Courses and study programs in the United States designed for initial or continuing training for all levels of management and administration in higher education are analyzed and compared with similar studies in the Federal Republic of Germany. It is concluded that there would be little advantage in simply transferring methods and ideas from American programs to German ones, but that successful programs should be observed first hand. A training program for top-level higher education administrators is proposed. (Editor/MSE)
If up to now the main objective of Phase 2 has been to report on the activities of the IMHE Programme or of its member institutions, the present issue deviates to some extent from this tradition inasmuch as its major theme is the management of higher educational institutions in the USA and the possibilities of transferring some of its methods to the European context - or more accurately - contexts.

Upon his return from a visit in the USA, Dr. H.J. Schützer, Kanzler of the Universität des Saarlandes, has analysed courses and study programmes designed for initial or recurrent training for all levels of management or administration in higher education. Comparing the organisation of postsecondary studies in the USA and the Federal Republic of Germany, Dr. Schützer concludes that there would be little interest in simply transferring methods but that there would be a lot to gain from observing at first hand training methods which have proved their value. In addition, he proposes a training scheme designed for top level managers in higher education.

Whereas this study only refers to the Federal Republic of Germany, it should be pointed out that educational structures in European countries are more or less comparable and the IMHE Secretariat would therefore welcome similar contributions from other countries for publication in Phase 2.

The NCHEMS (National Center for Higher Education Management Systems) is not unknown to our readers; indeed, the last issue of Phase 2 featured a comparison of costing methods developed by this organisation and by a group of French language universities carrying out research under the IMHE Programme. Costing is but one of the many tasks of NCHEMS and the Secretariat feels that it is timely to publish an article contributed by NCHEMS describing its activities, projects and publications.

The Secretariat is also pleased to present an innovation to Phase 2 readers: in this issue you will find book reviews on institutional research. We hope that this initiative will be appreciated by our readers.

In Phase 2 no 11, Dr. Keith Legg, President of the outgoing Directing Group, presented the problems related to the renewal of the administrative arrangements between the IMHE Programme and OECD-CERI. The present Directing Group has considered on a number of occasions the possible options and in this issue you will find its final proposals along with a few other items of information concerning the Programme.

TRAINING PROGRAMME FOR UNIVERSITY MANAGEMENT
IN THE UNITED STATES

by

H. J. Schützer

1. HIGHER EDUCATION AS A COURSE OF STUDIES AND SUBJECT OF ADVANCED TRAINING

1. Origins

The idea of scientific reflection upon the educational system and teaching process in the United States dates back to the late 19th Century. Its beginnings were marked by historical investigations describing the developments and transformations of the North American university system by the use of scientific historical methods. As the organizational sciences developed in the USA, increasing use was made of the institutional research approach.

During the '50's numerous colleges and universities introduced, usually with the assistance of foundation funds, what were called self-studies. Their quality and general usefulness varied but nonetheless prompted the universities to undertake a self-critical scrutiny of their own behaviour, and led to a growing number of experts, teachers as well as administrators, being given assignments involving quantitative survey methods and institutional research techniques.

A further fillip to scientific research in higher education was given by the movements for testing, counselling and guidance of student behaviour. Using psychometric aids, these contributed powerfully to the increasing thought being given to the aims and tasks of post secondary education. The new discipline derived therefrom elements for establishing a body of theory, improving its empirical methods and turning out a great many experts in the field.

Powerful boosts were also given by the wave of scientific policy after World War II. Numerous national and regional commissions endeavoured to frame recommendations for a new higher education policy. The need was felt to establish it on a firm empirical basis. Consequently these commissions were given

1. This article has been translated from German.
a multiplicity of research assignments. The activities of the Carnegie Commission deserve special mention. The spectrum of its publication takes in well-nigh all the topics and fields having a bearing on the concept of higher education as a branch of scholarship in the United States today.

