ABSTRACT

This report is intended to be a reference document to assist local unions in developing their own analyses. It encourages comparison of teachers' salaries to the salaries of other workers and provides some insights as to how the basic needs of members are being met by the compensation available. Tables provide information on: (1) current teacher salary levels; (2) scheduled teacher salaries for the 1980-81 school year based on contracts negotiated by American Federation of Teacher locals; (3) salary levels for non-teaching occupations and groups; (4) teachers' salaries and financial needs; and (5) the Consumer Price Index. Resources for further information are included as well as examples of formulas for calculating salary levels using the Consumer Price Index. A sample salary analysis worksheet is attached. (JD)

FOREWORD

The 1981 Salary Trends for Teachers: Survey and Analysis represents a departure from prior salary surveys in that it is intended to be a reference document to assist locals in developing their own analysis. While many of the usual components of prior surveys are retained, the additional provisions to assist in analysis of salaries relative to need should prove more useful to locals attempting to determine economic needs for members. It encourages comparison of teachers salaries to the salaries of other workers and should provide some insights as to how the basic needs of members are being met by the compensation available.

Periodic updates will be available throughout the year from the Department of Research. Members of the Research Network will automatically receive the information in the monthly mailings. Those interested who are not part of the network should contact the Department of Research at least quarterly to insure receipt of releases. In addition to regularly scheduled material, locals may find they need assistance that is specific to their particular problems. Such requests should be directed to James Gordon Ward, Director of Research, at the AFT National Office.

This report was developed and written by Jewell C. Gould, AFT Assistant Director of Research. Special recognition for work on this project is given to Anne Nelson Goldblatt of the Research staff for her contributions to the collection of data, organization, and preparation of significant portions of this report. Many locals assisted in providing information and suggestions so that all members can benefit from the shared knowledge.

HIGHLIGHTS

1980-81 expenditures for teachers salaries averaged \$17,364 for all reporting districts. This represents an increase of 7.9 percent.

Alaska, the District of Columbia, and New York reported the highest average salaries. Mississippi and Vermont paid the least to their teachers. (Table 1.0 - Salaries by State)

AFT bargaining agents are the leaders among the largest districts where teachers bargain contracts. (Table 2.0 - Largest Districts Where Bargained Contracts Exist)

The salaries in largest cities average one third higher than average for state. (Table 3.0 - Large City Maximum Salaries)

Selected locals report salaries increasing as base salary moves past \$11,000 toward \$12,000. (Table 4.0 - Scheduled Teachers Salaries from AFT Locals)

Minimum salaries paid all systems in a survey by Educational Research Service disclose some districts paying less than \$8,400 for starting teachers while maximum pay reached nearly \$38,000. (Table 4.1 - Minimum and Maximum Salaries by District Enrollment Size)

Superintendents earning at a rate three times as great as beginning teachers earning \$11,300. (Table 4.2 - Daily Rates of Pay)

Teachers earnings improve relative to other occupations but still lag behind Crafts, Managers and Administrators, and other Professionals. (Table 5.0 - Median Earnings for Full-Time Wage Earners)

Compared to other white-collar occupations, teachers' annual average salary is significantly low and pressure to change careers is increasing. (Table 6.0 - Average Salaries in White-Collar Occupations)

College students have no salary incentive to select teaching as a career when most beginning salaries for bachelor's degree holders are from four to ten thousand dollars higher in private industry. (Table 7.0 - Endicott Report Summary of Beginning Pay for Bachelor's Degree Graduates)

In the last decade teachers' salaries have fallen from 94 percent to 87 percent of the median family income. The buying power of a teacher dollar today is \$.80 compared to the 1971 salary. (Table 8.0 - Median Family Income and Average Teacher Salary)

A teacher's average salary will buy only 83 percent of the necessities for the intermediate family budget in a typical metropolitan area. This translates to mean that while the average person in the family of four living at the intermediate budget level can spend \$3.81 each day for food, the average teacher's family member has \$3.18 for food, or about a dollar and tax per meal. (Tables 9.0-9.2 - Intermediate Family Budget)

AFT ANNUAL SALARY REPORT
1981

CURRENT TEACHER SALARY LEVELS

In 1980-81, the average public elementary and secondary school teacher in the United States earned a salary of \$17,364 an increase of 7.9 percent over the 1979-80 average teacher salary of \$16,100. Over the past five years (1975-76 to 1980-81) the average teacher salary has increased 39.5 percent from \$12,448 to \$17,364.

The increases in average salary are affected by general schedule improvements, movement of teachers on those schedules, as well as changes in the teacher population, such as reductions in force affecting lower paid teachers. For example, the average salary of the teachers in a district would increase even if no individual teacher experienced a raise if a number of junior teachers at the lower end of the salary schedule were laid off.

In 1980-81, the states with the highest average teacher salaries were:

Alaska	\$29,000
District of Columbia	22,883
New York	21,316
Michigan	21,057
Hawaii	20,993

Only twenty states exceeded the national average teacher salary. Teachers were paid the lowest in:

Mississippi	\$13,000
Vermont	13,235
Arkansas	13,270
South Dakota	13,636
Maine	13,994

Table 1 shows the average teacher salary and percent of average U.S. salary by year and by state for 1978-79 to 1980-81. The percentage increase in teacher salary is also shown state by state for the period 1978-79 to 1980-81.

