tabulated by computer, since they were entered on scannable answer sheets. Statewide results are reported in Table 3e2.

The responses suggest that the lesson plans were mostly used in regular classrooms, though a significant percent were used in health classes (in the higher grades). Relatively few teachers asked for help from dentists only, but many requested help from other teachers, aides, school nurses, and dental hygienists, and 35 used more than one resource. Forty percent of the teachers used 11 ten lesson plans provided, while smaller percentages (20% or less) used only part of the program. The large majority (85%) received their dental materials on time, and no teacher was left completely without such materials.

A majority of teachers (67-78%) reported receiving sufficient support from the lesson plans, inservice training, the dental community, the reference material, and the educational structure, but only 58% received actual help with demonstrating brushing and flossing. A substantial number (75%) used disclosing wafers at least once, but only 37% used them more than once. Most classes in the program (62%) brushed and flossed two weeks or more, but 16% did not brush or floss at all, and 22% only once. Most teachers felt that dental problems were "about normal" in their classes; 19% felt they were "widespread and severe"; while none felt they were "non-existent."

A slight plurality (34%) of participating teachers had taught similar dental health programs several times before, and a majority (58%) had taught at least one such unit; however, 27% had never taught any dental health program previously. Most teachers (83%) reported at least slight improvements in dental behavior and attitudes in their classes because
of TATTLETOOTH. and 10% noted "drastic improvements." However, 12% thought things were "worse than before."

Visual aids were approved and used by a slim majority (61%), but about 26% could not get transparencies, though they would like to have used them.

Most teachers found the program well conceived and structured, deserving of the time it took, neither too complex nor embarrassing to teach, fairly complete, and at an appropriate level. (Of course there were expressions contrary to these, especially in answer to question 24, where 42% said the program has several gaps.)

A majority felt that the program could succeed with the present amount of dental participation, but 25% felt that more dental involvement is necessary for success. The teachers overwhelmingly (85%) expressed the opinion that parental participation is extremely important for lasting impact in a program like this.

Most found both the instructions and the time allowed in the field to be sufficient. Finally, only 16% had ideas for improvement, but these were extremely useful and were made available to the program developers.

There were 274 responses to the teacher evaluation form, although not every teacher answered every question. In fact, there were some missing answers to every question. The fewest "omits" was 3--this occurred in questions 4, 11, and 13. The greatest number of missing answers came, expectedly, in question #2, wherein 146 teachers (53%) indicated no help was sought by not answering at all; otherwise 39 answers were missing from question #30. The percentages shown should add to 100% for each question, representing the total of actual answers in each case.
f. Regional Variations

The obvious differences in educational and dental progress can readily be seen in Tables 3c2-3c11 and in XFl-XFl7, as well as in 3b1 and 3b2. One must constantly keep in mind that both types of examinations are quite subjective: the educational portion is subject to differences in number of lessons presented, teacher enthusiasm, funds for "goodies," and availability of technical support. Dental examinations are subject to individual dentist variances or changes, or to changes in local conditions (extensive efforts were made to eliminate differences between dentists by standardization and calibration.) Differences between dentists tend to cancel out because personal characteristics would appear in both pretest and posttest, but there are variations in consistency (and thus reliability). Caution must be used in trying to compare regions, or grades, or classrooms, whether in dental or educational progress. Each of the following paragraphs describes some situation which might underlie differences between regions.

Each of the Directors of the Educational Service Centers decided on his own just how much to participate in and support this non-reimbursable field test. Value judgments vary, and thus the ESC coordinators varied from a full time person to no participation at all, with the full spectrum covered in between. (From a field test point of view such a set of conditions is excellent; if a product can accomplish its objectives under various conditions from full time handholding to indifferent neglect, then it shows excellent promise as a self-starter.)

A few regions were able to get all the classrooms that the test had proposed--three full classes at each of nine levels (about 800 students). Many were unable to get the full quota for reasons of time, money, personality, or non-cooperation. Some felt it was better to try to do a fair job with fewer classrooms than to get (what in their case would be) overextended.
Some regions took the "systems" approach, and went all-out to get many agencies, organizations, people and facilities involved, to maximize the opportunity for improved dental health. Other regions left it all up to the teachers, who had a very difficult task even under the best of conditions. With little time for preparation, and insufficient time and funds for the field test, teachers had every right to be chagrined when no one helped out.

A sample scanning sheet was sent to each teacher with certain entries made as examples, including where to write the child’s number code. A few teachers used the same sample code number for their whole classes! Others did not receive the answer sheet for filling out the Teacher Evaluation Questions; these unfortunates fell into two groups, one that answered on the question form (and we manually filled out the scanning sheet), and the other group that gave up in frustration and sent nothing.

