"Environmental Dilemmas" is one of the "Preparing for Tomorrow's World" (PTW) program modules. PTW is an interdisciplinary, future-oriented program which incorporates information from the sciences and social sciences and addresses societal concerns which interface science/technology/society. The program promotes responsible citizenry with increased abilities in critical thinking, problem-solving, social/ethical reasoning, and decision-making. The dual purpose of the module is to introduce students (grades 10-11) to current/emerging environmental issues and to emphasize the moral/ethical decision-making related to the issues. This teaching guide discusses the purposes of the student module, strategies employed (focusing on the dilemma debate/discussion technique), module structure and objectives, and use of dilemmas in bioethics in the school curriculum. The module may be used as a separate unit of study, as a mini-course, or incorporated into existing subject areas, including civics, history, biology, chemistry, environmental science, and earth science. Theoretical basis for the PTW program (considering the social-scientific reasoning model used), and final student activity (developing guidelines for environmental policy) are discussed. A chart indicating moral issues (as defined by Kohlberg) contained in the 12 dilemmas presented in the student material, and selected bibliographies on moral/social/ethical development and the environment are included. PREFACE

We live in an exciting, rapidly changing, and challenging world—a world highly dependent upon science and technology. Our world is changing so rapidly that we sometimes fail to recognize that much of what we today take for granted as common, everyday occurrences existed only in the imaginations of people just a few short years ago. Advances in science and technology have brought many dreams to fruition. Long before today's school children become senior citizens, much of today's "science fiction" will, in fact, become reality. Recall just a few accomplishments which not long ago were viewed as idle dreams.

- New biomedical advances have made it possible to replace defective hearts, kidneys, and other organs.
- The first air flight at Kitty Hawk lasted only a few seconds. Now, a little over half a century later space ships travel thousands of miles an hour to explore distant planets.
- Nuclear technology—of interest a few short years ago because of its destructive potential—could provide humankind with almost limitless supplies of energy for peace-time needs.
- Computer technology has made it possible to solve in seconds problems which only a decade ago would require many human lifetimes.
- Science and technology have brought us to the brink of controlling weather, earthquakes and other natural phenomena.

Moreover, the changes which we have been experiencing and to which we have become accustomed are occurring at an increasingly rapid rate. Changes, most futurists forecast, will continue and, in fact, even accelerate as we move into the 21st Century and beyond. But, as Barry Commoner has stated, "There is no such thing as a free lunch." These great advances will not be achieved without a high price. We are now beginning to experience the adverse effects of our great achievements.

- The world's natural resources are being rapidly depleted.
- Our planet's water and air are no longer pure and clean.
- Thousands of plant and animal species are threatened with extinction.
- Nearly half the world's population suffers from malnutrition.

While science and technology have given us tremendous power, we are also confronted with an awesome responsibility, to use the power and ability wisely, to make equitable decision-tradeoffs, and to make valid and just choices when there is no absolute "right" alternative. Whether we have used our new powers wisely is highly questionable.

Today's youth will soon become society's decision-makers. Will they be capable of improving upon the decision-making of the past? Will they possess the skills and abilities to make effective, equitable, long-range decisions to create a better world?

To the student:
This module has been prepared to help you, the student and future decision maker, function more effectively in a rapidly changing world. Other modules in the Preparing for Tomorrow's World program focus on additional issues of current and future importance.

To the teacher:
It is our belief that this module and indeed the entire Preparing for Tomorrow's World program will help you, the teacher, prepare the future decision-maker to deal effectively with issues and challenges at the interfaces of science, technology, society. It is our belief that the contents and activities in this program will begin to prepare today's youth to live life to the fullest, in balance with Earth's resources and environmental limits, and to meet the challenges of tomorrow's world.

Environmental Dilemmas: Critical Decisions for Society

INTRODUCTION

We have recently celebrated the 200th birthday of our nation. Throughout the past two centuries Americans have witnessed a period of phenomenal growth—a period of growth matched by few civilizations in the history of mankind.

The Herculean growth of the past 200 years was unique—unique in that the necessary assets and conditions converged at precisely the appropriate moment; vast quantities of many different natural resources were available, rapid advances took place in science and technology, the great numbers of new immigrants provided a bountiful work force; and there was a growing population to buy and consume the products produced. The growth and advances also resulted in the development of a new life-style for a new and emerging world leader.

But all was not a tranquil bliss. Our 200 years of growth were not accomplished without loss. There is the old maxim that "you get nothing for nothing" or, as Barry Commoner states in his book, The Closing Circle, "There's no such thing as a free lunch." Simply, America's growth was accomplished by placing excessive demands on Earth's natural environmental systems. The consequences are coming to the forefront, and we encounter jarring environmental distresses at every turn.

We are finally beginning to realize that responsible environmental decision-making is no simple matter. If decisions related to environmental quality were solely questions of a scientific/technological nature, the task of deciding what is "right" might perhaps be easier. One could, for example, simply prepare a balance sheet, list the costs and benefits, and make an objective decision based almost totally on the factual or "hard" data on hand. It is our opinion, however, that any environment-related decision which is based solely on scientific/technological data, while ignoring social concerns and values is both extremely shortsighted and destined for failure. No plan for environmental action—even one based on "mountains" of "irrefutable" data can be effectively implemented without the cooperative efforts of society. And no persons in a free society will—or should for that matter—follow blindly, or without understanding why they are being asked to cooperate, why they are being asked to make personal sacrifices. Environmental quality is in our opinion, at least as much a social issue as it is a scientific/technological issue. Hence, any decisions regarding the environment must include what Harvey Brooks, professor of technology and public policy, has referred to as the "fragile," "humane," "intangible," or "soft" values.

The so-called "environmental crisis" can, for Americans at least, be viewed as a values crisis. Basically, Americans are very concerned about the depletion of natural resources, excessive energy consumption, pollution of all types and the deterioration of all environments. We want to protect our environment; we are finally beginning to understand that we can no longer continue to use our resources with impunity as we have over the past 200 years; we must value our total environment. But the fact remains that most of us have lived our entire lives in a fashion where all our wants and desires are quickly and more than adequately satisfied. Each of us has, as have our ancestors, been treated "royally" by our environment. We have become accustomed to having all we want when we want it. Hence, two of our most cherished values are in conflict—environmental quality and our accustomed lifestyles.

A survey conducted in August 1975 by Opinion Research Corporation in Princeton, New Jersey, found that "even during a time of recession, high unemployment and rising fuel costs, the public does not voice a readiness to cut back on environmental control programs even to solve economic and energy problems. In fact, six people out of ten say that it is necessary to pay the price necessary to protect the environment." Americans' concern about a quality environment persists it seems—but so do the powerful consumption drives that antedate it and which recession has not dampened. These competing values have given rise to environmental dilemmas which present critical decisions for society—critical decisions for both the present and the future; critical decisions that we, as educators, must prepare our students to make—decisions that will ensure that future generations will be able to celebrate America's Quatercentenary 200 years hence, and other centenaries beyond.

