ABSTRACT

Intended for persons working with handicapped and
gifted students, the publication presents reviews, by professionals
in their respective areas, of 56 books on various topics related to
special education. Covered are such conditions of exceptionality as
intellectually gifted, behavior problems, learning disabilities,
auditory and visual disorders, mental retardation, social and
cultural disadvantage, autism, developmental disabilities,
emotional disturbance, speech disorders, and dyslexia. Several areas
of interest are included, such as open classrooms, behavior
modification, childhood psychosis, adolescent psychiatry, counseling,
sex education, early childhood education, parent training, school
intervention, and music therapy. (IM)

CONTENTS

Preface 1
The ABC's of the Open Classroom, by Lesley P. Gingell 3
Abnormal Children and Youth: Therapy and Research, by Anthony Davids 5
Adolescent Psychiatry: Vol. II, Developmental and Clinical Studies, by Sherman C. Feinstein, Peter Giovacchini 8
The Annual of Psychoanalysis, Volume I, by the Editorial Committee, Chicago Institute for Psychoanalysis 12
Articulation Therapy Through Play: A Multisensory Approach, by W. Formaad 15
Auditory Perceptual Disorders: An Introduction, by David F. Barr 18
Behavior Change—Methodology, Concepts and Practice, by Leo A. Hamerlynck, Lee C. Handy, and Eric J. Mash 20
Behavior Pathology of Childhood and Adolescence, by Sidney L. Copel 24
Behaviour Problems in School: A Source Book of Readings, by Phillip Williams 27
Being Different: The Autobiography of Jane Fry, by Robert Bogdan 29
Beyond the Best Interests of the Child, by Joseph Goldstein, Anna Freud, and Albert J. Solnit 31
Child Rorschach Responses: Developmental Trends from 2 to 10 years, by L. B. Ames, R. W. Metraux, J. L. Rodell, and R. N. Walker 34
Child Studies Through Fantasy, by Rosalind Gould 38
Childhood Psychosis: Initial Studies and New Insights, by Leopold Kanner 40
The Children We See: An Observational Approach to Child Study, by Betty Rowen 44
Children With Learning Problems: Reading in a Developmental Interaction Approach, Selma G. Sapir, Ann C. Nitzburg 46
Cultural Diversity and the Exceptional Child, by L. A. Bransford, L. Baca, and K. Lane 49
Evaluation of Behavioral Programs in Community, Residential, and School Settings, by P. O. Davidson, F. W. Clark, and L. A. Hamerlynck 53
Experimental Psychology of Mental Retardation, by Donald K. Routh 57
The First Review of Special Education, by Lester Mann and David A. Sabatino 59

Preface

Myth has the swan sing just prior to its demise. Well, this is written as I depart as book review editor of Exceptional Children and those who've heard me know that I can't sing very well (but I hum beautifully). So here it is: a last hum!

I reread my foreword to the 1973 volume of Selected Media Reviews, and must confess that the stuff sounds very weighty indeed. However, although we tried hard to be serious, fair, and--above all--honest, much of this work for me (and I suspect for most of our contributors) was sheer pleasure. Reading books, talking about them, and writing on them are lovely ways to engage one's time. Further, being responsible for putting reviews together is fun and satisfaction, and can give one the sense of mild creation.

But reviewing books has a completely sober and socially significant aspect. If "the medium is the message" was a popular slogan of the 1960's, it is no less relevant to say that the medium is the mass age of the 1970's. Knowledge is said to double in many areas every few years, and one tends to think that books on such knowledge far exceed the first geometric increase.

Special education is no exception. It is with the intention of helping people who work with the handicapped and gifted to cope with such an array of published works, that we have compiled these reviews.

Written by professionals in their respective areas, the reviews range in content from articulation theory to sexual identity crises, from token economy to Rorschach responses. Although the true writer doesn't need critics or others to judge him and his works--he does it himself--the forthrightness of the reviewers comments together with thoughtful
summary cannot help but stimulate the reader's thoughts on the subject. And thinking—as well as helping—is what we really are about as educators.

Finally, to all of you who worked with me and contributed to these Media Reviews, to all who wrote the books for us to review, and to all who read the reviews—and the books—thank you very sincerely.

Burton Blatt, Centennial Professor and Director, Division of Special Education and Rehabilitation, Syracuse University, Syracuse, New York
According to the author, the purpose of this book is to attempt to "aid those fellow teachers who . . . wish to open up their classrooms a bit more . . . or even a whole lot" (p. 12). Toward that end, Gingell (a teacher herself) has given us a very personal account of her considerable experience in the British primary schools.

The book is divided into 15 chapters many of which focus on a single curriculum area such as language, environmental studies, discovery (science), math, art and crafts, music, and movement. Each subject is discussed in terms of purpose, methods, descriptions of specific projects, and the author's personal experience. Many of the chapters contain extensive examples of children's work, copies of teacher prepared materials, and photographs of groups of children engrossed in projects at school, performing in plays, or exploring community settings.

Immediately preceding the curriculum chapters are sections titled "The Child" (the author's view on children's needs and teachers' responsibilities to children), "The Teacher" (a discussion of teacher training in England), "The Place of the Individual in the Classroom and the School" and "Methods of Teaching Children in a Classroom Situation." This last chapter is really a general introduction to the content areas to come while the "Place of the Individual . . ." is a rather awkward combination of the intricacies, details, policies, guidelines, awards and honors, and the like, that constitute the English primary school system.

The real strength of this book is its personal quality. The author states her position in the introduction: "One thing of which I am quite sure is that there is no one way of teaching or learning" (p. ix). She confirms that position throughout the
book by describing for her readers a variety of experiences that represent innumerable ways of teaching and learning effectively and pleasantly. For example, Gingell sees the open classroom as a series of human relationships, not a particular structural configuration; such concern for human growth and development permeates her book.

The weaknesses of this book may be found in what the author has not included. In comparison to the number of examples and amount of description, the brief focus on issues in open education seems almost nonexistent. For example, the only mention of problems in this book occurs in a one page discussion of discipline that makes classroom organization and cooperation seem much easier than it really is. The last chapter, "Some Final Reflections," is not quite two pages and left me wishing it were much longer and more complete. Even the first chapter, a fascinating description of the author's experience in an American school, seems much too brief and not nearly as comprehensive as it might have been.

As it stands, however, The ABC’s of the Open Classroom is a useful and personal description of one teacher's efforts toward open education; it ought to be helpful to other teachers with similar interests.

Reviewed by: Steven J. Apter, Division of Special Education, Syracuse University, Syracuse, New York.
Although the attempt to unite educators and psychologists in the common cause of exceptional children has been made repeatedly, the fruit of these efforts has been elusive. Teachers suspect the visiting clinician, while clinicians, in haste or in lack of appreciation of the school environment, frequently fail to communicate their findings effectively. Thus, an endeavor to bridge the gap between the two is welcome, particularly in a time of renewed efforts to integrate exceptional children into regular classes.

This volume offers educators an understanding of the process of psychopathological development, from both a preventive and a developmental point of view. By acquainting teachers with the role of ego functions in the learning of intellectual material, the author seeks to open the design of curricula and methods of teaching emotionally disturbed children to the contributions of the psychologist.

The psychologist author employs studies of children in a psychiatric hospital, a halfway house, and a summer remedial program for underachievers undertaken at Brown University. Various forms of treatment are used, ranging from intensive long term therapy to behavior modification programs. In each case, considerable discussion is devoted to the linkage of treatment and research, a component frequently missing from entries in research journals. The author articulates this relationship in two ways: he describes the progression from the statement of the question, through planning and implementation, to follow up; he also evaluates critically the effectiveness of the research efforts in determining the success of intervention strategy.

In recording the evolution of five projects of child assistance, Davids concerns
himself with the working relationship between therapeutic or educational practice and research considerations. Each investigation is introduced with a comprehensive review of relevant literature in the field of emotional disturbance and ego development. The use of individual case studies serves to illustrate subtleties which underlie the more formal group studies, and the reader thus acquires a dynamic view of factors which might otherwise be seen as one dimensional.

Although the strengths of this volume are more salient than its failings, the latter tend to impede the author's objective of informing educators about psychological factors which impinge upon the learning process. It is not that the author does not relate his clinical findings to the broader issues of education; rather, it is that his assumptions and the language he speaks as a psychologist prevent the educator from entering into the thought processes he employs to arrive at his conclusions.

To work closely with one another, as Davids invites educators and psychologists to do, one needs to know both what the other selects as significant information and how he or she processes it in order to draw conclusions. Collaboration with a member of another profession which does not include this data is destined to some degree of failure. The mystery and threat of the other person remains; the individual can never be sure whether the other's decision making process is due to his style as a person or his professional right to a storehouse of technical and privileged information.

That this book is not entirely successful in issuing an invitation to educators to collaborate with psychologists is to be expected. Traditions built by two professions working separately in what is essentially a common cause will die slowly. If members of each profession heed this invitation, however, the basis will be laid for new and possibly more productive forms of collaboration.
Fifteen years ago the American Handbook of Psychiatry devoted 22 pages to the "Psychiatric Problems of Adolescence." In the ensuing decade the activities of many American youth were seen by their elders as a threat to the existing political, legal, economic, and social structures and to the cultural foundations of American life. As 'an increasing number of young people rejected the established values and norms of society, there was a corresponding increase in the number of young people who sought help in mental health facilities. The result has been expanding role for the mental health profession in the lives of American youth.
viewpoint is primarily clinical, and whatever we learn from areas that go beyond the clinical has to be assessed in terms of how it helps us deal with patients" (p. XIII).

Forty-one writers contribute to 27 chapters arranged under the following titles: "General Considerations," "Sexuality in Adolescence," "Psychopathological Aspects of Drug Abuse and Addiction," and "The
chats, and the last chapter, "Adolescence in Israel" often reads like a release from a travel agency.

The reader should not anticipate that the present volume is a comprehensive textbook of adolescent psychiatry. Almost without exception the contributors, most of whom are practitioners and teachers, speak of the psychiatric problems of adolescence in the language of practical adolescent psychiatry. Development means biological, psychological, and social-emotional growth and maturation.

chapters of Adolescent Psychiatry: Vol. II which will be of interest to any professional who wishes to understand more about adolescents and their remarkable difficulties in the modern era. This book, which ties theories to case studies, also reveals a good deal about the ideas and practices of the psychiatrists and psychoanalysts who endeavor...
The Annual of Psychoanalysis. Volume I.
illogical and the nature of the emotional ties of these patients to their therapists (the analysis of transference). The relationship of such studies to the teaching-and-child therapy situation is, of course, theoretical or derivative.

However, several of the 23 authors have written on topics of interest to educators and psychologists. Finchley's key to Symbolism and Mental Representation discusses the functioning processes of the mental apparatus in dealing with signs, symbols, and this description can be viewed as a single paper in Psychoanalytic theory. That this statement may sound vacuous is at the heart of the late psychoanalyst's efforts to make learning within the analytic framework understandable and translatable into a coherent and consistent method.
administration, and prescriptions of treatment. In its consistently serious effort to balance classical psychoanalytic viewpoints with modern approaches, it epitomizes the struggles within psychoanalysis itself. The indexing is adequate, and it would be useful as a resource volume in the library of a training center. Note: although it is an annual many of the papers date back to or 15 years.

In this book, the author presents a method for using planned play activities for articulation, stimulation, discrimination, and improvement with kindergarten and primary grade children. The method is based on the assumption that children learn best when they are active participants in their own learning process. Through play, children are encouraged to explore and develop their speech and language skills in a natural and enjoyable way. The book includes a variety of games, songs, and activities that are specifically designed to target various aspects of articulation and language development. It is an invaluable resource for speech therapists, teachers, and parents who are seeking creative and engaging ways to enhance children's speech and language abilities.
because of the play oriented nature of Formaad's method, such stages are given a somewhat different perspective. This perspective provides a context in which the speech and language clinician may assess the usefulness or feasibility of a play model in relation to speech articulation therapy.

The book has certain weaknesses. One concerns Formaad's development of the play model in relation to clinical speech and language therapy. Formaad's emphasis on play stages and the introduction of a play stage notation system in the early chapters, for example, is not entirely clear or consistent. It is hoped that further clarification and development will be forthcoming.
necessary at these points, is more properly the responsibility of the author.

A final weakness relates to the author’s frequent suggestion that the speech clinician slightly separate and exaggerate the “sound for the day” from the rest of the word containing that sound. This procedure, as Formaad suggests, may aid the child in sound identification; however, when exposed to such a model, the small child may attempt to match the speech sound by exaggeration and separation. Any speech may attempt to match the speech sound by exaggeration and separation. Any speech

The procedure is to match the speech sound by exaggeration and separation. Any speech
Auditory Perceptual Disorders: An Introduction.

