TITLE: Teaching Gifted Students Social Sciences in Grades Seven Through Nine.

SPONS' AGENCY: Bureau of Elementary and Secondary Education (DHEW/CE), Washington, D.C.

PUB DATE: 77

NOTE: 56p.

AVAILABLE FROM: Publication Sales, California State Department of Education, P.O. Box 271, Sacramento, California 95802 ($0.65)

EDRS PRICE: MF-$0.83 Plus Postage. HC Not Available from EDRS.

DESCRIPTORS: Anthropology; Class Activities; Gifted; Interpersonal Competence; Junior High Schools; Psychology; Secondary Education; Social Science Research; Social Sciences; Sociology; Teaching Methods

ABSTRACT: Intended for use by teachers, consultants and administrators, the booklet discusses social science instruction for gifted students in grades 7-9. An introductory section provides an overview of goals and parameters of the social sciences (psychology, sociology, and anthropology). The scientific research process is described in terms of five steps, and sample questions designed to help students communicate research hypotheses are given. A third chapter provides examples of applied research skills in anthropology, ontogeny, and phylogeny. Described are methods to heighten student awareness of justice through examination of the Bill of Rights. A final chapter considers the field study method of developing creative approaches in interpersonal relationships. (CL)

Prepared for the
Office of Curriculum Services
California State Department of Education
This publication, which was funded primarily under Public Law 93-380, Section 404, was edited and prepared for photo-offset production by the Bureau of Publications, California State Department of Education, and published by the Department, 721 Capitol Mall, Sacramento, CA 95814. State funds were used for the review and updating of the copy for this publication. The original version was funded under the provisions of the Elementary and Secondary Education Act, Title V.

Printed by the Office of State Printing and distributed under the provisions of the Library Distribution Act 1977.

Copies of this publication are available for 65 cents each, plus 6 percent sales tax for California residents, from Publications Sales, California State Department of Education, P.O. Box 271, Sacramento, CA 95802. A list of other publications that are available from the Department may be obtained by writing to the same address.

Information about other publications in the gifted education series may be found on page 49.
FOREWORD

A primary goal of California public schools is to provide equal opportunity for all pupils to become proficient in the basic skills and knowledgeable in the basic subjects. In our efforts to achieve this goal, we must provide programs that are of sufficient scope and depth to permit each child to learn at his or her own rate and to the full level of his or her ability.

Gifted pupils, as a group, have unique educational needs, many of which we can meet only by providing for a high degree of flexibility in their educational programs. Several years ago the Department of Education directed and coordinated a federally funded project for the development of curriculum materials of the type needed for such programs. The 1972 edition of this publication was a product of those efforts. I am pleased that the Department now has the opportunity to help further the educational opportunities for the gifted by publishing this 1977 edition, "Teaching Gifted Students Social Sciences in Grades Seven Through Nine." I am confident that this updated publication will prove to be as valuable as its predecessor in our efforts to help gifted children realize their full potential.

Superintendent of Public Instruction
PREFACE

This publication, which was planned and completed originally in 1972 as part of a project under provisions of the Elementary and Secondary Education Act, Title V, was updated this year as part of a Public Law 93-380, Section 404, project, “Development of Teaching Competencies—Gifted and Talented.” It is intended for use by teachers, consultants, and administrators involved in programs for students whose mental ability places them in the top 2 percent of all boys and girls.

The 1972 edition of this publication was written by Robert S. Miles, Long Beach Unified School District. He prepared it under the direction of Mary N. Meeker and James F. Magary of the University of Southern California. The publication was updated by Gordon Turner, Pasadena Unified School District, under the direction of Paul D. Plowman, Consultant, Gifted and Talented Education, California State Department of Education; and Director of the project, “Development of Teaching Competencies—Gifted and Talented.”

The readers of this publication should refer to another important publication of the Department of Education—Principles, Objectives, and Curricula for Programs in the Education of Mentally Gifted Minors Kindergarten Through Grade Twelve. That document complements the material contained here.

Overview of Instruction in the Social Sciences

No subject area lends itself more to the education of mentally gifted minors than does the study of the social sciences. Webster's Third New International Dictionary defines social science as (1) "the branches of science that deal with the institutions and functioning of human society and with the interpersonal relationships of individuals as members of society!"; and (2) "a science (as economics or political science) dealing with a particular phase or aspect of human society."

Donald Popham describes the social sciences as follows:

The social sciences may be described as those organized bodies of knowledge built up from the formal, scholarly, and advanced studies that deal with human beings and their interrelationships. These sciences are concerned with the detailed, systematic, and theoretical study of human relationships. They provide a perspective within which these relationships may be described, classified, and explained.

Cultural anthropology is the study of the customs, folklore, social activities, and organizations resulting from man's reaction to his environment. Sociology is the study of the forms, institutions, and functions of human groups.

Psychology, Sociology, and Anthropology

Another subject that falls within the discipline of the social sciences is psychology. A behavioral science straddling the disciplines of the natural sciences and the social sciences, psychology is usually defined as "the study of human behavior."

The junior high school can provide a basis for enriching the social science curriculum for the gifted by drawing from psychology, sociology, and anthropology. These disciplines and the overlap between them establish the subject matter that makes up the course of study; it is often difficult, however, to determine where one ends and the other begins. Each segment has its own exclusive body of knowledge, but for the gifted at this level, the boundary lines are erased.

Parameters of the Social Sciences

If individuals are to understand where they fit into the scheme of things and if they are to build a hierarchy of values for themselves and for the world in which they must exist, they need a background of understanding and a basis for making comparisons so that they can make ethical judgments. With the gifted, even in a junior high school situation, an opportunity exists to accomplish, to a limited extent, both of these objectives.

Phenix Hierarchy

This publication presents subject matter that can be divided into separate sections for the seventh, eighth, and ninth grades. The organization used for parameters is taken from Phenix's hierarchy. Seventh grade should have most emphasis on psychology (Who am I?), less emphasis on sociology (What is society?), and least emphasis on anthropology (Where have we been and where are we now?). In the eighth grade the emphasis should shift to sociology, with psychology and anthropology taking lesser roles. And in the ninth grade, anthropology should take the spotlight, with sociology being second in importance and psychology last.

Importance of Good Conduct

Much more goes on in the classroom than meets the eye of the casual visitor. The student must master subject matter, but he or she must also be punctual, cooperative, reliable, accurate, and neat. These and a host of other virtues that support harmonious relationships must be practiced by the successful student. The science teachers who say that science is the least important thing they teach are being realistic. They know from experience that group endeavor is successful if behavior traits are adequately developed.

Goals in the Social Sciences

The major goals in social sciences include the development of human potential within three divisions—process, personal, and situational.

Process Goals

1. The students become aware of the processes involved in learning, and they begin to see the reasons for specific assignments.

2. They are able to communicate abstract and complex ideas by breaking the ideas down to their component parts and finding their underlying assumptions.
3. They are not compelled to go through a predetermined number of stages but are allowed to bypass any stage that seems unnecessary.
4. They analyze complex theories, ideas, and concepts. When they encounter instances of cloudy thinking, they recognize them (for example, stereotypes, the desire to believe, failure to define terms, lack of consideration of all the data, the mistaking of correlation for causation).
5. They are aware of generalizations that are too broad (for example, words like always, never, all, everyone, and no one).
6. They support their own generalizations with specific data.
7. They learn to evaluate the reliability of their sources.

Personal Goals

1. The students learn independently and are able to recognize and use organizational schemata and structures.
2. They become effective questioners.
3. They share information when involved in a group situation.
4. They are able to take discrete ideas, thoughts, and generalizations and weave them into meaningful patterns.
5. They express intellectual curiosity and seek means to satisfy it.
6. They learn to disagree courteously and accept and profit from constructive criticism.
7. They evaluate their strengths and weaknesses realistically.
8. They and the teacher cultivate honest and direct communication.

Situational Goals

1. The students use various media to express their own ideas.
2. They make full use of their environmental sources as aids in problem solving.
3. They work in an environment that allows them to use their intellectual curiosity. The teachers do not impose their personal value judgments upon the students.