Another type of salary comparison is the relative salary level at specific points on the salary schedule. Traditionally, beginning salaries (step 1, column 1) have

been compared. However, with very few beginning teachers being hired, such a comparison is largely meaningless. More valuable would be a comparison at a point where many teachers are being paid. Table 2 shows the salary level for the master's degree maximum for a number of large public school districts where bargained contracts exist. The top five districts in the country in master's maximum salary are districts with AFT bargaining agents: Philadelphia, New York, Chicago, Washington, and Detroit. It is important to note that some districts may have a high master's maximum salary, but that it takes a considerable number of years to reach that maximum. Broward County, Florida, for example, has a master's maximum in excess of \$20,000, but it takes 28 years to reach this maximum. By contrast, in Dade County, Florida, it takes only 13 years to reach maximum.

Table 3 shows the maximum scheduled salaries for twelve large city school districts. These are typically districts in which enrollment has fallen sharply and the salaries at the maximum level are the salaries for a majority of the employees due to cutbacks in hiring and layoffs of less senior employees. The salaries show a steady increase over the years allowing these districts to maintain their leadership position in employee salaries. Among the leaders in increasing salaries from 1974-75 to 1980-81 were:

New Orleans	68 percent
Baltimore	65 percent
Philadelphia	57 percent
Miami	53 percent
Los Angeles	50 percent

More increases in some of the cities have very nearly kept pace with inflationary increases while outdistancing increases in their respective states. Baltimore, New Orleans, and Los Angeles have all been in the twenty-three percent or better range.

Compared to the state average salaries the large cities are about one third higher. Exceptions to this pattern in 1980-81 were:

Philadelphia	176 percent
Miami	168 percent
Chicago	150 percent
Detroit	147 percent
St. Louis	147 percent

Table 4.0

SCHEDULED TEACHER SALARIES
1980-81 SCHOOL YEAR

Table 4 shows summaries of approximately 75 teacher salary schedules for the 1980-81 school year. Presented are the reported average teacher salary for the district and step 1, step 5, step 10, and maximum scheduled salaries for four preparation levels: bachelor's degree, master's degree, master's plus 30 additional graduate hours, and scheduled maximum.

These data were extracted from contracts on file with the AFT Department of Research and were supplemented by a survey completed by selected AFT local affiliates. Complete salary information can best be obtained from the local itself.

This information should be useful for contract bargaining, factfinding, and other local union activities.

Table 4.1

The following minimum and maximum salary ranges from a sample of over 1,000 school districts surveyed by the Educational Research Service, Inc. show the variation that exists between beginning salaries and maximum salaries in districts of comparable size.

Minimum and Maximum Salaries by District Enrollment Size
1980-81

The larger districts, primarily urban and suburban, provide more attractive salaries at both extremes than the smaller districts. While starting salaries vary by only 6.7 percent, the differences at the maximum level are 19.8 percent apart. The pattern encourages career teachers to seek positions in districts with more than 10,000 pupils. In the final analysis teachers may be expected to seek the district having the greatest earning potential.

Table 4.2

Daily Rates of Pay by Region for Various
School Employee Groups, 1980-81

Daily pay rates are another means of measuring the unit of compensation. Since some districts work school years of varying lengths, total wages earned will not reflect the rate of earning as clearly as the daily rate. This information is from a survey of over 1,000 districts by Educational Research Service, Inc.

SALARY LEVELS FOR NON-TEACHING OCCUPATIONS AND GROUPS

Salaries for teachers, as a rule, are compared to salaries for other groups of teachers. This practice, while useful to establish the education market price of a teacher's services, is limited to a narrow segment of a larger employment and earnings universe. As many districts have seen in recent years, it is industry, not neighboring districts, which attracts the potential and the career teacher with salary incentives.

This section will provide data useful for comparisons of a broader nature than teacher salaries alone. It will provide data for wage earners in blue and white collar occupations, and for beginning college graduates in the private sector. Median-family income trends show the increase through the last decade in current dollars, the decrease in real buying power as measured in constant dollars, and the relative position of the average teacher salary for the same period.

These data provide a snapshot of various earning levels and occupations. Absolute comparisons to teacher salary data are not recommended due to the variations in data collection methods. Generalizations are appropriate and where possible comments are provided.

Table 5.0 illustrates the sluggish increase in median earnings for full-time wage earners in most occupation groups. The median earnings figure is midway between the highest and lowest earnings. Factors such as layoffs of beginning lower paid workers would tend to advance the median figure as would real increases in earnings. Teachers as a group have improved their relative positions with respect to most occupations. The median annual earnings for the two-year period show teachers' earnings closing the earnings gap consistently among all categories and surpassing that of sales workers. At the same time median earnings are increasing, rates of wage and salary change have stayed between 8.6 percent and 10.2 percent for the 12 months ending in March 1981. The Employment Cost Index, a publication of the Bureau of Labor Statistics, reports a total compensation change of 10.7 percent for all private non-farm workers.

A dilemma exists for school districts and for teachers. Median earnings for teachers have increased and the gap is closing to some extent. If this is due to wage increases, then teachers have some incentive to remain in the profession. The prospects for eventually reaching an acceptable salary

level is good. On the other hand, pressures for teachers to effect employment changes exist due to district-level problems such as massive layoffs related to perceived school district budget constraints and enrollment declines. It is not extraordinary for a teacher with a dozen years in the system to receive a layoff notice. It may well be that such layoffs are driving up the median earnings level by removing substantial numbers of lower paid employees. If this is the case then the combination of slowly rising wages and weakened job security provisions may force teachers to choose another, more stable occupation.