In spite of explicit instructions, some teachers did not give the pretests, and others omitted the post-tests. Still others composed their own tests; no doubt these served some particular purpose, but not TATTLETOOTH or its field test.

Several teachers did not use the model designed for the curriculum. Reasons for this are not too clear. Knowledge of this situation came from site visitors rather than from the teachers themselves, so it cannot be considered complete. Eventually, it would be desirable to establish the relative amount of improvement achieved by the model-followers as compared to the deviators.

Teachers were discovered who believe that dental hygiene instruction is really a parent responsibility and not a proper subject for school (probably a correct belief for some cultures; but where parents don’t even use toothbrushes, they can hardly be expected to give instruction). For this reason, and possibly others, some teachers allowed children to take their toothbrushes and dental materials home. While this offers the hypothetical advantage of
more practice, it also prevents further instruction, practice, and training in the classroom, which is the very core of TATTLETOOTH.

All-in-all, it must be emphasized that comparisons of regions, classrooms, grades, dentists, schools and outcomes is a tricky endeavor, and would overlook too many variables. But it is also considered that if, in spite of all these kinks, there is both a dental and educational improvement, then the product has a lot going for it.
4. DISCUSSION, CONCLUSIONS, AND RECOMMENDATIONS

A. Discussion

Fairly early in the second year of the TATTLETOOTH development process, a decision was made to use a true "field test" approach rather than to carry out an "experiment" to gather evaluation data. In other words, trying the program out in a large number of classrooms, on very close to an operational basis, was felt to be a more realistic and helpful test than designing a carefully controlled experiment, where limited numbers of teachers and children would be observed. The experimental approach is possibly a little more advantageous to the evaluation researcher, but the field test situation definitely yields more information that is useful when large-scale implementation is foreseen.

Thus the variability pointed out in the previous section is understood as a natural situation, and the various sources of unreliability that may frustrate the evaluator are a way of life to the educator and health professional. TATTLETOOTH was submitted to a real field test. It was made available to almost 16,000 children throughout Texas (and completed by about 10,000), in rural and urban settings, in large and small schools, in a variety of socio-economic settings, and with no racial or ethnic minorities excluded. The test required impressive cooperation from a large number of people in a variety of professional settings. The importance of dental health was almost universally admitted, and the magnitude of the problem of dental disease in this state gave a special urgency to both the development and field test effort.
Many individuals were critical, but constructively so. There was little question about the need for such a program, and most disappointment expressed involved timing and preparation rather than either the concept or the specific materials.

B. General Conclusions from the Evaluation Data

1. The teachers generally felt that their inservice training was helpful, and sufficient, the most frequent criticisms asking for
   a. earlier training,
   b. separate training for different grade levels, and
   c. "refresher" inservice training sessions.

2. The TATTLETOOTH curriculum materials were successful in teaching dental information and in increasing awareness of dental health practices and attitudes. This was true on all grade levels, but there was some Regional variation. There was less participation in the junior and senior high schools, and also a little less educational progress in these grades, especially in some Regions. Statewide, there was most improvement in the first and third grades and least in the fifth.

3. In terms of the dental criteria, almost all of the field test posttest scores are better than the control group posttest scores, with most obvious improvement seen in segment E of the examined surfaces and in the incisors, as compared to the other teeth. The differences are often modest, but, at least on a Statewide basis, mostly significant. In several of the field test classroom groups, the examining dentists found a general deterioration in the cleanliness of the children's mouths in the posttest, suggesting some deleterious factors operating, but in approximately 80% of the grade groups, the children who had the TATTLETOOTH curriculum either
a. improved more than those in the control group,
b. showed less deterioration than the control group, or
c. showed improvement while the control group gave evidence of deterioration.

4. The majority of the participating teachers understood the model and applied it conscientiously, but most of them modified the materials in line with their own individual preferences and teaching situations. This was expected and offered as an option in the lesson plans. Ninety percent of the expert classroom observations found the objectives of the lesson plans being wholly or nearly all met.

5. The teachers who used the TATTLETOOTH program liked it. Ninety-two percent said they would use it again. Most (83%) found at least some improvement in dental behavior and attitudes in their classes. There was a strong (85%) conviction that parental support is essential for success of a program like this.

6. The variability both within and among Regions, and lack of standardization in application of the model were sources of unreliability in the statistical treatment of the data, but they also offered strong evidence that TATTLETOOTH can survive in a real operational situation.