Requirements for Successful Program

The attitude of most junior high school students is expressed in the words “I dare you to teach me something; better people than you have tried.” This attitude makes these students difficult to teach, and the gifted in the group present a particular challenge.
Since junior high school students have several years of study ahead of them, they must be helped to form positive attitudes toward intellectual inquiry. As they enter the tenth grade, they should be able to reflect the balance and breadth of curriculum for the gifted. This objective cannot be achieved unless certain administrative procedures are followed.

Small Classes

The ideal number of students in a social science class is about 20, and the enrollment should never exceed 25. In the Long Beach Unified School District, teachers utilize the subgroup method in anthropology classes at the ninth-grade level. Each class is divided into two equal groups. These groups meet on alternate days; the entire class meets only on Fridays. The limitation of subgroups to about ten students each allows the teachers to conduct seminar-style meetings. These meetings contribute to (1) the development of process, personal, and situational goals; and (2) the achievement of those goals.

Exciting Topics

The teacher should encourage students to learn as much as possible by participating in discussions of exciting topics. Drill and rote learning should be eliminated from the classroom.

Reasonable Grading

The mentally gifted represent the top 2 percent of the student population. Letter grades should, therefore, be composed mostly of A's with a few B's. (In average classes nearly all gifted students would receive A's.) It is appalling to learn of high school teachers who grade gifted students in honors classes on a curve. A bell-shaped curve is a graphic way of demonstrating that if the nearly four billion people of the world were tested for intelligence, about 68 percent would be found to be average and would receive C grades if in class; about 16 percent would be found above and below the average and would receive B and D grades if in class; and the 2 percent left would represent the A and F categories.

Teachers who grade on the curve assume that they have a representative cross section of students. But a class for gifted and nearly gifted students would contain the top 2 percent of the student population together with representatives from the next 16 percent. These are the A and B students. The teachers of the gifted should, therefore, continually review their grading practices to make sure that they are treating each of their students fairly.
Cultural Exposure

Teachers should take their students to see and hear significant examples of culture and should bring culture to the students. Students should be able to hear speakers from the faculty, the business world, and community professions. When speakers relate what they do in their vocations, the students listen well, gain knowledge, and are more interested. Teachers should take students to local museums, places of historical interest, colleges, universities, and vocational schools. Each trip will generate discussions pertinent to the study of the social sciences. For example, a trip to a farm can initiate discussions of automation and its effects on migrant farm workers.

Communication with Parents

Some parents wonder why college-type classes are given to children who are gifted and "will all go to college anyway." But many of the gifted do not go to college, and of those who do go, many become disappointed and quit. Those who go on to college should have a background for their advanced studies, but not to such a degree that they will lose motivation to learn later on when they are exposed to college material. And those who do not go on to college will at least have been exposed to the higher processes of learning.

Variety of Activities

Confining a group of children in a class to the use of only a textbook is self-defeating. Yet to have a classroom full of electronic equipment that is misused or unused serves no useful purpose. What is needed is a variety of activities designed to produce worthwhile results.
Chapter 2

Process of Scientific Research

Scientific research conducted by students in the seventh, eighth, and ninth grades differs primarily in emphasis.

Seventh Grade

Special research projects in the seventh grade form an informal and thus introductory to scientific ways of studying human behavior. For example, Tom wants to make a model of a pyramid for the class. He asks, "Do you want a special kind of model?" You answer, "Anything that is three-dimensional." He says, "I don't make things well with my hands." You answer, "You are not to be graded on artistic talent." Tom asks, "What will I be graded on?" You reply, "You will be graded on what you show you have learned about pyramids from your model."

Significant questions such as What should I make my model of? show that the research may be coming to a temporary end. To students who are kinesthetically gifted, the most important part of the project will be the model; to the teacher, however, the model should be least important. Tom might be right about not having an aptitude for building things, but he will have had more academic exposure than mechanical exposure.

Of course, little demand exists for pyramid builders, but a demand will always exist for people who can assume the responsibility for a project and carry it out to a successful conclusion. These abilities are concrete properties of successful research to which students need to be introduced. Tom's model might look more like the leaning tower of Pisa than like a pyramid, but in industry the final model would probably be crafted by skilled workmen supervised by men like Tom and designed by professionals more kinesthetically gifted than he.

Eighth Grade

Research projects conducted in the eighth grade may be much like those conducted in the seventh grade except that a more sophisticated level is attained. For example, a model of Stonehenge may be constructed. For success at this level, more analytical intellectual skills are required.

Whether each student should be given the same assignment or a different assignment depends on factors such as class size, availability
of research material, and individual interests and time. When students have different projects, each student may present a five-minute oral presentation, which helps students to become proficient in expressing themselves orally. Moreover, an oral presentation helps others to learn better and prevents boredom.

Ninth Grade

In the ninth grade, projects can be chosen similarly from curriculum content, and the time allotment can be stretched over a longer period.

Steps in Successful Research

In carrying out a research project, students should proceed according to five important steps.

Step One: Logic

The first step to be taken is to devote a full week to the study of formal logic. Students should learn to think clearly. Here is one suggested approach that a teacher may make for arriving at clarity of thought: "We are going to study logic most of this week. Logic is the science of correct thinking. What do we mean when we say that something is logical? I am going to write some numbers on the board. You try to figure out what logically follows. (The teacher writes on the board the numbers 22 33 44 55 ___.) Bill, what goes into the blanks? Six? Why not seven? Of course, all problems in logic are not as simple as this one. Ice is cold, but dry ice can burn your hand. Heat may be used for purpose of refrigeration. A person may laugh until he cries or cry until he laughs."

Mistakes to be avoided. Mistakes in logical thinking may now be pointed out. These include the false analogy, the accidental concomitance, and the unknown circumstance. An example of false analogy is the belief that because a person has long fingers he or she should become a concert pianist. To attribute rain to the fact that one had planned a picnic on that day is an example of accidental concomitance. And the unknown circumstance is illustrated by the story about the king of Siam who called the traveler from Holland a liar because the Hollander said that people in his homeland could walk on water part of the year. (The king had never seen or heard of ice, so he could not believe it was possible to walk on water.) To be competent in evaluation skills, students must be aware of these fallacies.

Inductive and deductive reasoning. The basic types of reasoning are inductive and deductive reasoning. Each works in almost opposite
ways. Inductive reasoning goes from specific instances to a general rule; deductive reasoning goes from the general rule to the explaining of specific instances. For example, a small boy eating an apple discovers that the apple has a core. The next apple he eats also has a core, and the apple his sister eats has a core. Little by little he puts this information together and comes up with a general rule for all apples, which is that all apples have cores. He has gone from the observation of individual apples to a rule for all apples. This reasoning is an example of inductive logic. It also describes how students can derive concepts. The teacher should request students to develop their own examples.

Deductive logic goes the other way. If a child knows that all apples have cores, he or she can predict that another child eating an apple will find a core in the apple.

One of the most obvious uses of logical sequence is in outlining. A unit of study can be undertaken in which the mechanics of outlining are articulated in English class while the logic and sequence of outlining are taught in social science class.

Step Two: Research Paper

Step two deals with (1) specific qualifications; and (2) use of models.

Specific qualifications This part deals with specific qualifications; i.e., topics, footnotes, and sources. It is important to discuss what a true topic is; a paper entitled "Evolution" certainly promises more than it can deliver. A good paper is not composed of opinions. Opinions have their place, but not in this type of research.

Use of models. One technique for teaching form in a research paper is the showing of models. The teacher should copy a sample page on a ditto for each member of the class as a reference form to follow in writing his or her paper.

A Sample Page

The most important thing to remember when assigned a research paper is to begin it promptly. Once done, half begun. Make sure that your work is well organized. Select a topic that is brief. Make a tentative outline at this point. This is done to keep you from wandering off the subject. Philo Wartle has stated:

I meant well when I began, but I neglected to make an outline. By the time I got to the end of the paper I was no longer writing about the original subject, but it was too late to do the work over. I turned it in anyway. I knew I could fool the teacher.
“Find your references in the card catalog.”
Write down all of your sources.

Don’t use too many ibids.

Ibid., p. 123.

The error in the second sentence of the sample just given should be pointed out. “Once done, half begun” is wrong. It should be “Once begun, half done.” This error illustrates one of the many reasons for footnoting. If an “expert” is quoted and is wrong, it is his own fault, not that of the writer.

