This publication, the third in a series of modules designed for paraprofessionals working with handicapped children, presents objectives and related activities for three competencies in behavior management. The first competency, on the definition and underlying concepts of behavior management, focuses on the application of behavior management principles to everyday life and learning situations. The second competency addresses the role of the paraprofessional in behavior management, with objectives centered on the importance of self-awareness, observation and recordkeeping. The final competency deals with specific behavior management techniques (ignoring, signal interference, proximity control, interest boosting, humor, hurdle lessons, restructuring, routine, values clarification, removal of seductive objects, antiseptic "bounce," and physical restraints.) Activities and test questions are identified for each of the module's objectives. (CL)
BEHAVIOR MANAGEMENT

Training Module

SUGGESTIONS FOR CONDUCTING TRAINING SESSIONS

Before the Training Session

1. Familiarize yourself with the module. Read the module in order to learn the content of the module. Be familiar with the contents (activities and directions) to prevent stumbling during the training session.

2. Find out the needs of the trainees, their strengths and weaknesses and the amount of time you will have for training.

3. Adapt the module to fit the needs of the trainees and the time designated for training (e.g., four one-hour sessions, two four-hour sessions). Decide which parts of the module you will use.

4. Schedule a location for the training session. Be sure the room will lend itself to training activities—e.g., blackboard or chart; room can be darkened, enough seating and space for trainees, location of outlets.

5. Decide which audiovisual materials (films, videocassettes) will be needed so that they can be ordered.

6. Reserve audiovisual equipment needed. If possible, check to see that it works. Remember special items such as adaptors, extension cords, take-up reels, extra projector bulbs.

7. Adapt and/or reproduce all handouts needed. If possible, color code them for clarity.

8. Revise the training format to reflect your own training style and presentation plans. Make notes in the margins next to the activities.

9. Become familiar with local resources. Identify agencies, consultants, etc., to inform trainees of local contacts.

10. (Optional) Obtain folders or notebooks for trainees' handout materials. Handouts tend to get scattered if not kept in one place.

11. Review, if necessary, some basic principles of adult learning and training techniques.

12. Develop or adapt an evaluation form to use at the completion of the training session.
During the Training Session

1. Set the stage. If trainees do not know each other, use a few introductory ice-breaker activities at the beginning.

2. Use relaxed training approach. Create a "learning can be fun" attitude to help trainees feel free to participate.

3. Provide in-house rules if appropriate—e.g., use of the bathroom, getting coffee if it is provided, etc.

4. Review the handouts, if they have been given as a packet of materials, to ensure trainees have all of them.

5. Have all the materials needed for training on hand—e.g., magic markers, newsprint, chalk, audiovisual equipment, handouts, etc.

6. Elicit participation from trainees as soon as possible.

7. Observe the trainees for signs of involvement or lack of involvement. Be attuned to their needs and build in short breaks or change of pace of the activities.

8. Be aware some trainees may monopolize the discussion or digress from the subject. Trainer should include all trainees in discussing and help them adhere to the topic.

9. Introduce audiovisual presentations with preview questions to provide the trainees with guides for viewing the audiovisuals.

10. Make notes as you proceed to help in planning future training sessions. Note areas of confusion, activities that may need to be revised.

11. Use an evaluation form at the end of the workshop to obtain feedback from the trainees.

After the Training Session

1. Straighten the room—e.g., erase the blackboard, empty ashtrays, turn off the lights.

2. Return borrowed audiovisual equipment and materials.

3. Follow-up on requests for additional information from trainees.

4. Incorporate trainees' comments from the evaluations into future training designs.
5. Do a self evaluation of the workshop. What were its strengths and weaknesses?

6. Complete workshop correspondence. Write thank you letters to any consultants used in the workshop.

7. File the training design and a roster of participants so that you will have it available if needed.

</tbody>
</table>
What Is Behavior Management

Participants are asked to state words or brief concepts which convey their belief or idea of behavior management. Trainer records every comment on chalkboard or newsprint. Comments may include:

- punishment
- way to control
- help child's self-concept
- helping a child learn right from wrong
- correction
- setting limits
- showing love
- setting a good example
- helping children learn to accept criticism
- help children get along
- self-respect and respect for others
- guiding children

The trainer should comment upon those ideas which relate to the definition of behavior management. Ask participants to provide examples of their concept/idea.
Definition of Behavior Management

Note to Trainer:

Participants should be supported for working so hard on these tasks. The reason for spending time orienting participants to the meaning of behavior management utilized throughout this module is to dispel apprehensions many persons have about behavior management. These apprehensions are usually related to using behavior management and behavior modification as meaning the same thing.

Recognize, indeed, that many "experts" use the terms behavior management and behavior modification as synonymous. Review some of the negative connotations frequently associated with behavior modification, for example, controlling/manipulating behavior; lack of free will and choices; developed by psychologists using rats/pigeons, etc.

A single accepted definition of behavior modification does not exist. To many behaviorists, behavior modification is viewed as a defined set of clinical principles and procedures used to change behaviors. On the other hand, many educators view behavior modification as a teaching technique which is based on the old principle of reward and punishment. The principle of reward and punishment suggests that when a behavior is rewarded, that behavior is likely to be repeated so that it can be rewarded again. When a behavior is punished, it is likely to decrease or stop completely, to avoid punishment.

The concept of behavior management used in this module has a broader meaning. Behavior modification is part of the behavior management program. Behavior management affects everyone's behavior, adults and children, in all aspects of life.

Note to Trainer:

Find out if the group can buy into this concept. If not, you will need to explore with them what is preventing them from accepting this idea. You may need to review the
brainstorming and discussion of the participants' definition of behavior management.
Some Concepts of Behavior Management

1. Behavior is learned.

2. Encouragement and positive reinforcements are stronger means of helping children learn appropriate behaviors than disapproval and punishment.