C. Recommendations

One important source of evaluation data, not discussed heretofore, consisted of thoughtful overviews provided by participating dentists, TEA personnel, and Educational Service Center Coordinators. These individuals had insights that were most useful, and they were generous in offering suggestions and recommendations. Their findings, added to other evaluation data, including teacher suggestions, form the basis of this section.
1. Possibly the most often-heard recommendation (and implied criticism) involved timing. As previously pointed out, the tight schedule of development, pilot testing, and field testing dictated introduction of the TATTLETOOTH program at an inconvenient time, long after most teachers had planned their work for the year. In normal operational use, the inservice should be offered before schedules are planned in the Fall, and there were also recommendations involving brief "refresher" training a few months later.

2. The importance of high-quality inservice training was mentioned often, by expert observers, teachers, and coordinators. The philosophy and approach of TATTLETOOTH are crucial to its effective use, and only through inservice experiences of real freshness and power will teachers gain understanding of the model. The timing is, as pointed out above, a significant factor, but the quality and completeness of the training are even more so. For this reason, further refinement and standardization of inservice training procedures and materials would be recommended. A possible refinement approach, mentioned frequently by teachers, would concentrate on specific grade levels, possibly involving several Regions.

3. There was a strong feeling that parents and communities have an important impact on the success of programs in dental health. TATTLETOOTH developers were aware of this, and support packages were designed. Possibly because of the time pressure, these tools were not used to an optimal extent, and it is felt that more attention to enlisting the aid of significant community resources could increase the effectiveness of the curriculum.

4. Though the present test results do indicate both educational and dental progress with TATTLETOOTH, there is no suggestion of permanence in these gains. The point was made that the benefit from such a program would most
probably be cumulative, based on regular reinforcement of health behavior and attitudes. Long-term improvement is, of course, the real goal of all the agencies and individuals involved in TATTLETOOTH, and the recommendation here would be for immediate, continued, and expanding broad-scale application of the program, with additional evaluation efforts to estimate effectiveness over a time-span of years rather than weeks.

Standard Answer Sheet*

Educational Test Key

*Used for grades 4, 5, 6, and secondary levels. Grade 3 and lower answered on the question form.
To the teacher: Please read these questions slowly enough so that all the children can answer. Be sure that their names are on their answer sheets.

1. Do you have your own toothbrush at home? Put a circle around the little toothbrush if you do, and put a circle around the X if you do not have a toothbrush.

2. Put a circle around the snack that might be bad for your teeth. (Pictured are grapes, a banana, pie, and popcorn.)

3. How often do you brush your teeth? Put a circle around the two toothbrushes if it is two or more times a day. Put a circle around the one toothbrush if it is once a day. Put a circle around the X if you only brush now and then, and put a circle around the XX if you never brush your teeth.

4. Have you ever used dental floss? Put a circle around the dental floss picture if you have, and put a circle around the X if you have not.

5. What is plaque? If you think it is something that helps your teeth, put a circle around the happy tooth. If you think it hurts your teeth, put a circle around the sad tooth.

6. Have you ever been to a dentist? If you have, put a circle around the dentist picture. If you have not, put a circle around the X.

7. Put a circle around the picture that shows something that could hurt your teeth. (Pictured are reading a book, fishing, and two children swinging.)

8. Do your teeth ever hurt? If your answer is "yes," put a circle around the hurt tooth. If it is "no," put a circle around the X.
TATTLETOOTH

SPECIAL INSTRUCTIONS FOR TEACHERS
of Grade 1 and Grade 2

Please read these questions and answers slowly enough so that the children can all answer. If they have any trouble understanding, go over the instructions again, making any explanations you feel will make them comprehensible to your class. Some of these questions involve knowledge, and some ask for information. Let your students know that there are several questions they probably won't be able to answer because they haven't learned them yet, but that they should do their best anyway, and they will get another chance later on. (However, please do not help them with the meanings of the words in the actual test!) Please make sure the students' names and code numbers are on their papers. (Code numbers will be provided to you by your service center trainer.)
TATTLETOOTH--GRADE 1

Name__________________________
Code Number_____________________  

Your teacher will read these questions and answers to you. Put a circle around the letter by the answer you choose. Be sure your name and code number are on your test paper.

1. Do you own a toothbrush?
   A - Yes, I have one.
   B - Yes, I have more than one.
   C - No, I used to have one, but I don't now.
   D - No, I never had a toothbrush.

2. Mark the thing that is bad to chew.
   A - Apples.
   B - Ice.
   C - Popcorn.
   D - Fried chicken.

3. How often do you brush your teeth?
   A - Once a day.
   B - More than once a day.
   C - Three or four times a week.
   D - Only now and then.
   E - I never brush.

4. Your six-year molars
   A - Help keep other teeth in line.
   B - Will fall out later on.
   C - Don't need any special care.

5. How often do you use dental floss?
   A - Every day.
   B - A few times a week.
   C - Once a week.
   D - Once a month.
   E - Never.

6. What is plaque?
   A - A red wafer.
   B - A toothpaste.
   C - Something to fill teeth with.
   D - A sticky layer of germs on teeth.
   E - I don't know.

