This collection of abstracts is part of a continuing series providing information on recent doctoral dissertations. The 15 titles deal with the following topics: (1) a hierarchy of purposes for reading assignments applied to secondary school social studies; (2) the effects of sentence combining practice on reading comprehension; (3) the effects of values clarification upon reading achievement, biology content achievement, cognitive levels of development, and expressive language; (4) bimodal memory in disabled and normal readers; (5) the effect of an eclectic reading laboratory program on high school readers; (6) the effects of advance organizers on comprehension of a reading task; (7) the effects of transactional evaluation on reading attitudes and achievement of high school students participating in an interdisciplinary reading program; (8) the syllable or vocalic center group as a factor of word perception; (9) the teaching of content area reading skills; (10) the effect of confirmation of answers on comprehension in reading; (11) the effectiveness of study skills instruction; (12) cognitive operations employed in the reconstruction of text content; (13) the effect of interest on the reading miscues, strategies, and behaviors of high school students while reading American history materials; (14) the effects of training in note taking from written material; and (15) student achievement in selected reading programs and their impact on learning.
Reading and Study Skills and Instruction: Secondary

Abstracts of Doctoral Dissertations Published in Dissertation Abstracts International, January through June 1980 (Vol. 40 Nos. 7 through 12)

Compiled by the Staff of the ERIC Clearinghouse on Reading and Communication Skills

"PERMISSION TO REPRODUCE THIS MATERIAL HAS BEEN GRANTED BY University Microfilms International TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)."
The dissertation titles contained here are published with permission of the University Microfilms International, publishers of Dissertation Abstracts International (copyright © 1980 by University Microfilms International), and may not be reproduced without their prior permission.
This bibliography has been compiled as part of a continuing series designed to make information on relevant dissertations available to users of the ERIC system. Monthly issues of Dissertation Abstracts International are reviewed in order to compile abstracts of dissertations on related topics, which thus become accessible in searches of the ERIC database. Ordering information for the dissertations themselves is included at the end of the bibliography.

Abstracts of the following dissertations are included in this collection:

Burron, Kenneth Earl
AN INVESTIGATION OF A HIERARCHY OF PURPOSES FOR READING ASSIGNMENTS APPLIED TO SECONDARY SOCIAL STUDIES

Candal, Patricia Elaine-Tanner
AN INVESTIGATION OF THE EFFECTS OF SENTENCE-COMBINING PRACTICE ON THE READING COMPREHENSION OF NINTH GRADE STUDENTS

Compton, Myrna Jean Nelson
THE EFFECTS OF VALUES CLARIFICATION UPON READING ACHIEVEMENT, BIOLOGY CONTENT ACHIEVEMENT, COGNITIVE LEVELS OF DEVELOPMENT AND EXPRESSIVE LANGUAGE, AND OTHER FACTORS

Goldberg, Kay Ellen
BISENSORY MEMORY FOR CONCRETE AND ABSTRACT NOUNS IN DISABLED AND NORMAL READERS

Klein, Adria Fay
THE EFFECT OF AN ECLECTIC READING LABORATORY PROGRAM ON SECONDARY SCHOOL STUDENTS

Winn, Wynona Olita
A COMPARISON OF STUDENT ACHIEVEMENT IN SELECTED READING PROGRAMS AND THEIR IMPACT ON LEARNING
AN INVESTIGATION OF A HIERARCHY OF PURPOSES FOR READING ASSIGNMENTS APPLIED TO SECONDARY SOCIAL STUDIES

Order No. 8004438

The purpose of this study was to investigate the existence of a hierarchy of purposes for reading assignments in secondary social studies. The hierarchy was investigated was postulated as (1) Reading to list simple data (2) Reading to answer data based questions (3) Reading to group data (4) Reading to rank among data (5) Reading to defeat or refuse (6) Reading to identify a theme (7) Reading in order to evaluate or review.

The assumption that the levels of the hierarchy were ordered in an order of ascending complexity was explored.