3. Consistency in the adult's behavior towards the child's behavior is more effective in helping the child learn appropriate behaviors than sporadic approval.

4. Behaviors which are appropriate for one stage of development may persist longer than they should.

5. If a behavior is well established, it is more difficult to change it than to teach a new behavior.

6. Change should be gradual rather than abrupt.

7. All children need frequent social contact with adults and peers.

8. Negative behaviors are often a child's way of getting adult attention.

9. Behavior management can be a powerful tool. Sometimes futile, foolish or dangerous things can be taught.

10. People have to decide what to teach. Behavior management provides a "how to" not the "what."

11. Learning behavior management techniques does not make the average person a specialist. Help will still be needed on problems that are complex or beyond competence.

12. Frequently, the child's behavior will seem to get worse when a behavior management program is initiated.

13. Children under pressure to achieve, accompanied by much criticism, may resist in a passive way.

14. It is important for the adults to know themselves. Children will quickly learn the adults' strengths and weaknesses. If the adult is easily upset by disobedience, children may learn to disobey the adult.
15. Choose the time and place carefully whenever one consciously begins a behavior management approach with a child.

</table>
SMALL GROUP ACTIVITY

Values

Divide the large group into small groups of three to five persons. Have each group do the following:

1. List 10 values which govern their lives.
2. Prioritize the three most important values from the list of ten.
3. In a column next to the values record the sources for those values.
4. Share with large group.

The trainer records the lists on chalkboard while the groups share. Discussion should focus on how values help to mold or manage behavior. The sources of behavior and values primarily come from parents and significant adults, peers, laws, religious beliefs, and customs. The sources of values remain the same for each generation. However, as technology grows and customs change, the values may become more strict or more liberal.
SMALL GROUP ACTIVITY

Rights of Students

Participants remain in their small groups. Each group does the following:

1. List rights of students in a school setting.
2. List possible behaviors—two positive and two negative for each right.
3. Discuss lists.

Example:

Right

I. Right to Learn

A. Describe Behavior
   1. pays attention
   2. asks questions when uncertain
B. Negative Behaviors
   1. disrupts classroom
   2. disturbs peers

Trainer: end discussion by relating how our values help us understand ways to manage behavior of students.
COMPETENCY 1:

The Participant Will Be Able to Discuss the Definition and Underlying Concepts of Behavior Management

   a. Eye contact with students  
   b. Voice and gestures  
   c. Telling students to leave the room  
| (B) |
Use of Behavior Management in Learning Situations

All learning takes time and the learning of appropriate behaviors and skills is no exception. Often statements such as "I've tried everything" reflect that many techniques have been used and that the plan of action may not have been given enough time to succeed.

A number of factors are present in all learning situations which, if understood and used effectively, contribute to the learning process. The first is that the adults demonstrate by their actions behaviors the student may acquire. Namely, the teacher, the aide, the volunteer, the parent models behaviors for the student. If the adults demonstrate behaviors that show the student that they have confidence in him to acquire appropriate behaviors and that they have standards of behavior, the student will begin to internalize the adult's behaviors. Remember that this does not occur at once. For example, most learning involves relating to students on a one-to-one basis. Personal conversations, smiles, individual and group recognition, reprimands, etc., involve behavior management. Students also imitate the behavior of other students in the room. One student can be used to help another model appropriate behavior.

Second, the classroom environment provides another use of behavior management. In educational settings the adults set the emotional tone through their behaviors towards the students and other adults in the setting, the rules and expectations, the daily schedule, the room arrangement, and the learning tasks. Thus, the classroom environment can help the student learn about the order in society, learn to predict consequences for behaviors, and learn to make choices regarding his/her behavior.

However, the three factors—adults modeling behaviors, peers modeling behaviors, and the classroom environment—can contribute negatively to children's development. Some ways in which this may occur are:

- The adult models inconsistent behaviors, e.g., changing plans arbitrarily due to being in a good or bad mood.
- The adult's use of the physical environment does not enhance learning, e.g., cluttered, messy, chaotic use; few pictures, bare, unattractive room, etc.
- The adult's expectations of students' behaviors and learning tasks are unrealistic for the students' ages and abilities.
- The rules and limits are arbitrary.
- The adult's voice and body gestures are inconsistent with his actions; i.e., using a shrill voice to get control in a disruptive classroom.
SMALL GROUP ACTIVITY

Ways Voice and Gesture Control Behavior

Participants divide into small groups of three to five persons. Each person in the group relates an example from their classroom which exemplifies how voice or gesture can control behavior.

Some examples may include:

1. Adult shakes her head to a boy who is about to throw spit balls at his neighbor.

2. Adult speaks in a very soft voice to a group of students who are extremely loud; they quiet down to hear what the teacher is saying.

3. Adult uses a loud voice to rise above room sounds so that students can hear her.
MINI-LECTURE

Talking to Students

We often use our voice and body gestures to control and to prevent a lot of things from happening. If everything is going well, the teacher's voice is usually soft and casual. If there is a need for more control, the teacher's voice takes on a firm tone which seems to say: "easy does it, watch that, etc." Her voice and direct words may bring the situation to a more even keel.

If an area of the room breaks out into misbehavior, the teacher's voice may become loud and rise above the room sounds to let everyone hear what she has to say. Her resounding voice which differs from her warm, soft voice tells the children to listen for something important.

Remember, it is easy to let our voices betray our true feelings about behaviors which upset us. Many times a teacher will adopt practices to manage a difficult student which are inconsistent with her basic beliefs and behaviors. At such times, we need to listen to ourselves, look to see what our mistakes have been, and look at what the student's faces and behaviors are telling us.

