Recently, attention has been focused on changes that can occur during adulthood. This paper presents theories of mid-life crisis, an overview of trends and developments, and a perspective on counseling which deals with the funding of counseling and the need for human resources planning. A computer search of 70 articles forms the basis of the investigation. Abstracts of the articles, most of which are dated 1975 or later, are included. (LFB)
MID-CAREER CHANGE:
An Overview of Counseling Practices and Programs

Relevant Resources in High Interest Areas

Garry R. Walz
MID-CAREER CHANGE: AN OVERVIEW OF COUNSELING PRACTICES AND PROGRAMS

Garry R. Walz, Ph.D.
Director, ERIC/CAPS and Professor of Education

AN INFORMATION ANALYSIS PAPER
Based on a Computer Search of National Data Bases
November 1966 through April 1978

The work presented herein was performed pursuant to a contract from the
National Institute of Education
Department of Health, Education, and Welfare
Under the direction of
ERIC COUNSELING AND PERSONNEL SERVICES CLEARINGHOUSE

School of Education
The University of Michigan
Ann Arbor, Michigan
1978
Traditionally, career counseling has focused on adolescence and early adulthood. Implicit in this focus has been the notion of consistency in adulthood. It was assumed that once decisions and plans were made, the adult years were a relatively serene and stable period, complementing what had been decided earlier. More recently there has been widespread recognition that adulthood is a period of change. Mid-life, the period commonly defined as from age 35 to 55, has become acknowledged as a particularly significant period of life with potential for bringing great pain and/or pleasure. In both the professional and popular literature there is increasing recognition of the importance of the mid-life period and of the need for developing viable strategies for responding to the needs and concerns of periods in mid-life. While the changes occurring at mid-life are frequently pervasive, and deal with such areas as family life, intimacy, life-style, or inner-life, it is interesting to note these changes experienced by the individual have often had their most dramatic expression in matters relating to occupations. Thus, the literature, while dealing broadly with mid-life, has its major focus upon mid-life career change.

Playwrights and novelists have long recognized the importance of the mid-life malaise. They have seen it as a time of conflict and doubt, an uncertain bridge to the future. The recognition of the need for a special response by counselors and human
services specialists, however, has occurred only recently. The *Vocational Guidance Quarterly* acknowledged its importance through the rarely used device (for that publication) of a single-focus journal related to mid-career change (June 1977). Notably, this did not occur until 1977. A special issue of the *Personnel and Guidance Journal* published in May 1975 did not contain a single specific reference to mid-life career change. Therefore, much of the literature is of very recent vintage.

To provide a broad information base from which to conduct this analysis, a computer search was designed. The seven separate data bases searched yielded a total of 70 separate references, the largest number of references coming from the ERIC search (N=40). The descriptors used varied according to the data base being accessed but the two producing the greatest number of documents were "career change" and "middle-aged." In accord with the previous comments on the recency of the literature, the large majority of the references are from 1975 and later. A breakdown of the data bases searched and the number of items retrieved is located in the back of this publication.
Substantiating mid-life change through research is difficult. Neugarten (1973) points out that while psychologists are convinced that personality change occurs in adulthood, they lack adequate methods for measuring these changes. Nonetheless, we can identify: "hundreds of investigations which substantiate personality change in adulthood in reactions to situations, in attitudes, in reference groups, in self-descriptive items, in sources of gratification, in dyadic relationships, in the objective descriptions by friends and on psychological tests" (Brim, 1976, p. 3).

In describing the change process many scholars and researchers use the term "transition." Implicit in the concept of transition is movement from one personality stage or period to another. Levinson, for instance, uses the term transition with reference to changes in status of life structure, e.g., "getting into the adult world," "becoming one's own man" (In Brim, 1976, p. 7).

An analysis of the available theories and research on the idea of mid-life change being a crisis would suggest the following conclusions: (1) The concept of a crisis in mid-life should be thought of as involving both a rapid and a substantial change in personality, one which involves a major dislocation in one's sense of identity; (2)
Individuals may vary considerably in the extent to which they recognize or can articulate changes or transitions which they have experienced; (3) Research does not demonstrate that transitions or changes occur at predictable age levels; (4) For an indeterminate number of men a mid-life crisis is a "notable" event of great import to their future lives. Several current studies suggest that the mid-life crisis affects as much as 25% of the male population while a study of business managers between the ages of 35-55 reported that 30% of them were experiencing major personality and behavior changes.

Perhaps the meaning of a mid-life crisis can be described better by words than by theories or statistics. In the words of one man:

The hormone production levels are dropping, the head is balding, the sexual vigor is diminishing, the stress is unending, the children are leaving, the parents are dying, the job horizons are narrowing, the friends are having their first heart attacks; the past floats by in a fog of hopes not realized; opportunities not grasped, women not bedded, potentials not fulfilled, and the future is a confrontation with one's own mortality. (Lear, 1973)

### Theories of Mid-Life Crisis

There has been considerable discussion among theorists and researchers as to the causes for mid-life transitions which may in effect be crises. Currently seven theories are most frequently advanced in explanation of the crises.
1. Achievement-Aspiration Gap

This theory suggests that in mid-life a man is likely to assess his work achievements to measure what he has accomplished against what he has aspired to do. The comparison between "aspired to" and "achieved" leads to the realization that an individual will not be able to reach his goals; hence, those individuals undergo a personality change that enables them to become reconciled to the gap.

2. Endocrine Changes

Many hormonal changes occur during the mid-life period--reductions in the secretion of androgens, increases in other steroids--about which we know very little. It is hypothesized that these hormonal changes do affect a man's self-assessment and his ability to manage stress.

3. Reappearance of "The Dream"

Daniel Levinson and his colleagues believe that in the process of maturing a man must suppress certain parts of himself to meet the demands of family, career, and social activities. During middle-age the "suppressed aspects of the self push toward the surface and demand that the man reappraise who he is and what he is doing" (Brim, 1976, p. 5). The concept of "The Dream" is presented as a youthful view of the future self which never dies. A mid-life crisis according to this theory is as likely to occur for the man who has realized his dream as for the man who has not. Those who
ave fulfilled their dreams may ask, "Is there more to life than this? Was this worth what I had to give up?" Those who have not may ask, "Where did I go wrong?" "Will my dream never be?" Whatever has been his prior experience, the dream reappears in middle life and in dealing with it a man may be "crisis prone."

5. Stagnation vs. Generativity

In his work on stages of psychosocial development, Erikson (1950) identifies an important adult task as resolving the issue of stagnation vs. generativity. Middle aged men may feel that their achievements in family, work, and community are stagnating and that their lives lack challenge and opportunity. The need of the human organism for experiencing personal growth is omnipotent; lacking a feeling of growth the individual will seek ways, including significant behavior change, to regain a sense of growth and challenge.

6. The Awareness of Mortality

In the middle age period one stops counting from birth and begins to think in terms of time yet to be lived. Neugarten (1968) has identified a change in time orientation as one of the significant personality changes occurring in the middle age period, where the individual no longer perceives himself as growing up but as growing old. Perhaps as Brim (1976) has suggested, one of the major psychological tasks of the middle years is "resignation to death and a permutation, a reordering of life priorities"
If persons can successfully respond to their mortality, they can gain greater self acceptance and experience increased energy.

6. Family Relationships

In this theory the cause of a man's mid-life crisis can be traced to his changing relationship with his family. As the wife and children move their attention toward activities outside the family, the husband perceives himself as less needed and the other family members as less available for support. Typical family roles and rewards may be abolished. In this "empty nest" explanation of middle age male change, "normal changes in familial relationships that coincide with the middle years of a husband's/father's life" can produce significant changes in personality and behavior (Magazine Index, No. 1003575, p. 8).

7. Changes in Social Status and Role

Two particularly noteworthy longitudinal studies of adult development are the 20-year adult life study of Neugarten (1970), and Lowenthal's research on four age groups of men (Lowenthal, et al., 1975) Both of these researchers have studied the changes in status and role which occur over the adult life span. Lowenthal focuses on role gains and losses in adult transitions. Such occasions do not necessarily produce crises, but rather provide situations where incremental and decremental changes occur, where one state of life is left behind and a new phase of life is
begun. Neugarten sees the predictable changes in family, work, and health producing not only stresses but opportunities to display an invigorated sense of self and new coping skills. Neugarten also emphasizes that the predictable "on-time" status changes such as the death of an elderly grandmother do not produce crises. It is the "off-time" changes, i.e., the loss of a job in the prime of life, which produce trauma and crises.

