Course Content; Curriculum; *Electric Circuits; *Electricity; Independent Study; Learning Activities; Postsecondary Education; *Programed Instructional Materials; Secondary Education; Technical Education; Vocational Education

This independent self-study course on electricity was developed from military sources for use in vocational education. The course provides a source of study materials on the principles of electricity. The five lessons are divided into two parts, each of which contains criterion objectives and self-tests. The course provides basic coverage of atomic structures and matter; series and parallel circuits; measuring devices; batteries and electromagnetism. The course is presented in a programmed instruction format, in small steps using frames, and is easy to read and understand. Criterion objectives, self-tests, and answers are given. The materials are suitable for supplementing classroom activities, for enrichment materials, and for additional help for slow learners. (KC)
MILITARY CURRICULUM MATERIALS

The military-developed curriculum materials in this course package were selected by the National Center for Research in Vocational Education Military Curriculum Project for dissemination to the six regional Curriculum Coordination Centers and other instructional materials agencies. The purpose of disseminating these courses was to make curriculum materials developed by the military more accessible to vocational educators in the civilian setting.

The course materials were acquired, evaluated by project staff and practitioners in the field, and prepared for dissemination. Materials which were specific to the military were deleted, copyrighted materials were either omitted or approval for their use was obtained. These course packages contain curriculum resource materials which can be adapted to support vocational instruction and curriculum development.
The National Center Mission Statement

The National Center for Research in Vocational Education's mission is to increase the ability of diverse agencies, institutions, and organizations to solve educational problems relating to individual career planning, preparation, and progression. The National Center fulfills its mission by:

- Generating knowledge through research
- Developing educational programs and products
- Evaluating individual program needs and outcomes
- Installing educational programs and products
- Operating information systems and services
- Conducting leadership development and training programs

Military Curriculum Materials Dissemination Is...

an activity to increase the accessibility of military developed curriculum materials to vocational and technical educators.

This project, funded by the U.S. Office of Education, includes the identification and acquisition of curriculum materials in print form from the Coast Guard, Air Force, Army, Marine Corps and Navy.

Access to military curriculum materials is provided through a "Joint Memorandum of Understanding" between the U.S. Office of Education and the Department of Defense.

The acquired materials are reviewed by staff and subject matter specialists, and courses deemed applicable to vocational and technical education are selected for dissemination.

The National Center for Research in Vocational Education is the U.S. Office of Education's designated representative to acquire the materials and conduct the project activities.

Project Staff:
Wesley E. Budke, Ph.D., Director
National Center Clearinghouse
Shirley A. Chase, Ph.D.
Project Director

What Materials Are Available?

One hundred twenty courses on microfiche (thirteen in paper form) and descriptions of each have been provided to the vocational Curriculum Coordination Centers and other instructional materials agencies for dissemination.

Course materials include programmed instruction, curriculum outlines, instructor guides, student workbooks and technical manuals.

The 120 courses represent the following sixteen vocational subject areas:

<table>
<thead>
<tr>
<th>Agriculture</th>
<th>Food Service</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aviation</td>
<td>Health</td>
</tr>
<tr>

</tbody>
</table>

The number of courses and the subject areas represented will expand as additional materials with application to vocational and technical education are identified and selected, for dissemination.

How Can These Materials Be Obtained?

Contact the Curriculum Coordination Center in your region for information on obtaining materials (e.g., availability and cost). They will respond to your request directly or refer you to an instructional materials agency closer to you.

Course Description

This introductory course provides learners with a source of study materials on the principles of electricity. Each lesson is divided into two parts, each of which contains criterion objectives and self-tests. The course provides basic coverage of atomic structures and matter; series and parallel circuits, measuring devices; batteries and electromagnetism.

Lesson 1 — Matter and Atomic Structure is divided into two parts, the first dealing with matter, covers matter, volume, density, weight, porosity, inertia, and impentrability. The second part focused on atomic structure covers parts of the atom, atomic number and weight, positive, negative, and neutral charges, and electron direction.

Lesson 2 — Introduction to Electricity and Electrical Symbols is also divided into two parts. The first is an introduction to electricity and covers static electricity, charged bodies, current flow, potential difference, Ohm's Law, and resistance. The second part covers electrical symbols and schematic diagrams.

Lesson 3 — Series Circuits and Parallel Circuits also contains two parts. Part A solves series-circuit problems for current, voltage drop across an individual component, resistance of an individual component, total resistance, and total voltage. This section also covers short circuits, open circuits, and the use of the ohmmeter, ammeter, and voltmeter. Part B solves problems in parallel circuits for total resistance, resistance of an individual branch, total current, current flow of an individual branch, and total voltage. It also covers reciprocals.

Lesson 4 — Series-Parallel Circuits and Batteries. Part A covers series-parallel circuits and is concerned with solving for the unknown values of resistance, current, and voltage in series circuits connected in parallel, and in parallel circuits connected in parallel. Part B covers batteries.

The course is presented in a programmed instruction format. The information is presented in small steps by using frames, and is easy to read and understand. These materials could supplement classroom activities, be used as enrichment materials, and be helpful to the slower learner who needs additional help.
FUNDAMENTALS OF ELECTRICITY

Developed by: United States Marine Corps

Development and Review Dates: Unknown

Occupational Area: Building and Construction

Cost: $6.25
Print Pages: 305

Availability: Military Curriculum Project, The Center for Vocational Education, 1960 Kenny Rd., Columbus, OH 43210

Suggested Background: None

Target Audiences: Grades 10-14

Organization of Materials: Programmed instruction, criterion objectives, self-tests, answers

Type of Instruction: Individualized, self-paced

Type of Materials:

STUDY ASSIGNMENT: Information for MCI Students.
Course Introduction.
MCI 11.16a, Fundamentals of Electricity, part A and B of lesson 1.

STUDY NOTES: This course is presented in a form known as PROGRAMMED INSTRUCTION, a method by which you learn the material at your own rate of speed. The subject matter is presented in small steps called FRAMES. You should read each frame very carefully and then answer the question(s) asked. Be sure to keep the answer for the frame you are working on covered up with a slip of paper until you have written your answer. Compare your answer with the correct answer(s) found in the frame below it in the column on the left side. Below we have printed sample frames.

<table>
<thead>
<tr>
<th>FRAME</th>
<th>QUESTION</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1. The universe contains nothing but matter. The sun and a particle of dust are parts of the universe; therefore, each is an example of _______.</td>
</tr>
<tr>
<td>MATTER</td>
<td>2. Everything in the universe is composed of matter. Underline the items below that are matter.</td>
</tr>
<tr>
<td></td>
<td>a. Truth</td>
</tr>
<tr>
<td></td>
<td>b. Rock of Gibraltar</td>
</tr>
<tr>
<td></td>
<td>c. Freedom</td>
</tr>
<tr>
<td></td>
<td>d. Air</td>
</tr>
<tr>
<td></td>
<td>e. A tree</td>
</tr>
</tbody>
</table>

The answer to the first frame, question #1, is found in the frame below, in the column to the left of question #2. In other words, MATTER is the correct answer to question #1. Your answer should be the same or very similar to the given answer. IF IT IS NOT, GO BACK AND READ THE FRAME AGAIN. You SHOULD NOT be worried about time. You SHOULD be concerned about understanding the material given. If you find yourself having difficulty, you should return to where your difficulty began and go through it again. If you follow these instructions carefully, you will find yourself gaining a great deal of knowledge. GOOD LUCK!

SELF TESTS: At the end of each programmed booklet is a short self-test based on the objectives for that booklet; answer these to the best of your ability and check your answers on the pages following the self-test. If necessary, review the lesson until you are satisfied that you have accomplished the lesson objectives.

APPROXIMATE READING TIME: 180 minutes for this lesson.
LESSON 1

PART A

MATTER

OBJECTIVES

1. Given a list of definitions pertaining to the words listed below, match each word to its proper definition.
   a. Matter
   b. Mass
   c. Volume
   d. Density
   e. Weight
   f. Porosity
   g. Inertia
   h. Impenetrability.

2. For a given body of matter, state what happens to its mass if its location, volume, or state is changed.

3. Given the volume and weight of a body, determine its density.

4. State what effect the distance an object is from the surface of the earth has on the weight of the object.

5. State the results of matter having the property of porosity.

6. List three examples of the inertia of objects (balls, aircraft, vehicles) being overcome.

7. List the three states of matter.

8. Select from a list of the characteristics of matter those characteristics pertaining to each state of matter.
INTRODUCTION

Electricity cannot be seen. No one can draw a picture of electricity nor can anyone capture a boxful of it. Electricity and the laws associated with it are theory. You will have to accept this theory, as science has done, before you can understand any of the rules or laws of electricity.
1. The universe contains nothing but matter. The sun and a particle of dust are parts of the universe; therefore, each is an example of ________.

<table>

</tbody>
</table>

The dimensions that give matter the property of volume are __________, __________, and __________.
7. To have the property of volume, matter must have all three dimensions.
   
   Underline the illustrations that represent a body having volume.
   
   ![Illustrations](image)

8. Matter is defined as anything that has weight and occupies space. By occupying space, it will have the property of ______________.

9. Matter also has ______________.

10. The mass of a given body does not change although its state (solid, liquid, gas) changes.

   If a given body is changed from a solid to a liquid, what will happen to the mass of the body?
In the illustration above, the mass of the body change.
(did/did not)

The state of the water (liquid) has now been changed to steam (gas). What has happened to its mass?

Mass is the amount of matter a given body contains.

If 1 GALLON OF WATER is frozen into ICE, then melted into STEAM, then heated to form 1 GALLON OF WATER, the matter has been changed to the three different states. In all three states, the body of matter contained the same

</table>

In the illustration above, the mass of the sponge remains constant, although the volume has (increased/decreased)
| **21.** |  
| **A** MASS | **B** MASS |  
| ![Diagram](image) | In item A, the piston is in; in item B, it is out. Going from illustration A to illustration B, the volume has **DECREASED**%, while mass has **REMAINED CONSTANT**%. |  
| **22.** Define mass. |  
| ![Diagram](image) | **THE AMOUNT OF MATTER A GIVEN BODY CONTAINS** remains constant. |  
| **23.** |  
| ![Diagram](image) | Volume is the space mass occupies. In the illustrations above, the bucket contains **2 CUBIC FEET OF WATER** and there are **3 CUBIC YARDS OF ICE**. These are measurements of the volume of the two masses. Volume is always measured in units. |  
| **24.** |  
| ![Diagram](image) | The space mass occupies is its **VOLUME**. |  
| **25.** |  
| ![Diagram](image) | A tank contains 2 cubic feet of gas; this is a measure of the **VOLUME** of the gas. |
26. Shade the volume of the mass in each of the following:

- A: Water
- B: Board
- C: Champagne
- D: Steel

27. Volume is the space that mass occupies.

28. The density of a body is the weight per cubic unit of its volume. For example, the density of fresh water is 62.5 pounds per cubic foot.

The density of a body is found by dividing its weight by its volume:

\[ \text{Density} = \frac{\text{Weight}}{\text{Volume}} \text{ or } D = \frac{W}{V} \]

Use the formula above to solve the following problem.

Two cubic feet of salt water has a weight of 128 pounds. What is the density of salt water?

NOTE: Density must be expressed in weight per cubic unit.
29. Dividing the weight of a body by its volume will give you the \( \frac{W}{V} \) of that body.

\[ D = \frac{128}{2} \]

\[ D = \text{64 POUNDS PER CUBIC FOOT} \]

Density is the weight of a unit volume of matter. Iron has a greater density than wood. This means that one cubic foot of iron weighs more than one cubic foot of wood. The more matter (mass) there is in a given volume of a substance, the greater the density of the material.

Shown below are some examples of the density of different materials. Circle the item that has the greatest density.

**DENSITIES IN POUNDS PER CUBIC FOOT**

- Lead: 705
- Iron: 475
- Maple: 45
- Cork: 15

31. A tank with a volume of 32 cubic feet is filled with a fluid weighing 1280 pounds. What is the density of this fluid? **NOTE:** Density must be expressed in weight per cubic unit.
32. When volume and density are known, the total weight of a body can be found by transposing the formula in this manner:

\[
\text{WEIGHT} = \text{DENSITY} \times \text{VOLUME} \\
(W = D \times V)
\]

Solve this problem.

A tank contains 10 cubic feet of salt water. What is the total weight of the salt water?

**NOTE:** The density of salt water is 40 pounds per cubic foot.

\[
W = D \times V \\
W = 64 \times 10 \\
W = 640 \text{ POUNDS}
\]

33. A tank with a volume of 100 cubic feet is filled with a gas which has a density of 4 pounds per cubic foot. What will be the density of this gas if it is compressed to a volume of 2 cubic feet?

To solve for the new density, follow the steps below and fill in all blanks.

**STEP (1) Find the total weight of the gas.**

\[
W = D \times V \\
W = 4 \times 100 \\
W = \underline{400} \text{ pounds}
\]

**STEP (2) To determine the new density, divide the weight of the gas by its new volume (2 cubic feet).**

\[
D = \frac{W}{V} \\
D = \frac{400}{2} \\
D = \underline{200} \text{ pounds per cubic foot}
\]

Circle the number beside the statement that is correct for the problem above.

a. As volume decreased, density decreased.

b. As volume decreased, density increased.

c. As volume decreased, density remained the same.
A gas with a density of 5 pounds per cubic foot has a volume of 20 cubic feet, as in item A above. What is the density of the gas after it has been compressed as in item B?

As the bottle is filled with gas, the mass will increase but the volume will remain the same, while the weight and density will (increase/decrease).
<table>

</table>

How much will the man on the moon weigh if he is moved from the moon to the earth? ___ pounds
39. An increase in mass will cause an increase in gravitational pull.

In the illustration above, the mass of the man has __________. This has caused a(n) __________ in his weight.
40. Weight is a measure of the effect of gravity on a body.

41. The attractive force of the earth on matter is gravity. This attractive force decreases as the distance from the earth's surface increases; therefore, as a body increases its distance from the earth, its weight will __________.
Compare the weight of the body (car) at sea level with its weight on top of the mountain. At which point does it weigh the more? __________

**SEA LEVEL**

43. Weight is a measure of __________
   __________
   __________
   __________
   __________

**THE EFFECT OF GRAVITY ON A BODY**

44. Another property of matter is universal attraction. This means that all matter attracts all other matter.
   
   All matter attracts all other matter. This is the property known as __________
45. Another property of matter is porosity.

Some matter is more porous than others.

In the illustration above, circle the matter that will absorb the smallest amount of water.

In the illustration above, the smoke will travel through the cloth because it has more space between its particles. The smoke will not travel through the wood because it has less ____________
All matter has the property of porosity.
We normally think of steel, or even wood, as being very solid; but water, under high pressure, can be forced through their minute openings because they have the property of __________.

"Mama, get the mop, because these walls have the property of __________."
**Porosity**

72. A fluid is matter that flows easily and requires a container in which to store it or keep it confined.

73. Liquid will assume the \underline{\textit{(volume / shape)}} of the container in which it is placed (see illustration).
A liquid, as indicated above, will not assume the shape of a larger container.

Select the illustration(s) above which correctly represent(s) the transfer of a liquid from one container to another.

80. A liquid, for all practical purposes, cannot be compressed.

When piston A moves 2 inches, piston B will move 2 inches. This is because liquids cannot be

81. Why will the person in Illustration A get better braking action than the one in Illustration B?
82. Select the characteristics of a liquid.

a. Can be compressed.
b. Is a fluid.
c. Can be changed to a gas or a solid.
d. Will assume the volume of any container.
e. Will assume the shape of its container.

83. Matter is anything that has weight and occupies space. Gas has weight and occupies space. Therefore, gas is

84. Matter

Circle the letter under the illustrations representing matter as a gas:

A D

85. A fluid flows easily and requires a container in which to store it; therefore, both liquids and gases are
86. The molecules (particles) of a gas move freely as compared to those of a solid or liquid. All matter has movement of its molecules (particles); but, in comparison, the molecules of a ____ will move more freely than those of a solid or a liquid.

87. What characteristic of a gas allows the molecules (particles) of the perfume to fill the entire room?

88. Gas will assume the shape and volume of any container in which it is placed.

Circle the illustration above that represents the transfer of a gas from one container to another.
What will happen to the shape and volume of the gas when it is released from the bottle into the life raft?