Among State initiatives, those of California are outstanding, for under the pressure of its enormous upsurge in student numbers during the 1950's this State assumed a pioneer role in higher educational research. A lasting memorial of this trend is the University of California's Centre for the Study of Higher Education, established at Berkeley in 1956, which has stamped its image on this area of studies.

2. Training Curricula

The efforts described have resulted in a huge plethora of concepts and syllabuses. The official estimate of the number of professors specializing in higher education studies is 600. A list compiled and recorded by the American Council on Education currently includes 112 colleges and universities, spread over 45 States of the Union, offering courses of study in higher education; 67 of these institutions award doctorate degrees in the discipline.

In the Federal Republic Curtius was the first to report upon the American development of higher education study courses. The present paper amplifies his findings. In particular his observation is confirmed that the managerial grades of colleges and universities are increasingly recruited among graduates of such courses. The alumni registers of the educational establishments visited by the author indicate a high percentage of university and college presidents, vice-presidents and senior administrators in various branches. The trend shows that the proportion of officials having degrees in higher education is on the up-grade.

The abundance of concepts and syllabuses corresponds to an ambiguity in the idea of what is to be understood nowadays by higher education as a field of study. There is a big consensus that this cannot be a scientific discipline in the usual sense of the term. The specific nature of the discipline is determined by the object of study (the system of higher education, training centres are considered as teaching and research establishments for post-secondary teachers, training centres). The trend shows that the proportion of officials having degrees in higher education is on the up-grade.

The abundance of concepts and syllabuses corresponds to an ambiguity in the idea of what is to be understood nowadays by higher education as a field of study. There is a big consensus that this cannot be a scientific discipline in the usual sense of the term. The specific nature of the discipline is determined by the object of study (the system of higher education, training centres are considered as teaching and research establishments for post-secondary teachers, training centres). The trend shows that the proportion of officials having degrees in higher education is on the up-grade.

3. Advanced Training Programmes

The vocationally oriented advanced training programmes are to be distinguished from courses conferring formal degrees. A handbook published by the Academy for Educational Development and the American Council on Education lists for 1976 over 170 courses. These courses vary in kind and length and are for advanced training of higher education administrators at all levels, from members of the highest management bodies (trustees, regents, presidents) to specialists in particular areas of administration (e.g. student services, planning, budgeting, financial development and fund raising, careers planning and personal development). Emphasis is placed on pre-service and early in-service education. For

---

the Office Leadership Development in Higher Education. In pursuit of its purpose of providing initial training and retraining both for school leavers and experienced administrators, the Office organizes, at various venues in cooperation with other national or regional bodies, conferences, seminars and workshops. It also publishes striking research results and study material and fosters relations between colleges and universities, industrial and commercial organizations and State authorities in matters of training and professional development. Since its inception the Office of Leadership Development has now also taken over the Institute for College and University Administration (ICUA) established in 1955 and the Academic Administration Internship Programme (AAP) introduced by the American Council of Education in 1964.

ICUA specializes in ab initio training for recently appointed top-level officials. It offers as a rule one-week seminars for four target groups:

- College or University Presidents
- Senior academic administrators (Academic Dean, Provost, Academic Vice-President, Dean of a College or Professional School, Dean of the Faculty, Dean of Instruction, or Dean of Studies)
- Business Officers (Financial Vice-President, Treasurer, Controller and other officials responsible for finance)
- Student Personnel Officers (Vice-President for Student Affairs, Provost, Dean of Studies and other officials responsible for student affairs).

