In order to determine the specific counseling needs of the adult learner, staff of the Adult Counseling Project began by conducting a literature search pertaining to the problems of returning students and those considering a return to school. The review revealed that little is known about the educational and vocational needs of the returning adult. A second phase of the Adult Counseling Project involved (1) a survey of students enrolled in postsecondary vocational institutions ranging in age from 21 to over 50, and (2) a survey of those considering a return to school who also ranged in age from 21 to over 50. This survey involved administering a questionnaire to 650 students enrolled in three VTAE (Vocational, Technical, and Adult Education) schools in Wisconsin—Green Bay, LaCrosse, and Milwaukee, and to 100 nonstudents in the communities. Both the literature review and the results of the survey suggest that adults returning to school have academic and guidance needs which are only gradually being recognized and met. In particular, effective career guidance and study skill programs need to be developed and implemented for older students, since the bulk of existing study skills programs and career guidance strategies appears to be geared to adolescents and very young adults. Acknowledgements

We would like to thank Mr. Henry Wallace, Mr. William Campbell, and Mr. Bill Young for their co-operation in distributing the questionnaires in their respective school districts and communities. Without the help of these Administrators of Student Personnel Services and the willingness of the students and non-students to take the time to fill out the questionnaires, this survey or study could not have been undertaken.

In addition, we would like to thank Dr. Merle C. Strong, Director of the Center for Studies for Vocational and Technical Education, University of Wisconsin-Madison for his co-operation throughout the duration of the study.

Special appreciation is extended to Catherine Alexander for typing the many draft reports. Gratitude is also extended to Barb Glinski who assisted with the mailing of the questionnaires and to Joyce Seger for all her rapid assistance with the keypunching.

A special thanks to Dr. Lambert for his assistance with many problems that arose in the course of the research.

Lastly, many others who tracked down missing data, contributed suggestions and ideas remain unidentified but their work is sincerely appreciated. It is only the help of a co-operative group of people that makes possible the useful application of the findings of a survey of this nature for years to come.
Introduction

The 1975-76 Survey of Adult Counseling Needs in Adult Education is based on the rapid important changes in the structure of the world of work today. Jobs and skills may become obsolete as new jobs appear, requiring new skills and more formal educational/vocational training. Due to the presently tight job market, job vacancies may occur in one geographic area, while labor supply exceeds demand in another. These and other changes in the structure of society and the nature of labor demands have created a situation in which the majority of the adult population changes jobs several times in the course of their lives.

Because of this, most adults require job retraining and/or acquisition of new skills at various points in their employment history. In addition, large percentages of adults must change their geographic locations several times in order to secure jobs. With changes in employment status, job security and physical mobility, most adults are also faced with a need to make appropriate changes in their goals and aspirations. Many adults will be highly motivated to accept the challenges of our rapidly changing technological society. Others, however, will need help in accepting and adjusting to the changes. Career decision-making skills and individual feelings of inadequacy will need attention. Many adults will require the assistance of a counselor.
In order to deal effectively with these problems, concerted VTAE district efforts toward providing adult guidance and counseling services are needed. Expansion of services could and should include such activities as special testing, counseling, placement, pre-enrollment guidance, long-term counseling and financial help. These services should be made available to both day and evening adult students. Our findings thus far—based on a study of three Wisconsin Vocational Schools involving 1,824 students and prospective students—indicate that these concerns are widely experienced today.

Summary

In order to determine the specific counseling needs of the adult learner, staff of the Adult Counseling Project began by conducting a literature search (see Annotated Bibliography, Appendix 1) pertaining to the problems of returning students and those considering a return to school.

The review as a whole reveals that little is known about the educational and vocational needs of the returning adult, and that there is a concomitant scarcity of available materials geared specifically to the educational and guidance needs of that group.

A second phase of the Adult Counseling Project involved (1) a survey of students enrolled in post-secondary vocational institutions ranging in age from under 21 to over 50, and (2) a survey of those considering a return to school who also ranged in age from 21 to over 50. The survey questionnaire was
pilot tested at the Madison Area Technical College and the University of Wisconsin Counseling Center for Continuing Education Services. The areas of La Crosse, Green Bay and Milwaukee were chosen as the final sampling locations to insure cross-sections of students and non-students in the state.