**It will assume the shape and volume of the life raft.**

Mr. Dilbert may soon be pushing up daisies because a gas will assume the **shape** and **volume** of its container.
The space between the particles (molecules) of matter gives it the property of porosity. Some matter may be compressed because of the property of porosity.

Circle the illustrations above that represent examples of solids.

Illustration A: When a liquid is moved from one container to another, it will assume the shape of the new container but not its volume.

Illustration B: When a gas is moved from one container to another, it will assume the shape and volume of the new container.

Illustration C: When a solid is moved from one place to another, it will maintain the same...
99. Solids have a definite shape. The shape of a solid is not changed when moved from one place to another. This is because the molecules of solids are close together and are more fixed.

A solid differs from a liquid or a gas in that the molecules are _________ _________ and are close _________.

As illustrated above, a solid moved from SEA LEVEL to the top of a MOUNTAIN and then to the bottom of a LAKE will retain its shape and volume because its molecules are _________ _________.

101. Select the characteristics of a solid.

a. Its shape is not changed when moved from one container to another.

b. It can be compressed.

c. Its particles are more fixed and are very close together.
List the three states of matter in the blanks below. Below the blanks is a list of characteristics that pertain to these states when they are moved from one container to another. Place the number(s) found beside each characteristic under the state of matter to which it pertains.

<td>A property of matter that specifies there is space between the particles of matter.</td>
</tr>
<tr>
<td>h. Impenetrability</td>
<td>A measure of the effect of gravity on a body.</td>
</tr>
</tbody>
</table>

2. Will the mass of a given body change if it is moved from sea level to 35,000 feet?
   a. decrease and its mass will decrease.
   b. increase and its mass will increase.
   c. increase and its mass will remain constant.

3. If one gallon of water is changed to steam, its volume will
   a. decrease and its mass will decrease.
   b. increase and its mass will increase.
   c. increase and its mass will remain constant.

4. Which of the following is a measure of volume?
   a. Square units
   b. Cubic units
   c. Linear units
5. What is the formula for finding the density of a body?

6. A body weighs 2400 pounds and has a volume of 24 cubic feet; what is its density?

7. Ten cubic feet of gas with a density of 5 pounds per cubic foot are compressed to 2 cubic feet; what will the new density be?

8. As an object's distance from the earth's surface is increased, the weight of that object will ____________

9. At which location will a given body weigh the more?
   a. On top of a mountain.
   b. At sea level.
   c. Weight would be the same at both a and b.

10. What property allows some matter to be compressed easier than others?

11. Give an example proving that matter has the property of porosity.

12. Inertia must be overcome in order to stop or start the movement of matter.
    What is required to do this? ________________

13. Give an example proving that matter has the property of impenetrability.
14. List three examples of the inertia of objects (balls, aircraft, vehicles) being overcome.

a. 
b. 
c. 

15. List the three states of matter in the blanks below. To the right is a list of characteristics that pertain to these states. Place the number found beside each characteristic under the state of matter to which it pertains. Some characteristics may pertain to more than one state.

a. b. c.

(1) Is a fluid.
(2) Will assume the shape of its container.
(3) May be compressed.
(4) Will assume the volume of any container.
(5) Shape is not changed when moved from one container to another.
(6) Particles are more fixed and very close together.
LESSON 1, PART A
MATTER - SELF TEST ANSWERS

1. g, a, h, c, b, d, f, e

2. No

3. c

4. b

5. DENSITY = \frac{WEIGHT}{VOLUME}

6. \[ D = \frac{W}{V} = \frac{2400 \text{ lbs}}{24 \text{ cu ft}} = 100 \text{ lbs/cu ft} \]

7. STEP 1. \[ W = D \times V = 5 \text{ lbs/cu ft} \times 10 \text{ cu ft} = 50 \text{ lbs} \]
   STEP 2. \[ D = \frac{W}{V} = \frac{50 \text{ lbs}}{2 \text{ cu ft}} = 25 \text{ lbs/cu ft} \]

8. decrease

9. b

10. porosity

11. combining a bucket of sand and one of rocks into a third pail and occupying less volume than the rocks and the sand did previously or any other situation which shows or proves the existence of space in between particles

12. force

13. a nail pushing aside fibers as it goes into wood,
   a pool ball knocking another ball away so it can occupy its space,
   or any other example which shows that two things cannot occupy the same place

14. a. hitting the ball with a bat
   b. the arresting gear on an aircraft carrier stopping aircraft
   c. a car accelerating from a stop

15. a. solid - (5), (6)
   b. liquid - (1), (2)
   c. gas - (1), (2), (3), (4)

GO RIGHT ON TO LESSON 1, PART B-ATOMIC STRUCTURE

11. 16
   Isn 1; p. 41
FUNDAMENTALS OF ELECTRICITY

LESSON 1

PART B

ATOMIC STRUCTURE

OBJECTIVES

1. Given the terms compound, molecule, atom, mixture, ion, nucleus, and a list of the definitions of these terms, match each term to its definition.

2. Given an illustration of an atom, label its three parts.

3. Given an illustration of an atom, give the atomic number and the atomic weight of that atom.

4. Given some illustrations of atoms, label each as having a positive, negative, or neutral charge.

5. State the name given to electrons that have been removed from their orbit about an atom.

6. Compare a conductor and an insulator in relation to the number of free electrons that each contains.

7. State how electrical energy is transferred through a conductor.

8. State the direction the electrons flow when an atom with a negative charge is contacted by an atom with a positive charge.

<tr>
<td></td>
<td>7. The elements hydrogen and oxygen are gases. When properly combined chemically, these elements will form the compound water. Water is a liquid/gas.</td>
</tr>
</tbody>
</table>

11.16

isn 1; p. 48
| LIQUID | 8. A compound will possess properties different from the properties of the elements used to make the compound. When two or more elements are combined chemically, a compound is formed which has different _________ than its elements. |
| PROPERTIES | 9. Sodium, an element, will ignite on contact with water, while the element chlorine is poisonous. A chemical combination of sodium and chlorine forms the compound salt, which neither ignites upon contact with water nor is it poisonous. This is an example showing that a compound has different than the properties of the individual _________ making up that compound. |
| PROPERTIES | 10. The properties of a compound will depend on the chemical combination of its elements. Some examples are as follows: |
| ELEMENTS | a. Two parts hydrogen and one part oxygen form the compound water (H₂O). |
| ELEMENTS | b. Two parts hydrogen and two parts oxygen form the compound hydrogen peroxide (H₂O₂). |
| ELEMENTS | c. One part hydrogen, one part nitrogen, and three parts oxygen form the compound nitric acid (HNO₃). These three compounds have different properties because of the difference in the chemical combination of their _______. |
| CHEMICAL | 11. When two or more different elements are chemically combined, a compound is formed. The properties of the compound will depend on the _______ combination of its elements. |
| CHEMICAL | 12. When the elements hydrogen, sulfur, and oxygen are properly combined chemically, sulfuric acid (H₂SO₄) is formed. A chemical combination of two or more different elements forms a _______. |
| COMPOUND | 13. Select the definition of a compound.  
| --- | --- |
| | a. A combination of elements.  
| | b. A chemical combination of two or more different elements.  
| | c. A physical combination of two or more different elements.  
| |  
| b. | 14. When compounds or elements are combined and no chemical action takes place, a mixture is formed. The compounds water (H₂O) and sulfuric acid (H₂SO₄), as used in a battery, do not chemically combine. Therefore, they form a __________.  
| |  
| MIXTURE | 15. When the elements aluminum, nickel, cobalt, and iron are combined, ALNICO is formed. ALNICO is a mixture; therefore, the elements do not lose their original characteristics. ALNICO is used to make magnets, and is a mixture composed of different __________.  
| |  
| ELEMENTS | 16. When the compounds salt and fresh water are mixed, the result is salt water. By distillation, they can easily be separated and once again become salt and fresh water. By this example, we can see that compounds, when mixed, ________ their original characteristics.  
| | retain/lose  
| RETAIN | 17. ALNICO is a mixture of elements, while salt water is a mixture of compounds. A mixture can be composed of __________ or __________.  
| |  
| ELEMENTS COMPOUNDS | 18. A mixture is a combination of elements or compounds in which the elements or compounds do not lose their original characteristics. ALNICO and salt water can be separated and their elements or compounds will not lose their __________.  
| |  

Isn 1; p. 45
Characteristics

By taking one drop of the compound water and dividing it into smaller and smaller parts, as shown, the smallest part of water we can reduce it to is a **molecule**.

The smallest particle of a compound, which has all the properties of that compound, is a molecule. The smallest particle that the paper on which you are writing could be broken down to and still be paper is a **molecule**.

Molecule

20. The smallest particle of a compound, which has all the properties of that compound, is a molecule. The smallest particle that the paper on which you are writing could be broken down to and still be paper is a **molecule**.

21. The smallest particle of a compound, which has all the properties of that compound, is a molecule.

Illustration A shows a molecule of salt. Illustration B shows the molecule further divided into atoms. Do the substances in illustration B still have the properties of salt?

END OF LESSON 1, GO ON TO LESSON 2
This is a programmed lesson. It is designed to teach, not to test. You will need only this booklet, a pencil, and some time to complete this lesson. If there is something in the program you do not understand, ask your instructor or supervisor for assistance.

- REMEMBER -

This lesson has been written so that the amount of reading necessary is minimal and yet most meaningful. Therefore, it is very important that you follow these instructions.

- Read each page carefully.
- Fill in each blank.
- Keep the answer to the frame on which you are working covered with a slip of paper until you have written your answer.
- Correct all errors you make.
- Follow all directions given in the program.

SUGGESTED READING TIME
180 MINUTES
LESSON 2
PART A
INTRODUCTION TO ELECTRICITY

OBJECTIVES

1. State the source of the electrical energy found in all matter.
2. Given illustrations of different bodies, label each as being negatively or positively charged.
3. State the condition of two bodies when the electrons have been physically removed from one and attached to the other.
4. State the primary cause of static electricity.
5. Select from a given list of statements the one correctly describing what occurs when two unequally charged bodies contact each other.
6. State the hazard produced by the electron flow between two separated bodies.
7. List two means used in aviation to prevent the buildup of static electricity.
8. State what must be overcome by the potential difference in order to have current flow.
9. Select from a list of terms two terms that mean the same as potential difference.
10. List the three primary methods of producing electromotive force.
11. Name the correct units of measurement for measuring electromotive force, current, and resistance.
12. Select from a list of instruments the ones used to measure electromotive force, resistance, and current.
13. List two types of current flow.
14. State the term used to identify materials that offer low resistance to current.
15. State the term used to identify materials that offer high resistance to current.
16. State whether the resistance of a conductor or an insulator increases or decreases when its temperature or dimension is varied.
17. State what effect an increase in voltage or resistance will have on current.
18. Using the mathematical formula for Ohm's law, solve three given electrical problems.
19. Given the terms static electricity, charged body, current flow, potential difference, Ohm's law, and resistance, match them with their respective definitions.
1. From studying the program on atomic structure, you know that electrical energy is the movement of free electrons through a conductor. Since these free electrons are part of the atom, you can see that the actual source of electrical energy is the **atom**.

<table>
<thead>
<tr>
<th>ATOM</th>

<td><img src="image4.png" alt="Illustration" /></td>
</tr>
</tbody>
</table>

Circle the letter above the illustration that represents the source of all electrical energy.

| D | 3. The source of the electrical energy found in all matter is the **atom**. |

| ATOM | 4. Since all matter is made up of atoms, any body of matter is a source of **electrical** energy. |

| ELECTRICAL | 5. A body of matter in a normal or balanced state will have one electron for each proton. Electrons can be removed from one body and attached to another body. When this is done, one body will have more electrons than normal and the other body will have less electrons than normal. Label the bodies as having a balance of electrons and protons, an excess of electrons, or a deficiency of electrons. |
| A. ![Illustration](image5.png) | B. ![Illustration](image6.png) | C. ![Illustration](image7.png) |

**A. DEFICIENT**
**B. BALANCED**
**C. EXCESS**

| 6. When electrons are removed from one body and attached to another body, one body will have an excess of electrons while the other body will have a shortage of electrons. These unequal charges at rest on two bodies are known as static electricity. Select the two bodies that have a static-electrical charge. |
| A | B | C | D |
| ![Illustration](image8.png) | ![Illustration](image9.png) | ![Illustration](image10.png) | ![Illustration](image11.png) |
7. Count the number of electrons (−) and protons (+) on the body below.

![Diagram of electron and proton counts]

a. Number of electrons: __________
b. Number of protons: __________

8. There were eight electrons and four protons. This means that the body had an excess of electrons; therefore, it has a negative charge. These electrical charges at rest on a body are __________ electricity.

9. A charged body is one having more or less than its normal number of electrons (−). Which of these bodies is charged?

![Diagram of charged bodies A and B]

10. If a body has more or less than its normal amount of electrons, it is known as a __________ body.

11. Circle the letter above the charged bodies.

![Diagram of charged bodies A, B, C, D, E]
A body which has had some of its electrons removed will have a positive charge. Select the illustrations below that represent a body with a positive charge.

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
</table>

13. Circle the letter beside the true statement.

a. A body having fewer protons than electrons is positively charged.

b. A body having fewer electrons than protons is positively charged.

c. A body having an equal number of electrons and protons is positively charged.

14. A body that has more electrons than protons has a **negative** charge.

Select the items that have a negative charge.

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
</table>

15. Select the true statement.

a. A positively charged body is one having fewer protons than electrons.

b. A negatively charged body is one having more electrons than protons.

c. A negatively charged body is one having more protons than electrons.
16. Label the items below as having a positive or negative charge.

A. POSITIVE
B. NEGATIVE
C. POSITIVE
D. NEGATIVE

17. You have studied the electron and the meaning of positive and negative charges. Now you are ready to find out how these charges are produced. The primary cause of static electricity is friction. If you rub two different materials together, electrons may be removed from their orbit in one material and captured by the atoms in the other material. This is producing static electricity by
18. When a hard rubber rod is rubbed with fur, the fur loses electrons to the rod. The rod becomes negatively charged, and the fur becomes positively charged. Friction is one way of producing static electricity. Refer to the illustrations to complete the statements below.

**Figure A**

**Figure B**

- a. In figure A, the two bodies contain an amount of electrons.  
  \[\text{(equal/unequal)}\]
- b. After the two bodies in figure B have been rubbed together, their charges will be  
  \[\text{(equal/unequal)}\]
- c. The unequal charges that exist on the two bodies in figure B are ________ electricity.
- d. One way of causing electrons to leave one body and be transferred to another body is by ________.
<table>
<thead>
<tr>
<th>a. EQUAL</th>
<th>b. UNEQUAL</th>
<th>c. STATIC</th>
<th>d. FRICITION</th>
</tr>
</thead>
</table>

19. Friction between two bodies will cause both bodies to become charged— one positively and one negatively. Therefore, these two bodies will have an attraction for each other. For example, when you run a comb through your hair several times, the comb and the hair develop unlike charges because of the friction involved. Now, if you hold the comb over your hair, your hair will be attracted to the comb.

From the information above, we are given one of the laws pertaining to charged bodies. This law states that bodies with unlike charges will attract each other.

---

**ATTRACT**

20. Select the law that correctly explains why the man’s hair is attracted to the comb.

a. Like charges attract.
b. Unlike charges repel.
c. Like charges repel.
d. Unlike charges attract.

d. 21. If two unlike-charged bodies, one negative and one positive, are brought together, they will attract each other.

Select the two bodies that will attract each other.

<td>Anytime there is friction between bodies of different materials, such as fuel flowing in a hose or an aircraft flying through the air, opposite charges will build up on the bodies. If the charges become great enough, an electron flow will occur in the form of a spark.</td>
</tr>
</tbody>
</table>

| SPARK | 36. | When the difference in charges between two parts on an aircraft is great, there is danger of a spark jumping between the parts. A bonding wire (conductor) is a safety device used to connect these parts on an aircraft. This gives a path for electron flow between the parts. To prevent a spark between various parts on an aircraft, a bonding wire is used. |

| BONDING WIRE | 37. | Various parts of an aircraft are connected by bonding wire to permit a free flow of electrons between them. This flow keeps their charges balanced. To prevent the buildup of static-electrical charges, parts that are insulated or separated from each other are connected by bonding wire. |

| BONDING WIRE | 38. | The engines of this aircraft are mounted on rubber shock mounts. However, it does not have a buildup of static electricity because of several of these parts. The name of this part is a [Diagram](image). |
### Bonding Wire

39. To connect parts of an aircraft to prevent the buildup of static-electrical charges, a _____ is used.

40. Another device used to prevent the buildup of static electricity is a ground wire. A ground wire allows a constant dissipation of electrons and prevents a body from becoming charged. The chain hanging from the back of a gasoline truck is an example of a __________ ________.