Women and the Mid-Life Crisis

Relatively less emphasis has been given by the major researchers and theorists to the mid-life period for women and its potential for attendant crises. Most major theories are focused on male development. It should be emphasized, however, that the middle years present crises of adulthood, not solely of male adulthood. Apparently, women and men develop along separate paths. Women seem to be governed by what sociologist Jean Lipman-Blumen (1972) refers to as the "vicarious achievement ethic." That is, they gain their identities not through what they do but through the activities of significant people around them, i.e., fathers, husbands, and, later, children. In contrast, men are seen by Farrell (1974) as having a direct achievement syndrome. They are "success objects." Their value as persons is determined directly by what they do.

Of particular significance is a paradoxical shift of both sexes which occurs at middle age. Neugarten and Gutmann (1958) see women shifting toward becoming more
achievement-oriented, and men shifting toward becoming more affiliative. Interestingly, Lowenthal (1975) found that sex difference was greater than life-style difference among the adults she studied. "Indeed the life course trajectories--and in turn the needs, goals and problems--of men and women not only do not parallel each other but at a point seem to threaten a potential collision course" (Note 1, p. 8).

While it is important that we identify and analyze the different paths of development of men and women, Schlossberg (1976) is undoubtedly right when she suggests that "what should be emphasized is that both sexes go through crises and may need help in coping with them" (p. 33).

The seven theories of mid-life crisis run the gamut from psychological theories of personality which emphasize hormonal shifts to theories arising from a sociological perspective "which views the life cycle as a succession of social roles with personality change viewed as a product of life-long socialization experiences" (Brim, 1977, p. 7). It is apparent that none of the present theories is adequate by itself. All these theories should be viewed as a means of illuminating different aspects of adult development. Users of the theories need to have the conceptual skill to consider both inside and outside determinants of change and their interaction with each other. It will be observed that the notion of mid-life crisis is not emphasized by three of the main theorists (Levinson, Neugarten, and Lowenthal). They all, however, recognize
that transitions can become crises.

**Mid-Career Change--Basic Considerations**

A review of the causes or factors precipitating a mid-life crisis is useful in providing a backdrop against which to view a specific response to the crisis, such as job change. We also need to look at the motivations or situations which foster mid-career changes.

The importance of multiple motivations for mid-career change has been emphasized by Heddesheimer (EJ 147 849). Building upon the work of Murray, Powers & Havighurst (1971) she discusses two dimensions of pressures for change in work history as being from the self and from the environment. In each of these dimensions the pressure can vary from low to high. In assisting individuals to implement mid-career changes she presents six counseling considerations: (1) the vocational maturity of the clients, (2) the context within which job choice changes are made, (3) the resources available to the client, (4) an individual's self-confidence for achieving in a new situation, (5) the need to clearly identify appropriate goals, and (6) the importance of counselors knowing their own attitudes and values in counseling with individuals pursuing nontraditional career routes.

In another analysis of the motivations leading to mid-career change, Entine
(EJ 147 850) emphasizes broad sociological, economic, and psychological factors. He identifies five major factors: (1) the women's movement and the increasing entry and re-entry of women into the labor market, (2) the premature end of careers due to technology, (3) the pervasive influence of unemployment, (4) the relationship of life expectancy to retirement, and (5) the psychological dimensions of mid-life and their effect upon work and life-style redirection. Basically he recommends that we move from our present focus on factors inside the individual to a more balanced consideration of factors both external and internal to the individual.

Selected Programs and Resources

To assist the reader in choosing from among the available resources, the section that follows highlights four documents worthy of special mention.

Adult Career Education as an Intervention Strategy in Mid-Career Crisis.
ED 135 995. Commissioned by NIE, this report provides a useful review of mid-career crisis literature, intervention strategies, and an inventory of services currently available. A research and development strategy for NIE is presented, along with a strategy and a role for adult career education. Though the document is broad in scope, it could be very useful to anyone involved in program development.
Second Careers: A Model Program for Mid-Career Change. 1976. This program was developed at the George Washington University School of Medicine and Health Sciences. The program was designed to demonstrate that (1) viable career alternatives are available to older persons, and (2) mid-career planning can avert many of the symptoms associated with middle and later life. The volume contains a breadth of information useful to program developers in designing, establishing, and evaluating mid-career programs.

Second Careers: Counseling for Mid-Career Change. 1976. This is a companion volume to the one just previously described. It discusses in some detail the counseling component of the program. The detail provided on the counseling rationale and the procedures used would be extremely useful in establishing mid-career counseling programs. Particularly helpful is the extensive discussion of group counseling utilized in the program.

An Evaluation of Policy Related Research on Programs for Mid-Life Career Redirection: Vol. 11, Major Findings. ED 107 943. This report evaluates some 300 sources dealing with programs for mid-career change. In assessing the results to date, the conclusion is reached that the potential for mid-career assistance for workers has hardly been touched. Recommendations for future program development are included which are intended to aid developers in avoiding shortcomings present in the programs evaluated.
The literature on mid-life crisis and mid-life career change is as diverse as are the viewpoints of the writers. Depending on what one reads, one may become truly alarmed over the near epidemic proportions of male middle-age crisis. Or one may reflect with philosophical detachment on the importance and fruitfulness of the middle-age period for providing a redefinition of the last half of a lifetime. Perhaps the most useful approach this writer can take is to give visibility to the emerging conceptions concerning the mid-life period and mid-career changes, and how the helping services have organized responses to them. Examining emerging ideas and practices may help readers come to know what the current beliefs are and where they may wish to make their own casts for belief and action.

Mid-Life Period

1. There is general consensus that the mid-life period is one in which the male—male in particular—is likely to experience significant personality changes. Persons vary considerably in their awareness of these changes and the importance they attach to them.

2. The data and the writing on the experiences of women are less definitive than for men, but it appears that the middle life period may cause as much personality change for women as for men, but in the opposite direction—toward achievement for women, toward
affective behavior for men.

3. The personality changes which occur in mid-life are likely to stem from multiple causes. For some persons the stimuli for change impinging upon them are of overwhelming magnitude and mandate that personality change occur.

4. Multiple, simultaneous, and significant changes lead some persons to a mid-life crisis. The crisis may be characterized by grief, lack of identity, purposelessness, a lowering of mental and physical vigor, and, particularly, depression.

5. The forces for change that a person experiences may be concentrated in a few sharp years or stretched over 10 or 20 years. There are no specific correlates with age other than that these changes generally occur in the forties or early fifties.

6. There is no convincing evidence for "a developmental period or stages in the mid-life period, in which one event must come after another, or one personality change bump another in its wake" (In Brim, 1976, p. 4). Levinson's apt metaphor that they are more on the order of "seasons of the year" seems most appropriate. While each may arise out of the preceding one, and lead to the succeeding one, they "do not differ in value and all are necessary" (ibid.).

7. All of the research and writing notwithstanding, most of what we know about the mid-life period is based upon exploratory research, hypothesis generalization, and conjecture, rather than definitive, empirical data. Our current research base is more
on the order of an imperfectly-cooked waffle than a carefully-crafted mosaic. There are significant gaps in our research base, e.g., the causal process, and developmental and longitudinal data, which only more intensive and extensive research designs can fill.

8. Changes in an individual's behavior and personality seem to be the result of an interaction between intrapsychic and external social events, with the change in a person's focus moving from the outer self to an inner-self preoccupation.

Mid-Career Change

1. Job displacement and career disruption occur frequently enough to constitute a social problem. No occupational or educational classification of people (males particularly) seems exempt from these disruptions. Additionally, the long-term effects upon the individual and society are considerable.

2. The volume of literature relating to mid-life career change attests to the popular acceptance of the idea of the change. How we assist people to make mid-career changes, while a popular topic of the self-help literature, still seems murky. The preponderance of opinion suggests that a systematic program with special emphasis on helping mid-life career changers is preferred over a general counseling helping service.