A test passage relevant to social studies content in the target population area was constructed by the investigator. Questions directed at each level of the hierarchy of purposes were developed to determine the validity of the levels. The validity of the questions was assessed by graduate students in reading. Responses to the questions were developed by the investigator employing a pool of acceptable responses as provided by social studies teachers familiar with the materials of the investigation.

Subjects were fifty sixth-grade students from the River East School Division in Winnipeg, Canada. Subjects were students at a comprehensive high school in the Division, which was characterized as representative of the socio-economic characteristics of the Division.

The materials were administered to the subjects by classroom teachers in May, 1979. Subjects read the passage and responded to the questions. Subjects were allowed to refer to the passage as they responded to the questions. Responses were evaluated by the investigator.

Data were analyzed in the following manner. The total number of correct responses at each level was tabulated. The total number of instances where the subject had responded correctly to all preceding questions as well as the question at a given level was then determined. The total number of correct responses consistent with the hierarchy was then compared to the total number of correct responses at each level. If 80 percent of the subjects who responded correctly to a question at a given level had also responded correctly to all of the questions at the preceding levels, that level of the hierarchy was considered supported. Further, if 75 percent of the subjects followed the pattern of the hierarchy, the hierarchy itself was considered supported.

Data was illustrated in tables.

The first four levels met the 80 percent criterion and were supported. Levels 5, 6, and 7 did not meet the 80 percent criterion and were not supported. Less than 75 percent of the subjects conformed to the pattern of the hierarchy, thus the hierarchy was not supported.

The following conclusions were drawn: (1) Students who can function at Level 1 of the hierarchy can also function at Level 2 of the hierarchy. (2) Level 3 of the hierarchy, represents a transition in the demands placed upon a student's comprehension ability. (3) Level 4 and succeeding levels of the hierarchy place greater demands upon a student's comprehension ability than do Levels 1, 2, and 3. (4) There is an apparent relationship regarding the ability to function successfully at Level 1 through Level 4 as ordered in the hierarchy. However, it is questionable whether successful functioning at a given level is contingent upon successful functioning at the preceding levels. (5) Levels 5, 6, and 7 are not functional within the hierarchy in their present order. (6) The last four levels of the hierarchy appear to be equally difficult, however, successful student functioning at these levels does not appear to be interrelated. (7) There is little basis for claiming the existence of the hierarchy of purposes for reading assignments as postulated.

AN INVESTIGATION OF THE EFFECTS OF SENTENCE-COMBINING PRACTICE ON THE READING COMPREHENSION OF NINTH GRADE STUDENTS

Order No. 8011222
Candai, Patricia Elaine Tanner, Ed. D. University of South Carolina, 1979. 88 pp. Major Professor: Dr. Richard H. Kherlopian

This investigation examined the effects of sentence-related sentence-combining exercises on the reading comprehension of ninth grade students. The purpose of this investigation was to determine whether sentence-combining practice, utilizing exercises constructed to accompany the literature being studied, would affect reading comprehension ability of ninth grade students. Reading comprehension was defined as indicated by a test of fifth word deletion.

The subjects for this study were 86 ninth-grade students whose classes were randomly assigned to experimental and control groups. The experimental group contained 41 subjects, the control group contained 46 subjects.

In order to examine the effects of literature-related sentence-combining practice on reading comprehension of ninth-grade students, the experimental group received six weeks of intensive practice in combing groups of simple sentences related to the literature studied by both the experimental group and the control group. A combination of signaled and open sentence-combining exercises were used as stimulus materials for the experimental group. The control group received no sentence-combining practice.

Following the period of treatment, both the experimental and control groups were given Form B of the Stanford Diagnostic Reading Test (SDRT), Level III and Form B of a C.I./O.E. test of fifth word deletion.

The basic experimental design for this study was a Pretest-Posttest Control Group Design. The effect of literature-related sentence-combining practice on reading comprehension of ninth-grade students was evaluated using posttest results from SDRT I and C.I./O.E. The dependent measures were statistically analyzed by analysis of variance (ANOVA) with pretest mean scores as covariates. Analysis of variance (ANOVA) was conducted for each dependent variable to determine the degree of similarity between the experimental groups and the control group prior to ANOVA.