### Ground Wire

41. A ground wire is used to connect aircraft and fuel trucks to the earth during refueling. Label items A and B below.

![Diagram](image)

A. **Ground Wire**  
B. **Ground Wire**

42. To maintain a balanced charge between an aircraft and the fueling truck, four grounding connections must be made. Match each letter in the illustration below with the statement which describes that grounding connection.

- Truck to ground  
- Fuel nozzle to aircraft  
- Truck to aircraft  
- Aircraft to ground

![Diagram](image)
43. What are two means used in aviation to prevent the buildup of static electricity?
   a. __________
   b. __________

44. Static electricity has no real use to us; we only want to control it. Now let's study about electricity we can use—dynamic electricity. Select the item that must be moved from one point to another point to produce electricity.
   a. Proton
   b. Electron
   c. Neutron

45. Electrons flow from a point having an excess of electrons to a point having a lack of electrons.

   Draw an arrow between A and B to indicate the direction the electrons will flow.

46. The electrons that are moving are free electrons. These free electrons are in a random movement in a conductor all the time; but when we can get them to drift or move in one direction, we will have current flow.

   Which illustration represents current flow?

</tr>
</tbody>
</table>
| POTENTIAL DIFFERENCE | 55. Potential difference is the force that causes electrons to move from one point to another. Potential difference is also known as electromotive force (EMF).  
List two names for the force that causes current flow.
  a. ____________  
  b. ____________  
  a. POTENTIAL DIFFERENCE  
b. ELECTROMOTIVE FORCE (KITHER ORDER) | 56. Another term used for potential difference and electromotive force is voltage.  
Mr. Force above is called by three different terms; what are they?
  a. ____________  
  b. ____________  
  c. ____________  
  a. POTENTIAL DIFFERENCE  
b. ELECTROMOTIVE FORCE  
c. VOLTAGE | 57. What two terms mean the same as potential difference?  
  a. ____________  
  b. ____________ |
<table>
<thead>
<tr>
<th>ELECTROMOTIVE FORCE</th>
<th>58. The common term used for potential difference and electromotive force is ___________.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VOLTAGE</td>
<td>59. There are several methods of producing electromotive force (EMF). We shall only concern ourselves with three of the methods: thermal, chemical, and mechanical. Thermal, chemical, and mechanical are three ways to produce ___________.</td>
</tr>
<tr>
<td>ELECTROMOTIVE FORCE OR EMF</td>
<td>60. One of the methods of producing electromotive force (EMF) is the thermal (heat) method. When a metal, such as copper, is heated, the electrons tend to move away from the heated end towards the cool end. In other metals, such as iron, the opposite is true. The electrons move from the cool end to the heated end. If these two metals are connected at the heated end, the flowing electrons will cross at the junction point.</td>
</tr>
</tbody>
</table>

The method used to produce EMF in the illustration above is the ___________ method.
| THERMAL (HEAT) | 61. Another method of producing electromotive force (EMF) is the chemical method. When the molecules of a substance are altered, the action is referred to as chemical. For instance, when the molecules of air come in contact with bare iron, they combine and form rust. In some cases, the loss or gaining of electrons in this manner produces EMF. 

![](image1.png)

The method of producing EMF illustrated above is the _______ method. |
| --- |
| CHEMICAL | 62. Shown below are two methods of producing EMF. What method of producing EMF is shown in each illustration?

A. _______  
B. _______ |

A. CHEMICAL  
B. THERMAL | 63. So far you have learned two methods of producing EMF—thermal and chemical. Now, let's learn a little about a third method of producing EMF—the mechanical method. Anytime you move a conductor in a magnetic field, you are producing EMF. Producing EMF in this manner is an example of the _______ method. 

---

11.16. 
Isn 2; p. 17
### MECHANICAL

#### 64. Generators and magnetos produce EMF by rotating a large number of conductors in a magnetic field. This is an example of producing EMF by the __________ method.

#### 65. List the three primary methods of producing EMF.

a. __________
b. __________
c. __________

#### 66. The EMF produced by each of the methods must be known, or measured, so that it can be used to full advantage. The volt (V) is the unit of measurement for __________.

- **CHEMICAL**
- **THERMAL**
- **MECHANICAL**

#### 67. The EMF produced by some methods is extremely weak; however, in all cases the EMF can be measured. The unit of measurement for EMF is the volt (V). Write the unit of measurement for EMF in the space below.
68. To measure the EMF, an instrument which indicates volts is used. As shown in the illustration, this instrument is called a

![Voltmeter Diagram]

69. The unit of measurement for EMF is the [Blank].

70. The number of electrons the voltage can move past a point in a period of time is a measure of current flow. One volt moving a given number of electrons in one second past a point having one ohm of resistance is one ampere (amp) of [Blank].

71. Measuring the number of electrons one volt can cause to flow through one ohm of resistance in one second is the method used to determine one ampere of [Blank].

72. Because the electron is too small a unit to use in measuring the amperage, a larger unit is used. This larger unit is the coulomb (6,280,000,000,000,000,000 electrons). The coulomb is used as the unit which one volt must cause to flow in one second to obtain a current flow of one [Blank].
<table>
<thead>
<tr>
<th>AMPERE (AMP)</th>

### Ohm's Law

**113.** Ohm's law shows the close ties between ___________ and ___________.

<table>
<thead>
<tr>
<th>Electro motive force</th>
<th>Current flow</th>
<th>Resistance (Any order)</th>
</tr>
</thead>
</table>
| **116.** Part of Ohm's law states that current flow is directly proportional to E\text{ff}. As you increase the voltage or E\text{ff}, you will also increase current flow an equal or proportionate amount. Select the statement below that is correct.
| a. If voltage is increased by 1/2, current decreases by 1/2. |
| b. If voltage is increased by 1/2, current increases by 1/2. |
| c. If voltage is increased by 1/2, current remains unchanged. |
| d. None of these is correct. |
| **115.** When E\text{ff} increases, current flow also increases. This fact shows that the current flow is directly proportional to ___________. |
| **116.** If current flow will increase as E\text{ff} is increased, a decrease in E\text{ff} will produce a ___________ in current flow. |

### Decrease

**117.** The first part of Ohm's law shows how current flow and E\text{ff} are related. The second part of it shows how current flow and resistance are related. It says that current flow is inversely proportional to resistance. This means that a change in resistance, either higher or lower, will produce the opposite change in current flow. Select the correct statement below.

| a. As resistance increases, current flow decreases. |
| b. As resistance increases, current flow increases. |
| c. As resistance increases, current flow remains unchanged. |

**118.** As resistance increases, current flow decreases. This means that current flow is inversely proportional with ___________.

### Solve the problem given below by using the Ohm's law formula.

I = 2 amps.  
R = 6 ohms  
E = ?

\[ E = IR \]  

**E = 12 VOLTS**

127. In order to find \( E \), you must \( \frac{I}{R} \) by \( R \).

### Solve for the unknown in the problems below.

**A.**  
\( E = 12 \text{ volts} \)  
\( I = 3 \text{ amps} \)  
\( R = \_ \text{ ohms} \)

**B.**  
\( E = 24 \text{ volts} \)  
\( R = 6 \text{ ohms} \)  
\( I = \_ \text{ amps} \)

129. In order to solve for either \( I \) or \( R \), you must

**A. \( R = 4 \text{ OHMS} \)**  
**B. \( I = 4 \text{ AMPS} \)**

### Draw the mathematical formula for Ohm's law.

130. Draw the mathematical formula for Ohm's law.
In using the mathematical formula for Ohm's law, you probably noticed that letters are used to represent the various values. The letter E represents voltage. The letter R represents resistance, and the letter I represents the intensity or rate of current flow. Match the letter with the item it represents. Place the letter in the proper space beside its true meaning.

<table>
<thead>
<tr>
<th>Letter</th>
<th>Meaning</th>
</tr>

SELF-TEST

1. What is the source of the electrical energy found in all matter?

2. Label the illustrations below as being positively or negatively charged bodies.

A. 
B. 
C. 
D. 

3. If electrons are removed from one body and attached to another body, the two bodies would be in a condition.

4. What is the primary cause of static electricity?

5. Select the statement that correctly describes what occurs when two unequally charged bodies contact each other.

   a. The electrons will flow from positive to negative until the bodies equalize their charges.
   b. The electrons will flow from negative to positive until the bodies equalize their charges.
   c. There will be no flow of electrons because unlike charges repel each other.
   d. The electrons will flow from one body to the other as long as they are in contact.

6. What is produced that could be hazardous when there is an electron flow between two separated bodies?

7. What are two means used in aviation to prevent the buildup of static electricity between two bodies or objects?

   a.
   b.
8. What must potential difference overcome in order to have current flow?

9. Select two terms that mean the same as potential difference.
   a. Resistance
   b. Electromotive force
   c. Current flow
   d. Voltage
   e. Static electricity

10. What are the three primary methods of producing electromotive force?
    a. 
    b. 
    c. 

11. List the correct unit of measurement for:
    ELECTROMOTIVE FORCE (EMF) 
    CURRENT FLOW 
    RESISTANCE 

12. Select the correct instrument used to measure:
    ELECTROMOTIVE FORCE 
    CURRENT FLOW 
    RESISTANCE 
    a. OMMETER 
    b. VOLTMETER 
    c. AMPETER 

13. List two types of current flow.
    a. 
    b. 

14. What are materials called that offer low resistance to current flow?
15. What are materials called that offer high resistance to current flow?

16. What effect (increase/decrease) does the following have upon the resistance of a conductor?
   - Increase its length, and its resistance ____________
   - Increase its diameter, and its resistance ____________
   - Increase its temperature, and its resistance ____________

17. What effect (increase/decrease) does the following have upon the resistance of an insulator?
   - Increase its thickness, and its resistance ____________
   - Increase the temperature, and its resistance ____________

18. Complete these statements about Ohm's law.
   - When resistance is increased, current flow will ____________
   - When voltage is increased, current flow will ____________

FUNDAMENTALS OF ELECTRICITY
LESSON 2
PART B
ELECTRICAL SYMBOLS
OBJECTIVES

1. Given a list of electrical symbols and a list of electrical components, match the components to their respective symbols.

2. Given a list of statements pertaining to schematics, select the statement that describes a schematic diagram.
1. Whether you are in OF11 or OF13, a knowledge of electrical diagrams is necessary. The diagram used the most is the schematic diagram. The schematic uses symbols to represent the parts of the circuit, and a single line to represent the connecting wires. This is a typical schematic diagram.

Parts are illustrated in a schematic by.

| SYMBOLS | 2. The arrangement of the parts in a schematic is by electrical priority. This is to say, the parts appear in the order in which they receive electrical power. The schematic diagram is arranged by:
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a.</td>
<td>electrical location of parts.</td>
</tr>
<tr>
<td>b.</td>
<td>physical location of parts.</td>
</tr>
<tr>
<td>c.</td>
<td>neither A nor B.</td>
</tr>
<tr>
<td>d.</td>
<td>both A and B.</td>
</tr>
<tr>
<td>a.</td>
<td>3. In schematic diagrams, the parts are represented by ________, and they are arranged in ________ order.</td>
</tr>
</tbody>
</table>
4. To be able to read a schematic, you must first know what the symbols used in them represent. Below are eight basic shapes. From these shapes, or a combination of them, most electrical symbols are constructed. Study these basic shapes; then proceed to the next frame.

A \[\Rightarrow\] B \[\Rightarrow\] C \[\equiv\] D

These basic shapes may appear at different angles when used in combination with others, and straight-line shapes may appear with a bend in them.

EXAMPLE:

\[\Rightarrow\] \[\Rightarrow\]

5. The symbols below are made up of basic shapes. Break each symbol down into its basic shapes by drawing its basic shapes in the dotted boxes. Do not just recopy the symbol.

EXAMPLE:

\[\Rightarrow\] \[\Rightarrow\]

A

B

C

D

lsn 2; p. 37
6. NOW, DO THE SAME WITH THESE SYMBOLS.

A
\[\frac{1}{x}\]

B
\[\bullet \bullet \bullet \]

C
\[\text{square} \]

D
\[\text{circle} \]

E
\[\text{zigzag} \]

You may be wondering why you should know these basic shapes; they are the starting point for learning the symbols which they make up.
There are two groups of electrical symbols that are shaped somewhat alike.

The two groups are:

**RESISTORS** AND **COILS (or INDUCTORS)**

Notice that the lines in the resistor form a zigzag.

The lines in both of these types of coil symbols are coiled.

Remember this symbol by thinking, "The zigzag lines in the resistor symbol look like mountains, and mountains resist travel."

Now, label these symbols.

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
</table>

A. __________ B. __________ C. __________

3. a. Lines in a resistor symbol form a ________
   b. Lines in a coil symbol are usually ________
   c. Coils are made up of ________ wire.
   d. Label the symbols below.

(1) ________ (2) ________
9. A transformer is used either to step up or to step down voltage. Since a transformer is constructed with coils of wire, it seems reasonable that a symbol for a transformer should contain the coil shape.

Below are some symbols for transformers:

a. Which transformer symbol has an arrow running through it?

b. Which transformer symbol has nothing between the coils?

c. Which transformer symbol has heavy lines between the coils?

The heavy lines between the coils represent an iron core. The iron core is simply a piece of iron around which the coils are wrapped. An arrow running through the coils of a transformer or through a resistor means the transformer or resistor is variable.

Label the symbols below.

A. ________ B. ________

C. ________ D. ________

E. ________
10. Label the symbols below as coils, transformers, resistors, variable resistors, or variable transformers.

<table>
<thead>
<tr>
<th>a. VARIABLE</th>
<th>b. AIR-CORE</th>
<th>c. IRON-CORE</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. RESISTOR</td>
<td>B. COIL</td>
<td>C. COIL</td>
</tr>
<tr>
<td>D. AIR-CORE</td>
<td></td>
<td>E. IRON-CORE</td>
</tr>
<tr>
<td>TRANSFORMER</td>
<td>F. TRANSFORMER</td>
<td></td>
</tr>
</tbody>
</table>

11. Draw the symbols for these parts.

| a. Iron-core transformer | b. Variable resistor |
| c. Coil |      |
12. Perhaps some explanation of the term variable resistor should be given. The term variable simply means the resistance of a resistor can be varied. The rheostat is a good example of a variable resistor.

Variable resistor or rheostat.

There is another symbol which looks similar to the rheostat—the potentiometer. The main difference between the symbols is the number of terminals (shown as dots) which lead from each one. The rheostat will have two, and the potentiometer will have three dots in the symbol.

Potentiometer symbol.

Draw the symbols for the parts illustrated below.

a. Air-core transformer

b. Iron-core transformer

c. Resistor

d. An arrow through a resistor symbol or a transformer symbol indicates that it is a resistor or transformer.
13. Now, some symbols that use → and ↔ shapes: The simplest is the single cell.

![Single cell symbol]

The battery is merely a combination of cells; so the symbol for a battery is a series of cell symbols put together as shown below.

![Battery symbol]

A rectifier is a device that changes alternating current to direct current. Below are two symbols for the rectifier. Either of these symbols may be used.

![Rectifier symbol 1]

![Rectifier symbol 2]

What do these symbols represent?

A. _______ B. _______ C. _______ D. _______ E. _______

14. Using the shapes → and ↔, draw the symbols for these parts.

a. Cell

b. Battery

c. Rectifier
15. Here are some more symbols using the shapes — —

These three are capacitors.

This symbol with an arrow through it means a variable capacitor.

Variable capacitor.

Label the symbols below.

A. __________ B. __________ C. __________ D. __________

E. __________ F. __________ G. __________
16. Contacts may be illustrated by the symbols below.

When the symbols above are used, you will usually see the symbol for an electromagnet used with them—indicating a relay.

Electromagnet. Relay.

a. Label the symbols below.

(1) (2) (3) (4) (5)

b. Draw the symbol for the following:

(1) Battery (2) Capacitor

(3) Contacts (4) Electromagnet

(5) Relay
17. Now, let's look at some symbols using the shape. These should be no problem to remember. Look for the letter within the circle.