Clearly, different values have dominated society at different times in history. At times, for example, a personal or individual survival ethic was dominant. At other times in the history of our country a work ethic prevailed. At present, an ethic of "more is better" dominates. In our opinion, it is time for a new ethic to prevail—an environmental ethic.

During the sixties and throughout much of the seventies, education tried to instill in youth an environmental literacy—an awareness and knowledge about the intricacies of the natural and man-made worlds and
of the preservation and wise utilization of our natural resources — but produced no auspicious change. We should by now realize that environmental literacy alone is not enough! In our view, if humankind and Earth are to survive, education in the eighties must strive to develop an environmentally ethical citizenry.

The development of an environmentally ethical citizenry is a qualitatively significant step beyond environmental literacy. Environmental literacy implies that one simply knows or has a knowledge of how our natural and man-made surroundings function. One who is environmentally ethical is at least as knowledgeable as the environmentally literate person, but in addition exhibits a reverence and respect for all environments through behavior. Simply, literacy implies knowledge only, whereas ethics implies a knowledge and environmentally responsible behavior. In addition, the environmentally ethical person is motivated to, when necessary, change his or her life-style to insure the survival of quality environments for all. In our opinion, it is only when society begins to behave in environmentally sound and responsible ways that the continued existence of Earth and its inhabitants will be assured.

The task is not an easy one, and if humankind is to succeed, the cooperation and significant contributions of education are critical. Environmental Dilemmas: Critical Decisions for Society has been developed to help educators provide meaningful and effective values analysis activities for students. Insight into our value and ethical systems is clearly a proper educational directive if a dominant goal of education is to develop an informed and participatory citizenry. This module is designed to help educators achieve that goal as well as to help today's youth to become better environmental decision makers.
The Theoretical Basis of Preparing for Tomorrow's World:

The Socio-Scientific Reasoning Model

As pointed out in the Introduction to this guide, developments in science and technology are not without societal issues and problems. New developments and applications will inevitably bring about new issues as well as increase their complexity. Unlike scientific problems, socio-scientific problems often have no "correct" answer because they involve human choices and decisions. Such choices and decisions are value laden. The particular decisions made today and tomorrow will determine the course of the future. Hence, we are faced with the profound challenge to make just and wise decisions in order to create a better future world. To help prepare our students to become more effective problem solvers and decision makers, education will need to focus on the simultaneous development of the following skills:

- Ability to deal with problems containing multiple interacting variables
- Decision making that incorporates a wider social perspective
- Critical thinking in the evaluation of consequences and implications

Components of the Socio-Scientific Reasoning Model

In response to the above concern and recognizing the importance of this mode of development, we developed the "socio-scientific reasoning" model to serve as a framework in the production of our curriculum materials. This model combines our own philosophy, ideas and research with the theories and philosophies of Piaget, Dewey, Kohlberg and Selman. Basic to these theories is the idea of education as helping an individual grow both intellectually and morally. This is, we feel, a more functional approach than arbitrary indoctrination of values as used in "character" or "socialization" education or taking a "values relativism" stance, typically employed in the more common values clarification approach.

Kohlberg's moral, ethical development theory is an extension of Piaget's cognitive development theory. Similarly to Piaget, Kohlberg views moral development from childhood to adulthood as progression through a series of stages (Table 2). Each stage is characterized by a very different way of perceiving and interpreting one's experiences. At Kohlberg's Stage 2, for example, "right" and "wrong" are judged in terms of satisfying one's own needs and sometimes the needs of others if it is convenient to do so. Stage 3 type of reasoning centers around maintenance of approval in one's own social group. The orientation is towards conformity to group expectation. At the higher principled stages, reasoning takes into account concerns for the welfare of others in a broader context, and includes concerns for human dignity, liberty, justice, and equality—those very same principles upon which our Constitution is based.

Logical Reasoning

Jean Piaget, the noted Swiss psychologist, has made important contributions in the area of cognitive development which are pertinent to our efforts. Piaget views the development of logical reasoning as progression through the series of stepwise stages indicated in Table 1 (sensori-motor, preoperational, concrete operational, and formal operational). Each successive stage of logical reasoning occurs when the child incorporates new ideas and situations into his or her existing thought structures. On the other hand, the child also encounters objects and events that do not fit into his or her existing thought structures. In these contradictory situations, the child has essentially two options: he, she must either enlarge his, her existing structures or create a new category or structure. Piaget defines this as the process of accommodation.

In explaining growth in logical reasoning capability, Piaget postulates, occurs when the individual attempts to resolve the tension between the interactive processes of assimilation and accommodation by developing new thoughts and responses that are more suitable or adequate. Equilibrium is re-established when thought structures are altered, producing new accommodations that enable the individual to assimilate the new situations. Intellectual growth, then, occurs through internal self-regulation processes that lead to new, higher levels of equilibration.

Moral/Ethical Reasoning

While there are several approaches to values education, the more encompassing one is the cognitive developmental approach offered by Lawrence Kohlberg. Kohlberg's ideas are derived from the philosophic position of Dewey and Piaget. The emphasis here is to help individuals grow intellectually and morally. This is, we feel, a more functional approach than arbitrary indoctrination of values as used in "character" or "socialization" education or taking a "values relativism" stance, typically employed in the more common values clarification approach.

While there are several approaches to values education, the more encompassing one is the cognitive developmental approach offered by Lawrence Kohlberg. Kohlberg's ideas are derived from the philosophic position of Dewey and Piaget. The emphasis here is to help individuals grow intellectually and morally. This is, we feel, a more functional approach than arbitrary indoctrination of values as used in "character" or "socialization" education or taking a "values relativism" stance, typically employed in the more common values clarification approach.

Kohlberg's moral, ethical development theory is an extension of Piaget's cognitive development theory. Similarly to Piaget, Kohlberg views moral development from childhood to adulthood as progression through a series of stages (Table 2). Each stage is characterized by a very different way of perceiving and interpreting one's experiences. At Kohlberg's Stage 2, for example, "right" and "wrong" are judged in terms of satisfying one's own needs and sometimes the needs of others if it is convenient to do so. Stage 3 type of reasoning centers around maintenance of approval in one's own social group. The orientation is towards conformity to group expectation. At the higher principled stages, reasoning takes into account concerns for the welfare of others in a broader context, and includes concerns for human dignity, liberty, justice, and equality—those very same principles upon which our Constitution is based.

Social Role-Taking Stages

The research of Robert Selman indicates that social role taking ability is a developed capacity which also progresses in a series of stages from early childhood through adolescence. Role taking is viewed by Selman in terms of qualitative
changes in the manner a child structures his, her understanding of the relationship between the perspectives of self and others.