Frequently, the teacher's hands, face and body actions are needed to emphasize the words. The teacher needs to get over to the troubled student and not call across the room. She needs to get to the level of the student and talk directly to him. She may choose to reach out and gently take hold of the child. She may choose to sit down with the child and talk out the situation.
SMALL GROUP ACTIVITY

Talking to Students

Participants divide into groups of three to five persons. Play a tape recording of various communications within a classroom. Each group analyzes communication in regards to student behaviors it is trying to control.
COMPETENCY I:

The Participant Will Be Able to Discuss the Definition and Underlying Concepts of Behavior Management

fusing and contribute to chaotic behavior

- dull, bare rooms seldom stimulate excitement for learning
- displays, materials, etc., should be in close proximity where they will be used
- storage space should be accessible to child
- quiet areas should not be next to noisy areas

5. Making transitions which the daily schedule:

One of the most neglected areas in planning is the transition from one activity to another. As adults we assume that transitions just happen. However, many behavior problems occur during transition times.

As many as ten to fifteen transitions occur in a typical day. If transitions can occur in an orderly fashion, the student's and teacher's day will be much easier. (Recall with participants the daily schedule examples noting the emphasis placed on this aspect under adult responsibilities.)
MINI-LECTURE

The Daily Schedule

The daily schedule is one of the first steps in planning an effective program. Although the schedule is the responsibility of the teacher, anyone who is involved in the setting on a regular basis should be involved.

In planning the schedule consideration should be given to the needs of the children (e.g., individuals, small group, and large group instruction) periodic change of pace (e.g., quiet, semi-active, and very rigorous activities), and staff assignments (e.g., time for planning, preparing materials for activities, presenting tasks, etc.).

The handout, An Example of a Preschool Schedule or a Public School Schedule, has some unique aspects that identify some of the anticipated children’s "problem" behaviors and the adult responsibilities. This method helps to clarify roles and responsibilities throughout the day and can be utilized in any setting.

---

Note to Trainer:

Stress the importance of everyone, both children and adults, being knowledgeable of the daily schedule and knowing when changes occur in the schedule. The schedule helps to convey that there is order and consistency in life.

</table>
BRAINSTORM ACTIVITY

Why Is Room Arrangement an Extension of the Daily Schedule

Participants divide into small groups. Each group brainstorms on why the room arrangement is an extension of the daily schedule. The groups share their responses. Trainer lists ideas on newsprint.

Some possible answers could include:

- the daily schedule helps to determine how the room is to be arranged
- every space has a function
- there should be stated rules for space usage
- busy, complicated arrangements can be confusing and contribute to chaotic behavior
- dull, bare rooms seldom stimulate excitement for learning
- displays, materials, etc., should be in close proximity where they will be used
- storage space should be accessible to children
- quiet areas should not be next to noisy areas
SMALL GROUP ACTIVITY

Room Arrangement

Participants remain in their small groups. Each participant draws his room arrangement. Then participants share what changes they would like to make based on the previous discussion. The group critiques the room arrangement.
DISCUSSION

Transition Activities

Have participants identify how they handle transitions utilizing the following methods:

- Auditory signals—bell, statement, etc.
- Visual signals—blink lights, hand motion, etc.
- Concrete signals—moving objects from one place to another.
- Ticket/badge system.
- Novelty activities—children wearing blue, varying locomotion, etc.

Note to Trainer:

One of the most neglected areas in planning is the transition from one activity to another. As adults we assume that transitions just happen. However, many behavior problems occur during transition times.

As many as ten to fifteen transitions occur in a typical day. If transitions can occur in an orderly fashion, the children's and teacher's day will be much easier. (Recall with participants the daily schedule example previously discussed noting the emphasis placed on this aspect under adult responsibilities.)

MINI-LECTURE

Understanding the Role of the Paraprofessional in Behavior Management

All of us are unique people with values, beliefs, and learned behaviors which are the basis for our actions. At times, we agree on certain matters with others, and sometimes we disagree. If we disagree most of the time, we will find it very difficult to be able to relate to the people with whom we come in contact. We will avoid them, try to undermine their efforts, and in the work situation present confusing messages to the children.

In dealing with children, it is important to know yourself because you are a model for them. If you are aware of what you are doing, you will be in a better position to have a positive influence on children. Regardless of your own level of self awareness, the children will know you very well by the ways you interact with them and other adults in the setting.

It is important that you become more aware of yourself. By doing so, you will achieve more personal security to guide and intervene in children's behavior and a more consistent and planned approach to behavior management. You will be able to communicate better with others about your behavior management concerns and accomplishments.

Children with problems tend to test adults more than other children. They also illustrate the adults' mixed messages and inconsistencies in their behaviors. In order to work more effectively with problem children, as well as with all children, we need to know ourselves, our strengths and weaknesses.
INDIVIDUAL ACTIVITY

Identification of Behaviors

Directions: Trainer pass out handout "Student Behavior(s) in the Classroom Which I View as Inappropriate." Instruct participants to identify behaviors which seem inappropriate to them. Space is provided on the handout for participants to identify other behaviors which are not listed.

TELL PARTICIPANTS THAT THERE ARE NO RIGHT OR WRONG ANSWERS, AND THAT THE EXERCISE WILL NOT BE USED TO JUDGE THEM. REMIND PARTICIPANTS THAT THE PURPOSE OF THIS ACTIVITY IS TO INCREASE SELF-AWARENESS.

Participants should be given an opportunity to discuss their views. (Trainer should help participants become aware of individual differences and values, as reflected in differences in choices of inappropriate behaviors. Trainer should also help participants become aware of why some behaviors are important while others are not.)
Student Behavior(s) in the Classroom
Which I View as Inappropriate

DIRECTIONS: Please place a (✓) beside the behavior(s) listed below which seems inappropriate to you. Space is also provided for you to identify other behaviors which are not listed.