The content of the syllabus for the one-week seminars embraces all practical questions in higher education. The emphasis given varies with the topicality of the matters treated. For instance, in the late 1960's, it was placed on constitutional matters (e.g. equal opportunity) and the resolution of conflicts; for the past three years it has shifted to methodological questions in systems management and collective bargaining problems. Currently the bias is towards problems arising from the restrictive economic and financial situation, and from unemployment. The programmes announced by ICUA for 1975 comprise the following topics:

- the changing postsecondary education scene
- academic goals, organization, and governance
- management by objectives
- curriculum innovation and planned change
- student concerns, goals, life styles, and services
- consumerism in higher education
- personnel policies, development, and evaluation
- non-reten tion, tenure, and collective bargaining
- affirmative action programs, and strategies
- legal concerns, and issues in higher education
- program planning and budgeting
- financing higher education with limited resources
- statewide commissions, planning, and coordination
- relations with the governing board, and the public
- skills, styles, and strategies of academic leadership

Since it was established in 1955, 2,800 senior officials from more than 1,000 colleges and universities, have attended ICUA seminars. In addition it has cooperated with other national or regional bodies in organizing seminars for another 1,030.

The AAP caters for the professional training of a select number of young graduates for top-level posts.

The American Council on Education annually invites presidents and senior administrative staff from its member establishments to nominate suitable graduates, from among whom 40 are awarded ACE fellowships. The training includes a 10-12 month practical internship, usually in the office of a President of one of the member universities, three 6-day seminars, continuous counseling by an individually selected mentor, preparation of an "analytical paper on a significant aspect of academic administration" and study travel designed to broaden the trainee's acquaintance with establishments and organizations active in American higher education. Since the programme started in 1964, 393 ACE fellows have been appointed, almost half of whom now occupy posts of university presidents, vice-presidents or deans.

Besides these nation-wide activities of the American Council on Education, there are many regional or inter-regional professional training courses, some set up by the universities themselves, others in close cooperation with postgraduate courses at the various schools or departments of education. The Institute for Educational Management (IEM) of Harvard University has a scheme for training top-level university administrators that deserves special mention. The speciality of this kind of joint function of the Graduate School of Business and Management and Graduate School of Education is that it provides a common syllabus for different kinds of managerial posts. The course last 6 weeks and is held every summer; it covers the following items:

The prospectus emphasizes that IEM working days are long and strenuous, starting with a common breakfast at 7 a.m. and lasting until 7 p.m., after which each individual is expected to prepare his work for the following day.

The teaching staff gathered together for each advanced training course are usually professors, experienced administrators, university researchers and representatives of State or non-State establishments. An increasing number are coopted from industry and commerce. The American Council on Education pursues a twofold aim by securing the services of such experts: to familiarize participants to the utmost possible extent, for use in higher education, well-tried economic management methods and techniques, and to
give participants first-hand information on what industry expects the universities to supply. For simi-
lar reasons increasing importance is being attached
to exchanges of personnel between universities, pri-
ivate firms and State authorities.

The costs of advanced training are largely borne
by the U.S. Federal Government and private foun-
dations. For these exacting courses they are extremely
high, and usually require a contribution by the partic-
icipant or the university sending him. For the six-
week course of the Institute for Educational Man-
agement of Harvard University a fee of $2,000 is
charged. As a rule the universities sending trainees
provide holiday pay and travel costs. The teaching
methods used in the advanced training courses are
adapted to the length and specific aims of the course.
Longer courses offer opportunities for applications-
relevant research work. Shorter ones provide, in
addition to lectures that session take up more than
a quarter of the time available for instruction, semin-
rums, small discussion groups and case studies. In
addition to highly structured courses, there are also
ones laying particular stress on an informal atmo-
sphere and leaving plenty of scope for specialized
talks in small groups on current themes in university
management.

The advanced courses described so far are aimed
at professional development of top level management
personnel. They involve instruction for people en-
trusted with the final responsibility of particular
management processes and decisions, in the univer-
sities or higher educational system in general.

In addition there are numerous training courses
for the professional training of middle-management
personnel. As an example, we may take the Mid-
management Education Certificate programme of the
University of California, Berkeley.

This three-year course is intended for full-time
officials of the University who, while not having uni-
versity degrees, aspire to middle management posts.
Successful completion of the course, requiring prac-
tical experience in new fields, gives candidates equal
opportunities for filling middle managerial posts com-
pared with graduates with bachelor’s or master’s de-
grees in business administration. The syllabus in-
cludes among other subjects business administration,
economics, the computer sciences, mathematics and
English, and is tailored to suit the special needs
of individual trainees. The group size is limited to
10 participants. A fresh group starts every autumn.
The trainees have very limited allowances of paid
leave. The individual’s contribution to costs amounts
to $50 a year.