Results obtained thus far from enrolled students as well as from prospective students have revealed that over two-thirds of the respondents in nearly all age classifications at all three locations are greatly concerned about career exploration and vocational guidance. Typical responses reveal that students "need more information about jobs and occupations," "need to know more about . . . vocational abilities," and are concerned about "being unemployed after graduation." Respondents also indicated that they were interested in obtaining skills, although this concern varied by age, sex, and school. Students designated as study skills those activities involved in adequate school performance, such as doing well on exams, giving oral reports, writing well, understanding text books and pacing studies.

Methodology

Two pilot questionnaires were designed, one for adult students presently enrolled in an educational institution and one for prospective adult students considering returning to school. The questionnaires were tested at the Madison Area Technical College and at the Center for Continuing Education.
Services at the University of Wisconsin-Madison campus. The questionnaire were designed to obtain personal data and describe individuals according to sex, age, marital status and whether the adults enrolled in a vocational school were attending on a full or part time basis, how many years since they were last enrolled and asked for their highest grade level attained. In addition, they were asked if they were presently working while attending school and what kind of program they were enrolled in.

The second section of the questionnaire dealt with the concerns and needs of returning students. Each individual was asked to rate his/her level of concern based on a Likert scale ranging from 0 to 5.

The final section of this questionnaire asked who they would go to if they were having problems with their schooling (e.g. needing help in learning how to study, outside activities interfering with school work, any problems with personal conflicts in their lives in relation to school, or if they needed more job or occupational information). The list of people suggested for them to turn to included an instructor, an administrator, a member of student services (e.g. counselor), fellow students, or a member of their family. They were asked to list the reason for their choice.

The pilot questionnaire for the prospective adult students who might be considering returning to school was very similar
to the questionnaire for the presently enrolled students with
variation on only a few questions.

After the results of the pilot study it was found necessary
to shorten both questionnaires and make extensive changes such
as eliminating the Likert scale, condensing the age brackets
into broader categories, and, most importantly, developing more
adequate questions that would assess more efficiently the
students' and nonstudents' concerns and needs (see Appendices
2 and 3).

Revised questionnaires were distributed in three VTAE
schools in the State of Wisconsin; Green Bay, LaCrosse and
Milwaukee. Three administrators of student services personnel
were employed in each respective school to administer and collect
the questionnaires and return the data. Each administrator was
sent 650 enrolled student questionnaires and 100 nonstudent
questionnaires to be mailed to nonstudents in the community.

We requested the following breakdown:

<table>
<thead>
<tr>
<th>Age</th>
<th>Male</th>
<th>Female</th>
</tr>
</thead>
<tbody>
<tr>
<td>Under 21</td>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>21 - 25</td>
<td>50</td>
<td>50</td>
</tr>
<tr>

</tr>
<tr>
<td>26 - 35</td>
</tr>
<tr>
<td>36 - 49</td>
</tr>
<tr>
<td>Over 50</td>
</tr>
</tbody>
</table>
Information from nonstudents was collected by administrators at the three schools. One administrator requested people who came in to the building to obtain information concerning various programs to fill out a questionnaire. Another administrator asked his employees in student services to mail the questionnaires to people in the area who were considering returning to school, such as friends, relatives, and husbands or wives. The third administrator asked personal friends working in industry to fill out the questionnaires.

1824 questionnaires from the three districts were returned including both adults presently enrolled in school and adults considering returning to school.

Results

A preliminary analysis of the data suggested that over one-third of the male and female respondents in nearly all age groups at all three campuses are greatly concerned about career exploration and vocational guidance ("I need more information about jobs and occupations," "need to know more about my vocational abilities," and concern about "being unemployed after graduation.") The second major area of concern, which varied somewhat by age, sex and school, was study skills (doing well on exams, giving oral reports, getting studies done on time, interference of outside activities with school, required to take courses, writing difficulty and difficulty understanding textbooks).
The final analysis consisted of a chi square analysis according to school, sex, age, full or part-time student.

Table One shows the percent of respondents indicating a concern for each item; the eleven items which concerned over 15% of the respondents were subjected to further analysis.

Table Two presents an analysis by school (Milwaukee, Green Bay, and LaCrosse), Table Three an analysis by sex, Table Four an analysis by age and Table Five an analysis according to full-time or part-time student status.

A summary stereotype would suggest younger male, full-time students in Milwaukee express the greatest concerns and older female, part-time students at LaCrosse express the least amount of concern.

A brief summary statement follows each table.