The following conclusions were drawn: (1) Ninth-grade students exposed to literature-related sentence-combining practice did not score significantly higher on Test I of the Stanford Diagnostic Reading Test (SDRT) Level III (Form B) than ninth-grade students who were not exposed to literature-related sentence-combining practice. (2) Ninth-grade students exposed to literature-related sentence-combining practice did not score significantly higher on a close posttest of fifth word deletion than ninth-grade students who were not exposed to literature-related sentence-combining practice.

Interpretation of the results permitted the following conclusions: (1) Literature-related sentence-combining practice had no significant effect on the reading comprehension of ninth-grade students when reading comprehension was measured by Test I of the Stanford Diagnostic Reading Test, Level III. (2) Literature-related sentence-combining practice had no significant effect on the reading comprehension of ninth-grade students when reading comprehension was measured by a close posttest of fifth word deletion.

Findings of this investigation suggest a need for further research conducted over a longer treatment period. Correlation results between posttest scores of SDRT I and C.I./O.E. suggest the need for further investigation, perhaps utilizing a closer test deletion pattern other than fifth word deletion.

THE EFFECTS OF VALUES CLARIFICATION UPON READING ACHIEVEMENT, BIOLOGY CONTENT ACHIEVEMENT, COGNITIVE LEVELS OF DEVELOPMENT AND EXPRESSIVE LANGUAGE, AND OTHER FACTORS

Order No. 8004441

Purpose The purpose of this study was to investigate the contribution of participation in values clarification activities within a subject-matter course to the reading achievement scores of high school biology students.

Hypotheses. (1) There will be no difference in the portion of the variance explained by the full model containing all nine predictor variables and the portion of the variance explained by the restricted model when the preteaching score variable is deleted from the full model; (2) There will be no difference in the portion of the variance explained by the full model containing all nine predictor variables and the portion of the variance explained by the restricted model when the cognitive level of development variable, the age variable, and the sex of the student variable are deleted from the full model; (3) There will be no difference in the portion of the variance explained by the full model containing all nine predictor variables and the portion of the variance explained by the restricted model when the cognitive level of development variable, the age variable, and the sex of the student variable are deleted from the full model; (4) There will be no difference in the portion of the variance explained by the full model containing all nine predictor variables and the portion of the variance explained by the restricted model when the instructor variable, and the biology course type variables are deleted from the full model; (5) There will be no difference in the portion of the variance explained by the full model containing all nine predictor variables and the portion of the variance explained by the full model containing all nine predictor variables and the portion of the variance explained by the restricted model when the cognitive level of development variable, the age variable, and the sex of the student variable are deleted from the full model.
The Effect of an Eclectic Reading Laboratory Program on Secondary School Students

KLEYN, ADRIA EAY, PHD  University of New Mexico, 1979  155pp

A secondary school reading project involving the tenth grade of a large high school was undertaken in the fall, 1972. The clear need was to evaluate this project and to assign significant, measurable data. The number of students in the project was about 300, which were drawn from the total population of 1,200 in two years of the project on the basis of completing pre- and post tests.

The nature of the reading skills program was varied, with one hour per week taken from the regular English class (for the entire year in each of two years of the project) being the instructional time. An eclectic group of materials was used, with a serious attempt to individualize to each student's needs using available materials. Each student kept a folder with a record of his work and a checklist of specific skills in reading that were mastered.

All students were given the Comprehensive 1st of Basic Skills, vocabulary, and comprehension sections, and the Word Opposites Test both as pretest and posttest. Data gathering was done on a systematic basis. The two experimental groups were compared with each other and were found to be equivalent. These groups were then analyzed longitudinally using the same student-grade CIBS scores, with the scores from the fall of tenth grade and the scores from the midway point of the tenth grade.