II. ARE THE MODELS TRANSPOSABLE?

1. Fundamental Differences

It is impossible to over-emphasize the danger
of applying foreign models to the German system of
higher education. 1 This is also true of the models
prevented here of training and advanced training in
the United States. There are fundamental differences
in the higher educational scene, differences which
call for careful analysis before deriving individual
principles or system elements for application to our
own system.

a) Differences of Scale

A mere comparison of quantitative dimensions
between the American system of higher education and
that of the Federal Republic of Germany reveals basic
differences. In the U.S.A. there are currently some
185 million inhabitants and about 2,600 establishments
of higher education. The latter accommodate over
9 million full-time students and another 10 million
part-timers. According to official estimates about
60 million Americans, or nearly one-third of the total
population, currently attend courses, in one way or
another, in post-secondary education.

In the Federal Republic the listed establishments
engaged in the task of higher education number at
present 162. They catered for about 800,000 students
in 1975. The number of students not taking examina-
tions is dwindling to vanishing point. Colleges and
universities are still to a large extent unconcerned
with professional further training for graduates.

b) Multiplicity of Forms in the United States, Unit

Types in the Federal Republic of Germany

Such diversity is typical of higher education in
the United States. Colleges and Universities differ
not only considerably in size and sponsorship, some
have less than 500 students, while others have over
50,000; more than half the establishments are pri-
vately sponsored. However, some three quarters of
full-time students are registered in State establish-
ments. There are even greater differences in terms
of reference, aims and academic standards. About
300 of the 2,600 establishments award doctorate de-
grees. But it is a well-known fact that, measured by
their internal image and their academic standard out-
side the United States, they are by no means homo-
genous as the "Hochschulen" of Federal Germany,
with their justified degree standards, to which they
are supposed to be equivalent. Only 46, or a quarter
of the doctorate-awarding universities in the United
States, offer definitely research-related doctoral
courses. In the others research is of fairly minor
importance. The remaining 550 establishments of
university standard offer possibilities for post-gradu-
ate studies leading to a master's degree or other
less than doctoral diplomas. More than one-third of
the total are two-year institutions (junior colleges,
community colleges). They give candidates a two-
year course of study preparatory to some professional
terminal programme, or enable them to spend the
first 2 of the 4-5 years needed for a bachelor's degree
in their home town. The mostly 4-year liberal arts
colleges do not go any further than the bachelor's
degree; they constitute a quarter of the United States'
establishments of higher education.

1. cf. especially C.F. Curtius, "Zur Verwendung auslandischer
Hochschulmodelle - Moglichkeiten und Grenzen", Beitrage zur Hoch-
schulverwaltung vol. Annex 3 to the Zeitschrift Wissenschaftsrecht,
Wissenschaftsverwaltung, Wissenschaftsfoerderung (Festschrift fur Frie-
drich Graf Steinbach-Fermer), Tubingen 1963, pp. 28 et seq.
The general criteria for the classification of establishments indicated are: length of course, general terms of reference and aims, inclusion of research. The typology must not be mistaken as indicating any uniformity of content. The degree of freedom left to the individual establishments in drawing up their curricula certainly varies, but even State institutions are allowed a broad measure of decision making powers, so that within the same type in the same State they may vary very considerably in kind and content. It corresponds to a fundamental feature of official policy for higher education in the United States that such tendency towards diversity of content should be encouraged rather than inhibited. This is looked on as a means of keeping alive competitive spirit in the courses offered and accelerating the adaptation of curricula to the needs of society. In the Federal Republic, in contrast, there has been noticeable in recent years an opposite trend towards uniformization of content. In this respect the pressure exerted by the numerus clausus is causing an increased uniformization and ossification of courses of study.