3. Program developers agree that a mid-career change helping service should
involve at least the following components: (1) assessment of personal characteristics including vocational maturity; (2) individual and group counseling focusing on personal identity, work roles, values, and options; (3) training in decision-making and employment skills; and (4) job placement.

4. Systematic programs of the kind described above are costly. There is little evidence they can be self-supporting except with special, affluent client populations, e.g., business executives. Many of the better known programs have received external funding or are university- or agency-based and heavily subsidized.

5. Client acceptance of mid-career change programs is mixed. Program directors report enthusiastic participant response to the services and high program persistence rates (over 75%). The members using such services, however, remain comparatively few. Client reluctance to use mid-career counseling services stems from a negative feeling toward seeking help. This attitude may be particularly prevalent in business- and industry-based mid-career services.

6. Present counselor education programs frequently fail to prepare trainees to work with adults. Noted deficiencies are in the areas of aging, the occupational marketplace, and acquiring insight into their own (the trainees') potential age and sex stereotypes. Special updating and training for counselors who will work with mid-life career changers appear to be a prerequisite to the expansion of mid-career counseling services.
A Perspective on Mid-Life and Mid-Career Counseling

Middle age is a time of great significance to the individual and society. People in mid-life may experience personal crises, altered lifestyles, redirected careers, disrupted jobs, drastic changes in long-standing intimate relationships. Internal personal forces and external social factors may intermix in unpredictable ways to lead to a redefinition of self and a redirection of goals and behaviors.

Our knowledge about mid-life is a composite of thoughtful conjectures, frequently reported observations, and empirical data. It stimulates and provokes us to further thought as much as it aids us to define the period. Our certainties are few, but our speculations are bountiful. In determining the importance of the middle age period, however, our data sources converge—it is important.

Especially critical is how we respond to middle age—personally and collectively. There is broad consensus among theorists, writers, and researchers that it is the response to the middle age challenge which determines how the second half of a lifetime will be lived. It therefore behooves us to deal with the issues and implications associated with individual and collective responses to mid-life. We need to focus on what we are doing, should be doing, or should not be doing. But we must also consider the why of what we do and the potential effects and outcomes associated with one response as compared with another. Unfortunately, the literature has dealt more pervasively with describing
mid-life and the programs developed to respond to it than with the important issues inherent in mid-career change. It is the writer's objective in this section to stimulate thought and, hopefully, action upon those dimensions of mid-career change which have important future implications for individuals, society, and the helping professions.

A Response Mode for Mid-Career Change

A major issue is in what way to respond to the need for mid-career counseling. Do we create new programs and Centers specializing in mid-career concerns? Or, do we augment existing counseling programs with a mid-career special emphasis or program component? There are plentiful examples of both responses, and both have their vocal proponents. In practice, the local situation may be instrumental in determining which approach will work best. As society in general, and counseling in particular, are confronted with new demands for services, we face the fundamental issue of whether to extend and strengthen existing counseling services or create new, specially-focused Centers and programs. My guess is that the current professional knee-jerk response is to "start something new." There are the obvious advantages of the attention, excitement, and fund-drawing power of a newly-developed program to respond to a current crisis. Not so frequently noticed are the less dramatic but nonetheless compelling reasons for expanding the capabilities of existing counseling services. Two thoughts

New programs vs. expansion of present ones
are noteworthy.

First, if we consistently respond to pressing social needs as crises and give them precedence in our attention and resources, we run the risk of eroding the basic services which provided the foundation for responding to the special needs in the first place. Do we want a delivery system for counseling composed of numerous independent and uncoordinated programs, each vying for a larger share of the support pie? Are a number of specially-focused mini-Centers as worthy as a renewing basic counseling service? Where does our proliferation of special Centers stop? And what do we do with them when the need is no longer so pressing? Questions such as these need answers.

A second consideration relates to whether we view counseling for mid-career change as a one-time event, e.g., when a crisis occurs, or as an aspect of a developmental career plan. As discussed previously, we believe that mid-life should be viewed as an important period of life, one that must be planned for and that may hold stressful times. Preparing for and viewing mid-life as a developmental phase enables persons to avoid crisis responses and to capitalize on the opportunities at mid-life for a meaningful life redirection. Special Centers devoted to mid-career change by definition are less inclined to provide the long-range perspective toward career planning that emphasizes planning before the crisis appears.
Means of Funding Mid-Career Counseling

Generally, mid-career counseling programs have operated best under district sources of funding or university support, e.g., grants or course credits. Relatively few programs have been able to go it alone, to be essentially self-supporting through a fee for the service. Business and industry have not demonstrated a great willingness to commit resources to mid-career counseling services. It is apparent that economics as much as anything will determine how extensive mid-career counseling services become.

One important dimension in the support picture is the apparent reluctance of individuals to pay out of their own pockets for mid-career counseling services. By most accounts it is far easier to obtain "paying customers" for personal self-growth experiences of the sensitivity, personal-therapy variety than for mid-career counseling. Individuals either do not see the worth in mid-career counseling or believe that there is some stigma attached to seeking or needing help. It is apparent that this reluctance to seek help is more a male than a female characteristic--as witness the flourishing women's continuation education centers. Clearly, if mid-career counseling services are to be broadly diffused, there must be an extensive educational campaign to acquaint people with the services so that they may seek their use as a positive step toward their own development rather than an expression of weakness.

One step that would certainly aid in a more positive image of mid-career counseling

Education necessary for career counseling to be effective
is a change in the present tax structure. Currently, individuals may claim as a deduction money devoted to improving themselves for a present job but not for taking on a new job. Thus, an individual seeking a new career is left to his/her own resources during the difficult period of choosing and exercising a new option and obtaining retraining. It would seem to be in the best interests of the individual and society to provide tax relief, if not direct monetary support, for individuals wishing to redirect themselves toward more personally rewarding careers and to continue to be contributive to society rather than to be supported by the state.

A related area is that of third-party payments. We are clearly perpetuating a sickness rather than a health profession when we allow Medicare payments to be used for treating mental illness, but deny payment for services to avoid mental illness and breakdowns. As one historian observed, it is much easier for governments to obtain money for killing than for healing. To that we may add, it is much easier to obtain support for healing illness than for preventing it. Our present reward structure is at variance with our oft-repeated social goals and ideals.

For Whom Do We Provide Counseling?

The client in almost all mid-career counseling programs is the individual who is experiencing the pangs of mid-life, whether male or female. The focus is on assisting individuals to cope for themselves with the crises they are experiencing. So far, so
The next step in the process is for them to make plans and decisions based upon their redefinition of self. At this point the focus on the client alone breaks down. Any major alterations in career and life style are bound to have significant effects upon significant others in the client's life space. Spouses, children, relatives, close friends—they may not only be influential in the nature of the crises experienced by an individual, but, particularly important, they will be greatly affected by the new role, career options, and lifestyle adopted by the mid-career changer. Thus, it seems desirable that they play a part in deciding what those changes will be. Certainly spouses should be entitled to something more than dutiful acceptance of whatever changes occur.

If there is merit in this thesis, then participation in counseling must be expanded. Marriage counseling has moved toward family counseling because of the importance of the interactions among family members upon the marriage partners. Likewise, mid-career counseling should devote time and attention to all of those who will be affected by the new plans and decisions. The two-career family is likely to be beset with a special array of problems and concerns which will require a special emphasis.

A coordinated counseling plan that responds to the needs and interests of the career changer and related individuals, and that is anticipatory rather than reactive seems an important goal for us to be working toward. As mid-life counseling becomes a crisis
avoiding rather than a crisis overcoming service, the counseling intervention can be a means of assisting persons to develop a reciprocal support structure that will strengthen their capacity to cope with mid-life trauma. The male as sole breadwinner may have a hard time of it at mid-life, but others in close proximity to him will have their own set of vexing problems to deal with, not the least of which is knowing how to respond to him. Properly prepared through career life space counseling, the significant persons in a mid-life drama may be harmonious partners in planning. And better off for it!

