## ABSTRACT

Affirmative action is examined from various points of view. A distinction is made between the basic concepts and legal rationale of affirmative action and the many specific laws, regulations, and practices that have developed under this label. The magnitude of the problem that affirmative action programs were intended to solve is measured in some general terms. The actual results achieved and the general trends set in motion by these programs are consiđered. Finally, the implications of affirmative action policies for those directly affected and for society in general are weighed. The study deals with race and sex differentials in employment, pay, and pronotion prospects. In this study of the effectir, ness and necessity of affirmative action prograns the academic profession is used because it is an area in which crucial career characteristics can be quantified and have been researched. The study concludes that between the original concept of affirnative action and the goals and timetables actually imposed there is an ill-conceived mixture of unsupported assumptions and burdensome requirements that resain ineffective because of their indiscriminate nature. (JMF)

Thomas Sowell

TIIE AMERICAN ENTERPRISE INSTITUTE FOR PUBLIC POLICY RESEARCH, established in 1943, is a publicly supported, nonpartisan research and educational organization. Its purpose ts to assist policy makers, scholars, businessmen, the press and the public by providing objective analysis of national and international issues. View's expressed in the institute's publications are those of the authors and do not necessarily reflect the views of the staff, advisory panels. officers or trastees of AEI.
Instilute publications take three major forms:

1. Legislative Analyses-balanced analyses of current proposals before the Congress. prepared with the help of specialists from the academic world and the fields of law and government.
2. Studies-in-deuth studies and monographs about governnent prograns and major national and international jroblems, written by indepentent scholars.
3. Ratlonal Debates, Meetlngs and Sympogia- proceedings of debates. disrussions, and conferences where eminent authorities with cuntrasting views discuss controversial issues.

## AFFIR MATIVE ACTION RECONSIDERED

## INTRODUCTION

Labels and images have become central in the controversies surrounding affirmative action. To some people, affirmative action means making equal opportunity concrete, while to others it means reverse discrimination. To some people, affirmative action is only a partial compensation for monumental wrongs, while io others it just means replacing competent whites with incompetent blacks. The reality of affirmative action is much more complex than the labels and images, both in concept and in practice.

To make these intricate and emotionally charged issues manageable, it is necessary (1) to distinguish the basic concepts and legal rationale of affirmative action from the many specific laws, regulations, and practices that have developed under the affirmative action label, (2) to measure in some general terms the magnitude of the problem that affirmative action programs were intended to solve or ameliorate, (3) to consider the actual results achieved and the general trends set in motion by these programs. and finally (4) to weigh the implications of affirmative action policies for those directly affected and for society in general.

This study draws upon the large general literature on race and sex differentials in employment, pay, and promotion prospects. In addition, it presents some original data specifically focused on academic employment, pay, and promotion. For many occupa-

[^0]tions, the fact that some of the factors determining individual qualifications for jobr are intangible makes it difficult to determine how much of the observed difference in end results is due to discriminatory treatment and how much to differences in the relevant capabilities. For the academic profession, however, many of the job qualifications that are either conceptually or statistically elusive in other occupations are spelled out-most bluntly in the "publish or perish" rule. For example, the possession or nonpossession of a Ph.D. is crucial to an academic career, and the quality of the department at which the Ph.D. was earned is of major importance at the outset of a career and exerts a continuing influence for years thereafter.' Comprehensive data available from the American Council on Education cover both the degree level of academic individuals and the respective disciplines' own rankings of the various university departments which issue those degrees, as well as the publication records and academic salaries of individuals by race and sex. In addition, the National Academy of Sciences has made available data collected by the National Science Foundation on holders of doctoral degrees (Ph.D.s, M.D.s, and other doctorates) in various fields by race and sex. In short, the academic profession offers a unique combination of known job requirements and salary data with which to determine to what extent group differences in pay represent group differences in job requirements rather than employer discrimination.

## I. THE CONCEPT

Among the many distinctions that need to be made is the crucial distinction between the generof principfe of affirmative action and the specific actions taken by the courts and administrative agencies. The general principle behind affirmative action is that a court order to "cease and desist" from some harmlul activity may not be sufficient to undo the harm already done or even to prevent additional harm as the result of a paltern of events set in motion by the previous illegal aclivity. This general principle of affirmadlive action goes back much further than the civil rights legislation of the 1960 and extends well beyond questions involving ethnic, minorities or women. $\ln 1935$, the Wagner Act prescribed "affirma-

[^1]tive action" as well as "cease-and-desist" remedies against employers whose anti-union activities had violated the law.' Thus, in the landmark Jones $\&$ Laughlin Stee! case which established the constitutionality of the act, the National Labor Relations Board ordered the company not only to stop discriminating against employees who were union members, but also to post notices to that effect in conspicuous places and to reinstate unlawfully discharged workers with back pay. ${ }^{2}$ Had the company merely been ordered to cease and desist from economic (and physical) retaliation against union members, the future effect of its past intimidation would have continued to inhibit the free-choice elections guaranteed by the National Labor Relations Act.

Racial discrimination is another obvious area where merely to "cease and desist" is not enough. If a firm has engaged in racial discrimination for years and has an all-white work force as a result. then simply to stop explicit discrimination will mean little as long as the firm continues to hire its current employees' friends and relatives through word-of-mouth referral. (Many firms hire in just this way, regardless of their racial policies.) Clearly the area of racial discrimination is one in which positive or affirmative steps of some kind seem reasonable-which is not to say that the particular policies actually followed make sense.

Many different policies have gone under the general label of affirmalive action, and many different institutions-courts, executive agencies. and even privale organizations-have been involved in formulating or interpreting the meaning of the label. The corflicting tendencies and pressures of these various institutions have shifted the meaning of affirmative action and produced in, .sistent concepts as well. There is no way to determine the meaning of "affirmalive action." All that can be done is to examine the particulars-the concepts, the intentions, and the actual effects.

In a society where people come from a wide varlety of backgrounds and where some backgrounds have been severely limited by past discrimination. the very definition of equality of opportunity is elusive. For example, a seniority system in a company which previously refused to hire minority individuals means that present and future discrimination occur because of past discrimi-

[^2]nation. In 1969, the court of appeals struck down such a system on grounds of its current discriminatory effect. ${ }^{3}$ In another 1969 case, the Supreme Court struck down a mental test for voters in a community with a long history of providing segregated and inferior education for Negroes. ${ }^{4}$ Again the rationale was that the test represented present discrimination, considering the community's past behavior. This case touches the crucial question of what to do when the effects of past discrimination are reflected in current individual capabilities. Is equal opportunity itself discriminatory under such circumstances? If so, is anything more than equality of treatment justifiable under the Fourteenth Amendment and corollary statutes and court rulings? As important as the question of whether a legal basis exists for any compensatory or preferential treatment is the question of who should bear the inevitable costs of giving some citizens more than equal treatment. A question may also be raised as to whether compensatory or preferential treatment really serves the long-run interests of the supposed beneficiaries.

The legislative history of the Civil Rights Act of 1964 shows that many of these concerns and dilemmas were present from the outset. Senator Hubert Humphrey (Democrat. Minnesota), in helping to steer this legislation through Congress, attempted to meet criticism by pointing out that the act "does not require an employer to achieve any kind of racial balance in his work force by giving any kind of preferential treatment to any individual or group." ${ }^{3} \mathrm{He}$ said that there must be "an intention to discriminate" before an employer can be considered in violation of the law and that the "express requirement of intent" was meant to prevent "inadvertent or accidental" conditions from leading to "court orders." " Senator Joseph Clark (Democrat, Pennsylvania), another supporter, made it clear that the burden of proof was to be on the Equal Employment Opportunity Commission (EEOC) to "prove by a preponderance" that a "discharge or other personnel action was because of race"; Senator Clark added categorically: "Quotas are themselves discriminatory." ${ }^{\text {z }}$

[^3]Congress also faced the question of what to do about groups whose historic disadvantages left them in a difficult position when competing on tests with members of the general population. Senator John Tower (Republican, Texas) cited, as an example oî what he was opposed to, a case in Illinois where a state agency had ferced a company to abondon an ability test which was considered "unfair to 'culturally deprived and disadvantaged groups.'" ${ }^{s}$ Senator Clifford Case (Republican, New Jersey) replied that "no member of the Senate disagrees" with Tower on this point, and Senator fiumphrey affirmed that ability tests "are legal unless used for the purpose of discrimination." ${ }^{3}$ Humphrey rejected Tower's proposed explicit amendment on this point because he considered it "redundant": "These tests are legal. They do not need to be legalized a second time." ${ }^{10}$ Senator Case cheracterized the Illinois state agency's actions as an "abuse" "1 and insisted that the Civil Rights Act did not embody "anything like" the principle of the Illinois case. ${ }^{12}$ Humphrey brushed aside the Hlinois case as "the tentative action of one man," which he was sure the Illinois commission as a whole would "never" accept."

