ABSTRACT

Fiscal year appropriations and supporting data are presented for comparative analysis of state financing of public higher education. The report is based on the fall collection of state appropriations data reported by M. M. Chambers. It presents a model of state rankings for seven independent factors plus eight derived measurements that together represent the principal state conditions and financial actions underlying and governing appropriation levels. The text explains the design of the model and its use, defines the measurements, and presents a limited macro analysis. A technical appendix provides greater detail on data definitions; analysis and interpretation of the data are the responsibility of state and individual users. The seven factors of the model include: (1) resident student source, high school graduates; (2) college attendance ratio; (3) system support index, 1981-1982; (4) tax capacity, 1983; (5) tax effort, 1983; (6) allocation to public higher education, 1984-1985; and (7) tuition factor, 1984-1985. Tabular data are presented independently by state in rank order for fiscal year 1985; collectively by state in alphabetical order, fiscal year 1985; and historically by state 1978-1985. (SW)

NOTES TO READERS:

Data Accuracy

The critical data of public enrollments, appropriations, and tuition have been provided by the State Higher Education Finance Officers. Data validity is dependent on the availability of requested items at the state level and on the reporting agency's compliance with the definitions provided. In many instances the data, particularly older entries and current year amounts not finalized, have been estimated. Estimates have also been employed where the refinement of detail required is not possible from data available at the state level. The frequency of these estimates negates need for special identification. Sufficient is knowledge that this early report is based on considerable estimated data.

Data Comparability

Since the first edition of this report in 1978, data definitions have progressively been made more rigorous to improve inter-state comparability. Further progress is required and will continue. The data in this current report are reasonably comparable, particularly if properly augmented by knowledge of the special contributing factors unique to each state. In this regard, readers are strongly urged to contact their State Higher Education Finance Officer for additional information and interpretation.

Incomplete Data

Illinois and Ohio did not report appropriations for research, agriculture and health public services, and medical schools. To maintain the comprehensiveness of this report and establish U.S. totals, these appropriations have been assigned based on the national average 16.6 percent of total appropriations. Using the national average percent eliminates the differential effect of res-ag-med. appropriations for these two states. All ratios dependent on the assigned appropriations for Illinois and Ohio are identified by the symbol *, and should be interpreted with caution.

HOW STATES COMPARE IN FINANCING HIGHER EDUCATION 1984-85
Estimates for Public Institutions

by
Kent Halstead

This report is published annually in the spring to present current fiscal year appropriations and supporting data for comparative analysis of state financing of public higher education. The timeliness of the report is possible through the cooperation of the State Higher Education Finance Officers (SHEFO), and reliance on procedures for the early preparation and collection of data established by M. M. Chambers.

In the absence of absolute standards, the establishment of relative position through interstate comparisons is a primary means for judging funding adequacy and identifying performance goals. This report presents a model of state rankings for interstate comparison of seven independent factors plus eight derived measurements which together represent the principal state conditions and financial actions underlying and governing appropriation levels. The text explains the design of the model and its use, defines the measurements, and presents a limited macro analysis. This background should permit users to analyze and interpret individual state data. However, users are strongly encouraged to contact the appropriate State Higher Education Finance Officer, identified on the inside cover, for proper inclusion of relevant specific state conditions. A technical appendix provides greater detail on data definitions for financial and budget officers.

The seven factors of the model are presented in three tables. Table 1 presents the factors independently by state in rank order for fiscal year 1985. Table 2 presents the factors collectively by state in alphabetical order. Table 4 presents the factors by state historically for fiscal

¹ This study focuses on the major responsibility of states to support public higher education through appropriations to state institutions and through aid to students attending these institutions, and the additional support provided state citizens by payment of tuition. This concentration is justified by recognizing that 96 percent of state and local government funding for higher education goes to the public sector, and that appropriations and tuition constitute 87 percent of the total educational and general revenues (excluding government contracts) of public institutions. Appropriations to private institutions and for aid to students not attending in-state public institutions are important parts of the overall support of higher education in many states. But the absence here of this larger perspective should not seriously distract from the immediate value of concentrating on the financing of public institutions as a major distinct entity.

² Chambers collects state appropriation data in the fall of each year through reports by key state officials to his monthly newsletter GRAPEVINE. See, M.M. Chambers, Appropriations of State Tax Funds for Operating Expenses of Higher Education, National Association of State Universities and Land Grant Colleges, Washington, D.C.

years 1978 through 1985. The basic data on which the factors are calculated are presented in table 3 for fiscal year 1985 and historically in table 5.