7. How often do you go to the dentist?
   A - About twice a year.
   B - Only when I have a toothache.
   C - I've never been to a dentist.

8. The best way to brush teeth is
   A - Back and forth, pressing hard.
   B - Up and down only.
   C - With a gentle wiggling motion.
   D - In a circle, fast.

9. Do you think you have dental problems?
   A - Yes, very bad ones.
   B - Yes, but not serious ones.
   C - I'm not sure.
   D - Not now, but I used to.
   E - No, and I never have.

10. The root is one part of a tooth. The other part is the
    A - Crown.
    B - Base.
    C - Top.

11. Do you think you eat or drink a lot of sweet snacks?
    A - Yes, I always get more than I should.
    B - Sometimes I go overboard, but not regularly.
    C - Almost never.
    D - Never.

12. Which of these would be safest for your teeth?
    A - A baseball bat.
    B - Reading a book.
    C - Playing on a swing.
    D - Chewing a pencil.

   Turn the page over and answer the questions on the back.
13. How important are your teeth to your personality?
   A - One of the most important things.
   B - Pretty important.
   C - Average importance.
   D - Not very important.
   E - One of the least important things.

14. How important are your teeth to your general health?
   A - One of the most important things.
   B - Pretty important.
   C - Average importance.
   D - Not very important.
   E - One of the least important things.

Your teacher will read these questions and answers to you. Put a circle around
the letter by the answer you choose. Be sure your name and code number are on
your test paper.

1. Do you own a toothbrush?
   A - Yes, I have one.
   B - Yes, I have more than one.
   C - No, I used to have one,
       but I don't now.
   D - No, I never had a toothbrush.
   E - No, but I use someone else's.

2. A tooth that has been knocked out
   A - Can never be put back.
   B - Can sometimes be replaced by
       a dentist.
   C - Can always be put back.

3. How often do you brush your teeth?
   A - Once a day.
   B - More than once a day.
   C - Three or four times a week.
   D - Only now and then.
   E - I never brush.

4. Do you use any of the following:
   toothpicks, water pik, disclosing
   wafers?
   A - Yes.
   B - No.

5. How often do you use dental floss?
   A - Every day.
   B - A few times a week.
   C - Once a week.
   D - Once a month.
   E - Never.

6. Tooth cavities are caused by
   A - Accidents.
   B - Milk and raw foods.
   C - Crisp foods.
   D - Plaque and sugar.

7. How often do you go to the dentist?
   A - About twice a year.
   B - Only when I have a toothache.
   C - I've never been to a dentist.

8. The best way to brush teeth is
   A - Back and forth, pressing hard.
   B - Up and down only.
   C - With a gentle wiggling motion.
   D - In a circle, fast.
   E - Any direction, with a hard brush.

9. Do you think you have dental problems?
   A - Yes, very bad ones.
   B - Yes, but not serious ones.
   C - I'm not sure.
   D - Not now, but I used to.
   E - No, and I never have.

10. Flossing your teeth
    A - Helps clean away plaque.
    B - Takes the place of brushing.
    C - Isn't needed if you brush.

11. Do you think you eat or drink a lot of
    sweet snacks?
    A - Yes, I always get more than I should.
    B - Sometimes I go overboard, but not
        regularly.
    C - Almost never.
    D - Never.

12. Where do you get most of your information
    about dental health?
    A - Parents.
    B - Sisters and brothers.
    C - TV commercials.
    D - Dentists.
    E - Other.

Turn the page over and answer
the questions on the back.
13. Your six-year molars
   A - Will fall out later.
   B - Help keep other teeth in line.
   C - Don't need special care.

14. Which of these snacks would be best for your teeth?
   A - Candy.
   B - Peanuts.
   C - Cookies.
   D - Pie.

15. How important are your teeth to your personality?
   A - One of the most important things.
   B - Pretty important.
   C - Average importance.
   D - Not very important.
   E - One of the least important things.

16. How important are your teeth to your general health?
   A - One of the most important things.
   B - Pretty important.
   C - Average importance.
   D - Not very important.
   E - One of the least important things.

Code Number____________________________________________

Put a circle around the letter by the answer you choose. Be sure your name and code number are on your test paper.

1. Do you own a toothbrush?
   A - Yes, I have one.
   B - Yes, I have more than one.
   C - No, I used to have one, but I don't now.
   D - No, I never had a toothbrush.
   E - No, but I use someone else's.

2. What is plaque?
   A - A red wafer.
   B - A clump of germs on a tooth.
   C - A toothpaste.
   D - A material for filling a tooth.
   E - I don't know.

3. How often do you brush your teeth?
   A - Once a day.
   B - More than once a day.
   C - Three or four times a week.
   D - Only now and then.
   E - I never brush.