Using the open-ended clinical method of inquiry first applied by Piaget and then later by Kohlberg, Selman has identified and defined Stages 0 through 4 (age range is approximately 3 years to 15+ years). These stages are referred to as: Ego-centric Viewpoint (Stage 0), Social-Informational Role Taking (Stage 1), Self Reflection Role Taking (Stage 2), Mutual Role Taking (Stage 3), and Social and Conventional System Role Taking (Stage 4). Descriptions of the role taking stages appear in Table 3. Each of Selman's role taking stages relates closely to and parallels Kohlberg's moral reasoning stages.

Selman views the social role taking stages as a link between Piaget's logical reasoning stages and Kohlberg's moral reasoning stages. Just as Piaget's logical reasoning stages are necessary but not sufficient for attaining the parallel moral reasoning stages, a similarly necessary but not sufficient relationship appears to exist between the social role taking stages and parallel moral reasoning stages.

As Selman has pointed out, "...the child's cognitive stage indicates his level of understanding of physical and logical problems, while his role taking stage indicates his level of understanding of the nature of social relations, and his moral judgment stage indicates the manner in which he decides how to resolve social conflicts between people with different points of view".

The Socio-Scientific Reasoning Model

Combining our own philosophy, ideas, and research with the theories of Piaget, Kohlberg and Selman, the socio-scientific reasoning model has been developed. Socio-scientific reasoning, as defined here, is the incorporation of the hypothetico-deductive mode of problem solving with the social and moral/ethical concerns of decision making. This model has served as a guide in the development of educational materials to help students advance to higher levels of thinking and reasoning capabilities. Moreover, it is highly flexible and readily adaptable to other classroom activities.

The basic assumption of this model is that effective problem solving requires simultaneous development in the realms of logical reasoning, social role taking, and moral/ethical reasoning. Purely objective scientific thinking cannot be applied in the resolution of most of the probable future conflicts without regard to the impact of those decisions on human needs and human goals. A technological solution, for example, may be, after critical analysis, feasible and logically consistent. From a societal perspective, however, one must question whether or not it should be applied. How to best prioritize our needs and evaluate trade-offs with a concern for the needs of future generations involves logical reasoning and critical thinking, but now with an added dimension...a social moral/ethical reasoning dimension.

Hence, the Socio-Scientific model consists of four interacting components (see Figure 1): (1) logical reasoning develop-

ment is based on the theories of Piaget, while (2) moral, ethical reasoning relies strongly on Kohlberg's ideas. Selman's research provides the basis for the third component, the social role taking aspects of our model. Since the content or information component of the problem (component four) will vary, so too will the concepts vary accordingly. For example, in our applications of this model we have concentrated on issues at the interfaces of science, technology, and society. Of course, problem issues could also deal with or focus on any other topic one chooses to investigate.

The content component also consists of three interacting subunits. These subunits—science, technology, and society—relate to and influence each other for their very existence. While each of the subunits is dependent upon the others, their individual underlying value structures create a high potential for discord since the concerns of one subunit often conflict with those of the

ROLE TAKING DEVELOPMENT
idea that at each stage there is a characteristic form of think-
ning capability which determines how experiences and inform-
ation are interpreted and acted upon.

The main strategy underlying all of these activities is based
on Piaget's concept of equilibration. It is only when disequi-
librium is created that active restructuring of thought takes
place. This active restructuring leads to growth in logical
reasoning, in social role taking, and in moral, ethical reasoning
capabilities as well.

Restructuring of existing cognitive structures occurs when
internal disequilibrium is felt by the individual. New expe-
riences and inputs which are not readily comprehensible to
the individual challenge his, her existing mode of thought by
revealing inadequacies or inconsistencies in that problem
solving strategy. Arrestment at a given stage is partially
explained by the developmental theorists as the lack of
opportunities that create conflict or dissonance which place
the individual in a position where he, she needs to assess
his, her particular mode of thinking. Perhaps, as Clive Beck
points out, the reason why people do not develop morally is
because they have not had the opportunity to entertain alter-
atives— their imaginations have not been extended.

We, in addition, contend that the reason people do not
advance in logical reasoning can also be attributed, to a large
degree, to a similar lack of opportunities.

We have identified some of the basic elements needed to
provide experiential opportunities that promote develop-
ment of problem solving and decision making skills. A partial
listing includes providing opportunities for students to:
- Encounter a variety of viewpoints
- Experience higher level reasoning
- Take the perspective of others
- Examine and clarify one's own ideas
- Examine the consequences and implications of one's
decisions
- Defend one's position
- Evaluate possible alternatives
- Consider and recognize the role of the self to society
- Reflect on one's own value system
- Test own ideas and those of others

One educational activity which incorporates some of these
elements is the classroom dilemma discussion, an activity
most commonly associated with Lawrence Kohlberg and his
colleagues. We have, however, modified and extended this
approach to more systematically encompass critical analysis
and evaluation of information and data. We have also
employed such other formats as role taking, simulations, and
futures forecasting and analysis methodologies.

For example, reasoning at a particular stage is not a value
judgment of whether an act is good or bad, but is the pattern
of the concepts entertained in judging the "ought" of rights,
duties and obligations of human relationships. Younger child-
ren at lower stages reason about duties in terms of reciprocal
benefits from the party— "If you do me a favor, I will do you a
favor." Whereas in principled reasoning, duty is what an
individual has become morally committed to do and is self-
chosen. Higher stage reasoning is therefore the ability to
apply value concerns (Kohlberg's major concerns include self
welfare, welfare of others, sense of duty and of motives,
conscience, rules, punitive justice, role taking) in a more

Application of the Socio-Scientific Reasoning Model
in the Classroom

The Socio-Scientific Reasoning model therefore serves as the
basis for identifying the types of learning experience and the
 sophistication level of those experiences important to help
students develop. It recognizes that learning capabilities
differ with age, grade level, interest, and learning needs.
Implicit in the model and in accord with stage theory is the
idea that at each stage there is a characteristic form of think-

ERI
internalized, complex, autonomous, critical, consistent and
generalized manner.

Effective discussion, however, cannot take place in a
vacuum. Needed also is an information base or context from
which students can begin to analyze and evaluate informa-
tion. With information which they have extracted and syn-
thesized, additional ideas and rational arguments can be de-
veloped for discussion. For curriculum activities, we have
created problem situations in a variety of contexts which,
according to scholars in a variety of fields, will be prominent
in the next quarter century and beyond. This adds another
perspective to the dilemma problem—that which elicits sci-
entific logical reasoning in addition to moral/ethical
reasoning—but in a futuristic context.

These serve as mechanisms for students to put some of the
ideas and judgments that have emanated from the discussion
into larger structural frameworks. They also provide students
with opportunities to project into the future, to think beyond
their own immediate experiences, and to consider the impact
of different decisions on future society.