c) Differences of Financing

Whereas in the Federal Republic, the universities are almost entirely financed from the State budget, in the United States the proportion of non-State funding is of decisive importance, not merely in private establishments. Course fees still form an essential contribution. The Carnegie Commission recently recommended that the system of mixed financing should be retained. It urges that one third of expenditure in higher education should in future be covered by students' contributions. Hitleri about 20% of current expenditure in higher education in the United States has been made up of students' fees. In the competitive rivalry between State and private institutions to obtain backing from public funds, the private institutions won a notable partial success in 1971. In a legal hearing before the United States Supreme Court the latter conceded for the first time, under stated conditions, the constitutional constitutionality of private institutions (in this case church-maintained) for direct public financial assistance.

The dependence on sundry financial sponsors explains the greater importance of finance management in higher education in the United States.

d) More Management-Freedom in the United States

The application of the managerial concept in higher education operates more convincingly in the United States than in the Federal Republic. The reasons are mainly to be looked for in the deliberately cultivated multiformity, and different system of finance. If an institution wants to survive in competition with its rivals and the notion of survival figures prominently in the current literature on higher education - it must offer the most attractive curriculum at lowest possible prices. This commercial principle has certainly helped to enable the United States to afford an incomparable expansion of post-secondary education without the problem of the numerus clausus which stands in the way in Germany. But it has also caused notions like industrial management and research, policy formulation and analysis, educational planning, programming and budgeting system (PPBS), management information system (MIS), resource allocation and fund raising, to become of vital importance in the country's higher education, whereas transposing them to our system hardly creates more than a general dilemma. In the Federal Republic the new Acts certainly ascribe to the universities an active role in planning and patterns of studies. Yet the elbow-room enjoyed by higher education in the United States, and the driving forces for independent curricula formation that are active there, really do not exist in Germany. On the contrary, the authorities' distribution of student places as determined by the numerus clausus leads to the universities being largely excluded from co-responsibility for a cost-conscious planning of types of course. The risk of planning and financial commitment is one-sidedly borne by the State. But even the State authorities reach their decisions less by a fundamental analysis of cost-effectiveness than in terms of the possibilities and constraints of fiscal policy. An example is the overall education plan decided by the Federal-Länder Commission on June 15th 1973 and ratified by the Heads of Federal and Land governments on 20th September 1973: its planned implementation has been not only postponed by financial developments but fundamentally called into question by the latest drastic cuts imposed. This development, dictated by financial considerations, minimizes the scope of decision making in higher education. This is essentially limited to spreading the necessary cuts over the organizational units, more or less prisoners of the current state of affairs.

e) Role of University Research in the United States

The development of courses and educational programmes in higher education administration in the United States is, as has been shown, the consequence of multiple research activities on the subject. The establishments themselves have contributed substantially to this research, spurred on by their own vital interests. All this activity is mirrored in the enormous literature. A select list for 1974, compiled for fellows of the Academic Administration Internship Programme, includes, besides a large number of directories, bibliographies and documentation under the head of information sources, 121 periodicals including numerous specialized publications on higher education administration and management. 2 In 1968 there appeared one of the first surveys of the literature on "Management Science in University Operations". 3 It takes in practically the whole currently effective structuring of this field of expertise.

Investigations into the application of quantitative methods figure prominently. A survey published in October 1972 names the three important programmes for the United States:

1. The Ford Foundation Programme for Research in University Administration, located at the office of the Vice-President for Planning of the University of California, Berkeley. The Ford Project (2386 Fulton Street, Berkeley, California 94720) published in 1972 a report on "A Programme of Research in University Management" which gives information on the current status of research work and publications.

3. The CAMPUS (Computerized Analytical Methods in Planning University Systems) project developed by the Institute for the Quantitative Analysis of Social and Economic Policy of the Canadian University of Toronto.