Step Three: Selection of Hypothesis

A method that has proved effective and practical for selecting a hypothesis and that teaches analytical skills at the same time is the following:

For a group of ten, arrange five chairs in an inner circle and five in an outer circle. Arbitrarily divide the group. Tell them: “Inner circle, I am going to give you an idea to discuss. I will tell you what the topic is and give you about a minute to think it over. Then I will call on you one at a time. You will tell me whether you believe the statement to be true. Then you will give me your reasons. We will continue around the inner circle until everyone has contributed. Meanwhile, those in the outer circle will take notes. Then we will change places; the inner circle will become the outer circle and the outer circle becomes the inner circle.”

The instructor should say very little. However, making a tape of the discussion is a good technique if students don’t comprehend readily. The tape can be played back later with instructional comments or can be used for individual review.

Using hypothesis as a vehicle of scientific inquiry requires teaching it first as a vocabulary word. Using hypothesis as a concept, the teacher can begin a lesson plan. Some hypotheses that children enjoy discussing are the following:

1. Personal cleanliness is a sign of intelligence.
2. Light-skinned people are more sensitive to pain than dark-skinned people.
3. People of different races can safely give blood transfusions to each other.
4. Basic IQ throughout the world is distributed on an evenly basis.
5. Every society considers its own culture to be best.
6. Civilized people are happier than uncivilized people.
7. Language is society's most valuable invention.
8. People are human because they can reason.

_Early Man_ (from the _Life_ magazine series) offers many hidden hypotheses. The teacher should request three hypotheses of interest from each student and should provide each student with a 7.5 x 12.5 cm card on which to write them. As the cards are ready, the students can tack them to a bulletin board in the room. After the teacher reads the cards and writes comments on them, the actual research is ready to begin.

**Step Four: Class Evaluation**

When the finished papers are turned in, the teacher should give to each student the paper of another student together with a research evaluation sheet. The teacher using this approach may want to have each paper evaluated by several students before collecting everything, filling out his or her own evaluation sheet, and finally returning everything to the owner. A sample research evaluation sheet is given as follows:

_Sample Research Evaluation Sheet_

Name of author ____________________________
Title of paper ______________________________
Name of evaluator __________________________
Is the title a true topic? _________________
Is there an outline or table of contents? ______
Does the paper follow the outline? ___________
Rate the overall form: Poor  Good  Excellent
Comment on ways to improve the paper: ________________________________

**Step Five: Oral Presentation**

Each student reports to the class on his or her work. At the conclusion of each presentation, questions are solicited from the audience. This procedure teaches synthesis and gives the students practice in fielding questions and thinking on their feet.
Communication of Research Hypotheses

A value-centered approach stresses the importance of applying classroom-acquired information to the outside world. Most students from upper middle class homes have often discussed hypotheses with their parents around the dinner table. On assignment, these students can also discuss their hypotheses with their peers and with adults in the community. Disadvantaged or minority gifted children have usually not experienced such conversations.

Sample Questions

Questions are needed that (1) polish communication skills; (2) point out the importance of distinguishing fact from opinion; and (3) aid students in forming intrinsic values. Examples of such questions are the following:

1. Are individuals and societies the products of their cultures or are cultures the products of individuals and societies?
2. Do all human beings have the same basic needs? What are the basic needs? Is a car, in our society, a basic need? How are basic needs satisfied? How does environment fashion the way that people satisfy needs?
3. What do we mean by "uncivilized"? How can we explain that some uncivilized people have no jails because they have no crime? Why do civilized people need jails?
4. What are the subcultures in our society? What are the subcultures in other societies? When subcultures conflict, what must the individual do?
5. Are customs and beliefs learned or innate? How much of what one calls his conscience is a person born with?
6. What is there about culture that makes persons so slow to change their own society?
7. What is there about our own culture that makes us so slow to accept cultures much different from our own?
8. How does the lack of an effective language hinder animal societies? Are there human societies that are hindered by the lack of an effective language?
9. What is a superior culture? Contrast a superior culture with an inferior culture.
10. What characterizes the "American culture"? Can any parts of our culture be traced back to other cultures?
11. Are some people culturally behind others because certain races are more backward than others? What is a race?

Finding answers to these questions is not necessary; in some cases it is impossible. The thinking and inquiry involved are what is
important for the child's growth in the social sciences. Robert Frost once said that good teachers are those who ask questions that they themselves cannot answer. If the truth were admitted, the best sources of unanswerable questions are often the students themselves.

Use of Film Preview Techniques

Techniques used to preview films can also be used to evaluate other forms of communication. When organized planning is followed, students learn to know concepts, to analyze relations, and to abstract meaning. First, it is advisable for the teacher to read any information that is distributed by the producer. The steps to be taken then are as follows:

1. Preview the film and take notes for later use.
2. Prepare the class. Discuss the topic (not the film plot) ahead of time.
3. Do not compel the students to take notes as they view the film.
4. Discuss the film with the class after it has been shown. Point out details that are important.
5. Show it again. This time stop the film from time to time. Go up to the screen and point out subtle details such as the expression on an actor's face or a significant prop in the setting.
Applications of Research Skills

This chapter deals with sample applications of research skills. The method used is to begin inductively and end deductively.

Anthropology: Inductive Method

The Siriono Indians of Bolivia were studied for 18 months by Allan Holmberg, an anthropologist. He lived with these people to determine the relationship of the hunger drive to culture. He chose the Sirionos because of their constant struggle to survive in a land where economic scarcity prevails.

The teacher should initiate the case study with a lecture. After the lecture students should be given study sheets containing questions based on the lecture. Students are to fill in the answers on the study sheets. Additional questions that the teacher may wish to ask of the students are given as follows:

1. Knowledge and convergent production. Where is Bolivia? Can someone show it on the wall map? What is the altitude of the region in eastern Bolivia where the Sirionos live? How can altitude affect living conditions? Why are the Sirionos isolated from the civilized world?

2. Analysis and evaluation. What value is there to studying isolated tribes? Why is it important to know that Holmberg was theanthropologist who studied the Sirionos? When was his study made? Would there be any difference in the value of Holmberg's study if he had spent only two weeks among the Sirionos instead of 18 months? Although this study took place a number of years ago, is it still valid? Why or why not? What was the purpose of the study?

3. Divergent production and synthesis. What is a good definition for hunger? What is culture? Is there a relationship between hunger and culture? What is a biological drive? Can you give some examples? Are biological drives innate? Are they ever satisfied as long as the organism is alive? What is a psychological drive? Can psychological drives be satisfied permanently? Are they innate?
Other items that might appear on the study sheets given to the students are as follows:

Altitude?
Number of seasons?
What determines seasons?
How many inches of rainfall?
When is the rainy season?
Type of terrain?
Temperature?
Animal life?
Edible plants?
Average height and weight of Indians?
Color of skin?
Characteristics of hair?
Distinct facial characteristics?
Physical trademarks in general?
Population?
Social groupings?
Wars?
Marriage customs?
Leadership?
Family units?
Size of house?
Materials from which houses are made?
Furniture?
Degree of cooperation practiced by these people?
Use of materials found in their environment (plant fibers, clay, and so forth)?
Tools?
Weapons?
Clothes?
Decorations?
Use of fire?
Preparation of food?
Means of transportation?
Musical instruments?
Language?
Mythology?
Government?
Rhythm of activities?
Agriculture?
Hunting and fishing?
Ownership of property?
Preservation of foods?
Taboos?
Games and toys?
Marriage and divorce?
Health?
Problems of old age?
Death and burial?
Religion?

The reproduction of correct answers is, of course, an intellectual task of a lower level (convergent production), but it serves as a foundation for developing intellectual skills of a higher level.

Anthropology: Deductive Method

If the approach to the research is to become deductive, students will have to do library research to find another tribe or group of people to investigate for comparison. The teacher should discourage the use of only the encyclopedia and encourage the use of other sources like the National Geographic and sociological textbooks. The name of the new tribe being investigated is to become the topic for the deductive paper. Some of the information listed on the first study sheet will not be found for the people under investigation; on the other hand, information will be discovered that is not asked for. The teacher should discuss these possibilities and should encourage students to add whatever seems significant.