The stated purpose of this book is to present an introduction to theories and practice in auditory perceptual disorders. The intended readership includes...
In attempting to be concise, the author sometimes does not clearly differentiate theories, hypotheses, and speculation from established facts. For example, it is stated as fact rather than as speculation that "...breathing lead laden air from automobile emissions has added dramatically to the number of perceptually handicapped children." Birth order and family size are stated to be of great importance in language development although this is currently the subject of much debate.

Special educators utilize behavioral modification as an applied technique for...
of a tutorial strategy in the home stressing behavioral management by parents with predealing youth, with a primary objective of avoiding institutionalization. A very interesting discussion concerns the importance of behavioral skills and controls vs. academic skills; its result is a documented report that both are necessary, and it carries a warning to the behavioral modifier that to ignore the necessity of academic achievement skills is a dangerous proposition.

The third section contains a frank discussion of the application of behavioral modifications with delinquent youth in a group home. The cost benefit factors and projected behavioral goal obtainments rate suggest that this type of program may be one of ultra high yield. Broader application of behavioral principles in unrestricted social milieu, e.g. families, is an apparent general theme.

This book is an excellent review of the research related issues in behavioral modification. It would be an outstanding central point volume for use in a graduate seminar, or as a supplemental update of current issues in a second graduate course on the application of behavioral modification. I found it an exciting and scholarly approach to some very old but confusing issues. I would recommend this text highly to any doctoral student about to embark on a dissertation in behavioral modification, or any serious practitioner, or any trainer of practitioners. Try it, you'll like it!

Reviewed by: David Sabatino, Department of Special Education, Northern Illinois University, DeKalb, Illinois.
Paperback

There is a growing awareness that regular and special educators alike are beginning to look for brief, clear books which are directed at amplifying a single concept into usefulness. Poteet's Behavioral Modification is just such a slimline pocketbook.

It contains 93 very easy to read self instructional pages, filled with diagrams, "how to do it," and illustrative examples. It intermingles concepts, terms, concrete examples, and a review of research in a balance that encourages a beginner's reading, although it would be totally inappropriate for any teacher who has had a basic course in behavior modification. Poteet makes no pretense of talking to his peers, but doesn't talk down to his designated audience. Rather, he attempts a question and answer dialogue.

It is apparent, however, that Poteet is talking to experienced teachers, so I seriously doubt that the text is useful in preservice training. There are a dozen or so texts better suited to preservice audiences. It is excellent, on the other hand, for in-service teacher audiences, both for special educators who have not received specific preparation in behavior modification and for regular educators seeking to learn more about pupil management. It is ideal as a working collection for a special education resource teacher or for a school psychologist who is constantly asked for more detail or specific examples in behavior modification.

Criticisms: I find only three faults with this material. First, there is a gross injustice done to diagnostic-prescriptive teaching, treated in less than seven pages, in
an unclear style which seems irrelevant to the rest of the book. Second, there is only a one page discussion of modeling, and nothing on performance contracts. Third, I believe greater attention should have been given to the evaluation of behavioral management techniques. Each time the author brings the subject up (supposedly devoting all of Chapter V to it), he quickly glosses over it and goes on to something else.

On balance, however, the book is a good response to a new audience -- the teaching practitioner -- and for that target audience, it is well done.

Reviewed by: David Sabatino, Department of Special Education, Northern Illinois University, DeKalb, Illinois.
I love nostalgia. When I recently saw a film clip of Esther Williams performing a 2 1/2 tucked somersault dive into a glorious pool of flames and flowers, I said, "Now, that's entertainment!" I had the same feeling of nostalgia after reading Behavior Pathology of Childhood and Adolescence. For many of us who were raised and quizzed on psychoanalytic theory, thinking, and techniques, it was refreshing to turn away from the present mechanistic and gushy humanistic theories of behavior. This book, by contrast, is like experiencing a class reunion in celebration of old time orthodox Freudian psychology. Words and phrases such as "derivatives of unconscious conflicts," "primary process," "mental infringement on semantic integrity," "intrapsychic impulses," "phallic oedipal behavioral disturbances," "sublimation of erotic wishes," "narcissistic fixation," and best of all "parentectomy" roll off the page with the precision and ease of sounds from a player piano.

If you have to turn to a medical dictionary or your local psychiatrist to understand this rhetoric, then it is time for you to expand your world. This book is your chance to enter the excitement and mysticism of the unconscious forces motivating everyday behavior. I guarantee you will not be converted, but you will leave a bit more confused and perhaps questioning of your objective views of learning, love, and life.

The tone of the book is set by Copel who indicates without embarrassment that psychoanalysis is not a cure for the social ills of our society. Psychoanalysis is a comprehensive theory pinpointing inner psychological experiences of supreme and unconscious forces as the main determinants of behavior. The mind is a dynamic complexity of psychological processes which defies any simplistic explanation. One's

30
character is the constant selective interweaving of constitutional factors that both mold and are molded by psychosexual development. Enough of theory.

The book comprises 20 chapters written primarily by psychiatrists and including such topics as disturbances in development and childhood neurosis, drug addiction, suicide in children and adolescents, physically handicapped children, milieu therapy, and theoretical considerations of child psychotherapy. The majority of references are nestled in the 50's and early 60's, and thus give the chapters a solid historical perspective.

The most useful chapter and the one which educators need to know more about is "The Displaced Child: Problems of Adopted Child, Single-Parent Child, and Stepchild." Written by Luce, the chapter highlights the dynamic forces operating in these parent child relationships. Additionally, it provides enough excellent examples so that the reader may better understand what some of his exceptional pupils may bring into the classroom on Monday morning.

The book can best be used as resource text at the graduate level of training. Most important, it represents a fundamental theory of viewing the personality development of children. Although I happen to believe in this theory, I am concerned by the way it is here translated into educational strategies by clinicians. The purists are unable to recognize the importance of other significant variables operating in the classroom. Stennis' chapter, "Child Psychiatry in the School," for example, reflects this narrow view; his strategies are about as innovative and useful as a covered bridge in New England. While there is light at the end of the tunnel, it is still a constricted view. To make this approach viable, one must turn to the psychoeducational concepts for educational application.
The readings in this book deal with many facets of children's school-related behavior problems. The sections of the book are organized in a logical progression, beginning with an overview of the nature of these problems, proceeding to the identification and causes of maladjusted behavior, and ending with a series of papers on the various methods of treatment that may be employed. Each section contains a concise introduction by the editor, and four or five papers pertaining to the theme of the section.

The strength of this book seems to be in its attention to some of the traditional issues that have been raised by clinicians who work with children having difficulty in school. The papers are concerned with issues such as (a) definitions of maladjustment, (b) differential perceptions of children's behavior by various reference groups, (c) isolation of significant etiological factors, (d) treatment intervention modalities and (e) research methodology related to the understanding and treatment of behavior problems. Because the book does not deal intensively with any single aspect of this problem, and contains many relatively old readings, it appears that the book would be most suitable as a supplementary text for students in education courses, or as a background reference for researchers. The book is valuable as an historical overview but not as a source of innovative practical ideas for those who are knowledgeable in this field. One particularly interesting feature of this book is in its reporting of work done in British and American settings.
The major shortcoming of the book, from this reviewer's vantage point, is the relatively inadequate attention given to approaches that focus on modifying the school environment, in proportion to the concentration on changing the child's behavior. On page 130, Burt and Howard state that over a 20 year period they found that a "...complete and apparently permanent disappearance of every overt sign of maladjustment" occurred in greater than 65% of those cases in which a change of class or school was the only intervention utilized. Yet, with the exception of two articles on behavior modification in the classroom, there is no material that deals with changing the environmental conditions that foster maladjustment. With the increasing emphasis on training teachers to be more sensitive and effective in interpersonal relations, revising curriculum to reflect the social, emotional, cultural, and intellectual needs of children, and restructuring the school setting to promote more positive development for all children, it would seem appropriate to include readings directed at these issues and concerns. Otherwise, we are left with the same paradox that has plagued educators and clinicians for years: Our theories of development and pathology emphasize environmental influence, while our methods of intervention focus on changing the individual, without dealing with the environmental conditions that we have postulated as being so significant.

 Reviewed by: Robert Cohen, Director, Institute for Community Development, Syracuse, New York
Hardcover.

This biographical account of "Jane Fry" which has been collected, compiled, and edited by Bogdan is a unique document; it should be read by anyone interested in deviance and society's responses to it. Sandwiched between an introduction intended to establish the legitimacy of using first person narratives as data in the social sciences and a concluding section designed to "debunk" the traditional conceptions of mental illness, is the "meat" of this book. It is the narrative of a high school dropout, Navy veteran, former resident of five psychiatric facilities, exhusband and father, who, although she possesses the organs of a man, dresses, lives as, and feels like, a woman.

Based upon tape recorded interviews, the story of Jane Fry is recounted with great sensitivity and poignancy; it is replete with the frustrations and humiliations encountered by those who defy mainstream social values and dare to be different. Of particular interest to Bogdan (and to this reviewer) are Fry's encounters with those high priests of the middle class -- the mental health professionals -- and her descriptions of life in their institutions. Fry's keen intelligence and articulateness make her narrative a valuable addition to the literature which repudiates psychiatric diagnosis and treatment. Moreover, it lends a personal dimension to such repudiation.

But herein lies this book's major weakness. Since personal documents are not the stuff of which convincing arguments are made (arguments that might persuade or at least trouble the proponents of "mental illness") then Jane Fry's story might be turned around by a reader who believes in existence of mental disorders to support
his theories by pointing to the "sick" life-style and Fry's "paranoid" attitude toward psychiatric practices. Thus, unless the reader of this book is already aware of the social and political aspects of the labeling process, the impact of this narrative may be lost.

Although Bogdan proposes that the purpose of this sociological autobiography is to provide "a better understanding of society, its institutions, and those who pass through them," it may fall short of its mark. Readers must first be sensitized to the issues surrounding the "mental illness" controversy. This book, therefore, would be a fine supplement to the works of Goffman, Szasz, and the Braginskys, among others. Nonetheless, this highly readable portrait reminds us that the life history of a person is far more than a clinical case history and that, as Sarason points out in his foreword:

"Hopefully, through Dr. Bogdan's efforts, we will see the life-history accorded its rightful place as a productive social science technique" (p. viii).

Beyond the Best Interests of the Child.

Three distinguished authors have combined their understandings of law and developmental psychology to discuss current legal practice regarding contested child placements, and in proposals for constructive change. The result is a small, pithy, and provocative.

The authors contend that most decisions in cases of contested child placements, defined as "all legislative; judicial, and executive decisions generally or specifically concerned with establishing, administering, or rearranging parent child relationships" (p. 5), give priority to adult needs and rights over child needs and rights. They point out that although decision makers may give priority to children's physical needs (as in cases of illness or abuse), they seldom attend to their emotional needs. Indeed, strong psychological bonds between children and those who have nurtured them over considerable periods of time—their psychological parents, if not their biological parents—are often disturbed or destroyed. In justifying such disruption, decision makers frequently assert that their decisions will serve "best interests of the child in the long run." The authors point out that this assumes an ability to predict certainly the most desirable of long range alternative futures for the child, and question whether this ability resides in the courts or in any other placement agencies.

The authors make no secret of their conviction that priority must be assigned to the child's needs for "continuity of relationships, surroundings, and environments" (p. 31) while guidelines are developed to effect change in the present situation. They postulate that courts and other agents of the state should intrude but minimally.
into human relationships such as those between children and their psychological parents, and that child's present relationship with a psychological parent should not be disrupted in the name of the more abstract "rights" of a biological parent or relative.

As a more appropriate guiding concept for placements, the authors suggest the choice of that alternative which is least detrimental to the growth and development of the individual child. "The least detrimental alternative... is that specific placement and procedure for placement which maximizes, in accord with the child's sense of time and on the basis of short-term predictions given the limitations of knowledge, his or her opportunity for being wanted and for maintaining on a continuous basis a relationship with at least one adult who is or will become his psychological parent" (p. 53). Note here the stress on children's needs and understanding of their life situation. The authors illustrate these principles in the text through application to several judicial decisions, with attention to supporting precedent, and in a draft of a model child placement statute.

Given the current legislative and judicial activity seeking to promote the best interests of exceptional children by designing optimal environments for them, special educators will find themselves challenged to consider the application of a "least detrimental alternative" principle to cases where rights to education and "least restrictive placement" are also at issue. How can the possible benefits of moving an exceptional child to a less restrictive alternative placement be balanced against the possible disruption of the child's sense of continuity of relationships, surroundings, and environments? Given the limitations of human prediction, in what placement will the child have best chance of being not only accepted but wanted? What placement will provide the greatest positive emotional value for
the child and for the adults among whom he lives?