Table 6.0 provides a view of some of the choices available to teachers in the white collar professions. Accountants, attorneys, chemists, engineers, and drafters all earn an average salary that is greater than teachers'. The career teacher who is interested in changing professions can double and triple his earnings by selecting new occupations. Many teachers are able to qualify for new positions with little or no additional training. Ulysses, the figure in the Greek epic, facing a choice similar to that facing teachers, instructed his crew to lash him to the mast to avoid following the Sirens' call. School districts, strapped by tax limitation movements, may find they do not have enough money for the "rope" to hold their career teachers.

If districts are counting on an unending supply of new teachers to inexpensively replace departing teachers, a rude awakening lies just around the corner. By 1983 the first of the mini-boom children will begin arriving for classes. Within a short time after that it is likely that the children of the baby boom generation will be arriving, albeit tardy, in substantial numbers. Couples that delayed their family plans past the anticipated time are now beginning to add significant numbers of children to the birth rolls. Given this influx of new students we will find that teachers will shortly return to vogue. What is available to influence students to choose teaching as a career and fill these expected vacancies? Current starting salaries are no draw. Starting salaries for teachers are behind the beginning salaries for private industry. Table 7.0 shows the salaries paid college graduates as reported by the Endicott survey from Northwestern University. All fields, including liberal arts, are paid significantly higher beginning salaries than starting teachers. There is no salary incentive for students to choose education as a career. Furthermore, career teachers earning at the national average can examine the salaries and the historical rates of increase and determine that quickly they can improve their salary by a career change. It is apparent that districts must act at once to offer a

reasonably attractive salary or risk losing their faculty to private sector competition.

Table 8.0 illustrates the continuing decline, both relative and absolute, of the average teacher's salary compared to the median family income. At that point, as in the past, teachers' salaries were below that of the median family level. In the last decade teachers' salaries have increased in current dollars a little more than 79 percent while the median family income has increased 93 percent. This further widened the gap that has existed. In terms of constant 1971 dollars, the picture is quite similar. Both measures decline, yet teachers' salaries at a faster rate than the median family income. While the effects of inflation have hurt the American family's purchasing power, they have crippled teachers' ability to purchase goods and services. Only in the last five years have the two measures proceeded at an even pace. While the measures are not strictly comparable, it is apparent that the earnings of teachers and the American standard of living are separated by a wide gulf. Solutions to eliminate these career disincentives should be on the minds of all Americans. It should never be forgotten that the Pied Piper of Hamelin was a teacher the town could not afford to pay.

Table 5.0

Median Earnings for Full Time Wage Earners 1979 and 1981

TEACHERS' SALARIES AND FINANCIAL NEED

The Bureau of Labor Statistics provides annual estimates for a financial need measure known as the Urban Family Budget. Based on surveys of buying habits of groups at various income levels, the initial survey determined how much money was needed to support an urban family at low, intermediate, and higher levels. Updates for the budget are based on price increases in the various weighted categories established in the initial survey. Given a set of assumptions about the specific levels and allowing for geographic differences, the budget, though imperfect, provides an estimate of the annual costs for the various levels.

Teachers, by virtue of their interests, earnings, and consumption habits, are fairly compared to the Intermediate level budget family. Urban areas centered in Standard Metropolitan Statistical Areas (SMSA) provide reference for geographical comparisons. The population is 2,500 to 50,000 and outside of a SMSA, the non-metropolitan areas should be the reference.

One comparison that can be made is the relationship between teachers' salaries and the cost of the intermediate family budget for that area. Some comparisons are made in table 9.2 using the average teachers' salary for major metropolitan areas.

Table 9.0 is a summary of the increases for the U.S. average intermediate family budget. Overall the increased cost was 12.8 percent. Transportation led all components with a 14.3 percent jump. Automobile costs and the cost of fuel to the consumer helped to drive this portion up and significantly affect the rate of change. High interest rates pushed the housing component to 11.1 percent. Clothing was the best buy last year, increasing only 4.6 percent. Higher costs in all components and slowly advancing wage levels encourage conservation where possible. Continued conservation without controlling inflation will exacerbate the decline in the overall standard of living. Table 9.1 includes major components of the intermediate family budget for selected metropolitan and non-metropolitan areas. The category "other family" includes the cost of both education and reading, two areas of particular concern for teachers.

Anchorage, Alaska, with an intermediate budget cost of \$29,682, continues to be the most expensive place to live of the SMSA's listed. Of the areas in the contiguous

United States, Boston is no bargain at \$27,029. The family dollar goes farthest in Dallas among the metropolitan areas. All non-metropolitan areas continue to be attractively inexpensive by comparison.