Overview of Environmental Dilemmas: Critical Decisions for Society

Purpose
The purpose of this module is to introduce students to some current and emerging environmental issues. By posing problems and dilemmas encountered in today's world, students will gain an awareness and increased knowledge of contemporary concerns. They will have an opportunity to examine the impact of modern society's activities on the environment and natural resources and consider the future implications of those activities.

Moreover, they will begin to draw upon knowledge they have acquired and relate ideas/concepts from the various disciplines.

Through critical analysis of the issues, examining alternatives and scrutinizing potential consequences, it is anticipated that students will improve those abilities important in effective decision making. They will be living in a world where human activities from the personal on up to the government policy making level exert increasing pressures on the environment. They will construct tomorrow's world — we must prepare them for that responsibility.

Strategy
The dilemma debate/discussion is the main focus of student activity in Environmental Dilemmas: Critical Decisions for Society. Hypothetical dilemma situations are used to highlight and heighten the issues. It has been found that the dilemma discussion format can more personally involve students and demonstrates more sharply the relevancy of the issues to their lives.

It is our belief, however, that background information and some basic scientific knowledge are prerequisites to meaningful discussion. That is, discussions in a "vacuum" offer no new understandings. For each dilemma, associated readings will provide a sketch of the current types of research being conducted, methods used to obtain new knowledge, ways in which the knowledge is applied, and new choices that have become available for ourselves and future progeny. Many of the dilemma situations are adapted from actual case histories while others, though hypothetical, are possibilities of the near future. This dilemma discussion approach will require an active role on the part of the students, each having to take and defend his/her position and consider implications of that position. In this way the level of relevancy is heightened when students can begin to understand the importance of wise and responsible environmental decision making and the present and future questions that they need to address.

The dilemmas, as presented, are simple in form but can be developed with increasing complexity depending on the intellectual and conceptual potential of the students as well as their interest and curiosity. Depending on the subject area or course, the concepts and concerns of economics, sociology, history, politics, biology, religion, etc. might be further developed. Drawing relationships from what is learned in the course will inevitably make students' learning more meaningful and applicable.

Structure of the Module
Components of the Student's Manual:
Introductory Reading
Dilemma Story
Samples of Student Responses
Questions
Culminating Activity

Environmental Dilemmas: Critical Decisions for Society contains a series of twelve dilemma stories — each dealing with a critical issue concerning science and technological applications and environmental effects. The dilemmas are essentially brief stories that pose a critical decision to be made by the main character. Each situation is intensified to stimulate students to express their opinions and partake in the dialogue. The choice to be made revolves around the moral/ethical issues of the situation, and it is the moral/ethical implication that provides the thrust for the discussion. Within each dilemma two or more basic moral issues are in conflict. Table 4 identifies the issues emphasized in each of the dilemmas.

Although the dilemmas involve individuals, we have constructed the different dilemmas to reflect decisions having effects at the personal, community, national and global levels. In this way students can begin to expand their understanding as well as consider the implications of decisions from a variety of perspectives.

Preceding each dilemma are relevant readings or case studies to provide students with a basic background of information regarding the environmental issue presented in the dilemma. The readings are intentionally brief so that students need not be encumbered with details. However, "pro" and "con" arguments are included to help students better understand the points of contention.

A series of questions follow each dilemma. Students should consider these questions to help them determine why the central character should take a particular action. The questions are also useful in guiding classroom discussion, generating additional ideas about the issue or investigating other ideas associated with the issues. The questions, in essence, are intended to stimulate thinking about the issues and have students confront ideas they have not previously entertained.

In addition, "Samples of Student Responses" accompany each dilemma. These represent some of the positions taken by typical students and the reasons they offer. They characterize different moral reasoning stages. The sample responses are useful to help stimulate controversy and engage students in the discussion. By critiquing these responses, students can begin to formulate their own ideas.

The sample responses may also be used as a basis for forming the small discussion groups. After the students have read the dilemma and the three sample responses, ask for a show of hands — for example, those who agree with "Bob's response," "Carl's response," or "Jane's response." Students who make the same selection can then be grouped together to discuss their reasons for that choice. The arguments presented in the sample responses serve as a focal point from which students can develop additional arguments.
Or, groups may be formed based upon students selecting the sample response they disagree with most strongly. In this case, the group members will provide counter arguments to the response selected.

The dilemmas, as presented, are simple in form but can be further developed by the teacher with increasing complexity, depending upon the intellectual and conceptual level of the students as well as their interest and curiosity. The subject area or course(s) in which this module is taught will determine the ways in which many of the concepts might be further developed. Drawing relationships from what is learned in the course will inevitably made students' learning more meaningful and applicable.

As a culminating activity for the module, students have an opportunity to develop their own set of guidelines for environmental policy. Their guidelines should begin to address questions regarding environmental quality and how to best insure a quality environment for future generations. How must people change or alter their behavior so that resources are used with care and with consideration for society at large? This activity should provide opportunity for students to project into the future, develop their ideas on what is desirable and necessary, and examine and reflect on their concepts about the relationship between human society and the total environment.

Objectives of Module

- To increase student knowledge of environmental issues.
- To increase student ability to analyze environmental issues.
- To increase the moral/ethical reasoning ability of students.
- To increase the decision-making skills of students relative to environmental issues by considering a range of alternative solutions.
- To increase student awareness of potential conflict of interests on environmental questions.
- To increase student understanding of such concepts as resource allocation and scarcity; the relationship of human society to the ecosystem; environmental change, population and growth and the relationship to social, cultural, political and economic activities; government controls, justice, life; and society's increasing ability to impact upon the operation of these concepts.
- To increase student ability to recognize future problems in our environment.
- To increase student ability to develop and present effective arguments in a logical and comprehensive manner.
- To increase students understanding of the increasing importance of science and technology in their lives.
- To enable students to more critically examine their value systems.
- To enable students to effectively integrate technical and social aspects of environmental problems.
- To increase student self-esteem and ability to communicate and function more effectively in classroom discussions.

Environmental Dilemmas: Critical Decisions for Society in the School Curriculum

This module designed for the senior high grades (grades 10-11) has been used in a variety of subject area courses. The courses in which this module would be particularly useful include: civics, history, biology, chemistry, environmental science and earth science. In a civics course the concepts of law and social justice can be explored in light of new developments where laws do not exist or are conflicting or ambiguous. For instance, in regard to solar energy and its use, one might investigate whether or not "laws protect our rights to unobstructed sunlight." The use of nuclear power presents the question of international regulations on the disposal of uranium waste and the use of uranium by-products for nuclear weapons. In an earth science course one might pursue the question of how human activities change the surface of the earth and the effect of those changes on natural cycles. These are only a few examples of the range of possibilities available for relating dilemma discussion to an existing course curriculum.

The dual purpose of this module is to provide insight into environmental problems and to emphasize the moral/ethical issues that interact in decision making. Both elements are necessary for effective decision making and problem solving in society today and in tomorrow's world. Hence, this module is designed with flexibility in mind so that teachers can with ease incorporate the materials into his/her ongoing program. While a "recommended" approach is provided in this teacher's guide the dilemma discussion format can be adapted or modified in a variety of ways such as role play simulations, a formal debate or a community survey.