The results of this research and development work are attracting a lot of criticism in the United States at the present time. The chief objection to quantitative methods is directed against the neglect of qualitative aspects, especially in the evaluation of outputs. The limitations of conventional cost analysis are exposed in this respect. Aid is sought in the development of qualitative methods of evaluation. This is likely to be one of the main foci of future research.

In a general way it is to be noted that in the United States itself an overly uncritical application of models and techniques developed in existing higher education establishments has led to disillusionment and disenchantment.

The Director of the National Center for Higher Education Management System (NCHEMS), Ben Lawrence, points a warning finger at the limitations of the use of the cost analysis procedure developed by that Center. To avoid misleading results, he calls for strict observance of the instructions for its use, and greater efforts to produce comparable data inputs.

Two main conclusions may be drawn from the discussion on the efficiency of the models and techniques developed, and the demand for management data:

i) Detailed investigations are being initiated into the scope of managerial decision-making, and the kind and extent of the information required.

ii) In the ongoing programmes of adaptive retraining for university administrators, the emphasis is being shifted to information on the applicability and efficiency of the models and techniques developed in the existing establishments.

In the Federal Republic only the first steps in higher education research are visible. The universities themselves are conspicuously reluctant to investigate their own behaviour. The activities of ILIS-GmbH and the Bavarian State Institute for University Research and Planning encounter more reticence than cooperative willingness in the universities. The reasons are many and varied and by no means attributable only to a defensive attitude towards overhasty and unreflecting projecting into the educational process by outside bodies of notions of planning and optimization.

2. A Long-Term Strategy Needed

Analysis of the differences between the higher education systems in the United States and Europe, especially the Federal Republic of Germany, makes it plain that there can be no question of a straightforward transposition of American models and programmes to the training and advanced training of university administrators. On the other hand, it does appear possible to make use of the basic ideas and experience in the planning of training programmes. This suggests the following considerations:

a) The nature and scope of training and advanced training programmes for university administrators depend upon the nature and scope of the decision-making capability allowed in higher education. An administration of universities and education that is allowed to have its own independent role in educational policy and the planning and framing of its own affairs has, quantitatively and qualitatively, different educational requirements from one largely reduced to implementational requirements from one largely reduced to implementation of other people's decisions. In the Federal Republic of Germany, the university Acts do give the universities such a role. In practice, however, the universities' total financial dependence and the state's unrestricted control of education have the effect that the theoretically available competences cannot be made use of.

Therefore systematic investigations should be made of whether and on what conditions the competences provided for universities and educational bodies can be more fully utilized. This demands more, and more realistic university and educational research. It must not be limited to the development of slick operational systems but must attack the disproportionately more difficult field of qualitative evaluation. This signifies also research into mutual relations between university and science on the one hand and industry and society on the other.

For exhaustive use of the decision-making capa-
b) Not until university and educational research is also carried out more intensively at a number of universities can the latter establish courses in university and educational management on the lines followed in the United States. This should be done, on the basis of experience in America, not as if it were a basic discipline having its own independent scientific profile but only by way of courses of training making use of the methodology of various other disciplines. Based on sundry fundamental courses up to doctorate standard or training courses qualifying for a special diploma, the new courses should ensure that an adequate number of basically trained young graduates is available for university and general educational administration. The attempt to sketch out the content of training schemes for educational administrators with reference to experience in the United States proceeds on the assumption that the educational manager will not only be given responsibility for fundraising and resource allocation but also act as a medium between political authority and society on the one hand and university and science in general on the other.

A public programme of studies will be required to allow for participation by graduates of various basic educational backgrounds and to broaden knowledge of the fundamental discipline in relation to applications thereof (e.g. economists will qualify as educational economists), besides the acquisition of supplementary knowledge (e.g. the historian or mathematician will also be given a practical knowledge of educational legislation, the economics of education or educational sociology). The aim of training should not be so much qualification for a particular post as all-round competence within the university and general educational system. Guided by experience in the United States, the course of studies should primarily aim at a thorough understanding of the university and general educational system. The following presentation is not exclusive. Further additions may be made to the ancillary disciplines in the left-hand column. The subordination of subject-matter to ancillary disciplines indicates possible but not exclusive relations. Such interdependencies are to be encountered in most American study programmes, albeit with varying shades of emphasis.