</tr>
</tbody>
</table>
LARGE GROUP ACTIVITY

Observe a Penny (Apple or Orange)

Note to Trainer: This activity can be done with either a penny, apple or orange. If you decide to use a penny, you will ask each participant to use one of his own (of course you will need to have a few extra pennies on hand to supply to persons who do not have one). On the other hand, if you use fruit, you will need to supply one for each participant or enough fruit which allows sharing between participants.

Directions: Instruct participants to take out one penny or fruit, look it over, and be prepared to tell one thing about it. Also tell them that they cannot tell the same thing that someone else told. If group size is 10 or less, you can give participants a second turn to tell something else about their penny, apple or orange.

Warning: If trainer plans to have participants use one of their pennies, be sure to tell participants not to use old valuable pennies. They will get a penny back, but it may not be their original one.

After each participant has had a chance to tell something about their object, the trainer should collect all of the pennies, apples or oranges, mix all of them together and instruct participants to find their original penny, apple or orange. Guesswork is not allowed—participants must be certain that it's their original penny, apple or orange. If uncertain about their object, they cannot take one.

Note to Trainer: At the end of this activity return a penny to each participant who supplied their own. If using fruit, allow participants to wash and eat fruit at completion of activity.
MINI-LECTURE

Observation as a Part of Behavior Management

Note to Trainer:

Most people employ observation in daily activities; however, this does not suggest that they are skilled observers. A skilled observer would focus careful and directed attention upon a situation, person, etc., to obtain more knowledge about something. Thus, the use of skilled observation is not likely to be employed by most people in everyday activities.

Observation skills are essential for persons working with children. Observation skills can aid one in acquiring information about children's behavior, thinking, and feelings. Information is acquired by observing personal and non-personal interactions as well as the setting, over a period of time in a variety of situations. The information obtained from observation can be used to help children learn by providing the observer with information which makes it easier to choose appropriate materials and methods for individual children.

Observation can also provide information about oneself. Observers tend to observe from their own perspective; therefore, all observation contains the observer's biases. The observer may only notice certain types of behaviors and overlook other significant behaviors. For example, the observer may only notice physical behaviors and overlook verbal or withdrawn behaviors. Or the observer may tend to notice only those behaviors which reinforce pre-existing views. Once the observer is aware of personal biases, it is then possible to change the bias (if desired). In some instances, this can be done by expanding personal knowledge in the area.
INDIVIDUAL ACTIVITY

Observation of Picture or Film Directing Classroom Situation

Directions: Participants are given an opportunity to observe and record their individual observations of a picture or film. At the end of the observation the trainer will solicit observations from the group and list them on newsprint or chalkboard. Participants are then asked to categorize these observations into four (4) categories: physical behaviors, personal hygiene, environmental and others. For example:

<table>
<thead>
<tr>
<th>Observations</th>
<th>Physical Behaviors</th>
<th>Personal Hygiene</th>
<th>Environmental</th>
<th>Other</th>
</tr>
</thead>
<tbody>
<tr>
<td>boy crying</td>
<td>boy crying</td>
<td>boy with torn pants</td>
<td>broken window</td>
<td>boy reading book</td>
</tr>
<tr>
<td>girl throwing paper wads</td>
<td>two girls fighting</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>boy with torn pants</td>
<td>girl walking on teacher's desk</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>broken window</td>
<td>girl throwing paper wads</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>two girls fighting</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>boy running in classroom</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>boy reading a book</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Trainer should focus participant’s attention on how the observations were distributed among the categories. Where the observations equally distributed? Did most of the observations fall into one particular category? Why or why not? To provide participants with a closer look at their own observations, the trainer might suggest that participants categorize their own observations to determine if they focused their observations on any one aspect more so than another.

Note to Trainer: The trainer should emphasize that observations were categorized in this activity only for the purpose of developing
participants' awareness of how observers may or may not tend to focus on certain behaviors or aspects which could bias the observation instead of providing a true picture of the observation.

Suggested Pictures or Films: Pictures or films which exhibit classroom situations.
INDIVIDUAL ACTIVITY

Things Students Do or Do Not Do Which Are Disturbing
(Individual and Large Group)

Directions: Participants are given a sheet of paper and instructed to fold the paper in half (lengthwise). On one side of the paper the participants are asked to list the things students do in a classroom which bothers them. On the other side of paper participants are asked to list things students do which do not bother them.

Trainer should encourage participants to share and discuss their likes and dislikes. Are participants more likely to notice or ignore certain behaviors according to whether or not the behavior is disturbing? How could this affect classroom observation?

Note to Trainer: This activity is designed to develop participants' awareness of observer biases and why they may tend to observe certain behaviors or aspects while overlooking others. Thus, by focusing only on certain behaviors the observer is presented with a biased observation because it does not reflect the complete picture.
COMPETENCY II:

The Participant Will Understand the Role of the Paraprofessional in Behavior Management by Discussion of Behavioral Observation and How to Observe and Record Behaviors

Objective 3.0

  (F) |
MINI-LECTURE

Observation Methods

When observing children, there are a variety of observation methods available to choose from. However, regardless of the method of observation chosen, the observer must always answer the following questions prior to observing:

1. Why is observation being done?
2. How often will observation be done?
3. What situations will be observed?

The most common methods of observation include: the anecdotal, checklist, sociogram and formal or information conference (asking children). The anecdotal is the most fundamental method of observation. The anecdotal requires the observer to record exactly what happens, without judgment or explanation.

The checklist provides the observer with behaviors which have already been identified. The observer is only required to observe whether or not the child possesses a particular skill or behavior. When choosing a checklist, the observer must be certain that the checklist meets the purpose of the observation. For example, if the observer is seeking information regarding the child's gross motor development, then the checklist should be geared to yield information in that area.

