deserved but much of it, as today, emanated from people unwilling
to prosilete knowledge outside university confines and unaware
of the special teaching requirements of adult education.

Partnership with the Workers
Educational Association

The character of the movement changed with the inception
of the WEA set up in 1903, two years after the foundation of the
Labour Party. The WEA was the creation of Albert Mansbridge,
a socialist, member of the Co-operative movement, churchman and
adult educator. His aim was to equip the working class, especially
its trade union leaders, with the education they had missed when
younger. A network of voluntary WEA branches was set up
essentially to liaise with the extra-mural department in organizing,
publicizing and running joint classes. The WEA therefore, from
the start was a consumers organization for university classes
and much of its present day problems derive from the secondary
role it has always played. Following the 1902 Education Act
government grants helped bring class fees within the reach of
working people. Very soon most university work was being carried
out jointly with the WEA. These new classes required a more
systematic approach than Stuart's short series of one hour
lectures preceded by a handout and reading list and followed by
a discussion and the setting of essay topics. The three year
tutorial class was born. This entailed a small group working
closely with their university tutor, listening to informal
lectures, engaging in wide-ranging discussion and writing
fortnightly essays throughout a total of seventy-two meetings.
By 1912 the Secretaries of the Oxford and Cambridge extra-mural
departments felt able to describe their work as "one of the
greatest unifying forces in the social life of modern England".8
This was perhaps an exaggeration as even in 1914 the number of
students involved in tutorial classes was only 3,345.9
In 1919 a historic report appeared, entitled the Final Report of the Adult Education Committee of the Ministry of Reconstruction, which urged the establishment of an extra-mural department with an academic head at every university in Britain. Liberal education for adults, said the report, should be a standard part of university provision organized by these departments and financed from local and national public funds. During the 1920s extra-mural departments were established at Nottingham, Aberystwyth, Manchester, Exeter, Hull, Leicester, Southampton and Durham. From the outset structures varied. In some cases extra-mural department directors had professional status; in others not. In some cases association with the WEA was very close, in others remote. However, most departments now had full-time tutors who had a teaching and development role in districts where they were resident. Often their work complemented the organizational efforts of WEA branches and their own full-time tutors. But considerable duplication of effort emerged in some areas exacerbated by the difficulty of allocating distinctive roles to the two agencies (or Responsible Bodies as they have become to be called) in a country where adult education provision was still developing and uneven. Official regulations in 1924 intended universities to provide higher level, more cerebral courses than the WEA and the Local Education Authorities (LEAs), but in practice much overlap existed. The emergent LEA provision varied in type and quality. Most LEAs concentrated upon vocational studies, i.e. connected with work, and tended to ignore liberal education, but some like Cambridgeshire with its Village Colleges were very innovative.  

Postwar Developments

Local Education Authorities

The 1944 Education Act imposed a (albeit rather vague)
statutory duty upon local councils to provide educational facilities for adults. Most LEAs now take this responsibility very seriously and work has expanded to the extent that over two million students now attend non-vocational classes engaging the efforts of over 1,000 full-time and 80,000 part-time staff. The majority of classes occur in the evening, once a week between September and April, do not lead to examinations and are mostly concerned with physical or practical activities, foreign languages, arts and crafts, music and drama. In addition, LEAs give financial help and accommodation to voluntary societies, like the Women's Institutes and Townswomen's Guilds, when they engage in educational activities.

Workers Educational Association

In the last twenty years the full-time staff of the WEA has doubled to over 100 but its work has been overshadowed by the rapid expansion of the extra-mural departments; jointly organized classes have slumped to less than 20 per cent of their work. The WEA has rather lost its partnership role and some critics maintain it has yet to find a new one. Frequently voiced is the criticism that the WEA has been too concerned to copy the extra-mural department model. But the army of WEA voluntary workers should not be underestimated nor its range of introductory courses for the public undervalued; some of them are of a "standard comparable in every aspect to many classes provided by university responsible bodies". Moreover, following the recommendations of the government Russell Report in 1973 the WEA is seeking to develop its own considerable interest in work for industrial workers and socially disadvantaged groups.

Extra-Mural Departments

Structure

Since the war the number of the extra-mural departments has increased to thirty-eight employing some 340 full-time and 10,000 part-time tutors. Three-quarters of their salaries are
paid for out of Department of Education and Science funds the rest being made up by the University Grants Council, a semi-independent body set up by the Government to administer block grants for the running of universities. Over a dozen of the newer departments receive no DES grant and derive money from other sources.

The structure and organization of the departments tends to reflect internal university attitudes towards them. Some are accepted as a natural and valuable part of university life and others are regarded as mere appendages, irrelevant afterthoughts. The same elitist values which led to the rejection of Sewell's original plan live on in many university Senate committee meetings. Accordingly, the academic status of departmental heads still varies but generally it is rising; illustrative of this trend is the Manchester directorship which has recently been promoted to professorial level. Another development reflecting and reinforcing this trend, has been the gradual replacement of the resident tutor system by campus-based departments with well organized administrative support, proper offices for tutors and a high proportion of classes held on university premises. Some critics argue that this tendency has removed tutors away from the grass roots. Defenders point out that the departments are now better placed to fight for more resources for their neglected area and to help break down the barriers of privilege and mysticism which have long separated British universities from the rest of society. Campus-based extra-mural departments tend to employ tutors with responsibility to a subject rather than to a geographical area. Subject tutors have often shown great initiative and energy in tapping latent demand; "To give one instance, courses for social workers in one area, which numbered 9 with 177 enrolments before a staff tutor was appointed, increased in five years to 52 with 955 enrolments".16

Liberal Education Courses

Two-thirds of the work of the extra-mural departments -- involving annually over 200,000 students -- is still in the traditional area of liberal education; over one half in the
humanities (archaeology, history, literature, philosophy and art), 13 per cent in the sciences and most of the rest in industrial studies and social sciences. In this field, the departments might typically offer courses — advertised in a variety of ways — ranging from three-year tutorial classes, to sessional classes of 20-24, short courses of 6-10 meetings, day schools, single lectures, residential weekend schools and summer schools. Certificate or diploma courses have been a big growth area. London, always particularly interested in this field, have as many as 5,000 of their annual 20,000 students engaged in certificate courses. This growth reflects the growing need for paper qualifications discussed below. Evening classes are held on the campus or, in collaboration with the WEA and the LEAs, in schools and educational centres. Class fees at present are between 30-40p per meeting — relatively low compared with some LEA fees — but students and old-age pensioners can usually enrol at half price. Despite the near nominal fees, the extra-mural classes still attract only a small minority of working class people and a high proportion of their members are graduates or professional people.

Some universities, like Cambridge, Manchester, Bristol and Oxford have residential centres offering short-stay courses of a liberal and vocational nature. The Manchester centre, Holly Royde College, hosts a wide range of short courses from September to April and during the three summer months takes in two three-month international summer schools, one for working people from the Nordic countries, the other for trade promotion officers from the developing countries. Manchester also organizes a three-week summer school at the seaside university town of Bangor in North Wales comprising small, week-long seminars; this study/holiday approach has proved popular with foreign students.

Post Experience Courses

Along with the improved provision of state education and easier access to universities since the war, the extra-mural
departments have moved into more specialist vocational or post-experience areas. Courses for social workers, for example, now comprise 8 per cent of all their work; Manchester even has a six-person team which runs a two year professional training course. Industrial education has also grown immensely. Most departments now organize management courses and, in association with the Trade Union Congress educational department, a growing number of day-release courses for shop stewards. Some departments have used their classes to pioneer social research. The most famous example is Coats and Silburn's study of poverty in Nottingham but a Manchester class recently published a useful Housing Improvement Handbook designed to help occupants of poor housing to chart the labyrinthine official channels leading to local government improvement grants.

In addition, short post experience courses to provide special skills or up to date information, or which aim to widen the vision, are organized for a myriad of groups: local or central government officers, councillors, army officers, magistrates, lawyers, policemen, business executives, hospital administrators, doctors, clergy, architects, town planners and farmers to name but a few. The departments often take the lead in putting on conferences or symposia (as they are occasionally grandly described), for professionals in specific areas. These might be "one-offs" like the recent conference on North West regional government in the light of government proposals, or they might be annual events like Manchester's Symposium on Broadcasting Policy or its internationally known conference on Conurbation and Transport.

To organize these specialist courses the departments have to establish close working contacts with a wide range of organizations, many of which provide the necessary funds. The 1969 Further Education Regulations provide a 75 per cent grant "towards the cost of providing tuition in any course of liberal adult education in a programme approved ..." which means that the "closed" specialist courses are ineligible for grant; a situation which the Russell Report urged should be reversed.
Teaching and Training

Tutors (occasionally called staff tutors or lecturers) are expected to be academically up to university standard. They are usually encouraged to pursue academic research and many of them undertake lecturing duties in internal departments. But in addition they must have good organizational skills, be prepared to travel to classes and to face audiences of varying ages, social composition and intellectual level. Audience size can vary--anything from two or three to 500--but most extra-mural teaching takes place in small groups, and teaching techniques have developed accordingly. An informal atmosphere is essential to encourage class participation and to disarm the fears of those with limited educational background. The tutor may be faced with a group of diverse qualities but, at best he must seek to fire their interest and extend their learning abilities to the limits. At the very least, he must do enough to bring them back next week! The overall standard is high enough to move the Vice-Chancellor of Durham University to comment that the extra-mural departments have on their staff “the most successful practitioners of the art of teaching that the university has”.

Whilst full-time tutors have ample opportunity to develop their skills, part-timers can face initial difficulties and there is always a risk that the class will fail. When employing part-timers the departments have to satisfy themselves that a new recruit has the necessary qualities and potential. Many part-timers, however (60 per cent in Manchester) are proven university teachers and many others teach in schools, colleges or polytechnics. Some departments now organize short training courses for part-timers to try to communicate some of the special problems of adult teaching and the various ways in which they can be reduced or overcome.

Professional adult education and research exists in some universities as a separate department, in others as a constituent part of its extra-mural department. In Manchester there is a separate department of adult education offering post graduate courses for adult educators in Britain and the developing countries.
as well as training courses for internal university staff.
From small beginnings adult education research has taken off,
particularly in Manchester, Nottingham, Leicester, Oxford,
Liverpool and Leeds and in its evidence to the Russel Committee
the University Council for Adult Education (UCAE) urged more
research in such areas as: student motivation, learning
processes, and the educational needs of adults at different
levels of ability and attainment.22

Russel Report (1973)

Many of the UCAEs recommendations were echoed by the Russel
Report23 but unfortunately it appeared precisely when Britain
was plunging into economic recession. Government savagely
cut public expenditure to reduce the money supply and encourage
the private sector. Local government, accounting for one-third
of public funds, was forced to economise and adult education
as a low priority area came under the financial scalpel. The
range of courses was reduced; drastically in some areas; and
fees were generally pushed up. The extra-mural departments,
deriving their funds from central government, escaped relatively
lightly. Some of the organizational recommendations of Russel,
like the establishment of a national and regional advisory
councils have been followed but adult educators wait in vain
for the main measures to be implemented. Russel had urged a
doubling of the meagre 1 per cent of the national educational
budget allocated to adult education, but even without a financial
crisis adult education commands a low priority in Britain.24
Most of the top decision-makers in Britain have had little
contact with adult education; top civil servants have a predominantly
Oxford and Cambridge background, the majority of ministers too,
whether Conservative or Labour, are university educated.
Open University

Whilst the Russel Report continues to gather dust in the DES the Open University (OU) continues to gather momentum. The OU was founded, with much support from the extra-mural departments, by Harold Wilson's Labour Government in 1969, taking in its first batch of 24,000 undergraduates in January, 1970. The OU has a Royal Charter like any other university and it exists primarily to confer degrees although it also offers non-examination courses varying from six weeks to ten months. Candidates must be over 21 years of age and need have no qualifications but they have to be judged acceptable before being taken on. Courses are highly structured with special texts prepared to complement the programmes broadcast on radio and television (usually at non-peak viewing hours). The OU calculates that 65 per cent of student work is systematic reading, 10 per cent viewing and listening, 15 per cent contact with tutors and students in tutorials and at summer school and, 10 per cent written project work or examinations.

Degrees are built up on a credit system: one credit for each 12 month course studied. Six credits equal an ordinary degree whilst an honours degree requires eight, so typically a student will take six years to achieve an honours degree. At present there are 55,000 undergraduates and 11,000 post experience students, making the OU by far the largest university in the country. The drop-out rate is relatively very low: only 50 per cent.

The report of the OU Committee on Continuing Education looked forward confidently to the expansion of existing provision and the creation of a Delegacy of Continuing Education: in other words an OU extra-mural department.

Extra-mural Departments

All these Open University developments have been watched by the extra-mural departments with admiration tinged with envy and a little alarm. The 'egg which they themselves helped create
has hatched an infant which is growing so large so quickly that it threatens to become a cuckoo which will take over the whole nest. Behind the extra-mural movement from the earliest days has been the assumption that working people did not want or need examinations or university qualifications and that liberal education was somehow morally superior to both. Perhaps this itself was a disguised elite idea (though one with much in its favour) derived from the ideal of the nineteenth century gentleman scholar pursuing catholic intellectual interests in his leisure time. During the 1950s and 60s when the London University part-time degrees became increasingly popular, it emerged that for many people, extra-mural hors d'oeuvres were no substitute for main degree courses. But instead of using extra-mural expertise to answer this demand, the Government devised the highly original OU and also showed financial favour to the new polytechnics which could offer full and part-time degrees more cheaply than the universities.

The sight of new agencies carving out thriving new empires in areas of traditional extra-mural interest has left the extra-mural departments feeling by-passed and, understandably a little resentful. And yet, if these departments can abandon some of their traditional self-effacement a big opportunity exists to play a leading role in a new development. Spurred partially by the example of the OU and more especially by demographic trends which will leave universities with much spare capacity by the mid 1980s, the Government has been rethinking its policy towards universities. A Government discussion document Higher Education in the 1990s suggested that anticipated vacant places be filled by mature students, particularly women and working class people and that provision of part-time degrees be substantially expanded. Mr. Gordon Oakes, one of the education ministers, has even spoken of universities comprising 50 per cent mature students by the end of the next decade. The UCAE response in June 1978 eagerly took up these ideas.

Providing traditional areas of proven value continue to expand, the extra-mural departments can usefully apply their
experience, wisdom and special expertise in a variety of possible ways: running preparatory courses for mature students, helping to plan and teach courses involving mature students, particularly those undertaking part-time degrees, offering part-time degrees, providing a counselling service for mature students and so on.

For over one hundred years the extramural departments have been making their distinctive contribution to British life. They have helped considerably to reduce the barriers between the people and universities which academics with their special titles and esoteric subject languages tend to construct. It would be interesting to discover how many universities outside Britain organize events similar to Manchester University's Open Days when over 30,000 local people crowd on to the campus to visit laboratories and view displays and exhibitions. There are signs that at long last policy makers are beginning to realize that adult education is as vital a sector of education as any other. In the future expansion which now seems inevitable it is to be hoped that the extramural departments will be allowed to play a leading role in retraining, renewing, reorientating and perhaps, still most important, retrieving people who dropped out of the educational system at an early age.

SECONDARY SCHOOLS, UNIVERSITIES
AND ADULT EDUCATION IN ITALY

Alessandro Casiccia

Secondary Schools and Access to Universities

In Italy, in addition to the uniform elementary school system extending from pre-school through primary school to the uniform middle school, there is the advanced secondary school system, consisting of university stream secondary schools, art schools, teacher training colleges, technical institutions and vocational schools. Some streams within this differentiated secondary school system lead directly to a vocational qualification; others lead exclusively to the university entrance qualification.