Freud's generalizations from her work with displaced children in wartime England have undoubtedly been reinforced by more recent research on attachment and separation among humans. She and her co-authors challenge with clarity and force those among us who assume too easily that our manipulations of the psychological environments of children are inevitably constructive. At the same time, they offer general principles to guide us to the "least detrimental" choice when decisions must be made about children's presents and futures.

When *Child Rorschach Responses* was originally published in 1952, it was part of a clinical world that relied heavily on the Rorschach test but had become aware of the lack of adequate normative data, especially for use of the test with children. The book, along with several others, emerged from the Gesell Institute of Child Development in New Haven, Connecticut and reflected Gesell's emphasis on maturation as a prime mover of development. Children were viewed as moving from predictable stage to stage as internal factors unfolded according to a preset scheme and timetable.

*Child Rorschach Responses*, in both old and new editions, comprises a detailed description of Rorschach responses of 650 "normal" children between the ages of 2 and 10, with detailed descriptions and discussions of this data. Part One of the revised edition includes a careful description of the sample and of the scoring method and criteria, and a discussion of children's responses at each half-year- (between 2 and 6), or year- (between 6 and 10) level reflected in the major scoring dimensions: area of the blot used, determinants, and content. The second part of the book (the bulk of it) is made up of sample records from each age group, summary scores from that group, and a discussion of the characteristics of children of that age based on interpretations of their Rorschach responses. The last part of the book includes some data and discussion concerning longitudinal Rorschach responses (to contrast with the cross-sectional material elicited from the main sample); some comparisons of the main sample's scores with scores from children of other samples, with the emphasis on socioeconomic status differences and their reflection in Rorschach scores; and a discussion of the use of the Rorschach to predict the later development of level of...
adaptation and of reading ability.

The major changes in the revised edition include the presentation of data from samples with variations in socioeconomic status, the longitudinal data on the rate of certain factors, and more accurate dating, providing a clearer picture of the development of individual skills and abilities.
personalities at different ages. That is, the assumption was that the regularities in
development which appeared in the responses studied were reflective of intrinsic
regularities of childhood as opposed to possibly a reflection of the respondents' and
situation factors. This is especially true for groups of children to whom later
experiences influence their responses.
Child Studies Through Fantasy.

This impressive book gives new insight into the fantasy behavior of children.

It could be a systematic study of expressed spontaneous fantasy of subjects in their second, third, fourth, or even fifth year. These children were observed in their classrooms and recorded by trained observers. The results indicate that the spontaneous fantasy content of the fantasy stories is more derived from life experiences of the individual and less characteristic of the group. This may be due, in part, to the more active role of the individual in the construction of the stories.

The authors conclude that fantasy, if read and discussed in the classroom, can provide guidance in the development of the child's imagination and creativity.

The emphasis on the original fantasy stories is a significant feature of the book, as it allows for a more individualized approach to the study of fantasy and its influence on the child.

Overall, this is a valuable contribution to the field of child studies and a must-read for educators and researchers interested in the development of children's fantasy.
experiences a child has dealing with need, fulfillment, denial and modes of defense.

Child Studies Through Fantasy is a sequential study of the basis of moral development. When considering moral development, Dr. Gould defines superego, conscience and relates the concept to the process by which fantasy formulations in the child's actual encounters with the world are evaluated in such fulfilling acting. He goes on to explain things about the causes and effects of moral development. Are sexual roles culturally determined? Are they biologically determined? What causes the boy to steal?
Childhood Psychosis: Initial Studies and New Insights
$10.95 Hardcover.

The paper is written in a clear, logical manner. It covers a wide range of topics related to childhood psychosis, from its historical background to recent developments in the field. The author provides a comprehensive overview of the subject, backed by a wealth of research and evidence. This book is an essential read for anyone interested in the field of childhood Psychiatry.
In "Notes on the Follow-Up Studies of Autistic Children" Kanner says, "In summary, the life histories of 42 autistic children at an average age of 14 years
and the strongest conclusion Kanner presents from this material is that, "only a few
have failed to demonstrate visible progress" (p. 209).
work give the reader a sense of the complexities of understanding any human behavior. Although frustrating, this is ultimately more productive for the children involved and for those of us who are attempting to work with such children.
The Children We See: An Observational Approach to Child Study
Hardcover.
In the concluding section, Rowen applies observational and child development data to the problems of children. By means of the case study approach she discusses...
It must be noted that the book is subtitled Readings in a Developmental-Interaction Approach. All the major theories of development are not represented, but the theorists included in Part I all support an interactional view of development. Like the editors, these authors prefer to deal with the whole child rather than any one isolated aspect of development.
Given the role of the developmental-interaction approach as the unifying theme for this book, this reviewer wonders why a detailed account of the viewpoint is not given until page 982 of the slightly more than 700 pages in the book. The editors have provided an overview for each of the six parts of the book and have attempted to place the conclusions against the backdrop of the developmental interaction approach. However, the central purpose of the book might have been better served if the Shapiro and Biber sections had been incorporated into the others and given at the beginning of the book.
Cultural Diversity and the Exceptional Child. 

The purpose of this short paperback is to report the proceedings of an institute and conference held in Las Vegas in August 1973. The goal of the meeting was "to provide a constructive contribution to the quality of their [the culturally and/or linguistically different minority group children] education through the combined efforts of minority educators" (p. IV). It is assumed, therefore, that the goal of these proceedings is the same: i.e., to sensitize professionals to the problems of culturally and linguistically different children.

The book is divided into five sections. Section I is a paper by Gustavo Gonzalez, "Language, Culture, and Exceptional Children." This section sets the tone for the rest of the book by highlighting various aspects of language development, sociolinguistic, psycholinguistic, the linguistic aspects of tests, the anglocentricity of IQ tests, the role of language in community acceptance of children, and the influence of linguistic and social stereotypes on the identification of the minority gifted. Most of what Gonzalez says in this section is repeated in various forms for different target groups in later sections of the book.

Section II, "Highlights of the Institute on Language and Culture," presents summaries of the individual language sessions of each of the four components -- Asian by Imane, Black by Smallwood and Taylor, Indian by Kito and Lowe, and Spanish-speaking by Aragon and Marques. The Asian summary focuses on sociological and psychological differences within Asian cultures; the Black summary focuses on Black English and different views of it; the Indian summary focuses on the interface between
language and culture; the Spanish-speaking summary focuses on how the Spanish
language itself reflects cultural differences.

Section III is a single paper by Juan Aragon, "Cultural Conflict and Cultural
Diversity in Education." After presenting five criteria for culture, Aragon proceeds
to demonstrate how American education -- teachers, syllabi, textbooks, and the like --
 unwittingly or unwittingly diminishes minority cultures.

Section IV, "Ethnic Perspective on Cultural Diversity," is a collection of six
papers. Taylor presents an historical review of European attitudes toward the Black
man, the impact of "talking movies," the cultural deprivation era, the emerging new
era of cultural pluralism, and a discussion of test bias.

Sierra discusses the "Learning Style of the Mexican-American." She shows how
the Mexican-American's absorption in the task at hand, reluctance to compete academ-
ically (having been reinforced for achievement through cooperation), strong family
ties, and story-telling tradition have implications for techniques for instruction and
for interesting children in school tasks.

Sata discusses Asian cultures. He emphasizes some differences among them and
certain commonalities which lead to Asian American children being perceived as model
students but still lead to conflicts with the dominant culture. He points out that these
all lead to the promotion of rote learning, avoidance behavior in Asian children, and
loss of their creative abilities.

Sando points out aspects of American education which alienate Indian children.
He discusses three sources of conflict: time orientation, conforming to nature, and
social withdrawal, as well as differences in learning style.

Chinn discusses the Asian American's search for identity, relying heavily on
Japanese and Chinese studies. He identifies three main personality patterns: the traditionalist, the "marginal man," and the "Asian American," and describes how each may lead to conflict with the dominant culture.

Rios draws a dismal picture of the education of the Puerto Rican in New York City.

Section V presents the findings of the preliminary evaluation of the institute and recommendations therefrom. The Appendix contains the evaluative questionnaires and a complete list of papers presented at the Conference.

In summary, the book achieves its goal of sensitizing readers to the possible sources of the conflict which minority group children may experience with schools. Most of the papers are excellent in this regard, but one wishes that there were a more liberal use of examples to illustrate many of the points. The reader will also note a great deal of repetition among the papers, especially between the institute summaries and the papers in Section IV. Since the papers concentrated on describing points of possible conflict and sources of problems for children rather than on solutions to those problems, they tended to deal with generalizations and not with specifics. Therefore those who are conversant with the literature which deals with a specific minority will be disappointed in those parts dealing with that minority; yet they may find seemingly more useful information relative to the others. Indeed, the Introduction leads one to expect an intensive discussion of language vis a vis each minority group. This is only partially achieved.

It was of some interest to this reviewer that every minority group pointed to the ill treatment of that group in our history texts and classes as a major source of alienation and as a prime example of American education's diminution of cultures.
different from the dominant. Obviously social studies educators would benefit from reading and studying this book.

One could criticize the book on the grounds that seldom is reference made to exceptional children. Yet it is evident that before the minority exceptional can be treated as a separate area of study the education of the minorities in this country must be improved.

This book just scratches the surface of cultural diversity and schooling. It should be useful for introductory reading for all teachers but must be supplemented by lectures and other reading. Used in conjunction with books like Hickerson's *Education for Alienation* and Hunter's *Multi-cultural Education through Competency-Based Teacher Education*, this book will have maximum impact. Used alone, its impact may be negligible. Indeed, one hopes other conferences and other volumes will follow to put flesh on the bare bones here presented.

Reviewed by: Oliver L. Hurley, Division for Exceptional Children, University of Georgia, Athens, Georgia.
There is an urgent need for innovative and scientific approaches to the problems of program evaluation in the broad field of human services; of equal importance is the dissemination of new methodologies to consumers as efficiently and rapidly as possible. The present volume fulfills both of these needs in an admirable fashion.

The fifth in a continuing series of publications sponsored by the Banff (Alberta, Canada) International Conferences on Behavior Modification, the book has as its central theme program evaluation in community, residential, and school settings. It is primarily intended for use as a text on program evaluation in colleges and universities and as a primary reference for program managers in human service settings. Teachers and specialists in the field of instructional design and development would also gain much useful information from the numerous concepts and examples presented.

The book consists of fifteen chapters written by authorities in the areas of education, economics, social welfare, psychology, and psychiatry. The diversity of content provides the reader with a variety of evaluation strategies demonstrated across a broad range of behavioral programs. Examples include design and analysis problems in program evaluation, considerations in the implementation of program evaluation, behavioral measurement in community mental health centers, and evaluation of programs for juvenile offenders and the aged.

There are three chapters of particular significance to workers in the areas of special education and rehabilitation. The first is Neenan's discussion of the benefit-cost analysis procedure. Neenan describes the technique and reviews its use in the
evaluation of mental retardation programs in relation to Conley's comprehensive economic analysis of such programs.

A fascinating chapter which workers in residential facilities will find particularly useful is Cataldo and Risley's evaluation system of living environments within institutions for the retarded. From their research and observations of institutions and programs for the retarded, the authors have developed procedures for providing a Description of Resident Activity. These procedures consist of three measures: (1) A Stimulation measure which provides information on what the residents are experiencing; (2) An Interaction measure which provides information on what the residents are doing; and (3) An Activity measure which provides information on the participation of the residents in organized activities.

These measures are then used as an assessment hierarchy in which the activity measure is employed first. Those environments with extremely low scores are then assessed with the interaction measure. If scores remain low, the stimulation measure is used. Thus, the type of measure used as well as the level of behavior provides an index of the quality of the environment.

A third chapter of interest to special educators deals with cost efficiency and effectiveness in the early detection and improvement of learning abilities. In their paper, Pennypacker, Koenig and Seaver initially examine the history, then proceed to describe the major components of the behavioral measurement system known as the Standard Behavior Chart. They illustrate the applicability of this system by considering its use in the evaluation of a program designed to identify and remediate learning disorders in children.
In summary, this book has several outstanding features. It contains numerous concepts and ideas which can be applied directly in a variety of settings. The concepts presented are for the most part firmly documented by existing social, psychological, and educational research. The thrust of the entire volume is toward the scientific treatment of program evaluation in lieu of the traditional descriptive approaches of the past. A major strength is the sequential arrangement of the book in that design and analysis issues are initially considered, followed by excellent examples of program evaluations including local programs, regional approaches, and national perspectives. Furthermore, most chapters contain clear examples of concepts and procedures discussed as well as comprehensive summaries of content.