Five Most Expensive Metropolitan Areas

Anchorage, AK	\$29,682
Boston, MA	27,029
New York, NY	26,749
Washington, DC-MD-VA	25,203
San Francisco-Oakland, CA	24,704
Urban U.S. Average	23,134
Non-metro U.S. Average	21,070

Five Least Expensive Metropolitan Areas

Dallas, TX	\$20,776
Atlanta, GA	21,131
Houston, TX	21,572
Honolulu, HI	21,933
St. Louis, MO	22,248

Another comparison that can be made is by the individual component costs. If expenditures matched the budget, then it costs the average family member \$3.82 each day to eat. Their share of the family housing cost is \$3.50. Clothing purchase and cleaning costs are \$6.21 a week; the apple-a-day cost of good health is up to \$27.15 a month. The combined cost for books, magazines, recreation, tobacco, alcohol, and education amounted to just six bits a day. The average pupil in the public school has twelve to fifteen times that amount spent on his behalf each day. For those able to utilize this service, public education is a very attractive way to maximize a fairly tight budget. Table 9.2 is a comparison of the intermediate budget and the average teacher salary in selected areas. In eleven of the areas the average salary is at least 95 percent or more of the intermediate family budget. That leaves eleven in which teachers are 91 percent or less than the expected level for families. Detroit teachers are in the best relative position, while the average teacher in Houston is probably mailing resumes for new employment or working a second job.

Table 9.0

Annual Costs for an Intermediate Budget
for a 4 Person Family

The Bureau of Labor Statistics of the U.S. Department of Labor issues estimates annually for its Urban Family Budget series. The intermediate level budget approximates the budget level corresponding to teachers' salaries. From Autumn 1979 to Autumn 1980 the intermediate level total budget rose 12.8 percent.

Table 9.0

Component	Percent Increase for Intermediate Budget Level Autumn 1979 to Autumn 1980
Food	10.4%
Housing	11.1
Transportation	14.3
Clothing	4.6
Medical	10.8
Other Family	8.6
Other Items	9.1
Total Budget	12.8

The following table shows the major components and total budget costs of the intermediate level budget for families in metropolitan areas by region.

Table 9.1 (continued)

Footnotes Intermediate Budget, Autumn 1980

- 1 The family consists of an employed husband, age 38, a wife not employed outside the home, an 8-year-old girl, and a 13-year-old boy.
- 2 Total budget costs include personal income taxes, social security, other items, and total consumption.
- 3 Housing includes shelter, house furnishings and household operations. The intermediate budget does not include an allowance for lodging away from home city.
- 4 The average costs of automobile owners and nonowners are weighted toward the proportion of families who are owners and nonowners. Boston, New York, and Chicago were weighted 80 percent for owners, 20 percent for nonowners. The rest of the cities and non-metropolitan regions were weighted 95 to 100 percent for owners.
- 5 In total medical care, the average costs of medical insurance were weighted by the following proportions: 30 percent for families paying full cost of insurance; 26 percent for families paying half cost; 44 percent for families covered by non-contributory insurance plans (paid by employer).
- 6 Other family consumption includes the average costs for reading, recreation, tobacco products, alcoholic beverages, and miscellaneous expenditures. Education, a requirement or choice for our members, is included in this category.
- 7 Other items includes allowances for gifts and contributions, life insurance, and occupational expenses. Many of our members routinely incur occupational expenses.
- 8 As defined in 1960-61. For a detailed description of these and previous geographic boundaries, see the 1967 edition of Standard Metropolitan Statistical Areas, prepared by the Office of Management and Budget.
- 9 Places with population of 2,500 to 50,000.

THE CONSUMER PRICE INDEX

Inflation and a rising consumer price index (CPI) are synonymous to many Americans. So much personal experience has been linked to the CPI as the source of economic bad news, that some people believe it has a mean soul and substance all its own. Actually the CPI is quite a benign and uncontrollable measure of the cost of a market basket of goods at specific points in time. The market basket is essentially unchanged from month to month. If the cost of an item in the market basket increases or declines, then the index will reflect that same increase or decline. In reality, if a particular item's price increases too rapidly, then the consumer may switch brands, consume less, or find a substitute within his purchasing range. In other cases, such as the cost of a new home or higher interest rates, the price may increase but affect only those active in purchasing that good or service. Many will not be immediately affected if they keep their current residence. For this reason there is discussion of substituting or eliminating items from the market basket and using personal consumption indicators.

The CPI is published by the United States Department of Labor, Bureau of Labor Statistics, in many areas monthly and in some on a bi-monthly basis. Indexes for various metropolitan areas as well as demographic and geographic indexes are provided. It is a measure of the average change in prices for each area since the base period and not of the difference in price levels between cities. To this extent it is inappropriate to make comparisons between area indexes as a measure of the cost of the market basket. The Urban Family Budget is the appropriate measure because it measures the cost to a family for services based on a weighted proportion of a set expenditure level. The CPI began with all items indexed at a specific point in time to equal 100. The current index is based on 1967 = 100.0. The CPI is the cost of a market basket from which rates of change can be calculated rather than a measure from which absolute price levels can be identified.

The most common bargaining use of the CPI has been to trigger cost of living adjustments in wage agreements. This device, known as cost of living clauses (COLA), has been less popular as the annual rate of increase moves toward single digit figures. Last year's annual increase of over 13 percent is not likely to be repeated this year. Rising food prices in recent months may hold the index near 10 percent, but many insist that runaway inflation is behind us for the foreseeable future. And, in fact, the CPI, from July 1980 to July 1981 was 10.7% So much for Reaganomics!

This is not to say that we are not suffering as a nation from high prices and unemployment. It simply indicates that a bad situation will remain, but may not continue to deteriorate at as quick a rate as in the past. The argument used is that an inflation rate of 9 or 10 percent is not really helping anyone, but is better than 12 or 13 percent. Most American workers cannot tell the difference when bill paying time rolls around.