Up to a few years ago the advanced secondary school system, with its university stream secondary school, occupied a key position. A distinction was made between the liberal arts university secondary schools and the science university secondary schools. Both of these, but especially the former, were the product of a typically Italian educational tradition emphasizing eloquence and the humanities. Up until 1969 the university stream secondary school represented the only route to the university; on the other hand it was almost impossible to become a craftsman or to take some other trade or even to obtain a post in the civil service through these schools. Even today the main emphasis at the university stream secondary schools is on courses with a mainly philosophical and idealistic content.
and this emphasis on the humanities is complemented by a training remote from the practical aspects of life.

The discussion of the liberalisation of university entrance requirements which began in 1968 has threatened the traditional privileges of the middle class, namely to attend a university stream secondary school and to receive its diploma and thus earn the right to enroll in one or the other faculty at a university.

Now, following 10 years during which university entrance requirements were relaxed, some restrictions are being reintroduced. In July of 1978, in the draft bill of a university reform measure which has long been under discussion in parliamentary committees, an article was introduced under which admission to a university will be restricted to those having a secondary school diploma which "agrees" with the particular field or discipline which the applicant wishes to study. Anyone who does not have the required kind of diploma will have to pass an entrance examination.

Advanced Secondary Schools

In addition to the university stream secondary schools described above, which represent the traditional form of secondary school and which still exist today, there are a whole series of advanced secondary schools which offer specialised training and which grant diplomas, some of which provide direct access to employment or are also accepted as fulfilling the entrance requirements to a university. Examples of such schools are the language secondary schools, the arts schools, which are subdivided into art secondary schools and conservatories, the teacher training colleges, which provide the primary school teaching credential, the technical institutes, which provide direct entry into certain forms of employment, (e.g. as a bookkeeper or surveyor), and finally the vocational schools, whose students are almost exclusively from workers' families, (but which will not be discussed here).

Within the context of this tendency to continue to permit wide access to university, a trend has emerged in recent years
with regard to the transition from secondary school to university, or from secondary school to employment. A survey conducted in 1975 shows that a very high percentage of those leaving secondary school desire to enter employment and at the same time take a course of studies. In 1975 there was a total of 43.2 per cent of registered students who were also gainfully employed. It remains to be seen how this trend will develop in view of the plans alluded to above to restrict university entrance.

**Adult Education in Italy**

Italian adult education involves few established institutions and structures, but is rather more a question of some temporary State measures and of educational activities arising from social controversy and struggles by the trade unions. Italian adult education is characterised by constant processes of change and a lack of legislative security. It is only in the case of the people's schools that antiquated laws and decaying structures exist which maintain the function of adult education in a patriarchal and discriminating form. The areas of adult education to be described in the following are: (1) The outmoded people's school, the popular education courses and evening schools; (2) paid educational leave on the "10 hour model"; and (3) the use of university structures and institutions by part-time students.

**People's Schools, Popular Education Courses and Evening Schools**

Immediately after the Second World War attempts were made to come to terms with the problem of illiteracy which Fascism had been unable to solve. Thus in 1947 people's school courses and in 1949 popular education courses were initiated. The purpose of the people's school was to overcome adult illiteracy, to offer courses which would provide primary school education and lead to complete middle school, i.e. to a desired vocational qualification. The failure of these initiatives is evident...
from the following data. In 1951/52 500,000 adults participated in courses of this kind, but in 1961 there were still approximately 3,700,000 illiterates (of these, 2,600,000 in the south of Italy), to which must be added 4,000,000 semi-illiterates. Hence these initiatives have had little real impact and success and in the year 1974/75 the number of registered students dropped to 63,700.

In addition to the activities of the people's schools the Ministry of Education set up general popular education courses. To quote official statements, these courses were aimed at "adults from all social spheres and classes with various degrees of education" and their purpose was "to give people a clear and secure awareness as individuals of the necessity of achieving perfection in all aspects of life and not merely in their vocation...".

In the course of the fifties these courses slightly increased in popularity but in the sixties, despite ambitious plans, they became almost meaningless. When these courses were at their peak, the work included the following activities: elementary education courses, preparatory courses for apprentices, summer courses and courses on public holidays, introductory courses in music, courses in cultural motivation and continuing education and socio-cultural course offerings such as lecture courses.

Related to these activities, towards the end of the sixties the Ministry attempted to transform the regional lecture centres into social centres for continuing education and cultural services. However, this attempt was largely a failure as were the so-called evening schools, which were organized by the secondary schools and offered courses for adults, restricted to problems in education. All of these activities in the field of adult education set in motion by the initiatives taken by the Ministry had no lasting success.
Educational Leave Within the "150 hour Model"

The 150 hours are not the result of a reform law or other governmental initiative, although the intention of the legislation is completely compatible with the constitution of the Italian Republic. It resulted from the workers' struggles which culminated in the 1973 collective agreement between workers and management in the metal and engineering industries. In this contract the right of every worker was established to 150 hours of paid educational leave within a period of 3 years. This block of hours can also be taken in the form of paid educational leave within one year. This achievement, which initially applied only to workers in the industries mentioned above (1,200,000 in the major private metal and engineering companies, 150,000 in smaller ones, 400,000 in companies with State participation) was soon adopted as a clause in agreements in other sectors. Many agreements have variants of this clause: for example in the textile industry, which provides for 120 hours per annum (40 of these with pay) or in publishing (100 hours of paid educational leave in two years), or in the case of the agricultural workers (60 hours per annum).

The total number of hours which each industrial undertaking is obliged to grant its employees as paid educational leave can be calculated if the number of employees is multiplied by 30. The present settlement, modified by the agreement of 1976 in the metal and engineering industry, provides for an extension of paid educational leave to a maximum of 250 hours for every worker.

At present there are courses preparing for primary and middle school examinations which require 450 hours (16 hours per week distributed over 5 days). They are given in the afternoons and in part overlap with working hours. For the workers in the metal and engineering industry and the textile workers (who have achieved the extension of the 150 hours to a maximum of 250 hours in some companies) the working day is divided equally into a period of work and a period of study.

The 150 hours courses in their present form are not yet
integrated into the Italian education system. The Ministry is attempting to have the 150 hours courses changed into a one year evening course, which means that the authorities recognize the present form of the 150 hours courses only as an experiment. At the moment the Ministry issues an annual set of regulations governing the maximum number of courses and some aspects of course content. In some regions local governments fund courses based on the 150 hour model if demand exceeds supply. In principle the 150 hours thus have an insecure and only semi-official status.

From the outset it was the strategy of the trade unions

(1) To emphasize within the framework of the 150 hours the preparation for the compulsory uniform school-leaving examination. It is in this area that the greatest number of paid education leave courses are given. Nevertheless, 150 hour educational leave courses are also given at the secondary school and university level.

(2) To open up the 150 hours not only to workers on paid educational leave, but to all adults in general (housewives, the unemployed, casual workers). In this area significant success has already been achieved which points the way to a new system of adult education in Italy.

(3) To hold the 150 hour courses in the public schools and universities and to prevent them from being pushed aside into marginal areas.

The trade unions do not support, indeed they criticise, the attempt by the Ministry to change the 150 hours into normal evening courses. The unions also oppose the extension of the 150 hours into vocational training, because this could create competition for the cultural courses within the 150 hours which are offered by the secondary and university level institutions. Hence the trade unions argue in favour of the creation of a separate parallel level for vocational training and upgrading, which is closely linked with the other areas of adult training. However, this strategy of separating general and cultural education from vocational education, the goal of which is to provide
institutional security for both levels of education, creates a far-reaching problem especially at the university level. It could help to consolidate an existing tendency, and to support the traditional Italian education system with its emphasis on ideas, eloquence and the humanities. However, not to carry out this separation would in practice lead to the replacement of much of the general and cultural education courses by vocational education.

This problem has been recognized and discussed, especially at the university level. The result of this discussion was that a number of 150 hour paid educational leave courses were planned and given, dealing with the relationship of academic learning to problems of the industrial world: for example, the role of industrial medicine in diagnosing health hazards at the place of work; problems of the labour market from a political and sociological point of view etc. The participation of workers in these courses was, however, not as great as anticipated. This was probably because such topics were more specialised than the workers had associated with university education in the traditional sense.

Part-time Studies for Employed Adults

In addition to the 150 hours there are in Italy examples of more spontaneous and informal use by workers of university structures and institutions. For example, in the course of mass political demonstrations attempts have taken place to achieve a strategic convergence of individual activities through what is known as collective university projects, which represent alternatives to the official university programmes. An example of this is the Department of Political Science at the University of Turin:

A further innovation at the university level was achieved through the improvement of university admission requirements as of 1968, as a result of which part-time study considerably increased and the elitist character of the Italian universities was brought to an end. The Department of Political Science
in Turin is probably not a typical example in terms of the number of part-time students. Of the students who were enrolled there in 1973/74 76.9 per cent had completed their schooling at a technical school or at a vocational school. In no less than 25 per cent of the cases, however, more than six years had elapsed between their leaving school and commencing part-time studies.

As the following table illustrates, 83.2 per cent of the students enrolled in the Department of Political Science at the University of Turin are part-time students.

Studies have shown that approximately one third of the students enrolled had started out as workers and have meanwhile achieved the status of salaried employees. Both the so-called vertical and horizontal mobility of these students is very great. Because of the frequently long interval between leaving school and commencing studies, the age of part-time students is constantly increasing. At present 54.5 per cent of the students are above the age of 25; 4.1 per cent are over 40 years of age.

In the case of the Department of Political Science at Turin University the developments described above have led to references to a phenomenon known as recycling into the education system. Recycling into the education system means that both workers and management regard part-time studies in functional terms. The workers see it as an improvement of their promotion potential.
and hence a change to obtain better pay: the employers hope to achieve an increase in the mobility of intellectual potential. However, recycling into the education system does not automatically mean upgrading in the production system, i.e. increasing the qualifications demanded of a worker in the sense of giving him or her more responsible work.

It can be demonstrated that a university degree obtained through part-time studies leads to only a very limited increase in vertical mobility within the labour system. Bureaucratic structures within many companies hold those who have completed their degree in their old jobs. Hence those who have the greatest career ambitions tend to place greater trust in precisely these inflexible structures which facilitate promotion on the basis of personal connections rather than acquired abilities and knowledge.

To reach a better understanding of this complex problem it is also necessary to integrate into the discussion the personal variables, i.e. the attitudes and expectations of the part-time students. These variables are closely related to the motivation for the choice of a particular programme of part-time studies. The Department of Political Science at Turin conducted a survey on this subject. The most frequent reply to the question why a particular programme or course was chosen was "general interest in this field of study". Other frequent answers were "a need for cultural and political orientation" and "improvement of social relationships and widening my cultural horizons". The main component in these motives can be interpreted in two different ways: (a) as emphasizing the exchange value of the university degree; and (b) as emphasizing the utilitarian value of the knowledge acquired. Interpretation (a) implies that the part-time student is indifferent both towards his vocation and the specific content of his part-time studies, and that he regards his university diploma exclusively as a means of increasing his own exchange value on the labour market. Interpretation (b) implies that there is a need for the direct application of the contents of university studies. The student expects guidance, the gratification...
of cultural needs, the acquisition of knowledge, all of which are not directly related to his work but assumed to be useful both in general industrial life (participation in trade union and political activities) and also outside of work, for example the ability to understand better the information in newspapers and books and television, to develop social contacts, to be active in cultural events and to participate directly in political life.

In both of the cases described, however, part-time study is the answer to tendencies towards downgrading in the area of intellectual activity, due to changes on the capital side and within the immediate work sector. The answer consists in an attempt to "reacquire the value" of one's individual self, which is not directly applicable in one's job.
BIBLIOGRAPHY

Since 1965 an interesting expansion of the facilities for participation in extra-mural university studies has taken place. Such facilities are primarily designed for adults engaged in full employment. This development is the result of the Storting (Parliament) Bill No. 92, 1964/65 -- adopted by the Storting on June 12, 1965. In this comprehensive document mention is made, inter alia, of the part played by the universities and higher institutes in the field of adult education. It is emphasized that the universities and higher institutes would be able to play an important part with regard to educatory measures launched in conjunction with voluntary adult education organizations, and the universities have arrived at a flexible form of cooperation by means of the so-called university circles. The presentation of the programme outline and the leader must be approved by the University and the Ministry of Ecclesiastical Affairs and Education, which also supervise the activities. The Storting's resolution was subsequently succeeded by a declaration made by the collegia academica at the University of Oslo on April 11, 1969:

The University undertakes the responsibility for the courses on university level which are held in the districts by approving both the teachers and the professional content of the courses through the Department for Information Activities, whilst the Folk University attends to the practical arrangements, the recruitment of the participants and the finances.
A university circle constitutes an alternative way for people outside the universities with regard to an introduction to vocational subjects on a university level. At the same time, a university circle may provide assistance for part-time students who are preparing for a university examination on their own.

This last-mentioned factor has gained increasing topical interest as a result of the rising demand for post-secondary and continuing education. This development was foreseen in the Storting's proposal respecting adult education where, referring to university circles, the following is stated:

As regards the qualifications required for participation in the courses, no fixed rule has been laid down respecting general education. This gives rise to the question as to whether the usual requirement for artium (matriculation) as a qualification for admission to our universities and higher institutes may not more generally be waived.

From a modest experimental operation of university circles with a view to preparation for examinations which was launched in five places in the autumn of 1965, the extent of the activities today far exceeds any of the anticipated demand. In 1976, university circles were being run in 94 communities, and it is noteworthy that some of these places had only a few thousand inhabitants.

The total number of participants exceeded 18,000, but of this number there were certainly no more than approximately 8,000 who were enrolled as students at one of the universities and who were preparing for university examinations. The largest number of participants, totaling 6,112, is to be found among those preparing for their degree in philosophy. The other most usual courses offered are mathematics, pedagogy, English, German, Norwegian, religious knowledge, law, political science, history of the arts, modern mathematics, physics and phonetics. Under the auspices of the Folk Universities in Oslo, Bergen and Trondheim, university circles of a different character have also been conducted: viz., in subjects which for the time being
are not being taught at the universities: journalism, conservation of the environment and business administration, to mention just a few.

It is worthy of attention that the number of extra-mural students in pedagogy is considerable; as a matter of fact, in excess of the total number of students of pedagogy attending the University of Oslo. It is assumed that the main reason for this is to be found in the part examination arrangement which has been introduced in the basic study of pedagogy and which affords these students the opportunity of taking their examination in five stages. This development was also alluded to in the Storting's Bill No. 92, 1964/65, where the following is stated:

In connection with the extended activities of the university circles it may be appropriate to go further into the question concerning the right to sit for part examinations at the universities. Also as regards qualifications on university level, many persons will need some proof of the fact that they actually possess knowledge corresponding to the requirements at the universities in the discipline concerned.

The splitting of the programme of study into minor entities is gradually becoming the practice as regards other subjects where the conditions are favourable. In this connection mention may be made of the fact that the administrative authorities at the University of Oslo have called the attention of the faculties to the need for arranging the teaching in such a manner that part-time students may also participate.

In 1976 the Ministry of Ecclesiastical Affairs and Education has granted 5,100,000 Norw.Kr to the university circles. Even if only 10 per cent of the participants, i.e. 1,800 students, pass a university examination after having studied in this manner, the teaching expenses per candidate will be exceedingly reasonable from the State point of view. On the other hand, perhaps the gain in terms of knowledge is in accordance? The only available material that may elucidate the question are the statistics regarding the number of persons who fail to pass their examination...
In philosophy at the universities and in the extra-mural teaching centres respectively: all evidence points out that there are no significant differences. On the other hand it is customary to maintain that the participants in the university circles receive far from the same comprehensive teaching facilities and a milieu which can be said to be equally as inspiring as is the case at the universities.