A list of present-day groups or tribes that the students can investigate for comparison might be the following:

- Bushman
- Pygmy
- Eskimo
- Aborigine
- Bedouin
- Berber
- Koffir
- Druze
- Kirghiz
- Tartar
- Gypsy
- Ainu
- Dayak
- Maori

After a specified period of reading and note-taking, the group is brought back to a seminar. One student initiates the discussion by giving information about the tribe he or she investigated. The student discusses one aspect of the tribe's culture. A sample teacher-student exchange is as follows:

Teacher: "Bill, let's discuss religion first. What group did you study?"

Bill: "The Eskimos."

Teacher: "Tell us about their religion."
After Bill talks about religion among the Eskimos, Mary follows up by discussing religion in the tribe that she investigated. Everyone is limited to this one topic until all have reported. Group discussions follow in which comparisons are made, and both deductive and inductive reasoning is used to explain the differences.

Using this approach early in the first semester provides valuable background information and helps set standards for the inquiry process.

Psychology and Sociology

The making of lesson plans is not within the scope of this publication; however, several ideas are presented as stimulus questions or discussion starters. The curriculum areas are not divided by subject matter because of overlap; generally, however, they are drawn primarily from the fields of psychology and sociology.

Ontogeny and Phylogeny

The subjects discussed in the remainder of this chapter are divided into the headings of ontogeny and phylogeny. Ontogeny generally refers to the complete developmental history of an individual organism. Phylogeny generally refers to the complete developmental history of a race or group of animals. As applied here, the terms refer to the development of language. Where emphasis is placed on present development, ontogeny is used; where emphasis is placed on overall development, phylogeny is used.

Ontogeny

A problem. Does language change?

1. Gathering data
   a. Get a book of Shakespeare’s plays. Read several pages. Write down all words that are unfamiliar to you. Try to look these words up in an abridged dictionary. Try to estimate the percent of unfamiliar words in every 100 words you read.
   b. In the school library, get a copy of Chaucer’s Canterbury Tales. Repeat the rating process.
   c. Do the same with Beowulf

2. Evaluating data
   a. Make a master list of unfamiliar words from each of the three sources.
b. Discuss the reasons for some dictionaries having a “new word” section.

c. Try to bring in an old dictionary. Look for differences between this dictionary and a recent one. Discuss compound words.

3. Selected references

B. Problem: If language has changed, can we tell whether it is changing now?

1. Gathering data

a. Have students compile a master list of campus slang. As a homework assignment, have the students talk to their parents and make a list of the slang of their generation. Then have them talk to grandparents and to neighbors who are older than their parents. The students should make a master list of their parents’ slang and grandparents’ slang.

b. Have many slang words survived over the last two or three generations? Why is slang used? Is slang language? Can any slang words be traced back to their origins? Do foreign languages contain slang?

c. Have the class invent a list of slang words. Tell them to use the words with their friends. Obviously, the class must not divulge where the list came from or why it is being used. After a week or two, class members should be hearing their friends using some of these words. When this event occurs, what will the class have proved?

C. Problem: Can punctuation marks change along with language?
   1. Gathering data
      a. An advertising executive has invented a new mark of end punctuation. It is called the interabang (or interrobang). Its use is to terminate sentences that are half exclamation and half inquiry. Examples include *You don't say!* and *Who do you think you are?* The interabang's symbol is, appropriately enough, an exclamation point superimposed on a question mark.
      b. Is this mark of punctuation needed?
      c. Is there a mark of punctuation that is really unnecessary?
      d. Can the history of any of our punctuation marks be traced?
   2. Selected reference

D. Problem: Can a language such as English be suddenly replaced by a different language?
   1. Gathering data
      a. Almost 3,000 languages are in use in the world right now. Of the thirteen major languages, Chinese is spoken by 700 million, Russian by 130 million, and English by 250 million.
      b. Several world languages have been proposed. Among these are Esperanto and Interlingua. Are the major countries of the world likely to discard their present languages "in the interest of world peace" and take up a new language?
      c. What problems would be involved in such a change?
      d. What advantages would there be to such a change?
   2. Selected references

E. Problem: Will breaking the code of dolphin "language" help us to understand the evolution of our own language?
   1. Gathering data
      a. An animal that is raised in isolation normally develops sound patterns typical for its species. For example, dogs
that have never heard another dog, utter a sound of any kind still manage to bark. The same is not true for the human animal. Some ancients believed that a human raised in isolation would speak perfect Hebrew because it was man's "instinctive" language. But we know that if a human does not learn a language he or she has none; the same is also true for dolphins.

b. Do you have a pet?

c. How does it communicate with you?

d. Would you call its method of communication a language? Explain your answer.

e. Has your dog ever said to you, "Hi, Mary. What are you going to give me for lunch today?"

f. What would be the advantages of being able to talk with a dolphin?

g. Why are scientists trying to decode what a dolphin says instead of what a dog says?

h. What determines the intelligence of an animal?

i. What is the difference between knowledge and intelligence?

2. Selected references

Phylogeny

A. Problem: Which came first, a written or spoken language?
1. Gathering data
   a. Which form of language did you use first?
   b. Do you know of anyone who first learned to write, then to speak?
   c. Explain the expression "frozen words."
   d. Find an alphabet in an encyclopedia that shows the evolution of the alphabet from Phoenician to Greek to Latin to English. Explain how the changes took place.
   e. Are there any letters in our alphabet that these other alphabets do not have?
   f. Are there letters in our alphabet that we can eliminate?

2. Selected references

B. Problem: What makes us what we are?

1. Gathering data
   a. Have you ever heard anyone say about someone else, "He has no personality"?
   b. Is it possible for a person to have no personality? Why or why not?
   c. Find the origin of the word "personality." It comes from the Latin word *persona*, which means mask. We falsely think that a normal person is always the same. Each of us is many people. We continually put on masks of different kinds. Compare the mask worn in the classroom with the one worn at lunch. What kind of mask is put on when a mother asks a child for help with the dishes?
   d. What scale can be used to rate someone's personality?
   e. Is it possible for a person to be 100 percent good or bad? Give reasons for your answer.
   f. Can we rate personality by looking at the face of the person being rated?
   g. What does an honest person look like?
   h. What does a dishonest person look like?
   i. How does an honest person act?
   j. How does a dishonest person act?
   k. Bring in pictures for the class to rate for honesty.

2. Selected references

C. Problem: Can personality be "read" by checking the location and size of bumps on a person's skull?

1. Gathering data
   a. Do you think that the brain is the center of human control?
b. Do you think that different parts of the brain control different human functions?

c. Do you think that an excess of brain in one area is likely to make an individual show an increased sensitivity to that function?

d. Do you think that an excess of brain in one area is apt to make a bump in the skull?

e. Can you find a phrenologist's "map" of the skull? Bring it to class.

f. What has modern brain surgery proved or disproved about phrenology?

g. Are there phrenologists around today?

h. Why do you think some people go to phrenologists?

i. Name some other "sciences" like phrenology.

2. Selected references

Ellis, J. Character Analysis: Subman or Superman? Santa Ana, Calif.: Flagg, 1929.

D. Problem: What price have humans paid for standing erect?

1. Gathering data

a. Humans are the only quadrupeds that stand erect on the flat of their feet. (Gorillas stand erect only momentarily.)

b. The human backbone has become vertical. It bends forward in the neck, backward in the thoracic region, forward in the lumbar region, and backward in the sacrum.

c. The spinal column is the first organ in humans to age.

d. What back, leg, and foot problems do humans fall victim to?

e. What are the advantages of walking upright?

f. What would be the advantages of walking on "all fours"? Skeletal diagrams should be brought to class for comparison.

Chapter 4

Involvement With the Bill of Rights

The purpose of this chapter is to heighten student awareness of justice and due process of law through meaningful involvement with the Bill of Rights, which is a defendant's guarantee of a fair trial. The concepts of justice and the process of law are unit themes on which the class activities can be centered. Students are encouraged to seek out the meaning of these concepts through selected readings and library research in preparation for a mock trial. At the trial a famous person from history is charged with a crime and has to appear before the bar of justice. Students who do not feel capable of presenting their ideas orally can participate by editing a class newspaper or constructing a mural dealing with the trial.