4. Do you use any of the following: toothpicks, water pik, disclosing wafers?
   A - Yes.
   B - No.

5. How often do you use dental floss?
   A - Every day.
   B - A few times a week.
   C - Once a week.
   D - Once a month.
   E - Never.

6. Toothpaste is
   A - Only good if it has mouthwash.
   B - Necessary for clean teeth.
   C - Harmful if it has fluoride.
   D - Really only good if it has fluoride.
   E - Impossible to make at home.

7. How often do you go to the dentist?
   A - About twice a year.
   B - Only when I have a toothache.
   C - I've never been to a dentist.

8. The best way to brush teeth is
   A - Back and forth, pressing hard.
   B - Up and down only.
   C - With a gentle wiggling motion.
   D - In a circle, fast.
   E - Any direction, with a hard brush.

9. Do you think you have dental problems?
   A - Yes, very bad ones.
   B - Yes, but not serious ones.
   C - I'm not sure.
   D - Not now, but I used to.
   E - No, and I never have.

10. Flossing your teeth
    A - Helps to remove plaque.
    B - Takes the place of brushing.
    C - Removes tooth enamel.
    D - Is not necessary if you brush.
    E - Should be done only if teeth are stained.

11. Do you think you eat or drink a lot of sweet snacks?
    A - Yes, I always get more than I should.
    B - Sometimes I go overboard, but not regularly.
    C - Almost never.
    D - Never.

12. Where do you get most of your information about dental health?
    A - Parents.
    B - Sisters and brothers.
    C - TV commercials.
    D - Dentists.
    E - Other.

Turn the page over and answer the questions on the back.

-66-
13. Which of these snacks would be bad for your teeth?
A - Apple.
B - Soda pop.
C - Carrot sticks.
D - Orange juice.
E - Celery.

14. Who is the biggest influence on how you take care of your teeth?
A - Parents.
B - Teacher.
C - Boyfriend (or girlfriend).
D - TV commercials.
E - Other.

15. Both tooth decay and bleeding gums are caused by
A - Fluoride.
B - Failure to use toothpaste.
C - Raw foods.
D - Accidents.
E - Plaque.

16. Do you feel good about the appearance and condition of your teeth?
A - Yes.
B - They're ok, I guess.
C - No.
D - I've never thought about it.

17. What would you do if you had a dental problem?
A - See a dentist.
B - Ask the school nurse.
C - Tell a parent.
D - Not tell anyone and wait for it to go away.
E - Other.

18. Snacks that are bad for your teeth are mostly those that
A - Taste bad.
B - Are nutritious.

APPENDIX B

Teacher Evaluation Sheet

(Responses were made on Standard Answer Sheets; additional comments could be made on separate sheets.)
TATTLETOOTH FIELD TEST EVALUATION SHEET

Please try to answer all the questions, but provide only one answer to each question. Blacken the correct space on the answer sheet. This questionnaire need not be returned. You may put your name, school, grade, etc. on the answer sheet, as you see fit. But please be sure to put your Teacher Code Number on the answer sheet, in the six numbered spaces below "Form of this test is," and to the left of the column "Grade." Also blacken the correct rectangles. The answer sheet should be returned with your class' answers, to: Educational Development Corporation, 2813 Rio Grande, Austin, TX 78705.

1. Did you use the Tattletooth Lesson Plans?
   A. In a regular classroom activity.
   B. In a special subject class.
   C. Combined with another class.
   D. In a health class.
   E. Other.

2. Did you ask for help from any of the following (if none, do not answer this question)?
   A. Another teacher or aide.
   B. School nurse.
   C. A dentist.
   D. A dental hygienist.
   E. More than one of the above.

3. How many lesson plans did you use?
   A. Five or less.
   B. Six or seven.
   C. Eight.
   D. Nine.
   E. All ten.

4. Did you receive the dental materials?
   A. Yes, on time.
   B. Yes, but very late.
   C. Yes, but insufficient. (Everyone was short disclosing wafers, so please do not consider them.)
   D. No, we did a scrounge job.
   E. No, we had nothing to work with.

Please answer the next 6 questions with a yes or no.

Items 5, 6, 7, 8, and 9. In using these lessons, did you feel that you generally had adequate support

5. In the lesson plans and materials as provided?
   A. Yes    B. No

6. In the inservice training session?
   A. Yes    B. No

7. From the local dental community?
   A. Yes    B. No

8. From the reference material?
   A. Yes    B. No

9. From the educational structure? (School, district, service center, TEA)
   A. Yes    B. No

10. Did you receive any help in the demonstration of brushing and flossing?
    A. Yes    B. No

11. Did your class use disclosing wafers in the classroom?
    A. No.
    B. Yes, once.
    C. Yes, two to four times
    D. Yes, five to seven times.
    E. Yes, eight or more times.