Model Description

The model is intended to report the principal factors governing state support of public higher education, to indicate how these factors interrelate and their relative importance and susceptibility to change, and, to encourage interstate comparisons to identify benchmarks for performance appraisal. While the individual measurements are accurate, the analysis, focused at the state level, lacks the refinement of institutional detail necessary for a comprehensive study.³ The model should therefore be used primarily as an early guide to current state financing to be followed by more rigorous and detailed institutional level analysis.

The model is designed to take advantage of the early collection of state appropriations by M. M. Chambers. Modification of the Chambers' data plus additional concurrent data⁴ has been secured from the 51 State Higher Education Finance Officers to present as timely and complete a state level analysis as possible. Design features include a formula structure to show the interrelationships of the variables, and state ranking and indexing to indicate relative position.

The model consists of seven independent factors (numbered) and eight derived or dependent factors (short titled). They are organized according to four functions: derivation of enrollment load, state fiscal actions, role of tuition, and total support level.

Student annual full-time-equivalent enrollment (ENROL) is derived by applying an attendance expansion ratio (#2) to state high school graduates (#1). The expansion ratio reflects the general attractiveness and accessibility of state institutions relative to the principal enrollment source.

$$\begin{array}{lcl} \text{Resident Student} & & \text{Student Enrollment} \\ \text{Source (\#1)} & \times & \text{Ratio (\#2)} \\ & & = \text{Student Enrollment} \\ & & \text{(ENROL)} \end{array}$$

³ For financing revenue and expenditure detail by institutional type, see Marilyn McCoy and Kent Halstead, Financing Higher Education in the Fifty States, 4th Edition (FY 1982 data), National Center for Higher Education Management Systems, Boulder, Colorado, 1984, 546 pp. Price \$29.95 plus 50¢ per book for shipping. Order from NCHEMS Publication Department, P.O. Drawer P, Boulder, Colorado 80302, telephone (303) 497-0390.

⁴ The indebtedness of the author to the State Higher Education Finance Officers extends beyond the time they have given to collect and process the highly refined and thus comparable data required for this report. Many officers, individually and through a review committee, have provided constructive commentary that has proven invaluable. The report is thus very much a joint effort.

State fiscal actions in support of education involve the application of taxing effort (#5) to a state's inherent wealth or tax capacity (#4), and allocation (#6) of the resulting collected tax revenues (TAX) to higher education as education appropriations (APP). Education appropriations reported per student are for the student related functions of instruction, academic and institutional support, student services, and plant operation. They exclude state funding of research, agriculture and health public services, and medical schools (Res-Ag-Med).

$$\frac{\text{Tax Capacity (\#4)} \times \text{Tax Effort (\#5)}}{\text{ENROL}} \times \text{Allocation to Public Institutions (\#6)} = \text{Education Appropriations per Student (APP)}$$

The role of tuition is reported by the "tuition factor" (#7) which indicates the relative contribution of tuition versus appropriations. Appropriations multiplied by the tuition factor equal estimated tuition revenues (TUITION).

$$\text{Education Appropriations Per Student (APP)} \times \left[\text{Tuition Factor (\#7)} - 1.00 \right] = \text{Estimated Tuition per Student (TUITION)}$$

Total financial support is labeled as an OUTPUT and equals state and local government education appropriations plus tuition revenues. Reported on a per annual FTE student basis, this total represents an overall support level of achievement which can reasonably be compared state-to-state.

$$\text{APP} + \text{TUITION} = \text{OUTPUT}$$

The model is summarized as a set of INPUTS, multiplied by a PROCESS to equal the OUTPUT. The inputs are three of the independent factors (tax capacity, high school graduates, and attendance expansion ratio) which are relatively stable and limited to only modest change by governmental action. The process factors (tax effort, allocation to education, and the tuition factor) are adjustable by legislative action and constitute the fiscal means for yearly updating of state funding levels.

$$\frac{\text{INPUTS}}{\#4 / (\#1 \times \#2)} \times \frac{\text{PROCESS}}{\#5 \times \#6 \times \#7} = \text{OUTPUT}$$

⁵ Comparability would be further improved by correcting for geographical differences in the prices colleges and universities pay for goods and services. Such an index, currently not available, is discussed as a note in the appendix.

Funding requirements differ by type of institution, such as the additional costs at universities associated with graduate education, senior faculty, research, and public services. The System Support Index, SSI, (#3) measures the relative student related funding requirements (based on national per student related expenditures) of the particular mix of institutional enrollments in a state's public higher education system. The System Support Index is considered a separate independent INPUT factor. Multiplying student enrollment (ENROL) by the SSI derives an adjusted student measure, SYSTEM LOAD, which reports the institutional and student related funding needs of higher education due to a state's absolute level of enrollment and attendance pattern.