Surprisingly full-time students are more concerned about nearly everything.
Non-student response

An insufficient number of non-students (N = 301) were available for analysis of concerns by school. There were only minimal differences in concerns between males and females, and among the various age groups. Non-students who anticipated studying full-time in the future were more concerned about having sufficient job information, being unemployed after completing training and having sufficient money for their education. Students and non-students tended to have the same concerns.

Conclusions and Recommendations

Both the literature review and the results of the survey obtained thus far suggest that adults returning to school have academic and guidance needs which are only gradually being recognized and met. In particular, effective career guidance and study skill programs need to be developed and implemented for older students. At present, because of the lack of direct attention to the problems of older students, the bulk of existing study skills programs and career guidance strategies appears to be geared to adolescents and very young adults. For the next phase of the Adult Counseling project, the staff proposes to review study skills and career guidance materials presently available as to their appropriateness for adults.
returning to school. These materials could then be adapted, modified or revised, and new materials developed to answer the needs of adult students. Thus, the staff proposes to draw upon their previous work, the literature on adult and survey results of student needs, to structure program materials and procedures needed to meet the unique needs of adult students. This will be accomplished by designing and administering further surveys and field interviews to appropriate subject groups.

Objectives

To formulate a counseling program for returning adult students, the staff of the Adult Counseling project proposes to accomplish the following:

1. To survey student services personnel regarding the appropriateness of existing career guidance materials and study skills programs for use with adults.

2. To modify existing and/or develop appropriate adult-oriented career guidance materials and study skills programs.

3. To field test materials and programs.

4. To orient student services personnel to newly developed materials and programs and/or more appropriate approaches to utilizing materials and programs with adults.
Two ERIC searches have been conducted to determine (1) what is known about the unique needs of adults returning to post-high school education or training and (2) the existence of specific programs to meet these needs. In conducting the ERIC search the following descriptor words have been used:

- Adult Counseling
- Adult Counseling Programs
- Adult Education and Counseling
- Career Guidance
- Career Planning
- Educational Counseling
- Occupational Counseling
- Vocational Counseling

After reviewing all the articles, books, and monographs which were listed (approximately 300) in the ERIC system it was decided there were only 19 documents which contained information which could be helpful in understanding adult needs and identifying programs structured to meet these needs. In order to share these findings, an annotated bibliography has been prepared. It is safe to conclude from this review that little is known about the educational and vocational needs of the returning adult.
The Adult Learner: An Annotated Bibliography

In recent years, there has been a rapid increase in the number of women entering the labor force. According to the authors of this article women now represent 43% of the labor force. There are several factors operating in a woman's mind which lead to confusion as far as her identity in the work world: childhood conditioning, salary differential, child-rearing role, sexual discrimination, and the effect of mass media.

Even though there has been a broad expansion in programs for adults returning to school, extensive vocational guidance and counseling programs for the adult woman--before, during and following completion of a particular program--don't exist. The needs of women returning to school (and her needs are different than those of men) have been essentially ignored in the guidance structure.

Personal factors in relationship to age and family status must be dealt with or there is a strong possibility that these factors might interfere with effective work performance. It is also important for the adult female not to discount her past learning experiences in and out of school.

It is important for the counselor in assisting with the usual decision-making process to be aware of the biological and psychological implications of the various stages in the life of a woman. There are many cultural and environmental stimuli that influence the female throughout her lifetime which can conflict in deciding upon a course of study. Modifications in textbooks, curriculum, and mass media may help to reduce the conflict resulting from the stereotype that a woman "belongs in the home".

This article explains how the counseling process in continuing education functions on three different levels: (1) working directly with the student in a variety of ways ranging from individual counseling to job referral; (2) working with instructors and administrators as a resource person; and (3) providing a liaison with community groups that would work with the school and the adult student.

A major focal point of this article is characterizing the student as an adult who: (1) in a voluntary student; (2) is usually a part-time student.
often with heavy home and job responsibilities; (3) has probably been away from school for some time; (4) re-enters with a great deal of insecurity concerning his/her learning abilities, frequently with a previous poor school record which might add to his/her initial insecurity; (5) is motivated to improve his/her status or better a past education which is viewed as inferior.

The adult counselor must make the decision to advise the adult student in a number of meaningful directions. Moreover, not all problems are soluble within the educational institution as the returning adult student might be in need of social care, marital counseling, job counseling, psychiatric advice, etc.