12. Did your class actually brush and floss in the classroom?
    A. No.
    B. Yes, once.
    C. Yes, two or three weeks.
    D. Yes, four or five weeks.
    E. Yes, six or more weeks.

13. Do you feel that the dental problems in your class (or classes) are
    A. Widespread and severe?
    B. About normal?
    C. Rare?
    D. Non-existent?
    E. Don't know?
14. Which of the following is true for you?

A. I have taught a separate dental unit involving brushing and flossing at least once before Tattletooth.
B. I have taught a separate dental unit involving brushing and flossing more than once before Tattletooth.
C. I have taught a dental health unit that was part of a total health curriculum at least once before Tattletooth.
D. I have taught a dental health unit that was part of a total health curriculum more than once before Tattletooth.
E. I have never taught any dental health unit before Tattletooth.

15. How would you value the changes in dental health or in attitudes about dental health that the Tattletooth program has made in your class?

A. Drastic improvements.
B. Slight changes, all good ones.
C. No changes whatsoever.
D. Negative results, and things are worse than before.
E. The time has been too short for any changes to appear.

16. Please select the one of the following statements that is closest to your feelings:

A. I like visual aids and was able to use them to the maximum extent.
B. I like visual aids but was unable to get transparencies made.
C. My use of visual aids is limited because I cannot get an overhead projector.
D. I don't think visual aids are needed in Tattletooth.
E. I prefer to use a curriculum that doesn't use or need visual aids.

19. The level of instruction was, considering the grade you teach,

A. Just right.
B. Too childish.
C. Too mature.
D. Too repetitious.
E. Other.

Please answer the next 11 questions with a yes or no, indicating in each case your overall opinions about the Tattletooth program:

20. The program is well conceived and structured.

A. Yes  B. No

21. It requires too much time on this subject.

A. Yes  B. No

22. It is a necessary course, but is too complicated.

A. Yes  B. No

23. I found it embarrassing to teach.

A. Yes  B. No

24. The program has several gaps.

A. Yes  B. No

25. I like the approach but the materials are at the wrong level for my children.

A. Yes  B. No

26. This program could be successful only if dentists participated more.

A. Yes  B. No

27. I think parental participation is extremely important for lasting impact in a program like this.

A. Yes  B. No

28. Instructions were too vague.

A. Yes  B. No

29. I think that the program needs more time than the field test allowed.

A. Yes  B. No

30. I have several ideas for improvement and have attached a sheet with my comments to the answer sheet. (Clip, do not staple!!)

A. Yes  B. No
APPENDIX C

Checklist for Classroom Observation

Checklist for Teacher Interview
TATTLETOOTH
Checklist for Observation of Classrooms

1. Were students actively involved in the Tattletooth lesson?
   A. All participating actively.
   B. Some involved; others bystanding.
   C. Children involved only in response to teacher.
   D. Teacher doing the whole thing.
   E. It was difficult to relate the classroom activity to Tattletooth.

2. The teacher was using the prepared materials and using them with what success?
   A. Everything fell into place and worked out right.
   B. Mostly good - but a few turkeys.
   C. Moderate success.
   D. Teacher wasn't using the materials well and was having trouble.
   E. Teacher did very well; materials were faulty.

3. The teacher was given the option of using the materials as prepared, or she could modify them as she chose. She:
   A. was using them exactly as designed.
   B. used the materials with slight changes.
   C. found it necessary or desirable to change most of them.
   D. changed them completely.
   E. obviously was not prepared, and wasn't sure of what she was doing.

4. The teacher was applying the model (using the lesson plan) in teaching the lesson.
   A. Yes.
   B. No.
   C. Partially, and with good reason.
   D. Partially, but willy-nilly.
   E. Not observed.

5. To what extent were the objectives of that particular lesson plan met?
   A. Wholly.
   B. Nearly all.
   C. Slightly.
   D. Couldn't see any closure.
   E. Not observed.

6. What was the teacher's attitude toward the lesson during the class?
   A. Enthusiastic and supportive
   B. Positive but halfhearted
   C. Indifferent
   D. Mildly negative or condescending
   E. Opposed and destructive

90
7. What was the collective attitude of the students?
   A. Joyous and receptive.
   B. Accepting and passive.
   C. Similar to other routines.
   D. Hostile.
   E. Bewildered.