All of the dilemmas may be presented as a single continuous activity unit spanning several class periods, or the dilemmas may be interspersed throughout an existing course of study. In the latter case, a dilemma is introduced when the topic relates to a particular concept being studied. All the dilemmas may be used or a portion may be used. The dilemmas may be assigned to all the students or divided among small groups of students. The module is intended to provide another dimension to the existing course or to "stand on its own" as a self-contained mini course.

The dilemmas can also serve as a "springboard" for teachers to develop additional dilemmas for their classes. It is often the case that many of the best dilemmas are developed spontaneously from the materials that are part of the ongoing coursework. Having used these dilemmas, teachers can better understand the intent and value of dilemma discussions and begin to recognize other problematic situations that confront society. The questions of relevancy and meaning can be bridged when specific information is related to its impact on our lives and the more global effects on the future of man.

All important in this strategy is to engage students in the consideration of problems and new concerns that arise from this age of science and technology. How to best apply our new knowledge requires great wisdom which educators can nurture and develop in the classroom.

* These basic moral issues as identified by Kohlberg comprise the underlying elements of a conflict situation involving a moral decision. Our dilemmas were constructed to incorporate two or more of these issues. Dilemma resolution requires a choice or action to be made between conflicting issues. For instance, in a dilemma dealing with the issue of governance and social justice, the questions surrounding the issue of governance include: 1) Should one accept or reject the authority of the governing body? 2) What are the characteristics and responsibilities of good government? The social justice issue raises the questions: 1) Should one defend or violate the political, social and economic rights of another person? 2) What are the bases of these rights?

### A Note About the Readings

The readings associated with each dilemma have been selected on the basis of clear presentation, comprehensiveness in the coverage of issues and reading levels suitable for the middle secondary grades (9-11). Despite efforts to maintain the reading levels within this range, some of the readings may exceed these levels. This reflects the complex and often subtle nature of these issues and the many different concepts contained within each issue. Because of these complexities and the fact that many scientific problems are not discussed in publication directed to the lay public, readings containing technical jargon and concepts have been unavoidable.

Furthermore, it is our belief that reading level indices are but crude indicators of what can be easily read by students at a given grade. There is also a difference between the ability to read words and the understanding of concepts. We, therefore, cannot begin to emphasize the importance of the teacher in guiding the students through these readings and insuring that the concepts are comprehended. Only the classroom teacher can best assess the capabilities of his/her students and provide the necessary instructional activities.

We encourage the teacher to study each of the articles carefully and review the glossary to determine what possible difficulties students might encounter. It may be helpful to review some of the more sophisticated concepts and technical terms as a class exercise prior to the dilemma discussions. Additional activities, audio-visual presentation, outside research can all help to enhance student knowledge and interest. A clear understanding of the issues and concepts will prove to be invaluable in the subsequent group discussions.
Conducting Dilemma Discussions In The Classroom

Since dilemma discussion may be a new classroom technique, its major characteristics, the basic guidelines, and some helpful suggestions will be described. There are no hard, fast rules for leading dilemma discussions. Most important is that both teacher and students feel comfortable participating in the activity. The following guidelines are merely recommendations drawn from experiences of persons who have conducted moral dilemma discussions in the classroom. These may or may not meet the entire requirements of your particular situation and needs. Adjustments and changes may be necessary so that the dilemmas and discussion format correspond to the intellectual level and interests of your students.

Basic Steps in the Process
The five basic steps in conducting a dilemma discussion as outlined by Kohlberg and his associates are as follows:

- Presentation of the dilemma
- Selection of alternative positions
- Small group discussions
- Class discussion
- Summary and closing of discussion

Background Information—In our materials we have included an additional component—an information base. See Diagram 1, Schema for Dilemma Discussion. This background information will provide students with at least a basic understanding of the issues contained in the dilemma and therefore the substantive content which can be used to develop the discussion. Moreover, the background materials serve to bridge the gap between the real world and the hypothetical dilemma situation. Hence, the dilemma will be construed not simply as a story, but as a reflection of real societal concerns and values moral conflicts that arise from our scientific technological activities. Readings or other activities should therefore stimulate thinking and assist students in the formulation of their personal views regarding the action that the main character(s) in the dilemma should take.

The background information provided is by no means extensive, and you may find it desirable to include additional materials as the need arises. If you have readings or exercises which you feel are more suitable for your students, do not hesitate to substitute or supplement what has been included here. In addition, it may be necessary to discuss in class some of the more sophisticated concepts and technical terminology to ensure that students have an understanding of the basic issues.

Our desire is to avoid encumbering students with too much technical detail and information. Nonetheless, some classes may wish to pursue certain topics in greater depth and should be encouraged to do so. From our experience, additional research on the part of the students helps to generate a livelier exchange. In defending a particular choice, students may hesitate to bring up in a larger grouping for fear of ridicule or "put-downs."

Homogeneous Grouping—The small discussion groups (four to six students) may be formed in a number of ways. From a show of hands or written answers students who vote "yes" or "no" on the question can be identified and grouped according to their position. There should be enough heterogeneity among class members to create division in the question and formation of the small discussion groups.

Small groups where members hold similar positions would provide a more congenial atmosphere for initiating discussion. Here the students will feel less threatened if their peers share the same action decision and be more willing to contribute to the conversation. The membership would be more supportive, and individuals would not sense a fear of attack or failure.

Heterogeneous Grouping—In another format, students may be arbitrarily grouped. Here they have the additional task of evaluating, analyzing, critiquing and challenging the reasons given in the alternative choices. In this approach the degree of controversy is heightened, creating the potential of generating a livelier exchange. In defending a particular choice, the student will need to come up with more convincing reasons in order to persuade the others to support his/her side. Or the group might begin by using a "brainstorm" session and generate a series of supporting reasons for the different positions. These responses can then be examined and compared with one another. Through an elimination process, the group can select the more compelling arguments for each position.

Therefore, by proceeding from a simple situation, it is possible to increase the levels of complexity in a step-wise fashion with appropriate questions.

Provocative questions can also help students reflect on how they might be affected by certain decisions or policies and their roles as future decision-making citizens.

Presentation of the Dilemma—After the students have read the introductory material as a classroom or homework assignment, the dilemma can be presented. The dilemma may be read to the class as a whole, or else, each student can read the dilemma for himself, herself. At this point you may wish to determine if the students fully understand the dilemma. This can be identified by asking:

- Do you feel that this is a hard question to answer?
- Will someone please summarize the situation?
- What things might the main character have to consider in making a choice?
- What are the main points in the conflict?
- Who would be primarily affected by the decision?