One minor fault with the book is the editors' failure to include a single article concerned with strategies for evaluating public school programs which are integrating handicapped children into the regular educational mainstream. Although Mercer and others caution against premature evaluation of such programs, it is nevertheless important that ideas be generated and evaluative methods proposed in the near future. Thus, when the need arises, the probability of the validity of integration programs being clearly demonstrated in terms of financial economy, psychosocial development and academic competence will be significantly increased, if solid foundations are now laid within the spirit of scientific inquiry.

There is also a semantic fault which is fortunately limited to only a few chapters in the book. In these chapters, the authors consistently use the dehumanizing term "retardate" in reference to mentally retarded persons. This term is still quite common in the more technical and experimentally based journals concerned with mental retardation research. There is no need to use this archaic term in our
professional vocabulary when more humane terms can easily be substituted in its place. In our zeal to study mentally retarded "subjects" and to report the findings of experimental research, we sometimes forget that the retarded are first and foremost individual persons of character and dignity who are entitled to be characterized in positive and humane terms.

Aside from these few limitations, this is a truly outstanding book. There is a tremendous amount of useful information within its covers and it is strongly recommended for anyone concerned with the evaluation of programs in the field of human services.

Reviewed by: Carl E. Muehlberger, Regional Education Center, Syracuse, New York.
According to the editor, "This book is addressed to the topic of 'What can experimental psychological research contribute to our understanding of the retarded child's difficulties in a learning situation?'" The book is actually a collection of eight papers presented at a symposium at the University of Iowa in May, 1970. The authors of the various papers are, for the most part, well known persons who have spent some years working in the psychology of the retarded. Although the book displays the editing problems associated with the transcription of live presentations into printed format and discontinuity from varying author styles, such problems do not detract from an otherwise lucid presentation of the current status and future trends of the various speakers' research interests.

In his paper, N. O'Connor explores the thesis that the learning problems of the retarded are attributable to specific disabilities (especially in language) in addition to an overall generalized intellectual disability. Leonard and Susan Ross review classical conditioning and intellectual deficit. David Zeaman in his paper, "One Programmatic Approach to Retardation" describes 15 years of work leading toward the development of a theory of retardate discriminative learning.

A fascinating account of man's capacity for information processing is provided by Spitz in his paper titled, "The Channel Capacity of Educable Retardates." Norman Milgram stresses the differences between cognition and language and presents a case for cognitive training for the retarded. Edward Zigler asserts that "...any cognitive theory cannot be a complete theory of the behavior of the retarded." He reviews his and others work in rigidity, social deprivation and motivation, expectancies,
institutionalization and personality, and other factors related to behavior of the retarded.

Speaking as a special educator, I find that this book suffers from the same malady which afflicts similar books with a context of psychology. In my judgment, the book does not truly address the problem of how to help a retarded child cope with a learning situation. I would find it difficult to recommend the book for use in a conventional teacher education program, especially at the undergraduate or master's level. The book seems to be designed almost exclusively for researchers. Assuming that audience, however, the book is well done and is a significant contribution to the literature. While the book stops short of providing information that can be applied directly in the classroom, it is strong in information which can be used for further laboratory and perhaps field research dealing with learning problems of the retarded. The book is especially appealing to researchers or interested persons who are not fully aware of the work of the persons represented here. Each of eight papers presented at the symposium are at once an historical review of the researchers' work, a statement of current findings and, in most cases, a preview of work yet to be done.

Reviewed by: G. Phillip Cartwright, Department of Special Education, The Pennsylvania State University, University Park, Pennsylvania.
In the early portion of the 1960's various information retrieval systems were introduced as means by which special educators could attempt to cope with the "literature explosion" that has beset all scientific endeavor. Periodic reviews of selected topics within related fields have been another approach by which special educators can evaluate accomplishments, identify deficiencies, and indicate future directions of inquiry.

As the title indicates, this is the first of what is intended to be a periodic assessment of, primarily, the educational management of handicapped, socio-culturally disadvantaged, learning disabled, and gifted children. It is this reviewer's opinion that the editors should not limit their future content to "children" as such life functions as recreation and vocational success, to name a few, may be unintentionally excluded.

It is a difficult task for two editors to select and coordinate 23 authors in a two-volume work that emphasizes theory, research, and application in the area of education and training of exceptional individuals. Mann and Sabatino admit that the work necessarily had to concentrate on current and definitive issues in special education at the expense of comprehensiveness. Volume One features research on such topics as diagnostic-prescriptive teaching and language behavior of the mentally retarded. Volume Two is intended to underscore research applications in various topics such as specific reading retardation and the effect of research upon educational practices. Although certain chapters, such as reading research and administration in special education, transverse the field of
exceptionality, there is only a minimal amount of discussion related to the deaf, blind, gifted, speech and physically disabled. Given these omissions, one questions the inclusion of a chapter on special education in Eastern Europe as a ranking topic for review in this first issue.

The reader should note that some of the chapters have companions in other sources of literature. For example, the topics of behavior modification, role of litigation, and intelligence testing of ethnic minorities have attracted the attention of numerous authors and editors. Mann and Sabatino direct the reader's attention to the fact that all reviews were completed by August, 1972, so that one would be advised to place these chapters into a larger research context.

As one would expect in a work of this sort, some chapters read more easily than others depending upon the complexity of the subject matter under review and one's interest. For example, the chapters on instructional programs for the trainable retarded and on perceptual-cognitive styles had a particular appeal for this reviewer, since they included the teacher as an active element in discussion and related the application of research to the instructional process.

Several authors have obviously attempted to assist the reader by summarizing as much information as possible in graphic presentations and tables. This is especially helpful in the two extensive chapters that centered on research with the Illinois Test of Psycholinguistic Abilities and the singular reviews of the Frostig Visual Perception Test and auditory perception.

Since special education must draw from many social and physical sciences, it appears to move in several directions simultaneously, and with various speeds. This is important to understand in approaching The First Review of Special
Education since it is heavy with observations that may dishearten the wary reader. Yet if The Review is to be a periodic, "organic thing" as envisioned by Mann and Sabatino, then it must contain the continual growth struggles of a field that is thriving at the same time it is critically called to task.

There is little doubt in this reviewer's mind that the editors have launched a vehicle which, if continued, will provide still another stone in the foundation of information from which we draw answers to the basic questions: Who, what, and how to teach, and finally, how well is it taught?

Reviewed by: Charles Kokaska
In Growing Up In Garden Court, Lois Barclay Murphy has given us a clear, moving, and significant account of the philosophy and program of a unit of the Children's Hospital at the Menninger Clinic. The 10 children in residence here are latency age boys and girls with severe emotional problems and, in some instances, with neurological difficulties related to brain damage. Handicapped as they are, they are among the chosen children of our handicapped child population in that they have the good fortune to be in a setting where they can receive a kind of optimum treatment and care directly related to their very great need. Certainly this has implications for all children with special needs including the need for special education.

Dr. Murphy describes the Garden Court children, the depth of their hurt and disturbance, and the sensitive, differential treatment plan that is developed for each of them. She writes of a large and gifted staff, of the complexity of the service they offer, of the demands, the stresses, and the supports they experience. She creates for the reader a sense of the infinite care which goes into the meshing of multiple skills drawn from child care workers, social workers, teachers, and psychiatrists; she conveys a sense of the creative force and talent that go to make up such a fabric of treatment. What is of particular help to the practitioner is a definition of the contribution of each discipline, and of the mutual respect and trust with which they work together. There is a noteworthy emphasis on the role of the child care worker and the teacher; the child care worker logs, and the detailed teacher observations and interactions are of special value.

Handicapped English: The Language of the Socially Disadvantaged
John Nist
Hardcover

The subtitle, Handicapped English, is taken from a book that examines the special
case of language for the handicapped. It is a discussion of the English language and
the problems of language in the education of the handicapped. The author, John Nist,
stresses the position that
language is a social institution and that the handicap of language defective
students is not a result of physical or mental defects but rather a problem of
speech. The author argues that the handicapped are not deficient in language but
are instead faced with a language that is not accessible to them. He presents
several strategies for improving the language skills of the handicapped, including
the use of visual aids and the teaching of basic concepts through concrete
examples. The book is an important contribution to the field of special education
and is recommended for teachers, parents, and researchers in the field.

Learning Problems in the Classroom.
353 pp. $11.75 Hardcover.

This book was written to serve as a textbook and as a handbook for classroom use. Many suggestions for teaching are offered, with particular reference to children with learning disabilities. The numerous cited references and suggestions for further reading at the end of each chapter enhance the book's value.

The book is divided into five parts. Part I deals very briefly with causes of learning difficulties. Included in Part II are chapters on applications of neurophysiological theories, behavior modification, Bruner's humanistic point of view, and psychoanalytic thought. The three chapters in Part III deal with child development, evaluation, and programming. Part IV consists of five chapters covering movement education, visual perception, auditory perception, developing language abilities, and higher cognitive functions. Three chapters in Part V treat the teaching of beginning mathematics, reading, and handwriting.

Partly Part IV is the outstanding portion of the book. The rationale for movement education and training in visual perception is given, and suggested activities and exercises are printed or noted. The chapter on auditory perception is not of the same caliper. The conclusion of the suggested activities is surprisingly typical. It is essentially a call for teachers to become more skillful in the teaching of these important elements of learning and development.
the greatest value in the chapter lies in the examples of transformational grammar and the excellent outline of training procedures based on the ITPA.

There are some weaknesses in the chapter "Behavior Modification." Operant conditioning is introduced as a method, rather than as a theory or explanation of how the individual learns. Possibly the classroom teacher reading this chapter would have gained a more accurate concept if the basic principles of the theory had been presented with applications for classroom use. In several instances the term "elicited response" is used when perhaps "emitted" or "evoked response" would be more accurate. This suggests a possible misunderstanding of certain of Skinner's formulations which may also be reflected in the chapter "Developing Language Abilities." Here it is stated that "Skinner (1957) and his followers have stated that language is acquired through feedback, the approval and disapproval of the adult" (p. 223). Unfortunately, this statement is not precisely documented. The reader is not referred to a specific page of Skinner's Verbal Behavior. Despite these weaknesses, the suggested guidelines for applying operant conditioning theory are worth reading.

As a textbook, the student would be wise to take a careful and critical look at certain of the concepts presented. Liberal use should be made of the cited references. As a source of practical teaching suggestions, the book has much merit. The classroom teacher would find the text helpful for a large number of reasons.

This is not just another legal manual, but a well written, easy to read, step by step guide to "move mountains" -- the first "how to do it" advocacy manual that is written for parents. It explains how we parents can guarantee the human rights of our children with disabilities and it helps us to understand what must be done without feeling a necessity for militancy. Most importantly, it points out that we are not alone in our struggles.

Let Our Children Go identifies issues and feelings, and provides practical action guidelines. This is the first time that a publication treats seriously topics for parents such as knowing himself, building alliances, recognizing those who resist change (including what they say and why they say it). It further exposes "buck passing," blaming the parent, blaming the child, and "the expert knows best."

If this book were read by every parent of a deaf child and all of them took appropriate action, quality education for all of our children would be guaranteed. Parents have moved mountains to create a better educational setting for their child but with the advice of Let Our Children Go, who knows what would move? It's great: it's simple, and it's less expensive.

The Meaning of Blindness
$6.95 Hardcover.

The Meaning of Blindness is, in essence, a comprehensive review of the literature on attitude formation. Its ultimate message is that all who know and work with people who are blind must continuously attempt to understand the basis of both their own and public attitudes toward blindness. The physical and symbolic meanings of blindness, usually buried in the unconscious, are not readily recognized by individuals nor appreciably influenced by public education. Monbeck implies, however, that it may be possible to differentiate between attitudes toward blindness and attitudes toward people who are blind, and that this differentiation may affect the way blind people are viewed and treated.

Present and past attitudes toward blindness and blind people, the psychosocial origins of attitudes toward blindness and blind people, the mythological or archetypal meaning of blindness, and attitude change are reviewed. The author supplies clarifying comments and examples but does not attempt to persuade the reader to any position except one of openness in exploring the basis of his/her own attitudes. This is not a book to be read quickly. For maximum effect, the reader must stop now and then to assess the extent to which his own attitudes are based on the historical, psychosocial, or psychoanalytical citations. A strength of the book, then, is that if provokes the reader to think about his attitudes and his relationships with blind people. It is in addition a valuable source book for further reading. It should be noted that those who are uncomfortable with Jung's archetypal concept may see the extensive references to it in the book as pointless. However, this does not diminish the value of the book.
as a stimulant to productive thinking about attitudes toward blindness, blind people, and to a degree, therefore, about all handicapped people.

This is a wide spectrum book, the contents of which vary considerably in subject matter and quality. After an introduction by the editor that castigates government for neglecting problems relating to human welfare as well as academia for being oriented too much to research and not enough to service, 12 chapters are presented that range across the professional landscape from "Developmental Biochemistry" to "Employment."