The curriculum, which has been tried successfully with gifted students in grades seven through nine, offers the student a more exciting experience than the regular course of study. It capitalizes on the gifted child's greater curiosity, energy, and versatility. In giving an historical figure a preliminary and grand jury hearing, a trial, and an appeal, the class experiences the concept of due process. History becomes more meaningful to the young learner because it is related to the present in a manner that draws on his or her enthusiasm for the dramatic. Since each student is involved in some phase of the total process, he or she feels a part of it and comes to see that due process and justice are intended for everyone.

Learning Activities

The following learning activities are presented solely as a guide for those teachers who may wish specific examples. Teachers are expected to vary these activities in terms of their own interests and the interests and enthusiasm of their students.

Historical Defendant and the Charge

In planning for a mock trial, the students should try to find personalities who are controversial. Some possibilities are the following:
Medieval Justice: Trial by Ordeal

The class should analyze and evaluate the concept of justice accepted in the Middle Ages and that accepted today. Trial by ordeal as practiced in the Middle Ages did not involve an attempt to determine justice by rational means. People then looked to God to work miracles in protecting the innocent and punishing the guilty. Today we look to a fair hearing to discover the truth. Every person should be given a chance to defend himself or herself in a court of law.

The past human beings have demonstrated some strange practices in deciding a person's guilt or innocence. The following story describes the type of trial that took place in Europe many hundreds of years ago. The students should try to notice how such practices differ from the legal procedures we use today.

When Knights Were Bold

In charges of serious crime, the people of the Middle Ages often used methods that might well appall the most innocent. One was to bind the accused, hand and feet, and let him down by a rope into the water. It was believed that if he were guilty, the water would refuse to receive him and he would float; but that if he were innocent, he would sink. It is to be hoped that the officers never forgot to rescue the man who sank. Far worse than this was the ordeal by boiling water. This was a matter of much ceremony. It took place in the church. First a cross, a censer, and relics of the saints were borne into the building. The priest followed, carrying a copy of the Gospels. He chanted a litany and the seven penitential psalms. He prayed that the truth might be revealed and that if the accused had had recourse to herbs or magic, it might not save him. Holy water was sprinkled about, particularly upon the kettle, in order that any illusions of the devil might be driven away. Then with many prayers the hand of the accused was thoroughly washed. He drank a cup of holy water and plunged his hand into the boiling kettle. The hand was sealed up, and at the end of the three days it was examined formally. If it showed no sign of a burn, the man was declared innocent; but if there was a blister "half as large as a walnut," this was regarded as proof of his guilt.
Another ordeal was that of the hot iron. This sometimes consisted of carrying a red hot iron seven or nine paces; sometimes, of walking upon burning plough shares. In the eleventh century, Queen Emma of England was accused of crime and was brought into the church for the test. The pavement was carefully swept, and nine red hot plough shares were laid upon it. The queen’s shoes and stockings were taken off and her cloak thrown aside. Two bishops, one on either hand, led her toward the iron. Throughout the church there was sobbing and weeping. “Help her, Help her! Saint Swithin, help her!” the people cried. The bishops, too, were in tears; but they bade her not to fear, for God would not suffer the innocent to come to harm. Then she stepped upon the plough shares, one after another. The old account says that she felt no pain and that her feet showed no injury.

The theory of these trials was that God would always save the guiltless; but many explanations have been attempted of the reason why the hot water and hot iron did not burn. If the water or the melted lead, which was sometimes used, was hot enough, feats similar to these have been performed. In regard to the test of the red hot iron, it has been suggested that during the many prayers that seem to have been said after the irons were laid in place, plough shares on a stone floor would cool very rapidly. Again, we are reminded that all these trials were in the hands of the priests, that the people were expecting miracles, and that if the priests wished to save a man, they could easily arrange some deception or could harden his skin by some ointment.

Enrichment

Some teachers may wish to schedule several additional lessons to provide the class with more historical background about the defendant to help make the preparations more meaningful. Teachers can focus the attention of students on a few selected issues and use these as the basis for homework and class assignments. For example, if Hitler were being tried on the charge of waging wars of aggression, the class could investigate in their texts the whole period of the late 1930s and early 1940s in terms of the defendant’s invasion of other lands. They could also consider a possible defense, for example, other rulers such as Joseph Stalin and Genghis Khan committed similar deeds, yet were never brought to trial. Are the rulers of nations immune from such charges?

The Bill of Rights

The protection of the rights of a defendant in a criminal trial is one of the most important functions of the Bill of Rights.

---

The students should read the first two selections of Frank K. Kelly's *Your Freedoms The Bill of Rights*. These selections deal with the Fourth Amendment's protection against unreasonable search and seizure and the Fifth Amendment's guarantee of the right to remain silent. The teacher and the students should try to solve the four problems that follow. Several different solutions may be suggested. No one correct answer exists as to what the Bill of Rights means. Even U.S. Supreme Court justices disagree when they offer their interpretations. Many important cases are decided by a five-to-four vote; therefore, the teacher and the students should use their own ideas.

**Fourth Amendment Problems**

1. Three persons die in a collision between a truck and a car. The truck's driver is found by the police, unconscious. An empty liquor bottle is found in the truck, and the driver's breath has a strong odor of alcohol about it. The police order a doctor to take a sample of the unconscious man's blood and test it for alcohol content. The test reveals that the driver was under the influence of alcohol at the time of the accident. He is tried, found guilty of manslaughter, and sentenced to a term of six months to ten years in prison. Lawyers for the defendant appeal through the courts to the U.S. Supreme Court. They argue that the taking of a blood sample while the defendant is unconscious is an unreasonable search and seizure contrary to the Bill of Rights. If you were the judge, how would you decide this case? Give reasons.

2. Police enter the home of a suspected drug addict. They force their way into his bedroom, where he is hiding. As they enter the bedroom, the suspect seizes two capsules or pills from the nightstand and swallows them. The officers try to force open his mouth to get the pills. They fail to do so. The suspect is swiftly taken to a nearby hospital. There his stomach is emptied by a stomach pump. The contents brought out are then examined. Traces of morphine, a narcotic, are found in large enough quantity to conclude that the suspect recently swallowed the drug. The suspect is put on trial, and the hospital report is offered in evidence. The defendant is found guilty and is sentenced to prison. His lawyers appeal the case on grounds of improper search and seizure. How would you decide this problem?

3. Two police officers stop a speeding motorist on a desert road. As they write out his ticket, the officers smell a strong odor coming from the trunk of the man's automobile. The officers
ask for permission to take a look inside the trunk. The man
refuses to permit the officers to do so. In spite of his refusal,
the officers take his keys, open the trunk, and discover a body
that later turns out to be the motorist's wife. She, has been
murdered. Evidence on the body indicates that the motorist has
committed the crime.

The motorist is forced to stand trial. The defense lawyer
argues that the body should not be used as evidence against his
client since its discovery was the result of an "unreasonable"
search. The Bill of Rights does not forbid searches for evidence.
It does forbid unreasonable searches. Evidence obtained by the
police as a result of an unreasonable search may not be used in
court even though the evidence is true.

The judge agrees that the evidence may not be used. Since
the district attorney has nothing else to link the defendant with
the crime, the defendant is set free. Do you agree with this
decision? Why or why not?

4. You carry a bag as you walk through a strange neighborhood at
night. Police officers, alert because of a series of petty thefts,
stop you. They demand to see the contents of your bag. May
you, on the basis of constitutional right, refuse to permit the
officers to examine your bag? On practical grounds alone,
would it be advisable for you to let the officers see the
contents? Why?

Fourth Amendment: Enrichment

1. Because of a wave of cheating that has swept the school, the
principal has placed tiny electronic listening devices called
"bugs" in the boys' and girls' rest rooms. From his office the
principal can listen to what is being said in the rest rooms.
Several students are overheard to say that they cheated on tests.
On the basis of this evidence, the students are suspended. Has
the principal used a fair means of gathering evidence?

2. The police have a suspect who they think has committed a
series of brutal murders. The suspect, a man, is traced to a
motel. The officers place a "bug" in the man's room. They
overhear him confess his crimes to an accomplice. On the basis
of this evidence, the suspect is arrested, tried, and convicted.
Have the police used a fair means of gathering evidence? Why or
why not? If the student responses to this question are different
from those offered in Item 1 above, the students should explain
why their responses are different.
Fifth Amendment: Problem

The students may read Chapter 8, "Fifth Amendment: The Right to Remain Silent," in Your Freedoms: The Bill of Rights, by Frank K. Kelly.