Despite the clear intent of both the supporters and opponents of the 1964 Civil Rights Act, the actual administration of the law has led precisely in the direction which its sponsors considered impossible. The burden of proof has been put on the employer whose work force does not reflect the racial or sex proportions deemed appropriate by the federal agencies administering the law. The chairman of the Equal Employment Opportunity Commission has demanded of employer witnesses at public hearings what has been "the action taken to hire more minority people." " The commission's position is that "any discussion of equal employment opportunity programs is meaningful only when it includes consideration of their results-or lack of results-in terms of

[^4]actual nambers of jobs for minorities and women. ..." ${ }^{15}$ Numbers and percentages are repeatedly invokeu lo show "discriminalion" ${ }^{16}$-without any reference to individual cases or individual qualifications and with percentages below EEOC's expectalions being characterized as "exclusions" or "underutilization." The notion of qualified applicants has been expanded to mean "qualified people to train" "-that is, people lacking the requirements of the job whom the employer would have to train at his own expense. Contrary to the congressional debates, the burden of proof has been put on the employer to show the validity of the tests used." and the notion of "tests" has been expanded to include job criteria in general, whether embodied in a test or not. ${ }^{19}$ As for employer intentions, a poster prepared by the EEOC itself includes among ten true-false questions the statement, "An employer only disobeys the Equal Employment Opportunity laws when it is acting intentionally or with ill motive" En -and the answer to that question is false. Despite Senator Humphrey's assurances about "express requirement of intent," legal action can be taken on the basis of "inadvertent or accidental" condjtions.

The EEOC is only one of many federal agencies administering 'he Civil Rights Act in general or the affirmative action programs in particular. There are overlapping jurisdictions of the Department of Labor, the Department of Health. Education and Welfare, the Department of Justice, the EEOC, and the federal courls." There are also regional offices of all these agencies which vary significantly in their respective practices."' Moreover, when one federal agency approves-or requires-a given course of action, following such an approved course of action in no way mrotects the employer from being used by another federal agency or by

[^5]private individuals because of those very actions. ${ }^{32}$ Indeed, feueral agencies have sued one another under this act."4 In short, the meaning of the act is not clear even to those intimately involved in its administration.

The courts have not gone as far.as the administrative agencies in forcing numerical "goals and timetables" on employers. Numerical specifications have typically been invoked by courts only where there has been demonstrable discrimination by the particular employer in question-not simply where there are "wrong" racial proportions. In this specific context, numerical goals are "a starting point in the process of shaping a remedy" for "past discriminatory hiring practices" by the employer to whom the court order applies. ${ }^{3-}$ In the landmark case of Griggs v. Duke Power Company, the Supreme Court included the company's past record of racial discrimination as a reason why the company could not use tests which (1) eliminated more black job applicants than white job applicants and (2) had no demonstrated relationship to actual job performance.: ${ }^{6}$ In geneial, the courts have rejected the notion that "any" person be hired simply because he was formerly the subject of discriminátion, or because he is a member of a minority group. . . ."

Legal remedies under the Civil Rights Act and related executive orders of the President range from cease-and-desist orders through individual reinstatement and group preferential hiring to the cutting off of all federal contracts to the offending employer. The latter is a virtual sentence of death to any leading research university, whether public or "private," for they are all dependent upon federal money to maintain their competitive standing and will sustain a massive loss of top faculty without it.

## II. 'IHE PROBLEM

There is little real question that if one goes back a number of years one finds a pervasive pattern of discrimination against minorities in acadenic employment. This applies not only to blacks and

[^6]other minorities regarded as "disadvantaged," but also to Jews, who were effectively excluded from many leading university faculties before World War II.' The situation of women is somewhtat more complicated and so will be deferred for the moment. However, the question that is relevant to affirmative action programs for both minorities and women is, what was the situation at the onset of such programs and how has the situation changed since?

While colleges and universities were subject to the general provisions of the Civil Rights Act of 1964 and to subsequent executive orders authorizing cancellation of federal contracts for noncompliance, ${ }^{2}$ the numerical proportions approach dates from the Labor Department's 1968 regulations as applied to academic institutions by the Department of Health. Education and Welfare. ${ }^{3}$ More detailed requirements--including the requirement of a written affirmative action program by each institution-were added in Revised Order No. 4 of $1971,{ }^{4}$ which contains the crucial requirement that to be "acceptable" an institution's "affirmative action program must include an analysis of areas within which the contractor is deficient in the utilization of minority groups and women" and must establish "goals and timetables" for increasing such "utilization" so as to remedy these "deficiencies." ${ }^{5}$

For purposes of establishing a chronology, 1971 may be taken as the beginning of the application of numerical goals and timetables to the academic world. The question thus becomes, what were the conditions in academic employment, pay, and promotions as of that $d_{i}$ ? For minorities in general, and blacks in particular as the large. minotity, virtually nothing was known about academic employment conditions at that point. Assumptions and impressions abounded, but the first national statistical study of the salaries of black academics is that published in 1974 by Professor Kent G. Mommsen of the University of Utah. ${ }^{6}$ In short, affirmative action programs had been going full blast for years before anyone knew the dimensions of the problem to be solved.

[^7]Profesṣor Mommsen's data for the academic year 1969-70 show a grand total of 562 per year salary difference between black Ph.D.s and white Ph.D.s. ${ }^{7}$ An earlier stud̈y by Professor David Rafky found that only 8 percent of black academics in white institutions regarded themselves as havirg personally experienced discrimination in their careers. ${ }^{3}$

These data may seem to be sharply at variance with data showing numerical "underutilization" of minorities in the whice academic world, and it is these latter data which HEW and other supporters of affirnative action rely upon. There are some rather simple and straightforward reasons why the percentage of blacks (or minorities in general) in the academic world (or at white institutions) is smaller than their percentage in the general population:
(1) Only a very small proportion of blacks meet the standard requirements of a Ph.D. for an academic career. Less than ${ }^{1}$ percent of the doctorates earned in the United States are received by blacks and, despite many special minority programs and much publicity, less than 2 percent of graduate students are black. ${ }^{\text {. }}$ Various surveys and estimates show less than 4,000 black Ph.D.s in the United States. ${ }^{10}$ This is less than two black Ph.Ds for every American college or university-regardless of what goals and timetables may be set.
(2) Most black academics teach at black colleges and black universities." and so do not show up in the predominantly white inslitulions where affirmative action data are collected. Nor are these black academics eager to leave and join white faculties elsewhere: the average salary increase required to

[^8]induce black academics to move was over $\$ 6,000$ a year in 1970.'2 The crucial element of individual choice is left out of the affirmative action syllogism that goes from numerical "underrepresentation" to "exclusion." One study (by strong supporters of affirmative action) showed that some black academics refuse even to go for an interview at institutions that do not have a black community nearby. ${ }^{13}$
(3) The career characteristics of most black academics do not match the career characteristics of white (or black) faculty at the leading research universities that are the focus of affirmative action pressures. This is particularly true of the two key requirements at research universities-the Ph.D. and research publications. A survey of the facully at black private colleges and uriversities found that only 25 percent had a doctorate and only 4 percent had ever published in a scholarly journal. ${ }^{4}$ None of this is surprising, given the history of blacks in the United States. Nor should it be surprising that academics with those characteristics prefer to remain at teaching inslitutions rather than move to research universities.

None of this disproves the existence of discrimination in the academic world. It merely indicates that numerical underrepresenlation is not automatically equivalent to discrimination. More fundamentally, it makes discrimination an empirical questionnot something to be established intellectually by sheer force of preconception or to be established administratively by simply putting a never-ending burden of proof (or disproof) on institutions. For both minorities and women, a distinction must be made between saying that there is discrimination in general and estat lishing the particular locus of that discrimination. Even the mos casual acquaintance with Antericen history is sufficient to establish the existence of discrimination against blacks. The question is whether the statistical end results so emphasized by HE'N are caused by the institutions at which the statistics were gathered.