Below are several symbols; they are self-explanatory.

- **A**: Ammeter
- **V**: Voltmeter
- **Ω**: Ohmmeter
- **M**: Motor
- **G**: Generator
- **MA**: Milliammeter
- **MV**: Millivoltmeter

As you can see, the letter is the identifying mark. The symbol for the lamp is the exception.

- **Lamp symbols.**

Motors and generators have some variations.

- **Motor symbols.**
- **Generator symbols.**

Draw the symbol for the following:

- a. Ohmmeter
- b. Ammeter
- c. Voltmeter
- d. Lamp
18. Match each component with its respective symbol.

<p>| | | | |</p>
<table>

5. Electromagnet
6. Rectifier
7. Capacitor
8. Battery
9. Contacts
10. Rheostat
11. Iron-core transformer
12. Air-core transformer
13. Ammeter
Let’s study switches next. Since an electrical circuit is a pathway for current to flow through, a break in this pathway would stop current flow. Switches are simply ways to break this pathway or to control the flow of current.

Below are some symbols for switches:

- SINGLE-POLE, SINGLE-THROW SWITCH
- SINGLE-POLE, DOUBLE-THROW SWITCH
- DOUBLE-POLE, SINGLE-THROW SWITCH
- DOUBLE-POLE, DOUBLE-THROW SWITCH

To remember these switches, think of the number of poles as the number of wires coming to either side of the switch. The throws can be thought of as the number of on positions.

Example:

SINGLE-POLE, SINGLE-THROW

OFF

ON

ONE WIRE, ONE ON POSITION

SINGLE-POLE, DOUBLE-THROW

OFF

ON

ON

ONE WIRE, TWO ON POSITIONS

a. The number of wires coming to each side of a double-pole switch is
b. The number of on positions a double-pole, single-throw switch has is
c. The number of on positions a double-pole, double-throw switch has is
20. From the descriptions below, name the switch and draw the symbol for it.

EXAMPLE: Has one wire connected to each side of the switch and has one on position.

<table>
<thead>
<tr>
<th>Name</th>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-pole, single-throw</td>
<td>![Symbol]</td>
<td>Has one wire connected to each side of the switch and has one on position.</td>
</tr>
</tbody>
</table>

a. Has one wire connected to each side of the switch and has two on positions.

b. Has two wires connected to each side of the switch and has one on position.

c. Has two wires connected to each side of the switch and has two on positions.

21. Two other devices which can control current flow in a circuit are circuit breakers and fuses. Both of these are safety devices. A circuit breaker amounts to nothing more than a fuse that can be reset.

Below are the fuse and circuit breaker and the symbol for each:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Fuse Symbol]</td>
<td>Fuse</td>
</tr>
<tr>
<td>![Circuit Breaker Symbol]</td>
<td>Circuit Breaker</td>
</tr>
</tbody>
</table>

Both of these devices protect the circuit by breaking the pathway for current flow. Label these symbols.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
</table>
The ground symbol is the most often used symbol in electrical diagrams. This is the symbol for ground.

\[ \begin{array}{c}
\text{SWITCH} \\
\text{MOTOR} \\
\text{POWER SOURCE} \\
\text{BATTERY} \\
\text{FRAME}
\end{array} \]

In an aircraft, as in your car, some components are grounded to the frame. This type of installation is known as a grounded circuit. This means that the ground (frame) is the return line for current back to the power source. Let's look at a grounded circuit.

In the circuit above, current flows from the battery, through the switch, to the motor, and then to ground. Since both the battery and the motor are grounded to the frame, there is a complete circuit.

Make the circuit below a complete circuit by putting in the ground symbols.

The only thing shown in an electrical diagram is the ground symbol. The ground (frame) is assumed to be there.

23. Place a ground symbol wherever it is needed in the diagram below.
24. Connection symbols represent permanent connections such as soldered connections or connections to terminals (screws and lugs). Below are some connection symbols you may see.

You will notice that each of the illustrations above has dots at the intersection of the lines. The dot is the actual connection of the wires. Shown below are symbols known as "no connection." In other words, these illustrations merely show wires that cross each other but are not connected.

NOTICE NO DOT.

Label the symbols below as "connection" or "no connection."

A. B. C. D. E. F.

![Connection symbols]

25. Draw the symbol for each of these components.

d. Connection  e. No connection  f. Ground
26. Below are two more symbols for connections. These symbols represent connections which are frequently connected or disconnected. The first is called the **connector** (cannon plug).

Looking at the symbol for the connector, you can easily see its use. The connector is used for multiwire installations. The letters identify the wires.

The next symbol represents the **disconnect**.

Again, the symbol shows how it is used. The disconnect is for single-wire installations. You have probably seen this type on your car.

Label the symbols below.

A.  
B.  
C.  
D.  
E.  
F.  
G.  
H.  
I.  

<table>
<thead>
<tr>

</tr>
<tr>
<td>e.</td>
<td>f.</td>
</tr>
<tr>
<td>A. CONNECTION</td>
<td>B. NO CONNECTION</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------</td>
</tr>
</tbody>
</table>

27. The last two symbols are the spark plug, as used in your car, and the spark igniter, as used in a jet engine. First the spark plug. This symbol is composed of the ground symbol and two arrows facing each other. Below is the spark plug symbol.

![Spark Plug Symbol]

As you can see below, the spark igniter uses the ground symbol also, but it has a circle and cross in place of the two arrows.

![Spark Igniter Symbol]

Label the symbols below.

a.  

b.  

c.  

a. CIRCUIT BREAKER  
b. SPARK PLUG  
c. SPARK IGNITER

28. You have seen a lot of symbols separately. Now, let's put them in a schematic and see if you can identify them.

Label the numbered symbols in the schematic below.

![Schematic Diagram]

END OF LESSON 2, GO-ON TO LESSON 3
This is a programmed lesson. It is designed to teach, not to test. You will need only this booklet, a pencil, and some time to complete this lesson. If there is something in the program you do not understand, ask your instructor or supervisor for assistance.

- REMEMBER -

This lesson has been written so that the amount of reading necessary is minimal and yet most meaningful. Therefore, it is very important that you follow these instructions.

- Read each page carefully.
- Fill in each blank.
- Keep the answer to the frame on which you are working covered with a slip of paper until you have written your answer.
- Correct all errors you make.
- Follow all directions given in the program.

SUGGESTED READING TIME
180 MINUTES
LESSON 3
PART A
SERIES CIRCUITS

OBJECTIVES

1. From a list of statements pertaining to electrical circuits, select the statement that correctly describes an electrical circuit.

2. From a list of statements pertaining to electrical circuits, select the statements that correctly describe a series circuit.

3. Solve series-circuit problems for the following:
   a. Current
   b. Voltage drop across an individual component
   c. Resistance of an individual component
   d. Total resistance
   e. Total voltage

4. From a list of statements pertaining to source voltage, select the statements that are correct concerning source voltage in a series circuit.

5. Given a list of statements concerning the ohmmeter, ammeter, and voltmeter, match each statement with the meter to which it applies.

6. From a list of statements pertaining to circuits, select the statements that apply to a short circuit.

7. From a list of statements pertaining to circuits, select the statements that apply to an open circuit.
1. There are three configurations (types) of circuits used in electrical work. If you were building a complex electrical device, how many different types of electrical circuits could you possibly use?

<table>
<thead>
<tr>
<th>THREE</th>
</tr>
</thead>
<tbody>
<tr>
<td>2. One of the three types of circuits is the series circuit. In electrical work, one type of circuit you can use is the ________ circuit.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>SERIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>3. Electric current must have a means of getting from its source to the point where it is to be used and back again. This is accomplished with a circuit. A circuit provides a continuous electrical pathway for _________.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CURRENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>4. The illustration below represents a circuit because it has a continuous pathway for current to flow from the source, through the light bulb, and back to the source.</td>
</tr>
</tbody>
</table>

![Circuit Diagram]

If the wire between points A and B is disconnected, will the light continue to burn? ________
1. Circle the letter under the illustration that correctly represents an electrical circuit.

<table>
<thead>
<tr>
<th>NO</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>A series circuit has only one continuous pathway through which current may flow. Other types of circuits have more than one pathway. A circuit that has only one path for current is known as a circuit.</td>
</tr>
<tr>
<td>B</td>
<td>A series circuit is a circuit having only one pathway for current.</td>
</tr>
</tbody>
</table>

**SERIES**

A. Circle the letter below the illustration that represents a series circuit.
8. Select the correct answer.

A series circuit has

a. at least two paths for current.

b. any number of continuous electrical pathways for current.

c. only one path for current.

9. In a series circuit, there is only one path for current; therefore, current is the same any place in the circuit. Current at any point in a series circuit will be ________________

10. Current in a series circuit is constant throughout. Current is the movement of electrons.

If it were possible to count the electrons in a series circuit, the same number of electrons would be flowing across any point in the circuit.

How many electrons would leave the positive side of the circuit illustrated above?

a. 10,000.

b. Less than 10,000.

c. More than 10,000.

d. None.
11. The law of current states that the current in any part of a series circuit is equal to the current in any other part of the same circuit ($I_t = I_1 = I_2 = I_3 \ldots$).

NOTE: GO TO PAGE 339 UNFOLD THE FOLDOUT SHEET, READ, AND KEEP OPEN FOR REFERENCE.

What will the current be across $R_1$ and $R_2$ in the circuit above?

$R_1$: 

$R_2$: 

11. 16

1sn 3; p. 6
12. Select the correct answer.
An electrical circuit is a
a. continuous electrical pathway for voltage flow.
b. minimum of two pathways for current.
c. continuous electrical pathway for current.

13. Select the two correct answers.
A series circuit has
a. only one pathway for current.
b. more than one pathway for current.
c. current that will vary throughout the circuit.
d. constant current throughout the circuit.

14. In a series circuit, there is only one path for current, and the current is constant. The current will flow from the negative side of the power source, through the circuit, and back to the positive side of the power source. The amount of current is measured with an ammeter. An ammeter indicates amperes.

In the illustration above:

a. Draw arrows in the illustration above to indicate the direction of current.
b. What type of meter is represented by items A and B in the illustration above?
15. Current can be measured by an ammeter, or it can be determined mathematically by using Ohm's law. The formula for Ohm's law is illustrated in the magic circle.

The letters in the magic circle represent specific factors: E = voltage, I = current, and R = resistance. To use the magic circle, simply cover the unknown factor with your finger and you can see what you need to do to find the unknown. Example: To find current, cover the I, and you can see that you divide E by R.

One way of determining current in a series circuit is by using the total values. The total voltage (source voltage) divided by the total resistance will give you current. Complete the steps below and determine the current.

Step 1

Step 2

Step 3

24 + 12 = I

I = _______ amps.
16. Current in a series circuit can be found when total values are not known. When the amount of voltage drop across an individual component is known and the resistance of that component is known, we can divide the voltage drop by the resistance and find the current. Remember, this value will be for the entire circuit, because current is constant.

In the illustration below, you will notice there are no total values given; however, the voltage drop across $R_2$ and the resistance of $R_2$ are given. Using these values, we can find current.

Complete the steps below.

Step 1

Step 2

Step 3

12 + 4 = I

I = \_\_\_\_ amps.
### 17. Find the current in the series circuits below.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a.</td>
<td>![Circuit a with 36V and 4Ω]</td>
</tr>
<tr>
<td></td>
<td>$I = _ _ _ \text{amps}$</td>
</tr>
<tr>
<td>b.</td>
<td>![Circuit b with 36V and 6Ω]</td>
</tr>
<tr>
<td></td>
<td>$I = _ _ _ \text{amps}$</td>
</tr>
<tr>
<td>c.</td>
<td>![Circuit c with 24V and 6Ω]</td>
</tr>
<tr>
<td></td>
<td>$I = _ _ _ \text{amps}$</td>
</tr>
<tr>
<td>d.</td>
<td>![Circuit d with 48V and $R_T=12\Omega$]</td>
</tr>
<tr>
<td></td>
<td>$I = _ _ _ \text{amps}$</td>
</tr>
</tbody>
</table>

### 18. You previously found current by dividing the voltage drop across a component by the resistance of that component. Now, let's see how this voltage drop is found. To find the voltage drop across an individual component, multiply the resistance of that component by the current through it.

Follow the steps in the illustration below and find $E_2$ (voltage drop across resistance number two).

**Step 1**

**Step 2**

**Step 3**

$2 \times 3 = E_2$

$E_2 = \_ \_ \_ \text{volts}$

---

11, 16

Isn 3; p. 10
19. Using the information in the illustration below, complete the steps and find $E_1$ (the voltage drop across resistance number one),

**Step 1**

**Step 2**

**Step 3**

$E_2 = \frac{\text{volts}}{\Omega} \times \frac{\text{volts}}{\text{volts}}$

20. Solve for voltage drops $E_1$ and $E_2$.

**Step 2**

**Step 3**

$3 \times 4 = 12$ VOLTS

$E_1 = 12$ VOLTS

$E_1 = \frac{\text{volts}}{\Omega}$\n
$E_2 = \frac{\text{volts}}{\Omega}$
21. Now that you know how to find a voltage drop across a component, let's use this voltage drop to find the resistance of a component. To find this resistance, divide the voltage drop across the component by the current through it.

Follow the steps in the illustration below, and find the resistance of $R_1$.

<table>
<thead>
<tr>
<th>$E_1 = 12$ VOLTS</th>
<th>$E_2 = 20$ VOLTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>$R_1 = 3$ OHMS</td>
<td></td>
</tr>
</tbody>
</table>

22. Complete the steps and find the resistance of $R_1$. 

$R_1 = \phantom{00}$ ohms
23. Solve for the resistance of $R_1$.

STEP 2

\[ \frac{12}{4} = R_1 \]

$R_1 = 3 \text{ ohms}$

Solve for the resistance of $R_2$.

\[ R_2 = \text{ ohms} \]
24. Solve for the unknown.

\[ R_1 = 2 \text{ OHMS} \]
\[ R_2 = 4 \text{ OHMS} \]

**a.**
\[
\begin{align*}
&6V \\
&2\Omega \\
&\boxed{2A} \\
&R_1 \\
&R_2 \\
&3\Omega \\
&4\Omega \\
&R_3 \\
&? \\
\end{align*}
\]
\[ I_t = \text{amps} \]

**b.**
\[
\begin{align*}
&4\Omega \\
&R_1 \\
&R_2 \\
&2\Omega \\
&R_3 \\
&6\Omega \\
&2A \\
\end{align*}
\]
\[ E_3 = \text{volts} \]

**c.**
\[
\begin{align*}
&3A \\
&R_1 \\
&R_2 \\
&6\Omega \\
&R_3 \\
\end{align*}
\]
\[ R_2 = \text{ohms} \]
25. After determining the resistance of the individual components, it is a simple task to find the total resistance of a series circuit. The law of resistance states: The total resistance of a series circuit is equal to the sum of the individual resistances of the circuit 

\[ R_t = R_1 + R_2 + R_3 \ldots \]

Complete the following example.

\[ R_1 = 5 \text{ ohms} \]
\[ R_2 = 10 \text{ ohms} \]
\[ R_3 = 15 \text{ ohms} \]
\[ R_t = \ldots \text{ ohms} \]

26. Total resistance \( R_t \) of a series circuit is found by the individual resistances.

Find the total resistance \( R_t \) of the following circuits.

\[ 3 \text{ ohms} \]
\[ 7 \text{ ohms} \]

\[ R_t = \ldots \text{ ohms} \]

\[ 2 \text{ ohms} \]

\[ R_t = \ldots \text{ ohms} \]

\[ 3 \text{ ohms} \]

\[ 4 \text{ ohms} \]
27. Previously, you added individual resistances to find the total resistance of a series circuit; however, this is not the only way it can be found. When total voltage and current are known, we can divide total voltage ($E_t$) by current to determine total resistance ($R_t$). Complete the following example.

Step 1

Step 2

Step 3 \[12 \div 4 = R_t\]

$R_t = _\text{ohms}$

28. Complete the steps and find the total resistance ($R_t$).

Step 1

Step 2

Step 3 \[? + ? = R_t\]

$R_t = _\text{ohms}$
29. Solve for the total resistance ($R_t$).

\[ 24 \div 6 = R_t \]
\[ R_t = 4 \text{ OHMS} \]

\[ R_t = 12 \text{ OHMS} \]

30. Solve for the unknown.

- **a.**
  \[ \begin{align*}
  R_1 & + R_2 = 12V \\
  3A & \text{ (current)}
  \end{align*} \]

- **b.**
  \[ \begin{align*}
  R_1 & + R_2 + R_3 = 24V \\
  4\Omega & \text{ (resistance)}
  \end{align*} \]

- **c.**
  \[ \begin{align*}
  R_1 & + R_2 = 24V \\
  3A & \text{ (current)}
  \end{align*} \]
By now, you should have a good understanding of how to find resistance in a series circuit. A little review of current is in order at this point. Remember, current can be found by dividing total voltage by total resistance.