The university circles have been mentioned in connection with the need for relieving the pressure on the universities -- amongst others, by Mr. Bondevik, the then Minister, during a Parliamentary debate following a direct question put to him on October 27, 1970. The approximately 6,112 students who attend lectures in their respective local districts with a view to taking the examination in philosophy, bring a relief of the pressure with regard to bed-sitters and vacancies in the reading-rooms. On the other hand, the university circles bring an appreciable pressure on the whole examination apparatus and administration of the universities and, to a certain extent, also on the teaching staff. Yet, the purpose of the university circles has never been to relieve the pressure on the universities, but to contribute to a kind of regional development which was not previously afforded much attention. The university circles are part of the same development which has given rise to the touring State theatre, the touring State gallery, the touring State concerts, and similar activities.

The great majority of those who study at the basic or intermediate level in their subjects in the districts would not as a rule have burdened the universities. This particularly applies to housewives who in their early youth either had to interrupt their studies or who were not given an opportunity to even begin. It is rather inconceivable that these people would leave their husbands and children in order to enroll at a university for an indefinite period. On the other hand, it is not impossible that the university circles may become a relieving factor if the conditions are made favourable so that full-time students deem it to be their advantage to use the
university circles as an alternative towards a basic study examination -- and then later on to apply for entry to the universities in order to pursue more advanced courses of study. The possibilities of such a development were discussed at a recent conference held in Hamar and can be summer up under the following items:

1. The information and guidance services intended for the students in the districts must be more effective and co-ordinated. For the time being it will suffice if one consultant position is established at each university.

2. University teaching posts must be instituted, involving compulsory extra-mural teaching either on a full-time or a part-time basis. It will thus be possible to supplement the teaching which is carried on by local lecturers.

3. The Ministry must provide for additional grants to cover the costs of external examiners' fees. An arrangement must be established which ensures the adequate payment of permanently employed university lecturers who act as external examiners for the students from the districts.

4. New, and more time-saving methods of evaluation should be set into operation.

5. Experimental use of audio-visual aids should be introduced into the district teaching, combined with short summer and weekend courses, and other similar arrangements.

6. As is known, in the National Budget for 1976, the total net expenses towards universities, higher institutes and other research work amount to 1.664,8 million Norw.Kr. Where there is no research work there is no university tuition. But an increase in research will not necessarily involve an increase in university tuition. A rationalization of the university circle system can ensure the maximum exploitation of the tuition section without any disruption of the priorities as regards the research section.

At the annual meeting of the Folk Universities held in Bergen in March of 1971 it was maintained that modern society will come to demand elements of university education in two-thirds
of all employment positions. Should this actually happen, we shall be faced with educational problems which can not solely be met through the building of new universities.
UNIVERSITY ADULT EDUCATION
IN POLAND

Agnieszka Bron-Wojciechowska
and
Michał Bron Jr.

This paper represents a brief description of the functions of university adult education in Poland. First of all, it provides the notion of an overview of university adult education. Second, it describes the structure of higher education in Poland as the basis for discussing the range of university adult education, i.e., studies in adult education, research in adult education, part-time study, and university extension. Third, it deals with the coordination bodies in Polish university adult education and other activities. Finally, it presents some perspectives of university adult education in Poland and needs for further development.

Overview of University Adult Education

Four most important activities can be distinguished in Polish university adult education. First, there are studies and degrees in adult education. Those studies are provided by the education departments of the universities and by the teachers' training colleges for full-time studies as a compulsory subject. Most of the students are being prepared to become teachers or administrators within the educational system. Some of the students take M.A. seminars in adult education and specialize
to be adult educators.

Research in adult education is undertaken in Poland by specialists at the universities and colleges as well as by those who work in the independent research institutes.

Part-time studies, primarily evening and extra-mural programmes, are provided by most departments of universities and colleges for employed adults. These programmes are on the same level as full-time studies and lead to M.A. and M.S. degrees. Part-time credit study is not an integrated part of university extension activities as is usually the case in English speaking countries.

The last area is connected with university extension which is something different when compared with university extension elsewhere. There are no separate extension departments which provide activities for the general public. It is better to classify this area as that of the popularization of knowledge. Most of the university staff members popularize knowledge through books and essays or give lectures on results of their research. But those activities are not organized by the university or, if so, at best, only very sporadically.

The Structure of Higher Education in Poland

There were 89 higher education establishments and 16 affiliated institutions in Poland in the academic year 1975/76. They include 10 universities, 18 technical universities, 7 agricultural academies, 5 economic academies, 2 marine higher schools, 12 teachers' training colleges, 10 medical academies, 6 higher schools of physical education, 16 higher schools of art and music and 2 theological academies. Besides, there were 20 faculties (12 of them belonging to technical universities) connected with colleges. In addition there are 127 study and consulting centres throughout the country. Both types of institutions offer courses for part-time students.

The Polish universities and colleges are run by the State and are financed from the State budget, both for teaching and research. University education is free of charge for the student as it is on all other levels of education in Poland. The only
private higher education establishment is the Catholic University of Lublin.

The management of higher education system is centralized. The highest authority rests with the Rector (President, Vice-Chancellor), who governs the school as a principal for all staff members. He is also a chairman of the university senate.

The university is subdivided into faculties with the dean as a superior authority. The faculty is in turn divided into departments which are governed by directors. Faculty, and sometimes departments, have an authority to give higher degrees because they possess their own Academic Councils. The departments are divided into sections.

To be admitted as a student at Polish university or college, it is necessary to receive matriculation from the secondary school (general or technical) and to pass the secondary school final examination. The next step is to apply for and successfully pass the university entrance examination in relevant subjects which is highly competitive. This is because of the restriction on the number of students in Polish higher education system (numerus clausus).

There are more candidates than places at most universities and their faculties or institutes; the annual number of available places is controlled by the Ministry of Higher Education through the medium-term. In the academic year 1975/76 there were 468,129 students at Polish universities and colleges. Most of them took part in full-time studies -- 283,159 (60.5 per cent) -- while the rest -- 184,970 (39.5 per cent) -- were part-time students.

In 1975 6,312 students participated in 3-years full-time doctoral studies; while 11,645 were enrolled in postgraduate studies (full- and part-time), up to 2 years. The highest proportion of students are in technological fields (1/3 of the student population), the second highest enrollment is in social sciences and the third in natural sciences.

Higher education study lasts for 4-5.2 years, the period depending upon the field or discipline. Technology and medical studies are the longest. Generally there are two types of
studies, i.e. full-time and part-time. The latter is organized as evening courses, extra-mural studies, external and sandwich courses.

In terms of social background, most of the Polish full-time students come from the intelligentsia (54.1% per cent), followed by workers' families (30.5% per cent), while the smallest percentage comes from farmer families (11.9%); others make 3.5 per cent. There are still too few students coming from workers' and farmers' families. To increase their number, candidates from these families are as a rule given some additional credits in their university entrance examination. The situation is reversed among part-time students. A high percentage of them are of working class origin (48.7% per cent), followed by farmers (26.5% per cent) and intelligentsia (23.5% per cent); others form 1.3 per cent.

The help which the students get from the state during their education include: scholarships, free accommodation in student residences and subsidized university canteens.

The university teaching staff included in 1972/73 academic year 6,395 professors and assistant professors, 21,223 senior lecturers and 3,618 junior lecturers; making a total teaching staff of 31,236.

The objectives of higher education institutions in Poland are not only to educate but also to conduct research and to provide training and advancement of young research workers.

The research work pursued by research staff of universities and colleges along with the teaching is conducted in the school institutes and other centres. Research is also undertaken at research centres subordinated to the Polish Academy of Sciences and the Ministries, as well as in central laboratories, and the like. Higher education institutions constitute a firm link in this system. More than 1,000 research topics are dealt with at the universities and colleges every year.

Studies in Adult Education and Masters Degrees in Adult Education

There are no separate programmes in adult education in Polish universities and colleges, i.e. there are no Adult Education
Institutes at the universities. But there are compulsory lectures, classes or seminars of educational studies.

Educational studies are offered by 22 higher education institutions in Poland, i.e. 10 universities and 12 teachers' training colleges. The educational studies last for 4 years (8 semesters). They are divided into two parts: the first part which lasts for two years introduces to the students the general knowledge of education. The following subjects are included in this part: general education, history of education, didactics (teaching-learning process), theory of education, comparative education, re-socialization, biology, economy, statistics, methodology of education etc. All students have to take two languages and they also have physical training.

In addition, in the second year of study all students participate in compulsory adult education courses (lectures and classes) for two semesters. The content of the adult education course is the following: the concept of adult education, its object and field of study, origin and development of adult education in Poland and abroad, the development of adult education in the Polish People's Republic, the adult learner as an object and subject of educational activities, the education of adults in contemporary Poland, teaching and learning of adults, adult educators and teachers. The course consists of 30 hours of classes and 15 hours of lectures. The education content and chosen method depend upon the teacher and his specialization in the field of adult education. The curriculum is general and varies according to the university. Discussion is the most popular method used during classes.

In the second part of the education studies, which also lasts for two years, all students have to choose a specialization from among the following: pre-school education, school education, in- and out-of-school children care, and cultural and educational activities. The last named specialization is taken by most of the students, and can be recognized as preparation for adult education as well. In this specialization students are being prepared for cultural and educational work outside the school.
system, both with children and adults. During the four-year programme students are trained also practically: they visit educational institutions and serve there also their practicum.

The studies discussed above end with an examination for Masters degrees. The oral examination and written thesis can be chosen from the following disciplines of education: general education, theory of education, didactics, history of education; education for revalidation, in- and out-of-school children care, comparative education, vocational education theory, and adult education. In the second year of their study, students participate in master programme seminars. Altogether they have 120 hours of seminars in the masters degree programme. Their projects are mostly empirical.

All universities and colleges which offer educational studies have departments or sections of adult education; the staff of these departments provide the courses in adult education.

In some universities there used to be inter-faculty courses in educational and cultural work. These were organized by adult education departments of the faculties of education and were available as electives for all students from the university. Students could participate in classes and lectures when they completed the second year of their own studies. The motivation for participation was their personal interest in educational and cultural work, desire to know the methods of research work, and interest in education through art. There were 4 hours of classes and lectures every week and discussion was most commonly used as a method of teaching.

The study in educational and cultural work which lasted for two years included the following subjects: psychology of adults, theory of adult education, sociology of culture, methodology of research work, education through art. The course ended with an examination which consisted of two colloquia and two examinations. There was also a month of practice in an educational or cultural institution. Students received special certificates, which were honoured as professional or even post-graduate study. Most of
the students came from such faculties as history, geography, education, and philosophy.

The first inter-faculty studies in educational and cultural work started in 1965 at Poznan University which is the only university where they still exist. In 1966, these studies were established in other universities as well, but after 15 years of work they were abolished. The educational authorities justified their decision as follows: (a) the number of students graduating from each university (20-30 persons annually) was too small in comparison to the high cost, and (b) the problems of educational and cultural work became a part of the regular curriculum in educational studies. The studies continued at Poznan University because the student participation had been greater than anywhere else. The studies there contain two very important additional subjects: problems of tourism and hiking (with observation and study of the region), so they can prepare students for tourist guidance as well.

There are no post-graduate studies in adult education yet, but in 1979 it is planned to establish them at the University of Warsaw.

Research in Adult Education

As has been mentioned above, there are departments of adult education in faculties of education at all Polish universities and in teachers' training colleges. Those departments not only organize and provide classes, lectures and seminars in adult education, but they also conduct research in adult education. The following is a list of several main research topics carried out in various universities and research centres.

At the Warsaw University, the Department of Adult Education carries on research in areas such as: comparative studies in adult education (Arabic countries, Scandinavian countries, the Soviet Union), industrial relations (work adaptation, evaluation of vocational and upgrading courses for working people, education in creativity at work), popularization of knowledge (folk high school participants and their educational needs, contents and
methods of popularization of knowledge in the people's universities, methodical education of adult educators).

Researchers in the Cultural Popularization Section at the Jagiellonian University of Cracow conduct investigations in education through art, mass communication, adults' hobbies, adults' leisure.

The main areas of research in the Department of Adult Education at the Poznan University are: reading habits of adults, adult reading interests, motives of reading, and comparative studies in reading habits in Poland and abroad.

The staff of the Adult Education Department at the Lublin University are interested in schools for adults, educational policy, popularization of knowledge at people's universities, education for adults living in villages, and further training for teachers.

The Department of Adult Education at the Torun University conducts studies in history of adult education in Poland and in distance education.

At the University of Lodz a group of adult educators work mostly on the problems of adults' leisure, educational counselling, and parent education.

There are many other institutions outside the universities which conduct research in adult education. For example, there is the Institute for Science Policy, Technological Progress and Higher Education in Warsaw. The Education Department of the Institute conducts research in part-time studies for adults, self-directed learning and personal development of adults, teaching problems for adults, and comparative study of university adult education.

Research in agricultural education for adults is undertaken by the Academy of Agriculture in Warsaw and Academy of Agriculture and Technology in Olsztyn.

Studies in education for workers, vocational training and upgrading are undertaken by the Institute of Vocational Training in Warsaw, Warsaw Technical University and the Institute of Organization of Engineering Industry.
The problems of teaching adults, modern methods and media are investigated by the Teachers' Training College in Cracow, Wroclaw Technical University, The Institute for Building Organization and Mechanization in Warsaw, and the Teachers' Training College in Zielona Gora.

The study of problems of the educators of adults is undertaken by the Research Institute of Teachers' Training in Warsaw. The Institute of Educational Programmes prepares programmes and investigates their value and effectiveness at the school for adults.

Finally, general adult education is studied at the Silesia Research Institute in Katowice.

Part-time Study

There has been a long tradition of part-time study in Poland. The first correspondence courses for teachers were organized in 1890. In 1916 two-year correspondence programmes for non-qualified teachers were organized. Then the correspondence university and correspondence courses in agriculture as well as in cooperatives were established.

Today there are four kinds of part-time study at universities and colleges, i.e. evening courses, extra-mural courses, sandwich courses and external studies.

The programme of evening study is the same as of full-time study, but the students have to work more on their own. Classes and lectures are held in the evenings 3-5 times a week. They are specially organized for courses which need laboratories. To become more effective, the evening programme should include 1-2 whole days in a week of study (day-release courses).

Extra-mural study is organized mostly as guided independent study with the help of programmes, syllabuses, counselling centres, methodological counselling agencies, text-books, radio and TV programmes. There are sessions once in two weeks for two days, organized by the universities for laboratory work, tutoring and examinations. The extra-mural form is the best for non-laboratory courses, such as economics and humanities.
External studies are the most self-directed form of study. The post-secondary institution does not organize any help, it gives only a list of examinations and the range of obligatory content of particular subjects. The students may consult the time-table of examinations.

Sandwich courses, so popular in Great Britain and the USA, are still at an experimental stage in Poland. This form of study has been introduced at Warsaw Technical University in close cooperation with the Polish Fiat Factory. Comparatively high effectiveness of this course makes one expect that sandwich courses will soon become common in Poland.

There are two levels of part-time study in Poland: professional (diploma) programmes which last for 3½ to 5 years, depending on the course, and master (degree) programmes which last for 5 to 6 years. After completing a professional programme it is possible to participate in the masters programme lasting from 1½ to 2½ years.

In 1976/77 part-time study was organized at 13 faculties for 53 professions. University courses were held at 9 universities and 11 counselling centres; economic studies were organized at 5 academies of economics, 3 universities and 15 counselling centres; agricultural studies were provided by 7 academies of agriculture, 1 affiliated institute and 12 counselling centres.

In 1973/74 39.1 per cent of all students participated in part-time study, i.e. 28.1 per cent in extra-mural study, 9.4 per cent in evening courses and 1.6 per cent in external studies. The experimental sandwich courses had only a very small number of students.

There is a trend towards a lower age among part-time students. Today adults between 21 and 25 years of age prevail. As it was stressed before, more part-time students are of working class origin (54.4 per cent) and farmer class origin (24.6 per cent) than the full-time students.