The extent to which the patterns of minorities can be generalized to women is also ultimately an empirical question. In some

[^9]specifir and important respects, acadenic women are quite different irom minority academics:
(1) Womea have not risen to their present proportions among college and university faculty from lower proportions in earlier eras, despite a tendency towards such fictitious parallelism in the literature. ${ }^{15}$ Women constituted more than 30 percent of all faculty members in 1930, and the proportion declined over the next thirty years to about 20 percent in 1960. Women reached a peak of nearly 40 percent of all academic personnel (faculty and administrators) in 1879, with fluctuations, generally downward, since then. ${ }^{16}$ Similar declines have occurred in the representation of women in other high-level professions over a similar span, both in the United States and in Europe. ${ }^{15}$ It is not merely that much of the assumed history of women is wrong but more important, that the reason for current fentale disadvantages in employment, pay, and promotion are misunderstood as a result. The declining proportions of fentale academics occurred over a period of rising rates of marriage among academic women, ${ }^{18}$ and a period of rising birth rates among white women in general. ${ }^{19}$ In short, there is at least prima facie evidence that domestic responsibilities have had a major impact on the academic careers of women over time-which raises the question whether domestic responsibilities should not be investigated further as a factor in :'rrent female career differences from males, rather than iong directly from nu.. srical "underrepresentation" to "exclusion" and "discrimination."
(2) Women have administered and staffed academically toprated colleges for more than a century, ${ }^{20}$ in contrast to the black colleges which have never had top-rated students or

[^10]faculty. ${ }^{1}$ Although women's colleges such as Bryn Mawr, Smith, and Vassar have been teaching institutions rather than research universilies, their students have been quite similar academically to those in the research universities and their faculty typically has had training similar to that of the faculties of research institutions. In fact, in some instances, these women's colleges have been part of research universities (Radcliffe, Barnard, Pembroke, and so on). In short, academic women have had both higher academic standing than minorities and readier access to faculty positions at research universities. Information barriers in particular have been far less important in the case of women than in the minority case, and word-of-mouth methods of communication among prestige institutions have included women for a longer time.
The point here is not to minimize women's problems but to point out that they are in some ways distinct from the problems of minorities. In other ways, of course, they are similar. For example, women academics also do not publish as ratuch as academics in general, ${ }^{ \pm 2}$ and women academics do not have a Ph.D. as often as other academics. ${ }^{23}$ But in the crucial area of salary, not only do women academics average less than men, ${ }^{31}$ but also feme'n "h.D.s average significantly less than male Ph.D.s.". In short, women in academia face a different, though overlapping, set of problems from those faced by minorities in academia.

In addition to questions about the HEW "solution" for minorities, there may be additional questions about the simple extension of the minority solution to women by Executive Order No. 11375.

It must be emphastzed that all the statistics cited thus far are for the academic world prior to affirmative action. They are intended to give a picture of the dimensions and nature of the problem that existed so as to provide a basis for judging the necessity of what was done under affirmalive action programs. Now the results of those programs can also be considered.

[^11]
## III. THE RESULTS

The academic employment situation has been described in terms of rough global comparisons-black-white or male-female. Finer breakdowns are necessary in order for us to determine the effects of many variables which differ between the groups whose economic conditions are being compared. Some of these intergroup differences have already been mentioned-educational differences and differences in publications, for example-but there are others as well. If discrimination is to mean unequal treatment of equal individuals, then comparisons must be made between individuals $\dot{\text { whe }}$ are similar with respect to the variables which generally determine employment, pay, and promotion. Only insofar as we succeed in specifying all these variables can we confidently refer to the remaining economic differences as "discrimination." One of the perverse aspects of this residual method of measuring discrimination is that the more determining variables that are overlooked or ignored, the more discrimination there seems to be. Since no study can specify all relevant variables, the residual pay differences between minority and female academics, on the one hand, and white males, on the other, must be understuod as the upper limit of an estimate of discriminatory differences.

For both sets of comparisons, the data sources are the American Council on Education (ACE) and the National Academy of Sciences (NAS). Tıe ACE data are based on a sample of 60,028 academicians surveyed in 1969 and a sample of 50,034 academicians surveyed in 1972. The NAS data are from (1) a National Science Foundation survey conducted in 1973, based on a stratified sample of 59,086 doctorates in the social and natural sciences and engineering ' and (2) a longitudinal compilation by NAS of biennial surveys of the same targel population by the National Science Foundation during 1960-70.

Minorities. Existing studies of black faculty members show many ways in which their job-related characteristics differ from those of facuity nembers in general. All these differences tend to have a negalive impact on employment, pay, and promotion for academics in general:

[^12](1) A smaller proportion of black faculty than of white faculty holds a doctoral degree. ${ }^{\text {a }}$
(2) The distribution of biack doctoral fields of specialization is biased towards the lower-paying fields-particularly education (roughly one-third of all black doctorates) and the social sciences (one-fourth)-with very $f \in \mathrm{w}$ (about 10 percent) of the doctorates in the natural sciences. ${ }^{3}$
(3) The bulk of black faculty is located in the South ${ }^{4}$-a lower-paying region for academics in general, ${ }^{5}$ as well as for others.
(4) Blacks complete their Ph.D.s at a later age than whites "a reflection of both financial and educational disadvantagesand academirs in general who complete their Ph.D.s at a later age tend to be less "productive" in research publications.
(5) Black academics, both at black colleges and at white institutions, publish much less than white academics.' Among the factors associated with this are much higher teaching loads and late completion of the Ph.D.
(6) Black academics are less mobile than white academicsand less mobile academics tend to earn lower salaries. Forty percent of the black professors in the Mommsen study had not moved at all, despite an average of three or four job offers per year, ${ }^{8}$ and the median pay increase which they considered necessary to make them move was a $\$ 6,134$ per year raise. ${ }^{9}$. By contrast, among faculty int „eneral, "the academic career is marked by high mobility," ${ }^{10}$ and "professors expect to switch schools several times, at least, during their careers." "
(7) Women constitute a higher proportion ( 20 percent) of black doctorates than of doctorates in general ( 13 percent) ${ }^{13}$ and women earn less than men among both blacks and whites.

[^13]With all these downward biases, it is worth noting once again that the academic salaries of white doctorates averaged only $\$ 62$ per year more than those of. black doctorates in 1970. On a field-by-field basis, black doctorates were generally earning more than white doctorates in the same area of specialization and receiving more job offers per year ${ }^{\prime \prime}$-all this before the affirmative action program under Revised Order No. 4 in 1971. In other words, the effect of the straightforward antidiscrimination laws of the 1960s and of the general drive toward racial integration had created a premium for qualified black academics, even before HEW's goals and timetables. Moreover, the improvements that have occurred since then need not be due to HEW pressures but may be thought of as a continuation of trends already evident before affirmative action programs began.

The data from the American Council on Education permit a standardization for degree level, degree quality. field of specialization, and number of articles published, so that the salaries of blacks. whites, and Orientals who are comparable in these respects may be compared. Table 1 omits field of specialization to give a general view of race and salary in the academic world as a whole. Degree rankings in the table are based on surveys conducled by the ACE to determine the relative rankings of Ph.D.granting departments in twenty-nine disciplines, as ranked by members of those respective disciplines. (I have collapsed the two departmental rankings, "distinguished" and "strong." into one category in order to maintain a large sample size.) Articles published were selected as a proxy for publication in general, avoiding the problem of trying to convert books, monographs, conference papers. and articles into some equivalent.

My results for 1973 (Table 1) are generally not very different from those of Professor Mommsen for 1970: white facully earned slightly more than black faculiy in general ( $\$ 16,677$ versus $\$ 10,037$ ). But when degree level and degree quality are held constant, blacks earned more than whites with doctorates of whatever ranking, while whites had all edge of less than $\$ 100$ per year among academics withoul a doctorate. The overall salary advantage of whites over blacks- 8640 per year-is a result of a different distribution of the races among degree levels and degree qualities. as well as a different distribution among publication categories. For example, 11 percent of the white faculty members in the ACE samples had Pl.D.s from departments ranked either "distin-

[^15]guished" or "strong" by their respective professions, while only 4 percent of the black faculty came from such departments. Only 18 percent of the black academics in this sample had a doctorate at all, compared to 38 percent of the white academics. Thirty-one percent of the white faculty had published five or more articles while only 12 percent of the black faculty had done so. Blacks who had published at all had higher salaries than whites wilh the same number of publications.