Table 10.0 provides the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) for the years 1971 through May 1981 by month and includes an annual average. Calculations from the index can be accomplished by determining the index point change from which the percentage change can be derived. An example is provided.

Table 10.1 is the index for selected cities for April and May 1981. The variations in the rates of change for areas can be observed. Baltimore and St. Louis have increased at about the same rate over time, but the initial cost of the market basket may have been substantially different. Locals wishing information for their area may contact the nearest office of the Bureau of Labor Statistics for specific information. Regional office addresses are in the resource section.

Table 10.0

CONSUMER PRICE INDEX FOR URBAN WAGE EARNERS AND CLERICAL WORKERS (CPI-W)
 1971 to 1980
 (1967=100.0)

YEAR	JANUARY	FEBRUARY	MARCH	APRIL	MAY	JUNE	JULY	AUGUST	SEPTEMBER	OCTOBER	NOVEMBER	DECEMBER	ANNUAL AVERAGE
1971	119.2	119.4	119.8	120.2	120.8	121.5	121.8	122.1	122.2	122.4	122.6	123.1	121.3
1972	123.2	123.8	124.0	124.3	124.7	125.0	125.5	125.7	126.2	126.6	126.9	127.3	125.3
1973	127.7	128.6	129.8	130.7	131.5	132.4	132.7	135.1	135.5	136.6	137.6	138.5	133.3
1974	139.7	141.5	143.1	144.0	145.6	147.1	148.3	150.2	151.9	153.0	154.3	155.4	147.7
1975	156.1	157.2	157.8	158.6	159.3	160.6	162.3	162.8	163.6	164.6	165.6	166.3	161.2
1976	166.7	167.1	167.5	168.2	169.2	170.1	171.1	171.9	172.6	173.3	173.8	174.3	170.5
1977	175.3	177.1	178.2	179.6	180.6	181.8	182.8	183.3	184.0	184.5	185.4	186.1	181.5
1978	186.9	188.3	189.8	191.3	193.2	195.1	196.7*	197.7	199.1	200.7	201.8	202.9	195.3
1979	204.7	207.1	209.1	211.8	214.3	216.9	219.4	221.5	223.7	225.6	227.6	230.0	217.7
1980	233.3	236.5	239.9	242.6	245.1	247.8	248.0	249.6	251.9	254.1	256.4	258.7	247.0
1981	260.7	263.5	265.2	266.8	269.1	271.4	274.6						

Percentage Increase Since 1971 for Selected Years

Year	January	May	September	Annual Average
1975	31%	32%	34%	33%
1980	96	103	106	104
1981	119	123	NA	

*beginning of revised series

To determine the percentage increase from one month to another determine the index point change, divide by the previous index, and multiply by 100

January, 1971 = 119.2
 January, 1981 = 260.7
 Index Point Change = 141.50
 $141.50 \div 119.2 = 1.19$ or 119% increase

50

51

Table 10.1

CPI-W for Selected Cities

The Consumer Price Index for urban wage earners and clerical workers is published for several cities and standard metropolitan areas. In addition the index is available by region and population size classes. Area indexes do not measure differences in the level of prices among cities; they only measure the average change in prices for each area since the base period. For inter-area comparisons the Urban Family Budget is more appropriate.

Consumer Price Index for Urban Wage Earners and Clerical Workers

RESOURCES

American Federation of Teachers, Department of Research

A variety of reports in the areas of education statistics, economic data, and fiscal analysis are available. Through AFT's Department of Research, reports are mailed monthly to the Research Network. Special reports are announced in the American Teacher and AFT Action. Unpublished data is available to affiliates through the Department of Research.

For copies of publications or assistance contact:

James Gordon Ward, Director of Research (202-797-4428)
Jewell C. Gould, Assistant Director of Research
(202-797-4445)
American Federation of Teachers
11 Dupont Circle, NW
Washington, DC 20036

United States Department of Education, National Center for Education Statistics

The Statistical Information Office of the National Center for Education Statistics provides data on all facets of education. A catalogue of NCES publications may be obtained by contacting:

Statistical Information Office
National Center for Education Statistics
1001 Presidential Building
400 Maryland Avenue
Washington, DC 20202
301-436-7900

Some of the more useful publications are:

1) Digest of Education Statistics, published annually. This abstract covers enrollment, graduates and degrees, student and teacher profiles and other useful information. The publication attempts to maintain historic comparability. The major drawback is that the data, by nature of its national coverage, is usually more than one year old. More current information is available by writing or calling for specific answers to questions.

2) Projections of Education Statistics attempts to look ahead several years to estimate pupil, teacher, expenditure, and similar data. The statistical methods for projections are included so users may judge the value of the data.

3) The Condition of Education analyzes current issues at all levels of education. This publication includes graphs and charts as well as summary statements.

Special reports in addition to the above are available on a number of specialized topics. Some include state data, revenues and expenditures, federal programs and national longitudinal studies.

United States Department of Labor, Bureau of Labor Statistics

BLS offers free and for sale publications on employment, wages, and economic data including the Consumer Price Index and the Urban Family Budget series.

Contact the regional office nearest your local for copies of publications. Addresses are included at the end of this section. The BLS publications catalogue, published semiannually, provides a listing, with selected annotations, of all bulletins, reports, news releases, reprints, periodicals, special articles from periodicals, and summaries issued from January through June by BLS's Washington, DC office.