The sociogram provides the observer with a visual diagram of the child's social interactions in the classroom. To use the sociogram the observer develops questions which measure interpersonal preference among group members. The child responds to the questions by choosing group members of his preference. The observer must diagram the child's responses to determine the interactions within a group.

The formal or informal conference (asking children), involves direct conversation with the child to obtain information about the child. The formal or informal conference is often used to gather information which is not easily obtained by other means. The observer should determine, beforehand, the type of information to be sought. By doing so, the observer increases the chances of securing information which provides a true picture of the child's thoughts. The observer should encourage the child to communicate fully. However, the observer should refrain from second-guessing the child.

Note to Trainer: Review handout: "Observation Methods."
Observation Methods

The development of observation skills usually begins with learning how to effectively observe one child. The methods employed in observing one child are applicable for observing groups of children. A brief summary of the most common methods follow. For more detailed explanations of these methods, read some of the suggested resources.

Anecdotal

The most common and fundamental method is anecdotal. The observer decides on the child or children to be observed and records over a period of time the behaviors viewed. Two examples of anecdotal observations follow.

Charles gets out of his seat. Reminded to go back to his seat until his name is called. Charles goes back to his seat. Charles gets out of his seat. Looks at teacher. Sits down again. Charles gets out of seat when teacher is not looking at him. Goes over to Tommy's and takes a book. Tommy reaches for his book. Charles and Tommy start fighting. Teacher intervenes.

Checklist

In using checklists the behaviors are already identified and the observer notes whether or not the child exhibits the behaviors. Checklists provide an assessment of whether or not the child possesses a particular skill or behavior. Care in the selection of checklists needs to be done in terms of meeting the purpose of the observation. Checklists can be commercially obtained or developed by the observer. A sample of a checklist developed by an observer could be as follows:

<table>
<thead>
<tr>
<th>YES</th>
<th>NO</th>
<th>SOMETIMES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Points to pictures of objects when named</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>Listens to simple stories</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>Understands size comparisons as big-bigger, little-big</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Able to tell the content of a story</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>
In using sociograms the observer can learn about social interactions of the child in a class. Examples of questions one might ask:

- Who would you like to invite home to play with you?
- Who would you not invite home to play with you?
- With whom would you share your ice cream?
- With whom would you not share your ice cream?

The use of sociograms is more limited with young children than older ones. This method also requires the teacher to diagram the responses to determine the interactions within a group.
LARGE GROUP ACTIVITY

Review Handout: Observation Methods

Trainer summarizes the observation methods listed on handout.
LARGE GROUP DISCUSSION

Types of Observation Methods Used

 trainers ask participants what types of observation methods they have used before. Did the method provide them with the information they were seeking? Did certain methods work better than others? What methods are they comfortable with? Were they familiar with all of the methods discussed in the handout? Which methods have they not seen before? Etc.

trainer: Encourage participants to share their observation experiences with the group.
COMPETENCY II:

The Participant Will Understand the Role of the Paraprofessional In Behavior Management by Discussion of Behavioral Observation and How to Observe and Record Behaviors.

   c. the conclusions the observer makes from the observations (A) |
| | 3. Observations should not be recorded in sequence as they occur. (True/False) (F) | | |
MINI-LECTURE

Inferences Versus Actual Observations

If observation is to be used to obtain useful information about students which increases effectiveness in working with students, then the observations must be based on actual observations rather than inferences or assumptions. Inferences made by the observer during the observation period prevents the observer from getting a true picture of the actual behaviors which occurred. Thus, the skilled observer understands that behaviors are recorded as they occur without the observer inferring reasons for the behaviors. However, after obtaining several samples of similar observations, inferences can be made in order to analyze the observations and plan strategies.

In the next activity we are going to identify some actual observations and inferences.
SMALL GROUP ACTIVITY

Identifying Actual Observations and Inferences

Directions: Trainer divides participants into four teams. Tells them they are going to play a game. Each team is instructed to pick a captain or spokesperson. The trainer has numerals 1-20 written on chalkboard or chart paper. Trainer tells participants that there is a statement and/or a question on a 3x5 card to correspond with each number. Each team in turn picks a number, the trainer reads the corresponding card. The team must answer the question correctly to win a point(s).
SMALL GROUP GAME QUESTIONS

Identifying Actual Observations and Inferences

1. Because you picked number one, you will have an easy question. Is "chewing a pencil" an observable behavior or inference?
   (answer: observable behavior)

2. Because your team needs motivation, your score will be doubled if you answer each of the following questions correctly. (If you do not have any points, you win two points after answering the questions correctly.)

   The statement "Jim is nervous" is an observable action. True/False
   The statement "Fran is learning spelling words" is an observable action. True/False
   The statement "Betsy is hitting another child" is an observable action. True/False

   (answer: false, false, true)

3. Which of the following is an inference?
   Johnathan is daydreaming.
   Tonya is biting her fingernails.

   (answer: Johnathan is daydreaming)

4. Because your team members lost self control you lose a turn.

5. To give you a real jump on the other teams, you get to answer two questions. Identify the following behaviors as inferences or observable behaviors and pick up two points if you answer each question correctly.

   Frank is being sympathetic. (answer: inference)
   June is taking a pencil from another student's desk. (answer: observable)

6. Which of the following is an inference?

   Bill is completing a language worksheet.
   Julia is being angry.

   (answer: Julia is being angry)
7. Is the following statement an inference or actual observation?

Phil looks self confident. (answer: inference)

8. Your team has gotten sophisticated! You are now ready to match observable behaviors with inferences. Do so correctly with the following and win five points.

The statement, "Jerry is a terrible speller," is an inference. Identify two (2) observable behaviors which could support this statement.