Small Group Discussion—It is usually recommended that dilemma discussions be first conducted in small groups followed by discussion with the entire class. Students often are more willing to speak out in small rather than large groups. It offers individuals greater opportunity to speak out as well as places more responsibility on each person to contribute to the group's activities. The sense of informality in a small group allows for entertaining unique or unusual ideas that students may hesitate to bring up in a larger grouping for fear of ridicule or "put-downs."

Diagram I. Schema for Dilemma Discussion. This back-
Whatever grouping strategy you decide to employ, all the groups should focus on the moral issues of the dilemma. To more personally involve students in the group discussion have them first express their feelings about the dilemma. Some preliminary questions for consideration might include:

- What issues in the dilemma are hard to talk about? What makes them difficult to discuss?
- Can you foresee yourself having to make such a decision?
- Do you know anyone who has had to make a similar decision?
- Have you recently read any news articles about similar dilemmas?
- How do you think you would feel if you had to make such a decision?
- When you have a problem, how do you think it through?

Once the students become comfortable with the discussion format, they can then begin to critically discuss the position taken and the supporting reasons. They should consider the adequacy of the reasons given as well as the adequacy of their own reasons. After stating comparing and evaluating each of the reasons, they might select two or three of those that they believe best support the position taken on the dilemma issues. Each of the dilemmas contains two or more major moral issues. It is important that the students recognize the issues within a dilemma and direct their attention to the issues and not to the irrelevant aspects of the dilemma (i.e., speculating on the reality of such a situation).

If a group has difficulty in getting started or if discussion begins to lag, the teacher can interject a probe question or two to activate conversation. (See the discussion below on the different types and uses of probe questions.) Sample probe questions are listed at the end of each dilemma and may be used selectively as needed. It is often useful to have students answer a few of probe questions as a written assignment prior to the group discussion. In this way, students have time-and-opportunity to reflect on the issues and become more constructive contributors to the dialogue.

A recorder should be selected to list the group's conclusion to be presented in a written or verbal form for the entire class discussion.
Class Discussion  The entire class reconvenes to hear the comments made in the various groups. The discussion results of each of the groups are presented for the entire class to examine. They might be best displayed on the chalkboard or overhead projector. This procedure presents the opportunity for students taking opposing views to ask questions and challenge the different viewpoints. Again, the adequacy of the reasons are critically analyzed and merits of each discussed. Students reasoning at lower levels will be exposed to higher level reasoning and discover that their reasons may not have taken wider implications into consideration and hence be less appropriate for resolving the conflict.

The class as a whole can then choose the best reasons for each position. You will find that although students may not be able to generate higher level reasons they will tend to prefer reasons one stage higher than their own.

The class discussion is most fruitful if the discussion guides students to explore ideas they have not considered and to think about those higher level reasons. This can be accomplished through the use of probe questions. There are basically seven types of probe questions:

1. Clarifying probe. Asking student to explain what he, she means in his, her statement. "What do you mean when you say that concealing evidence is immoral? What is the meaning of immoral?"

2. Perception checking probe. Determining whether student understands a statement made by another individual. "Please explain to me what Joe has just said.

3. Issue specific probe. Examining student's thinking on the major issues (Kohler has identified ten that underlie moral reasoning—see Table 4). "Why should the government establish standards for air quality? What should good guidelines take into account?" (Issues: governance and law)

4. Inter-issue probe. Resolving conflict when two or more issues appear to be at odds. "Should a richer country be allowed to use a greater share of the earth's resources?" (Issues: social justice, life, property)

5. Role switch probe. Placing student in the position of someone involved in the dilemma. "What would you do if you had to make that decision?"

6. Universal consequences probe. Considering the implications of the judgment made when applied to everyone. "What might happen if every household were required to reduce its use of electricity by 30%? Is it fair to place such demands on everyone?"

7. Reason seeking probe: "How did you come to this conclusion?" or "Why?"

Questioning along these lines will lead students to broaden their scope of thinking and to evaluate effects and consequences of different solutions. It offers them an opportunity to see how others might think about the same issue and challenges them to consider the many sides of an issue.

Probe questions can also be used to develop alternative dilemmas or introduce more abstract ideas by increasing the complexity of the dilemma. For instance, a dilemma involving personal sacrifices in a gasoline rationing situation might be extended to consider social and life-style changes in our highly mobile society. How should transportation fuel be best allocated? Does private and public interest conflict if gasoline were rationed? Dilemmas of an inter-personal nature can thus be presented from a community, national or even inter-global perspective to stimulate thinking about future implications for human society.

Skillful questioning becomes the tool to aid students to think critically analyzing the positions they take and the values inherent in their position. They should begin to discover the significance of their principles by relating those principles to specific decisions and situations. Is government severely limiting our freedom of choice when it enacts safety regulations? What should freedom mean? What is the relationship between freedom and responsibility? What should be the role of government in protecting the health and welfare of future society? The constant interplay between the abstract principles, concepts and specific instances is pertinent in making the dialogue a thoughtful, meaningful exercise. Students need to understand concepts on their own terms before they can integrate new concepts and ideas into this thought structure. The process of development is one where students actively experience (or think about) new ideas which in turn interact in restructuring the form of thinking.

Discussion should also include analysis of the information and facts given. How does the information influence the decision? What is inferred from the information presented? Were the facts provided sufficient for informed decision making? What additional information is desirable? How might one go about acquiring additional knowledge? On what basis does one sort out and analyze the facts given? To what degree does the information influence the decision towards one position or another?

Finally, the consequences and implications must be appraised. This is the test of the effects of the position taken; again values are weighed. What values are held? What makes them desirable? What are the priorities? How is the nature of human society perceived?

Closing the Discussion — The discussion can be closed with a simple summary statement of the major points made. This summation will help the student bring together the ideas entertained during the discussion into a new focus. One approach is to write down the list of the major reasons/arguments "pro" and "con". The reasons most preferred by the students can be indicated, or the reasons can be ranked ordered.

The different positions on the dilemmas should not be judged for that would imply a correct answer. A "right" answer would also defeat the purpose of future discussions; students will try to "second guess" the optimum position response. However, at this time the students should have another opportunity to choose reasons they personally prefer or find most persuasive. This decision need not be openly declared. Suggest that the students examine their original reasons after hearing the other comments. What might they wish to change or add?

It may be appropriate at this time to point out some actual situations that resemble the hypothetical dilemma. How were they resolved and what were some of the results? Students may begin to notice analogous dilemmas that are currently making the news headlines. It is a good idea to take every opportunity to relate concepts discussed in class to the students' personal experiences and levels of interest.
Some General Guidelines for Dilemma Discussion

Dilemma discussions should flow naturally and comfortably. However, when students have had little exposure to open-ended types of discussions, it is often difficult to engage them in in-depth exploration of an issue. The following are some pointers that might be useful in stimulating discussion.