Some of the more popular publications and news releases used in this report are:

- 1) Industry Wage Survey - featured industries
- 2) Union Wages and Benefits - featured occupations
- 3) Current Wage Developments - trends in wages earned
- 4) Consumer Price Index - trends in the cost of a standard market basket of goods
- 5) The Employment Cost Index
- 6) Employment and Earnings - employment and wage data for workers
- 7) Occupational Outlook Quarterly - projections on employment trends
- 8) News Releases - covering employment, wages, bargaining, professional salaries, work stoppages, etc.

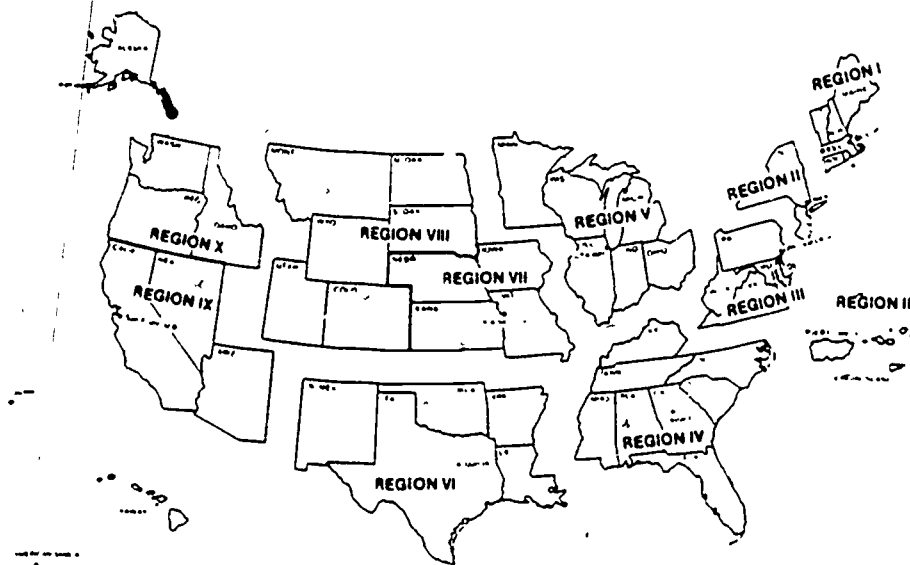

United States Department of Commerce, Bureau of the Census

The Bureau of the Census produces significant data based on the official census and periodic surveys. An example of such a survey is the Median Annual Salary for Full-Time Workers. Finances of Public School Systems is produced by the U.S. Bureau of the Census as part of the annual Government Finances series.

FORMULAS AND EXAMPLES

This selection of formulas are those most commonly used in the calculations and specific examples.

These formulas are used to solve specific examples provided in the text of the report and will be useful in the preparation of the local district salary comparisons. Both basic computations and more advanced references are provided for the variety of applications which will develop in the process of salary evaluation. For further assistance, contact the Research Department with your questions.

I. Comparison on one salary to another

Definition of terms

S_1 = salary for first time period

S_2 = salary for second time period

d = difference between salaries

P_i = percent change (increase or decrease)

P_s = percent of salary

Salary differences

- a. To calculate the difference in like dollars between two salaries

$$d = S_2 - S_1$$

- b. To calculate the percentage difference between two salaries

$$P_i = 100 \left(\frac{d}{S_1} \right) \quad \text{or} \quad P_i = 100 \left(\frac{S_2 - S_1}{S_1} \right)$$

- c. To calculate the percentage one salary is of another

$$P_s = 100 \left(\frac{S_1}{S_2} \right)$$

Examples

62

U.S. average expenditure for salary = \$17,364
Alabama average expenditure for salary = \$15,150

- a. What is the difference between the average salary for teachers in the United States and the average teacher in Alabama?

$$d = S_2 - S_1$$

$$d = \$15,150 - \$17,364$$

$$d = \underline{\$2,214}$$

- b. What percentage below the U.S. average salary is Alabama average salary?

$$P_i = 100 \left(\frac{d}{S_1} \right)$$

$$P_i = 100 \left(\frac{\$2,214}{\$17,364} \right)$$

$$P_i = 100 (.13)$$

$$P_i = 13 \text{ percent}$$

- c. What percent of the U.S. average salary is the Alabama average salary?

$$P_s = 100 \left(\frac{S_1}{S_2} \right)$$

$$P_s = 100 \left(\frac{\$17,364}{\$15,150} \right)$$

$$P_s = 100 (.87)$$

$$P_s = 87 \text{ percent}$$

II. Calculating using daily rates of pay

Definition of terms

S_a = annual salary

D = length of school year in days

R_d = daily rate of pay

- a. To determine the daily rate of pay

$$R_d = \frac{S_a}{D}$$

Examples

- a. Compare the daily rates for districts with varying work years and salaries:

	Salary 1	Salary 2
Annual salary for teacher	\$16,000	\$16,522
Length of work year	184 days	190 days
	$R_d = \frac{\$16,000}{184}$	$R_d = \frac{\$16,522}{190}$
	$R_d = \$86.96$	$R_d = \$86.96$

- b. Compare the local teachers daily rate with the minimum rate for region when local rate is \$58.24 per day and city is in Michigan.