Orientals present a somewhat different picture. Only those Orientals with "distinguished" and "strong" Ph.D.s received slightly higher salaries than their white counterparts (\$18,235 versus $\$ 17,991$ ), and even this difference was not uniform across publications categories. Among the lower-ranked doctorates, both whites and blacks earned more than Orientals, and among those with less than a doctorate, considerably more. The overall salary average of Orientals was only slightly below that of blacks, but solely because Orientals were far more concentrated in the higher degree levels and higher degree qualities. Less than half of the Oriental faculty mernbers lacked the Ph.D. and more than 40 percent of all Oriental faculty had published five or more articles. In short, just as group differentials do not imply discrimination. s) an absence of such differentials does not imply an absence of uscrimination. Orientals receive less than either blacks or whites with the same qualifications, and only the fact that the Orientals have generally better qualifications than either of the other two groups conceals ihis.

When field-by-field comparisons are made, very similar patterns emerge. In the social sciences, blacks have higher salaries than whites or Orientals, and especially so among holders of Ph.D.s from "distinguished" and "strong" departments (Table 2). In the natural sciences (Table 3) and the humanities (Table 4). whites lead, with blacks second in the humanities and Orientals second in the natural sciences. A comparison of overall sample size from one table to another reveals very different distributions of these racial groups among academic fields: 37 percent of all black faculty members were in the social sciences, 23 percent were in the humanities, and only 16 percent were in the natural sciences. By contrast, 44 percent of the Orientals were in the natural sciences, 28 percent in the social sciences, and only 16 percent in the humanities. Whites were distributed more or less midway between blacks and Orientals: 30 percent in the social sciences, 24 percent in the humanities, and 25 percent in the

natural sciences. Again, the net effect of chese distributions is to exaggerate the overall salary differences between blacks and whites and to understate salary differences between Orientals and whites.

The National Academy of Sciences data cunfirm soma of these patterns and reveal some new ones. NAS data for full-time doctoral scientists and engineers" (ä̆ademic and nonacademic) show blacks earning slightly more than whites, with Orientals last-and a spread of only $\$ 1,500$ per year over all three groups (Table 5). Publications data are not available for this survey but age was tabulated as a proxy for experience. Degree quality was again available, and again Orientals with given credentials quality had lower salaries than either blacks or whites in the same categories. In all three groups, salary rises with age, but the relative positions of blacks and whites are reversed in the oldest and youngest age brackets. Young black doctorates-under thirty-five-earn more than their white counterparts in either degree quality category, but older blacks-over fifty-earn less than their white counterparts in either degree quality category. These results hold up when the sample is broken down into natural sciences and social sciences. It is also consistent with a larger study by Professor Finis Welch of UCLA which showed a much highe. rate of return to education for younger blacks than for older blacksboth absolutely and relative to their white counterparts. ${ }^{1+}$ Two important fac:urs are involved here: (1) the oider blacks were educated in an era when their public school education was inferior not only by various quality measures but also in sheer quantity (black schools bad fewer days than white schools in their respective school years), ${ }^{15}$ and this poorer preparation could not help affecting later capability, and (2) the level of job discrimination was also greater when the older blacks began their careers, ana this too could not help affecting the later course of those carcers, making it difficult for these blacks to exploit new opportunities as readily as the younger blacks just beginning their careers. A further implication of all this is that global comparisons of blacks and whites caplure many existing effects of past discrimination, while an age-cohort breakdown of the same data permits a belter look at the current results of current policies and the trends to expect in the future.

[^16]
## Table 5

MEDIAN ANNUAL SALARIES OF FULL-TIME SCIENTISTS AND ENGINEERS, BY RACIAL GROUP AND DEGREE QUALITY, 1973

Source: 1973 Survey of Doctoral Scientists and Engineers, National Research Council, National Academy of Sciences.

In summary, the salary differentials among these three racial or ethnic groups are small, both in the academic world and among holders of the doctorate in the social or natural sciences (academic and nonacademic). With such variables as credentials, publications, and experience held constant, blacks equalled or surpassed whites in 1973-but they also equalled or surpassed whites with fields held constant in 1970. Without these variables held constant, the overall black-white differential was $\$ 62$ per year in 1970 and $\$ 640$ in 1973. Given that these are different samples, it is perhaps best to say that there were negligible overall differences among black and white academics in both years-that affirmative action has achieved nothing discernible in this regard. But if an arithmetic conclusion is insisted upon, then it must be said that there has been a negative effect of affirmative action as far as black-white differences are concerned.

Women. The classic study Academic Women by Jessic Bernard described women as "overrepresented iñ college teachirg." This was based on the fact that women were only 10 percent of the Ph.D.s but constituted more than 20 percent of college and university faculties. ${ }^{16}$ This was written in 1964-before affirmative action. Unlike HEW's crude "underutilization" measures, this study (by an academic woman) considered not only the number of women with the usual degree requirements but also "the large number of educated women-30.6 pcrcent of those with five years or more of college-who are not in the labor force." "' Withdrawal from the labor force is only one of many career characteristics which have a negative effect on the employment, pay, and promotion of academic women. Some others are:
(1) Female academics hold a doctorate less frequently than male academics-20 percent as against 40 percent in 1972-73. ${ }^{18}$
(2) Female academics publish only about half as many articles and books per person as do male academics. ${ }^{1 "}$ and females

[^17]are especially underrepresented among frequent publishers. ${ }^{20}$
(3) Academic women are veducated disproportionately in lower-paying fields of specialization, such as the humanities, ${ }^{11}$ and they prefer teaching over research more so than academic men, not only in attitude surveys, ${ }^{22}$ but also in their allocation of time ${ }^{* 3}$ and in the kinds of institutions at which they work ${ }^{24}$-which are the low-paying teaching institutions more so than the top research universities with high salaries.
(4) Academic women more frequently subordinate their carcers to their spouses' careers, or to the general well-being of their families, than do academic men. This takes many forms, including quitting iobs they like because their husbands take jobs elsewhere. ${ }^{23}$ interrupting their careers for domestic reasons, ${ }^{36}$ withdrawing from the labor force ( 25 percent of women Ph.D.s) ${ }^{27}$ doi.g a disproportionate share of household and social chores compared to their husbands in the same occupations, ${ }^{\text {as }}$ and a general attitude reported by women themselves of putting their homes and families ahead of their careers much more often than do male academics. ${ }^{39}$ All this goes to the heart of the question of the actual source of sex differentiation-whether it is the home or the work place, and therefore whether "equal treatment" as required by the Conslitution and envisioned in the Civil Rights Act would eliminate or ensure unequal results by sex.

[^18]None of these factors disproves the existence of sex discrimination; but they do mean that attempts to measure sex discrimination must be unusually careful in specifying the relevant variables which must be equal before remaining inequalities can be considered "discrimination." Unfortunately, such care is not evident in HEW pronouncements or in much of the literature supporting affirmative action. Even the comprehensive studies by Helen S. Astin and Alan E. Bayer make the fatal mistake of holding marital status constant in comparing male-female career differences. ${ }^{30}$ But marriage has opposite effects on the careers of male and female academics, advancing the man professionally and retarding the woman's progress. Not only do the men and women themselves say so, ${ }^{31}$ but the Astin-Bayer uata (and other data) also show it. ${ }^{32}$ Therefore to treat as "discrimination" all residual differences for men and women of the "same" character-istics-inciuding marriage-is completely invalid and misleading.

Marriage is a dominant-and negative-influence on academic women's careers. A study of academicsawho had received their Ph.D.s many years earlier showed that 69 percent of the total-mostly men-had achieved the rank of full professor, as had 76 percent of the single women but only 56 percent of the married women. ${ }^{33}$ In short, many of the statistical differences between the broad categories "men" and "women" are to a large extent simply differences between married women and all other persons. It is an open question how much of the residual disadvantages of single academic women is based upon employer fears of their becoming married academic women and acquiring the problems of that status. One indication of the difficulty of successfully combining academic careers with the demands of being a wife and mother is that academic women are married much less frequently than either academic men or women Ph.D.s

[^19]in nonacademic fields, ${ }^{34}$ are divorced more freçuently, ${ }^{35}$ and have fewer children than other female Ph.D.s. ${ }^{36}$

Much of the literature on women in the laber market denies that "all" women, "most" women, or the "typical" woman represent special problems of attrition, absenteeism and other characteristics reflecting the special demands of home on women. For example, the "typical woman economist" has not given up her job to move because of her husband's move, but 30 percent of the women economists do, while only 5 percent of male economists accommodate their wives in this way. ${ }^{37}$ Similarly, while most female Ph.D.s in economics have not interrupted their careers, 24 percent had interrupted their careers prior to receiving the degree (compared to 2 percent of the men) and "another 20 percent" afterwards (compared to 1 percent of the men). ${ }^{38}$ These are clearly substantial percentages of women and severalfold differentials between men and women.