Transition Dynamics and Mid-life Counseling

One way to view human development is as a series of transitions from one relatively stable period to another. Transitions can be trying times. The movement from child to adolescent or adolescent to young adult is frequently tumultuous. However, once the transition has been managed, the individual typically experiences a period of relative stability. Interestingly, much of our literature has focused on the period itself, i.e., adolescence or mid-life, but has basically ignored the transitional experience. Transition means a discontinuity in a person's life space—a change or disruption in a person's life which causes him/her to give up one way of life and adopt another. By the time individuals have reached mid-life, they have undergone numerous transitions: from one period of life to another (childhood to adolescence); from
One social role to another (student to worker, unmarried to married); from one job to another. They have also had to cope with countless numbers of transitions which have occurred—some by choice, others by chance. However, there is little or no relationship between the quantity of transitions which they have experienced and the qualitative nature of their responses. Though they are highly experienced in transitions, they may be, or even are likely to be, inexpert in the process of managing transitions.

The writer believes that preparation in transitional dynamics (see Adamo, et al., 1977) will enable a person to deal far more effectively with the stresses and tasks of mid-life career change. It seems entirely possible that we can assist people to develop a strategy and a repertoire of viable skills for coping with the emotional strain and cognitive tasks associated with transitions. So-equipped individuals would approach mid-life with a confidence born of successful mastering of difficult transitions. Such confidence would enable them to minimize anxiety latent in mid-life and to exercise their options assertively and creatively.

**Individual Needs Versus Programmed Services**

It has been suggested that we lack reliable predictors as to who will experience a mid-life crisis when. Some evidence suggests that the mid-life years preceding the career change may possess greater difficulty and turmoil than the period of career.
change itself. Suffice it to say that with such high variability in both the onset and the characteristics of the malaise, it behooves all counselors to avoid programmed, canned approaches and to respond to the individual needs as well as the common needs of their clients. Variability in characteristics and behavior is likely to be at least as great among middle-aged as younger people. To treat the middle-aged as a class is to act on a seriously distorted stereotype, one that will seriously impair the effectiveness of any counseling service. Any service worthy of the name “counseling” must assess the present characteristics and needs of each client rather than rely on a generalized picture of clients.

Youth As A Time For Mid-Career Planning

Much of the literature we have reviewed has stressed both the need and the potentialities for counseling interventions at mid-life. A less-often acknowledged, but nonetheless crucial, imperative is for counselors to provide leadership in the development of programs which will aid young people to understand the process of aging and their own mobility. They can be aided to understand the development of their own careers along life dimensions, and become more aware of the need to be anticipatory of change and redirection. Additionally, as they come to understand the process of aging better, they will, as Schick suggested, develop understandings which will help bridge generation
gaps that stress "human continuity and unity" (Sinick, 1976, p. 101).

The Counselor As An Agent for Change

Intervening in management's decision-making structure, or providing leadership in developing support for needed social legislation, are nontraditional counselor functions. They do, however, represent needed shifts in counselor role. Counselors must expand what they do to include bringing about needed changes in a system. Their knowledge of the system and effects upon its members places them in a favorable position to be agents for change. A model for counselor change agency has been developed by Walz and Benjamin (1970). Using a 7-step approach, this model builds upon counselors' communication and relationship skills. Changes in current methods of financing mid-career counseling and increased on-the-job opportunities for mid-career counseling are far more likely to occur if counselors take concerted action. By extending their role to include change agentry and utilizing a systematic approach, counselors can become a force for change not only with specific clients but also in the larger society in which they work.

Business and Mid-Career Counseling

Stirrings within business and industry suggest that mid-career assistance may receive increased emphasis in the near future. Outplacement, a form of career counseling and placement assistance to individuals who have been fired through no fault of their own,
is gaining adherents (Van Slambrouck, 1978). Operating under the promotional banner of "Think of Being Fired as the First Step in Finding a New and Often Better Job," companies are doing outplacement counseling as a way of both avoiding employee bitterness and satisfying their own need for humane personnel practices.

Traditionally, business and industry have devoted considerable time and attention to the long-term usefulness of any equipment acquisitions. People acquisitions have not always received the same emphasis because people mistakes could be simply corrected by termination. With more companies moving to guaranteed employment, there is new justification for providing needed personal services such as mid-career counseling. The need for human resources planning and services becomes even more important where retirement is no longer mandatory and the decision as to when to retire becomes a matter for negotiation between the employee and management. Mid-career counseling and decision-making take on a new significance when it is possible that an individual may work for as long a period after mid-life as before. Some individuals may even experience second and even third-careers within an organization.

Emerging is the basic idea that, with a great commitment to lifetime employment for employees by some companies, it becomes economically as well as psychologically desirable to provide career counseling which assists each individual to develop a career plan that considers both the individual's and the company's needs and interests. In
such a plan the mid-life period would deserve special emphasis.

**Conclusion**

Much of our discussion has emphasized the negative aspects of mid-life career change. Crisis, disruption, depression, and uncertainty are commonly used terms. For many people, however, the years after the crisis may bring greater happiness and reward than the years preceding mid-life. What needs to be emphasized is the "opportunity value" present in the disruption of crisis. There is great potential for growth in any crisis. One has to die a "little death" to become something larger, to grow and become someone new. It requires that a person let go of what is and can be.

Hopefully, we will perceive mid-life as a time of shedding a previous self so that we may more fully embody our potential as persons. Viewing mid-life as a time of opportunity and growth will do much to help individuals reap full rewards in their mid-years.

Mid-Career Change: Self-Selected or Externally Mired?/Thomas, L. Eugene/ Vocationa Guidance Quarterly, 25, 4, 320-327/ Jun 77 Career change and lifestyle are closely related, but not in all instances. Different kinds of changers are examined and implications for counseling are drawn. (Author) Descriptors; *Career Change/ *Life Style/ *Vocational Counseling/ *Vocational Development/ *Adult Development/ State Of The Art Reviews/ Middle Aged
Mid-Life Counseling: Prognosis and Potential
Entine, Alan D.
Personnel and Guidance Journal, 55, 3, 112-114 Nov 76
Describes the sociological, economic, and psychological considerations that are encouraging persons to seek new mid-life educational, career, and life style changes. Discusses these considerations and the counselor's role.

Multiple Motivations for Mid-Career Changes
Hodgesheimer, Janet
Personnel and Guidance Journal, 55, 3, 109-111 Nov 76
The author maintains that mid-career changes should be viewed as a natural step in a career pattern rather than a radical shift that forsakes all that went before. She outlines some considerations for counselors.

The Mid-career Counseling Process
Entine, Alan D.
Industrial Gerontology, 3, 4, 105-11 Spr 76
Individuals at the mid-life stage are likely to experience a combination of psychological and economic causes for seeking change. A model for mid-career counseling centers is presented to enable programs to use an appropriate combination of career and personal counseling techniques to meet individual needs.

Second Careers: An Integrated Learning Experience in Career Change for Older Persons
Boren, Nora; And Others
Industrial Gerontology, 3, 2, 75-82 Spr 76
The Second Careers program which combines academic work, experiential learning, and group and individual counseling to assist older persons in mid-life transition (who are contemplating a career change) is described. A report of a conference which was part of the program is included.

 why Study Mid-Life Career Change?
Thomas, L. Eugene
Vocational Guidance Quarterly, 24, 1, 37-39 Sep 75
The author makes a case for needed research on mid-life career change and stability. The study of those who have made career changes during the middle years would contribute to the understanding of normal development, the impact of career change on identity, psychological well-being, and personality.

Changing Careers in Midstream
Hyman, Stanley D.
Manpower, 7, 6, 22-6 Jun 75
The Second Careers program which combines academic work, experiential learning, and group and individual counseling to assist older persons in mid-life transition who are contemplating a career change is described. A report of a conference which was part of the program is included.

Middle-Aged Job-Losers

Parnes, Herbert S.; King, Randy

Employment and Training Administration (DOL), Washington, D.C. 77 38p.

EDRS Price MF-$0.83 HC-$2.00 Plus Postage.

A study involving ninety-nine men who had been involuntarily separated from their jobs was done to analyze (1) what happens to a man over forty-five years old when he loses a job after having served with his current employer for at least five years; (2) what are the probabilities of his finding work within a reasonable period of time; (3) how likely is he to become discouraged and retire; (4) if he does find work, how does it compare with the previous job; and (5) what impact does the total experience have on his economic position and physical and mental well-being. Longitudinal data from the 1966 to 1973 National Longitudinal Surveys (NLS) of middle-aged men were used which provided the opportunity to observe men prior to and two years after their job separation and compare them to a matched control group of employees. The study suggests that while job displacements during middle-age are not common, they occur frequently enough to constitute a social problem. No occupational or educational category of men is immune to this kind of career disruption. The major-long-term impact of displacement appears to have been a substantial deterioration in occupational status. In addition to economic losses, the displaced workers suffered from deteriorating health and some sense of alienation. (EW)

Priorities in Postsecondary Education. Report R-36.