Great Lakes Region, Teachers Mimimum = \$64.53

$$P_s = 100 \left(\frac{S_1}{S_2} \right)$$

$$P_s = 100 \left(\frac{\$58.24}{\$69.53} \right)$$

$$P_s = 100 (.90)$$

$$P_s = 90 \text{ percent}$$

Reference: Table 4.2 for state/region information

III. Calculating weekly earnings

The median annual salary for full time workers assumes full time year round employment of 35 hours per week or more, 52 work week annually figures reported are aggregate for groups interviewed for report series "Weekly Earnings of Workers and Their Families."

Teachers should base their calculations on 52 weeks, the period in which they will receive their annual salary. This is consistent with the questions asked in the survey, "How much does...usually earn per week at this job before deductions? Include any overtime pay, commissions, or tips usually received." "Usual" is defined as more than half the weeks worked during the past four to five months. The response will vary during the months surveyed from zero to 133 percent of the average weekly earnings.

Definition of terms

S_a = annual salary

W = length of work year in weeks

R_w = weekly rate of earnings

$$R_w = \frac{S_a}{W}$$

Example

- a. What is the weekly rate of earnings for a teacher whose annual salary is \$17,364?

$$R_w = \frac{\$17,364}{52}$$

$$R_w = \$334$$

IV. Calculations using the Consumer Price Index

Definition of terms

$I_{a...z}$ = Consumer Price Index at points a, b, c,... which may be months of specific years or annual averages

d = difference between index points

p = percent change between index points

S_c = salary in constant dollars (specific year)

S_f = future salary

S_i = salary increase

Percent Change in CPI

- a. To determine the percentage change in the CPI from one index point to another

$$p = 100 \left(\frac{I_b - I_a}{I_a} \right) \quad \text{or} \quad \left(p = 100 \frac{d}{I_a} \right)$$

- b. To determine the increase to be applied due to a cost of living adjustment

$$S_i = \frac{p}{100} \times S$$

- c. To determine the future salary due to a percentage increase.

$$S_f = \left(1 + \frac{p}{100} \right) S$$

Constant Dollar Calculations Using the CPI

- a. To calculate the value of a current salary in constant dollars of a specified year using standard CPI index of 1967 = 100

$$S_c = 100 \left(\frac{S}{I_a} \right)$$

In the event that salaries for more than one point in time are to be converted the salary at each point is divided by the index at the same point.

Where $S_1 \dots (n)$ = Salaries at points 1, 2, 3... (n)

and $I_a \dots z$ = Indexes at similar points a, b to z

then

$$S_{ca \dots z} = \left(\frac{S_{1 \dots (n)}}{I_{a \dots z}} \right)$$

as in

$$S_{ca} = 100 \left(\frac{S_1}{I_a} \right); \quad S_{cb} = 100 \left(\frac{S_z}{I_b} \right) \dots S_{c(n)} = 100 \left(\frac{S(n)}{I_z} \right)$$

The index points used will be taken from existing CPI tables where 1967 = 100.

- b. To calculate the value of a current salary in constant dollars in a specified year using other than 1967 = 100 as the basis
 - 1. Convert CPI based on 1967 = 100 to selected index year and produce the index
 - 2. Proceed as in (a) above using new index

Constant Dollar Calculations

- 1. Convert CPI based on 1967 = 100 to selected year

Let the index for the selected year = I_z

then

The index may be calculated for each point by dividing $I_{a...z}$ by I_z

$$\text{Index } I_z = 100 \left(\frac{I_{a...z}}{I_z} \right)$$

Examples

- a. Determine the percentage increase in the CPI between January 1975 and January 1981

$$I_a = 119.2$$

$$I_b = 260.7$$

$$d = 141.5$$

$$p = 100 \left(\frac{I_b - I_a}{I_a} \right) \text{ or } \left(100 \frac{d}{I_a} \right)$$

$$p = 100 \left(\frac{260.7 - 119.2}{119.2} \right) \text{ or } 100 \left(\frac{141.5}{119.2} \right)$$

$$p = 118.7 \text{ percent increase}$$

Reference: Table 10.0

- b. What increase in the salary of \$14,500 can be expected due to the application of a full cost of living increase based on the 12 month period from May 1980 to May 1981?

Index May 1980 = 245.1

Index May 1981 = 269.1

S = \$14,500

$$p = 9.8 \text{ percent} \left(\frac{269.1 - 245.1}{245.1} \right) \times 100$$

$$S_i = \left(\frac{p}{100} \right) S$$

$$S_i = \left(\frac{9.8}{100} \right) \$14,500$$

$$S_i = (.098) \$14,500$$

$$S_i = \$1,419.83$$

Reference: Table 10.0

- c. What will be the new salary following a COLA adjustment based on the full increase in average cost of living for the previous year?

Index for 1979 = 230.0

Index for 1980 = 258.7

S = \$14,500

p = 12.5 percent

$$S_f = \left(1 + \frac{p}{100} \right) S$$

$$S_f = (1.125) \$14,500$$

$$S_f = \$16,312.50$$

Reference: Table 10.0

- d. What is the value in constant 1967 dollars for annual salaries in the following table?