1. When given spelling words that are above his grade level, Jerry has a hard time spelling the words correctly.
2. Jerry missed 9 out of 10 words on his spelling test.
3. Jerry misspelled 95 percent of the words in his past weekly reports.

(answer: 2 and 3)

9. Which of the following is an inference?

Carol gets along well with classmates.
John comes into the room running.

(answer: Carol gets along well with classmates)

10. Which of the following is an observable behavior?

Paul feels involved.
Bill talks during class discussions.

(answer: Bill talks during class discussions)

11. Your team is ready for the Olympics. Identify two (2) inferences in the following description.

When Susan comes into the room, she sits down in her seat and puts down her head because she is tired and lonely.

(answer: tired and lonely)

12. The statement, "Harc’d enjoys his food," is an observable action or inference?

(answer: inference
LARGE GROUP ACTIVITY

Recording Observations

Directions: Trainer shows 5-10 minutes of the film Four Children. Prior to showing the film, the trainer may assign each person a particular child to observe in the film (this is optional). Participants are instructed to observe and record their observations. At the end of the observation period, the trainer will list participants' observations on newsprint or chalkboard. (As trainer lists the observations, he/she should refrain from identifying inferences or actual observations.) After all observations are listed, participants are encouraged to identify inferences and actual observations.

Note to Trainer: If film Four Children is not available, then allow participants 5-10 minutes to observe the training room.
ADDITIONAL OBSERVATION ACTIVITIES

A. Individual and Large Group Activity

Each participant observes and records for three minutes what he sees in the room in which the training session occurs. (Or, it could be a large picture depicting a busy scene for a small group.)

Then, the trainer asks several participants to read their observations and records these on newsprint/chalkboard. It is helpful if they can be written so that comparisons can be made. For example:

#1 white ceiling  
red & white striped walls  
footprints on wall  
ten chairs

#2 chandelier lights  
piano with two candles on it  
chairs in semicircle

#3 two females  
four males writing  
tables and chairs

This activity helps to illustrate the unique and different way each person approaches and views a situation. Everyone is viewing the same environment, but differences usually can be noted in what they observed and in the sequence of their observations.

B. Individual or Audiovisual Presentation

Each participant should have an opportunity to practice their observation skills. Different options might include:

- observe a real life setting and record observation  
- view the film with sound used in Activity 4 (provide participants with a comparison between their earlier observations and to reinforce observation skills)

C. Audiovisual Presentation

Show the filmstrip "Observing and Recording a Child's Behavior."* This filmstrip requires participants to complete exercise sheets as they progress through the filmstrip. The exercise sheets provide an opportunity for participants to apply knowledge and skills obtained from activities in competency 2.
*The Observing and Recording a Child's Behavior (filmstrip and cassette tape) can be obtained from: Center for Innovation Teaching the Handicapped, School of Education, Indiana University, Bloomington, Indiana.

D. Individual Activity

Self observation (through videotaping) optional.

Trainer: This activity is an outside assignment for participants to do in their respective settings. This activity is designed to develop participants' awareness of classroom actions and interactions. Be sure to follow-up on assignment at next session.

Participants will be videotaped (about 20 minutes) interacting with students in the classroom. Participants are to observe themselves on the videotape and record their observations. They are to pay close attention to what they do, how they feel and the students' reactions to them. Suggest they analyze themselves in a 1-1 situation with a problem child and in a small group situation.

At the next training session self observations are shared with the group. The trainer should be accepting of all feelings, behaviors, and records the comments. Several things usually occur:

- the adult will tend to focus on the child's behavior, rather than his own
- adults have trouble owning up to their own feelings of frustration and anger in a difficult situation
- adult behavior may cue the child's behavior; children learn the number of times an adult will request the behavior before compliance is required
- children's behaviors can cue adult behaviors
COMPETENCY III:

The Participant Will Be Able to Discuss Behavior Management Techniques

Objective 1.0

### Answer to Test Questions

1. Which of the following is an example of proximity control:
   a. John throws paper on the floor. The teacher picks it up.
   b. As the teacher notices John about to throw a wad of paper, she moves over by his desk.
   c. When the teacher sees John throw a wad of paper, she makes him leave his seat and pick it up.

2. Which of the following is an example of restructuring:
   a. Mary cannot sit still for a 20-minute reading period. The teacher allows her to go to the learning center for 10 minutes after being with a reading group 10 minutes.
   b. Because Mary cannot sit still for 20 minutes in reading, she is sent to the resource room for instruction.
   c. Mary has proved to be

MINI-LECTURE

Introduction to Behavior Management Techniques

In the teaching-learning settings adults structure the environment for the children until the children can structure it for themselves. Adults create controls until students can control themselves. Thus far, we have discussed some of the ways adults structure the environment—through the daily schedule, the room arrangement, and our voice tones. In addition, there are other skills which must be practiced at the same time. Some of these skills are observing, listening, reading body language and communicating.

Why are these skills important in behavior management? They are our tools for learning about children's skills, feelings and attitudes. We use them to learn about children's strengths and weaknesses in a variety of areas, and the children's relationship to their physical and social environment. With these tools we figure out what the children know and can do, so that we can plan strategies to teach them what they currently do not know and cannot do.

Central to all behavior management techniques is the ability to observe. While formal test results may provide information about the areas in which the child excels or has deficits, the specifics of what the child does and does not know must be decided through observation. Observation also provides us with a measure of progress. Observations made over a period of time show whether or not progress has been made. Thus, we will know it is time to start teaching something else or whether another way should be tried.