The literature on women workers in general makes much of the fact that most women "work to support themselves or others," not just for incidental money. ${ }^{33}$ However, this does not alter the facts (1) that women's labor force participation rates are substantially lower than men's ${ }^{30}$ and (2) that married women's labor force participation declines as their husbands' incomes rise. ${ }^{\$ 1}$ This is also true of academic women. ${ }^{42}$

In considering global male-female differences in career results, the question is not whether "most" women have certain negative career characteristics but whether a significant percentage do and whether that percentage is substantially different from that of men. Moreover, $\mathbf{i t}$ is not merely the individual negative characteristics that matter but their cumulative effects on male-female differentials in employment, pay, and promotion. Nor can these differences in career characteristics be dismissed as

[^20]subjective employer perceptions or aversions. ${ }^{47}$ They represent in many cases choices made outside the work place which negatively affect women's career prospects. As one woman researcher in this area has observed: "One way of insuring that the academic husband's stalus will be higher than his academic wife's is to allow the husband's job opportunities to determine where the family lives." ${ }^{44}$ But regardless of the wisdom or justice of such a situation, it is not employer discrimination, even though it may lead to statistical male-female differences between persons of equal ability.

One of the fertile sources of confusion in this area is the thoughtless extension of the "minority" paradigm to women. It makes sense to compare blacks and whites of the same educational levels because education has the same positive effect on black incomes and white incomes, thongh not necessarily to the same extent. It does not make'sense to compare men and women of the same marital status because marital status has opposite effects on the careers of men and women. Minorities have serious problems of cultural disadvantages, so that faculty members from such groups tend to have lower socioeconomic status and lower mental test scc ees than their white counterparts, ${ }^{4 \pi}$ and black colleges and universities have never been comparable to the best white colleges and universities, ${ }^{46}$ whereas female academics come from higher socioeconomic levels than male academics, ${ }^{17}$ female Ph.D.s have higher IQs than male Ph.D.s in field after field, ${ }^{\text {8 }}$ and the best women's colleges have had status and student SAT levels romparable to those of the best male or coeducational institutions. Women have been part of the cultural, informational, and social nelwork for generations, while blacks and even Jews have been largely excluded until the past generation. While minorilies have been slowly rising in professional, technical. and other high-level

[^21]positions over the past $\mathbf{1 0 0}$ years, women have declined in many such areas over the same period, even in colleges institutionally oparated by women, ${ }^{49}$ so that employer discrimination can hardly explain either the trend or the current level of "utilization" of women. Marriage and childbearing trends over time are highly correlated with trends of women's participation in high-level occupations, as well as being correlated with Intra-group differences among women at a given time. In short, women are not another "minority," either stalistically or culturally.

When male-female comparisons are broken down by marital status and other variables reflecting women's domestic responsibilities, some remarkable results appear. Although women in the economy as a whole earn less than half as much annually as men, ${ }^{\text {" }}$ w with this ratio declining from 1949 to 1969,"' the sex differentials narrow to the vanishing point-and in some cases are even reversed-when successive corrections are made for marital status, full-time as against part-time employment, and continuous years of work, For example, in 1971 women's median annual earnings were only 40 percent of those of men, but when the comparison was restricled to year-around, full-time workers, the ligure rose to 60 percent, and when the comparison was between single women and single men in the same age brackets (thirty to forty-four) with continuous work'experience, "single women who had worked every year since leaving school earned slightly more than single men." ${ }^{\prime 2}$ Those are government data for the economy as a whole.

The severe negative effect of marricige on the careers of women is not a peculiarity of the academic world. Other nationwide data on sex differences show single women's incomes ranging from 93 percent of single men's income at ages twenty-five to thirty-four to 106 percent in ages fifty-five to sixty-four "'-that is, after the danger of marriage and children are substantially pas!. For women alrcady married, the percentages are both lower and decline with age-ranging from 55 percent of married men's

[^22]incomes at ages twenty-five to thirty-seven to only 34 percent at ages fifty-five to sixty-four. ${ }^{54}$ Apparently early damage to a woman's career is not completely recouped-at least not relative to men who have been moving up occupationally as they age while their wives' careers were interrupted by domestic responsibilities. in the early years of career development, single women's labor force participation rates are rising sharply, while those of married women are declining sharply. ${ }^{55}$ Again, the data suggest that what are salled "sex differences" are largely differences between married women and all others, and that the origin of these differences is in the division of responsibilities in the family rather than employer discrimination in the work place. The increasing proportion of married women in the work force over time ${ }^{\text {si }}$ has been a major factor in the decline of the earnings of women relative to men.

Academic women show similar patterns. For example, the institutional employment of married women is "determined to a large extent" by the !ocation of their husbands' jobs, ${ }^{5 *}$ and this contributes to a lower institutional level for academic females than for male Ph.D.s. Academic women apparently find it harder than other women of similar education to combine marriage a.d a career. One study of "biological scientists receiving their degrees during the same time period" found only 32 percent of such academic women married compared to 50 percent of their nonacademic counterparts, even though initially virtually identical percentages were married before receiving their Ph.D. ${ }^{\text {si }}$ A more general survey of women holding doctorates found only 45 percent to be married and living with their husbands. ${ }^{53}$ Although there were more married than single women among women doctorates in general, ${ }^{\text {cip }}$ in the academic world there were more single than married female doctorates."' Moreover, female academics had divorce rates several times higher than male academics. ${ }^{62}$ Another study of college teachers found 83 percent of the men but only

[^23]46 percent ${ }^{*}$ of the women to be married. ${ }^{63}$ Women in other highlevel, high-pressure jobs requiring continuous full-time work show similarly low proportions married. ${ }^{04}$

Childbearing is also negatively associated with career prospects. Among Radcliffe Ph.D.s, those working full time had the fewest children, those working part time next, those working intermittently next, and those not working at all had the most children. ${ }^{65}$ Various surveys show that "female Ph.D.s who are married are twice as likely to be childless as women in the same age group in the general population" and even when they do have children, to have fewer of them. ${ }^{\text {e6 }}$ The husband's prospects also have a negative effect on women doctorates' careers: a woman married to a "highly educated man with a substantial income was leș likely to work" or, if she did, was more likely to take a parttime job. ${ }^{67}$ This parallels a negative correlation betweta married women's labor force participation and their husbands' incomes in the general economy. ${ }^{\text {cs }}$

In research output, "the woman doctorate who is married and tas children was less likely than the single woman doctorate or a childless married woman doctorate to have many scientific and scholarly articles to her credit." ${ }^{36}$ It is not surprising that the married woman doctorate "tended to make a lower salary than the single woman, even if she was working !ull time." ${ }^{70}$ Unfortunately, studies of academic women have not simultaneously controlled for marital status, full-lime continuous employment, publications, and degree level and quality.

The National Academy of Sciences data permit comparisons of the salaries of male and female doctorates who worked full time both in 1960 and in 1973 and who responded in all the biennial surveys of the National Science Foundation from 1960 through 1973 (see Table 6). This gives an approximation of full-time continuous employment, but does not show whether the respondent was employed full time in each of the years during which a survey was made or whether the respondent worked at

all in the non-survey years. These data show female salaries at 83 percent of male salaries in 1970 (before affirmative action) and 84 percent in 1973 (after affirmative action)-a smaller proportion than in other data which controlled for other variables such as publications and degree quality. It also indicates no discernible effect of affirmative action programs.

A 1968 study of full-time academic doclorates found women's salaries ranging from 89 percent to 99 percent of men's salaries in the same field, with similar length of employment, and in broadly similar inslitutions (colleges versus universities)." These higher percentages-as compared with the results in Table 6-suggest that the distribution of women by institutional type and ranking and by years of employment explains a significant part of the male-female salary differences among acadenics. Moreover, since women acadenics with Ph.D.s in this 1968 study earned 92.2 per-

[^25]cent of the income of men academics with Ph.D.s (even without controling for publications), these figures indicate how small the sex differential was for even roughly similar individuals before affirmative action.