Year	Salary	Annual CPI (1967=100)
1975	\$10,000 (S ₁)	161.2 (I _a)
1976	11,000 (S ₂)	170.5 (I _b)
1977	12,100 (S ₃)	181.5 (I _c)
1978	13,310 (S ₄)	195.3 (I _d)
1979	14,641 (S ₅)	217.7 (I _e)

$$S_{ca\dots z} = \frac{100 S_{1\dots(n)}}{I_{a\dots z}} \quad \text{or}$$

$$S_{ca} = 100 \frac{S_1}{I_a}; \quad S_{cb} = 100 \frac{S_2}{I_b} \quad \dots \quad S_{ce} = 100 \frac{S_5}{I_e}$$

$$S_{ca} = 100 \frac{S_1}{I_a}$$

$$S_{ca} = 100 \frac{\$10,000}{161.2}$$

$$S_{ca} = \$6,203$$

or

Year	Current Dollars	÷	Index	x 100	=	Constant Dollars (1967=100)
1975	\$10,000	÷	161.2	x 100	=	\$6,203
1976	11,000	÷	170.5	x 100	=	6,452
1977	12,100	÷	181.5	x 100	=	6,667
1978	13,310	÷	195.3	x 100	=	6,815
1979	14,641	÷	217.7	x 100	=	6,725

e. What is the value in constant dollars for annual salaries in the following table?

Year	Salary	Index 1967 = 100	Index 1971 = 100*
1975	\$10,000 (S ₁)	161.2	132.7 (I _a)
1976	11,000 (S ₂)	170.5	140.5 (I _b)
1977	12,100 (S ₃)	181.5	149.6 (I _c)
1978	13,310 (S ₄)	195.3	161.0 (I _e)
1979	14,641 (S ₅)	217.7	179.5 (I _f)

*Index for 1971 = 1-- calculated as follows

1971 index when 1967 = 100 is 121.3

Year	Index 1967=100	÷	1971 index (1967=100)	x 100	Index 1967=100
1975	161.2	÷	121.3	x 100	= 132.9
1976	170.5	÷	121.3	x 100	= 140.5
1977	181.5	÷	121.3	x 100	= 149.6
1978	195.3	÷	121.3	x 100	= 161.0
1979	217.7	÷	121.3	x 100	= 179.5

$$S_{ca} = 100 \frac{S_1}{I_a}$$

$$S_{ca} = 100 \frac{\$10,000}{132.9}$$

$$S_{ca} = \$7,524$$

Year	Current Dollars	÷	Index	x 100	=	Constant Dollars (1971)
1975	\$10,000	÷	132.9	x 100	=	\$7,524
1976	11,000	÷	140.5	x 100	=	7,829
1977	12,100	÷	149.6	x 100	=	8,088
1978	13,314	÷	161.0	x 100	=	8,270
1979	14,641	÷	217.7	x 100	=	6,725

SALARY ANALYSIS WORKSHEET

This worksheet is provided for locals to determine which of the several measures available for salary comparisons might be most useful for local needs. Consider the finished worksheet in light of your specific needs. Statistics and comparisons, however carefully developed, are no substitute for independent judgment. While the completed worksheet may contain many useful bits of information, careful reflection will indicate which items will support your position and which will add little to your argument.

Examples of the calculations required are provided in the formula section of this report to show the procedures which may be followed. Due to the wide distribution of this document the calculations are necessarily basic. Further assistance and procedures may be obtained by contacting the AFT Department of Research, 11 Dupont Circle, NW, Washington, DC 20036.

In completing the various portions of the worksheet, decisions must be made as to which universe will be used for comparison purposes. Some data is available in the report which may meet your purposes. In some instances locally obtained data may be more appropriate. References for charts and tables indicate the source of the information so that additional or more extensive material can be obtained. A separate reference section lists major sources of information and some useful publications.

To assist the Department of Research in meeting your needs it would be most helpful to have a copy of your worksheet. Please forward a copy to our office at your earliest opportunity.

¹ See formulas Part IV for constant dollar calculations using 1967 = 100 or other year index

Reference: Table 8.0 and Local Salary

12. Select the intermediate urban family budget for your area and compare total cost and components to selected teacher salary for your area. Assume the components to be a percentage of the total budget

Annual Costs of the Urban Family's Intermediate Budget and
 _____¹ Salary

Area	Total Budget	Selected Major Components			
		Food	Housing	Transportation	Clothing ³
_____	\$ _____ 100%	\$ _____ % ²	\$ _____ %	\$ _____ %	\$ _____ %
Local	\$ _____ 100%	\$ _____ %	\$ _____ %	\$ _____ %	\$ _____ %

1. Designate salary; e.g., master's maximum
2. If total budget is \$23,134 and is 100% then food at \$5,571 is 24 percent. Calculate the percent for each component and apply it to the salary selected. For example, from above, if food is 24 percent of the budget and the salary is \$18,900, then \$4,551 is available for food for the family of four in the example. Summary of the local component can be expressed as "each member of the teacher's family has \$1,138 annually for food, or \$3.12 each day." See the text on "Teachers Salaries and Financial Need" for further examples.
3. Include as many or few components as necessary to draw a relative picture of the costs for the salary in question

Reference: Table 9.1

13. Compare the average teachers salary to the total costs for the urban family's intermediate budget for your area and the U.S.

Area	Total Budget Costs	Teachers Average Salary	Salary as a Percent of Budget Costs
U.S.	\$ _____	\$ _____	_____ %
1 _____	\$ _____	\$ _____	_____ %

- 1 Select appropriate areas or regions
Reference: Table 9.1, 9.2

14. Calculate the percentage increase in your area CPI for reference using several points on the index.

CPI-W Index and Percent Increase

Year	Month	Index	Percent Change
19____	_____	_____	_____ %
19____	_____	_____	_____ %
19____	_____	_____	_____ %