On the biomedical end of the spectrum, there are two highly technical, but well written chapters on "Congenital Malformations: Hydrocephaly" (Dignan and Warkany) and the aforementioned "Developmental Biochemistry" (Himwich and Agrawal). On the behavioral and social sciences end (the more noteworthy chapters in the sense that some interesting review material and recent theoretical formulations are presented) are "Sociology" (Farber), "Education" (Gallagher), "Sexual Behavior" (Hall), and "Language" (Schiefelbusch).

Although somewhat lacking in focus, the author of "Sociology" discourses eruditely over a variety of extremely interesting issues such as defining mental retardation as a social category, the role of the family environment in transmitting intellectual behavior, sociolinguistics, and forces leading toward a reduction in the mentally retarded population.

"Education" reviews, in a readable style, current issues and trends in special education for the mentally retarded. Mentioned among such issues are the influence of litigation on special education services; behavior shaping programs, particularly with the severely retarded; contract systems; and early intervention programs.
The chapter on sexual behavior is a valuable addition to the literature on
the sexual development and adjustment of mentally retarded individuals. This
well organized paper integrates topics such as sterilization, sexual expression,
performance in marriage and child care, and contraception.

After reviewing some definitional issues in the language, speech, and
communication of the mentally retarded, the chapter on language presents
interesting material on assessment, research on inappropriate language, and
some of the more recent findings on language training for the mentally retarded.

The mid-spectrum chapters are "Genetics and Intelligence" (Anderson) and
"Clinical Aspects" (Kirman). The former is a highly competent review of such
issues as heritability estimates in the determination of intelligence and gene
environment interactions. It suffers only because there has been so much of
this subject in recent literature that the reader is inevitably forced into a déjà
vu experience. The latter chapter is readable and informative but for a short
selection, ranges breathlessly over too much territory. It goes from the need
for improved consulting services for the mentally handicapped and their families,
to visible chromosome anomalies, to epilepsy, to social factors in the production
of mental retardation.

Somewhat less rigorous in approach, but of interest to particular students and
practitioners, are the chapters, "U.S. Federal Funds: A Policy Study" (Braddock),
"Physical Education and Sport" (Hayden), "Employment" (Posner), and "The
Voluntary Association on the International Scene" (Dybwad).

In the main, the editor has brought together some interesting and valuable
material, primarily in the area of mental retardation. Although it continues a
tradition established by earlier volumes in the series, the coverage is too broad
for one book. It would be more useful to the average reader if the annual volumes
were devoted to a more circumscribed set of topics, not necessarily within any one particular discipline but certainly not extending over the extremes of content presented here.

Neither is this reviewer entirely convinced of the value of the "Chronicle: 1972-1973" (Soloyantis and Yoder) and the "Calendar: 1974" (Soloyantis and Yoder), that appear at the end of the volume. The chronicle may have some usefulness as a pocket guide to historians but is uneven in terms of the significance of its items. Moreover, calendars by definition have very short-lived interest value; this particular one seems more appropriately placed on the back cover of a journal than in a hardcover book of this type.

The Mentally Retarded Child and His Family.
Paperback.

The cover of The Mentally Retarded Child and His Family correctly points out that its subject is currently one of the most widely discussed topics not only in education but widely discussed in many disciplines. The author points out that the text is appropriate for parents, parents to be, teachers, and other professionals. Certainly, the table of contents suggests that the author is making a frontal assault on some of the major issues confronting those involved with the retarded child. The chapters relating to "Adjustment of Parents of Mentally Retarded Children" and "Parental Advice" will whet the reader's appetite.

As the reader proceeds beyond the front flap he soon comes to sense, however, that the book is a series of one liners and that not much real information is provided in any depth. If parents are to become "... better equipped to handle problems and to recognize and cope with their retarded children," it is unlikely to happen from reading such comments as "Where does one go in your area for a thorough medical and psychological evaluation?" Numerous statements of that sort and "Are the diagnostic facilities available adequate for the needs of your community?" may only suggest to the reader that his questions and concerns regarding retardation are being met with a rephrasing of those questions by the author. Of the forty lines of print in the section on "Habilitation" (pp. 67-68) very few deal with the subject in a useful way. When the section on "Habilitation" is reached again in a later portion of the book a sense of exasperation is again felt as the reader is asked "Once a child has been diagnosed as retarded, what services are available to him and his parents?" then told that "... there are over 400 state and private residential institutions and homes for the retarded in the
United States."

Indeed, the reader may come to wonder if the book is addressed really to the parents of the retarded or, possibly to his neighbors since parents would not be so easily satisfied with this approach. While it is difficult to anticipate that a parent will profit from such statements as "Having a mentally retarded child calls for strong efforts on the part of the family to adjust to the problem," or "Through knowledge... the mentally retarded will no longer be a whisper, but will become a reality to be nurtured and loved," there are useful suggestions for parents whom, we might assume, are functioning in an atmosphere of uncertainty and non-direction.

On the other hand, it is a fallacy, as the experienced educator knows, to assume that there are readily available sources of advisement for the families of the retarded, and so it may well be that this text will provide the best initial advice that a parent might receive on the subject. However, when one admonishes the parent to create conditions which give the child a sense of belonging, one should recognize that the use of the phrase "the young retardate" probably does not enhance the development of a favorable attitude toward his/her child -- retardate or not.

The last chapters: "Education of the Mentally Retarded," "Recreation for the MR," "Prevention and Treatment of MR," and "The Entire Family," are considerably more informative to a reader who has limited experience with the problems of retardation.

However, a Dr. Spock it is not; in fairness to author and publisher it perhaps was never intended to be, but the title does create an expectation for the reader which is not fulfilled. What are some of the things a parent should know in considering those "...400 state and private residential institutions and homes for the retarded in the United States"? What do you do when your child will not walk, talk, or become toilet
trained at the appropriate ages? What do you do at home, as a family, during the night, on weekends, and during the pre- and post-school years when community services are not appropriate for the retarded child?

Overall, this book falls short of the promise that it "...will enable parents to become better equipped to handle problems and to recognize and cope with their retarded children." It is useful, however, as a primer and if so regarded will meet the needs of those very new to the experience of mental retardation.

The Mentally Retarded Child and His Motor Behavior: Practical Diagnosis and Movement Experiences.

Beter and Cragin have written a practical handbook for parents and professionals interested in adapted physical education and recreation for special children. While the procedures recommended should not be attempted with physically handicapped children without medical supervision, they can be adapted to children having a wide range of physical strength and dexterity.

Test exercises for measuring motor development and developmental activities are described. The test exercises are accompanied by tables of norms based on scores of approximately 100 children who were classified as educable mentally retarded. While not adequate for research purposes, such norms will provide a group perspective for judging the performances of children tested by those using the book.

The authors avoid involvement in the disputes current over the relationship between perceptual motor development and academic achievement. They point out that while the evidence for one view or another is not conclusive at present, currently influential theories of cognitive development such as that of Piaget hypothesize that sensory motor development has an important influence on higher level functioning. Instead of taking sides, however, they focus on what has worked for them with children, producing gains in strength and skill which they feel also have had facilitating effects on development in academic and social areas. They call for direct teaching of social skills that will be important in program success; for example, teaching children to move from verbal direction-following to self direction in the performance of exercises.

All in this useful book, one to use and to become familiar with over time.
probably in conjunction with some of the basic references suggested in the bibliographies accompanying each chapter and at the end of the book. This reviewer shared the authors' conviction that improvements in the physical functioning of special children are important educational goals in themselves; and that such improvements contribute measurably to their overall healthy development even if the intricacies of how and why as yet escape analysis.

Some of those youngsters in the norm group seem to have had an edge on at least one middle aged professor on certain exercises. More power to 'em! There are plenty of ideas here to help them keep and maintain their margin.

Reviewed by: Frank H. Wood, Department of Psychoeducational Studies, University of Minnesota, Minneapolis, Minnesota.

This is a fine book for a practitioner who desires guidance in the development and implementation of a rehabilitation program for mentally retarded young adults. The token economy system described in the book was developed to meet the needs of handicapped individuals at the Center for Developmental and Learning Disorders at the University of Alabama. The book (which consists primarily of a detailed description of the token economy system) has two major strengths: There is ample guidance in the pages of this book for anyone wanting to implement a similar kind of program, for the material is thorough and explicit; the description of the token economy system and its implementation is done within a framework that emphasizes the setting of behavioral objectives and the defining of meaningful goals for clients.

It should be emphasized that this is a description of a specific program designed to meet specific needs of a fairly circumscribed handicapped population. Nonetheless, the application of the principles so outlined should certainly be transferable to other settings as well. Moreover, the authors provide a good model for integrating a token economy system with the ultimate goal of the system, i.e. the rehabilitation of handicapped individuals for practical jobs.

This is a how-to-do-it manual. The book should therefore be of interest to practitioners in psychology and special education who wish to develop a token economy system of their own. The application of this book as a text in either undergraduate or graduate programs in behavior modification or special education, however, would depend upon its being combined with other resources. It is light on theory; and the
the evaluation of the program is limited to what is essentially a series of case studies (represented by 60 pages of graphs) showing changes in behavior of individuals over time.

The work would have to be supplemented with material which would give students some background in learning theory and behavioral analysis as well as emphasize the importance of an evaluative component in any system of the sort described in this volume.

Problems of the Gifted Child: IQ 150,

After reading the first twenty-five pages of Problems of the Gifted Child: IQ 150, the professional may be tempted to set the book aside. It is not a piece of scholarly work; there is no documentation, and reference to research is meager. This reader initially felt frustration with the lack of definitions and supporting data. But the text's soft siren call of human interest won out. I read on in order to find out if the little urchin with the wet Wellingtons ever found someone to talk to about his jam jar full of trophies from the local pond.

The author, Sidney Bridges, is a member of the British Schools' Council Working Party on Gifted Children, and this book is based on many years of experience working with gifted children in England. He shares his experiences with the reader through anecdotes and insightful suggestions. His perceptive, Piagetian observations of children are obvious in his graphic portrayal of the needs, problems, and behaviors of children with superior intelligence. Although a lack of familiarity with English idioms or with the educational system in England may make the book somewhat less readable, this reader could readily perceive the similarities to the American system.

This well-organized, comparatively small book opens with a presentation of general characteristics of gifted children and possible informal identification procedures. After exploring problems and needs from the child's point of view, the author presents the parents' and teachers' points of view concerning those same problems and needs. Finally, suggestions are made to teachers and schools as to the provision of educational experiences for the gifted child.
This book is not a primary college text, for it lacks the specificity of facts and figures necessary to create a knowledge base; neither is it a "cookbook" of detailed directions for the parent or teacher. Rather, it is a thoroughly readable piece of work that contains accurate general information and demonstrates considerable depth of human understanding of the behaviors, needs, and need-gratifications of gifted children.

Those who will find the book most useful are parents and teachers of gifted children. Such usefulness will chiefly be in the areas of development of understanding-gifted behaviors and in the development of a more positive attitude toward those who demonstrate exceptional skills. For many, this must be the beginning.

This monograph represents a collection of papers on work related to Piagetian theory presented as part of a University Affiliated Program conference held at the University of Southern California in January, 1972. There is no formal organization of papers in the monograph; 11 of the 17 manuscripts are reports of research studies; 4 of the 17 are abstracts of papers; and also included are five discussion papers and a literature review.

Particularly noteworthy in the document are the presentations by C. Edward Meyers, Henry W. Maier, F. Annette Tessier, and Marcia Maguire. Meyers proposes the development of mental measurement scales based upon Piagetian theory. His paper makes a good case for measurement based upon process rather than information. Maier also offers a conceptual dimension to the monograph by relating in well organized fashion Piaget's work on spatial and temporal concepts to ego psychology. He feels ego psychology and Piaget's theory of cognitive processes supplement each other.

Tessier's study tests the applicability of Piaget's sensorimotor theory to young cerebral palsied children. The outstanding feature of her paper is the excellent discussion of findings for application. In addition to her paper, two others in the monograph relate directly to exceptional children. One reports a study with low vision children (R. Swallow and M. Poulsen); the other a study conducted with hearing impaired children (M. P. Simmons).

Another paper with excellent attention to the implications for practice is Maguire's brief review of research. Her review indicates that formal operations are a sequential
development process but that children differ as to age of emergence of this stage.

The generalization of these conclusions is further supported in a study reported in the monograph by P. M. Bentler which found that sequence but, not rate of conservation acquisition was fairly consistent across several different cultures.

In general, there was a consistency of findings among all of the research reported in the monograph. This suggests strong support for the validity of Piagetian theory and for its practical implications. Though the monograph has limited potential as a textbook, it can serve as a limited reference source for those interested in Piagetian theory and as a stimulus to additional research.