In the magic circle, it looks like this:

Solve for current in the circuit below.

\[
\text{I} = \frac{E}{R} \text{ amps.}
\]

In order to work with series circuits, you must know how to determine total voltage. You can determine total voltage \(E_t\) by multiplying current by total resistance \(R_t\).

Complete the example below.

Step 1

Step 2

Step 3

\[4 \times 6 = E_t\]

\[E_t = \text{volts}\]
33. Using the information in the illustration below, complete the steps and determine the total voltage ($E_t$).

**Step 1**

**Step 2**

**Step 3**

$$E_t = 24 \text{ VOLTS}$$

34. Solve for total voltage ($E_t$).
35. Previously, you found the voltage drop of an individual component by multiplying the resistance of the component by the current through it. The law of voltage states: The total voltage of a series circuit is equal to the sum of the individual voltage drops of the circuit \( E_t = E_1 + E_2 + E_3 \ldots \). This total voltage is equal to the source voltage.

Complete the example below.

\[ E_t = 48 \text{ VOLTS} \]

Find each individual voltage drop and the total voltage in the circuit below.

\[ E_t = 24 \text{ VOLTS} \]

Find each individual voltage drop and the total voltage in the circuit below.
### Exercise 37

In a series circuit, the sum of the individual voltage drops is total voltage \( E_t \). The total voltage \( E_t \) is equal to the source voltage. It should be understood that the source voltage and the total voltage in a series circuit have the same value. Source voltage is the voltage of the battery or other source potential; total voltage is the sum of the voltage drops in the circuit and equals the value of the source.

Complete the example below.

<table>
<thead>
<tr>
<th>( E_1 )</th>
<th>( E_2 )</th>
<th>( E_t )</th>
</tr>
</thead>
<tbody>
<tr>
<td>18 VOLTS</td>
<td>12 VOLTS</td>
<td>6 VOLTS</td>

- **Source Voltage:** \( E_t \) volts

### Exercise 38

Solve for unknowns in the circuits below.

**a.**

- **Source Voltage:** 24 VOLTS

**b.**

- **Source Voltage:** 24 VOLTS

**Diagram:**

- **Source Voltage:** \( E_t \) volts
- **Source Voltage:** \( E_t \) volts
39. The values of source voltage and total voltage are equal. The value of source voltage will diminish as you progress through a series circuit.

Each component will cause a certain amount of source voltage to be used because there is resistance to current within it. This is voltage drop. Source voltage will be expended by moving the current through the circuit.

In moving current through a series circuit, the source voltage will be completely ________.

40. Source voltage will be totally expended while moving current through a series circuit, but only a portion of the source voltage will be expended moving current through each component, as shown in the illustration below.

a. What is the total amount of voltage expended by moving current through R1 and R2 above? ________ volts

b. What is the source voltage of the circuit above? ________ volts
41. As you now know, there is a certain amount of source voltage expended or used at each component in the circuit. The amount of source voltage expended at each component is known as the voltage drop across that individual component. The voltage expended at a component is known as **voltage drop**.

42. Voltage drop, resistance of a component, and current through a component can all be used in the formula for Ohm's law. You can find the voltage drop of a component by multiplying its resistance by the current through it. Find the voltage drop ($E_1$) in the circuit below.

![Circuit Diagram](image)

$$E_1 = \text{volts}$$

43. To find the resistance of a component, divide its voltage drop by the current through it. Find the resistance of $R_1$ in the circuit below.

![Circuit Diagram](image)

$$R_1 = \text{ohms}$$

| a. 24 VOLTS | 41. As you now know, there is a certain amount of source voltage expended or used at each component in the circuit. 45. If you work around electrical circuits, you will be using various meters. You need to know how to connect these meters in a circuit and know what each meter measures after it is connected. A voltmeter is connected parallel with a circuit. A voltmeter is used to measure the potential difference between two points. This potential difference is the voltage drop across a resistance.

![Diagram of a circuit with a voltmeter connected across points A and B]

Using the information and the illustration above, answer these questions.

a. The potential difference (voltage drop) is measured in __________.

b. A voltmeter is connected __________ with a circuit.

c. If 6 volts are available at point A, how many volts would be available at point B? __________.

d. A voltmeter measures the __________ between two points.

46. An ammeter is connected in series in a circuit and measures the current in the circuit. All current in a series circuit must go through the ammeter.

![Diagram of a circuit with an ammeter connected in series with a 3Ω resistor]

a. Current is measured in __________.

b. An ammeter is connected __________ in a circuit.

c. An ammeter measures the __________ in a circuit.

11.16
1sn 3; p. 25
47. An ohmmeter is a meter used to measure the resistance between any two points. The ohmmeter has its own power source and is connected in series with the component to be measured. Since the ohmmeter has its own power source, the circuit power must be off while testing a circuit with an ohmmeter. Failure to turn off circuit power could result in damage to the ohmmeter.

![Diagram of ohmmeter in series with component]

Using the information above, answer these questions.

a. An ohmmeter measures the ________ between two points.
b. An ohmmeter is connected in ________ with the circuit to be measured.
c. An ohmmeter has its own ________ source.
d. What must be off when testing a circuit with an ohmmeter? ________

48. The voltmeter above is indicating the potential difference between what two points?

![Diagram of voltmeter connected to circuit]

A circuit condition frequently encountered around electrical equipment is a short circuit. A short circuit occurs when current takes a path short of its intended circuit. Illustrated below are two examples of a short circuit.

Improper wiring. Bare wires touching.

Ohm's law states that when resistance decreases, current increases. In a short circuit, the current takes the path of least resistance; therefore, a short circuit will result in greater than normal current. Fuses and circuit breakers are examples of safety devices to protect against short circuits.

Using the previous information, answer the following.

a. Which of the circuits below indicates current taking a path of least resistance because of short circuits?

b. Which of the following circuits illustrates the current taking a path short of its intended circuit?

c. Which of the following circuits will have the greater amount of current?
53. Complete the following.

   a. In a short circuit, the current will take the path of least ________.
   
   b. In a short circuit, the current will take a path short of its ________ circuit.

   c. In a short circuit, the current will be ________ than normal.

54. Select the statements that apply to a short circuit.

   a. Current will take a path short of its intended circuit.
   b. It is a form of an open circuit.
   c. It results in greater than normal current.
   d. Current will take the path of greatest resistance.

55. A grounded circuit is a circuit that uses something other than a wire as part of the circuit. We can form a grounded circuit by using the fuselage of an aircraft as one part or one path of the circuit. One side of the power source would be connected to the fuselage, while the other side would be connected to the equipment to be operated. The equipment would also be connected to the fuselage. The current path will be from the power source via a wire conductor to the equipment and back to the source via the metal framework (ground). The metal framework acts as a conductor.

In the illustration above, the path formed by ground is from points

   a. A to B.
   b. B to C.
   c. C to A.
56. The last circuit condition is the open circuit. An open circuit is an opening or break in an electrical circuit.

(1) SWITCH OPEN
    . CREATE'S OPEN CIRCUIT

(2) SWITCH CLOSED
    . CIRCUIT COMPLETE

a. Which of the illustrations above shows an open circuit? ______
   The open circuit can be intentional, such as in the case of the light switch above, or it can be unintentional. A broken wire in a circuit is an unintentional open circuit as long as the broken end does not touch another conductor. An open in a series circuit will affect the entire circuit, since there is only one path for current.

b. Which circuit above contains an open circuit? ______

57. Using the previous information, complete the following.

a. An opening or break in an electrical circuit is an example of an ________ circuit.

b. An open circuit created by opening a switch is an example of what type of open circuit? ________

c. An open circuit created by a broken wire is an example of what type of open circuit? ________

   c. It will result in greater than normal current.
   d. Current will take the path of greatest resistance.

7. Which statements apply to an open circuit?
   a. It will affect the entire series circuit.
   b. Current will take a path short of its intended circuit.
   c. It is a form of short circuit.
To be able to talk about circuits or solve problems dealing with circuits, we have to be able to identify the various components and their functions in the circuits. This will be done by using capital letters and subscripts. The subscripts will consist of numbers or lower-case letters.

The capital letters will be E (voltage), I (current), and R (resistance).

Any time you see one of the designations, say the full meaning of it to yourself. Example: If you see the designation $E_1$, say to yourself, voltage drop across resistance number one. This will get you used to the designations, and you will learn them a lot faster. Study the examples below.

$E_t =$ Total voltage of a circuit.
$I_t =$ Total current in a circuit.
$R_t =$ Total resistance in a circuit.

$E_1 =$ Voltage drop across resistance number one.
$E_2 =$ Voltage drop across resistance number two.

$R_1 =$ Resistance of component number one.
$R_2 =$ Resistance of component number two.

$I_1 =$ Current through resistance number one.
$I_2 =$ Current through resistance number two.

If more than two resistances are in a circuit, the subscript numbers or letters will be in numerical or alphabetical order. Examples below.

$E_1, E_2, E_3, E_4, \text{ etc.}$

$R_1, R_2, R_3, R_4, \text{ etc.}$

$E_a, E_b, E_c, E_d, \text{ etc.}$
1. b
2. c, d
3. a. \( R_T = \frac{V}{I} = \frac{12}{4} = 3 \text{ ohms} \)
   b. \( R_T = R_1 + R_2 + R_3 = 10 + 7 + 8 = 25 \text{ ohms} \)
   c. Step 1. \( R_T = R_1 + R_2 + R_3 = 2 + 2 + 2 = 6 \text{ ohms} \)
      Step 2. \( I = \frac{V}{R_T} = \frac{12}{6} = 2 \text{ amps} \)
   d. \( I = \frac{V}{R} = \frac{12}{6} = 2 \text{ amps} \)

Note: Current is the same throughout a series circuit.

e. \( V_2 = IR_2 = (8)(3) = 24 \text{ volts} \)
   f. \( R_3 = \frac{V_3}{I} = \frac{45}{5} = 9 \text{ ohms} \)
   g. \( V_T = V_1 + V_2 + V_3 = 20 + 25 + 15 = 60 \text{ volts} \)
   h. Step 1. \( V_T = V_1 + V_2 + V_3 \) 
      Step 2. \( V_1 = IR_1 = (3)(6) = 18 \)
      \( V_2 = IR_2 = (3)(2) = 6 \)
      \( V_3 = IR_3 = (3)(8) = 24 \)
      \( V_T = 18 + 6 + 24 = 48 \text{ volts} \)

4. a, c

GO RIGHT ON TO LESSON 3, PART B - PARALLEL CIRCUITS
FUNDAMENTALS OF ELECTRICITY

LESSON 3

PART B

PARALLEL CIRCuits

OBJECTIVES

1. From a list of statements pertaining to circuits, select the statements which apply to parallel circuits.

2. Solve problems in parallel circuits for the following:
   a. Total resistance
   b. Resistance of an individual branch
   c. Total current
   d. Current flow of an individual branch
   e. Total voltage

3. Given a list of numbers, determine the reciprocal of each.
1. Resistances side by side and with their ends connected are parallel-connected, if the resistances in a circuit are so connected, the circuit is known as a parallel circuit.

2. The resistances in a parallel circuit are connected parallel to each other. Each of these resistances will be a branch. If a twelve-volt battery was the source voltage of a parallel circuit, the voltage in each branch of that parallel circuit would also equal twelve volts. The voltage of each branch of a parallel circuit equals the source voltage.

3. The voltage in each branch of a parallel circuit will equal source voltage.

What is the source voltage in the circuit above? ___ volts
24 VOLTS

<table>
<thead>
<tr>
<th>4.</th>
<th>PARALLEL CIRCUIT LAW FOR TOTAL VOLTAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>$E_t = E_1 = E_2 = E_3 \ldots$</td>
</tr>
</tbody>
</table>

In the illustration above, the source voltage and branch voltages are (equal/unequal).

**EQUAŁ**

5. Put the $\times$, $+$, $-$, or $=$ sign in the parentheses to make the statement correct.
Since source voltage (total voltage) and branch voltages are equal, the parallel circuit law for total voltage is $E_t(\ ) E_1(\ ) E_2(\ ) E_3(\ )$, etc.

| $E_t = E_1 = E_2 = E_3$ |

6. The voltage is the same across each branch of a parallel circuit, and the voltage of each branch equals source voltage.

![Parallel Circuit Diagram]

What is the voltage in branch A and what is the voltage in branch B above?

8. Now that you know that all the branch voltages and the source voltage are equal in a parallel circuit, you will find that solving for total (source) voltage is relatively easy. You can determine total voltage (source voltage) in a parallel circuit by applying Ohm's law. If you multiply the current of a branch by the resistance of that branch, you will determine the.

12. As you probably have noticed in this program, the difference between a parallel circuit and a series circuit is that a parallel circuit has two or more paths for current. Knowing this, you can now understand why an open in a parallel circuit only affects the branch or branches in which the open occurs.

![Figure 1](image1)

![Figure 2](image2)

a. Which of the illustrations above shows a parallel circuit?

b. A parallel circuit has ___ or ___ paths for current.

c. Which branch of the parallel circuit above contains an open?

<table>
<thead>
<tr>
<th>a. FIGURE 1</th>
<th>b. TWO OR MORE</th>
<th>c. BRANCH B</th>
</tr>
</thead>
</table>

13. What effect will the open in branch B have on the light bulb in branch A?

![Light bulb diagram](image3)

a. The bulb will burn brighter.

b. The bulb will get dimmer.

c. No effect.
c. The reason the open has no effect on the bulb in branch A is that an open in a parallel circuit affects only the _______ or _______ in which the open occurs.

<table>
<thead>
<tr>
<th>BRANCH OR BRANCHES</th>
<th>15. Draw arrows to indicate the path of current flow in the parallel circuits below.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>![Parallel Circuits Diagram]</td>
</tr>
</tbody>
</table>

14. Since a parallel circuit has two or more paths for current flow, the amount of current in each branch may be different. To find the total current ($I_t$) in a parallel circuit, add the current of each branch.

PARALLEL CIRCUIT LAW FOR TOTAL CURRENT:

$$I_t = I_1 + I_2 + I_3 \ldots$$

a. To find total current ($I_t$) in a parallel circuit, the current of all the branches should be _______.

b. Find the total current ($I_t$) in the circuit above. $I_t =$ _______ amps.
17. If current in each individual branch is known, total current ($I_t$) in a parallel circuit can be determined by **adding** the current of the individual branches.

18. What is the total current for the parallel circuit below? $I_t =$ ________ amps.

19. Find the total current in the circuits below.

   a. $I_t =$ ________ amps

   b. $I_t =$ ________ amps

   c. $I_t =$ ________ amps.
<table>
<thead>
<tr>

<tr>
<td>b. $I_e = 16$ AMPS.</td>
</tr>
<tr>
<td>c. $I_e = 25$ AMPS.</td>
</tr>
</tbody>
</table>

20. There may be times when branch current is unknown in a parallel circuit. Determining branch current is a simple application of Ohm's law. If you divide the applied voltage by the resistance of a branch, you will determine the branch current.

21. In order to find the current of a branch, divide the applied voltage by the resistance of that branch. Complete the steps below and determine the current for branch 3 ($I_3$).

**Step 1**

**Step 2**

**Step 3**

\[ I_3 = \frac{12}{3 + 2} \text{ amps.} \]

---

11.18
lsn 3; p. 51
22. Using the information in the illustration below, determine the current for branch 2 ($I_2$).

**Step 1**
- \[ 12 + 2 = I_3 \]
- \[ I_3 = 6 \text{ AMPS.} \]

**Step 2**
- \[ 24V \]
- \[ R_1 = 12 \Omega \]
- \[ R_2 = 8 \Omega \]
- \[ R_3 = 6 \Omega \]
- \[ I_2 = \text{amps.} \]

**Step 3**
- \[ 24 + 2 = I_2 \]
- \[ I_2 = 3 \text{ AMPS.} \]

23. Find $I_2$ in the circuit below.

- \[ 110V \]
- \[ 2A \]
- \[ ? \]
- \[ 5A \]

- \[ I_2 = \text{amps.} \]
### 24. You have been solving for current in the preceding frames by dividing the applied voltage by the resistance. Look at the illustration below and study the relationship between current and resistance in each branch.