8. What was the atmosphere in the classroom?
   A. Warm, zealous, and electrifying.
   B. Interesting, keen.
   C. Mediocre, usual.
   D. Hum-drum, dull.
   E. Boredom.
TATTLETOOTH

Checklist for Teacher Interview

1. Were you generally satisfied with the inservice training session?
   A - Yes
   B - No
   C, D, E - (Unused)

2. What was the strong point of the inservice training?
   A - Organization
   B - Presentations
   C - Brevity
   D - Discussion
   E - Other

3. What was the weak point of the inservice training?
   A - Organization
   B - Presentations
   C - Lengthiness
   D - Foolish questions
   E - Other

4. Now that you are implementing the curriculum program, and using hindsight, were the inservice directions clear and adequate?
   A - Yes
   B - No
   C, D, E - (Unused)

5. In carrying out the program, how do you evaluate cooperation and support from the school administration?
   A - Terrific
   B - Good
   C - So-so
   D - Very little
   E - Absent

6. In carrying out the program, how do you evaluate cooperation and support from the school nurse?
   A - Terrific
   B - Good
   C - So-so
   D - Very little
   E - Absent

7. In carrying out the program, how do you evaluate cooperation and support from the P.T.A.?
   A - Terrific
   B - Good
   C - So-so
   D - Very little
   E - Absent
8. In carrying out the program, how do you evaluate cooperation and support from the educational service center?
   A - Terrific
   B - Good
   C - So-so
   D - Very little
   E - Absent

9. In carrying out the program, how do you evaluate cooperation and support from the dental community?
   A - Terrific
   B - Good
   C - So-so
   D - Very little
   E - Absent

10. Everything considered, describe total educational, dental, and community support for your program:
    A - Almost too much
    B - Very fine
    C - Some -- from the usual quarter
    D - Not enough
    E - What support?

11. How do you feel about the Tattletooth program at this point?
    A - Extremely good
    B - It's okay, but has gaps
    C - It's just like any other program
    D - I've seen many better dental programs
    E - I hate it

12. If the materials are available again next year, and if it were your choice, would you voluntarily use the program again next year?
    A - Yes
    B - No
    C - Too early to tell
    D, E - (Unused)
APPENDIX D

20 May 1976 Letter to Regional Coordinators (20) and to Dental Examiners (7)

25 May 1976 Letter to Site Visitors (8)
20 May 1976

To the Educational Coordinators:
To the Dental Examiners:

The Tattletooth field test is over, and the river of paper really has us on our toes. Most of the teachers are sending in their students' answer sheets and their own evaluation answers promptly and accurately. (But there are a few that are something else!) If you thought we had forgotten you, now is your chance!

We think you probably are now walking around with some valuable and useful information about Tattletooth, and it would be unfortunate not to use it properly. So we are asking you for your opinions, your ideas, and your overall judgment about the whole program.

No questionnaire for you. We are not looking for statistics—only broad conclusions and judgments. From the teachers and students we are getting a lot of information about specifics, but from you we hope to get an overview of the whole program—such things as major chunks that were missing, or gross conflicts, or unreasonable excursions in the wrong direction. Conversely, where things went particularly well, please say so. If you can explain the "why" as well as the "what," so much the better.

We know that you are busy and we hate to ask. Give it some thought on your way to work tomorrow, jot down a few notes, then bang out a brief and forthright opinion. And please send it before June first to

Educational Development Corporation
2813 Rio Grande
Austin, TX 78705

Thanks for your help—it is really appreciated.

Very truly yours,

Dorothy A. Fruchter, Ph.D.
President
25 May 1976

Dear

Those persons that have been conducting site visits during the Tattletooth field test have accumulated opinions and ideas which we would like to know about. The checklist forms that you've been sent have, by and large, reflected the teacher and practitioner viewpoint, augmented by a few of your comments.

But now that it's over, we'd like your own views. Please be brief, constructive, and broad-gauged. And we'd really appreciate it by June first. Please send to

Educational Development Corporation
2813 Rio Grande
Austin, TX  78705

Thanks for your help--it is really appreciated.

Very truly yours,

[Signature]

Dorothy A. Fruchter, Ph.D.
President
APPENDIX E

(Dental Examination Instructions)

Dentist

Teacher

Dental Hygienist

Dental Hygienist Assistant

Recorder

Student Go-Getter

Supplies
DENTIST

Please read the job description of all personnel involved to avoid last minute problems.

1. A. Distribute mark-sense sheets to the teachers prior to dental exam so that they can fill in student numbers.

B. Distribute permission slips for teachers to give to students and collects them.

C. Examine students according to the procedures outlines in previous meeting. Refer to attached sheets.

The tenth, twentieth, and thirtieth students will be sent back for re-examination after the 14th, 24th, and 34th students without restaining.

2. Upon completion of the pre-test, send the pre-test mark-sense sheets to: George Higginson
2813 Rio Grande
Austin, Texas 78705

3. Get the rosters from the principal and give these to the person going for the students.
1. The teacher sends out and collects the permission slips for the dental exam.

