A model for program evaluation with pertinent data from a variety of methods applied in six settings is described. The settings include two university clinical psychology programs at Alabama and Kansas; the Memphis Internship Consortium; the University of Arkansas Student Development Center component of the Counseling Unit; and two county social service agencies, Benton and Washington counties in Arkansas. The evaluations of the clinical psychology training programs are described in some detail herein to augment (and antedate in methodology) the separate presentations of programs in the other four settings. The model format includes entree to setting, shared planning, participation in data collection by setting personnel, informal oral feedback with all setting participants, formal feedback between researcher and program, and a continuing relationship between researcher and program. The model encourages a continuity of relationship between researcher and program to stimulate shared involvement over time, increasing the likelihood that findings will have an effect upon future program practices. Methods include interviews with participants, group meetings with participants, stream of behavior accounts and occupancy counts of behavior settings, needs assessment data, time logs of activities and concurrent feelings of program participants, and questionnaire data. These methods separate persons and settings so that feedback of findings may be individualized, and personally relevant data as well as program relevant data may be provided to participants. (Author/IS)
For several years I have been concerned with the description of training and service delivery settings in which human service workers, including clinical psychologist, find themselves. The handout (Table 1) indicates the settings that have been described. I want to briefly mention the three components of this table by way of introduction. First, you will note a progression from academic training settings through clerkship and internship settings and finally to service delivery settings in the community. Second, the research process has been largely shared with students, undergraduates and graduates, as part of formal seminar work, honor's program, and otherwise since we believe that we need to infuse academic knowledge with an awareness of the everyday problems of doing research in training and service delivery settings. Third, the methodology varies with the setting and, in general, the more structured the methods the shorter the time period for the evaluation process. For example, the university programs were looked at in one day while the clerkship, internship and social service agencies used a one week time log as the data base, either alone or with additional interview or paper-and-pencil measures. Finally, where the evaluation process proceeded by interview alone and was consequently subjective, the time period was generally extended.

These studies follow what I would label as an action research model (Lewin, 1946). An outside researcher collaborates with a client system in an interactive cycle of analysis, fact-finding, conceptualization, planning, execution, and evaluation. This model has been labeled more precisely as
a "contingency design" (Ketterer & Perkins, 1977). The four ingredients of this design are a systems analysis perspective, a theory-generating methodology, collaboration between outside researchers and staff, and specific utilization strategies. The systems analysis perspective provides for relations between persons and the environmental context or setting as the focus for the study.

A theory-generating methodology serves to identify relevant variables, use multiple methods, and makes pertinent group comparisons. Collaboration implies a warp-and-woof of relationship between researchers and agency personnel that begins before the research process and continues long after the research is completed. Utilization strategies include the use of multiple audiences for feedback, needs assessment prior to evaluation, a linkage of research and data via feedback, a timing of research and feedback to (hopefully) ensure utilization of data, and clear, precise, tailored messages from researchers to agency personnel.

Table 2 presents a rough goodness-of-fit between "contingency design" characteristics and the four program evaluation studies herein reported. Since this table is an exercise in after-the-fact dovetailing, I would rather direct your attention to Table 3 which depicts the process of program evaluation in these four settings. This process includes entree to the setting, shared planning, participation by setting persons in data collection, informal oral feedback, formal written feedback, and a continuing relationship with the setting. Explicit in this representation is that there is something of enduring value for the setting that comes directly from the evaluation experience. That "something" may be a set of recommendations that are acted upon by setting administrators, (counseling center), a concern with the research as a continuing monitoring system as well as an
entirely new research process (internship), and descriptive material that can be used in describing the program for potential students (university). The intent of these procedures is to provide some sense among program personnel that they own and can make use of the evaluation experience over a period of time.

With this cursory introduction to the overall research process I would like to describe the evaluations of university programs since these two of the six settings are not dealt with by the other papers. This research odyssey began with an internship site visit to the University of Alabama Medical Center and some brief words with Dr. C. J. Rosecrans regarding the typical one-way communication from academic program to internship. In an effort to provide feedback to university programs, a now controversial survey of internship directors succeeded in identifying programs that provided competent interns. Since programs were ranked it became of interest to specify some of the ingredients of graduate clinical training in specific programs that led to a positive evaluation by internship directors. Accordingly two highly-rated programs, Alabama and Kansas, were selected and contacted for permission to study their program. During the previous year a methodology had been developed and piloted as well as following set of training goals or clinical skill components:

(a) acquisition of clinical skills; (b) communication of clinical skills; (c) professionalization; (d) autonomy; (e) flexibility; and (e) personal integration. This list of training goals came out of my own experience and represent neither consensus nor empirical origin. It constitutes a framework for the development of a methodology in order to examine program functioning and thus has primarily an heuristic value.
The methodology for university program evaluation was an adaptation of Roger Barker's eco-behavioral approach (Barker, 1968) that was essentially an indexing of program activities to Barker categories and a subsequent clustering of these data into the clinical skill or training goal components. The heart of this indexing occurred in the practicum and case conference settings which were subjected to a stream of behavior analysis that indicated faculty and student input in the form of case presentations, didactic content, questions, comments, disposition statements, evaluation, and affect. These data were obtained in one-minute time samples with substantial scorer reliability. Comparison of structural components across training settings both within and between programs was feasible. Table 4 suggests how this juxtaposition between Barker categories, data categories, and training goals was accomplished. Table 5 looks at the final product in which program components and training goals are directly compared. The data from this entire process together with interview content was then assembled into a description of the program that highlighted the training values (Dana, 1976a; Dana 1976b).

I would suggest that the application of any systematic coding to the behavioral contents of training settings is both novel and necessary. We need to be able to describe training procedures as they articulate with program goals in order to evaluate the quality of clinical training. Moreover, these evaluations could have been accomplished just as readily using program goals germane to each program rather than those previously mentioned. In fact, it might be useful to compare generalized training goals with program-specific training goals as frames-of-reference for organizing program data. For example, the University of Alabama has developed their
own set of training goals which include therapy, assessment, teaching and
training, personal development as therapists, personal growth, identifi-
cation with the profession, and the development of an individual profes-
sional identity.

I stress the use of program-specific training goals since it is
ultimately necessary for program evaluation to be part-and-parcel of the
ongoing accountability process within a setting. These studies were all
gratuitous or "imposed" since they did not emerge as the results of program
deficits as defined by program administrators in any instance. One of the
desired outcomes of all of these studies is to encourage a transition to
in-house accountability paradigms. Such accountability is more than sheer
documentation of the training or services provided. Routine program
evaluation can be the basis for planned and continuous changes in order to
meet the demands for novel and altered training and/or services without
disruption of the system itself.