Training courses of the kind outlined are a precondition for the carrying out in the longer term, by means of systematically trained managerial elements, of university and educational management in general, previously based on practical experience and inadequate management methods.

c) In the medium term the studies pursued at existing institutions and one or two universities (HIS, Bavarian State Institute for University Research and Planning) for ab initio and advanced retraining of university and general educational administrators are capable of being utilized. Examples and experience in the United States are highly relevant here. One step towards acclimatizing at any rate the retraining of management personnel for university and educational administration in Germany too, can be to arrange for a limited number of managerial personnel from the Federal Republic of Germany, from the appropriate ministries, interregional educational organizations and the universities, to attend advanced training courses in the United States. The advanced

training programme, described in Section I, of the Institute for Educational Management of Harvard University specifically affords such a possibility.

However, the advanced training content of this programme can only to a limited extent be taken as a model to imitate, with due allowance for the special conditions and requirements of the university and educational system of the Federal Republic of Germany. Nevertheless, the principle of flexible feedback from current management problems is transposable. In applying it, the following questions arise in the context of current training requirements in the Federal Republic of Germany:

- How can universities and educational establishments ensure the quality of their services? Tackling this problem entails an analysis of their capability, with inclusion of an evaluation of their efficiency.

- Where does the boundary line run between operational rationalization and monitoring of economic efficiency in the field of science? To answer this question the university and general educational manager has to come to grips with econometrics and its efficiency.

- How can the lack of mobility of educational personnel be dealt with? To ensure a high standard of educational performance a balanced relation between the various age groups represented is of great importance. As regards imbalances that have occurred or are likely to occur, alternatives to the present staff structure should be tested.

- How can universities and other educational establishments be adjusted to requirements under the conditions of a stagnant economic climate? The necessity of proceeding from plans to expansion to planned adjustment requires different strategies of planning and decision making.

On this side of the Atlantic there have only been made so far modest essays towards such a kind of advanced training. The need for developing and encouraging them is an urgent one, if the universities and the educational system in general are to perceive and secure the scope for decision making that ought to be allocated to them in the interest of their social function in society.

The above is a report on a study mission carried out by the author in the Autumn of 1975 with the aid of a travel grant from the Donors' Association for Promotion of German Arts and Sciences; the author wishes to convey his thanks and indebtedness to the following persons who generously helped with information, advice and data:

- at the American Council on Education: Roger W. Hejms, President; Bradus N. Butler, Director, Office of Leadership Development in Higher Education; Charles F. Fisher, Program Director, Institute for College and University Administrators; Rose Lee Hayden, Associate Director, International Education Project; John F. Hughes, Director, Policy Analysis Service; Thomas M. Stauffer, Program Director, Academic Administration Internship Program;

- at Harvard University: Richard P. Chait, Director, Institute for Educational Management;

- at the University of Michigan, Ann Arbor: Joseph P. Cosand, Director, Center for the Study of Higher Education; Marvin W. Peterson, Faculty Member; Edward A. Dougherty, Office of the Vice-President for Academic Affairs;

- at the University of Minnesota, Minneapolis: Jack G. Mervin, Dean, College of Education; Paul V. Gramsbech, College of Business Administration and Graduate School of Business Administration; Carl R. Adams and Roger G. Schroeder, Center for Academic Administration Research; Vernon Hendrix, Clifford Hooker and Don Morgan, Department of Educational Administration;

- at the University of California, Berkeley: Frederick E. Balderson, Chairman, Center for Research in Management Science; Lyman A. Glenny, Chairman, Center for Research and Development in Higher Education; Dale Tillery, Division of Higher Education, School of Education; James M. Corley, Chancellor's Office.