Goals of Moral Discussion—Barry Beyer, who has written extensively on moral discussion techniques, has pointed out that the goals of moral discussion should contribute to the overall objectives of the course and general educational goals, in addition to introducing new ones. Hence these goals are general rather than narrow in nature. Among these are: 1) improving learning skills, 2) improving self-esteem, 3) improving attitudes toward school, 4) improving knowledge of key concepts, and 5) facilitating stage change.

An important teaching strategy is to encourage students to think about and reflect on alternatives and consider different ideas. The process of development includes extending one's imagination and exploring one's thinking.

Classroom Atmosphere—Every effort should be taken to create an atmosphere conducive to an open, free exchange of ideas. Students should feel at ease when expressing their thoughts and, when confronted with challenge, not feel that they are being attacked personally. The emphasis is on analyzing the reasoning process by considering divergent viewpoints and alternative choices. It would be stressed that no one answer is correct or absolute; each position has merits and invites investigation.

Classroom furniture should be arranged in such a way that students can speak directly with one another and can be easily heard. For small group discussions the chairs might be arranged in a number of small circles so that attention can be given to all members of the group with-out delineating an authority focal point. The seating should also offer some degree of flexibility so that students might be able to shift groups or share their thoughts with members of other groups. A student who is uncomfortable with one group or who wished to take the opposing position may want to move to another group.

Role of Teacher—The teacher's crucial role in dilemma discussions is that of a creative process facilitator whose function is to stimulate students' searching and "stretching," and help students embark on their own personal search. A key skill lies in sensitive listening. By listening with care and delaying action the teacher can begin to:

- Identify problems that students may have in coming to grips with the issues—do the questions need further clarification?
- Identify students who monopolize or dominate the conversations;
- Find students who are hesitant in expressing their ideas;
- Prevent the discussion from becoming a clash of personalities;
- Find when the discussion begins to lag or focuses on irrelevant details, etc.

By posing questions to the group or certain group members, the teacher can then provide helpful guidance or gently direct the course of the discussion.

At all times it is important that the teacher be supportive and reinforce in a positive manner. Students should not be singled out as having given particularly "good" or "bad" answers. Each response should be taken as a point of departure for further discussion. The question "why" should be the dominant concern.

Some degree of structure in a discussion is necessary but structure should never hinder the flow of ideas. Probe questions can serve as the guiding structure, but they need not be taken in any order or progress in a stepwise fashion. For a given group of students some questions may stimulate more interest or controversy than others; the less fruitful questions, therefore, need not be pursued.

Promoting student to student interaction is another major role of the teacher. Requiring insight and patience. The discussion process is an evolutionary one, often requiring much time before a definitive direction can be perceived. At times it may even appear that the discussion is circuitous, but it is imperative that each student has the opportunity to air his/her views and partake as an active member of the group. The student, when he/she becomes confident in himself/herself and recognizes the worth of his/her ideas, will then accept the responsibility of his/her role in the group as well as become more receptive to the ideas of others.

Characteristics of Dilemma Discussion

- **Open-ended approach:** There is no single "right" answer. The goal is not to reach agreement but to critically discuss the reasons used to justify a recommended action. The emphasis is on why some reasons may be more appropriate than others.
- **Free exchange of ideas:** Students should feel comfortable in expressing their thoughts. Each student should have an opportunity to contribute to the discussion within a non-judgmental atmosphere.
- **Student to student interaction:** The conversation is primarily between student and student, not teacher and student. The teacher uses questions to guide the discussion and to encourage students at adjacent stages of moral reasoning to challenge one another. Lecture or recitation should be avoided.
- **Development of listening and verbal skills:** Each student should be intimately engaged in the discussion activity, building and expanding on one another's ideas as well as examining each response critically.
- **Focus on reasoning:** Reasons are to emphasize the prescriptive "should" rather than the "would" arguments.
- **Dilemmas produce conflict:** Conflict heightens student involvement and interest and should have a personalized meaning for the student. Resolution of internal conflict is a precondition for advancement to higher stage reasoning.

Helpful Hints

- Review carefully the dilemma to be discussed in class and try to anticipate any problems that students might encounter when dealing with the dilemma.
- Identify the main issues and list a few questions that might help clarify the issues for the students (particularly, how these issues might relate to the students' lives).
- Determine if there are words or concepts that may be unfamiliar to your students. These should be defined and
discussed so that the students do not become overwhelmed by the terminology and can more easily grasp the essence of the problem.

- If you have readings which you feel are more pertinent or appropriate, use them in place of those included here.
- Consider whether or not the dilemma poses conflict for your students. It is often possible that the dilemma as written is either too sophisticated or too simplistic, and the students cannot appreciate the implicit conflict. The dilemma question might be reworded or altered in order to elicit a division of opinion among the students.
- When presenting the dilemma story make sure the students understand the problem and the goal of the discussion activity. This can be accomplished by having a student summarize the story and list some of the possible alternatives available to the main character(s).
- If a class is not accustomed to discussion-type activities, it might be wise to group the students in such a way that those who are more vocal and aggressive do not dominate or monopolize the discourse. Try to balance each group with different personality characteristics.
- When the discussion has difficulty getting started or gets bogged down, have the students role-play the main character. The shift in focus can assist them in gaining additional perspective into the situation.
- Try not to be too impatient if the discussion does not seem to go anywhere. As in any other type of group interaction, some warm-up time is necessary so that students can relax and reflect on their own thoughts.
- Students may continually look to you as teacher for direction and "correct" answers. When asked a question you can shift the attention by posing that question to another student and seek his/her opinion. In this way the dynamics of student interaction can be maintained.
- Tape recording some of the student dialogue may be useful as an evaluation tool to help organize future discussions and suggest additional probe questions.
- It is important that the discussion does not drift aimlessly or become a clash of personalities. Skillful interjection of probe questions will provide direction to the group discussion; therefore, become familiar with the different types of probe questions so that you can use them with fluency.

Questions Commonly Asked

* In order to lead dilemma questions, do teachers need to identify the stage at which a student reasons?

No, there is usually enough heterogeneity within a classroom so that several stages of reasoning are represented.

* What if everyone in the class takes the same position?

This does not present any difficulty. The particular position taken is not important; what is important is the argument used to support the position. The different levels of reasoning on the dilemma should provide sufficiently lively debate. Students can also be asked to put themselves in the other position and develop arguments to support that position.

* Should students be required to give reasons for their decisions?

No, if reasons are not volunteered, you can simply ask another student to comment. The debate should not be forced but evolve naturally.

* How does one detect student growth?

Development is a slow process and a limited number of classroom dilemma discussions is not expected to advance students from one stage to the next overnight. However, students having experienced a diversity of alternative ideas should begin to develop an increasingly more global orientation and consider the different aspects of a problem.

* Will a student reasoning at higher levels regress and accept the reasons of a more forceful lower stage argument?