This volume represents the directions and approaches of psychoanalytic work at the present time. It is divided into several different sections: psychoanalysis and the law, clinical contributions, a theoretical section, and a section of problems of development. Part of the book is shaped by an obituary of and a commemorative collection of papers by Seymour L. Lustman, who was an eminent psychologist, psychiatrist, and psychoanalyst belonging to the Yale group. While he perhaps was not well known outside of psychiatry, he was a scholar of great breadth. His paper, "A Perspective on the Study of Man," is an excellent presentation of the issues involved in biopsychological and social investigations of human personality. His paper on "Yale's Year of Confrontation" discusses the student unrest at Yale as seen by a Master of one of the university houses; it is an informed presentation and examination of the events, and it provides a perspective on what happened in the universities in the 1960's. Interestingly, he commented that there did not seem to be an increase in the symptoms of adolescence, when one compared the late 60's with the late 30's. Although student language concerning identity crises and psychology was strikingly different, he felt that recent students were not any more mature than their predecessors even through better traveled; that they were no more successful in resolving their struggles over dependency than those living in previous decades.

Among the clinical contributions there are papers on the superego in late adolescence, a collection of writings by adolescents, a paper on heroin addiction and crowd activity, and a paper on campus youth which offers some guidelines for parents.
or community leaders about how to respond to students. All are clearly written, and well worth examining.

In the area of psychoanalytic theory, there is a long section on the interpretation of dreams. The work illustrates the enormous shift in psychoanalytic interest from Freud's original work to studies in linguistics, so that the emphasis in this particular paper is on the use and construction of language as a species specific, separate characteristic of the human mind. It deals with the human mind's symbolic function, and its relationship to the generation of appropriate linguistic forms in the unconscious as well as conscious person, a complex and new view. However, some of the papers on early object relations, instinctual vicissitudes, and the experience of time, are in an orthodox psychoanalytic framework of conceptualization and thus of more limited interest (as is the paper on internalization). The section on the law deals with the currently emphasized problem of advocacy for children, placement of children, and the realities of finding practical alternatives in child care. This actually means finding "the least detrimental alternative," because finding the best alternative for children in divorce situations and in broken homes turns out often to be an academic exercise, devoid of realistic possibilities. Placements are difficult to find, bureaucracy and the courts cumbersome, and grinding destructive family conflicts persist.

The section on clinical work includes sections on psychoanalytic technique during latency, problems of ego regression, neurodermatitis and the psychoanalysis of a psychotic child (which might have been published without change 30 years ago).

Overall, this book has much that will be of interest to special education. It has some material which will interest only analysts; some sections which will arrest any child care worker or teacher; it shows the stirrings within modern psychoanalysis
which attempt to redeploy it as a modern and developing field. At the same time, some of the themes show a continuing direction toward separatist orthodoxy and academic theorizing about old formulations.

This book would be a useful addition to a psychology and education library.

Reviewed by: Norman R. Bernstein, M.D. Harvard Medical School, Harvard University, Cambridge, Massachusetts.
Dr. Sol Gordon, a professor of child and family studies at Syracuse University, is perhaps best known for his series of "comic books" aimed at adolescent audiences and designed to bring a straightforward approach to sex education. Dr. Gordon's critics accuse him of all manner of vile crimes including the exacerbation of moral decay in the United States, while defenders envision him as a rallying point for causes of sensible sex education and freedom of the press. Supporters and detractors share but one commonality -- the ardor with which they leap into the fray. Dr. Gordon seems to be one of those phenomena for which there is no middle ground. His personal appearances and publications are never received apathetically. This book, *Psychology for you*, is no exception. I am sure that readers of this book will feel either that it is a major breakthrough in psychology texts or that it is an illconceived attempt at "pop psych."

The foreword to the book indicates that the author intended it as a text for "Psych I" in high school or college. According to the author, its primary purpose is to explore the "...developments, needs, and concerns of the 1970's -- whether it be sex and morality, youth alienation, Women's Lib, population pressures, encounter groups, street crime, drug abuse, the counter culture, and many, many others." The table of contents, divided into five major areas: Psychology and the Individual, Realms of the Unconscious, Youth in a Changing World, Psychology and Social Problems and Psychology and Education, juxtaposes such staid and traditional avenues of psychological study as "Freud and the Freudians," "Problems of the Self," and "Intelligence" with such topics as "Mind Bending--Altered States of Consciousness,"
"The Hippie Culture," "Why Does Man Kill? and, of course, "Sex and Morality."

The final chapter, "Discovering Who You Are (A How-Not-to-Do-It Guide to What You Really Want to Do)" certainly covers academically virgin territory.

In a message "To the Teacher," Dr. Gordon cautions not to force every student to read every chapter nor to memorizing anything. The impression is given that the book is meant as a stimulus for discussion and personal growth rather than as an academic treatise on psychology. Herein lies the strength and weakness of the text. For those seeking an issue oriented vehicle for discussion with a general goal of more self-understanding and growth, this book is indeed a valuable tool. The topics it covers and its breezy, informal style should capture the interest of even the most jaded student. The contemporary text and illustrations are handsomely complemented by the "Things to Discuss--Things to Do--Things to Read" section following each chapter. The extremely wide range of material covered and the book's unflinching attitude toward covering controversial topics would seem to provide relevance for most individuals reading the book. Also, an attempt is made to provide some background in traditional psychology with a stated bias for classical Freudian psychology.

High school teachers and professors seeking an introductory text in psychology with a goal toward establishing a foundation for future study will not find this book relevant for their needs. The book's extensive coverage of controversial topics may be viewed by some as a rather cursory and, at times, dogmatic attempt to provide motivation and relevance at the expense of scholarship. Little documentation is used, a rather significant weakness when such enormous topics as "mental illness" are covered in twenty-eight pages. Many academic psychologists may be irritated by the superficiality as well as the glibness of style which often conceal very subjective judgments and statements in a "We all know that..." manner.
In many respects this book represents a text on Sol Gordon, rather than an exploration of basic psychology. This is not necessarily a liability. Dr. Gordon's interests and the engaging way in which he presents them could be a welcome addition to the experience of most adolescents. In summary, it is a most difficult book to review. One cannot divorce the book from its intended context. Teachers of "Psych I" would do well to read it. The preface, "To the Teacher," states adequately and fairly the strengths of the book. If one's goals coincide with those of Sol Gordon and one desires a stimulus for discussion rather than a psychological primer, this is a fine text.

Sex Education for the Developmentally Disabled: A Guide for Parents, Teachers, and Professionals
Henry L. Fischer, Marilyn J. Krajicek and William A. Borthick

An interdisciplinary team consisting of a clinical psychologist, a nurse, and an instructional technologist have developed an innovative method to offer sex education directly to mentally retarded people. Since the public admission not only to the sexual activities of adults but also to the mental and behavioral characteristics of retarded people, the team has developed a program designed to prepare mentally retarded individuals for their eventual role as sexual partners. This program includes instruction in the principles of human reproduction and the societal aspects of sex. The team has also developed a series of educational materials, including a workbook, a filmstrip, and a series of slides, to facilitate the teaching of these concepts. The program has been well-received by parents, teachers, and mentally retarded individuals, and has been shown to be effective in increasing their knowledge and understanding of sexual matters. The team has also been active in developing a series of workshops and seminars for parents, teachers, and mental health professionals to further disseminate their knowledge and techniques.
Although the guide is not appropriate in its present form for use with the severely retarded, the authors have found that it is effective with moderately retarded children and adolescents (ages 8 - 18), as well as with some adults.

The authors do feel that with some adaptation, the guide could be used with some severely retarded children. However, this would depend almost entirely on the skill and productivity of the teacher.
In 1954 Dr. Harry Benjamin coined the word "transsexual." This term has become the clinical designation for people who are physiologically one sex, but in whom the biological sex is psychologically the opposite. One of the defining characteristics of a transsexual is the insistence on being their gender of choice. They often face significant challenges in their personal and professional lives due to societal pressures and discrimination. In addition to psychological adjustment, some transsexuals may also undergo medical procedures to address their biological sex.
The next two chapters survey psychological and biological research which bear on various theories which explain the existence of the transsexual individual. The rest of the book consists largely of a description of children and adults who pretent living the sex role opposite their biological sex. The adults described are people who have elected to change operations. The children...
conflict, and psychological and biological research in the subject are available in other works (Money and Ehrhardt, Green and Money, and Benjamin). To these areas, this book can only serve as a general introduction. Green writes clearly and the book is engaging. This, combined with the inherent interest and popularity of the subject, would make the book a possible choice as a supplemental text in undergraduate psychology courses.

In a more critical vein, the book has a number of weaknesses. While the approach he uses, transcripts of conversations with transsexuals and their associates, is extremely valuable, Green does not approach the material in a way that maximizes its value. The interview selections give us a sense of what it is like to be a transsexual; it gives us an understanding of the phenomena and the people who share the label. Yet Green chooses to be concerned constantly about sexuality. While not much of the book directly deals with this question, it is central. In the conclusion he laments that he and his colleagues don't have the facts concerning the causes of transsexualism; he leaves us with the impression that this field of study is young and that as the wheels of progress move the facts will get to the base of the problem. Green's inability to step out of the role of the scientist with a belief in and dedication to discovering the effect of certain indeterminate variables on this newly created clinical category in order to understand transsexualism well in different contexts with his readers is, in my view, the inherent flaw in the book.

Rather than seeing the limitations and strengths of the approach he has taken and organizing the book and materials to exploit their strengths, he remains concerned with "the facts" rather than the impressions and thus muddles
the meaning and impact of the work. The data tell us much—it helps us to understand transsexuals—Green should be content with that.

A related criticism is that Green does not succeed in putting the transsexual phenomena into a larger cultural and political framework. Certainly the very reason that we are reading his book is related to the social movements afoot that call into question traditional sex roles and definitions of sexuality, i.e., various liberation movements and the youth counterculture. Green deals with this in less than a page in the next to last chapter. To ignore the raging controversies set loose in these times and not to discuss the place and influence of these movements on research and on transsexuals, makes him vulnerable to criticism. Similarly, the book needs some mention of the role of the transsexual as an oppressed minority. What is the societal reaction to this phenomenon and how does this affect the possibilities of what it and those so labeled can become? This question points to social factors that affect the problems that transsexuals, as a minority group, experience. As a group of persons, they take transsexualism out of the clinical realm and the problem area, and into the arena of social issues with public as well as individual solutions.

We cannot expect one book to do everything and this book does much. Changing this book just a little would effectively deal with some of my criticisms. In an area of research which is so controversial, it is imperative for a socially conscious researcher to reflect publicly on social issues and to raise more than just clinical questions. Clearly, Green is more than just a scientist. His concerns for individual happiness and social change are seen in his writing and in his life work. In fact, he states at the end of his book:
The researcher turned clinician wears yet another hat: it is that of the educator and mediator of social change. He works for revision of public laws and private attitudes so that persons of any age whose sexual identity is atypical may live in dignity.

Green has played that role with this book but not as effectively as one feels he would like.

Reviewed by: Robert Bogdan, Center on Human Policy, Syracuse University, Syracuse, New York
Social Adjustment of Young Children presents an exciting and explicit program designed to enhance the problem solving skills in four year old children. The program described is an outgrowth of extensive research through which the authors became convinced that a relationship exists between an individual's problem solving skills and his behavioral adjustment. Numerous revisions and extensive experimentation have resulted in a program for which data are available attesting to the program's effectiveness in producing positive behavioral changes in children. Because of the explicit nature of the presentation, interested readers may readily replicate the program.

The authors outline seven principles upon which their program is based.

1. To teach prerequisite language and thinking skills before teaching problem solving strategies.
2. To teach new concepts in the context of familiar content.
3. To base program content on people and interpersonal relations rather than objects and impersonal situations.
4. To teach generally applicable concepts rather than correct grammar.
5. To teach the habit of seeking solutions and evaluating them on the basis of their potential consequences rather than on the absolute merits of a particular solution to a problem.
6. To encourage the child to create his own ideas and offer them in the context of the problem.
To teach problem solving skills not as ends in themselves but in relation to the adaptiveness of overt behavioral adjustment (p. 29).

The training script consists of daily lessons which use a game format designed to take from 5 to 20 minutes of instruction. The suggested script is recommended for an approximately 10 week period.

Specific guidelines are presented for accommodating children with asynchronous behaviors, i.e. nonresponding, dominating, and disruptive behaviors. In addition, suggestions are provided to assist the instructional leader in incorporating the techniques specified for the formal program into informal conversations and problem situations.

This book is well written and promises to make a significant contribution to special education. The ideas may be easily extended to include elementary school-aged children who demonstrate deficits in problem solving skills and personal adjustment.