![Electric Circuit Diagram]

You can readily see that as resistance becomes larger, current becomes smaller. As resistance decreases, current ______.

### INCREASES

| 25. Current in each branch of a parallel circuit depends on the ______ in that branch. |

### RESISTANCE

| 26. Finding the resistance of a branch in a parallel circuit is similar to finding current. When you divide the applied voltage by the current of a branch, you determine the ______ of that branch. |

### RESISTANCE

| 27. In order to determine the resistance of a branch in a parallel circuit, divide the applied voltage by the current in that branch. Complete the steps in the example below, and determine the resistance of branch $R_3$. |

![Resistances Diagram]

Step 1 ---

Step 2 --- 

Step 3 --- $\frac{E}{I_3}$ + $$ = R_3$$

$R_3 = ____$ ohms.
28. From the information given below, complete the steps and find $R_2$.

Step 1 ---

Step 2 ---

Step 3 --- $+ = R_2$

$R_2 = \ldots$ ohms

29. Using the current, voltage, and resistance laws you have learned thus far, determine the values for the circuit below.

$R_1 = \ldots$ ohms  \hspace{1cm} $I_4 = \ldots$ amps.

$R_3 = \ldots$ ohms  \hspace{1cm} $E_4 = \ldots$ volts

$I_2 = \ldots$ amps  \hspace{1cm} $I_t = \ldots$ amps.
Before we start finding the total resistance of a parallel circuit, here is something to remember. The total resistance of a parallel circuit will always be less than the smallest branch resistance of the circuit.

The total resistance of the circuit above will be

a. 6 ohms.
b. 12 ohms.
c. less than 6 ohms.
d. more than 6 ohms.

Resistances in parallel are like water pipes in parallel. In each case, when the total size is increased, then the total resistance to current flow is decreased. Two water pipes of equal size placed side by side carry twice as much water as a single pipe of the same size; and equal resistances connected side by side pass twice as much current as a single resistance. This greater current flow in a parallel circuit indicates that total resistance is ________ than that of a single resistance.

When you figure the resistance values in a parallel circuit, you will find that total resistance is always smaller than the resistance of the smallest branch.

In the illustration above, the total resistance is ________ than the smallest branch resistance.

Lesson 3; p. 55
33. Since you now know that total resistance in a parallel circuit is less than the resistance of the smallest branch, it is easy to see that you cannot add individual resistances to find total resistance. Finding total resistance is another application of Ohm's law. If you were to divide total voltage ($E_t$) by the total amperage ($I_t$), you would determine ________________.

34. One way of finding the total resistance ($R_t$) of a parallel circuit is to divide the total voltage ($E_t$) by the total current ($I_t$). Complete the steps below to determine total resistance ($R_t$).

<table>
<thead>

24V \\
\text{B} \\
\text{C} \\
\end{array}
\]

\[
\begin{array}{c}
2A \\
4A \\
3A \\
\end{array}
\]

a. Total resistance will increase.
b. Total resistance will decrease.
c. Total current will increase.
d. Total current will decrease.

38. Let's review some things we have learned about parallel circuits. Select the statements below that are correct concerning parallel circuits.

a. Voltage is the same across each branch of a parallel circuit.
b. Source voltage and branch voltage are never equal in a parallel circuit.
c. A parallel circuit has two or more paths for current.
d. The total resistance of a parallel circuit is the sum of all the branch resistances.
e. Total resistance of a parallel circuit is always less than the resistance of any branch.

39. When the only values known in a parallel circuit are the branches' resistances, total resistance can be determined by the reciprocal method.

What method can be used to determine \( R_c \) in the circuit above?
In order to find total resistance in a parallel circuit by the reciprocal method, you must first understand what is meant by reciprocal. The reciprocal of a number is that number divided into one.

Example: Find the reciprocal of 2.

Step 1 --- Set up the problem to divide the number into 1.

Step 2 --- Invert the divisor and change division sign to a multiplication sign.

Step 3 --- Multiply.

\[
\frac{1}{2} \times \frac{1}{2} = \frac{1}{2}
\]

\[\frac{1}{2} \text{ = the reciprocal of 2}\]

Find the reciprocal of 4 by dividing it into 1.

\[
\frac{1}{4} \text{ = the reciprocal of 4}
\]

The easiest way to find the reciprocal of a whole number is to make it a fraction by giving it a numerator of one. When you do this, you have the reciprocal without performing a division process.

Example: Find the reciprocal of 4.

Give the whole number a numerator of 1, and a denominator of 1.

\[
\frac{1}{4} \text{ = the reciprocal of 4}
\]

Find the reciprocal for the following numbers:

a. 6  
b. 8  
c. 10
42. Giving a whole number a numerator of one gives the ______ for that whole number.

43. Find the reciprocal of these whole numbers.

<table>
<thead>
<tr>
<th>Whole Number</th>
<th>Reciprocal</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 7</td>
<td>e. 88</td>
</tr>
<tr>
<td>b. 9</td>
<td>f. 12</td>
</tr>
<tr>
<td>c. 15</td>
<td>g. 3</td>
</tr>
<tr>
<td>d. 40</td>
<td>h. 5</td>
</tr>
<tr>
<td>i. 6</td>
<td></td>
</tr>
</tbody>
</table>

44. To find the reciprocal of a fraction, simply invert the fraction and reduce to its lowest term.

Example: \( \frac{1}{2} \) inverted becomes \( \frac{2}{1} \). Reduced to its lowest term it becomes 2. Then, 2 is the reciprocal of \( \frac{1}{2} \).

Example: \( \frac{2}{3} \) inverted becomes \( \frac{3}{2} \). Reduced to its lowest term it becomes \( 1 \frac{1}{2} \). Then, \( 1 \frac{1}{2} \) is the reciprocal of \( \frac{2}{3} \).

Find the reciprocal of the following fractions.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>d. 6</td>
<td>e. 9</td>
<td></td>
</tr>
<tr>
<td>f. $2\frac{1}{4}$</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

11.16
lsn 3; p. 61
48. Now, let's use the reciprocal method to find the total resistance ($R_t$) of a parallel circuit by following the steps below.

Parallel circuit law for total resistance:

\[
\frac{1}{R_t} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}
\]

**Step 1** --- Find the lowest common denominator and add.

\[
\frac{1}{R_t} = \frac{1}{2} + \frac{1}{3} + \frac{1}{4}
\]

\[
\frac{1}{R_t} = \frac{6}{12} + \frac{4}{12} + \frac{3}{12}
\]

\[
\frac{1}{R_t} = \frac{13}{12}
\]

**Step 2** --- The sum of the resistances is the reciprocal of $R_t$ and it must be inverted.

\[
\frac{1}{R_t} = \frac{13}{12}
\]

\[
R_t = \frac{12}{13}
\] ohms
Find the total resistance \( R_t \) of the parallel circuit below by completing the steps.

**Step 1** --- Find the lowest common denominator and add.

\[
\frac{1}{R_t} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}
\]

**Step 2** --- The sum of the reciprocals of \( R_1 \) is the sum of the reciprocals of \( R_2 \).

**Step 3** --- Find the lowest common denominator and add.

\[
R_t = \frac{R_1 R_2 R_3}{R_1 R_2 + R_1 R_3 + R_2 R_3}
\]

\( R_t = \frac{12}{13} \text{ ohms} \)

195
Find the total resistance of the parallel circuit below by completing the steps.

**STEP 1**
\[
R_t = \frac{1}{\frac{1}{3} + \frac{1}{3} + \frac{1}{15}}
\]

**STEP 2**
\[
R_t = \frac{1}{\frac{3}{15} + \frac{5}{15} + \frac{1}{15}}
\]

**STEP 3**
\[
R_t = 1 \frac{2}{3} \text{ OHMS}
\]

- Step 1: \(\frac{1}{R_t}\)
- Step 2: \(\frac{1}{R_t}\)
- Step 3: \(R_t\) = \(\frac{2}{3}\) ohms

Find the total resistance of the parallel circuit below.

**STEP 1**
\[
R_t = \frac{1}{\frac{1}{6} + \frac{1}{3} + \frac{1}{2}}
\]

**STEP 2**
\[
R_t = \frac{1}{\frac{1}{6} + \frac{2}{6} + \frac{3}{6}}
\]

**STEP 3**
\[
R_t = 1 \text{ OHM}
\]

- Step 1: \(\frac{1}{R_t}\)
- Step 2: \(\frac{1}{R_t}\)
- \(R_t\) = \(1\) ohms

\(R_t = 1 \frac{10}{11} \text{ OHMS}\)
1. A parallel circuit has (select three)
   a. only one path for current.
   b. voltage that is the same across each branch.
   c. voltage that varies between the branches.
   d. two or more paths for current.
   e. a total resistance smaller than the resistance of any branch.
   f. current that is constant throughout.

2. Solve for the unknown in each of these problems.

   a.
   ![Diagram of a parallel circuit with a 120V voltage, 30A current, and电阻R1, R2, R3.]
   Resistance of branch 2 = ____ ohms

   b.
   ![Diagram of a parallel circuit with a 120V voltage, 40A current, and no explicit resistance values.]
   Total resistance = ____ ohms
c. Total resistance = ___ ohms

d. Current through $R_1$ = ___ amps.
Current through $R_2$ = ___ amps.

Total current = ___ amps.

LESSON 3, PART B
PARALLEL CIRCUITS-SELF TEST ANSWERS

1. b, d, e

2. (a) Step 1. Recall voltage is equal to the source voltage across each branch.

\[
V_T = \frac{120}{30} = 4 \text{ ohms}
\]

Step 2. \[R_2 = \frac{V_T}{I_2} = \frac{120}{30} = 4 \text{ ohms}\]

(b) \[R_T = \frac{V_T}{I} = \frac{120}{40} = 3 \text{ ohms}\]

(c) \[\frac{1}{R_T} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} = \frac{1}{3} + \frac{1}{6} + \frac{1}{6} = \frac{2}{6} + \frac{1}{6} + \frac{1}{6} = \frac{6}{6} = 1\]

\[R_T = 1 \text{ ohm}\]

(d) \[I_1 = \frac{V_T}{R_1} = \frac{24}{6} = 4 \text{ amps}\]
\[I_2 = \frac{V_T}{R_2} = \frac{24}{8} = 3 \text{ amps}\]

(e) \[I_T = I_1 + I_2 + I_3 = 4 + 3 + 2 = 9 \text{ amps}\]

(f) \[V_T = I_1 R_1 = I_2 R_2 = I_3 R_3\]
\[= (2)(6) = (3)(4) = (4)(3) = 12 \text{ volts}\]

(g) Step 1. \[\frac{1}{R_T} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} = \frac{1}{15} + \frac{1}{15} + \frac{1}{15}\]
\[\frac{1}{R_T} = \frac{3}{15} = \frac{1}{5} \quad R_T = 5\]

Step 2. \[V_T = I_T R_T = (15)(5) = 75\]

1sn 3; p. 68
This is a programmed lesson. It is designed to teach, not to test. You will need only this booklet, a pencil, and some time to complete this lesson. If there is something in the program you do not understand, ask your instructor or supervisor for assistance.

- REMEMBER -

This lesson has been written so that the amount of reading necessary is minimal and yet most meaningful. Therefore, it is very important that you follow these instructions.

- Read each page carefully.
- Fill in each blank.
- Keep the answer to the frame on which you are working covered with a slip of paper until you have written your answer.
- Correct all errors you make.
- Follow all directions given in the program.

SUGGESTED READING TIME
180 MINUTES
LESSON 4

PART A

SERIES-PARALLEL CIRCUITS

OBJECTIVES

1. From a list of statements pertaining to electrical circuits, select those pertaining to series-parallel circuits.

2. Given a battery and four resistances, draw in connecting lines to form two series circuits connected in parallel.

3. Given problems with series circuits connected in parallel, solve for the unknown values of resistance, current, and voltage.

4. Given a battery and four resistances, draw in connecting lines to form two parallel circuits connected in series.

5. Given problems with parallel circuits connected in series, solve for the unknown values of resistance, current, and voltage.
1. A series-parallel circuit may consist of series circuits connected in parallel or it may consist of parallel circuits connected in series. You have had the necessary laws and formulas needed to solve series-parallel circuit problems. The important thing to remember is that when working with resistances connected in series, use series-circuit laws; and when working with resistances connected in parallel, use parallel-circuit laws.

The following formulas are based on the laws of series circuits.

Total resistance equals the sum of the individual resistances.

\[ R_t = R_1 + R_2 + R_3 \ldots \]

Current flow is the same across each resistance.

\[ I_t = I_1 = I_2 = I_3 \ldots \]

Total voltage equals the sum of the voltage drops across each resistance.

\[ E_t = E_1 + E_2 + E_3 \ldots \]

The following formulas are based on the laws of parallel circuits.

Total resistance is determined by the reciprocal method.

\[ \frac{1}{R_t} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} \ldots \]

Total current is equal to the sum of the current of each branch.

\[ I_t = I_1 + I_2 + I_3 \ldots \]

Total voltage is equal to the voltage of each branch.

\[ E_t = E_1 = E_2 = E_3 \ldots \]

a. A series-parallel circuit is a combination of ________ and ________ circuits.

b. A series-parallel circuit may consist of ________ circuits connected in parallel.

c. A series-parallel circuit may consist of ________ circuits connected in series.

d. When working with the portion of series-parallel circuits having resistances connected in series, use ________ circuit laws.

e. When working with the portion of series-parallel circuits having resistances connected in parallel, use ________ circuit laws.
2. The circuit in figure A consists of two series circuits connected in parallel across a battery.

Figure A

Figure B shows resistances $R_1$ and $R_2$ connected in series with each other to form one path for current from the battery.

Figure B

Figure C shows resistances $R_3$ and $R_4$ connected in series to form a second path for current from the battery.

Figure C

Refer to figure D.

a. How many series circuits are in this circuit?
b. How many paths are there for current?
c. How are these series circuits connected?
3. Draw connecting lines between the following components to form two series circuits connected in parallel.

4. No new formulas are needed to find the values of series-parallel circuits. Instead, a simplified circuit is made of the original series-parallel circuit, and the necessary circuit laws are used for the simplified circuit. The circuit in figure A below is electrically the same as the circuit in figure B.

**Figure A**

![Original Circuit](image)

**Figure B**

![Simplified Circuit](image)

In figure A, the circuit has two paths for current; each path (branch) has a total of 10 ohms resistance. \( R_1 + R_2 \) gives the total resistance of the first branch. \( R_3 + R_4 \) gives the total resistance of the second branch.

Figure B is the simplified circuit of the circuit in figure A. To solve for \( R_c \) in figure B, use circuit laws.

\[
R_c = \text{ohms}
\]
Simplified circuits are very useful when solving series-parallel circuit problems.

Draw and use simplified circuits when solving the problems in this program.

Figure B is the simplified drawing of the circuit in figure A. To solve for the total resistance of the circuit below, first, solve for the combined resistance of the series network $R_1$, $R_2$, and $R_3$. This combined value is represented in the simplified circuit as $R_a$. Second, solve for the combined value of $R_4$ and $R_5$. This combined value is represented in the simplified circuit as $R_b$.

Figure A consists of series circuits connected in parallel.

- $R_a$ in figure B represents which resistances in figure A?
- $R_b$ in figure B represents which resistances in figure A?
- What is the value of $R_a$?
- What is the value of $R_b$?
- $R_t = \ldots$ ohms.
6. The total current ($I_t$) in series circuits connected in parallel is equal to total voltage ($E_t$) divided by total resistance ($R_t$).

Total current is also equal to the sum of the branch currents.

**Using the illustrations above, solve for:**

- $R_a = \quad$ ohms
- $R_b = \quad$ ohms
- $R_t = \quad$ ohms
- $I_t = \quad$ amps.

a. TWO
b. $R_1$, $R_2$, $R_3$
c. $R_4$, $R_5$
d. 100 OHMS
e. 100 OHMS
f. 50 OHMS
7. a. Complete the simplified circuit.