A defendant in a burglary case admits to being in the vicinity of the burglarized house at the approximate time of the theft. When asked a subsequent question, the defendant pleads his right under the Fifth Amendment to remain silent. May the defendant refuse to answer any more questions? Why or why not?

Fifth Amendment: Enrichment

A student may be asked to prepare a brief play to be acted out by other members of the class and to be used for discussion. The play should revolve around the following questions:

1. Should people be informed of their rights?
2. Should a "confession" be read to a jury?
3. Should the police have a search warrant to seize evidence?

A suggested title for the play would be: The Arrest of Adolph Hitler.

Sixth Amendment: Problem

Students may read Chapter 9, "Sixth Amendment: Fair Trials and Trials by Jury," in Your Freedoms: The Bill of Rights, by Frank K. Kelly.

Millions of Americans are shocked when, before their very eyes, an important political leader is shot to death while giving a speech on nationwide television. The suspect is clearly visible on the picture screen as he fires the shot. His attorneys argue that he may not be put on trial anywhere in the country because it is impossible to find 12 impartial jurors. How would you, in the role of a judge, decide this issue?

Sixth Amendment: Enrichment

The teacher may arrange with an outsider to enter the class at a prearranged time to act as an "assailant." The assailant, who could be carrying a weapon made of paper, pretends to scuffle with the teacher. After a few moments the assailant runs out the door. The students are then asked to describe what they saw. What was the weapon? In which hand was it? Describe the assailant. What was said? The class might develop an interesting discussion concerning the reliability of witnesses and the need for cross-examination.
Eighth Amendment: Problems

1. The local board of education empowers a principal to punish offensive students. According to the rules, “the pupil is to be placed in the pillory during part of each lunch hour for a period to be determined by the principal; his head and hands are to be thrust through the holes made for that purpose; his offense is to be posted nearby for all students to see.” Do you think this punishment violates the Eighth Amendment’s prohibition against cruel and unusual punishment? Why or why not?

2. As punishment for violating school rules, the offending boys and girls have their heads shaved: Is this act a violation of the students’ constitutional right to be free from cruel and unusual punishment? Why or why not?

3. A teenaged boy is accused of stealing a new car from its owner. The judge sets the trial for a date four months away and orders bail set at $2,000. Is the judge’s action fair?

4. A man is involved in a serious automobile accident that results in the death of three people. He was drunk at the time of the accident. This is the fifth time he has been involved in an accident while drunk. The judge orders him held for trial and refuses to set bail. Is the judge’s action fair?

5. Several teenaged boys and girls are arrested for disturbing the peace. They were overturning garbage cans and honking auto horns to celebrate their team’s victory. The judge finds them guilty and sentences each to pay a fine of $100 or to spend a month in jail. Is the judge’s action fair?

6. A teenaged boy is arrested for speeding. At the time of his arrest he was driving nearly 100 miles per hour. The boy pleads not guilty, and a date for the trial is set. In the meantime he is released without bail in the custody of his lawyer. Is the judge’s action fair?

Additional Activities

The activities presented here are designed to promote active learning among the students.

Interested students may volunteer to read scenes from Twelve Angry Men.2 Approximately 15 minutes are needed during each class meeting to complete the reading of the play.

Some sample discussion questions are the following:
1. Who do you think made the best juror? Why?
2. Did the young defendant receive due process? Why or why not?
3. According to the writer of the play, what are some of the strengths and weaknesses of our system?

Written and Oral Analyses

The students may read and react to selections dealing with the Eighth Amendment concerning reasonable bail and cruel and unusual punishment.

Case Study

The students may read the following selections:

Some students may want to be the editors assigned to cover the trial for the class newspaper. These students are free to decide what stories to place in the newspaper and how they are to be written. But what if the defendant complains that a newspaper influenced the jury and made a fair trial impossible? Here we see a conflict between different kinds of rights. Which right takes precedence? Who decides?

Citizenship Quiz (Review)

The students should read *The National Citizenship Test* 3 Then, on a separate sheet of paper, they should answer the questions about the rights of the people in the story.

Analysis of Trial Records

Transcripts of any of the mock trials from *The National Citizenship Test* may be used to initiate discussion of the historical

---

inaccuracies that may have emerged during the trials. Students may (1) discuss propaganda devices that participants may have employed to argue their cases; (2) analyze conflicting testimony of witnesses; and (3) trace conflicts and differences in primary and secondary sources used in student research.

Bulletin Board Project

The teacher may appoint a small committee of students to create a bulletin board. Members of the class may be asked to bring in articles and pictures relating to the unit themes.
Chapter 5

Development of Creativity: Field-Study Method

The social sciences offer a unique opportunity for developing creative approaches in interpersonal relationships. The field-study method, when used by students, has advantages as follows:

1. Places the student in a position of understanding other people's opinions
2. Develops sensitivity to other people's problems
3. Gives the student practice in communication skills
4. Trains the student in the art of inquiring
5. Exposes the student to nuances of meaning that will further his or her understanding of social behavior in general

Topics for Interviews

Topics for exploration in interview situations are as follows:

1. What are some good questions to ask around our school?

After making up a list of questions, the teacher should have the class members predict the number of yes and no answers they will get from polling 100 students. Then the class should be sent into the "field" to ask the questions. A specific number of interviews should be assigned to each student to keep the total around 100.

Do you think our percentages would be different if we polled 200 people? 300 people? 500 people? Would polling more people tend to make our figures more or less reliable?

How carefully must we choose the people we interview?

2. What do you think is the difference between observation and introspection?

Which is more reliable?

Can you think of a third method?

Do you think people ever lie to themselves?

Why should anyone ever lie to himself?

Is there danger in lying to oneself?

Have you ever lied to yourself?
Is daydreaming a form of lying to oneself?
Is a lie always bad?

3. How would you compare instinct in humans and in lower animals?

If an animal is raised with humans, it remains an animal. If a human is raised with animals, is he or she an animal? Why?
If a child touches a hot stove, he or she will never touch a hot stove again. If a monkey touches a hot stove, it will never touch any stove again.

4. Some psychologists think that human beings may enjoy torturing themselves to a slight extent. What do you think?

How amusing are amusement parks?
Alcoholic beverages may give the user a hangover. Do you think some people drink to get a hangover?
Do you think that bad-tasting medicine is more popular than good-tasting medicine?
If an antiseptic "burns," is it really doing its job?

5 There is nothing good or bad, thinking makes it so

What do you think this statement means?
Is nothing really good or bad?
Should there be censorship?
If so, who will be the censor?
What sort of thing will we censor? Why?

Topics for the Classroom

In the opening section of this publication, a definition of social sciences was given: "Social sciences are concerned with the detailed, systematic, and theoretical study of human relationships." The disciplines that give major emphasis to the study of humanity are psychology (concerned with the individual); sociology (concerned with the grouping of humanity); and anthropology (concerned with the beginnings of human acculturation). Gifted children in junior high school need to probe these disciplines more than the average child would.

The topics suggested in this section are only a few of many that can be used by the teacher to initiate gifted students into the broad coverage of psychology, sociology, and anthropology. These topics are given as follows:

1 How many ages do you have?

Ages are almost always given chronologically. The teacher should explain that persons have many ages. Chronological age is probably the least important of all.
2. If you were put in charge of training humans or animals, would you prefer to use reward or punishment? Could you use them in combination? If you did use them in combination, which would you start with? Does society use reward or punishment more often? Bring to class three pages of a newspaper. Mark examples of reward and punishment. If a police officer stops your father's car, is he or she more likely to apply reward or punishment? Why? What is the police officer's job? What should you do if you think the police officer has treated you unjustly? How would our lives be different if there were no police officers?

3. Should an unjust law be obeyed? What makes a law unjust? Can you think of an example of an unjust law? Do you think that a curfew is unjust? What can we do about unjust laws? What is justice?

4. Consider the school to be a city in miniature. What roles are played by the principal, teachers, and students? Make a sociogram of the student body. Include such headings as socialites, hangers-on, hoodlums, and so forth. Which groups do your lines connect? How does the school as a city compare with a primitive tribe already studied?