Even more revealing patterns appear in our tabulations of ACE data by marital status (Table 7). In 1969, academic women who never married earned slightly more than academic men who never married. This was true at top-rated institutions and at other institutions, for academics with publications and for academics without publications. The male salary advantage exists solely among married academics and among those who used to be married ("other" includes widowed, divorced, et cetera). The male advantage is greatest among those married and with dependent children. Being married with children is obviously the greatest inhibitor of a woman's career prospects and the greatest incentive to a man's. The salaries of women who never married were 104 percent of the salaries of their male counterparts at the top-rated institutions and 101 percent at other institutions. For women who were married but had no dependent children, the percentages fell to 88 and 84 percent, respectively. For married women with dependent children, the percentages fell still further, to 69 and 70 percent. For women and men without publications and in nonranked-essentially nonresearch-institutions, the "never married" women earned 145 percent of the "never married" men's incomes-confirming a general impression that women prefer teaching institutions, and therefore a higher proportion of top-quality women than of top-quality men end up at such places by choice. It also suggests that employers are not unwilling to recognize such quality differentials with salary differentials in favor of women.

In the literalure on sex differentials and in the pronouncements of governmental agencies alministering affirmative action programs, sinister and even conspiratorial theories have been advanced to explain very ordinary and readily understandable social phenomena: (1) academic individuals who are neither aiding nor aided by a spouse make very similar incomes, whether they are male or female, (2) academic individuals who are aided by a spouse (married males) make more than unaided individuals, and (3) academic individuals who aid a spouse (married females) make less for themselves than do the other calegories of people. The social mores which lead women to sacrifice their carcers for their husbands' careers may be questioned (as should the high personal

price exacted from academic career women, as reflected in their lower marriage and higher divorce rates). But social mores are not the same as employer discrimination. The fact that single academic women earn slightly higher salaries than single academic men suggests that employer discrimination by sex is not responsible for male-female income differences among academics. Moreover, even as regards social mores, it must be noted that academic women report themselves satisfied with their lives a higher percentage of the time than do academic men ""-a phenomenon which some explain by saying that women do not put all their emotional egss in one basket as often as men, ${ }^{83}$ and which others explain by treating high research creativity as a somewhat pathological and compensatory activity of the personally unfulfilled. ${ }^{-4}$ The point here is that the evidence is not all one way, nor the logic overwhelming, even as regards apparently inequitable social mores. On the basic policy issue of employer discrimination, such evidence as there is lends no support to this as an explanation of male-female career differences, and the slight but persistent advantage of single females over single males undermines the pervasive preconception that employers favor men when other things are equal.

## IV. THE IMPLICATIONS

The academic profession has been chosen as an area in which to study the necessity and effectiveness of affirmative action programs, primarily because it is an area in which crucial career characteristics can be quantified and have been researched extensively over the years. The questions are: (1) What are the implications of affirmative action in the academic world? (2) To what extent is the academic world unique-or, to what extent are these research findings applicable to the economy at large? (3) Both for the academic world and for the economy at large, what alternative policies offer a better prospect of achieving the general goal of equal opportunity which provides much of the driving force behind the particular policies and practices summarized as affirmative action?

[^26]Academia, The central assumption of affirmative action programs is that "underrepresentation" of minorities or women represents employer "exclusion" rather than different career characteristics of groups or different choices by the individuals themselves. In the academic world, major intergroup differences have been found in degree levels, publications, and fields of specialization-ail these differences being to the disadvantage of minorities and women. For minorities, holding such variables constant reduces, eliminates, or even reverses salary differentials" as compared to white academics. Even without holding such variables constant, the pay differentials between minorities and other academics were less than $\$ 100$ per year before affirmative action and less than $\$ 1,000$ afterwards-indicating that both the necessity for such programs and the effectiveness of them are open to serious question, For women, holding the same variables constant does not eliminate salary differentials, but holding full-time employment constant comes close to doing so, and for those women without marital responsibilities, sex differentials disappear. Together with much other data, this suggests that marital status in general and an unequal division of domestic responsibility in particular explain both differential trends over time and the differences at a given time between male and female academics.

The terr "career characteristics" has been used here, not simply to avoid the emotionally loaded word "qualified," but because it seems more accurate and germane. Given the enormous range of American colleges and universilies, virtually anyone with graduate training is "qualified" to teach somewhere, while only a small fraction of the Ph.D.s are "qualified" to teach at the very top inslitulions. The question of qualifications therefore amounts to a question of whether a particular individual matches a particular institution, rather than whether he or she belongs in the profession. An institution is not excluding a "qualified" applicant because it hires someone else whose career characteristics fit its institutional needs, even though those not hired have career characleristics which make them valuable to other kinds of institutions. Research universities-a major focus of affirmative action programs-offer a specialized environment which many acalemics do not want, as well as one for which many do not lave the appropriate set of career characteristics. It is as unnenessary to denigrate either individuals or groups as it is io denounce as "irrelevant" the characteristics which research universities seek for their special purposes.

The crucial element of individual choice is routinely ignored in analyses and charges growing out of statistical distributions of people. Women choose to emphasize teaching over research, and this has implications for their degree levels (a Ph.D. is not as essential), the kind of institutions they prefer, and the life style it permits-including part-time and intermittent careers that mesh with domestic life. Black faculty prefer being where they are to such an extent that it would take more than a $\$ 6,000$ raise to move them, according to a survey of several hundred black academics.

One of the peculiarities of the academic market is its fragmentation or balkanization. ${ }^{1}$ A particular department typically hires people trained at a relatively small number of other departments. This is due to the high cost of specific knowledge about specific individuals as they emerge from graduate school. At that point, the individual usually has no publications or teaching experierre, and the only indications of his intellectual potential are the estimates of professors who taught him or directed his thesis research-and the value of those estimates depends crucially upon the reliability of those professors, which in turn means it depends on how well members of the employing department know members of the department where the applicant was trained. The top departments in many fields typically hire: $9 m$ other top departments in the same fields. This has led to charges of an "old boy network" among the top departments which excludes outsiders in general ond minorities and women in particular. But despite loose talk about "recruitment procedures that tend exclusively to reach white males," ${ }^{2}$ the fact is that (1) most black Ph.D.s were trained in a very few highly rated, predominantly white departments ${ }^{3}$ and (2) a slightly higher proportion of female doctorates' than of male doctorales received their Ph.D.s from the lop twelve universities. ${ }^{1}$ In short, whatever the merits or demerils of the "old boy network," as high a percenlage of minority and female Ph.D.s as of white male Ph.D.s are inside its orbit,

[^27]Affirmative action practices ignore both choice and career characteristics by the simple process of putting the burden of proof on academic institutions to explain why their percentages of minority and female faculty do not match the kinds of proportions preconceived by governmental authorities. Career characteristics are accepted as miligating factors only when job criteria have been "validated"-which is virtually impossible. The statistical "validation" process, as developed for written tests in education, involves prediction for a very short span of time on a very limited number of variables, such as grades and graduation. To extend the "validation" concept to the whole hiring process for complex professions with many dimensions is to demand mathematical certainty in areas where good judgment is the most that can be expected. In such circumstances, where "validation" amounts to convincing government officials, it means convincing people whose own carcer variables-appropriations, staff, and power-depend upon not believing those attempting to convince them, General findings of reasonable hiring decisions would be a general sentence of death for the agency itself. More basically, this situation replaces the principle of prescriptive laws with ex post administrative determination of what should have happened, combined with never-ending burdens of proof as to why it did not.

A mitigating factor (in the opinion of some) is that the ultimate sanction of contract cancellation is not actually invoked. But this means that the real penalty is having to repeatedily devote substanlial institutional resources to producing the pounds of paper which constilute an affirmative action report-and this penalty falls equally on the just and on the unjust. Even aside from the disturbing moral implications of this, it means that the effectiveness of the penalty is reduced when a discriminating employer has little to gain by becoming a non-discriminating employer, in a society where the career characteristics of the target population ensure that he will never be able to fill affirmative action quotas anyway. There is truth in the bitter comments from both sides of the affirmative action controversy that (1) colleges and universilies are under unremitting and unreasonable pressures and that (2) virtually nothing is actually being accomplished for minorities and women. An even weightier consideration is that the appearance of massive benefits being conferred on minorities and women undermines the very real achievements of minorities and women themselves, often made at
great personal sacrifice-achievements whose general recognition would be a vet - healthy influence on society at large.