R<sub>a</sub> = 36 OHMS
R<sub>b</sub> = 36 OHMS
R<sub>c</sub> = 18 OHMS
I<sub>t</sub> = 2 AMPS.

b. Label the two branches in the simplified circuit as R<sub>a</sub> and R<sub>b</sub>.

c. Use the completed simplified circuit to solve for I<sub>t</sub>.

Remember, the current through each branch of a parallel network is equal to the voltage across the branch divided by the total resistance of the branch.

\[ I_a = \frac{E_a}{R_a} \]

\[ I_b = \frac{E_b}{R_b} \]

\[ I_t = I_a + I_b \]

\[ I_t = \frac{24V}{9} \] amps.

**Original Circuit**

**Simplified Circuit**

\[ I_t = \text{amps.} \]
8. Draw connecting lines between the following components to form two series circuits connected in parallel.

9. The total voltage ($E_t$) applied to series circuits connected in parallel is equal to $I_t$ times $R_t$. $E_t$ is also equal to the voltage across either of the parallel branches.

The simplified circuit shows two resistances in parallel; the voltage across either parallel branch is equal to the applied voltage (parallel voltage law).

\[ E_t = E_a \]
\[ E_a = I_a \times R_a \]

$I_a = \underline{\hspace{2cm}}$ amps.

$R_a = \underline{\hspace{2cm}}$ ohms

$E_a = \underline{\hspace{2cm}}$ volts

$E_t = \underline{\hspace{2cm}}$ volts
10. The ammeter in the circuit below indicates the total current in the circuit. Complete the simplified circuit and solve for the values listed below.

**ORIGINAL CIRCUIT**

**SIMPLIFIED CIRCUIT**

Ohm's law: \( E_t = I_t \times R_t \)

- \( R_a = \) ohms
- \( R_b = \) ohms
- \( R_t = \) ohms
- \( I_t = \) amps.
- \( E_t = \) volts.
11. Draw a simplified circuit of this circuit, and solve for \( R_t \).

**ORIGINAL CIRCUIT**

\[
\begin{align*}
R_a &= 30 \text{ OHMS} \\
R_b &= 60 \text{ OHMS} \\
R_t &= 20 \text{ OHMS} \\
I_t &= 2, \text{ AMPS.} \\
E_t &= 40 \text{ VOLTS}
\end{align*}
\]

**SIMPLIFIED CIRCUIT**

\[
\begin{align*}
R_a &= 30 \text{ OHMS} \\
R_b &= 60 \text{ OHMS} \\
R_t &= 20 \text{ OHMS} \\
I_t &= 2, \text{ AMPS.} \\
E_t &= 40 \text{ VOLTS}
\end{align*}
\]

12. Solve for the value of \( I_t \).
13. Solve for the value of $E_t$.

\[ E_t = \boxed{\text{volts}} \]

\[ \begin{array}{c}
  - & R_1 & 23\Omega & R_3 & 14\Omega & R_5 & 5\Omega \\
  + & 2A & R_2 & 17\Omega & R_4 & 26\Omega & R_7 & 10\Omega \\
\end{array} \]

14. Solve for the value of $I_t$.

\[ I_t = \boxed{\text{amps}} \]

\[ \begin{array}{c}
  - & R_1 & 5\Omega & R_4 & 8\Omega & R_6 & 10\Omega \\
  + & 60V & R_2 & 5\Omega & R_5 & 7\Omega & R_8 & 10\Omega \\
\end{array} \]

15. a. A series-parallel circuit is a combination of \underline{____} and \underline{____} circuits.

b. A series-parallel circuit may consist of \underline{____} circuits connected in parallel.

c. A series-parallel circuit may consist of \underline{____} circuits connected in series.

d. When working with the portion of a series-parallel circuit having resistances connected in series, use \underline{____} -circuit laws.

e. When working with the portion of a series-parallel circuit having resistances connected in parallel, use \underline{____} -circuit laws.

\[ \begin{array}{c}
  - & R_1 & 5\Omega & R_4 & 8\Omega & R_6 & 10\Omega \\
  + & 60V & R_2 & 5\Omega & R_5 & 7\Omega & R_8 & 10\Omega \\
\end{array} \]

You have completed the section on series circuits connected in parallel. Next we will cover parallel circuits connected in series.
16. The circuit below consists of **two parallel circuits** connected in series.

- Resistances $R_1$ and $R_2$ form one parallel network.
- Resistances $R_3$ and $R_4$ form one parallel network.

The parallel network $R_1$ and $R_2$ and the parallel network $R_3$ and $R_4$ are connected in **series**.

17. Draw connecting lines between the following components to form two parallel circuits connected in series.
18. There are many combinations of parallel circuits connected in series.

Which of the circuits above are combinations of parallel circuits connected in series?

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
</table>

19. Draw connecting lines between the following components to form two parallel circuits connected in series.
20. Solving problems with parallel circuits connected in series is made easier by drawing simplified circuits.

Remember, when working with resistances connected in parallel, use parallel-circuit laws; and when working with resistances connected in series, use series-circuit laws.

**ORIGINAL CIRCUIT**

**Simplified Circuit**

![Circuit Diagram]

Figure A

Figure B

NOTE: The simplified circuit is a series circuit; therefore, \( R_t \) is found by adding the values of \( R_a \) and \( R_b \) (series-circuit law for total resistance).

a. The circuit in Figure A consists of parallel circuits connected in series.

b. \( R_a \) (Figure B) represents the combined value of the parallel network of which resistances?

c. \( R_b \) (Figure B) represents the combined value of the parallel network of which resistances?

d. What is the value of \( R_a \)?

e. What is the value of \( R_b \)?

f. \( R_t = \) ohms
21. Find the total resistance of the original circuit below by:

a. Finding the total resistance of the parallel network of $R_1$ and $R_2$. Represent this in the simplified circuit as $R_a$.

b. Finding total resistance of the parallel network of $R_3$ and $R_4$. Represent this in the simplified circuit as $R_b$.

c. Totaling the values of $R_a$ and $R_b$ to get $R_t$.

\[
\begin{align*}
R_a &= \text{ohms} \\
R_b &= \text{ohms} \\
R_t &= \text{ohms}
\end{align*}
\]
22. This illustration shows current flow through a parallel circuit connected in series.

At what points can total current be measured in the circuit above?

a. Points A and B only.
b. Points A and C only.
c. Points C and B only.
d. Points A, B, and C.
23. Total current is equal to the total voltage divided by the total resistance. To solve for $I_T$ in the circuit below:

a. Solve for the value of $R_a$ and $R_b$.

b. Solve for $R_T$.

c. Divide $E_T$ by $R_T$ to get $I_T$.

$E_T$ is the source voltage.

**Original Circuit**

**Simplified Circuit**

\[ R_T = \text{ohms} \]

\[ I_T = \text{amps} \]
24. Solve for the values of $R_t$ and $I_t$.

Given:
- $R_t = 6 \text{ OHMS}$
- $I_t = 4 \text{ AMPS}$.

\[ R_t = \text{ ohms} \]
\[ I_t = \text{ amps} \]

25. Draw connecting lines between the following components to form two parallel circuits connected in series.
26. The total voltage in a circuit is equal to total current multiplied by total resistance \((E_t = I_t \times R_t)\).

In the circuit below, \(I_t\) equals 6 amps. Find total resistance \((R_t)\) and source voltage \((E_t)\).

\[ R_t = \text{ohms} \]
\[ E_t = \text{volts} \]

\(R_t = 8\ \text{OHMS}\)
\(E_t = 48\ \text{VOLTS}\)

27. Solve for the value of \(E_t\) in the circuit below.

\[ E_t = \text{volts} \]
28. In a series-parallel circuit with the parallel circuits connected in series, total voltage \( E_T \) is equal to the sum of the voltage drops across each parallel network.

\[ E_T = 75 \text{ VOLTS} \]

The total voltage \( E_T \) of the circuit above is _______ volts.

29. The voltage across each branch of a parallel network is the same.

In the illustration above,

a. voltage across branch A is _____ volts.

b. voltage across branch D is _____ volts.

c. total voltage is _____ volts.
30. Determine the total voltage of the circuit below.

\[ E_t = \text{volts} \]

\[ E_t = 36 \text{ VOLTS} \]
1. Circle the letter beside the statements that pertain to series-parallel circuits.

   a. When working with the portion of the circuit having the resistances connected in parallel, use parallel-circuit laws.

   b. The total values can be determined by multiplying the sum of the series portion by the sum of the parallel portion.

   c. When working with the portion of the circuit having the resistances connected in series, use series-circuit laws.

   d. A series-parallel circuit is a combination of series and parallel circuits.

   e. The total values can be determined by dividing the sum of the series portion of the circuit by the sum of the parallel portion of the circuit.

   f. You may use either series-circuit laws or parallel-circuit laws, regardless of how the resistances are connected.

2. Draw connecting lines between the following components to form two series circuits connected in parallel.
3. Solve for the unknown in each of these problems.

a. \[ \begin{array}{c}
2\Omega \\
 \hline
4\Omega \\
 \hline
1\Omega
\end{array} \]

Total resistance = ___ ohms

b. \[ \begin{array}{c}
4A \\
 \hline
6A
\end{array} \]

Total current = ___ amps.

c. \[ \begin{array}{c}
10V \\
 \hline
6V \\
 \hline
4V \\
 \hline
8V
\end{array} \]

Total voltage = ___ volts
4. Draw connecting lines between the following components to form two parallel circuits connected in series.

5. Solve for the unknown in the following problems.
   a. 
   
   Total resistance = ___ ohms

   b. 

   Total current = ___ amps.
Total voltage = ____ volts

\]

3. (a) \[
\frac{1}{R_T} = \frac{1}{R_1} + \frac{1}{R_2} = \frac{1}{2} + \frac{1}{4} + \frac{1}{2} = \frac{1}{2} + 1
\]

\[
\frac{1}{R_T} = \frac{1}{6} + \frac{1}{3} = \frac{3}{6}
\]

\[
R_T = \frac{1}{\frac{1}{2}} = 2
\]

(b) \[I_T = I_1 + I_2 = 4 + 6 = 10 \text{ amps}\]

(c) Remember: 1. Add voltages together when they are in series
2. Voltage is the same over parallel branches

\[
V_T = V_1 = V_2 = V_3 + V_4 = 10 + 4 + 6 + 8 = 14 \text{ volts}
\]

4.

\[
\begin{array}{c}
\text{Diagram}
\end{array}
\]

11.16
Isn 4; p. 27
5. (a) \( R_T = R_{1,2} + R_{3,4} \)

\[
\frac{1}{R_{1,2}} + \frac{1}{R_{3,4}} = \frac{1}{10} + \frac{1}{20} = \frac{2}{20} = \frac{1}{10}
\]

\( R_{1,2} = 10 \)

\( R_{3,4} = 10 \)

\( R_T = R_{1,2} + R_{3,4} \)

\( 10 + 10 = 20 \text{ ohms} \)

(b) Step 1. \( I_T = \frac{V}{R_T} \)

Step 2. \( R_T = R_{1,2} + R_{3,4} \)

\[
\frac{1}{R_{1,2}} = \frac{1}{20} + \frac{1}{20} = \frac{2}{20} = \frac{1}{10}
\]

\( R_{1,2} = 10 \)

\[
\frac{1}{R_{3,4}} = \frac{1}{30} + \frac{1}{30} = \frac{2}{30} = \frac{1}{15}
\]

\( R_{3,4} = 15 \)

\( R_T = 10 + 15 = 25 \)

\( I_T = \frac{V}{R_T} = \frac{30}{25} = 2 \text{ amps} \)

(c) Remember: (1) That voltage is the same over branches of a circuit. (2) That voltage over a series circuit is the sum of all voltages around it.

\( V_T = V_1 + V_2 = 60 + 30 = 90 \text{ volts} \)

GO RIGHT ON TO LESSON 4, PART B - BATTERIES

11.16
1sn 4; p. 28
LESSON 4
PART B
BATTERIES
OBJECTIVES:

1. Define a cell.
2. Given a diagram of a cell, label its two basic parts.
3. State the difference between a primary cell and a secondary cell.
4. State what determines the amount of current a cell will produce.
5. State how a cell is charged.
6. Name the instrument used to determine the condition of a cell’s electrolyte.
7. State the reason a discharged lead-acid cell will freeze if exposed to subfreezing temperatures.
8. Define a battery.
9. State how cells are connected to produce maximum voltage.
10. State how cells are connected to produce maximum current.
11. State the damage that will result from spilling battery acid on aircraft metals.
12. State how battery terminals and cable clamps can be protected from corrosion.
13. State the measures to be taken when battery acid comes in contact with the skin, eyes, and clothing.
14. State two safety precautions to observe when working with or near batteries.
1. If a piece of metal is suspended in acid, a chemical action will take place. The acid will attack the metal. A piece of zinc dropped in a certain acid will cause a ______ action.

2. Chemical energy is released when an acid attacks metal. By utilizing this energy, an electric current can be generated. Chemical energy can be changed into ______ energy.

3. Any device which changes chemical energy into electrical energy is called a cell. A flashlight cell changes ______ energy into ______ energy.

4. A piece of zinc and a strip of copper immersed in a solution of sulfuric acid will cause a chemical action to take place. The acid will start eating the zinc and an electric current will be produced. This device which is changing chemical energy into electrical energy is called a ______

![Diagram of zinc, copper, and sulfuric acid](image)

5. A device which changes ______ energy into ______ energy is called a ______

6. Define a cell. ______

<td>23. The size of a cell has no effect on the voltage but does have an effect on the amount of __________ it will deliver.</td>
<td></td>
</tr>
<tr>
<td>CURRENT</td>
<td>24. The voltage of a cell depends on the composition of the electrodes and electrolyte. The amount of current a cell will produce is determined by its __________.</td>
<td></td>
</tr>
<tr>
<td>SIZE</td>
<td>25. What determines the total amount of current a cell will produce? __________________________</td>
<td></td>
</tr>
</tbody>
</table>

11.16
Isn't it 33.
<p>| THE AMOUNT OF CURRENT A CELL WILL PRODUCE IS DETERMINED BY ITS SIZE. |
| 26. To recharge a secondary cell, a current is forced through the cell in a reverse direction. Forcing current through a cell in a reverse direction reverses the chemical action. |
| CHARGES (RECHARGES) |
| 27. Charging a cell reverses the chemical action. Forcing a current through in a reverse direction restores the chemicals to their original form. Forcing a current through a cell in a reverse direction reverses the chemical action. |
| CHEMICAL ACTION |
| 28. The recharging process changes the water back to acid and changes the composition of the lead plates to their original condition. Recharging a cell changes the electrolyte from to. |
| WATER TO ACID |
| 29. How is a cell recharged? |
| BY FORCING CURRENT THROUGH THE BATTERY IN A REVERSE DIRECTION |
| 30. If the electrolyte in a cell is strong with acid, it indicates the cell is charged. If the electrolyte through chemical action is reduced to water, the cell is considered discharged. The condition of a cell can be determined by the condition of the electrolyte. |
| ELECTROLYTE |
| 31. The most convenient method for determining the charge of a cell is by using a hydrometer. The specific gravity of a cell's electrolyte is determined with a hydrometer. |
| HYDROMETER |
| 32. The specific gravity of a liquid is an indication of its density. A water-acid solution is denser than water. A fully charged battery contains approximately 27 percent sulfuric acid and 73 percent water. A fully discharged battery is practically all water. Therefore, the bulb of a hydrometer will sink in the solution from a discharged battery, but in the solution from a fully charged battery, it will higher. |</p>
<table>

"FUNDAMENTALS OF ELECTRICITY"

LESSON 5

MAGNETISM AND
ELECTROMAGNETISM AND ELECTROMAGNETIC INDUCTION

INSTRUCTIONS

This is a programmed lesson. It is designed to teach, not to test. You will need only this booklet, a pencil, and some time to complete this lesson. If there is something in the program you do not understand, ask your instructor or supervisor for assistance.

- REMEMBER -

This lesson has been written so that the amount of reading necessary is minimal and yet most meaningful. Therefore, it is very important that you follow these instructions.

- Read each page carefully.
- Fill in each blank.
- Keep the answer to the frame on which you are working covered with a slip of paper until you have written your answer.
- Correct all errors you make.
- Follow all directions given in the program.

SUGGESTED READING TIME
170 MINUTES
LESSON 5
PART A
MAGNETISM
OBJECTIVES

1. Given a list of statements pertaining to magnets, state whether each statement applies to a natural magnet or an artificial magnet.