5. Can you make a distinction between "upper class" and "lower class" in a society? Can yearly income be a criterion? Can attitude toward society be a criterion? Can the type of work done by the head of the household be a criterion? If these classifications exist, is it possible to move from one class to another? If so, how? Is education a criterion? If combinations of criteria are needed to identify a person as belonging to the upper or lower class, what would the most likely combinations be?
6. Trace the recreational activity of human beings from ancient times to the present.
   Are there any similarities between past and present?
   Do you see any general improvement?
   Do the amusements of a civilization reveal anything about its morals or state of decay?
   Do you think boxing and wrestling are moral amusements?
   Are they now more moral than they once were?
   What is your opinion of bullfighting?

7. Do plants and animals adapt themselves to their environment by changing structurally?
   If you think they do, what authorities can you quote?
   If you don't think they do, what authorities can you quote?
   What argument can you muster for either view?

8. People attempt to solve their problems by means of devices they invent called folkways.
   One folkway is shaking hands. Why do we shake hands?
   Another folkway is having the man work and the woman stay home (usually). Is this folkway changing? Do folkways change? Why?
   How many folkways can you list?
   Can you find folkways in other societies somewhat like our own?
   How many of our folkways can you trace back to their origins?
   Do you think that folkways have helped people to solve problems?
   Can you think of any problems people have raised by their use of folkways?
   What are emotional age, social age, and mental age?
   What other ages does a person have?
   How can these ages be measured in others?
   How can we measure these ages in ourselves?
   Can a junior high school student have an emotional age of five? What would happen if he or she did?
   What advantage is there to discovering our various ages?

9. How do societies decide who gets what?
   Do all societies use the same method?
   Research and contrast unlike societies.
   Is service to society a criterion for reward?
   What other criteria can you think of?
10. How are decisions made in primitive or tribal societies?
   Who enforces decisions?
   What types of punishment are used for transgressors?
   What types of rewards are given to those who do not transgress?
   Do you think capital punishment is civilized? Why or why not?

11. Are we born with inbred pugnacity?
   If pugnacity is not inbred, how can we survive in a competitive world?
   If pugnacity is inbred, does this mean that war is inevitable?

12. An ancient philosopher said that luxury causes war. Do you agree?
   What is luxury?
   Is your father's cat a luxury?
   Is luxury inevitable?
   Do you have possessions that you consider to be luxuries?
   Do civilized countries fight more wars than do uncivilized countries? What reasons can you give for your answer?

13. Most sociologists say that people have always lived in groups
   Do you agree with this statement?
   What reasons do people have for living in groups?
   Can nature, as an enemy, be resisted better by groups of people than by the individual?
   What disadvantages are there to living in groups?
   What do you think the first groups consisted of?
   Compare groups in primitive societies with our own.
   What groups do we have within our own society?

14. It has been said that of all the animals in the world, human beings are the only ones who can change their environment to suit themselves, and yet they are the only maladjusted animals.
   Do you believe this statement to be true? Give reasons for your answer.
   Name some ways in which people have changed their environment.
   When people change their environment, do they always do it for the better?
   Make a list of environmental changes that have been for the better. For the worse.
If certain animals could change their environments, what do you think they would do?
What would be the advantages and disadvantages if a human could control the weather?
If a human could control certain physical functions of the solar system (such as planet rotation and revolution), would this power be good or bad? Give your reasons.

15. Petrified ant hills show that millions of years ago ants acted precisely as they do now. Over the years, however, humans have continually changed their behavior. Can you give reasons why the above statement is true?
Do you think people will continue to change in the future? How?
Do you think ants will change? If so, how?
What kinds of things can make animals change their behavior? What kinds of things make you change your behavior?
What do you call a change of behavior?

16. How many societies are you a member of?
What identifies a society? What kinds of things affect society? What does society affect?

17. Human beings have great need for security, but they also have need for adventure.
Do these needs run contrary to each other? If they do, how can they be present at the same time in the same individual?
Give examples from your own life.
Do you think that some people need security more than others?
Do you think that some people need adventure more than others?
What are the advantages of being more rather than less adventurous, and vice versa?
Have you ever been homesick?
What do you think causes homesickness?
What influence does a person's age have on his or her need for security and adventure?
What influence does a person's environment have on his or her need for security and adventure?

18. Einstein once said that if his ideas turned out to be good, the Germans would say he was German, and that if they turned out to be bad, they would say he was Jewish.
What did he mean? Einstein spent the last years of his life in the United States. Would you say he was German or American? Make a list of people who were born elsewhere but came to the United States. List their accomplishments. Can you find the names of Americans who left this country to take up citizenship elsewhere? What reasons did they give for leaving? Why do so many persons come to this country but so few leave? Write the name of a country in which you would like to take up residence. Then study about that country.

19. The meeting of the Indians and the white people is often regarded as one of the great tragedies of history because no two races have understood each other less. Do you think the Indians or the white people were right? (Debate.) Does a superior culture have the right to destroy an inferior culture? Was the Indian culture inferior? What reasons did the white people have for coming here? How has Indian culture affected our own culture? Contrast the treatment of Indians in the United States with the treatment of those in Mexico. What has happened to the Indians of Japan?

20. Recently, natives on a Pacific island raised money to buy our President from us. These natives remembered that during World War II American soldiers had arrived with thousands of tons of supplies. The islanders thought that buying our President would bring them more supplies. Do you think that the islanders would give our President god-like status? Do you think that you could diplomatically explain to the natives why they may not purchase our President? Give some reasons.

21. Discuss the "great people theory." Does history make great people or do great people make history? Would Washington and Lincoln fulfill their roles in history (in a modified way, of course) if they were living today? Or, if the political situation today did not call upon their
special talents, would they lead quiet lives like the majority of the rest of us and never be heard from?

Do you agree with the historian who said that if Hitler were alive today in a nation that has the hydrogen bomb, the world would be destroyed?

22. How can poor communication endanger relations between different groups of people?

The Boxer Rebellion began when foreigners in China built towers, not realizing that the Chinese believed that the spirits of the dead flew low. The towers, they reasoned, would interfere with the flight of the spirits.

The Maori cut down a flagpole flying the union jack. The British felt this action to be justification for war, not realizing that it was Maori custom to cut down a pole during a dispute. This action simply meant that the Maori were ready to discuss the problem. The British couldn't understand why the Maori would provoke them by cutting down their flag. The Maori couldn't understand why the British would attack them when they showed a willingness to communicate.

23. When some students were asked to predict how life would be different in future years, they found the following predictions made by architect Norman Bel Geddes in 1931. These changes were to have taken place in ten years, or by 1941.

There will be double-deck streets, divided into lanes for slow stop-off traffic and lanes for express traffic.

Synthetic materials will replace natural materials used in the construction of buildings.

Every roof will have a garden.

Houses in all climates will have flat roofs.

The garage will become part of the house and will be placed on the street front.

Airplanes will land and take off vertically.

Generally speaking, houses will be smaller, but rooms will be larger.

Mechanical devices will open doors, serve meals, and remove dirty dishes and clothing to the appropriate departments in the building.

Talking pictures will replace talking professors.

Aircraft will attain speeds up to six miles a minute.

A combination dictaphone and typewriter will replace stenographers.
Events of national interest will be available by television simultaneously with their occurrence.

There will be no epidemics.

There will be no incurable diseases.

The working week will consist of four six-hour days.¹

How many of these predictions would you say have come completely true? Partially true?

Would you say that the most important predictions have come true?

In some cases, how much have we progressed past the prediction, such as in the case of airplane speed?

Do you think that epidemics will ever be eradicated?

24. When students were asked to predict how life would be by the year 2000, they assembled the following predictions:

Cars will be powered by electricity.

Boston through Washington, D.C., will be one city, as will San Francisco through San Diego.

Cities and farms will be located beneath the sea.

Watches will be nothing more than miniature television receivers.

Television will be three-dimensional and will cover the entire front wall of a room.

Weather will be controlled, and certain cities will be completely encased by plastic domes.

Many of the present deserts will be productive farm areas.

Transplants of human, animal, and artificial organs will keep people alive until they just "wear out."

A pill to make people smarter will be widely used.

A cup of coffee will cost 50 cents.

The average work week will consist of 22 hours, the average vacation will be 26 weeks, and the average retirement age will be 38.

Students will be taught at home by telephone; television, and computer.