Part-time students get considerable support from the state: those who are attempting to enter higher education institutions get 6 working days leave for the entrance examination. Part-time
129

students receive paid educational leave for classes, examinations and writing of masters thesis or diploma work: students in extra-mural study get 28 working days leave per year; in evening courses they initially get 2½ days leave but after the second year of study and if they obtain good marks they receive an extra day every year; extra-mural and evening students get a special leave of 21 working days for writing projects and diplomas or masters thesis; evening course students can get also a maximum of 5 hours per week off for study; if working students have to travel to their classes, the travel costs are reimbursed by their employers.

Popularization of Knowledge

There has been a tradition at Polish universities to give public lectures for the wide public. First such lectures and cycles of lectures were given by J. Osinski, professor of Collegium Nobillium in Warsaw in the years 1779 to 1782. The Vilnius University provided public lectures twice a year during 1813 to 1822. At the end of the 19th century public lectures were given by the University of Lwow and the Jagiellonian University of Cracow.

Today only few activities of the university are open to the general public. Public lectures or cycles of lectures are organized only sporadically. The Faculty of History and the Faculty of Polish Literature of the Warsaw University occasionally organize public lectures on subjects important for the society: history of Warsaw, history of the Warsaw Castle, great Polish poets and novelists, etc.

Every year all Polish universities and colleges are open for a week to the young people who intend to study at the post-secondary level. They can visit lectures and decide what they want to study. There are also special courses provided by every school, where university staff members give lectures preparing for the university entrance examination. But they are mostly organized by the youth and students' organization and not by university authorities.

Thus, popularization of knowledge is not provided by the
university itself, but university teaching staff are actively engaged in this work. There are many public lectures organized by social and public associations and given by university staff and research workers from independent institutes. The biggest of these associations is the TWP, the Society for the Popularization of Knowledge which organizes lectures at people's universities. There are about 4,000 people's universities in Poland, providing lectures for 2 million adults. Lectures at people's universities are given by university staff and specialists in various professions.

There is also the Popular University of the Polish Academy of Sciences, which provides only public lectures and cycles of lectures. Its lecturers are the members of the Polish Academy of Sciences.

Many professors from universities are organized in scientific societies, such as the Polish Historical Society, the Polish Archaeological Society, and the Polish Amateur Astronomers' Association. There are also many regional scientific societies. All of these have to deal with scientific problems, publish books, and also popularize science and knowledge for the public; they organize public lectures, publish popularizing books and journals, and organize competitions for the youth.

There are many series of popular scientific books which are written by well-known professors and research workers. There are also many popular journals for the wider public with articles published by university professors.

An exact number of university staff members participating in popularization of knowledge cannot be established as there is no research available on this subject. However, it is known that there are not enough university staff who can provide lectures for the public or write popularizing books.

Other Activities

Generally, teaching staff in adult education in Poland are mostly part-timers. They very often are good specialists in their subjects, but they do not have knowledge and experience on how to teach adults. Thus, adult education theoreticians
and researchers help the educators by organizing courses and seminars in adult education, and by publishing books and articles. Several groups of adult education theoreticians and researchers from universities and colleges and adult educators are working together for theory building in adult education; for upgrading, and for broadening of knowledge of adult education processes.

An important group in this respect is the Andragogical Section of the Society for the Popularization of Knowledge, which organizes seminars in adult education with researchers and practitioners, publishes special booklets, and undertakes research in people's universities.

There is also the Andragogical Summer School organized by the Adult Education Section of the Teachers' Union. (It should be pointed out that in Poland there is only one Teachers' Union comprised of all teachers, educators and professors of education.) The subject of discussions at the Summer School changes every year. Two years ago the main topic was the theory and practice of self-directed learning. The participants in the seminars are adult education theoreticians and researchers from all over the country, practitioners and foreign guests.

The latest group is the Adult Education Section of the Committee of Educational Sciences of the Polish Academy of Sciences. The section has a group of young theoreticians and researchers as the auxiliary. The task of the section is to coordinate and to stimulate research in adult education in all universities and independent institutes, and to develop theory of adult education; its aim is also to educate adult educators, and to introduce research findings to the practice.

There is a monthly journal Oświata Dorosłych (Adult Education) which publishes theoretical articles, research findings, problems of practice, reports on adult education abroad, reviews and bibliography. It is very useful for theoreticians and practitioners alike. The editor-in-chief of the journal is Dr. Kazimierz Wojciechowski, Professor at the Warsaw University.
It seems that the development of the four areas of university adult education as discussed above will not be proportionate.

The main activities in the development of adult education research can be noticed. That is because there are first attempts to integrate the milieu of all Polish adult education theoreticians and researchers. It is the hope that the integration will allow to define the most significant tasks of study and will start the exploration of blanks in the discipline of adult education.

The second area which will develop seriously is part-time study for adults. It will be a result of an arrangement in the changing structure and programmes of post-secondary schooling in Poland.

As to the training of adult educators we have to wait until the results of current studies are available. It is the hope that those results will let us prepare the new modern programmes of education for adult education.

A very slow development will be seen in the area of opening the higher education establishments to the public. This means not only the popularization of knowledge but also non-credit courses organized by universities and colleges. The slow rate of change in this area is due to the rigid university structures and the conservative attitudes of the teachers and administration staff. It can be expected that the phenomenon of the growing educational needs of the society will contribute to a faster development in this area possibly much faster than was anticipated.
UNIVERSITY AND NON-UNIVERSITY ADULT EDUCATION IN SWEDEN

Bert Frederiksson
and
Peter Hammarberg

Introduction

If the term adult education (adult training) is understood to mean the education (training) of adults -- without regard to the level of the education -- approximately one third of all adults take part in adult education courses in Sweden. This high proportion is partly attributable to the wide variety of courses offered. Swedish terminology distinguishes between adult education at the universities (conventional and technical) -- so-called university education -- and non-university adult education, not offered by the university. Non-university adult education can be offered both at university level and at lower levels. The distinction between the terms university adult education and non-university adult education is based largely on structural criteria, hence the following description will use this distinction as a starting point. This paper will outline university education in Sweden first.

Why a New University?

On June 1, 1977 the reform of university education in Sweden
The goals of this university reform are:
- to increase access to training,
- to broaden the range of courses and make them more specialized,
- to make more democratic the organization of training.

During the fifties and sixties more and more high school graduates were anxious to receive a higher education at a university or a university technical institute. Initially these academically trained people enjoyed excellent job opportunities, but as early as the mid-sixties it became evident that there were not enough jobs available for certain groups of academically trained persons. After that, the purpose and quality of university education was widely discussed, while earlier these questions had been pushed aside due to the problems of the growing numbers of students. The discussion of these problems became even more intense at the beginning of the seventies, when the full effect was felt of the shortage of jobs for university graduates.

In the sixties, within the framework of some experimental models, new groups of people who had not taken the university entrance examinations were permitted to study selected subjects. These students came to the university with different experience and thus had other expectations and requirements with regard to an academic training.

The rapid social changes both in Sweden and in other countries influenced the interpretation and evaluation of academic training: one of many demands made was for the internationalization of training, another was for greater democracy.

The school reforms in the fifties and sixties were aimed at offering a larger number of students a university-stream secondary school education. The changes which were introduced were designed to remove barriers and enable all primary-school students to enjoy an academic-secondary school education which would lead further. The same demands were then made of academic education. There was to be easier access to universities in order to remove barriers between secondary school and university. At the same time it became evident that academic education provided a number of qualifications which were becoming increasingly
important for the training (and continuing education) of those already employed. A large number of these employed persons had not taken the final examination at a university-stream secondary school and hence were not entitled to enter a university under the regulations in force at that time. However, the experimental models alluded to above -- the offering of university courses in certain subjects to employed persons -- had had some positive results and thus it seemed logical to improve and increase the opportunities for study by employed persons, possibly through a combination of study and employment. The argument in favour of so-called recurrent education became increasingly persuasive.

University Reform: Evaluation and Future Prospects

The new Swedish university does not break with tradition. It builds on the existing prerequisites which apply to the universities and technical institutes and to numerous other educational institutions.

There has always been debate as to the function of the university and how this was to be fulfilled. The problem of linking academic research and teaching with the needs of society has been discussed as long as the university itself has existed. Some elements within the new university have different roots and traditions to those of the traditional universities and thus for them other developmental criteria apply. For example the normal school seminars were established in the first half of the nineteenth century in the context of the introduction of the compulsory elementary school. The schools of nursing were created in the second half of the nineteenth century and schools of social work can be traced back to the Institute for Social-Policy Social-Political Institute in Stockholm which was founded in 1920.

Most all of the post-secondary institutions shared the dramatic rise in student enrollment in the fifties and sixties. However, in some university faculties, e.g. the arts faculties, student enrollment has considerably decreased in the seventies.
Some features of the university reform can be attributed to the reforms which were implemented within the regular school system in the decade which preceded this period. Amongst these was the intention to make university education accessible to the greatest number of people without regard to sex, social and geographical factors. A further common problem is preparation for vocational and professional life.

In the fifties and sixties the Swedish Parliament passed the basic legislation governing the quantitative expansion of post-secondary education and research. The universities and university technical institutes, which 25 years earlier had an enrollment of approximately 3,000 students each, had grown to become the large-scale universities of today. New universities and technical universities were created, among other places in Umeå, Linköping and Luleå. New schools of social work and teacher training institutions were established and in 1972 the university library school was set up. The training of pre-school teachers increased from 200 student places in 1960 to approximately 5,000 in 1976.

An important feature of the new university reform is decentralization, i.e. decisions as to the content of the training and the methods used, decisions as to the extension of the universities are to be made on a decentralized basis. Hence the implementation of the reform and the further development of the universities in future will be much more dependent on local and regional initiatives.

Basic University Education

As of July 1, 1977 the new university comprises those training programmes which previously had been offered by the universities and the technical university institutes (the agricultural, forestry and technological institutes amongst others). The university now offers a series of programmes which previously could be taken on leaving the elementary school but which now are developing more and more to be an alternative to traditional university training.
Among such programmes are some former special courses offered at the university-stream secondary school, for example the training of rehabilitation therapists and of leisure-activity counsellors, laboratory assistants and medical technical assistants. The training of nurses, some apprentices, as well as the training of pre-school teachers, regular school teachers and vocational training teachers is now incorporated within the new universities.

Due to the new university reform post-secondary education has received a uniform structure. Step by step it is intended to achieve an increase in the adequate distribution of funds within the entire university sector, in order to thus develop long-term courses which are more closely adapted to the students' wishes and the needs of society and industrial life.

Course Offerings and Programmes

The new basic university education is divided into so-called training programmes and so-called individual courses. By programmes is meant a cohesive set of courses aimed at a certain sector of the labour market. One example might be the programme in the behavioural sciences, which is aimed at activities in the field of personnel administration, personnel development and educational planning as well as activities within the field of industrial science. The various programmes are divided into the following groups:

The General Programme: These are programmes which are to cater to a permanent social need, for example, medical training, teacher training or the training of journalists.

Local Individual Programmes: These are programmes which are directed towards the specific wishes, requirements or resources of a particular place or region.

Individual Programmes: These are programmes tailored to the needs of individual students (or a group of students) at their request.

Upgrading Programmes: Courses in upgrading programmes build on the general programmes and are intended for further training and specialization.

The offerings in the individual programmes consist of courses
which are so devised that they can be taken in stages and hence make it possible for the student to combine study with gainful employment. The Government decides in each case which general programmes may be offered and how many students may be enrolled. Uniform and clear plans are issued for the general programmes, which among other things stipulate any specific prerequisites. The local authorities decide questions of specific organization and the form of the individual programmes at the particular university or technical institute. The latter can make independent decisions relating to local programmes which may be offered, i.e., course offerings which can only be offered at one university or technical institute.

**Individual Training Courses**

Those who do not wish to take an entire programme can take one or more individual courses. This can be an independent course or part of a programme. Most individual courses are taken in places where there is a university or an institution affiliated with a university, and they are usually related to subjects in the field of general education which, prior to the university reform, were given within the faculty of arts.

**The Units System of Credits**

To indicate the duration of a course or programme units system has been introduced, in which one week of full-time study is credited with one unit. Hence a full-day course lasting one semester (ca. 20 weeks) receives 20 units of credit. If the same course is given on a half-day basis, it will -- in order to receive the same number of units -- be given over two semesters. Within the framework of the general programmes 40 to 220 units can be obtained; in the local and individual programmes a minimum of 60 and a maximum of 160 units can be obtained. An individual course is normally given 60 units of credit.

**The Linking of University Training with Employment and Research**

The legislation of 1975 stipulates that the primary function
of university education is to provide the student with knowledge and skills which are relevant to his subsequent employment. At the same time it is stressed that the function of the university must not be confined to purely vocational training. The linking of studies with subsequent employment is likewise not intended to adapt university training to the requirements of vocational life or the requirements of the employer. The relationship between university training and employment must be viewed in a more complex context. The students should learn to evaluate critically processes in their working life and in society and to contribute constructively to the development and renewal of these processes.

In addition a broad range of qualifications is demanded of the training, so as to facilitate versatile utilisation of personnel in the various sectors of industrial life.

The legislation stresses that a particularly characteristic aspect of the system should be the relating of university training to scientific research. However, this is not meant to imply that chairs are to be established for the entire university education system in its new and comprehensive form, nor is it intended to spread research funds more widely than hitherto. The legislation stresses two ways in which training and research are to be linked. Firstly, the entire basic university training is to be linked with training in research; secondly, research and training in research are to be so developed that they relate directly to the content and problems of the individual basic courses.

Admission Requirements

As of 1977 new regulations for admission to programmes within basic university training apply. There are so-called general admission requirements for entrance to university, requirements which are common to the vast majority of university programmes and in part there are special requirements, which stipulate specific prerequisites for certain programmes or courses. In applying for admission to certain programmes both the general
and special requirements must be fulfilled.

General Requirements: The general requirements are met if the applicant either
- has had two years of education at a university-stream secondary school or the equivalent education and
- has a level of proficiency in the Swedish language equivalent to two one-year courses within the two-year programme at the university-stream secondary school, and
- has a level of proficiency in the English language equivalent to two one-year courses within the two-year programme at the university-stream secondary school;
or
- has reached the age of 25 and has had at least four years of work experience (for this purpose 10 years taking care of one's own children or other dependents, as well as military service, are also counted), and
- has a level of proficiency in the English language equivalent to two one-year courses within the two-year programme at the university-stream secondary school;
or
- has had at least 11 years of education at a school in another country which, under normal circumstances, lasts until the age of seventeen, or is, in some other respect, entitled to admission to university in the country where he received his secondary school education, and
- has a level of proficiency in the English language equivalent to two one-year courses within the two-year programme at the university-stream secondary school, and
- has a certain level of proficiency in the Swedish language.

Special Admission Requirements: Certain programmes or individual courses have special prerequisites which are listed in a special catalogue relating to specific subjects or one-year courses at the university-stream secondary school, although it is possible to fulfill these requirements without actually attending the
university-stream secondary school. Where prior knowledge in one subject only is required, a grade of at least 3.0 in that subject is necessary. If the prerequisites are in several subjects, an average of at least 3.0 in all subjects is necessary. These special requirements may be waived in the case of persons who meet the general requirements, have normally reached the age of twenty-five and have had four years of employment experience.

The candidate is allowed to decide for himself whether he is suitably prepared, for example, by virtue of his employment experience. However, before making such a decision, it is advisable for the student to consult a counsellor.

The Selection Process

Candidates to be selected are divided into categories according to their educational qualifications and/or their employment experience. The classifications differ depending whether the candidate is applying for a programme or for an individual course. In both cases, however, the stipulation is that the number of places available must be divided in direct proportion to the number of applicants within each group.

(a) Selection System for the Individual Programmes

Grouping of Applicants

I Applicants who have completed the three or four-year programme at a university-stream secondary school, or an equivalent Swedish education.

II Applicants who have completed a two-year programme or special course at the university-stream secondary school, or an equivalent Swedish education.

Ranking of Applicants

Points awarded on the basis of school certificates with additional points possible for employment experience. (Within these quota groups 25 per cent of the places are reserved for students whose points derive exclusively from school certificates.)
III Applicants who have taken courses at the residential folk high schools.