There are a number of ways in which affirmative action piograms hurt the academic world without benefiting minorities or women:
(1) The sheer volume of resources required to gather and process data, formulate policies, make huge reports (typically weighing several pounds), and conduct interminable communications with a variety of federal officials is a large, direct, and unavoidable cost to the institution-whether or not it is guilty of anything, and whether or not any legal sanction is ever imposed.
(2) The whole academic hiring process is changed by outside pressures, so as to generate much more paperwork as evidence of "good faith" hiring efforts and in general to become slower, more laborious, more costly, and less certain-even where the indi!idual eventually hired is a white male, as is in fact typically the case. It is not that it costs more to hire minorities or women, but that it becomes more costly to hire anyone.
(3) Faculty decision making on hiring, pay, and promotion is increasingly being superseded by administrative determination, in response to affirmative action piessures on academic institutions. The historic informal balance of power is being shifted away from those with specific expertise in their fields to those who feel outside pressures to generate either acceptable numbers or acceptable procedures, excuses, or promises. The bitterness and demoralization generated by this undermining of traditional faculty autonomy occurs whether or not any minority or female faculty members are eventually hired.
(4) The "up-or-out" promotion and tenure policies of top research universities have meant in the past essentially a "no-fault" termination of untenured faculty members, who typically go on to have successful careers at other institutions. Now the threat of "discrimination" charges based on nothing more than statistics forces an accumulation of evidence as potential "justification"-with both financial and morale costs to individuals and instilutions.

In short, many-if not most-of the costs of affirmative action imposed by the government on academic institutions do not rep-
resent gains by minorities or women, but simply burdens and losses sustained by the whole academic community.

What is most lacking in the arguments for affirmative action programs is a detailed specification of who is expected to benefit, in what manner, with what likelihood, and at what risk of negative effects on net balance. The potential beneficiaries in the academic world might be existing minority or fen:ale academics, and the specific benefits might be financial or psychic, through working at more prestigious institutions. Of course, the possibility of financial or psychic loss should also be considered, but seldom is. perhaps future minority or female academics might be expected to receive financial or psychic benefits-or to lose in either or both respects. Or perhaps minorities and females as groups are expected to benefit financially or psychically from any increase in the numbers or standings of the members of these groups or in the academic world-and again, this prospect of the reverse has to be considered. Some have argued that minorities or female sludents benefit from sceing "role nodels" or that white male sludents benefit equally from seeing minorities or women successful in spite of slereolypes. Let us briefly examine each of these possibilities, its like!ihood, and the likelihood of the opposile.

- First, minority or female facully as potential beneficiaries. Our data show no reason to single oul these well-paid professionals as a "disadvantaged" group, either absolutely or relative to white males with the same career characteristics. But assume thal we wish to do so anyway. The data show no evidence of any' significant group-wide adrance in pay after affirmative action. What of prestige? Most black faculty apparently think so little of it as to be unwilling to leave their present jobs-overwhelmingly at black institutions-without very large financial compensation for the move. Female academics have a long history of giving a low rating to academic pre alige as a source of career satisfaction. ${ }^{\text {. In }}$ short, the benefits expected to be conferred by affirmative action have not in fact been conferred, nor is there much evidence that they were much desired by the supposed beneficiaries. Perhaps future minority and female acaderaics will be different-but they will enter an academic world where atlitudes toward them will have been shaped by present policies on minorilies and women. which means facing the resentment, doubts, and presumptions of incompetence spawned by the biller controversy surrounding this basically ineffective program.

[^28]Second, as for general image upgrading for the benefit of the group as a whole or of society, this can hardly be expected in such an atmosphere. Indeed, the emphasis on the government's conferring a benefit on minorities and women amounts almost to a moratorium on recognition of achievements by such groups, for their achievements tend to be subsumed under the notion of conferred benefits. Certainly there is no clear-cut way to separate the two in practice. How can this upgrade images or improve intergroup relations? No small part of the very real benefits of working in a top research university consists of the voluntary cooperation and mutual interest of academic colleagues. Already there have been bitter complaints by minority faculty concerning their reception by colleagues, ${ }^{\text {b }}$ indicating how little can be expected from merely shoe-horning someone into a given selting under government auspices.

What is particularly ominous is that the affirmative action pressures are occurring during a period of severe academic retrenchment under financial stress. Many thousands of wellqualified people of many descriptions were bound to have their legitimate career expectations bitterly disappointed, whether there was affirmative action or not. Affirmative action, however unsuccessful at really improving the positions of minorities and women, gives these disappointed academics and would-be academics a convenient focus or scapegoat for their frustrations.

The Economy. To what extent cari the patterns found in the academic profession be generalized to the larger society? That question can be answered only after applying a similar approach to the esonomy as a whole-that is, going beyond the global black-white or male-female comparisons to comparisons of segments carefully matched for the relevant variables. For women, such matching eliminates sex differentials among continuously employed single individuals. ${ }^{7}$ Among blacks, college-educated men had achieved starting salary equality by $1970 .{ }^{8}$ with "virtually all of the improvement in relative income" occurring "after passage of the

[^29]1964 Civil Rights Act" ${ }^{9}$ but before affirmative action quotas under Revised Order No. 4 in 1971. For black male workers as a whole. firms with government contracts showed a larger increase in the earnings of black workers relative to the earnings of whites than firms without government contracts, but this difference "accounts for only about $6 \%$ of the overall change in the relative position of black workers." ${ }^{\text {to }}$ In short, it was antidiscrimination or equal opportunity laws, not goals or quotas, that made the difference. A nother way of looking at this is that blacks achieved when given equal opportunity, and were not passive beneficiaries of conferred gains.

While only segments of minority and female populations have achieved income equality with their white male counterparts, the diffrrences between these segments and other segments of the sarr 3 populations give clues as to the causes of the remaining inequa ties. For , vample, as noted above, marital status is as crucia, a variable chiong women in general as it is among academic women in particular. Among married women, iabor force participation declites as the husband's income rises, both in the general economy and in the academic world. ${ }^{1 "}$ Children have a negative effect on work participation for women in general as well as for academic women. ${ }^{12}$ As for trends over time, there has been a generally dechining trend in the proportion of women in various high-status occupations since around 1930, coinciding with earlier marriages and the baby boom. ${ }^{13}$ but this trend began to reverse-before affirmative action. For example, the proportion of "professional and technical workers" who were female was 39.0 in 1950, 38.4 in 1960, and 39.9 in 1970. ${ }^{14}$ The proportion of "college presidents, professors and instructors" who are female was 31.9 percent in 1930, falling to a low of 24.2 percent in 1960, and rising slightly to 28.2 percent in $1970 .{ }^{15}$

Among blacks, income parity has been achieved not only by college-educated men (and slightly more than parity achieved by

[^30]college-educated black women) ${ }^{\text {nd }}$ but also by young (under thirtyfive) intact husband-wife families outside the South. ${ }^{17}$ For the latter, this parity was achieved in 1971, but this could hardly have been a result of goals and timetables formulated in December 1971 and implemented the following year. Another way of looking at the still substantial black-white income inequalities is that these inequalities exist among older blacks, blacks in the South, in "broken" families, and among the less educated. There remains a substantial agenda for further progress, but the record shows that the progress that has already occurred wac the result of antidiscrimination or equal-opportunity pressures which allowed blacks to achieve sharply rising income relative to the income of whites in a few years, after decades of stagnation in the same relative position. ${ }^{18}$ The ratio of black family income to white family income reached a peak in 1970-before affirmative actionand has decined slightly in 1971 and $1972 .{ }^{19}$ It is unnecessary to blame affirmative action for the decline. It is enough that there is no evidence that goals and timetables produced any further advance, but only cast doubt on, and caused interracial bitterness over, what blacks had already achieved themselves without quotas.

Policy. The long and virtually complete exclusion of outstanding black scholars from all of the leading universities in the-United States until the past generation ${ }^{20}$ suggests that market forces alone were not enough to open up opportunities in this nonprofit sector. Indeed, economic principles would suggest that nonprofit sectors in general are Iess likely than other sectors to reduce discrimination in response to economic forces alone "1-and this includes government, both local ${ }^{22}$ and national. ${ }^{23}$ The question is not whether there is a legitimate role for government to play in reducing discrimination, but how government should carry out its responsibilities. Affirmative action came along after a series of

[^31]antidiscrimination laws and a change of public opinion. It must be judged against that background, not against a background of uninhibited discrimination in earlier eras, as its proponents like to judge it.