Specific Dyslexia.

This book is a research report of "Specific Dyslexia," a project undertaken by the Invalid Children's Aid Association (ICAA), Word Blind Centre for Dyslexic Children, in London, England, from January 1967 through March 1969. It was felt that more research on dyslexia was needed because even though a vast literature existed, basic knowledge about the topic was inadequate. It was also felt that certain theories lacked controlled scientific supporting data.

A historical review of the literature covers the topics of terminology, early history, and current concepts. The current concepts of dyslexia are outlined under the headings of genetic factors, maturational lag, neurological dysfunction, and cerebral dominance. The survey showed that opinion is still divided as to the extent to which pathological neurological dysfunction should be included among the causative factors of dyslexia.

The persistent problem of defining terms is discussed. "The multiplicity of terms used to describe reading disorders has added to the confusion. Unfortunately for ease of recognition, dyslexic children do not present clear cut consistent clinical patterns and many of their features are found in normal readers."

The definition of dyslexia used for the purpose of selecting subjects in this study was as follows:

"Specific dyslexia is defined as a condition causing difficulty in learning to read and to spell in physically normal intelligent children in spite of continuous schooling and in the absence of severe emotional disturbance."
The objectives of this study were to identify those features by which boys who conformed to an accepted definition of specific dyslexia might be recognized; to discover evidence which might support or refute hypothesis as to the causes of the disability; and to determine if there may be subgroups or types of dyslexia characterized by different patterns of disability.

Ninety-eight boys divided into two groups were included in the study. The first exhibited a severe degree of reading and spelling retardation, and the second a severe spelling retardation and a relatively minor degree of reading difficulty.

Each experimental group was matched with a control group of a similar number of average boys. Both groups were matched for age, sex, type of school, and were from predominantly middle-class areas. All were of at least average intelligence, normal physical status, had no evidence of gross neurological abnormality, were judged to be emotionally stable, had had normal educational opportunities. Extensive case histories were collected from the parents. All subjects received medical examinations and extensive psychological tests.

The conclusions drawn from the study were:

Some reading and spelling disorders are constitutionally determined.

The evidence does not support the existence of clearly defined subtypes of dyslexia.

Patterns of disability vary but there is evidence to suggest that a sequencing disability may underlie the reading and spelling retardation.

In the cause of specific dyslexia, the importance of developmental neurological anomalies (some genetic, some acquired) is demonstrated.
There were greater similarities than differences between the two groups, suggesting that their disorders are of an essentially similar nature.

Family histories of reading and of spelling difficulty were significantly greater for the experimental groups than their controls.

There were no differences in family and personal variables for the experimental and control groups.

Although the majority of the dyslexic boys were given much remedial help, all were still experiencing considerable difficulty, indicating the help given was inadequate.

The implications and recommendations of the study are that many factors can cause specific dyslexia and that only by a comprehensive and qualitative medical, educational, and psychological assessment can we ever hope to identify the cause of the problem. It is obvious that more clinics with a multidisciplinary staff must be established. Children with such a learning disability require specialized methods of teaching, but there are too few trained teachers. Finally, the report makes a plea for early identification of children who are failing to read. Studies suggest that children with specific learning difficulties can be identified before they go to school.

The book should prove useful for the researcher concerned with dyslexia. Eleven statistical tables, as well as the various record forms and questionnaires used in the study are included. An international bibliography completes this study. This study was a thorough evaluation of a select population with the results, therefore, generalizable. It reinforces the need for additional basic research in this area. In conclusion, it appears that the British have the same concerns about learning disabilities that we have in the United States.

Square Pegs Round Holes: The Learning Disabled Child in the Classroom and at Home.

Square Pegs Round Holes is a book about learning disabilities (LD) written by Harold B. Levy for other doctors, parents of LD children, and for teachers. The forward to the book promises that "parents will find comfort and relief from feelings of guilt about their children who have specific learning disorders."

Part One covers the development of the concept of specific learning disability. The problem of terminology and semantic confusion is discussed, as well as normal and abnormal child growth and development. An overview of the disorders of activity, behavior, and thought, as well as the learning disorders of the LD child are described. Another chapter discusses the specifics of the reading process, and, finally, studies classifying the problem of dyslexic children are discussed.

Part Two handles the confusion that still exists in the area of LD and discusses the need for valid research. The author describes the divisions that separate the educational, psychological, and medical professions, which have further served to prevent comprehensive understanding of the learning disabled child.

The chapter dealing with the use of medications is a defense for the positive results shown by LD children when such medications are prescribed by knowledgeable physicians. The author's point is that LD children are biochemically different and that they require medication in order that they may function in a more acceptable manner.
The final part of the book discusses the need for teamwork if the needs of the LD child are to be met; and this team is to be comprised of the teacher, the parent and the physician.

The chapter describing the role of the teacher presents what must be an idealistic situation. When a regular teacher is well trained, knowledgeable about all facets of the LD problem, accepts the fact that children are LD, and that their specific problems can be identified, then she can give the appropriate remediation. In addition, it is stressed that this teacher should understand the medical nature of the LD problem.

The chapter which discusses the role of parents again gives what must be the ideal relationship between the parent, the child, the teacher, and the physician. Specific recommendations are given by the author as to the most effective approaches that can be used by the parents in order to manage and educate their child. He also advises as to how the parents might better face the social implications of having an LD child. Finally, mention is made of the great importance of parents helping each other as individuals as well as through their parent organizations.

The last chapter discusses the role of the physician on the team. The author highlights what the interested physician can do for the LD child and his family, e.g., the need to discuss with the child questions which arise from the medication prescriptions. Mention is made of the unique role the physician can play because "the physician is an authority" and "carries all the prestige of his profession". Thus the physician can act as a counselor, and teacher to parents and teachers alike.
In conclusion he discusses some future directions for the LD child. These include identification of the LD child in kindergarten or first grade, a more individualized teaching approach, open classrooms, an understanding of the relationship between LD and delinquency, between LD and emotional disturbance, and the need for opportunities for the young adult to participate in educational programs after high school.

Suggested additional readings for the teacher, parent, and physician are listed, as well as the associations concerned with the LD child.

I believe that parents of LD children and physicians would be the best consumers for this book. Teachers of such children would find the information useful but there are more comprehensive texts which would help with the diagnostic and remedial approaches necessary for this complicated problem.

As is the author's privilege, he states his views forcefully, but there are many who do not share his enthusiasm for medications. He comes on a bit strong when he describes the "physician as an authority" who "...must act as a counselor, helping parents and educators alike avoid the mistakes so frequently made by the illinformed." If this is the physician's role in the parent, teacher, physician team, then he will have trouble with many teachers who may also believe they are authorities. When one thinks in terms of a team effort, an individual discipline must not appear to be more dominant than the others if we assume that all are well trained and experienced. No rationale is given as to why other professionals such as psychologists or social workers are not included in his team.
The whole issue of mainstreaming mildly handicapped children into regular classrooms is another area which relates to meeting the educational needs of the LD child and needs more attention. Here we will be faced with the need for greater coordination and cooperation of many disciplines and parents if the individualization of services to children can become a reality.

Reviewed by: George Olshin, Division of Clinical Services, Southern Connecticut State College, New Haven, Connecticut.
The purpose of this book, as the title suggests, is to provide information and guidelines for families who cope with the problems of an emotionally disturbed person in their family unit. If this seems a broad goal, the range of content is equal to it; Ms. Burch discusses problems ranging from childhood to senility, neurotic and psychotic disturbances, mental retardation, alcoholism, drug addiction, forms of treatment, terminology, available resources, and much more. It is the most comprehensive coverage of the topic this reviewer has seen.

There are many strong points in the text, but the most outstanding is the attitude Ms. Burch conveys; she is clearly an advocate for the distressed family. From the beginning, she attacks the notion that parents and other family members somehow are guilty of their relative's disorder. She writes frankly about hospitalization pro and con. She tells what to look for in a public or private facility; she describes factors in decisions regarding hospitalization (including the impact of the disturbing person on the family), and alternatives to total hospitalization. She explains various "brands" of psychotherapy and provides guidelines for selecting a particular type. There also is a great deal of practical information on how to cope with the daily problems of living with a behaviorally disordered person: where to set limits and expectations in terms of conduct and family responsibilities; how to handle difficult behavior; where to go for help. All are supplemented by realistic case vignettes. This information is accurate, relevant and, for the most part, useful.
The range of content also becomes the major weakness of the book. Research and depth often is sacrificed for breadth. For example, relatively little to say that specifically applies to children. Especially the absence is a discussion of how parents might relate to their children. The rights, parents with respect to school placement receiving special education is presented in a manner that is general rather than specific, but in the main part, the author
homogeneous clinical entities, which is misleading, to say the least. In view of the established unreliability of psychiatric diagnoses, especially applied to children, one questions Ms. Burch's advice to first obtain a diagnosis to "find out how disturbed the child is". It is short, while the author may have a learned perspective regarding the various models of madness, it is doubtful that he can fully understand the implications of his advice. Consequently, the view that diagnosis is strongly supported by the medical or disease model. In the end, the author's perspective is more descriptive in its attitude toward the issue.

planning to help teachers prepare for the mainstreaming of learning handicapped students.
Training Retarded Babies and Pre-Schoolers.

Training Retarded Babies and Pre-Schoolers offers a basic behavior modification program for children from birth to age six. Parents can follow the program systematically, and, as a result, learn the art of training. Linde and Kopp point to the parents' role in their child's training. Emphasis is placed on the need to plan and organize the child's environment and training schedule. The authors also stress the importance of group activities and the need for coordination and cooperation among the parents throughout the book.

The book is designed to be a companion for parents in their training of the child's behavior. It provides a multitude of ideas and suggestions that can be used to develop an individual training program for the child. The authors emphasize the importance of consistency and the need for parents to be patient and understanding. They also stress the need for parents to be flexible and adapt their training strategies to the child's individual needs.

The book is divided into several sections, each focusing on a specific area of training. These sections include areas such as feeding, toilet training, and socialization. Each section is filled with practical tips and strategies that parents can use to help their child develop the necessary skills.

Overall, Training Retarded Babies and Pre-Schoolers is an excellent resource for parents who are looking for a comprehensive guide to training their child. The authors provide clear and concise explanations of the training process, along with practical tips and strategies that parents can use to help their child develop the necessary skills. Whether you are a new parent or an experienced one, this book will undoubtedly be a valuable addition to your collection.
they seem to want parents to view their book as a second Dr. Spock book, this one being the text on raising retarded children.

What to do About Your Brain-Injured Child or Your Brain-Damaged, Mentally Retarded, Mentally Deficient, Cerebral Palseid, Spastic, Flaccid, Rigid, Epileptic, Autistic, Athetoid, Hyperactive Child

Although variance exists in the estimation of incidence of birth defects
which may fall into categories such as brain damage, neuromuscular disorders, and cerebral palsy, the number is agreed to be uncomfortably high. If one recognizes that a handicapped younger does not live in isolation, a handicapped therefore, must be thought of as residing within a handicapped family.

With the relatively high incidence and concomitant conflicting reports concerning this parameter of the population, some authoritative literature for such children is almost mandated. Such a resource should be directed to the primary caregiver of the child, the parent.

Brain-Trauma Child reveals that it

The needs of parents handling the birth and development of a child who differs from the ideal.

The multiplicity of dysfunction encountered

135
it is the degree and location of the injury which makes the difference. The author, however, overstates his point when he suggests that "it is extremely likely that we can count every human being as brain injured, at least imperceptibly" (p. 230).

A brief lesson is also delivered by Doman concerning the manner in which dysfunction may result. It is noted that in many cases the cause for the dysfunction resides within the central nervous system, and pure physical or occupational therapy procedures will not correct the problem. However, in a subsequent discussion of the "patterning" procedures, little more than physical and occupational therapy is discussed. The explanation that either sensory or motor disruption may result in the observable disability is made clear to the reader, and is generally described in easily understood terms.

The use of certain vocabulary is misleading. For example, the term "feel" is substituted for the more accurate term "touch," and may have rendered a more emotional connotation rather than the intended physical meaning. The term "cybernetic loop" receives repeated referral and may have intimated to the non-technical audience an actual neurophysiological connection. The author justifiably and commendably refers to means of obtaining discipline of the child. He notes praise as the most desirable, and coercion as least desirable, separated by a continuum of intermediate measures. Yes, indeed, the handicapped child, as the non handicapped child, must respond to the requirements of society! It is also pointed out that the answer to many of the problems of the child reside with the parents. It is further made clear that almost no professional people talk to mothers, who are the source of vital information regarding their child. While using parents' involvement is again noteworthy, strict adherence to certain schedules prescribed by Doman may do more harm than good to the already handicapped family.
It might be suggested that certain areas of discussion within the text should have been presented in a somewhat tempered style. Repeatedly, allusion is made to four stages of development in all sensory and motor areas. These four stages, divided according to the "level of the brain" which controlled them are discussed under locomotion, and are reiterated in the areas of hearing, vision, tactility, ad infinitum. It is not made clear that this is the construct under which the author is operating, and may not be necessarily acceptable to other professionals or institutions handling similar problems. While it is realized that one espouses his own particular school of thought, more care should be exercised when directing information of an extremely controversial nature to a non-technical population which is vulnerable to charlatan tactics.