In a study of seventy evening college students examined with the Motivational Analysis Test, it was shown that the motives of wives and sweethearts exerted a great influence upon the success or failure of male students.

This article cites increasing evidence that large numbers of 30, 40 and even 50 year old persons in a variety of professions are becoming involved in the career changing process. The latest statistical figures from the 1970 Manpower Report of the President indicates unemployment of professional and technical workers has gradually risen from 3% in 1958 to 5.1% in 1969. According to this article, in addition to the unemployed professionals searching for work related to their particular fields many others are seeking to change careers.

According to the author, the maladaptive behavior resulting from lack of informed assistance can range from frenzied trial and error attempts at finding the appropriate occupation to various types of withdrawal from the job market.

The author suggests that it would be more useful to develop assistance seeking behaviors and/or educative coping behaviors. An educational model is proposed entitled Developmental Tasks in Life Stages based on Super's work.

In our modern society work is generally separated from family life. A man's career, life style, leisure time, and choice of mate are all dichotomized and unconnected. A woman choosing a career must also decide where she would like to live, what kind of life to lead, whether to marry, and whether she wants a family.

Many jobs are demanding more or higher levels of specialization which means more education and higher levels of competitiveness among students seeking to secure jobs which are scarce in number.

The following adult education topics were rated as being critically in need of research: (1) What motivates adults? (2) How do adult education programs encourage motivation? (3) How do social values affect participants and learning? (4) How do you reach the lower social classes? (5) To what extent should the client be involved in determining objectives? (6) How can you measure the effectiveness of adult education? (7) What styles of leadership produce change most efficiently?

According to the author, his work with adults centered around the following assumptions: (1) Adults need to be stimulated toward further self-improvement. (2) Adults want to improve or increase their educational level but are unsure as to how to do it. (3) Due to past unsuccessful experiences with school, many have become disillusioned with education.

A guidance program in continuing adult education should concentrate on the total development of the individual and should provide for: (1) personal growth; (2) value clarification; (3) making choices; (4) recognizing and organizing decision-making skills; (5) adapting to living in a modern, technical society; (6) identifying and recognizing one's individual strengths and weaknesses.

An individual through participation in a guidance program can learn to confront his problems, act on his own sense of values, and develop capabilities to interact with other humans.
According to this article, the human brain achieves peak efficiency at about 50 years of age while physical attainment is greater between 20 and 30 years of age. The young tend to learn by trial and error whereas older people ask questions and tend to learn more efficiently through abstract reasoning. The older person's handicap is the belief that he/she cannot learn.

Older people have three advantages over younger persons: (1) experience or adapting previous knowledge or skill to new learning; (2) maturity or reflecting on and starting new learning in a cautious manner; and (3) judgment which is superior to that of those without experience and maturity.

The best qualities of mind--creative imagination, reasoning, and other higher functions--increase with age at least to 50 with no evidence of a severe decline for several years beyond 50.

As the adult ages, feelings of inadequacy, anxiety, loneliness, guilt and suspicion may occur. Interests seem to narrow and become more conservative. The adult tends to live in the past and the ability to adjust to change decreases. It is the fear of aging, rather than aging itself which is seen as bringing about deterioration.

This article discusses how the needs of adults are different from those of their younger counterparts stressing the adult students' need to have their goals realistically attainable and clearly defined.

The article begins with a definition of counseling as "... a systematic exploration of self and/or environment by a client with the aid of a counselor to clarify, self-understanding and/or environmental alternatives so that behavior modifications or decisions are on the basis of greater cognitive and affective understanding."

Whether the adult is independent or dependent, resourceful or not, he/she has spent a considerable amount of time debating about whether to see a counselor. Even after deciding to see a counselor the adult is fairly skeptical about the value of the experience.

McDaniel also cites the high degree of anxiety and fear among adults returning to school. Group counseling is suggested as an effective means of reaching those adults who have been asked to leave for academic reasons. Special counseling techniques are seen as needed for adults who reenter an institution and are disillusioned by their initial exposure. Counseling programs also need to be developed to help returning students who have been disillusioned by previous exposure to the educational system.

This study of different student personnel programs in community colleges is a follow-up to the 1965 McConnell-Raines study of student personnel programs in community colleges. Results are discussed within the following areas: (1) Personnel Administration (2) Educational and Vocational Background (3) Budget and Organization (4) Full-time Assignment of Staff (5) Decentralization of Services (6) Extension of Services to the Community (7) Major Problems (8) Further Analysis.