IV Applicants who fulfill the requirements in other ways.

Points awarded for previous studies and possibly points for employment experience.

Points awarded for employment experience and for the voluntary university test.

(50 per cent of the applicants who fall solely within this category are entitled to the places allocated to this group.)

(b) The University Test

The university test examines knowledge and skills which are considered to be general university entrance requirements, e.g., general knowledge, vocabulary or the ability to read and comprehend graphic information. The test consists of approximately 150 questions and takes an entire day. Candidates may repeat the test as many times as they wish. Only the best result then counts. The result of the test is valid for a period of two years.

(c) Selection System for the Individual Courses

As was already indicated, the selection process for individual courses is conducted differently. The Selection Board is entitled to reserve a block of places to be allocated according to a system of priorities. Each case is then evaluated on the basis of the need for training, previous training and employment experience.

After these places have been allocated on the basis of the system of priorities, the other applicants are divided into three groups:

- applicants with at least two years of university training;
applicants without university training as described under Point I but who have at least 15 months employment experience; and

- other applicants.

The ranking of applicants is made according to the priority set by the applicant himself with regard to the course for which he applies compared to the other courses which he will take should he not get his first priority. As a last resort selection is made by the drawing of lots.

Summary

To sum up, the following are the characteristic features of the Swedish university reform:

(a) New admission requirements are intended to enable persons already employed to complete university training. A new aspect here is that employment experience has become an important criterion in the selection procedure and the fact that a candidate has reached the age of twenty-five and has had four years of employment experience has been included in the list of requirements.

(b) A reorganization of the courses is intended to create increased opportunities for employed persons to obtain university training and to facilitate their alternating between employment and study (in the sense of recurrent education). Obviously the principle of recurrent education requires a high degree of organizational flexibility. At present in Stockholm experimental models have been implemented, for example, to retrain nurses to become doctors.

(c) New forms of distribution and geographical dispersion are intended to make it possible for persons who are already employed to receive university training outside the traditional existing university towns. One of these new forms of distribution is so-called distance education which permits the student to take certain sections of a course by independent study and then to study for short periods at the university.
within the framework of concentrated course offerings (lectures, examinations etc.). Most of the courses offered in this form at present are individual courses in the faculty of arts. This system makes it possible to combine employment with study. A further form of distribution which has been considerably extended in recent years is the decentralization of university courses, i.e. the university organizes individual courses in places where university education is unavailable. The courses can be moved from place to place and carried over from year to year. Finally, reference must be made to the considerable increase in the number of evening courses in university towns. Normally they count as half-day courses, i.e. their duration is twice that of the regular day courses.

Non-University Adult Education

As was already stated in the Introduction, non-university adult education, i.e. adult education which is not organized by the universities themselves, can be found in a variety of different forms and programmes. The overwhelming majority of participants in non-university adult education combine their studies with regular employment or employment in their own homes or are involved in other social activities.

Aims of Adult Education

The aim of adult education is to achieve a more uniform level of education for all citizens. Adult education is intended to narrow the gap between young people with relatively good education and adults with a relatively brief basic education, as well as between adults with a relatively brief education and those who have had a more extensive one. Thus, adult education is primarily oriented towards the following groups: (a) adults who have had only a brief or inadequate education in their youth,
(b) culturally and educationally deprived groups, 
(c) employed persons, and 
(d) persons living in areas with low population density.

Funding

In addition to the general public funding of adult education, which has been considerably increased, a law was introduced in 1975 under which every employee is entitled to paid educational leave (financial problems arising from this arrangement are to be resolved through agreement between labour and management). Specific measures to promote adult education were already introduced. For example, the State provides funds for recruitment and counselling at places of work and in residential areas where new immigrants tend to live. These measures are funded by special items in the adult education budget.

According to a survey in the academic year 1973/74 approximately 29 per cent of the total Swedish population between the ages of 16 and 74 took part in some form of adult education courses. The percentage of female students was slightly higher than that of male students, (29.5 per cent and 28 per cent respectively). The survey also shows that the difference in the level of education alluded to above is constantly widening. Whereas the better-qualified adults continue to upgrade their educational qualifications, a large number of the lower-paid workers, handicapped persons in socially disadvantaged positions, persons who are employed for irregular periods and immigrants have remained at the education level which they reached in their youth. The survey also shows that among the under-educated there is a latent interest in further qualifications but that numerous obstacles make it difficult or even impossible for them to pursue this interest.

The Different Forms of Adult Education

In Sweden a large number of central authorities are responsible for the planning and coordination of public education in each
of the completely separate social sectors. There is, for example, the University Authority (UHA), which is responsible for the university sector, and the National Board of Education (SE), which is responsible for the school system. The latter is also responsible for adult education offered outside of the universities. Both authorities are in turn responsible to the Ministry of Education. Sweden has 149 local government authorities and 24 provincial legislatures which in matters of taxation are relatively autonomous. Some local and provincial governments are financially responsible for the local (municipal) universities which, like the state universities, are part of the regular university system. Similarly, the local government authorities and the provincial legislatures are responsible for adult education outside of the universities, and promote it in various ways.

The following is a brief outline of the best-known forms of adult education not offered by the universities:

(a) In Sweden there are about 100 folk high schools which receive state subsidies. Approximately half of these folk high schools are funded by various organizations (e.g. by political, professional or religious organizations). The number of students has risen steadily and was about 8,700 in the academic year 1975/76.

(b) In the Fall Semester of 1975 approximately 120,000 persons were enrolled in adult education courses funded by local governments. Approximately 29 per cent of them were taking courses in the compulsory (9 year) primary school programmes, approximately 43 per cent were taking university-stream secondary school courses and 28 per cent were taking practical vocational training courses. Local-government supported adult education takes the form of all-day courses and evening courses and is based on the curriculum for the regular school system. In addition there are in Sweden two state schools for adults (at the university-stream secondary school level) which are primarily intended for those students who, for a variety of reasons, are unable to pursue their studies in the place where they normally reside.
(c) Adult education aimed at the labour market at present has an annual capacity of 95,000 persons. It is primarily intended for adults who, for a variety of reasons, are unable to find employment or who have lost their job. This programme of adult education aimed at the labour market offers a very large number of varied courses.

(d) The central professional organizations receive state subsidies for various types of upgrading of their own members. Particular support is provided for those courses which relate to legislation introduced in recent years pertaining to the regulation of the labour market. Many professional associations have their own educational facilities.

(e) A year ago a special public corporation was created in Sweden, the Swedish Educational Broadcasting Corporation, which is responsible for adult education courses on radio and television. This education medium is so new that it is impossible to estimate reliably the number of users.

(f) Finally, there are approximately ten adult education associations which, as voluntary associations, are often affiliated with specific organizations such as political or professional associations. They undertake very extensive educational activities. In 1975/76 these associations organized approximately 270,000 study circles, with approximately 2.5 million students. These organizations also organize the recruitment and counselling at the place of work or in certain residential areas. They receive financial support from the local, provincial and federal governments. The courses offered by these associations can, in principle, include any course from the primary school to the university level.

In 1947 the first sweeping reform of independent and voluntary adult education was undertaken in Sweden. The general financial support for the work of the study circles and the general activities of the adult education associations was regulated by a special law. A certain rate of funding was set for the study circles and funding was made dependent on certain organizational
conditions; the legislation imposed no conditions on the extent of the activities of the study circles, the content of courses, and their goals. The absence of such conditions was deliberately intended to make possible independent and voluntary adult education, which would reflect the ideology and interests of the various popular movements affiliated with the adult education associations. The university study circles were an exception in that they were supported but only up to a specific limit, which was dependent on the total amount expended for state support of adult education; however, this drawback was removed in 1963.

Swedish adult education has been subject to a number of influences and stimuli from England. The university study circles are a good example, since they are modelled on the English tutorial classes. The university study circles seek to make it possible to offer programmes at the same level as the university programmes, in order to acquaint people with the scientific pattern of thought characteristic of contemporary society.

The activities of the university study circles are the only kind of independent adult education where certain conditions were imposed with regard to the qualifications of the seminar leaders. There are approximately 3,000 university study circles with annual participation of some 35,000 adults. The overwhelming majority are offered by the social sciences and arts departments, amounting to approximately 1,300 circles; next come the languages with 420, art and culture with 285, and economics and business administration with 280 study circles. In many cases the university study circles have their courses on the university course content in order to enable their students to sit for the university examinations; by this method they obtain the same final qualification as regular university students. The extremely rapid development of adult education within the Swedish universities has caused a certain stagnation within the related courses offered by the university study circles, but on the other hand the number of university study circles with independent course offerings has increased substantially.
The competition from short courses offered by the universities has caused some alarm within the adult education associations. Just as the local government supported adult education at the primary and secondary level developed since 1967 can be regarded as an eleventh adult education association, many of the original ten associations regard the universities with their new activities as a twelfth adult education association. An Adult Education Committee is grappling with the problem of where and how to draw a line between the activities of the adult education associations and the programmes which are organized within the framework of local-government supported adult education and the university, wherever these courses show a distinct similarity to those offered by the adult education organizations. The problem is aggravated by the fact that the adult education associations charge a fee for their courses, whereas the courses offered by the university study circles and the local-government supported courses are free of charge. There is the additional factor that adults who take these courses receive state grants which, unlike the regular student loans, do not have to be repayed.
Switzerland is a small country; its universities can be counted on the fingers of both hands. Eight of these are provincial (canton) universities (Basel, Bern, Fribourg, Geneva, Lausanne, Neuchatel, St. Gallen, Zurich); the remaining are federal technical universities (Zurich and Lausanne). The country's structure -- above all that of the education system -- is federalist and hence a description must deal with peculiarities and distinctions rather than uniform features.

This applies even more so to adult education which exists in many forms but which is fragmented and uncoordinated. It is based mainly on private initiatives and receives only modest public support. Even today it takes place mainly outside the universities.

This paper on the university and adult education in Switzerland is intended as a factual description of the situation as it is at present. However, these very facts -- even though they leave the formulation of problems and evaluation largely to the reader himself -- will show that university adult education in Switzerland is still very much in its infancy. This applies both to the education of adults at universities -- at least if this is measured by the criteria which are usually associated with adult education today -- and to the role of the universities.
This paper describes first the traditional and then the more recent contributions by the universities to adult education (although these are mostly in the form of vocational upgrading); these are described in general terms and then some examples are given. The paper then goes into present trends in educational policy and future prospects for university adult education and closes with a short description of the only contribution which the universities are at present making in the training of adult educators.

Traditional Contributions to Adult Education by the Universities

In Switzerland two forms of general university or partial university adult education and continuing education have been widespread and institutionalized; these are the auditor system and the people's universities. The auditor system in particular has such a long tradition that it is hardly surprising from this point of view if a university, asked how long it has offered continuing education, replies: since the year the university was founded. In the case of the University of Basle this would be the year 1460.

In the following a brief description of both systems will be given.

Auditoren

The auditor system exists at all Swiss universities (where three separate Swiss terms are used to describe them: Auditoren, Auskultoren and Freifachhoerer).

Auditoren are usually 18 years of age or older; anyone can participate as an auditor in certain university courses (these are usually lectures) without regard to their previous education or their present occupation; such courses are, however, naturally designed for the regular university students. A small fee, which
could be described as symbolic is charged for auditing the courses. Taking part in the courses entitles the auditor to no formal status or other official recognition. Hence the question arises whether the auditor system can meet the expectations which today are associated with general institutionalized university adult education.

Although no statistics are available which could provide information about the socio-economic and educational background of the auditors, the universities constantly stress that the auditors are often people who regard the lectures primarily as a cultural leisure-time activity. Thus it is usually courses in the departments which offer languages and history which attract the most auditors.

People's Universities Affiliated with Universities

It would be inappropriate to go into the history of the Swiss people's universities here. Nevertheless, in the present context it is important that everywhere where there is a university, it is in some way affiliated with the local people's university.

The closeness of this relationship varies greatly. In Basel, for example, the People's University is part of the University itself. It is administered by a commission whose president is selected by the Regents of the University. In other places, e.g. in Zurich, the University's contribution consists in providing the infrastructure (rooms and possibly equipment etc.) and faculty (today, however, in ever-decreasing numbers) for the rest it restricts itself to taking its place in the foundation Council along with the representatives of the City and the authorities, the representatives of the Technical University and the secondary schools, the delegates from the trade unions and the employees' associations, the party educational organizations and the women's and youth organizations.

The question as to what influence the link between the people's university and the university has on the nature of the public which attends the people's university programme will
be discussed next; the answer is based on a survey which the Association of the Swiss People's Universities conducted at various local people's universities during the Winter Semester 1969/70. (17)

Naturally, the following data cannot provide absolutely firm information regarding the question of a filter effect which can be anticipated from the affiliation of the people's university with the university. Too many other factors cannot be monitored, for example, contextual and socio-structural differences between the areas from which the people's universities draw their students; as a result no final conclusions can be drawn as to the effect of an independent influence exerted by this affiliation. Thus, the following presentation is intended more to stimulate critical reflection on the role of the universities and their participation in the work of the people's universities.

The discussion of this interrelationship will compare data from the city of Basel, as an example of a high degree of affiliation between the people's university and the university, with data from Zurich, as an example of a moderate degree of affiliation, and finally with data from the Bernese Jura, an area where there is no university affiliation.

Table 1
Enrollment by Sex at People's Universities in Basel, Zurich and Bernese Jura

<table>
<thead>
<tr>
<th>University affiliation</th>
<th>high</th>
<th>medium</th>
<th>none</th>
</tr>

<tr>
<td>Others, no data</td>
<td>6</td>
</tr>
<tr>
<td>Total</td>
<td>100%</td>
</tr>
</tbody>
</table>

In analysing the data relating to enrollment in terms of formal education it is, by way of contrast, evident that the degree of affiliation with the university exerts a strong influence on the enrollment; the more powerful this influence is, the greater the tendency for the people's university to lose its compensatory function and to attract persons who already have a high degree of formal education.

Consistent with the differences which were found in demographic data, considerable differences are revealed in the expectations of the participants, i.e. what they hope to achieve by their work at the people's university. They were asked what their most important expectation was of the people's university. There was a choice between the following six alternatives: (1) general education, (2) personal continuing education, (3) supplementation...
and continuation of the education received at school, (4) courses leading to a comprehensive knowledge in a specific field, (5) improvement of vocational expertise, and (6) advanced courses for persons with various levels of previous training.

Table 3

Enrollment by Personal Expectations at People's Universities in Basel, Zurich and Bernese Jura

| Expectations of PU Participants (for categories 1-6 see text on pp. 155-156) | University Affiliation of the PU |
|---|---|---|
|   | high | medium | none |
| 1 | 30   | 28     | 26   |
| 2 | 49   | 47     | 27   |
| 3 | 5    | 6      | 7    |
| 4 | 7    | 12     | 19   |
| 5 | 1    | 3      | 11   |
| 6 | 2    | 4      | 3    |
| Do not know | 6    |        |      |
| No answer   |      |        | 7    |
| Total       | 100% | 100%   | 100% |

The data shows that where the influence of the university is particularly strong, an enrollment with cultural needs predominates, whereas in the case of a people's university with no university affiliation, participants expect a direct instrumental contribution to the improvement in their situation.

Summing up, it can be said that the degree to which the people's university is associated with the university evidently has a characteristic relationship with certain distinguishing
features of the participants, both in demographic terms and in
terms of personal expectations of the people's university.
It is evident that where the university itself organizes the
people's university (Basel), students evidently come from the
upper social strata and use the people's university as a place
for cultural encounters. However, where the people's university
has no direct link with the university, it is possible to appeal
to new layers in the population. Hence it is possible to speak
of a genuinely restricting effect which occurs in cases where
the people's university is closely associated with the university.