Parker, Michael; and Others

Available from: Institute for the Future, 2740 Sand Hill Road, Menlo Park, California 94025.

EDRS Price MF-$0.83 HC-$3.50 Plus Postage.

During the next few years, postsecondary education in the United States will undergo some important changes. Studies will be older on the average; innovations will alter the course content and structure; and more education will take place outside the traditional system. Nine topic areas have been isolated that are believed to be of high priority for postsecondary funding. Each might well serve as a focal point for the programs of an educational foundation. The nine areas evolve from the concept of "educational needs-party groups in society whose needs will grow in the next decade, place or medium that will have growing educational possibilities, or an innovative program that might serve needs of a wide range of special interest groups. The nine areas are: (1) self-assessment; (2) public libraries as adult education centers; (3) the telephone in education; (4) high education; (5) the adult illiterate; (6) the elderly; (7) low-income women; (8) prisoners; and (9) midlife or midcareer education and retraining. A reading list is provided (Author/Institute).

Adult Career Education as an Intervention Strategy in Mid-Career Crisis.

Nelson, Valerie J.; And Others

31 Jul 75 87p.

EDRS Price MF-$0.83 HC-$4.67

Based on a review of the literature on mid-career crises and various intervention strategies and on collection of a representative inventory of services currently available, a strategy and role for adult career education was developed and priorities and highlights of a research and development strategy were suggested for the National Institute of Education (NIE). Conclusions which emerged are these: (1) A mid-career crisis can be defined as a crisis of re-employment and possible forced mid-life change of career. This crisis can be precipitated by an unexpected loss of work and a shortage of jobs in the local area which utilize the skills of the individual. (2) The literature and data on mid-career crises are inadequate in several key respects. In particular, minimal data exist on the affected population or its numbers, or on the long-term effects of the crisis. (3) A mid-career crisis will for most workers entail short-term economic and associated psychological disruption, unless we commit ourselves to a European solution of substantial income support and long-term education for the worker. (4) Current programs of assistance are piecemeal and uncoordinated. The experience of programs to date shows, as expected, minimal success at averting short-term losses to those individuals who are minimally qualified by objective standards to reenter the labor force at previous levels of status and earnings. (5) A successful program of adult career education must take into account the labor market and psychological factors in the crisis and therefore must include a combination of the following: Counseling, assurance of reemployment, and involvement of employers in the area.

Developed for use in a university life/career planning course, this bibliography applies the principles of business management to personal and occupational planning and career development. The first part of the document contains the model for life/career planning which includes student activities in decision making, personal and environmental analyses, self-management, and stating objectives. The annotated bibliography covers the following areas: what life/career planning is all about; self-knowledge as planning base for objectives; interest, values and beliefs as guidelines for decision making; environment; exploring the world of work and a career; self-concept and life purpose; objective setting and strategic action plans for personal growth, career development, social responsibility, entry into the job market, achieving a self-management capability, positive attitudes and motivations, and developing creative capabilities; behavior control; job promotion; and making mid-career job changes. The third section contains sources of information on occupations and career fields. Author and subject indexes are included.

Vocational Education for Special Groups. Sixth Yearbook.
Wall, James E., Ed.
American Vocational Association, Washington, D.C.
76 351p.
Available from: American Vocational Association, Inc., 1510 H Street, NW, Washington, D.C. 20005 ($12.00)

Issues, concepts, and strategies that impact directly on the ability of vocational education to deliver its services to special groups are the focus of this yearbook. Chapters by 24 different authors are divided into three sections. Section 1 provides an overview of special groups, how special groups evolved, their underlying structure and diversity, and how vocational education might be of benefit in solving some of their problems. Section 2 contains chapters which focus on specific special groups and their individual status in society-at-large and describe in detail certain personal characteristics that tend to categorize persons into special groups. Section 3 includes a series of chapters that give detailed attention to specific strategies that might be employed in delivering vocational education to special groups. Programs for personnel development, integration of special services with instruction, and general administrative and organizational techniques are discussed. The special groups discussed include the handicapped, women, retirees and middle-age career changers, blacks, Native Americans, Mexican-Americans, prison inmates, migrants, welfare recipients, veterans, and youth. There is increasing popular interest in the phenomenon of the successful professional or businessman who switches careers in middle age. There is little hard data available about the phenomenon although there is a great amount of psychological conjecture. This paper briefly reviews the various theories that attempt to explain midlife career change, and then focuses specifically on white collar or professional workers, from ages 35 to 60. It deals with the following aspects: a workable definition of career as it relates to job and leisure; a conceptual framework of the process by which one seems to become a career changer; a review of current literature; theories about career change; constraints on career change; some proposals for intervention; and some of the developing social movement responses. Mid-Aged Career Dropouts: An Exploration.
Roberts, Betty H.
EDRS Price MF-$0.83 HC-$1.67 Plus Postage.

This research deals with the phenomenon of the successful middle-aged careerist who drops out of his occupation into an alternate life style. These people are considered a subset of the growing numbers who change occupations in midlife, despite continuing success in their chosen career. There is some exploration of the philosophical and practical meaning for society of such practice. The research uses data obtained through interviews with 40 people who had dropped out of their careers. The research attempts to provide a composite picture of the dropout: his motivations for dropping out; his pre-dropout situation and personality; his present concerns and status; and the process of dropping out. The author notes that for these people values appear to have become less extrinsically centered—for example, money has become less important than autonomy; status less important than self-expression. Contrary to the author's expectations, the dropout is neither an "impulsive" nor a relatively high-risk-taking individual. There are two ways of viewing the phenomenon—either as a threat to society or as a benign act; both approaches are examined. (NG)

Predicting Career Change of Mature, Middle-Class, Married Women

Meyer, Goldye W.; Owen, Steven V.

Apr 76 21p.; Paper presented at the Annual Meeting of the American Educational Research Association (San Francisco, California, April, 1976); Best copy available
EDRS Price MF-$0.93 HC-$1.67 Plus Postage

The research reported was an effort to determine whether, in the absence of validated models or measuring instruments effective for objective counseling of mature females, such often-relied upon, easily obtained, visible pieces of data as age, number of children, and educational background are critical predictor variables for counselors and counselors to consider in career decision making. Data were obtained from a follow-up survey of 110 women with home-oriented careers who had participated in a career counseling program; their decisions were categorized as: (1) no change, (2) return to school, or (3) return to paid employment. Ten personal/social factors often used predictively were examined for effectiveness as predictors of (1) vocational maturity and (2) women's career change. The factors studied did not effectively predict vocational maturity. Questions were raised regarding the viability of accepted concepts of vocational maturity as they apply to mature women and regarding the appropriateness of instruments available for measuring vocational maturity, specifically, the Adult Vocational Maturity Inventory. The personal/social factors were more effective in predicting career change of the women studied and yielded a limited model for classifying women into the three career-decision groups noted above. Tables and survey instruments are appended.