Other misleading statements and concepts are rendered by the author. For example, constant referral is made to the amount of stimulation which a child is receiving in a particular sensory modality. While it is true that frequency, intensity, and duration of stimuli are controllable parameters, it is not true that all children require extreme values of each. While the hard of hearing may require greater intensity of auditory stimuli, and certain visually impaired cannot perceive small objects, this is far from covering the spectrum of disorders of sensation. Sensory "overloading" is also a tenable hypothesis, the reason for which explains why a child tunes out the environment. These alternatives are not presented to the reader, and "overstimulation" appears to be commodity of choice.

The author also finds it his responsibility to reduce all areas of brain dysfunction to three simple categories which consequently result in three groups.
of children: "the deficient child, the psychotic child, and the brain injured child" (p. 224). The reader is instructed that the deficient child "was not intended by the Good Lord or nature to have a good brain" (p. 225), but are "nice children". The psychotic child has an "improperly programmed" (p. 226) brain, and the "brain-injured child" was intended by nature to have a good brain but had something happen at some time after the instant of conception that hurt that good brain (p. 226). The plethora of these terms introduced by Doman, along with their misconceived explanations does a great deal more to mislead the reader than to inform him. In similar light, terms such as premature and post mature are referred to as children who were "simply not done" (p. 231), and "too done" (p. 232), respectively. Doman further suggests that "Patterning in a sense is a sort of closed brain surgery" (p. 180). This is a completely inappropriate analogy to make to parents seeking a means of correcting what may be essentially not correctable. While functional ability may be increased in certain cases, patterning does not remove lesions of the brain.

The danger here is that certain procedures are presented to parents in such a laissez-faire manner, and without precautions to their inappropriate use, that they may be interpreted, in a cook book fashion, as prescriptions for helping children, no matter what the problem. This feeling is encouraged and is further reinforced by the broad spectrum antibiotic entitled, "What to do About Your Brain-Injured Child, or Your Brain-Damaged, Mentally Retarded, Mentally Deficient, Cerebral Palsied, Spastic, Flaccid, Rigid, Epileptic, Autistic, Athetoid, Hyperactive Child.

Reviewed by: Ellis I. Barowsky, Department of Curriculum and Teaching, Graduate Program in Special Education, Hunter College, New York, New York
Margaret O'Brien Steinfels, an historian, has provided a lively and easy-to-read book on day care. It is based upon her extensive readings and visits to "thirty-five centers and ten to fifteen family day care homes in different parts of the country" (p. 91). The major strength of the book lies in the variety of conceptual categories she provides for understanding day care.

Day care may be understood through examining the groups interested in it and their goals. Welfare reformers inside the government and out of it, early childhood educators, and women concerned with liberation, are the major groups pressing for day care. Over a period of time, within each of these groups, at least three major attitudes toward day care can be discerned: day care as "patchwork" to shore up a failing family; day care as "realization", to provide greater opportunities for self-development for mothers and children; day care as "utopia", part of a scheme for radical social reform.

Day care may be understood through its history. From its origin in the early 19th century, through the rapid industrialization and urbanization of America, the influxes of immigrants and the wrenching poverty in the crowded cities—all these disrupted family life and child rearing. In those days, day care operated as a service for families whose mothers had to work, or otherwise could not take care of the children.

The early day nurseries took children of all ages. As modern psychological concepts grew, and specialization and professionalization in education and in social work developed, the nature of the care and the target population were
adjusted to suit the needs of the professions. The nursery school teachers wanted children old enough to teach, while the Freudian oriented social workers increasingly looked upon day care as part of a syndrome of familial maladjustment, rather than an aid to families wanting to improve their lives.

By the end of the 1920's, with the decrease in immigration, with the decline in feminism, with the decline in interest in progressive reform, and with the economic expansion of the mid-20's, day nurseries were generally neglected by their upper class patrons, and by public funding. The depression years brought a resurgence of interest, and federal and state funds were spent on day care centers which could supply jobs to teachers, nurses, clerks and others out of work. After the WPA programs faded, the next great impetus to the growth of day care centers was provided by the need for labor during World War II. With Federal and State funding, by July 1945, a million and a half children were in day care.

After World War II, the Federal government ended its involvement in day care. This was ill-timed, for in fact, the labor force participation rates of women increased steadily following World War II. In 1940, one in eight mothers worked, and by the end of the 60's two in five worked.

During the 60's attitudes about day care began to change again. Among the reasons Steinfels cites is the renewed emphasis on early childhood learning; this has lent respectability, justification, and purpose to the day care movement. The Women's Liberation movement, powered by the huge number of women in the labor force, has made day care one of its major goals.

From the beginning, a variety of criticisms has been leveled against day care. It will loosen family ties, it will lessen the parents' feeling of responsibility for children, it will encourage mothers to work, and thus depress male wages. Steinfels responds that the question is not whether America should have
day care; we already have it. The question is rather the quality of the day care we should have. She argues that since mothers are working, since the concept of sex roles for both men and women is changing and expanding, children will be better served by having much more and much better day care than they now receive. She concludes her book with guidelines to help in the search for answers to the complex matter of day care, and she expands the concept by asking the reader to consider a variety of ways of caring for children of all ages, in addition to family-arranged, privately financed methods.

The book is well worth reading for the overview of the history of day care from the beginnings to the present time, for the presentation of the variety of goals of day care, for the description of the political issues involved in the Comprehensive Child Development Act and for the discussion of the relationship between day care and the family as an institution in society.

Steinfels' lengthy description of day care services, while interesting and informative, is not as systematically presented as the ideas in the rest of the book. The title is somewhat of a misnomer. While the author provides an overview of the history of day care, from its beginnings, the politics of the movement is chiefly confined to a description of the Nixon administration's handling of the Comprehensive Child Development Act. Such flaws are not serious, for Steinfels covers a good deal of material in very good style. The book is well referenced, and includes an excellent, extensive bibliography.

This work should be useful for introductory courses for day care professionals and social workers. It places the day care question into a larger perspective for people interested in the question of new roles for women. Finally,
for a lay audience it provides absorbing, thought provoking reading on a topic
of importance to anyone who lives in a family, is interested in the family, or is
concerned with the future of our society's children.

Reviewed by: Adeline Levine, Department of Sociology, State University of
New York at Buffalo, Buffalo, New York
On November 25, 1972, a delegation of American leaders in special education, early childhood education, and speech entered the Soviet Union for a whirlwind tour of facilities and programs serving handicapped children. What they found was a system of programming which is "matriarchal, authoritarian, and communal" (p. 3). Women constitute the vast majority of teachers, professors, and researchers (the Soviets call disability related researchers "defectologists"). Through a centralized educational system, several research and development policy making bodies chart programs at the national level, including teaching and therapy methods, curricula, and texts for dissemination to local communities. The centralized and seemingly uniform nature of the system is, however, mitigated by attention to regional need to accommodate materials to cultural experience as well as to language differences. The communal organization of services, another emphasis that emerged from the Americans' visit, has meant heavy reliance upon residential and (what we have come to call) segregated services. Only in early childhood programming can there be found a significant degree of special programming for handicapped children in typical settings.

In view of our American preoccupation with questions of deinstitutionalization and mainstreaming, it will surprise no one that during ceremonies which marked the Americans' departure from the Soviet Union, leaders within the Institute of Defectology suggested an openness to reevaluating sharing information on the integration/segregation question: "If we were to discuss this question, I would say that in the past we had some experience with integrating handicapped children into the normal schools and it
was not effective. This was in an earlier stage, the 1920's and 30's. Now we are in a new stage of education and science, with new opportunities, so now we can return to this question to study what each country has that is useful" (p. vii). The Soviets also expressed considerable interest in future collaboration and inquiry concerning issues of testing, diagnostic methods, and strategies for manual deaf education.

Yet the truly exciting content of *Windows on Russia* concerns not so much these Soviet responses to issues that have been controversial in America but rather those essential themes and components which make Soviet special education and research different from our own.

What do we learn from "defectologists" in the Soviet Union? The Institute of Defectology includes five main areas or categories for study and education: Abnormal Children; Visually Impaired Children; Intellectual Disorders; Auditorially Handicapped Children; and Speech Disorders. Social retardation and behavioral disturbance exist neither as research nor education areas, apparently because such concepts are "incompatible with the ideological system of the Soviet Union." Some children have, however, been labelled "developmentally backward," a term applied to children with problems that we generally call learning disabilities. Further, the Soviets regard spelling and writing problems as speech related and, so, such matters are dealt with by the speech specialists. As the Soviets' term "defectology" so clearly implies, the Russian model assumes that all disabilities, including all recognized forms of retardation, are organically based.

Research tends to follow a case study design, usually clinical and often applied. The Americans report that while Soviet colleagues have considerable expertise in experimental design and statistical methods, the Institute of Defectology has not
emphasized these approaches. It was found too that Soviet scholars are more interest-
ed in the equivalent of competency based testing as opposed to more global I.Q. style assessments. This of course fits with the strong Soviet commitment to continual engagement in curriculum development and thereby to translate research findings into practice. The theory to practice theme has its origins in Marxist ideology.

Epidemiology has not been a priority for Soviet scholars and, as a consequence, data are unavailable as to the incidence of disabilities. We do learn from this report, however, that the goal for the end of the current five year educational plan (December 1975) was to have 425,000 children enrolled in special programs. That figure represents 1% of all school age children. One would think that better incidence data will be available in the near future, especially in view of the fact that all parents of newborn children take their babies to diagnostic centers (polyclinics) sixteen times during the first year of life. If abnormalities are found, parents are offered the opportunity to enroll their children in special nursery and kindergarten programs. "During the last preschool year the child is seen by the diagnostic team involving psychoneurologists, defectologists, logopedists, and other appropriate physicians or specialists" (p. 9), and may then be referred to a special commission for special programming and placement by the regional educational authority.

Special curricula vary for each area of disability, but all have the common features that they relate directly to children's real life environments and attempt to involve children through levels of development, play with objects, and dramatic role playing. Teacher training programs offer courses in these skill areas, as well as other liberal arts topics, including the study of Marxism and Leninism. Teacher training candidates must have had previous practical experience in teaching children,
and they receive regular opportunities for practicum placement during their years in the University.

*Windows on Russia* presents so many interesting revelations about Soviet special education that one can hardly resist the desire to further this investigation with additional investigation, perhaps first hand. What, for example, are the implications of the policy to prohibit school children's "social advancement" apart from academic accomplishment? Is the Soviet economic and political system particularly adaptable to the policy of paying disabled adults equal wages for manufacturing work? These and many other questions still deserve our attention.

If one can find any serious criticism with this illuminating report, based on an admittedly brief visit to Russia, it is that we are afforded too little insight into the delegation's personal experiences. As anyone who has examined crosscultural issues first hand will know, one often learns the most about a society and its policies and practices from those incidents where a question seems strangely irrelevant to the visiting or host group, from particularly humorous events, from experiences at informal meetings with ordinary citizens of another country, and from popular media accounts. Only the final chapter of *Windows on Russia* makes explicit reference to a personal perspective on the trip. And here we gain some insights into the concerns of people with disabilities. Here we see that the history of Soviet development over the past forty years has not given priority to research into children with disabilities until recently. And here we learn that most citizens know little about disabilities. Yet one is left with additional and essential questions that might emerge from a more personal, culturally oriented investigation. How do the Soviets explain the predominance of women in special education and research? How does Marxist ideology influence the
field of special education and research? How do students conceptualize the relationship of ideology, research, and teacher? If Soviet society has created a competitive educational system that emphasizes personal excellence, especially in scientific fields, what impact has this had on the value placed by educators and citizens on persons who cannot or have not excelled intellectually? Is social cooperation a powerful enough social value in the Soviet Union to make normalization and integration in future years a logical course of development?

These are just a few questions that emerge from reading *Windows on Russia.*

It is as if we have given our curiosity just a quick taste through this whirlwind visit, and have opened up a panorama of scientific, cultural, and political questions to be answered, it is hoped, through continued Soviet-American exchanges. To all who have a concern for international perspectives and practices in the field of exceptionality, *Windows on Russia* provides impetus for curiosity and reflection upon our own culture, its policies, and its practices.