At this point reference needs to be made again to the
limitations which were established at the outset of the discussion:
the data available here, namely the degree of affiliation of
the people's university with a university on the one hand, and
the characteristics of the participants at a particular people's
university on the other hand, are insufficient to permit any
conclusive statements about the effect of the one factor on the
other. Above all we lack data as to the causal determinants
of the relationship between the people's university and the
university.

It is in this light that one must regard the reservations
voiced by responsible persons in the Swiss Association of
People's Universities regarding excessive dependence on the
universities especially, whose paternalism does not always aid
the people's universities in the fulfillment of their functions.
A certain autonomy with regard to the public education system
appears necessary. If the people's universities are to be given
an opportunity to fulfill their functions in a meaningful way
through appropriate innovations.

Hence what the people's universities are seeking to achieve
is an intensification of their cooperation with the
universities, and more the full recognition of their general
public function through the provision of an appropriate public
legal status, which would also ensure the required funding but
which would not result in the people's universities having to
be integrated into the state public education administration.
Recent Contributions by the Universities to Adult Education

This section of the paper will summarize briefly the results of a survey on The Policy of the Swiss Universities in the Field of General Continuing Education and Post Diploma Studies which was conducted at all the Swiss universities. Following this some forms of university continuing adult education -- particularly new trends -- will be described.

General Continuing Education

In the field of general continuing education the above-mentioned survey covered a total of 41 activities; (even if individual figures may have in the meantime changed slightly, the overall picture remains essentially valid). These activities are distributed as follows among the individual universities: Basel 6; Bern none; Technical University-Lausanne 2; Technical University-Zurich 1; Fribourg 5; Geneva 8; Lausanne 7; Neuchatel 4; St. Gallen 3; and Zurich 5.

Table 4
Breakdown of Activities in Terms of Course Subjects (disciplinary emphasis)

<tr>
<td>Interdisciplinary Emphasis</td>
<td>10</td>
</tr>
</tbody>
</table>
The low figures for the technical universities as well as the University at St. Gallen are surprising, particularly in view of the fact that general continuing education in the natural sciences and economics and commerce seems to be relatively well developed, as Table 4 shows.

The importance which a particular university attributes to these courses naturally cannot be assessed through purely a quantitative compilation of the courses in general continuing education, as long as the quality and nature of the contribution made by the university to activities of this nature is not taken into consideration.

Table 5

<table>
<thead>

<tr>
<td>The university supports activities of other organizations with its infrastructure</td>
</tr>
<tr>
<td>The university supports activities of other organizations with its faculty</td>
</tr>
<tr>
<td>The university supports activities of other organizations financially</td>
</tr>
</tbody>
</table>

It is striking that the universities relatively often participate in activities which they themselves have not organized. The same picture emerged when the data on bodies charged with the organization of continuing education courses are examined.
Table 6
Bodies Responsible for Organization of University Level General Continuing Education

<table>

<tr>
<td>Special bodies in which, in addition to university, other organizations are represented</td>
<td>9</td>
</tr>
<tr>
<td>The university itself not responsible for organization</td>
<td>13</td>
</tr>
</tbody>
</table>

Although the data here is incomplete (in the case of five courses it was not possible to determine who was responsible for the organization), it is evident that only to a very limited degree do the universities operate completely autonomously in the field of continuing education. Only in a third of the cases surveyed do the universities undertake the organization, in all other cases other institutions or organizations are responsible and the universities limit themselves to the provision of certain services.

This kind of collaboration takes place in the great majority of cases with organizations which are closely or loosely connected with industry. This situation reflects the manifest objectives which the universities seek to achieve through their general activities in continuing education as well as the composition of the continuing education participants. Among the chief objectives are the importance of the production sector, the increasing of productivity and efficiency, and the characterization of the students is usually a matter of their vocational status.

The survey data contained in Tables 8 and 9 is further underscored through the examination of the profile of the participants in university level general continuing education courses, of whom 32 were former university students and 15 were not former university students.

</tr>
</tbody>
</table>

The heterogeneous nature of the university with regard to university level general continuing education courses is also reflected in the figures which pertain to the teaching faculty. In a high proportion of the continuing education courses the instructors are recruited from outside the university.

Of a total of 108 teaching faculty included in the survey, 42 came from within the university. Among the 33 who came from outside the university, 9 came from the civil service, 16 from industry, 4 from trade unions and professional associations, one was an expert in continuing education, and three were teachers from secondary schools and other specialized teachers.

Post-Diploma Studies

Of the 57 individual post-diploma courses which were surveyed, the distribution among the individual Swiss universities is
as follows: Basel 1, Bern 5, Technical University-Lausanne 9, Technical University-Zurich 5, Fribourg 4, Geneva 20, Lausanne 8, Neuchatel 5, St. Gallen none, and Zurich none.

The survey shows that post-diploma studies are more developed in the French area of Switzerland than in the German area although Bern, due to its proximity to the French-speaking area, has easy access to the courses offered by the French language universities and can participate in these (by agreement with the Conventions Romandes). In the German language area of Switzerland the Technical University-Zurich is an exception, showing an unusually strong development of post-diploma studies for this part of the country. This is obviously related to the fact that the 3rd cycle for the time being appears to be important, above all in the natural and applied sciences.

Table 10

</tr>
<tr>
<td>Natural Sciences</td>
<td>28</td>
</tr>
<tr>
<td>Applied Sciences</td>
<td>8</td>
</tr>
<tr>
<td>Arts</td>
<td>7</td>
</tr>
</tbody>
</table>

Here again, as in the discussion of the data relating to general continuing education, it must be pointed out that a purely quantitative analysis does not reflect the situation accurately. An evaluation of the data relating to the nature of the contribution by the universities to these courses reveals a distinctly different picture.
Table 11

University Involvement in Post-Diploma Studies

<table>
<thead>
<tr>
<th>Type of Involvement</th>
<th>Number of Courses</th>

</tr>
<tr>
<td>The university supports the activities of other institutions financially</td>
<td>5</td>
</tr>
<tr>
<td>The university supports the activities of other institutions with personnel</td>
<td>2</td>
</tr>
</tbody>
</table>

As the survey shows, in most cases the university itself organizes the courses. In about half of the cases the responsible bodies are specifically and exclusively competent for post-diploma studies, whereas in the other cases they are identical with those who offer the other university courses.

Table 12

</tbody>
</table>

A distinct emphasis on collaboration between the different universities emerges, whereas -- and this is a distinct contrast to the findings for general continuing education -- collaboration with industry seems to be less evident in post-diploma studies.

It appears that the development of post-diploma studies represents a kind of opportunity for the universities to defend themselves against the transfer of research from the educational institutions to industry. This assumption is based on the findings in the area which was already discussed, namely the relatively extensive organizational autonomy enjoyed by the universities in the field of post-diploma studies; it is corroborated by the data on the recruitment of teaching faculty.

Of a total of 125 teaching faculty in post-diploma studies, included in the survey, 50 were recruited from their own university, while 51 were recruited from other universities.
and 24 were recruited from sources other than universities.

**General Continuing Education and Post-Diploma Studies as Aspects of Two Different University Policies**

In the following the attempt will be made to reduce continuing education and post-diploma studies to model types and to interpret them as the expression of two different university policies, which can be called the policy of autonomy and the policy of fusion.

In order to elaborate the post-diploma programme model and the general continuing education model, a systematic comparison is offered below of the frequency of occurrence of some central characteristics to which reference has been made above.

</tbody>
</table>

In very general and simplified terms it can be said that the universities organize general continuing education in a form which institutionalizes strong external co-determination: the influence which the university itself can exert on the programmes...
and courses offered is greatly reduced, both because of factors originating at the organizational level as well as through the hiring of instructors from outside the university and the strong emphasis on collaboration with sectors outside the university. For reasons which cannot be explained here, the university makes itself dependent on other sectors of society. An extension of general continuing education thus does not appear normally to promote autonomy but rather to have the opposite effect. On the other hand post-diploma studies appear as the activity through which the universities emphasize autonomy: the university claims as its responsibility the planning, organization and conduct of such programmes and special organs are created for this purpose. Interaction occurs mainly within the educational institution itself; recruitment of instructors outside the university is minimal. It is striking that those disciplines which are also promoted outside the educational institution (theology in church institutions, economics and commerce within industry) tend to be given less consideration, perhaps because the policy of autonomy would be endangered. It should also be noted here that what the post-diploma courses deal with is obviously primarily knowledge generation. In contrast to the data on general continuing education, methods which seek the mere diffusion of knowledge (lectures which limit the student mainly to the reception of the material offered) are hardly used; instead more active methods are employed, such as colloquia and courses which involve student participation.

It must be stressed that the typological distinction made in the models between general continuing education as a policy of fusion and post-diploma studies as a policy of autonomy, are naturally contractions and simplifications of reality. In order to undertake a wider and more detailed analysis, it would be necessary to show where and when the individual universities initiate the policy of fusion within the field of post-diploma studies (as for example in the case of the University of Lausanne in connection with the IMEDE) or emphasize a policy of autonomy within the field of general continuing education (as for example
in the case of the University of Geneva and their Secretariat for Education Permanente). An analysis of this kind would, however, go beyond the purpose of this paper.

**Examples of Some Forms of University Continuing and Adult Education**

In this section first two forms of relatively conventional university vocational continuing education are described and then two examples of new trends in university adult education, namely the senior citizens universities and the credit system at the Faculty of Psychology and Education at the University of Geneva.

**Continuing Education at the University of St. Gallen for Economics, Administration and Social Sciences**

The so-called Continuing Education Level has existed at the University of St. Gallen, which institutionalizes the continuing education of graduates in state and business administration since 1968.

The Continuing Education Level is an established unit in the university organization with its own permanent organs for the Continuing Education Level, Commissioner and Alumni Council). Its programme is aimed primarily at executive and managerial personnel from Switzerland, the Federal Republic of Germany and Austria, as well as local commerce teachers.

The professional continuing education concept comprises the following five types of seminars.

1. Orientation seminars: at intervals of several years the attempt is made to provide a survey of new trends in the whole range of disciplines offered at the University of St. Gallen.

2. General seminars in economics, administration and the social sciences: these seminars deal with basic or topical subjects.
(3) MethOd-oriented seminars: the goal of these seminars is the training or continuing education of students in the application of recent methods in the fields of economics, administration and the social sciences.

(4) Seminars oriented towards spheres of responsibility: in these seminars basic or topical problems from individual areas of responsibility are dealt with on an interdisciplinary basis utilising new research data.

(5) Branch-oriented seminars: these deal with problems of individual branches of the economy; the courses for commerce teachers also fall within this category.

The seminars organized by the Continuing Education Level usually develop from research projects of the individual institutes. The supervisor of a research project of this kind usually joins in the seminar planning as the university teacher in charge of the project and also gives some reports in the seminar. Besides other instructors from the university, additional teachers from outside the university as well as persons from industry and government are employed. A written questionnaire is administered to the participants at the conclusion of each seminar in order to provide information as to the success of the course and suggestions for its improvement.

Courses offered by the Continuing Education Level must be financially self-supporting and appropriate fees are charged.

In addition to cooperation within the university the continuing education seminars also lead to close contact with business and industry and with government. Here the Alumni Council has its function, since it represents a kind of intermediary between the university and business and industry. Relatively close collaboration with the professional association has become institutionalized through the seminars for commerce teachers.

In addition, the individual institutes of the University of St. Gallen organize events (courses, congresses etc.) aimed at persons active in government and business and industry; these have no educational restrictions with regard to participation.
The Communaute Romande pour l'Économie d'Entreprises (COREDE)

The COREDE is a foundation in which the five universities of French Switzerland and the regional industries collaborate in the continuing education of executive and managerial personnel from business and industry.

The working-meetings and seminars which last several days (some are also seminar series which last longer) and which normally are conducted outside the university, consist of lectures, colloquia, working groups and practical work (short periods spent in industrial plants) dealing with interdisciplinary topics in industrial management. There are no formal admission requirements, although in each case the programme contains a relatively explicit description of the group for which each seminar is intended.

Instructors are recruited from the five universities as well as from business and industry and, in part, from government. The seminars are financially self-supporting and costs are covered by course fees.

The Senior Citizens' Universities at the Universities of Geneva and Neuchatel

In the Autumn of 1975 course offerings at the University of Geneva were extended to include a programme for senior citizens which consists of lectures, panel discussions, discussions, films, and guided tours. From the outset this programme enjoyed a wide popularity which has constantly increased; whereas at the outset there were 838 participants in the programme, after only 6 months there were more than 1,000 and in the Spring of 1977 the enrollment figure had reached 5,680.

The programme is organized by a committee of seventeen persons (of these eight are senior citizens) and has the following goals: (a) Cultural enrichment; (b) overcoming the loneliness of old people; (c) introduction to new activities; (d) intermixing of the generations; (e) treatment of the specific problems of old age, and (f) development of international solidarity. The regular teaching faculty of the University offer their services.
The experience gathered with the Senior Citizens' University is being evaluated with reference to further development and extension of such activities. This evaluation uncovered part of the present problem in the average profile of the participants: what emerges is a socially well-integrated middle class or upper middle class person who is thus financially better off than the average pensioner. (9)

On a smaller scale and on an experimental basis courses for senior citizens were offered at the University of Neuchatel in the academic year 1976/77. These courses too are being evaluated with a view to the extension of this activity. (3)

The Credit System in the Education Department of the Faculty of Psychology and Education of the University of Geneva

In the academic year 1972/73 a system of units and credits was introduced within the Education Department of the Faculty of Psychology and Education of the University of Geneva. (10) This innovation which will be demonstrated -- takes into account essential principles of current adult education, was possible because of the coincidence and particular constellation of various factors. On the one hand the Department was for various reasons in an acute crisis which even threatened to close it down; on the other hand a considerable potential for ideas and proposals for reform was available. This situation coincided with the demand by the Geneva Teachers' Association that the University provide continuing education of teachers and the very clearly expressed desire of the University Administration to contribute to education permanente within the framework of the University.

The basic idea of the credit system consisted in ending the traditional system of studies which is conceived of in terms of semesters and years of study, and in replacing it with an individualized programme which takes into account the time that is available to each student and his specific interests. At the same time part-time study by employed adults was officially
173

recognized as a fully-fledged form of study. In addition to the units of course work, a certain number of which lead to the completion of the degree programme, elements of basic training and practical experience were granted an equal status — where the student has had at least three years of practical vocational experience.

Through this new form of study — adult education at the university — in an initial phase courses were given which appealed primarily to teachers, school inspectors, social workers and training personnel for health care workers.

The innovation caused a massive rise in the number of Education students (from 233 in 1969/70 to 551 in 1976/77) as well as a radical change in their age structure.

Table 15

<td>102</td>
</tr>
<tr>
<td>Total</td>
<td>329</td>
</tr>
</tbody>
</table>

As the table shows about half (46.7 per cent) of the present Education students are over 30 years of age. This produces a mixture of ages within the total student body and leads to interaction between the students with and without vocational experience. As a result of this structural change in the student
body, the Department is changing more and more from an institution providing basic training to one offering further training.

The courses offered in the Department are divided into the following four areas: (a) focused on the individual; (b) focused on groups, institutions and society; (c) psycho-pedagogical and didactic; and (d) focused on research and methods. As a result of the increased enrollment and the attention which is paid to individual interests, the number of courses rose from 44 in the academic year 1972/73 to 111 in the academic year 1976/77.

Under the system of individual choice there was a change in the emphasis on various functions; student counselling and the organization of individual student programmes is now as important as teaching itself.

A further radical change is taking place in evaluation of student achievement. Through the introduction of the credit system, the system under which a satisfactory average grade is the condition for the successful completion of a programme of studies has been replaced by the system under which completion of the individual courses (obtaining the required number of credits) leads to the successful completion of the degree or other qualification. The evaluation of the individual units of study is undertaken in a wide variety of ways.