2. The teacher obtains the mark-sense sheets from the regional dentist or some other person.

3. Only seventeen students from each class will receive the dental examination. These seventeen students are selected by taking every other name on the class roster if they have returned the signed permission slip.

4. The teacher fills in the 17 students' number on the mark-sense sheet USING A #2 PENCIL and lightly writes the student's name on the back of the mark-sense sheet. The purpose for writing the name lightly on the back is to facilitate handing out the mark-sense sheets to the students at the time of the post test and as a means of checking to see that the student has his own mark-sense sheet.

5. The teacher who is teaching the Tattletooth program (experimental group) gets together with the teacher on the same grade level who is serving as the control group. (e.g. First grade Tattletooth teacher and first grade control group teacher.) Together they formulate the roster by mixing the names of the students of their two classes. The order in which the students names are placed on the roster should not be systematic; for example: two students from the control group followed by two students from the experimental group. In other words they scramble up the order in which the two groups go into the examination. This is so that the dental examiner will not know which is the control group and which is the experimental group. Put the student's room number next to his name. Number the students' names on the roster from 1 through 34 and place asterisk after the names of the 10th, 20th, and 30th students. The dentist will re-examine these students, consequently they will be out of the room a little longer than the other students. These students need two mark-sense sheets. Place an asterisk next to their names on the back of the second mark-sense sheets.

6. Approximately eight students from the two classrooms will go for the exam at the same time returning individually to the classroom upon completion of the exam. It is anticipated that each student will be out of the classroom approximately ten minutes. They will be called for by a person assisting in the examination.
The teacher gives the student permission slips to the person who takes the children to the exam room.

The teachers should not tell the students whether they are or are not participating in the program. The teacher should tell the students that they will be mixed with another class during the dental exam. She should tell the students that the dentists will only be looking in their mouth and that the only instrument he will be using is a mouth mirror.

Send the rosters to the principal. The dentist will get these from the principal at the time he arrives to do the dental exam.
1. Be sure that the students are in the order that their name appears on the roster before staining their teeth.

2. Pour disclosing solution into a cup--using one cotton swab/student. (The solution in the cup is used until all gone. Do not change for each student.) Use full strength.

3. With the cotton swab, stain only the following surfaces of these teeth:

- Maxillary 1st molar
- Maxillary right central labial
- Maxillary left 1st molar
- Lingual mandibular left 1st molar
- Labial mandibular left central
- Lingual mandibular right 1st molar
- Labial mandibular right central

If one of these is missing, not fully erupted, more than half decayed, or covered with a crown, stain the nearest fully erupted tooth in the same quadrant. Where possible go to the tooth posterior.

Saturate the cotton swab with disclosing solution and only touch the surface of the tooth to be stained at the gum line on the maxillary and at the occlusal of the mandibular. Let the disclosing solution spread over the tooth surface. Be sure not to disturb the plaque on the tooth. Try to be as uniform as possible in the disclosing.

4. Direct student to dental hygiene assistant to complete the staining.
DENTAL HYGIENIST ASSISTANT

1. Prepare the disclosing solution as follows:
Place 10 drops of Disclosing Solution in 2 tablespoons
of water in a paper cup.

2. Place about 2 tablespoons of plain water in another cup.
This is for the students to rinse with.

3. Make up as many of these as possible at a time so that
they will be ready to hand to the students as soon as the
dental hygienist has stained their teeth.

4. Have the students first swish the Disclosing Solution around
in their mouth for 30 seconds. They spit this back into
their paper cup.

5. Have the students then swish the plain water around in their
mouth for 30 seconds. Again they spit this back into their
cup.

6. Have paper towels ready to give to students if they need to
wipe their lips.

7. Dispose of liquid and cups.

8. Send student to the recorder.
RECORDER

1. Takes scan sheet from student. Marks 1 for plaque when the dentist calls out #1. Leaves blank for no plaque when the dentist calls out the number "0".

2. The recorder must use a #2 pencil.

3. The recorder verifies that she has the mark sense sheet for the student being examined.

4. The recorder collects all scan sheets and gives them to the dentist at the end of the session.
STUDENT GO-GETTER

It is critical that this person be flexible and use common sense to ensure that the examiner's time is not wasted and that the student's time out of the classroom is minimal.

This person obtains the class roster from the dentist and brings approximately 8 students at a time to the room where the examination takes place and also brings the permission slips for the two rooms that match the roster.

Students should be quiet and orderly so that the recorder will be able to hear the dentist.

After the individual has received the examination that person returns directly to his classroom.

Do not wait until all the group has completed the dental examine before getting the next group of students.

When you go to get the next group of students depends on 1.) how far away the classroom is from the examining room and 2.) quickly the dentist is doing the exam.