Nero, Sharon A.
Wisconsin Univ.-Stout, Menomonie. Center for Vocational, Technical and Adult Education.
75 52p.
Report No.: VT-102-659
EDRS Price MF-$0.83 HC-$3.50 Plus Postage
The study explored the impact of mid-career changes for women who were enrolled in or had recently completed a program in the Wisconsin Vocational, Technical, and Adult Education (VTAE) System for the purpose of changing careers from housewife and mother to that of labor force participant. Sixty-six women, aged 30-49, returned a survey questionnaire that sought information about socioeconomic, marital, and educational status; the effect of the change on interpersonal relationships and lifestyles; motivation for change; resulting benefits and liabilities; and self-image. An important objective was to develop implications and recommendations for VTAE system programming and to design a model of mid-career decision making for women. It was found that the primary motivation for a return to school was financial. The majority experienced a feeling of achievement and an increase in self-confidence, with new friends, interests, and experiences rated as important benefits. The greatest problems were adjusting to the student role and coping with the demands of home and school responsibilities. Suggestions were offered on ways to encourage women to enter into male-oriented occupations and on ways to improve preparation and counseling for re-entering school and the labor market. (NU)

Mid-Life Needs: Assessments and Responses.
Entine, Alan D.
9 May 75 13p.; Paper presented at the Meeting on New Careers at Mid-Life (Florida Technological University, Orlando, Florida, May 1975)

The current economic outlook, including the prospect of high unemployment rates, create new objectives and new lives to the growing national phenomenon known as the mid-life change. During the past five to seven years we witnessed the growth and development of adult centers, whose primary focus is to provide vocational and educational counseling for older individuals. While institutions of higher education have adapted their programs and curriculum to meet adult educational needs and have responded to the changing vocational and personal needs of individuals in middle age and older years, what remains is to tackle the adoption of the world of work to the work needs of those in middle age and later life through: (1) enforcement of existing state and federal legislation with respect to age discrimination in employment; (2) educational and public affairs programs that demonstrate that older people are good workers; (3) research into the relationship between aging and intelligence; and (4) new policies from government and the private sector that provide meaningful options for the individuals in middle years and older. (Author)
Innovative Approaches to Occupational Programs for the Rural Two-Year Colleges.

Gillie, Angelo, Sr.

75 14p.: Speech delivered at the Annual Workshop of the Southeastern Community College Leadership Program (16th, Tallahassee, Florida, March 12-14, 1975)

Available from: Not available separately; See JC 750 441 Document Not Available from EDRS

The rural community college must be vocational in orientation and provide its students with social, economic, and political facts related to their lives and employment now and in the future. It must offer equal opportunity to consider and select training for either rural or urban occupations. In order to offer this diversity, a college must have a minimum of 1,000 full-time students; this may necessitate an increase in geographical service area and the building of residence halls. Job flexibility for young adult students can be achieved by delaying their specialization until a job is secured. Once the employee specifies the skills required, it can be decided whether these are best learned at the college skills center or on-the-job. An entry-exit operation for vocational training would facilitate this flexibility for rural youth and adults. Many middle-aged persons would return to school for additional training or a complete career change were it not for economic hardship. Sabbatical-like funding should be provided to these students. Retirees and hobbyists should also be served by the college in building a second career or in maintaining mental health and physical activity.

The report evaluates some 300 items of literature dealing with programs for mid-life career redirection. A 20-page introductory chapter presents background information, a general description of target groups, and suggestions for further research in mid-life redirection of careers. Part one, Mid-Life Redirectors: Sources and Opportunities, contains chapters on aspiration and dissatisfaction among workers, training potential among older workers, and using manpower forecasts in career redirection planning, and suggest that as people grow older they tend to seek movement from data- and materials-oriented jobs to people-oriented jobs. Part two, Manpower and Educational Programs: The Experience, contains chapters on government programs, employer-sponsored programs, union-sponsored retraining programs, foreign programs, and special redirection efforts, and suggests that existing education and manpower programs provide many of the components necessary for career redirection. Part three, Synthesis and Implications for Policy, (1) summarizes the lessons from the literature, concluding that the potential for mid-life career redirection in the American work force is virtually untapped; and (2) makes recommendations for policymakers, sketching a spectrum of experimental pilot programs of various scale and coverage, intended to meet the shortcomings of existing programs. Every chapter but one contains a bibliography. (UR)

Report No.: R-1582/1-NF
Available from: The Rand Corporation, 1700 Main Street, Santa Monica, California 90406 ($3.00)
Document Not Available from EDRS.

The report is concerned with the evaluation of existing literature on alternative programs to facilitate mid-life redirection of careers, with a view to identifying how literature in relevant fields can be used by policy makers. The report is a condensed and abbreviated version of the material in Volume 2. Major Findings. Some 300 items of literature were evaluated with reference to internal and external validity and policy relevance. Factors motivating mid-life change, the rationale for public intervention in redirection, definitions of terms, and target groups are outlined. The literature covered worker dissatisfaction as a factor in redirection; evaluations of education and skill training for older workers, including foreign programs and programs sponsored by government, industry, and unions; and manpower forecasts and career opportunities for redirectors. The adequacy of existing programs and experimental program initiatives are also covered, and followed by recommendations for additional research. (SA)

Twelve papers address three topics: the middle years and dilemmas; the middle years—suggestions and solutions; and the changing university—new audiences for learning. Bruce Dearing examines personal, human questions posed by maturing individuals and indicates how they present challenges for a lifetime learning process. Bentley Glass discusses two aspects of lifelong learning. A statistical overview of the economy indicating an increasing demand for workers in their middle years is presented by Herbert Bienstock. Eli Ginzeog outlines costs to the society and the individual in establishing new work patterns for the middle years. Costs in relation to investment in human capital are examined by Victor Fuchs, and Samuel Conner discusses the concept of midcareer change in relation to an individual’s personal and financial needs. Bernard Bellush describes the activities of a union to promote work satisfaction and career flexibility; F. Bruce Hinkel reports on the work of a corporation to reach the same goals. Ruth VanDoren discusses the changing nature of careers and education; Betty Roberts addresses the voluntary occupational change of middle-aged people. Designing new work patterns for women which could be applied throughout the economy is discussed by Felice Schwartz. In the concluding presentation, John Toll comments on the design of new work-learning relationships. (Author/AG)

New Careers for Mid-Life: May We Help You?

Ronald Hoenninger
National Vocational Guidance Association, Washington, D.C.

EDRS Price MF-$0.76 HC-$1.95 PLUS POSTAGE

Numerous societal changes have encouraged the marked increase in second careers for people in general and for those over 35 in particular, raising implications for both career development and vocational decision-making. A developmental model needs to be realigned with new developmental strategies for the midlife years. Research literature has suggested that most people undergo a midlife crisis—a reaction to the onset of aging and a reawakening to unresolved problems and/or career decisions. Recent research studies have shown higher achievement values and motivations for candidates for second careers than noncandidates and a high proportion of second-career candidates having a low degree of autonomy on their jobs. Moreover, vocational decision-making at midlife has been found more complex, "soul-rending," and fearsome than at other stages. The role of this Commission needs to be threefold: educational, collaborative, and creative. Recommended collaboration includes the American Association of Community and Junior Colleges, the Adult Education Association, the National Institute of Education, and the military. Recommendations for creativity include: radio and television materials; career education-placement agencies in cooperation with labor and industry; research pertaining to counseling/assessment skills, models, and/or autobiographies of people changing careers; publications and regional meetings; training of personnel; focus on problems of women. (EA)

Available from: Macmillan Publishing Co., Inc., 666 Third Avenue, New York, New York 10022 ($5.95)

Document Not Available from EDRS.

The author explores the self-realization opportunities possible through second careers as well as the uncertainties and hazards involved in such a major life change. Numerous examples of middle-aged second careerists are included in the book as well as some classic examples. There is no set pattern of career changing in mid-life; new directions and the reasons for shifts are as diverse as the people. The book opens the door to those who feel "bound to their wrong choice, caught in a dead end, and/or victimized by the rat race." The chapter focuses on the need to train people for a cluster of occupations in our technologically changing society that suggests more job changes for the future. Disillusionment with materialistic values and the trends toward social service are often motivating factors for second career choices of a more altruistic endeavor. More women than ever are looking forward to or moving into second careers; retirement, and today's trend toward early retirement, is yet another life stage that can launch a second career. This intimate glimpse at the lives of hundreds of men and women who began new careers (and the psychologists, family counselors, and employment agents who advised them)--provides encouragement and identification for those seeking a similar choice. (EA)

Parsen, George E.
71 157p.; Ph.D. Dissertation, Ohio State University
Available from: University Microfilms, P.O. Box 1764, Ann Arbor, Michigan 48106 (Order No. 72-4604, MF $4.00, See catalog for hardcopy price)

This study was designed to investigate the occupational movement and reasons for movement of men aged 45 to 59 between their first and current jobs, and more precisely to examine:

(1) change and stability of various occupational personality types,
(2) the effect of selected variables on change and stability of personality types,
(3) the relationship between job satisfaction and worker attachment to an occupational personality type, and
(4) the relationship between job satisfaction and worker attachment to an occupational personality type by use of John Holland's theory of career selection. The data used were collected by the Bureau of the Census for the Center for Human Resource Research at The Ohio State University in 1966 as part of the National Longitudinal Surveys. A multi-stage probability sampling technique was used. Major findings indicated that realistic types were the most stable personality types and that occupationally mobile individuals were different from occupationally stable individuals, blacks from whites, vocationally, and realistic types from the other five personality types. The most significant implication of this study was that it indicated the relevance of Holland's theory of occupational selection to older men in the labor force and to the study of occupational mobility.

before attempting to find a job. Chapters Eight and Nine discuss employment possibilities and remuneration and explode the myth about fantastic salaries on the "outside." Chapter Ten explores the realities of employment for women retirees. Chapter Eleven outlines a plan for job searching, and Chapter Twelve discusses the best way to set up a resume. Chapters Thirteen through Fifteen discuss the advantages and disadvantages of various careers and the case history of the top 20 successful retirees. Chapter Sixteen highlights the advice of those who have already retired, and Chapter Seventeen outlines the format for a personal retirement plan. Appendix A lists publications giving helpful job hints: Appendix B gives statistical data. Appendix C discusses previous studies of military retirees. References, an index, and biographical notes are included. (CK)

The seventeen articles in this book were written to help middle-aged retirees, especially the military, in finding second careers. Chapter One discusses the attitudes, policies, and needs of potential employers. Chapters Two through Four separate myth from reality concerning the chances of gainful employment past the age of 45. Chapter Five explores wives' attitudes toward the retirement years. Chapter Six compares situations of the 20-year and 30-year retiree. Chapter Seven discusses the importance of improving one's education and pursuing additional training.
Changing Careers after Thirty-five: New Horizons through Professional and Graduate Study.

The author deals primarily with people who make a change in career orientation so distinct that the move requires at least a year of professional or graduate education. Chapters examine such topics as the changing nature of middle age; fields of study or endeavor (mainly social work, librarianship, elementary and secondary education, and other service professions) favored by middle aged students; reasons why men and women over 35 decide to enter or reenter professional or graduate school; and kinds of financial, academic, and family problems and adjustments experienced by such students. Seventeen case histories are presented to illustrate a wide diversity of motives, circumstances, and personal characteristics. Major findings include these: (1) most middle aged people who change careers were largely successful and satisfied in their previous work; (2) they tend to be dynamic individuals actively searching for new interests; (3) many people who return to work act with relatively little prior planning or guidance. Implications for education and guidance, theories of occupational choice, developmental psychology, and manpower policy formation, are discussed in the last chapter. An index and seven tables are included. (LY)

Occupational Change and the Choice of Teaching as a New Career.

Londoner, Carroll Alton

Indiana Univ., Bloomington.

Mar 70 306p.; Ph.D. Thesis

Available from: Universit Microfilms, 300 N. Zeeb Rd., Ann Arbor, Michigan, 48106 (Order No. 70-22,833, MF $4.70, Xerography $13.95)

Document Not Available from ERDS.

A study was made of how job factors, as related to age and sex, induce persons educated and working in one career to leave and then choose teaching as a new career. Subjects (45 graduate students in an Indiana University teacher certification program) ranged in age from 25 to 56 and had undergraduate backgrounds in fields other than education. They were administered a specially developed questionnaire and rating scale. Men aged 24-39 were more dissatisfied by the factors as a whole than comparable women. Regardless of sex, subjects aged 24-39 tended to be dissatisfied with opportunities for promotion, decision making, and personal growth; level of job creativity and challenge; responsibility for the efforts of self and others; recognition by peers; managerial foresight and planning; interpersonal relations; use of their abilities; existing sense of pride and success; and supervision. Most of these factors may have influenced persons 30-34 to leave their careers. Men and women differed on work with young people, social progress, and commitment as factors leading them to choose teaching. These and other findings led to the conclusion that age is relevant to leaving one's old job in favor of teaching. (LY)

Counseling older persons: Career change and retirement.

Sinick, Daniel

George Washington U

Vocational Guidance Quarterly 1977 Sep Vol 25(1) 18-25

Describes 2 major counseling opportunities in work with older people: career change and retirement. In approaching mid- or late-life career change, emphasizes the counselor is likely to find useful include (a) evaluating client motivations for change, (b) regenerating client self-confidence, (c) minimizing use of traditional testing, (d) identifying usable old interests and skills, (e) developing new interests and skills, and (f) assisting clients in finding jobs. Counseling emphasizes crucial in dealing with retirement are (a) role adjustments, including mourning changes and appreciating continued living; (b) the multiple options for creative use of time; and (c) management of "mundane" matters, e.g., housing, independence, and preventive health care. The challenge of second careers: To society and to the individual.

Ossofsky, Jack

National Council on the Aging, Washington, DC

Industrial Gerontology 1976 Sep Vol 3(2) 75-82

Describes the Conference on Older Workers: Issues in Second Careers, sponsored by the National Council on the Aging, which represents a major effort of the program to focus on second careers as a response to mid-life changes. Topics discussed included (a) the extent of life expectancy from 35 to 72 yrs; (b) the decrease of the work role, (c) the motivation of women through benefit inadequacy, and (d) the need for different types of programs.

Why study mid-life career change?
Thomas, L. Eugene; Shepherd, Joseph
U Connecticut
Vocational Guidance Quarterly 1975 Sep Vol 24(1) 37-40
Identifies areas in developmental knowledge of mid-life career change and stability that need more research. These include (a) motivations for mid-life career change, (b) the relationship between career change and identity change, (c) the balance between work and leisure activities related to psychological well-being in middle age, and (d) correlates of persistence and change at mid-life, especially in the light of current opportunities, presented for career change. Besides studying others, developmental psychologists should investigate themselves and colleagues since this concern also touches their lives. The nature of the problem requires an interdisciplinary approach, and the help of guidance workers is needed.

Unemployment and mid-career change: A blueprint for today and tomorrow.
Kinn, John M.
Inst. of Electrical & Electronics Engineers, Educational Services, New York, N.Y.
Industrial Gerontology 1973 Spr No. 17 47-59
Describes programs resulting from the Conference on Mid-Career Counseling of 1970 by the Institute of Electrical and Electronics Engineers, Inc. A placement program was developed which relocated 25,000 people in 2 1/2 yrs. Related problems included effects of national priorities upon unemployment, need for a national science policy, and options and opportunities for individual re-employment. Institutional, personal, and psychological problems were often incurred in mid-career changes. Findings indicate that (a) engineering training should be flexible because career demands are rooted in technological advances; (b) engineers have certain skills with high transfer value; (c) private industry and construction furnish many employment opportunities; (d) education has more liberal art requirements than many government jobs required; (e) the health field is opening up new areas of opportunities; and (f) there will be competition for jobs from laid-off career men other than engineers.

Personality and career change.

Clopton, Willard C.

Raymond Walters Coll., Psychological Services, Cincinnati, Ohio.

Industrial Gerontology 1973 Spr No. 17 9-17

Presents a condensed report of a doctoral study initiated to identify personality attributes and life circumstances associated with career change in mid-life. Ss were 2 groups of 31-53 yr old males. "Shifters" were a group of 20 men pursuing, or in recent receipt of, an advanced degree as prerequisite for a newly-chosen career. "Persisters" were 20 men matched with shifters for age, education, marital status, 1st career field, and years spent in that field. Shifters had a mean age of 41.7 yrs, persisters, 40.8 yrs. Data were gathered through taped interviews, California Psychological Inventory, SVIB, and Rotter Internal-External Control Scale. Shifters had enough money to see them through transitional periods; 20% were divorced or separated. All persisters lived with their 1st spouse; 20% had money enough to see them through their career reorientation. Dissatisfaction with career was found to be only 1 factor behind change. Psychopathological behavior was not a characteristic of the group. Shifters appeared to be acutely aware of their mortality. It is concluded that present rather than past conditions reinforce the desire for change.