The content of individual courses is negotiated between students and instructors. Compared with the situation in traditional university teaching the relationship between the knowledge and experience of the instructor and the student has fundamentally changed. The change in course contents has meant that the courses are constantly being revised and adapted to the particular needs of the students, a fact which -- despite the increase in the number of part-time instructors -- has meant a considerable increase in the work-load of the instructor.

Some doubts have been expressed with regard to the research policy of the Department, since the traditional function of research (generation of knowledge) is confronted with a new function (the solution of urgent problems arising from practical...
work in the field).

The main concern of the Department in the present situation of innovation is the constant search for a balance; a balance in the conflict between growing specialization in individual Education courses, accompanied by a tendency towards more stringent admission requirements, and the basic idea of individual choice as the underlying principle of the programme of study; balance also between precisely this almost unlimited choice and the protection of the polyvalence of a university degree which continues to be regarded as necessary. In order to preserve this polyvalence, it proved necessary to demand certain balance in individual student programmes between the four above-mentioned areas, i.e. to impose a measure of restriction the freedom of choice.

Contribution of the Universities to the Training of Adult Educators

If one disregards certain courses which are offered at various universities, above all within the framework of programmes in Education, Social Education, Psychology and Theology, it is relatively easy to describe the universities' contribution to the training of adult educators. With the exception of the University of Geneva, where one Assistant Professor and several Lecturers form a Department of Adult Education within the Faculty of Psychology and Education, there is no Chair for Adult Education in the entire country. Hence reference must again be made to the University of Geneva. The following information is based on an earlier publication of the Work Group for University Adult Education. (4)

Advanced Studies Programme in Adult Education in the Department of Adult Education at the Faculty of Psychology and Education of the University of Geneva

(1) History and Institutional Framework.

Since 1971 it has been possible to acquire in this Faculty a
Diploma d'Études Avancées, mention Education des Adultes.

This is offered by the University of Geneva which also provides the funding. The Department of Adult Education has one Assistant Professor, four Lecturers and seven Assistants and various persons with short-term appointments who are employed from time to time.

(2) Target Groups and Participants in the Programme

The Programme is open to persons active in adult education provided that they have passed the State Examination or have an equivalent diploma and have had at least 3 years of experience in adult education teaching. In 1977 approximately 30 persons from France and Italian Switzerland, France and Canada studied in the Department. There are special courses for personnel in the women's, workers' and handicapped persons' sectors.

(3) Goal of the Training and Types of Diploma

The Programme is intended to provide information about the current situation in adult education, facilitate reflection on the student's own experience in the field, as well as provide an opportunity for academic work in the student's field of special interest or the Department's area of research. The Diploma is granted as soon as confirmation is provided that the 8 units of study (lectures, seminars, courses with student participation) have been completed. The student's programme is individually arranged on the basis of consultation. The Diploma enjoys relatively public recognition as a university qualification.

(4) Contents and Methods

The course contents change from year to year but regularly deal with psychological, sociological and economic aspects of adult education, questions of teaching methods, as well as structural problems of the education system. Points of emphasis in course work and research in recent years were paid educational leave, evaluation and workers' education. The methods are those normally used at universities with a very marked element of co-determination by the students.
which also extends to the administration of the Department. The latter already has various publications to its credit.

(5) Relationship with Practical Life and Cooperation with Sponsors of Adult Education
One of the main characteristics of the work of the Department is that it has crossed the conventional border lines of university work and has collaborated closely with trade unions, women's organizations, institutions for the handicapped the communities etc.

(6) Organization
The Programme of Advanced Studies is a one-year programme but usually takes two or more years to complete, above all because of the emphasis on field work. Various course components take place outside the university, in suburbs, new housing areas, trade union centres etc. The costs are linked to the normal University fees.

University versus Non-academic Training of Adult Educators*

The wide, indeed almost exclusive experience with non-academic training programmes -- the Faculty at Geneva is the sole exception -- naturally means that in Switzerland, university training for adult educators is not simply regarded without reservation and uncritically as the perfect solution. Underlying this point of view may be an element of justification for the methods hitherto adopted by Swiss adult education. The reason for the sceptical assessment of exclusively academic training of personnel. However, also a desire to avoid at all costs the dangers (particularly in the light of previous experience in the Federal Republic of Germany): overemphasis on theory in adult education and overqualification of adult education personnel. The latter can be seen in the fact that there are simply too many good, too highly-trained, candidates available for the

* The following remarks are also based on the study by Armand Claude to which reference was already made above. (4) They are representative for Swiss adult education but do not in every respect reflect the views of the present author.
limited number of positions available in Swiss adult education. There are also fields, for example continuing education for workers or parents, where an exclusively academic training can be a disadvantage rather than an advantage. That is not in any sense to imply that for such basic functions in adult education, personnel should be less well trained; it is much rather a question of the desired educational requirements and the most meaningful special training of adult education personnel which, from the Swiss perspective, need not necessarily be academic training. On the other hand, university training is doubtless necessary for various functions within adult education; this makes an increased commitment by the universities imperative.

Present Trends and Future Prospects in Educational Policy in the Field of University Adult Education

The Swiss Academic Council, as the senior advisory organ of the Swiss Government, has, among other things, the following responsibilities: (a) The drawing up of guidelines for the extension of and collaboration between the Swiss universities, whilst preserving the autonomy of the Swiss Federal Institutions in matters of school and university education; (b) the drawing up of recommendations for the promotion of their responsibilities in teaching and research (these recommendations are made to the Federal Department of the Interior and the Universities Conference; and (c) advising the universities on the reform of their structure and working methods.

In the summer of 1978 the Academic Council will publish its Third Report on the Extension of the Swiss Universities. As in the first two reports, quantitative aspects of university education will play an important role, but qualitative considerations have become much more prominent. An innovation in this context is that questions of adult education are dealt with in the report; in the chapter on "Aspects of General Educational Policy"
an entire section devoted to the problems of adult education.

An important concept of the Third Report on Extension is
"to call attention to the increasing need for opportunities
to participate in adult education. The contribution of the
universities would consist in making their course offerings
accessible to a wide circle of persons and at the same time
creating special continuing education courses, also for interested
persons without previous university education. In the opinion
of the Academic Council the primary objective at present is to
recognize the promotion of adult education at the universities
as a project of great importance for future developments and to
integrate it into current reform planning. Thus decisions would
be avoided which could later make the extension of adult education
more difficult".

The relaxation of admission requirements -- as is currently
being tried out in Geneva -- is regarded as entirely worthy of
support where an appropriate extension of course offerings is
undertaken.

In the non-university sector of post-secondary education
the Academic Council diagnoses a lack of horizontal mobility
and of organized cooperation between the component parts. An
effective means of improving such cooperation is seen in the
creation of training profiles, in which components of the training
which were previously given at separate institutions are
consolidated into new training courses. "This would achieve
a contribution to the qualitative enrichment of opportunities
for training (diversification) at the post-secondary level;
it would at the same time create a prerequisite for the extension
of adult education."

Assuming that the primary justification offered for the required
extension of adult education is to provide the individual
throughout his life with the possibility of realising and
extending his capacity to act, the Academic Council expresses
its commitment to the concept of recurrence as the means to
achieve life-long learning. Hence even the various forms of
basic education are to be designed for recurrent continuing
education. It is consistent with the foregoing goals that legislation to regulate paid educational leave is called for, since it is usually only with the existence of such legislation that participation in longer continuing education courses, which alternate with employment, is possible. Two other basic aspects of recurrence are also explicitly accepted: "Admission is to be less dependent on formal proof of achievement than upon effective prior training (which can also be acquired through practical experience)", and "the programmes shall in part consist of units of learning which can be combined in various ways and when so combined lead to a successful completion of the programme".

A long road remains to be travelled before the recommendations of the Academic Council summarized briefly here are implemented. The universities themselves, or at least some of them, will resist the new functions which have been foreseen for them in the field of adult education. It will be even more difficult to implement innovations which require legislative or constitutional changes, i.e. which will require the expression of the opinions of the voters.

Three examples from recent and very recent history, which are very directly related to the problems dealt with here, provide grounds for scepticism.

In March of 1973 the Federal Proposal Concerning the Amendment of the Federal Constitution with Regard to the Education System was accepted by a slim majority in the popular vote but rejected by the Provinces (Cantons) by 21 to 17 votes. Among other things this constitutional amendment would have authorized the Federal Government to establish principles for the organization and extension of adult education.

On May 28, 1978 the Swiss electorate rejected the Federal Law on the Promotion of the Universities and on Research by a vote of 56.6 per cent against and 43.4 per cent in favour.

Since the Provincial Legislature of the Province of Aargau in the Autumn of 1976 rejected by a narrow vote the proposal to support the project of an Aargau University Institute for Education, the chances that this project will be realized have decreased.
enormously. Among other things the project included the detailed planning of a Department of Adult Education. (7, 16)
BIBLIOGRAPHY

ADULT PART-TIME STUDY AT
YUGOSLAV UNIVERSITIES

Education and schooling in Yugoslavia have recently been
undergoing radical changes. They are being given special
attention and have more than any other social process become
the subject of public debates, which deal with the issue primarily
in connection with work and self-management. In an effort to
design an adequate educational model, social interests are
being given special emphasis. Now more than ever before social
objectives in education and schooling are being put in relief.
Within the developments and changes in the realm of education
as a whole, changes in the realm of higher education have become
necessary.

Some General Trends in the Realm of Education

Industrial growth and the development of social relations
have greatly increased the need for knowledge. Therefore in
Yugoslavia, as in other countries, the schooling of the young
was continuously extended; an ever growing proportion of the
young continued their studies after finishing compulsory (8 years)
schooling. Some 40 to 70 per cent of the young (the percentage
varied for different areas of Yugoslavia) completed schooling at various
types of secondary schools, increasing need for knowledge, especially on the
part of the young to enter institutions of higher education.
to this end were some other factors, such as: increasing aspirations for education, the democratization in the realm of education, the ever increasing concentration of the population in cities where education is more readily available, the rising living standard etc.

Not all young people, however, who were exposed to these factors, did have equal opportunities to continue their studies at institutions of higher education either because of objective reasons (living too far from adequate schools), or lack of required preparatory training, or because they held a job for which they had been trained at vocational schools. The greatest differences, however, in the opportunities to enroll at the university were due to the fact that the young people were trained in different types of secondary schools. Secondary schools and some secondary vocational schools led directly to the university whereas the remaining types of schools trained their pupils primarily for a job as a result of which it was only an exception that their pupils continued their studies at a higher scholastic level. They were admitted to institutions of higher learning only after taking an entrance examination. These examinations, however, were so demanding that only few pupils from vocational schools or pupils with some other 'inadequate education' were able to pass them, notwithstanding the fact that workers were granted this opportunity by law.

Thus part-time study developed rather slowly. Most of the requests for education were granted by some types of secondary schools that gave a somewhat more free access to the general population of students (School of Business Management, School of Work Organization, etc.). Candidates with inadequate secondary education had little choice and sought further education at institutions at which part-time study was better organized and which offered better opportunities for further studies irrespective of what vocation they themselves would have liked to adopt.

In order to do away with these anomalies, and in order to give all equal opportunities for further studies and at the same
time to satisfy the demands of society for education, a reform was launched of all educational institutions above the eight-year compulsory school. First the reform of secondary schooling was undertaken with the end in view to do away with the dualism of the secondary school and to ensure that part-time study was put on a par with regular studies. Thus adult education at the university level was an extension of part-time education at lower educational levels. The reform was also to solve some other urgent educational problems.

In the meantime the curricula had become too bulky and increasingly estranged from practice and life. The final process of training and the actual preparation for a job began only after one's entering upon a job. The process of training following schooling was becoming ever so protracted. The schools were accused of poorly preparing their graduates for the actual functions they were expected to carry out in our society even though the curricula were too demanding and too bulky. Thus the reform brought about changes also in the curricula, which were not to be tailored as though they were something static and final but were to follow the concept of life-long education. Part of the content of the existing programmes was to be omitted and offered later in the form of continuing education, while some subjects were to be extended over a longer period of time and were to be included in the university studies as general subjects (these are primarily subjects of general educational value).

The curricula of regular schooling and of part-time schooling are designed in such a manner that they take into account later continuing education following regular schooling. Regular studies, part-time study and continuing education are three equivalent parallel branches of higher education. As a general trend in the realm of education also the phenomenon that part-time education is given an increasingly strong emphasis is discernible. Adult education and regular schooling (education of school-age children) have been given equal social status by the reform.

The reform introduced also technical training into all
regular schools, accepting at the same time the experience gained previously by workers who come back to school for further education. The experience gained on the job is on a par with the acquired knowledge in school. Thus the schooling of the young and that of adults are fused into a uniform indivisible system. This being so the social status of adult education has risen, for it has up till now been claimed that adult education plays only a subordinated social role.

The new aspects of adult education and its new social evaluation offer great opportunities for a fast development of part-time study at the university level and help to overcome the difficulties of, prejudices against and doubts about part-time study at some institutions of higher education, especially some colleges and art academies. It is for this reason that the changes introduced by the reform into education and schooling should not be ignored whenever we speak of the development of part-time study in Yugoslavia.

Stages in the Development of Part-time Study

So far three characteristic stages in the development of part-time study in Yugoslavia can be discerned. Within this chronological framework part-time study has gained momentum, has spread, has earned public respect and has at the same time changed qualitatively in such a manner as to meet the needs of practical life, to further social development and to comply with the principles of andragogic theory and andragogic science.

The first stage is represented by the transition from irregular studies to part-time study. Even today part-time study is frequently equated with irregular studies even though they are two different and distinct pedagogic phenomena: they are also distinguished in pedagogic theory and practices.

Irregular studies are defined as individual study mainly on the principle of self-education. This form of education has been resorted to primarily by a person who for one or another reason has dropped out from regular schooling. Irregular studies have not been characterized by any one typical form of
the educational process; every irregular student has organized his study all by himself and thus differed from case to case. Every irregular student fought all by himself his way to an examination or diploma. Irregular studies were by and large self-education. It is, however, well known that pure forms of self-education are fraught with numerous drawbacks and that they no longer keep pace with the rhythm of modern life, especially because they are not efficient enough. Nowadays time has become a decisive factor in numerous decisions. Fraught with all the shortcomings of self-education, irregular studies are becoming an increasingly impracticable form for meeting the need for knowledge. In the face of all this, the studies took too long a time while the effect was rather scanty. Further development, moreover, was greatly influenced by the fact that irregular studies could be done only in some disciplines, primarily those which do not entail practical, experimental or laboratory work. Thus irregular students had limited possibilities in the choice of disciplines. Irregular study of medicine, chemistry, biology and similar disciplines was impossible so that only social sciences and the humanities were accessible.

Irregular studies were primarily compensatory education in which the candidates followed the standard regular programme. Part-time study, on the other hand, is based on group study and learning by adults, springing from broader needs of society (and not only of individuals) for education and is therefore qualitatively different from irregular studies. Part-time study is not only compensatory study but also is innovative. Adult students enroll and follow programmes specially designed for them. They, however, can follow also entirely novel programmes (innovational education), which did not yet exist at the time these students obtained their regular schooling. Being based on previously acquired knowledge and experience, part-time curricula normally differ from regular ones; they are tailored to do justice to the previous knowledge and experience of adults.

The organization of curricula is closely connected with the problem of the duration of part-time study. Judging from
experience, part-time study still takes longer than regular study, even though in view of the previously acquired knowledge, experience and maturity of adults one would expect the opposite to be true. The reason for this protracted duration of study is that the criteria for establishing and evaluating the adult students' previous knowledge and experience are deficient. Since in most cases the criteria are missing, all this is neglected and part-time students are offered a repetition of the standard regular programme. Such a situation, however, is a warning that in this area we are still lagging behind, for we have succeeded in solving only some problems posed by part-time study whereas others are still open. Frequently part-time study is inefficiently organized, the students are offered material they know already for our criteria are still only formal education, teaching periods, lectures and subjects. The material takes practically no issues, is rigidly presented and suffers from the formalism with which regular study is saddled.