The crucial issue of principle is whether the focus of governmental efforts shall be statistical categories or individual rights. :The crucial, practical issue is who shall bear the burden of proofthe government or those subject to its power?

Categories and statistics are a bottomless pit of complications and uncertainties. For example, an economics department with a job opening is not looking for an "economist," or even for a "qualified" economist; it is looking for an international trade specialist with an econometrics background or a labor economist familiar with manpower programs, et cetera. Statistics on how many "qualified" minority or female "economists" in general are "available" are meaningless. Neither minorities nor women are randomly distributed by field or within fields. Female economists, for example, are not distributed the same way as male economists among specialties. ${ }^{34}$ Even to define the relevant pools for purposes of realistic goals and timetables is impossible, even if all the statistics on the profession are at one's fingertips and completely up to date-as they never are. No department can predict in which sub-specialty its vacancies are going to occur, for that involves predicting which particular members of its own department will choose to leave-and in an era of retrenchment, vacancies have more effect on hiring than does the creation of new positions.

Statistical "laws" apply to large numbers of random events. But universities do not hire large numbers of random academic employees; dopartments each hire small numbers of specialists within their respective fields. To establish numerical goals and timetables for such small-sample tenpredictable events is to go beyond statistics to sweeping preconceptions. Nowhere can one observe the random distribution of human beings implicitly assumed by affirmative action programs. Mountains of research show that different groups of people distribute themselves in different patterns, even in voluntary activities wholly withi their control, such as choice of card games or television programs, not to mention such well-res ararched areas as voting, dating, childrearing practices, et cetera.

[^32]The Ämerican system of justice puts the burden of proof on the accuser, but this principle has been reversed in practice by agencies administering affirmative action programs. Those subject to their power must prove that failure to achieve the kinds of employment proportions preconceived by the agency is innocent in general, and in particular colleges and universities must "validate" their job criteria-even if the government administrators could never do the same for their own jobs. No proof-or even hard evidence-was necessary for the agencies to demonstrate that the academic situation involved individual discrimination rather than statistical patterns reflecting general social conditions outside the institution. Any policy which is to claim respect as a prescriptive law must put the burden of proof back on the government, where it belongs.

A change from categorical statistical presumptions to evidence on individual cases requires a knowledge of academic norms and practices going well beyond the expertise of nonacademic government officials. The lack of such knowledge by those administering "guidelines" for higher education has been a bitter complaint among academics. ${ }^{27}$ Certainly it is revealing when J. Stanley Pottinger can refer to the university "personnel officer" as hiring agent, ${ }^{26}$ when faculty hiring is in fact done by individtal departments, with the candidates having little or no contact with "university" officials before being hired. In any event, if professional judgments are to be subject to review in cases where discrimination is charged, that review requires at least equally qualified professionals as judges. Since academic disciplines have their own respective professional organizations-the American Economic Association, the American Sociological Association, et cetera-these organizations could readily supply panels of experts to review the reasonableness of the decisions made in disputed cases. If academic freedom and faculty self-governance are to be maintained, such a review must determine whether the original hiring decision fell within the reasonable range, not substitute the choice of the panel for the choice of the department.

The great problem with individual case-by-case adjudication is the backlog that can be generated-to the detriment of all and perhaps fatally so for the effectiveness of the program. There are

[^33]some countervailing factors in the case of judgments by a panel of experts. First of all, the panel can quickly dismiss frivolous claims-especially where the claim must be based on demonstrable evidence of superiority of the candidate rejected over the candidate actually hired. Second, to go before such a panel risks public confirmation of the opposite by leading scholars in one's field. Finally, the mere fact that such a program is based on professional criteria rather than nebulous presumptions must have an inhibiting effect on claims without substance.

Remedies for demonstrable discrimination must hit those responsible, not be diffused over a sprawling entity such as a large research university. A history department which discriminates against minorities or women is unlikely to be deterred by the medical school's possible loss of a government contract. But there is nothing to prevent the government from levying a stiff fine on the specific department or other academic unit that made a discriminatory hiring decision-and taking that fine out of that department's or unit's budget for salary and research, without interruption of contracts and the often vital work being produced elsewhere in the university. Indeed, such a fine is a more credible threat, for the government and the public would often lose heavily if some university contracts were cancelled. Contract cancellation is like a nuclear weapon that is too powerful to use in any but the most extreme cases and so loses much of its apparent effectiveness. Fines are a more conventional deterrent and can be invoked whenever the occasion calls for them.

Between the original concept of affirmative action and the goais and timetables actually imposed lies an ill-conceived mixture of unsupported assumptions and burdensome requirements which remain ineffective because of their indiscriminate naturetheir failure to distinguish discriminators from nondiscriminators, or to give anyone an incentive to change from one of these categories to the other. Inescapable burdens do not cause change but only bitterness. That bitterness not only has been directed againsi those administering affirmative action programs, but has inevitably affected the perception and reception of minorities and women in the academic world-and beyond.

## SELECTED 1975 PUBLICATIONS

GOVERNMENT-MANDATED PRICE INCREASES. A NEGLECTED ASPECT OF INFLATION. Murray L. Weidenbatin (112 pages, 53.00)
electoral reform and voter participation, Kevit P. Phillips and Pand H. Blackman (135 pages; 53.00)
'ARAB-AMERICAN RELATIONS IN THE PERSIAN GULF. Emile A. Nakhich ( 82 pases, S3.00)
britain at the poll.s: the parliamentary elections of 1974, cdited by Howard R, Peminuat ( 250 pages, $\mathbf{5 3 . 0 0}$ )
STATE-LOCAL FINANCES in THE LAST HALF OF THE 1970s, David $]$. Oit, Altiat F. Ott, Jantes A. Maxwell, J. Richard Arouson (105 pages, \$3.00)
U.S.SOVIET DETENTE: PAST AND FUTURE, Vladamir Petrod ( 60 pages, 53.00 )

THE PHENOMENON OF WORLDWIDE INFLATION, edited by David 1 . Mcisclman att Arthur B. Laffer (218 pages, cloth \$8.50, paper 54.00)
price controls and the natural gas shortace, Panl w. MacAvoy and Robert S. Pindyck (81 pages, 53.00 )
THE EXPECTED RETURN FROM PHARMACEUTICAL RESEARCH, Datid Schnortenam (57 pages, 53.00)
DRUG DEVELOPMENT AND MARKETING, edited by Robert B. Helms ( 300 pages, cloth 59.00, paper 54.00 )
WORLD FOOD PROBLEMS AND PROSPECTS, D. Galc lohnson (83 pages, 53.00)

THE 1976 BUDGET. SHORT-RUN STABILIZATION POLICY AND THE LONGRUN BUDGET OUTLOOK, David J. Ott atd Attiat F. Ott ( 38 pages, $\$ 250$ )
INDUSTRIAL CONCENTRATION AND INFLATION. Stiven Lastgarten ( 55 pages, 53.00 )
CORRECTING TAXES FOR INFLATION, W'illimn Fellner, Kenneth IV, Clarkson and John H. Moore (47 pages, $\mathbf{5 2 . 5 0}$ )
NuCLEAR THREAT in the middLe EASt, Robert J. Pranger and Dale R. Talutinen ( 57 pages, 53.00 )
POLITICAL ELITES IN THE MIDDLE EAST, edited by George Lenczowski ( 227 pages, cloth \$9.50, paper \$3.50)
REDISTRIBUTiON AND THE IVFLFARE SYSTEMi, Edgar K. Browning (131 pages, 53.00)
reGulation and druc derelopment willam M. Wardell and lonis Lasagna (181 pages, 53.50)
THE NORTHEAST RAILROAD PROBLEM, George W'. Hilton (50 pages, S3.00)
france at the polls. the presidential. election of 1974, edited by Howard R. Pemiman (324 pages, 54.50)
THE fEDERAL ANTITRUST LAWS, 'fhird Revised Edition, edited by Jerrold $G$ Van Cise (88 pages, 53.00)
SIGNIFICANT DECISIONS OF THE SUPREME COURT, 1973-74 Term, Bruce E Fcin (148 pages, 53.00 )
A DISCUSSION WITH FRIEDRICH VON HAYEK ( 20 pages, 51.00 )
public policy and the dental care market, alex R. Mares ( 73 pages, 53.00 )
veterans administration hosritals, Cotom M. Lemisay (ss pases, S3.00)
regulation of automobile safety, San Pelizman (5.3 pages, 53.00 )