Some of the major problems blocking the implementation of student personnel programs according to the respondents were lack of adequate funding and consequently the need for more professional or clerical staff; and inadequate professional support for the student services area from administration, faculty, governing boards, and the community with a particular emphasis on the lack of faculty understanding and support.

One of the major obstacles to adult learning has been that teachers consistently use traditional methods of instruction. Adult instruction has largely consisted of teaching adults as if they were children. The result is that adult education has not been effective in dealing with attitudes, world views, and approaches to life basic to one's adult status. "The art and science of helping adults to learn--based on crucial assumptions about the difference between children and adults as learners--is known as 'andragogy'."

From an educational perspective, adult means to be self-directing. Adults tend to react resentfully and resist being put into situations in which they feel that others are imposing their will on them. 'Andragogy' is based on the assumption that the most significant need of an adult is to be treated as an adult.
Along with the adult's personal goals and objectives, the adult carries his/her own cognitive learning style. Some prefer visual stimuli such as books, pictures, films, etc. Others want auditory stimuli from records or speakers. The point to be stressed is that adults respond to a variety of educational techniques and the ones that parallel the mode used in their non-institutional learning is likely to be the most effective.

This article mainly focuses on informing the reader of the variables that are unclear in a counseling relationship and raises several fundamental questions such as: (1) If the helping relationship is individually oriented, how can this process be transmitted? (2) How can counselors be free to grow as the client grows in the process of changing? (3) How can educational programs be structured to incorporate 'the relationship' as a central component to learning?

Mulvey, M. Adult referral and information service in education. ERIC Reports, 1970.

In counseling women returning to school who have been out of school and working for quite some time it may be necessary to deal with fears of: (1) inadequacy, (2) examinations, (3) inability to study and read rapidly, (4) class discussion, (5) being out-of-date, (6) competition from adolescents, (7) failure, and (8) being unemployable, as well as dealing with both personal adjustment and social problems.

Individuals may be reacting to stress brought on by such problems as needing to set priorities, budgeting one's time, searching for one's identity, and conflicts in social roles and self/social expectations.

The purpose of this study was to collect planning and staff information for the establishment of an educational counseling service for adult students within the Continuing Education Division of Pennsylvania State University. Data was to be collected to help determine the urgency, for and the types of counseling services desired by adults enrolled in the university's Continuing Education Division.

In the Spring 1972 term 19,884 CE adult students were sampled in the survey and 9,283 or 47% completed the questionnaire. Adults were asked questions.
about their reasons for enrolling in continuing education credit courses, their need for counseling services and the types of counseling services they would prefer.

The type counseling service, if one were to structure the service according to the responses of CE students, would largely focus on meeting the needs of adults contemplating a career change. Thirty-four percent of the respondents indicated an urgent need for counseling services and 60% desired administrative advice as a form of counseling service.

According to the author, the need for education is imposed on everyone by historical necessity. In an affluent society to live life at the lowest level, "higher education will become a civil right." This ethic places pressure on those who are working to improve through more schooling in order to make progress on the job.

The author feels that vocational research has neglected the problem of the evening adult student in that their needs are different than the day student's needs. For example, evening students often need to change jobs and residence before graduation which may take 5 to 10 years after matriculation. Marital counseling is much needed as well as a study of the effects of stress on the family because the student frequently must be at the library studying. There is also a great need for financial aid.
There are thousands of adults like yourself taking courses in Wisconsin School of Vocational, Technical and Adult Education. This brief questionnaire attempts to identify your concerns so we can review our policies and better utilize staff in meeting these concerns.

DIRECTIONS: PLEASE CHECK THE APPROPRIATE SPACE OR PROVIDE THE REQUESTED INFORMATION.

1. Sex: __________ male __________ female

2. What is your age group?
   __________ under 21 __________ 21-25 __________ 26-35 __________ 36-49 __________ over 50

3. Are you: __________ single, widowed, divorced, separated with no children under 18 at home.
   __________ single, widowed, divorced, separated with children under 18 at home.
   __________ married, with no children under 18 at home.
   __________ married, with children under 18 at home.

4. Are you a full-time student? __________ yes __________ no

5. Before taking the present course, how many years has it been since you were last enrolled in an educational institution? _______