Family Influences on Mid-Life Occupational Attainment: A 23-Year Follow-Up Study
Laurence P. Sealer, Robert C. Sylvinia State U, University Park 16802

Descriptors: OCCUPATION; ATTAIN; FAMILY; INFLUENCE; MIDDLE-AGE; UNITED STATES

Index Phrase: US, midlife occupational attainment vs family influences, 23-year follow-up study; dominant achievement culture, components assimilation, creative conformity, path model;

DDC TYPE: R551977829

Abstract: A multivariate, multistage path model was employed to test parental family influences on educational & occupational antecedents of Ru development among a representative sample (N=460) of Ru reared Pa M's. As high school sophomores, they were first contacted in 1947 & contacted at different points up to 1971. At the microstructural level of the family, educational & occupational opportunities are viewed as linear functions of direct & indirect forms of intergenerational cultural & SE assistance, family size, home environment, & parental achievement training. The Alwin-Hauser (1975) technique for decomposing .sigma. effects in a path model was utilized to tabulate the direct & indirect effects of these family-related variables on measured intelligence, academic performance, & years of schooling in the adolescent & late teenage stages of the R's life cycle. Compared are relative effects of all of the foregoing variables of early-adult occupational rank & participation, financial, managerial behavior, & economic aspirations. This comparison revealed that occupational attainment can be viewed as a process of acquiring key components of the dominant achievement culture & that the internalization of these components serves to direct the development of human resources in creative conformity with that culture. Also, the family is part of a larger cultural matrix (eg, postindustrialization) experiencing change over time & that it is influential in specifying the degree to which young men were able to prepare for, & subsequently adapt to, industrial shifts in the economy & the ensuing expansion of employment opportunities at the upper reaches of the occupational structure. Effects of several indicators of family background on midlife occupational attainment showed that parental inputs as well as high school performance behavior, educational attainment, & early-career rank significantly contributed to the ability of some R's to perform technically oriented & cognitively complex occupations & professions at age 40. The path model explained 43% of the variance in occupational attainment at about age 26 in 1957; 14 years later, it accounted for 40% of the variance in occupational attainment at age 40.
MATURE ADULTS. HAVE DEAL WITH A NEW GENERATION OF WIVES WHO WILL NOT PLAY DEAF-ENU CAREER POSITION AND STAGNATION, EXTENSION OF HER HUSBAND'S, OUT, IT LESS WORK TO DO. LOOK TRANSFER ROBS HER OF PART OF HER IDENTITY, 'EAVING HER OLD WHILE HER HUSBAND IS STILL MIDDLE-AGED. HE CAN LOOK FORWARD TO MORE RAISES AND MORE RESPONSIBILITY IN HIS JOB. WHILE SHE CAN LOOK FORWARD TO A DIMINISHING-JOB, LESS RESPONSIBILITY, AND LESS WORK TO DO. THE COMPANY EXPECTS HER LOYALTY AS AN EXTENSION OF HER HUSBAND'S, BUT IT HAS DONE NOTHING TO DESERVE IT. TRANSFERS ARE ACCEPTED BECAUSE NON-ACCEPTANCE LEADS TO A DEAD-END CAREER POSITION AND STAGNATION, BUSINESS IS GOING TO have TO DEAL WITH A NEW GENERATION OF WIVES WHO WILL NOT PLAY THE 'PASSIVE, HOUSEWIFE' GAME. THEY WISH TO BE CONSIDERED MATURE ADULTS.

When men reach the mid-30's, they have a burst of energy and desire to reach the top of their profession, believing that work performance is a criterion of their worth. If they fail to reach the top, they must adjust their goals down. They should either seek a more satisfying occupation with meaning or take on a second career that is fulfilling. Even if the goal is attained, it is usually not as thrilling as anticipated. The severity of midlife crisis depends on how strongly the man sees his goals as a solution to personal problems or how he has modified his goals to be more realistic. They face the crisis of generativity, in which they either voluntarily want to help take care of others, or see others as a threat. They should ideally seek activities that give them a deeper sense of satisfaction, like a renewal of their marriage or a career change.

Doc Type: JOURNAL PAPER
THE MIDDLE-AGED MANAGER'S OWN JOB PERFORMANCE AS WELL AS THAT OF HIS WHOLE DEPARTMENT OR SECTION CAN BE AFFECTED BY THE MIDLIFE CRISIS, WITH ITS REALIZATION OF LOSS AND DEPRESSION, ITS CRITICAL SELF-EXAMINATION, FEAR AND HOSTILITY, AND HEALTH PROBLEMS. A GROWING NUMBER OF MIDDLE-AGED MANAGERS ARE LEAVING THEIR FIRST CAREER TO UNDERTAKE AN ENTIRELY NEW ONE. MORE AND MORE COMPANIES, HOWEVER, ARE NOW ESTABLISHING MIDDLE-CAREER CLINICS TO HELP THEIR EMPLOYEES THROUGH THESE DIFFICULT YEARS, THEREBY OPENLY RECOGNIZING THE PROBLEM. THROUGH COMPANY TRAINING PROGRAMS AND INFORMATION COMMUNICATION, MANAGERS CAN BE INFORMED OF THE NATURE OF THE MIDLIFE CRISIS. PERSONAL AND VOCATIONAL COUNSELING應 BE OFFERED TO MIDLIFE MANAGERS, WITH COUNSELING OF A SUPPORTIVE NATURE. SMALL GROUP MEETINGS OF MIDDLE-AGED MANAGERS ARE FOUND TO BE PARTICULARLY EFFECTIVE.

HOW TO GIVE PHASED-OUT MANAGERS A NEW START
CUDDYH, BASIL ROBERT
Doc Type: JOURNAL PAPER
WHEN ALUMINUM COMPANY OF CANADA, LTD. WAS FACED WITH A PERIOD OF ADVERSE BUSINESS CONDITIONS THAT MADE MASSIVE MANAGERIAL CUTBACKS INEVITABLE, THE COMPANY THREW A NEW APPROACH TO DEVELOP A SOCIAL RESPONSIBLE PROGRAM TO HELP 200 MIDDLE-AGED EMPLOYEES EMBARK ON NEW CAREERS. THIS ALSO LED THE COMPANY TO ADOPT NEW PERFORMANCE APPRAISAL PROCEDURES TO PROVIDE A USEFUL RECOGNITION OF THE SITUATION. THE TERMINATION POLICY AND PROCEDURE ARE DESCRIBED. THIS PROGRAM TAUGHT THE BASIC LESSONS THAT MIDDLE-AGED EXECUTIVES DO HAVE MARKETABLE SKILLS AND CAN FIND NEW JOBS IF THEY LOOK FOR THEM AND THAT THE COST OF RUNNING SUCH A PROGRAM IS GREAT, BOTH IN TERMS OF MONEY AND ANGEL, WHICH MIGHT BE LOWERED WITH THE USE OF SOME GUIDELINES. UNUSUAL ASPECTS OF THE PROGRAM included USE OF OUTSIDE CONSULTANTS AND THE COMPANY'S STAFF PSYCHOLOGIST ALONG WITH PROVIDING TEMPORARY OFFICE SPACE FOR THE TERMINATED EMPLOYEES.

The object of this research is to provide insight into the process of midlife career change. A variety of adjustments are made by the individual in a job transition, and these adjustments can be potentially stressful events. Coping response theory will be combined with an ego functioning model to produce a model with 12 ego functions. Using this model, the researcher hopes to: (1) determine the motivations underlying the decision to change careers at midlife; (2) understand sources of stress and difficulty in the process of midlife career change; and (3) assess adaptive and maladaptive patterns of coping response to this stress.

A clinical interview procedure will be used to obtain detailed life history information on individuals 40 to 60 years old who have changed careers. A content analysis will assess the level of ego functioning, both at the time of career change and at present.

DESCRIPTORS:

The committee is appointed to stimulate and develop research on relationships between work and personality during the mid-life period. The intention is to serve as a center for exchange of information among the increasing numbers of social scientists working in the area. Accordingly, the committee is developing contacts with interested scholars both in the USA and in other countries and has distributed bibliographies, progress reports, and correspondents lists.

In the year ahead, the committee will commission secondary analyses of survey data archived at the University of Michigan and initiate study groups or seminars on such topics as (a) definitional questions with respect to types of careers, career patterns, and the measurement of career trajectories, (b) cross-cultural and ethnic differences in conceptualizing the life cycle and the middle years, (c) women's work, men's work and the family's life cycle, and (d) life roles, life cycle, and the "convoy of social support" during the middle years, where "convoy of social support" refers to those persons on whom an individual relies for support and those who rely upon him/her for support.