Behavior management techniques should always be used in conjunction with a well planned program based on the teacher's and aide's knowledge of each individual student's needs.
BRAINSTORM ACTIVITY

Participants divide into groups of five. Each group brainstorm techniques they have used to deal with children's behaviors. Their answers are recorded on newsprint. The list will probably include items such as:

- ignoring
- physical restraint
- humor
- redirecting
- offering alternatives/options
- removing objects
- moving closer to the child
- stating consequences (depriving the child of an activity; punishment)
- nonverbal signs
- removing child from the scene

Each group shares its list with the total group.
Some Techniques for Working with Children

1. Give warning before changing activity.

2. When giving directions or suggestions, state them in the positive. Avoid using "No" and "Don't" as much as possible. Make demands short and simple.

3. Substitute a toy or an activity when a child must have something taken away or denied.

4. Give a child a choice only when you intend to let the child follow his choice.

5. Redirecting activities often prevents trouble.

7. Remove a child from a situation when he can't cooperate, or deprive him from playing with something when he can't use it correctly.

10. A child must be protected. Safety precautions must be used. Stop or change activities which are dangerous.

11. Use reminders rather than questions when children get defensive or tell things which aren't so.

12. If a child has no option or choice, but must follow directions, be positive in giving directions. Expect him to follow the directions.
MINI-LECTURE and/or HANDOUT

Managing Surface Behavior of Children

The following techniques can be used by a teacher to maintain the surface behavior of children in the classroom. They are techniques used spontaneously as problems or disruptions arise. They should be used with a well planned program based on the teacher's knowledge of each individual student's needs.

1. Planned Ignoring: Much child behavior carries its own limited power and will soon exhaust itself (especially if the behavior is done to "get the teacher's goat"). Assuming the behavior will not spread to others, it might be possible for the teacher to ignore the behavior and thus extinguish it.

Example: Bobby sometimes comes to school very excited and very active. The result of ignoring his initial antics is that he soon gets seated and quiet at which time I will smile at him and touch his shoulder. He responds with a broad grin, and a positive attitude toward his time with me in class.

2. Signal Interference: Teachers have a variety of signals that give the child a feeling of disapproval and control. These non-verbal techniques include such things as eye contact, hand gestures, tapping or snapping fingers, coughing or clearing one's throat, facial frowns, and body postures. These techniques seem most affective at the beginning stages of misbehavior.

Example: When a child begins to act up, I find that a glance in his direction often will stop the behavior for a while. I find that this technique is most effective for children with whom I have developed relationships.

3. Proximity Control: Every teacher knows how effective it is to stand near a child who is having difficulty. The teacher is a source of protection, strength, and identification and helps the child control his impulses by her proximity (closeness).

Example: If a child is off task or beginning to talk while I'm talking, I will continue to talk to the group while, at the same time, I will move toward him or even stand next to him for a moment. This may go unnoticed by the other children since I normally move about the room as I talk. The result is, the child is not embarrassed or given unnecessary attention, and the talking or off-task behavior stops for a time.
4. **Interest Boosting:** If a child's interest in his work is declining, and he is showing signs of boredom or restlessness, it may be helpful for the teacher to show an interest in the student. The teacher may engage the student in a conversation on a topic which is of interest to him. Stimulating the child's interest may motivate him to continue his work, and/or help him view the teacher as a person to please.

**Example:** Fred was a collector of Hot Wheels. Fred also became bored easily because he found his assignments to be "too easy" or the same old stuff. When this happened, he would draw pictures or daydream and his assignments would not be completed. I knew a little about "Hot Wheels," but there was much I could learn. I asked him about the cars one day when I noticed him drawing a car. His face brightened and he talked to me quietly for about 10 minutes. At that point, I asked him if he felt he could complete his assignment and told him I would like to talk to him again about his interests. He finished his work and now seems more interested in class.

5. **Tension Decontamination Through Humor:** Most of us are aware of how a funny comment is able to change a tense situation. It makes everyone feel more comfortable.

**Example:** Though I had injured my knee not long before this incident, I decided I would play football with my children. The ground was very wet from a recent rainstorm. The ball was hiked to me and as I backed up to throw a pass, I slipped on my injured leg. The children rushing in to tag me did so just as I fell back and landed on my back in the mud. I could see the concern and apprehension on their faces. They were afraid I was hurt and muddy, and they feared I would blame them. I sat up, looked around at them and smiling, pulled a white handkerchief from my pocket and waved it indicating surrender. I also told them it looked like I was going to have to play dirty the rest of the game. They helped me up and continued the game without fear.

6. **Hurdle Lessons:** Children occasionally experience difficulty with center activities. Many children seek help from the teacher or peers when appropriate. Other children skip over the difficulty and go on to work they can do. Occasionally, however, some children stop working and don't know what to do next. They need to be able to overcome whatever has them stopped. The teacher can be most helpful in getting the child back on task by doing (or solving) the problem with the child, thus, removing the hurdle and allowing the child to continue.

**Example:** Louise is a very serious child. She pushes herself and has high expectations for herself and others. When she experiences difficulty with her work, she becomes frustrated and angry. Often her anger doesn't
allow her to use her skills, thus increasing her frustration. If I can recognize her frustration when it first appears, I can help Louise over the hurdle, and she can usually get back on task and remain calm.

7. **Restructuring the Classroom Program**: How much can a teacher differ from his scheduled program and still feel he is meeting his teaching responsibilities? Some teachers believe that they must follow their class schedule rigidly. They feel children should learn discipline and self-control. Other teachers feel it is necessary to be flexible and sensitive to the children's needs and concerns. A middle ground between the two is best. Discipline and structure are valuable, but not when they fly in the face of a general class need. Moderate restructuring based on effective as well as academic goals can be very effective techniques. Restructuring is appropriate when it is necessary to drain off high tension or emotion in the classroom. The technique is as its name implies, simply a change of plan, format, task, or location based on a need to train off tension or high emotion in the class.