It was found that the students gained significantly more in reading scores during the eighth grade of the tenth-grade laboratory reading program than in the total of the two previous years of traditional English instruction. No correlation was found between the number of skills mastered and gains on CIBS comprehension section. No correlation was found between the gains on the Word Opposites Test for the two groups.

The study concluded that the addition of reading skills instruction using an eclectic set of materials in a regular English program produced significant gains on standardized tests.

A Comparison of the Effects of Two Types of Advance Organizers on Comprehension of a Reading Task

KNEEN, MARY JANE, PHD  The University of Toledo, 1979  115pp

The purpose of this dissertation was to compare the effects of two types of advance organizers, guide material and the structured overview, on comprehension of a reading task. The subjects were seventy graders from the Washington Local School District. The topic of the readings was the nullification crisis of 1838. The guide material was a 500-word passage consisting of the pendulum words included in the reading task. The structured overview was a graphic representation of the key words included in the reading task. The reading task was 2500 words in length.

All instruments were designed and implemented by the experimenter. After the subjects received the treatment (one of the advance organizers), they had the opportunity to ask questions. Next, they received the reading task, which was followed by the twenty-five-item comprehension test.

The purpose of this study was to determine: (1) Which form of advance organizer resulted in greater comprehension of a reading task as evidenced by comprehension of a reading task as evidenced by comprehension test performance. (2) Which form of advance organizer was most effective for high, middle, or low ability readers. (3) Which form of advance organizer was more effective for boys and which form was more effective for girls.

Ninety-six subjects were involved in this study. A three-way completely crossed ANOVA was used to analyze the data. Each cell was of equal size. The independent variables were instruction, reading ability, and sex. The two levels of instruction were guide material and the structured overview.

BISENSORY MEMORY FOR CONCRETE AND ABSTRACT NOUNS IN DISABLED AND NORMAL READERS

GOLDBERG, KAY ELLI, PHD  University of Southern California, 1979  114pp

Chairman: Gerald S. Harshbarger

This study had two principal purposes. The first was to determine whether differences in recall accuracy and/or response style exist between disabled and normal readers on a task requiring the free recall of bisensory presentations of concrete and abstract nouns. The second purpose was to investigate the possibility of an interaction between presentation modality and the level of rated concreteness of stimulus words in a bisensory presentation.

Subjects were 23 disabled readers and 23 normal readers in the 10th and 11th grades. Each subject viewed a slide tape presentation in which simultaneous auditory and visual lists of non redundant nouns were presented in trials of four auditory presentations. The lists were presented at a rate of one auditory pair per 2.5 seconds, with the level of rated concreteness of nouns varied across modalities. Subjects were free to report the items of the stimulus presentation in any order.

1. The dependent measures for recall accuracy were the frequency of auditory words, visual words, concrete words, abstract words, and total words correctly recalled by subjects. These data were statistically analyzed using a 2x2x2 repeated measures analysis of variance. Additionally, the response style of subjects was assessed by the ordering of the report of words for each trial. The subjects' entire response for a particular trial was then classified as (a) a pair order response (characterized by the report of items in the temporal order of arrival to the two senses in auditory pair), (b) a modality order response (characterized by the report of items from one modality followed by the items from the other modality), or (c) a mixed order response (where the order of report could not be classified as either pair or modality). Separate one-way analyses of variance were calculated to compare group means for each of the three response types.

2. The statistical analysis for recall accuracy indicated significant main effects for the three independent variables of presentation modality, word concreteness, and reading group. More auditory words than visual words were recalled by subjects. Concrete words were recalled more accurately than abstract words. Group differences between disabled and normal readers were also found with regard to recall accuracy. However, none of the interactions between the independent variables reached significance.

From the statistical analyses for response style it was determined that disabled readers produced significantly fewer pair order responses but a significantly greater number of mixed order responses than normal readers.