No, regression is not consistent with the stage theory. Persons reasoning at higher stages will see their argument reinforced as the discussion continues. Their reasons can deal more effectively with the question over a broader variety of situations, lower stage reasons begin to fall short. Studies have demonstrated that higher reasons are preferred over lower reasons.

* How long does one continue the discussion?

Discussion should continue for as long as it is fruitful and students continue to display a level of interest and involvement.

* Is the object of the discussion to convince the class to accept higher level reasons?

No. Simply "parroting" higher stage reasons does not effect or indicate growth. A stage reflects one's dominant mode of thinking on moral issues, one that is utilized. The purpose of the discussion is to provide new exposures and create a state of disequilibrium so that individuals begin to rethink and restructure. Discussion facilitates the course of development, it does not dictate it.

---

CULMINATING ACTIVITY (OPTIONAL)

Student Development of Guidelines for Environmental Policy or a Code of Environmental Ethics

After completing this module, you may wish to try the following activity.

This final activity can serve as a mechanism for students to put some of the ideas and judgments that have emanated from the dilemma discussions into a larger structural framework. The concerns of each of the dilemmas can be focused on a wider dimension and tied together under a series of prescriptive statements on how society ought to act. It further requires students to project into the future and summarize the implications our activities have on future society and our natural environment. “What kind of society do we want for the future?” “What ethical guidelines do we need to achieve this?”

The guideline statements can be developed by the class as a single group, in small groups, or as an assignment for each student. Alternatively, the class might be divided into small groups, each selecting a section to develop.

The guidelines may be written for one or more areas of concern. The following is a sample outline for water conservation and includes some introductory questions. However, it is expected that during the course of discussion students have formulated some ideas about preferred types of actions/behaviors.

The exercise can be more or less extensive. It may simply consist of a series of short statements but should reflect some in-depth thinking on the part of the student.

Policy Guidelines for Emergency Water Conservation in My Community
(e.g., the water supply is down by 40% and measures must be taken to conserve water)

Possible ideas for consideration:

1. Who cuts back?
   Where can the greatest cutbacks be made? (Homes, businesses, industry, farms, recreation, hospitals or schools?) What group uses the largest amount of water? What group can best afford to reduce consumption? Is there a category where large cutbacks cannot be made?

2. Equalizing the sacrifice
   What is the most equitable way to determine the water allowance? (E.g., if households are asked to cut back by 40%, is the person who previously used large quantities of water, such as taking 30-minute showers or watering the lawn daily, giving up as much as someone who uses very little water?)
   Should a uniform set allowance be imposed on everyone? Are there some people who have greater need for water? (Will those who can afford it simply go out to eat and not use the water for cooking and dishwashing? Or go to their private club to shower? Or buy bottled water brought in from elsewhere?)

3. Decision-maker
   Who should make the decision on the amount of cutback for each category of users? Public vote? (What group is in the majority - businesses? industry? homeowners? Whose interest would be advanced?)
   The mayor? (What if he is the owner of a large paper mill in town?) The Water Company? (Will its large customers be favored?)

4. Regulating the rationing
   Should the cutback be voluntary or strictly monitored? How will offenders be disciplined? By fines, imprisonment? (If fines are imposed, will the rich really be affected?)
   Who will be responsible for regulating the cutback?

5. Effects
   Will individual privacy be jeopardized if someone is monitoring how people use water? Will some people be unfairly penalized? (E.g., car-wash or laundry businesses)

Some other topics for policy guidelines might include:
   A personal environmental action guide; Ethics toward the natural environment; A Bill of Rights for animals; Controlling chemical pollutants in the air or water; Allocation of scarce resources (energy, gasoline, etc.); Disposal of toxic wastes (chemicals, radioactive materials, etc.); Ownership of beaches or lakes; Food for famine-stricken countries; Industrial safety; Development of land.

APPENDIX

Stages of Moral Development

PRECONVENTIONAL LEVEL

At this level the child is responsive to cultural rules and labels of good and bad, right and wrong, but interprets the labels in terms of either the physical or the hedonistic consequences of action (punishment, reward, exchange of favors) or in terms of the physical power of those who enunciate the rules and labels. The level is divided into the following two stages:

STAGE 1

The punishment and obedience orientation. The physical consequences of action determine its goodness or badness regardless of the human meaning or value of these consequences. Avoidance of punishment and unquestioning deference to power are valued in their own right, not in terms of respect for an underlying moral order supported by punishment and authority (the latter being stage 4).

STAGE 2

The instrumental relativistic orientation. Right action consists of that which instrumentally satisfies one's own needs and occasionally the needs of others. Human relations are viewed in terms of those of the market place. Elements of fairness, of reciprocity, and of equal sharing are present, but they are always interpreted in a physical, pragmatic way. Reciprocity is a matter of "you scratch my back and I'll scratch yours," not of loyalty, gratitude, or justice.

CONVENTIONAL LEVEL

At this level, maintaining the expectations of the individual's family, group, or nation is perceived as valuable in its own right, regardless of immediate and obvious consequences. The attitude is not only one of conformity to personal expectations and social order but of loyalty to it, of actively maintaining, supporting, and justifying the order, and of identifying with the persons or group involved in it. At this level, there are the following two stages.

STAGE 3

The interpersonal concordance of "good boy - nice girl" orientation. Good behavior is that which pleases or helps others and is approved by them. There is much conformity to stereotypical images of what is majority or "natural" behavior. Behavior is frequently judged by intention; "he means well" becomes important for the first time. One earns approval by being "nice."

STAGE 4

The law and order orientation. There is an orientation toward authority, fixed rules, and the maintenance of social order. Right behavior consists of doing one's duty, showing respect for authority, and maintaining the given social order for its own sake.

POSTCONVENTIONAL OR PRINCIPLED LEVEL

At this level, there is a clear effort to define moral values and principles which have validity and application apart from the authority of the groups or persons holding these principles and apart from the individual's own identification with these groups. This level again has two stages, which are as follows.

STAGE 5

The social-comitant legalistic orientation. Generally welfare utilitarian overtones. Right action tends to be defined in terms of general individual rights and standards which have been consistently held and agreed upon by the whole society. There is a clear awareness of the rationality of personal values and opinions and a corresponding emphasis upon procedural rules for reaching consensus. Aside from what is constitutionally and democratically agreed upon, the right is a matter of personal "values" and "opinion." The result is an emphasis upon the possibility of changing law in terms of rational considerations of social utility (rather than freezing it in terms of stage 4 "law and order"). Outside the legal realm, free agreement and contract is the binding element of obligations.

STAGE 6

The universal ethical principle orientation. Right is defined by the decision of conscience in accord with self-chosen ethical principles appealing to logical comprehensiveness, universality, and consistency. These principles are abstract and ethical (the Golden Rule, the categorical imperative), they are not concrete moral rules like the Ten Commandments. Instead, they are universal principles of justice, of the insobriety and equality of human rights, and of respect for the dignity of human beings as individual persons.