Example: Just before class, two girls got into a fight. Children immediately formed an audience and began guessing what caused the fight. After the fight was stopped, the children went to other activities. Emotions were still very high and many children were seeking information while others were proudly telling their version of what happened. The teacher realized how difficult it would be to have his class attend to colors (he was also curious himself), so he opened the class to a discussion of what happened and how fighting made us feel.

8. **Support from Routine**: We all need structure. Some children need more than others before they feel comfortable and secure. Some become anxious without a set routine. To help these children, a daily schedule should be provided to help calm some of their feelings of anxiety. They know what is expected of them and can prepare for the activity.

9. **Direct Appeal to Values**: A teacher can often appeal to a child's values when intervening in a problem situation. He might:

   a. appeal to the relationship of the teacher with the child; for example, "You seem angry with me. Have I been unfair with you?"
   b. appeal to reality consequences; for example, "I know you're angry, but if you break that aquarium, the fish will all die, and you'll have to replace it with your own money."
   c. appeal to a child's need for peer approval; for example, "Your classmates will be pretty angry if you continue to interrupt them and correct them."
   d. appeal to the child's sense of the teacher's power of authority;
for example, tell him that as a teacher you cannot allow his behavior to continue, but that you still care about him.
e. appeal to the child’s self respect; for example, “I know you’ll be mad with yourself if you tear up that paper you worked on all period.”

10. **Removing Seductive Objects:** It is difficult for the teacher to compete with certain objects, such as squirt guns and balloons and other similar seductive objects. Sometimes removing seductive objects leads to power struggles between the child and the teacher. A way to prevent this follows. Take a strong interest in the object and politely ask to see it or handle it. Once in your hand, you can return it with a request for it to disappear for the remainder of the period, or to keep it with a promise to return it at the end of the period. This technique is most effective if you have a relationship with the child.

11. **Antiseptic Bounce:** When a child’s behavior has reached a point where the teacher questions whether or not the child will respond to verbal controls, it is best to ask the child to leave the room for a few minutes—perhaps to get a drink or wash hands.

In antiseptic bouncing, there is no intent of punishing the child, but simply to protect and help him and/or the group to get over their feelings of anger, disappointment, uncontrollable laughter, hiccups, etc. Unfortunately, many schools do not have a place to which the teacher can send a child that the child will not think of as a punishment.

**Example:** One morning during group time, I became aware of giggling in the circle. I looked up to see that Joyce had evidently thought of something hilariously funny. I tried signal interference, and, though she tried to stop, she succeeded only in choking and coughing. By now, most of the children around her were aware of the circumstances and were smothering laughter, too. I asked Joyce if she would like to get a drink of water. I think she was grateful for the chance to leave the room. When she returned, she appeared to be under control, as was the class, and things proceeded normally.

12. **Physical Restraint:** Once in a while, a child will lose complete control and threaten to injure himself and others. In such emergencies, the child needs to be restrained physically. He should be held firmly but not roughly, with no indication of punishment—only concern. Such techniques as shaking, hitting, or spanking make it harder for him to believe the teacher really wants to help him.

The preferred physical hold is for the adult to cross the child’s arms in front of the child while the adult stands behind him holding the
child's wrists. If it becomes necessary to control the child further, the adult can move the child to the floor with arms crossed in front as before and apply his weight across the child's hips and waist. Be careful to avoid being butted or kicked. There is no danger that the child will be injured in this position, although he might scream that you are hurting him. There is no danger that the child will be injured in this position, although he might scream that you are hurting him. There is no danger that the child will be injured in this position, although he might scream that you are hurting him. There is no danger that the child will be injured in this position, although he might scream that you are hurting him. There is no danger that the child will be injured in this position, although he might scream that you are hurting him.

There are usually four different phases the child passes through: 1) Being held, he becomes enraged. He may swear, bite, and carry on in a primitive way. The teacher, although frightened or angry, must provide the nonaggressive handling the child needs. The teacher's control system must take over until the child's is operating again. 2) The child begins to cry—his defenses are down. His toughness has vanished and his inadequacy and immaturity are evident. 3) The child becomes silent or asks to be let go. The teacher, not the child, must make the decision. As he gains control, his language becomes clearer and more to the point. 4) He usually will try to save face by pulling away or making a sly remark.

If possible, do not hold a child in the classroom. If it cannot be avoided, get the class away from him. Later, the teacher must explain to the class exactly what happened to save face for the child. The relationship with the child usually will improve significantly. The message the child receives is: "I care enough about you to protect you from your own dangerous impulses."

ROLE-PLAY

Utilizing Behavior Management Techniques

Trainer divides participants into small groups. Each group receives one of the situations. The group then does the following:

1. Decide which behavior management technique they will use.
2. Role-play the situation to the total group.

The total group then critiques the behavior management technique that was used. Was it appropriate? Was it effective? Could an alternate technique have been used?

Situations

1. John and Bill are building a block tower. John reaches high above his head to place a block on the tower. The structure crumbles. Bill and the teacher look at each other.

2. Sally has difficulty sitting and listening to the group story immediately before lunchtime. She constantly rocks, hums to herself, and talks to the children next to her.

3. Mrs. Smith has taken her class out to the playground. Susie and Jack see the empty swing and run for it, arriving at the same time. They start to yell and push each other.

4. The teacher asks a group of children to put away their blocks and join her in a circle activity. From David comes a firm "No, I don't want to," which grows louder with each request to join the group.

FILMS

Behavior Modification in the Classroom

This film introduces behavior modification through a brief description of the learning theory basic to the technique. Three specific problems in actual classroom situations are presented in which individual problem learners and their particular behavior are shown. The process of training teachers in behavior modification techniques, teacher application of the technique to above situation, and the resulting improved student behavior is then demonstrated.