The data were considered as confirming the facilitative effect of concreteness on recall, and also as corroborating the evidence from the majority of bisensory studies that auditory presentation is more efficient than visual presentation for short-term verbal memory. Although the conflicting evidence from bisensory digit span studies does not permit the conclusion of a general bisensory memory deficit of disabled readers relative to normal readers, the group differences in recall accuracy found in the present study were interpreted as pertaining to the use of nouns rather than digits as stimulus items. Group differences in the production of pair order responses were considered to reflect the ability of disabled readers to differentially greater difficulty in the integration of auditory and visual information.
The three levels of reading ability were high, middle, and low. This was based on student performance on the Stanford Diagnostic Reading Test, Brown's Level A which was administered to all seventh graders in the Washington School District in February 1979 by school officials.

Next, means were compared by treatment, sex, and reading ability. Each student questionnaire was considered and, although not statistically analyzed.

The findings and conclusions of this study were as follows: (1) The importance of cooperation in the transactional evaluation process was significant. The evaluation task was more effective in facilitating comprehension of the reading task than that of a material group. (2) The structured overview was most effective in facilitating the comprehension of the task. (3) Teachers gained valuable information from the guide material as evidenced by comprehension test performance. (4) There was no interaction among sex, treatment, and reading ability. (5) Reading ability and sex did not reveal a significant difference in the two groups. Further, two and three combinations of effects did not significantly change the pattern of performance differences. (4) Student questions asked by the guide material group were the same as those asked by the structured overview group. (5) Significant changes occurred between the two groups. Further, changes frequently exceeded the scope of the structured overview.

**EFFECTS OF TRANSACTIONAL EVALUATION ON READING ATTITUDES AND ACHIEVEMENT OF HIGH SCHOOL STUDENTS PARTICIPATING IN AN INTERDISCIPLINARY READING PROGRAM**

Purpose. The purpose of this study was to investigate the attitudinal changes and concomitant gains in reading achievement of high school students utilizing the transactional evaluation process in an interdisciplinary reading program.

The process of transactional evaluation (TE) involves program participants (students) in program change or modification through the development of and responses to the Transactional Evaluation Instrument (TEI).

Procedures. Ninth, tenth, and eleventh grade students enrolled at Socorro High School were pre- and post-tested with the Semantic Mnemonic Differential attitude scale and the Stanford Diagnostic Reading Test. Pupils were categorized according to their enrollment in classes instructed by either experimental (TE), project control (C-1) or nonproject control (C-2) teachers. One hundred eighty-eight students who qualified as either experimental or control subjects completed pre- and post-test instruments which measured the amount of gain in reading attitude and achievement obtained during the seven-month experiment.

Ten teachers voluntarily participating in the Title IV-C federal innovative program, "Teaching Reading in All Disciplines" (TRIAD), were selected for either experimental (TE) or control (C-2) groups through a stratified randomization process according to content area. Five teachers were placed in each group. TRIAD project teachers participated in a transactional evaluation process as part of their 48 required hours of group and individual inservice sessions focused on teaching reading in content areas and integrating reading skills into their instructional techniques.

Nonproject teachers conducted no training.

Furthermore, the five TE teachers conducted a TE in one of their own classrooms while simultaneously integrating reading teaching skills. The project control teachers conducted no TE.

**Findings.** (1) The mean pretest/post-test differences on attitude scores were significantly greater for the experimental group (TE) and project control (C-1) than for the nonproject control group (C-2). (2) Significant differences were found among the three groups on Comprehension, Vocabulary, and Reading Rate. (3) Although the differences were not significant at the .05 level, Comprehension gain scores favored the experimental groups. (4) Student Attitude Toward Reading was positively correlated to a significant degree with eleventh-grade project control Group Comprehension gain scores and with TE tenth-grade Decoding gain scores. (5) The experimental teachers' evaluation of conducting the TE in their content classes yielded these important teacher perceptions: (a) Teachers gained valuable understanding of students' needs and interests; (b) students developed—especially in attitude toward classroom management and heightened interest in the subject matter; (c) each teacher expressed optimism about conducting future TE as a means of obtaining greater insight for instructional improvement and as a motivational strategy.