With six billion people on earth, we will be eating foods that most of us would not consider edible today; i.e., seaweed, algae, and so forth.

There will be fish farms.

Parking spaces might be hereditary.

¹D. Gordon and V. King, College Readings on Today and Its Problems New York, Oxford University Press, Inc., 1933, p. 3.
How many of these predictions do you think are likely to come true?
How would a six-months' vacation for your parents affect you?
Can you think of any disadvantages to being taught by a computer?
In a food shortage, do you think you could eat eel, snake, ants, or grasshoppers?
What determines our taste in food?
Go to a supermarket and make a list of the exotic foods sold there.

25. Imagine that the year is A.D. 2300. The class is made up of a team of archaeologists. You are digging on the site of where the school once stood.

How much of the ruins would be above ground, if any?
Where does the debris come from that covers ruins?
In how many ways could the school have been destroyed?
What parts of the school are apt to be preserved? Lockers? Walls? Books? Notebooks?
Are we apt to recognize a pencil sharpener if we dig it out of the ruins?
What artifacts are we apt to find that will tell us this was a school?
Imagine we find the foundations of the walls. Draw a floor plan of the school.
Would it help archaeologists if a time capsule were left behind? If we were to bury a time capsule now for archaeologists to find in 500 years, which of the following items would be most representative of our lives today?

- A set of textbooks
- Blackboard and chalk
- Pencils and pens
- A grade book
- An annual
- A copy of the cafeteria menu
- A diary kept by the gifted class
- A map of the school grounds
- A set of rules and regulations for the school
- Records of the alma mater (or tapes)
- Records of a typical class session.
Imagine you are going to leave such a time capsule.
Can the class begin keeping a diary?
What items are important enough to put into such a diary?
If you were taking pictures of events to include in the capsule, what events would you record?

The numerous topics in this chapter are presented so that teachers may have a wide selection of topics likely to stimulate creativity, analyses, and evaluation. The topics may be used for reporting, newspaper articles, debates, and plays.
Selected References

Books for Students

**Nonfiction**

Presents data, taken from actual specimens, about the physical development, home life, and environment of primitive man.

Describes in clear, interesting detail the work of the archaeologist in locating a site, organizing and conducting the excavation, and studying and identifying the find.

Comparative study of different cultures through which "we can see our own socially transmitted customary behavior set beside that of the other and strangely different peoples."

A popular work on comparative religion. Traces the growth of religious faith from earliest times to the rise and spread of the great religions. Covers a vast field and is most readable.

Explains the principles of logic and describes the 13 common fallacies to which all are prone, together with their use as propaganda techniques. Chase believes that straight thinking calls for "common sense, lining up the facts, and figuring out what they mean and how best to react to them."

Comprehensive work on art from prehistoric times to the present. Good for reports rather than for reading of the whole book.

Comprehensive and comparative description and interpretation of native American cultures from the Arctic to Panama.

Easy to read. Covers the laser, comsat, electronic computers, biopower, the solar battery, ultrasonics, ground-effect machines, and bionics.

Points out difficulty people have in communicating with one another. Defines *culture* as various concepts of people's readiness to act.

Readable book especially valuable for stimulating discussions. Emphasis is on semantics, which helps to make human beings human.

Very practical little booklet. Has an index and explains the use of all types of library tools. Gives many examples.

Interesting treatise covering (1) cybernetics, brains, and computers, and (2) background of cybernetics and bionics.

Revelation of influences that change cultural patterns: e.g., advertising, public relations, and the like.

Story of the Dead Sea scrolls from their discovery in 1947 to their final purchase by the Palestine Archaeological Museum in the old part of Jerusalem.

Volume three of the series contains an account of the Sinai Mono Indians by Allan R. Holmberg.

Introduction to all the languages of the world, past and present, with emphasis on the world's 100 most important languages. Tells what language is, what part it plays in our everyday lives, how to improve our written and spoken tongue, and how to save time and energy in learning the most useful foreign languages.

Offers an informal introduction to sound reasoning. Discusses superstition
versus scientific fact, deductive and inductive reasoning, and the role of language in the reasoning process.

Tappan, Eva M. *When Knights Were Bold*. Boston: Houghton Mifflin Co., 1939. Illustrated stories about the days when knighthood was in flower.

**Fiction**

About a Jewish girl sent with her family to a German concentration camp during World War II. She spends about seven years of her life in different camps.

Convincing novel of life in an impoverished black ghetto. Rufus Henry, a sixteen-year-old black youth out of a prison forestry camp on parole, finds it impossible to protect himself from a gang unless he joins an enemy gang and thereby violates his parole.

Making his way alone across Africa, a young boy whose parents were killed in the Suez bombings encounters many types of people and animals. A revelation of human nature, types of cultures, and of a boy's maturing.

Fine, humorous, moving novel with setting divided between England and Maine. Comparisons of customs and the times are delightful.

Adventure tale of Americans starting life over from scratch after their town has narrowly escaped nuclear bombing. Unhurt but threatened from all sides, they find themselves back where their pioneer ancestors had been.

Story of how two London slum children make a garden from a packet of cornflower seeds dropped on the pavement and how their actions change the lives of several other persons.

The charming, often humorous story of a parish priest and his problems in dealing with his wayward people. Warm in human experiences.

Author, who did much research on the Stonehenge phenomenon, here tells how Stonehenge was constructed by prehistoric people. Based on all facts presently known, the novel is fast-paced and suspenseful.

A European immigrant tells, in an unusual style, of his dramatic experiences since coming to the United States at the age of twenty.

**Biography**

Addams, J. *Twenty Years at Hull House.* New York: Macmillan Company, 1938. For loving, work in helping minorities from all parts of the world to help themselves, Jane Addams became known as one of the great humanitarians.

Braymer, M. *The Walls of Windy Troy: A Biography of Heinrich Schliemann.* New York: Harcourt, Brace & World, Inc., 1960. Schliemann was the amateur archaeologist who excavated down through seven cities to prove that the bottom city was the Troy of Homer's *Iliad* and *Odyssey.*

Reference

Richly illustrated story of the American Indian from prehistoric times to the present. Organized mostly by regions. Two chapters on the Inca, Maya, and Aztec and one chapter on the social and economic status of the Indian since 1890.

Authoritative compendium in the field.

Illustrates problems concerning civil liberties. Uses examples from history.

For current English in the United States. Also includes British usage, answers questions of grammar, word preferences, style, punctuation, idioms, spelling, and similar problems.

Manual in dictionary form for cultivated writer or speaker. Does not include information for the uneducated.

Contains selections of outstanding creations of the human mind. Each of the works in this collection is a masterpiece of the imagination and intellect of man.

Illustrated compendium of world mythology including prehistoric, Egyptian, Assyrio-Babylonian; Roman, Celtic, Teutonic, Persian, Indian, Chinese, Japanese, African, and American mythology. Comprehensive and very readable.

Beautifully illustrated, easily read discussion of lost civilizations, including Egyptians, Mesopotamians, Indus Valley people, Minoans, Mycenaeans, people of Anatolia, Etruscans, Khmers, and Maya.

Not easy reading, but challenging. Its use is limited to reference and reports.

Account of universal history from the ancient river cultures of the Middle East to the present. First eight chapters discuss the growth of civilizations on all the continents. Last eight chapters discuss the impact of Europe on the entire world.

Text and pictures about man's beginnings on earth, the rise of civilization (up through the Greek and Roman cultures and, in America, the Mayan, Aztec, and Inca cultures); and primitive societies today

Deals with the United Nations, Africa, the Americas, Asia and Australia, and Europe. Includes maps for each country and useful bibliographies.

Books for Teachers

decisions of several major Supreme Court cases. Thought-provoking questions included.

Audiovisual Aids

Motion Pictures

Due Process of Law Denied, 29 min. New York: Teaching Film Custodians, Inc., 1950. Scenes from the movie The Oxbow Incident depicting what happens when “justice” is carried out through mob action.

The Great Rights, 15 min., color. New York: Brandon Films, 1963. Through animation the film shows what could happen if there were no Bill of Rights.

Profiles in Courage—George Mason, two reels, 25 min. each. New York: I. Q. Films, 1965. Portrays the efforts of George Mason to have the Bill of Rights added to the Constitution.

Filmstrip