2. Given a list of materials, classify each as being either magnetic or nonmagnetic.

3. Given a list of true and false statements about magnetic lines of flux, select the true statements.

4. Given an illustration of a magnet, with the direction of the flux lines shown, label the poles of the magnet.

5. Given illustrations of magnets, select the one that shows where the greatest concentration of flux lines occurs.

7. Given illustrations showing different molecular arrangements in a magnetic material, label each as being unmagnetized, partially magnetized, or saturated.

8. Given the terms residual magnetism, magnetism, retentivity, permeability, transparency, saturated, induced magnetism, and a list of their definitions, match each term with its definition.

9. List three ways of magnetizing an iron bar.

10. State whether the permeability is high or low and whether the retentivity is high or low for metals used to make permanent magnets.

11. State whether the permeability is high or low and whether the retentivity is high or low for metals used to make temporary magnets.

12. Given a list of metals, select the one(s) used to make permanent magnets and the one(s) used to make temporary magnets.
1. When a metal attracts a magnetic material, that metal is said to have magnetism. Magnetism can be defined as having the ability to _______ magnetic materials.

<table>
<thead>
<tr>
<th>ATTRACT</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>

2. Because the magnet in the illustration attracts the nails, it is said to have _________

5. Artificial magnets have many practical uses and they are man-made. The magnets used in electrical motors and magnetos are artificial; they are produced by _______.

<table>
<thead>
<tr>
<th>MAN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>

6. Since these magnets are used in various applications, they must be made in different shapes and sizes; and because these practical magnets are produced by man, they are called _______.

|                |
|                |

11. 18
1sn 5; p. 3
### ARTIFICIAL MAGNETS

7. There are two kinds of magnets:
   a. An artificial magnet which is produced by man.
   b. A magnet found in a natural magnetic condition. This magnet is called a ______ magnet.

### NATURAL

8. What are the two kinds of magnets?
   a. __________
   b. __________

9. Magnetite is a material found in a magnetic condition. Since magnetite is found in a magnetic condition, it is a ______ magnet.

### NATURAL

10. Although magnetite is found in a magnetic condition, it has no practical use. Would magnetite be used as the magnet in a motor or generator? ______

### NO

11. Because of the difficulty in obtaining desired sizes and shapes from magnetite, it has no practical use as a ______

### MAGNET

12. Magnetite is the only type of iron ore found in a magnetic condition. It has no practical use in motors or generators, but it was used in ancient times as a crude compass.

Select the correct statement. ______
   a. Magnetite is a type of iron ore.
   b. Magnetite was used as a crude compass.
   c. Neither A nor B is true.
   d. Both A and B are true.

13. Because magnetite was used as a compass, it is called lodestone. Lodestone means leading stone. From its early use as a compass, magnetite is often referred to as ______
14. Select the names which apply to the type of iron ore that is a natural magnet.
   a. Magnesium
   b. Lodestone
   c. Manganese
d. Magnetite
e. Magneto

15. What is the only type of iron ore found in a magnetic condition?

16. There are many materials which can be made into artificial magnets. There is only one that is a natural magnet; it is called

17. Circle the letter beside each statement that pertains to an artificial magnet.
   a. It is called lodestone.
   b. It is a magnet produced by man.
   c. It has the greater application.
d. It is the magnet with the least practical use.
e. It is the most practical magnet.

18. All magnets, whether they are artificial or natural, have a ________ and ________ pole.

43. Although the lines of flux cannot be insulated, equipment can be shielded by using a magnetic material to direct the lines of flux.

In the illustration above, the soft iron acts as an

44. Lines of flux traveling outside the magnet will seek the path of least resistance. If two paths exist, one air and one magnetic material, the flux lines will travel through the magnetic material, even though it may be the longer route. This shows that magnetic material offers the path of

45. Why do the lower flux lines travel the path shown?

11.16
Isn 5, p. 11
Which illustration shows the path the lines of flux will travel through magnetic and nonmagnetic materials?

Why is the watch not affected by the lines of flux?
48. Select the statement that states how to protect an instrument from lines of flux.

- Insulate the instrument with a nonmagnetic material.
- The instrument cannot be protected from lines of flux.
- Use a shield of magnetic material.
- Protection is obtained by the use of a glass face.

49. The lines of flux travel outside the magnet from the north pole to the south pole and never cross each other.

Which illustration correctly shows how the flux lines travel outside the magnet?

50. Complete the illustration below by drawing the lines of flux. Use arrows to indicate the direction of travel; remember, lines of flux never cross.

---

The watch is shielded by the soft-iron material. Lines of flux take the path of least resistance.
51. Although the magnetic field surrounds the magnet, the greatest concentration of flux lines is at the poles. Circle the area(s) where the greatest concentration of flux lines occurs.

52. Because the poles have the greatest concentration of flux lines, the greatest strength of the magnet is at the ________

53. The illustration which correctly shows where the greatest concentration of flux lines occurs is

A. ________
B. ________
C. ________
D. ________
54. The greater the concentration or intensity of flux lines in a given area, the greater the strength of the magnetic field. Which area has the stronger magnetic field, A or B?

55. We know that both natural and artificial magnets have a north and south pole. There are two laws of polarity concerning these poles.

a. Like poles repel (north repels north and south repels south).

b. Unlike poles attract (north attracts south and south attracts north).

Place the letter representing the law (a or b) under the illustration to which it applies.
This illustration demonstrates one of the laws of polarity. This law states that ___ poles ___.

When the unlike poles of two magnets are brought near each other, flux lines join and cause an attraction between them.

The illustration above shows the other law of polarity. This law states that ___.

In illustration A, the south pole will ___ the south pole. In illustration B, the north pole will ___ the south pole.
59. State the laws of polarity.

a. ____________

b. ____________

60. (Any order)

a. LIKE POLES REPEL.

b. UNLIKE POLES ATTRACT.

The darkened end of the molecules represents the north pole.

The molecular theory of magnetism is based on the theory that each molecule of a magnetic material is a magnet. In the illustration, each molecule is a ____________

61. When the molecules are not aligned, the material is said to be unmagnetized.

Which illustration shows a material that is not magnetized?

The reason is (circle the letter beside the correct statement)

a. the molecules are aligned

b. the molecules are not aligned
There are three ways of aligning the molecules of a material and making it a magnet.

These are:

- Stroking the material with a magnet.
- Placing the material in a direct-current coil.
- Placing the material in a magnetic field.

Which method is being used to align the molecules in the soft iron bar?

A material can be magnetized by a magnetic field. This causes the molecules to be aligned with their north poles in one direction and their south poles in the opposite direction. Magnetism is induced in a material when the molecules are caused to be aligned by a magnet.

By placing a material in a magnetic field, we induce magnetism. This will align the molecules of the material.

Draw the arrangement of the molecules in the soft iron bar.
ALWAYS STROKE IN ONE DIRECTION ONLY

The method of aligning molecules by stroking is shown in the illustration. What does the illustration show that must be remembered when using this method?

ALWAYS STROKE IN ONE DIRECTION ONLY

A. UNMAGNETIZED

B. PARTIALLY MAGNETIZED

C. FULLY MAGNETIZED (SATURATED)

Stroking a material in one direction with a magnet will align the molecules as in illustration C. During the stroking procedure, prior to reaching a saturated (fully magnetized) condition, the material will be in a ________ condition.
67. The best method of obtaining a saturated condition in a material is by placing the material in a coil carrying a direct current.

Which illustration shows the best method of fully magnetizing a material?

A. 

B. 

C. 

68. Label each illustration as to the method being used to magnetize the material.

A. STROKING WITH A MAGNET

B. PLACING IN A MAGNETIC FIELD

C. PLACING IN A COIL WITH DIRECT CURRENT

69. When a material is saturated, which means it has been fully magnetized by one of the three methods, all its molecules are aligned. A material, when fully magnetized, with all its molecules aligned is said to be
### 70. A material when saturated is fully magnetized, and the strength of the magnet cannot be increased.

<table>
<thead>
<tr>

lsn 5; p. 32
OBJECTIVES

1. Given three illustrations of straight conductors carrying current and three statements describing the illustrations, match the true statement with the correct illustration.

2. Given the terms core, solenoid, relay switch, and electromagnet, and a list of their definitions, match each term to its definition.

3. Given an illustration of a solenoid and an electromagnet, label each illustration as being either a solenoid or an electromagnet.

4. List the three factors that affect the strength of an electromagnet.

5. Given illustrations of two types of relay switches, label them as being either the solenoid and plunger type or the armature type.

7. Given illustrations and statements pertaining to induced EMF, match each statement to its correct illustration.

8. List the three requirements for induced EMF.

9. Select, from a list of statements pertaining to lines of flux, the factor(s) that determine(s) the number of flux lines cut per second.

10. Given three illustrations of electrical circuits, select the one having the requirements needed for induced current.

11. Given an illustration of an induction coil, label the components of the coil as being the primary coil, the secondary coil, the interrupter, or the core.

12. Given a list of statements about induction coils, select the true statements.

13. Given an illustration of an induction coil and its circuitry, state in your own words how the low input voltage is changed to a high output voltage.

14. Given a list of statements about transformers and induction coils, state whether each statement pertains to transformers, induction coils, or both.
1. A compass, when near a magnet, is affected by the magnet’s magnetic field. A compass is also affected when it is near a straight conductor carrying current. This indicates that a conductor carrying current has a **magnetic field**.

The fact that a conductor carrying current is surrounded by a magnetic field may be proved by using a compass. Move the compass around the wire. At any place along the conductor, the needle will be deflected. 

![Diagram of a compass showing deflection due to magnetic field](image)

As long as current is flowing, the needle of the compass will be deflected at any point along the conductor because of the presence of the magnetic field.

2. **Magnetic Field**

3. As shown in the previous frame, the magnetic field (runs parallel/circles) the straight conductor when **is** flowing.
4. The magnetic field around the conductor may be illustrated like this.

![Diagram of magnetic field around a conductor](image)

The magnetic field about the conductor is in the shape of a **circle**.

5. Although a magnetic field surrounds a current-carrying conductor and will affect a compass, it does not have polarity.

   This means:
   
   a. it does not have a north and south pole.
   b. it does have a north and south pole.
   c. it has a north pole only.
   d. it has a south pole only.

6. Which illustration correctly shows the magnetic field about a straight conductor?

   ![Illustrations of magnetic fields](image)

   - A
   - B
   - C

20. Label the illustrations as representing either a solenoid or an electromagnet.

A. ___________  B. ___________

21. Electromagnets have many uses. They can be very small, such as the ones used by doctors to remove metal splinters from a patient's eyes; or they can be very large and capable of lifting tons of metal. Because of these varied uses, it is necessary to have some means of changing the strength of an electromagnetic.

22. The strength of an electromagnet is determined by three factors. One of these factors is the type of material used in the core. An electromagnet with a core of low permeability would not be as strong as an electromagnet with a core of ___________.

23. Permalloy has a higher permeability than soft iron. Which electromagnet is stronger? ___________

---

11.16
lsn 5; p. 39
24. Another factor that determines the strength of an electromagnet is the number of turns or loops in the conductor— the more loops or turns, the greater its strength.

![Diagram of electromagnets with metal cores](image)

Which electromagnet is the weakest? ____
Which electromagnet is the strongest? ____

A WEAKEST  
B STRONGEST

25. Two of the factors that determine the strength of an electromagnet are:

a. ____________

b. ____________

26. The third factor that will affect the strength of the electromagnet is the amount of current. The greater the current, the ____________ the electromagnet's strength.

27. The three factors that affect the strength of an electromagnet are the type of core material, the number of loops or turns of the coil, and the ____________

Illustration A shows an __________ type of relay switch.

Illustration B shows a __________ and __________ type of relay switch.
We have seen how electricity can be used to produce magnetism. This is called electromagnetism. We can do the opposite and use magnetism to produce electricity. To do this, the flux lines must be cut by a conductor through relative motion. This is called electromagnetic induction.

When conductor A is moved rapidly up and down across the magnetic field, meter B will show that electricity is being produced. This action is known as

**ELECTROMAGNETIC INDUCTION**

Electromagnetic induction is the action involved in producing electricity by the use of a _______ field, a _______ , and relative _______ between them.

Producing electricity by using a magnetic field, a conductor, and relative motion is called

MAGNETIC, CONDUCTOR, MOTION

Electromagnetic induction is producing electricity by using a _______ , a _______ , and _______ between them.
### Electromagnetic Induction

**45. What is electromagnetic induction?**

Electromagnetic induction is producing electricity by the use of a magnetic field, a conductor, and relative motion between them.

**46. An EMF (electromotive force) is induced in the conductor when the relative motion between the conductor and the lines of flux causes the flux lines to be cut.** With the conductor moving parallel to the lines of flux, no flux lines are cut and an induced EMF will not occur.

**47. In which illustration will induced EMF not be produced in the conductor?**

- **A**
- **B**

**48. An EMF is not produced when the flux lines are not cut by the conductor. For induced EMF, the conductor must move so the flux lines are cut.**

**49. To obtain induced EMF in the conductor, the best method to follow is to cut the flux lines at right angles (perpendicular).**

Which illustration shows the most efficient method of producing an induced EMF in the conductor?

---

**A**

**B**

**C**
50. Relative motion is the motion of the conductor or the magnetic field; that is, the conductor can be moved to cut the flux lines of the magnetic field, or the magnetic field can be moved so that flux lines are cut by the conductor.

CONDUCTOR

51. What will result from the action shown in the illustration?

INDUCED EMF IS PRODUCED WHEN A MAGNETIC FIELD MOVES ACROSS THE CONDUCTOR.

52. To have induced EMF, there are three requirements: a magnetic field, a conductor, and relative motion between them.

When flux lines are cut by the relative motion between a magnetic field and a conductor, there will be an induced EMF in the conductor.

INDUCED

53. Which illustrations indicate that EMF will be induced in the conductor?

![Diagram of magnetic field and conductor]

11 16
lbn 5: p. 47
54. What are the three requirements for induced EMF?
   a. __________________________
   b. __________________________
   c. __________________________

55. The strength of induced EMF is dependent on the number of flux lines cut per second. When the number of flux lines cut per second is increased, the strength of induced EMF will ________
   a. CONDUCTOR
   b. MAGNETIC FIELD
   c. RELATIVE MOTION

INCREASE

56. There are three factors that will affect the number of flux lines cut per second. One of the three factors is the flux density (number of flux lines per unit area).
   Which illustration shows the stronger induced EMF?
   Why?
   ________

57. When the magnet used in a magneto loses part of its strength, the EMF it produces will decrease.
   Why does this happen?
   ________
<p>| | |</p>

The second factor which will affect the number of flux lines cut per second is the number of turns or loops of the conductor. The device in illustration A is capable of producing twice the amount of induced EMF as the device in illustration B. Why?
| **INCREASE THE** | **61.** Induced EMF is dependent on the number of flux lines cut per second. If one hundred million flux lines are cut in one second, an induced EMF of one volt is produced; but if two hundred million flux lines are cut in one second, an induced EMF of two volts is produced. Other than flux density and number of turns of the conductor, what is the third factor that affects the number of flux lines cut per second? |
| **NUMBER OF**: | |
| **TURNS OF THE** | |
| **CONDUCTOR**: | |
| **(COIL)**. | |
| **RATE OF SPEED** | **62.** The strength of induced EMF is dependent on three factors. They are: |
| **OF CUTTING THE** | a. |
| **FLUX LINES.** | b. |
| **FLUX DENSITY** | c. |
| **NUMBER OF TURNS** | **63.** When a conductor is moved through a magnetic field, an EMF is induced; however, there is no induced current (electron flow) unless there is a closed path or circuit. To have induced current, there must be a closed |
| **OF THE** | | |
| **CONDUCTOR** | |
| **(COIL)** | |
| **RATE OF SPEED** | |
| **(ANY ORDER)** | |
| **CIRCUIT** | **64.** Up to this point, we have only discussed how an EMF is induced. Using this induced EMF, we can get an induced current. You must realize there is a difference between induced EMF and induced current. An induced EMF is potential energy. When the circuit is closed, this potential energy causes electron flow in the circuit, and this electron flow is known as |
| **INDUCED CURRENT** | **65.** To have an induced current, two conditions must be met. There must be an and |
When a conductor is moved, cutting the flux lines, an induced EMF is set up in the conductor; and as long as the circuit is closed, an induced current flows, as indicated by the meter.