**Conclusions.** Transactional evaluation had a significant effect upon participating teachers' and students' attitudes toward reading. Although the differences were not always significant, the reading achievement results favored the experimental group. The greatest differences occurred between project and nonproject students. Involvement with TRIAD seemed to exert a strong, positive influence on the results of this study.

**THE SYLLABLE OR VOCALIC CENTER-GROUP AS A FACTOR OF WORD PERCEPTION**

**MUNDAY, PEGGY ANN. PH.D. NORTHWESTERN UNIVERSITY, 1979. 100pp.**

The nature of word perception was investigated as it relates to the variables of the number of syllables or Vocalic Center Groups (VCGs) contained in a word, the number of letters comprising a word and the age of the reader. It was predicted that the number of VCGs and number of letters in a word would affect perceptual accuracy and that the number of VCGs would have more of an effect on perceptual accuracy than the number of letters. Younger students were predicted to be less accurate in their perception of tachistoscopically exposed words than older students.

Subjects included 18 seventh-grade students from a suburban Chicago junior high school and 17 students from Northwestern University. Test words were chosen from the Thorndike-Lorge word count (1944) and included words with 8, 10 and 12 letters and 2, 3, 4 and 5 syllables or VCGs. Categories of words resulted from letter/VCG combinations, e.g., 8 letters/2 VCGs, 10 letters/2 VCGs, etc. Results were analyzed according to data gathered on 7 words per category which were controlled for frequency. Each subject was shown the series of test words tachistoscopically for 20 msec and asked to report verbally what was seen.

Age was found to be the only significant factor. A possible cause for the difference in expected and actual outcomes was attributed to the possibility that confounding and featural characteristics of words might have interfered with perceptual accuracy.

**AN INSERVICE MANUAL FOR TEACHING CONTENT READING SKILLS: GRADES TEN TO TWELVE**

This dissertation consisted of developing and writing an inservice teacher training manual of functional models and strategies for teaching reading in the content area, secondary school, grades ten to twelve. Since inservice training manuals are generally not available, a need existed for a well-organized manual of strategies and procedures for teaching those reading skills. The manual focused on skills lessons in the areas of word identification, vocabulary, literal and interpretive comprehension, and critical and applied comprehension, and reading study skills, along with evaluation and information related to the reading deficient student. The manual was field-tested in college classes and with inservice teachers in a rural high school in New Mexico. Surveys of attitudes and competency to teach reading skills were given students in college classes and inservice teachers following the training. All results were positive.

**THE EFFECT OF CONFIRMATION OF ANSWERS ON COMPREHENSION IN READING**

**PATERRA, Mary Elizabeth Cecelia, Ph.D. UNIVERSITY OF MARYLAND, 1979. 460pp. Supervisor: Dr. Robert V. Duffey**

This experimental study provided information on the achievement of junior high school students on a criterion measure consisting of higher order and lower order questions following story parts when three different conditions for answering questions were used. The conditions were: (1) reading story parts and answering questions following by review of the story material to locate the answers, (2) reading story parts once and
Conclusions

1. Significant differences in performance on the criterion measure, higher order questions, and lower order questions were within the comprehension score range of one standard deviation below the county grade level equivalent mean, 6.8, and within the aptitude percentile range between 2 and 95.

2. Within these ranges, girls performed significantly better than boys. Girls who read story parts twice achieved significantly higher scores than girls in the other two conditions. Boys who used locate achieved significantly higher scores than boys who used recall.

3. Correlations between students' performance on the criterion and reading comprehension and on the criterion and aptitude ranged from .31 for girls to .70 for boys.

4. There were no significant differences in the time spent reading and answering questions in the three conditions.

For Theory

Confirmation achieved through locate and through access to correct answers was differentially effective for less able students and performance differences were related to the sex of the student.