Part-time study has originated in response to a massive need for knowledge and is an expression of a general social interest. Unlike former irregular students, part-time students do no longer depend on self-education only -- part-time study is a special form of higher learning and represents a continuous and completely conducted educational process, differing from regular full-time study by being specially programmed and organized. Besides being differently programmed, part-time education boasts a different didactic approach. The aims and objectives of part-time education, however, are the same as those of regular study, as are the criteria for the evaluation of knowledge (however they are arrived at along different routes).

In the first stage of the development of part-time study there were only few centers offering well designed curricula. Part-time study was still looked at askance and found its way only into less prestigious institutions of higher education where the needs of practical life were obvious.

The new Higher Education Act which each of the Yugoslav
republics promulgated in the years 1974 and 1975 set part-time study on a par with regular full-time study. In this second stage of the development part-time study became part and parcel of the entire educational system. Under the new socio-economic conditions in the area of education and schooling, irregular studies definitely withered away. Financial aid was granted only to group programmes that had been tested and evaluated.

This second stage in the development of part-time study was characterized primarily by a fast quantitative growth. The number of part-time students increased rapidly while part-time programmes were being offered in entirely new branches of knowledge.

In addition to this quantitative growth the second stage was characterized by certain qualitative changes: the relations between part-time and regular education had undergone an alteration. Part-time education began to influence the organization, the programming and the remaining problems of regular education. At the beginning there was a one-way connection so that regular study programmes exerted their influence on part-time study whereas now the influence was also the other way round. In the advanced educational process so many new things had happened that the already organized and traditional regular full-time programmes could no longer retain their original form. The changes brought upon regular full-time study by part-time study can be summarized as follows: (a) regular study programmes were remolded into a more consistent educational process and began to function as a more clearly determined uniform system, less dependent on the methods of individual teachers or on their personal professional interests; and (b) regular study adopted an increasing number of new didactic approaches and techniques of advanced education applicable to both regular students and adults at the university.

Relative to the change referred to above, it can be stated that the reorganization of regular full-time study is well under way. Thus many colleges and other higher education institutions have been articulating their curricula so that single subjects
supplement each other and tie in with each other in view of the fundamental educational aims and objectives. This being so the university has attained the character of a mass school. The teacher is chosen in accordance with the demands of the curriculum and not the other way round when the teaching programme (curriculum) at the university had been tailored to suit the professional interests and specialities of the teacher.

A comparison of the programmes of the same discipline at various universities revealed that they differed widely, whereas the curricula of secondary schools showed practically no differences. At the university level it was frequently found that entire areas of knowledge in one discipline were missing because no competent teacher was available, whereas other areas of knowledge were overemphasized if staff interests were involved. In some university departments two teachers for the same area of knowledge were employed with the result that the subject was allotted many more teaching periods a week. With the development of part-time study university programmes have been standardized. The criteria according to which subjects are being chosen are dictated by educational aims and objectives as they are at lower level schools.

Thus also the remaining pattern of study is becoming better organized and predetermined. As a rule examination dates are fixed in advance for the whole scholastic year and tests are given at least once monthly. Consultations, teachers' office hours and other help offered to students are also fixed.

The problem of the duration of study is acute. The average completion time needed for a discipline demanding 4 years (8 semesters) has been 7 years. The crowded universities simply cannot endure such retardation because it creates financial and staff problems. As long as there were only a handful of students enrolled at the universities, that is, a low percentage of the young generation, one or another student could afford to extend his studies. Mass enrollment, however, makes protracted study no longer feasible.

Under the influence of part-time study, didactics at the
higher education institutions have been undergoing a rapid development. Short courses model has been introduced also in regular full-time study and has at some departments become a sine qua non for the so-called year-by-year study where the student undergoes tests in all the required subjects before the beginning of the new scholastic year. The short course system enables the students to finish some subjects immediately after the end of the course, at mid-year, or later. Thanks to the introduction of the short course system, the students have had occasionally fewer lectures and a greater opportunity for other more creative forms of study.

Following the practice established in part-time study, an increasing amount of written material is being used also in regular full-time study. There is also an ever increasing output of text-books, manuals, expositions, written directions, etc. Without all these facilities part-time study would not be feasible, but regular full-time study also greatly profits from them. Part-time study has also given an impetus to the use of different audio-visual teaching aids which up to now have been rarely used at the university level, even though they have been widely used at the elementary and secondary school level.

The above shows that some rather unconventional forms of education and ever so much practical work have become part and parcel of regular study. Thus regular study should go hand in hand with cultural engagement, socio-political actions, and the practical work in various organizations of associated labour. The full-time students are required to do practical work in order to gain experience acquired otherwise by adults on the job. In these ways, the profile of the regular student and that of the part-time study gradually approach along several routes. This in turn ties in with the further development. In the light of the existing trends the question arises of what is going to happen in a few years if the number of part-time students will increase so fast and so steadily. The percentage of part-time students has in some departments even exceeded that of regular full-time students so that one is justified to ask whether at
rate of development a day might not come when there would be no full-time students at all.

The answer lies in the reform of part-time education and in the new Part-Time Education Act involving secondary schools, and institutions of advanced learning as an undivisible system, intrinsically connected and intertwined. After nation-wide public discussions, the Yugoslav constituent republics have promulgated their Part-Time Education Act in 1977 or 1978. With this, part-time study has reached a new stage in which the entire advanced education system will be transformed into adult education and will no longer be divided into regular and part-time education but into part-time education and recurrent education. A student will be able to enroll in a university only after having held a job for a while and having gained some experience in practical work. In the face of the financial capacities of the organizations of associated labour, it is justified to expect that at least at the beginning part-time studies will prevail, because recurrent education would put them under too great financial and other obligations to the students they had sent back to school.

The clearest picture of the aims and objectives of the part-time education can be obtained by reading those passages of the prepared law that concern the status of students. In Yugoslavia the debate about the status of students has been going on for a long time. It is closely connected with the policy of scholarship funds distribution which, in spite of several efforts, could not meet all the needs and satisfy all the ambitions because of the ever increasing number of enrolled students. The debates about scholarship funds distribution have led to the conclusion that our society is not so rich (nor is any other society, for that matter) as to solve the problem of the ever increasing need for and aspirations after knowledge by simply handing out student grants. Thus an alternative solution had to be found. It is obvious that part-time study offers such an alternative.

The part-time student has an orderly social status, holds
job, is financially independent and can assume his duties and exercise his rights within the framework of the Yugoslav self-management system. There is not much fear of a part-time student failing in his studies. If his job ties in with his study because he works in an industrial branch similar to the discipline he studies, then he will have even an advantage over the regular students; he will bring to the lecture or laboratory a certain amount of applicable practical knowledge whereas the regular student will have to begin at the beginning and will greatly depend on the teacher's rendition of the subject.

The pieces of information held by a part-time student come from several sources and thus may supplement each other, are more copious and may even shorten part-time study.

Regular students who have struggled with the problem of scholarships and have had the feeling that they stand on the fringe of social events, have increasingly felt and constantly pointed to the differences in their social status as compared to that of the part-time students. In spite of some differences, they have come to see the advantages of part-time study and have begun a struggle for an improvement of their own status which, however, cannot be radically changed if they do not accept new additional responsibilities. The reform visualizes a close tie-in of all students with associated labour bodies. In this way the social status of the students will change, and they will gradually assume the character of part-time students. By this not only the problem of the regular students' means of subsistence can be solved, but also their social status extended, because they become part and parcel of the production and self-management system. Thus the entire higher education would become part-time education.

In this stage of development, of course, which is yet to be accomplished, not only an attempt must be made to solve the problem of the students' social status but the changes must also involve teaching programmes, the adaptation of education to practical needs and life, the social role of university study and other problems. It would not be sufficient if the reform was to
solve only the problem of the student's social status without making an attempt at solving some concomitant problems which currently burden education and schooling. One of the major successes of the reform is no doubt in that it has brought education nearer to the workshop and life in general. At secondary schools, great efforts are being made to work out competent curricula through which students would be adequately trained for their chosen vocation. The higher the level of education, the more difficult it is to say what 'adequate education' indeed means, what in fact will prepare the candidate for his future job and life.

The solution to this problem lies in making education and work a closely knit and intertwined process at educational levels above secondary school. Thus university study becomes entirely part-time study in the very sense of the word.

In this solution the answer is found to some claims of some foreign pedagogic researchers that the more the study time has been protracted, the more schooling has become an abstract structure estranged from real life. The greater the number of years spent at school, the looser are the contacts with the actual aims and objectives of the study themselves, the study has begun to be pursued for its own sake. With the years, also the motivation for education decreases, the candidates squeeze out of the educational process a bare minimum, as much as is absolutely necessary for the conclusion of their study; since for more they lack the motivation. The present-day needs for knowledge, however, call for maximum efficiency and more than that: it is not enough that one knows something, that one is able to reproduce certain facts; the criterion for successful education is that one is capable of using that knowledge in practical life, that one can apply the acquired knowledge. For this purpose part-time study is much more suitable whereas full-time study is less satisfactory in this respect.

It is expected that in the future part-time study will not be merely one of the possible alternatives available to the students, but will become the sole educational system supplemented
only by the previously concluded schooling and recurrent education.

The Development of Part-time Study in Yugoslavia from 1966 to 1975

The data compiled for the whole of Yugoslavia show some general trends in development. First of all it must be said that so far the development of part-time study has been rather irregular; there are considerable discrepancies between the institutions of higher education and colleges as to the number of enrolled part-time students as well as in the proportion of graduates.

The available data indicate that part-time study is in large measure a question of prestige as to the type of school and the social structure of part-time students (see Tables.

Part-time study has had the fastest development at schools of higher education other than universities (4 semesters); the same has been true of institutions of advanced learning. The development at universities has been somewhat slower. As to the development of part-time study at the universities it has been found that the various disciplines have diverged and greatly differed.

The lowest percentage of part-time students has been found at art academies. It seems that these institutions admit primarily talented individuals to exclusively full-time study.

The differences in the development of part-time study have also been due to the different degrees of complexity of the study and to the nature of the discipline. It can be said that there is practically no area of knowledge in which part-time study could not be organized (here belongs also the study of medicine, about which so many doubts have been voiced). The question, however, is by means of what methods and forms of work this can be attained. The differences between the data for individual institutions are by no means due to major differences between disciplines and thus cannot be attributed to them.

Among the graduates from two-year post-secondary institutions there are 75 per cent of part-time students and only in three instances (of the 19 listed types of such institutions) the
percentage of graduates from among part-time students drops below 20 (School of Chemistry and Technology, School of Marine Engineering, School of Statistics). In all the remaining institutions the proportion is much higher and includes about one-half of the students.

Two-year post-secondary institutions face a special situation. Some have been set up exclusively for part-time students (School of Political Sciences, which, however, is not included in our data); later on the number of part-time students has decreased in favour of full-time students. Two-year post-secondary institutions have always the ambition to become incorporated into a university; as a result, they endeavour to approach one way or another faculty standards and put emphasis on regular full-time study. The proportion of graduates from part-time study has ranged in recent years from 36 to 100 per cent (School of Economics).

In the light of the type of schools at which part-time study is most developed one can conclude that part-time study develops under the pressure of economic and societal needs.

The proportion of part-time students among university graduates ranges from 0.1 to 32 per cent. The highest percentage hardly reaches the lower limit of the hitherto discussed schools. The data reveal that part-time study programmes at the university have not developed in keeping with the needs of industry, but have developed where it was easier, because of the nature of the work, to shift from irregular studies to adult group studies. These are: Faculty of Law, Faculty of Economics, Faculty of Philology, Faculty of Political Sciences, and Faculty of Philosophy. Actual needs for personnel, however, demand that part-time study programmes be developed in the areas of technology, mathematics, and natural sciences, which, of course, would present a somewhat more complex problem.

The data under discussion are valid for the whole of Yugoslavia. In the summary data, however, sight was lost of some special problems which have appeared here and there at the universities as harbingers of a new development. In some places isolated islands of part-time education have sprung up. They have been
initiated by individual teachers who have brought in new ideas from their study abroad. Let us cite as an example from the University of Ljubljana where part-time study is best developed at the Faculty of Mechanical Engineering and the Faculty of Electrical Engineering, and less so where one would expect it from the nature of the disciplines. In this stage of the development of part-time study many varied forces and agencies have been at work. Part-time study has only recently become a well-rounded system.

So far we have had a look at the data for Yugoslavia by faculties, two-year post-secondary institutions, academies and higher level schools. We have seen that part-time study varies greatly in extent. It has shown a fast growth especially at some higher level schools and faculties. If, however, we have a look at the population of part-time students as a whole, we see that it grows only slowly. The number of part-time students at two-year post-secondary institutions and faculties has increased by 12 per cent between 1966 and 1975. The same increase has been observed in the number of graduates from among the ranks of part-time students in higher education.

There are considerable differences between the number of graduates from the ranks of part-time students at higher level schools or after 4 semesters at the university (38 per cent) on the one hand, and the number of graduates who have finished study at an institution of advanced learning or faculty (6 per cent). The reason for such a great difference seems to be in the fact that part-time study is better developed at higher level schools than at faculties. Some higher level schools have been set up exclusively for part-time study (School for Work Organization, School of Business, School for Transportation, School of Political Sciences). It has been only later that these schools have begun to enroll also full-time students. The differences are due also to subjective factors. Since for a student the attainment of a diploma of a higher level school is a rather short-term venture, it represents a much more attractive objective than a diploma that could be attained in an unknown number of years and with unpredictable difficulties.

</table>
Among part-time students an interesting study pattern has emerged. Quite a number of graduates from a higher level school enroll at a faculty, for they seem to think that it is simpler to attain a faculty diploma after they have finished a higher level school.

Conclusion

At the present time part-time study still represents the more difficult alternative road to a diploma. The opportunities offered by institutions of higher education in total vary greatly. By and large each student generation includes some 25 per cent of part-time students of which only every fourth or fifth graduate.

In various societal documents the potential social status of part-time study is put on a par with or is even higher than that of regular full-time study. In reality, however, part-time study still has a poor reputation among people and in some professional circles and represents an inferior alternative. This can be seen from the opinions so frequently encountered in practice. Such opinions are not encouraging, especially not for educational institutions which are to introduce part-time study into their teaching programmes or which are to further develop them.

There is also much uncertainty as to the criteria for the evaluation of the knowledge derived from part-time study. In practice, some cases have been found in which these criteria have been considerably laxer than those for regular study, especially so at those schools at which the criteria for the evaluation of knowledge have been found to greatly differ from discipline to discipline in regular study. It has, however, also been reported that at some schools the criteria for the evaluation of knowledge acquired in part-time study is higher than usual "because part-time students prepare themselves for the examination more thoroughly, because they are better informed and have their own experiences as a result of which they can answer more demanding questions."
A considerable shortcoming of part-time study is lack of reliable criteria for the evaluation of the previously (also informally) acquired knowledge and experience. Therefore part-time study is frequently specious and becomes needlessly protracted. Another even worse consequence of the rudimentary criteria for evaluating the experience of adults is the refusal to introduce part-time study in the area of some natural sciences, technology, medicine, etc., where the teachers do not know how to tie in the required laboratory and other practical work with the experience of adults gained on the job. Here everything is judged from the point of view of regular, full-time study and no attempt is made to devise teaching methods applicable to part-time students. By reason of all this some faculties still reject part-time study.

Experience shows that owing to some attending circumstances part-time study is still subject to social discrimination. It attracts primarily students coming from financially weak social strata, because it is cheaper, while it is looked at askance by students from the upper social strata on account of its low prestige.

Normatively, part-time study is promised a great future. There is, however, still a considerable difference between the normative pattern of part-time study and the actual practice in this area. Pedagogues will have to make great efforts in order to develop and transform this pattern of study into a general system of university studies. The development as a whole, however, depends on the interdisciplinary approach involving a number of specialists as well as on a revised attitude towards part-time study.