For Teaching

(1) A two-way ANOVA was used to answer the questions relative to student performance differences. (2) Reaping comprehension and aptitude subtest scores from the Iowa Tests of Basic Skills

For Research

(1) Research should include a larger sample, elementary students, high school students, and a longer period of time. (2) Research should be made into able and less able readers' performance for locate and recall.
THE EFFECT OF HIGH AND LOW INTEREST ON THE READING MISCUES, STRATEGIES AND BEHAVIORS OF SECONDARY STUDENTS WHILE READING AMERICAN HISTORY MATERIALS

Order No. 8004477
TANNER, MICHAEL LOWELL, ED D University of Northern Colorado, 1979 191pp

The Problem: The purpose of this study was to investigate and describe the effect of high and low reader interest in what is read on reading strategies and reading behaviors selected by the reader while reading U.S. History materials.

Questions: Four questions were formulated to guide this study. They were: (1) What is the quantitative effect of high and low interest on miscues in U.S. History materials? (2) What is the qualitative effect of high and low interest on reading the three cueing systems: graphophonic, semantic, and syntactic? (3) What is the effect of high and low interest on what is remembered from reading? (4) What is the effect of high and low interest on the type of reading behaviors used to read the material and their effectiveness?

Procedure: Two Interest Inventories were administered to identify U.S. History topics of high and low interest to students. One was administered to teachers and one to sophomores and juniors. Passages for Reading Miscue Inventories (RMI's) were developed for the two topics identified as high-interest and the two topics identified as low-interest. Two testing sessions were scheduled for each student. Within the first testing session, each student ranked the four topics identified in the Interest Inventories from most interesting to least interesting to read. Based on their choice of topic of high and low interest, an RMI passage was selected and administered. Then a Reading Behavior Checklist (RBC) was administered. In the second testing session, each student read the RMI of opposite interest and filled out a second RBC.

Treatment of the Data: All miscues made by each student while reading with high and low interest were recorded and coded. Students' retelling scores were calculated based on their verbalization of what was remembered from their reading in high and low interest material. The pattern of retelling was also noted. From the Reading Behavior Checklist, the total number of reading behaviors used by students when reading in high and low interest materials was tabulated. Tests on four clustered samples were computed to test the significance of differences between mean percentages accounted for miscue analysis, retelling, and reading behaviors in reading material of high and low interest.

Conclusions: (1) Students made more miscues when reading in U.S. History material they ranked as low in interest than when they read in material they ranked as high in interest. (2) No significant difference was found due to sex. (3) No significant difference was found due to age. (4) Group membership was significant in improving scores of notetaking efficiency. The accelerated group improved more than the basal group, which improved more than the control group. (5) There was a high positive significant correlation between the number of ideas found in the notes and scores on tests of literal recall on the Common Test. Although there was a positive correlation between ideas and recall on the Level Tests, the correlation was not significant. (6) Both the accelerated group and the average group showed significant correlation between their literal recall test scores and the number of ideas found in their notes on tests controlled for readability. The slower group showed the lowest correlation between the number of ideas found in notes and scores on tests of literal recall.

A COMPARISON OF STUDENT ACHIEVEMENT IN SELECTED READING PROGRAMS AND THEIR IMPACT ON LEARNING

WINN, WINDSOM OIELA, PH D. Kansas State University, 1979 236pp

This dissertation examines two different approaches to teaching reading to seventh grade students who were experiencing difficulties in reading content area materials. One of the reading programs was described as a...
traditional basal approach to reading instruction. The other reading program was described as an experimental individualized approach to reading instruction in the content areas.

The participants in the program were 104 seventh grade remedial readers. Fifty-nine were randomly assigned by ability strata to the experimental reading program and forty-five were randomly assigned by ability strata to the traditional reading program. The subjects were pre and post tested using the California Achievement Test. The achievement test covered three areas: reading, English, and mathematics. The pre and post test scores were analyzed using a two-way analysis of variance.

The results indicated the experimental group made higher mean scores at the .10 level in all three tested areas than did the students enrolled in the traditional program.

The findings from this study indicated reading skills can be fused with content area subject materials. Through direct instruction, remedial reading students can transfer reading skills to other subject matter.