Dividing dollar amounts per student by the System Support Index establishes values relative to state system funding requirements. The measurements of education appropriations, tuition, OUTPUT, INPUTS, and PROCESS are each converted in this manner to report amounts relative to the state system's financial requirements. Values are reported as indexes relative to the U.S. average and are state ranked.

The model is designed for the study of public higher education financing by individual states. The following analyses are suggested: (1) selection of peer states for comparative study and to identify performance benchmarks and possible goals; (2) establishment of a state's relative position for each of the seven independent factors and determination of the consequences of a high or low position on the dependent conditions (enrollment, tax revenues, and tuition) and on final education appropriations and tuition OUTPUT; (3) review of the status of INPUT conditions to determine the desirability of long-run change; (4) review of the financial PROCESS factors to determine recommendations for immediate legislative action; and (5) trend analysis of factor values to determine improvement or retrograde change and to develop projections for planning.

Measurement Definitions

The model measurements are ratios using the following nine basic data elements identified by letters A through I:

- | | |
|--------------------------|---------------------------------------|
| A. Population | F. State & Local Gov't Appropriations |
| B. High School Graduates | G. System Support Index |
| C. Public FTE Enrollment | H. Estimated Tuition Revenues |
| D. Tax Capacity | I. Disposable Personal Income |
| E. Tax Revenues | |

(These data elements are defined in the technical appendix.)

#1--RESIDENT STUDENT SOURCE Public and nonpublic high school graduates per 1,000 population. (B/A)

The major responsibility of a public higher education system is to provide educational opportunity to state residents. Thus, a state's high school graduates are the primary source of entering freshmen at public institutions and, therefore, the best single starting base for deriving total enrollments.

#2--ATTENDANCE EXPANSION RATIO Annual full-time-equivalent enrollment in public institutions of higher education per high school graduate.
(C/B)

The attendance expansion ratio essentially measures the degree to which a state provides attractive public higher education opportunities to both resident and nonresident students relative to its high school graduates. The ratio indicates the degree to which a state has "extended" its higher education endeavors beyond its principal responsibility to resident high school graduates. Large values indicate states heavily in the "business" of public higher education compared to their basic enrollment potential.

The index reflects the net effect of the entrance rate of high school graduates into state institutions, in-migration of out-of-state students, the retention of students in college, and the degree to which students are enrolled part-time as opposed to full-time. The entrance of high school graduates further reflects their preparedness for college, the financial and geographical accessibility of suitable college programs, and student, parental, and community disposition toward attendance at state institutions.

ENROL--STUDENT ENROLLMENT Annual average full-time-equivalent enrollment in public institutions of higher education per 1,000 population. (#1 x #2)

Student count is the basic financial load measure of this study. It is applicable as a load measure only to funding that supports student-related functions; viz., instruction, academic and institutional support, student services, and operation and maintenance of the physical plant. Appropriations for these functions are identified as "education" appropriations and are obtained by excluding sums for sponsored research, agriculture and health care public services, and medical schools.

Student count, as a financial load measure, makes no distinction between the varied support requirements of the different types of institutions. Dividing appropriations by student enrollment indicates the level of funding available to purchase educational resources for the average individual student without taking into account the type of institution attended.

Annual average FTE enrollment is based on total yearly student credit-hours, including summer sessions, but excluding enrollment in the schools of medicine, dentistry, veterinary medicine, and osteopathic medicine. Full-time-equivalency for undergraduate students is 15 credit-hours per semester or quarter; for graduate students, 12 credit-hours. Non-credit enrollment in vocational-technical programs is converted on the basis of 875 contact hours per year equals one annual FTE student. The current year annual enrollment is projected from the previous year's value based on the ratio of corresponding year fall enrollments.

#3--STATE HIGHER EDUCATION SYSTEM SUPPORT INDEX (SSI) Constructed state and local government education appropriations and tuition revenues per student based on application of national average rates by type of institution to state enrollment mix. Expressed as an index relative to the U.S. average equal to 100. Separate indexes are also reported for education appropriations (SSIA) and tuition (SSIT). (G)

The basic measure of financial load in this study is annual average FTE student enrollment count. However, the type of institution attended--its mission, level of instruction, and associated quality factors--affect student costs. Thus student support requirements vary substantially from one type of institution to another because of differences in average class size, faculty salary level, academic support requirements, public service role, administrative overhead, plant operation and maintenance, research, hospital operations, and economies-of-scale.

Universities with large graduate and upper division enrollments, a large senior faculty, and an emphasis on research and public service, have missions that inherently require a high level of funding. Since student count measures only a portion of this institutional load, universities appear "expensive" to operate on a per student basis. Two-year colleges, on the other hand, are much less "costly" per student because enrollment is a fairly accurate measure of load for their primary mission of providing instruction at the lower division. States with proportionately more students enrolled in universities have financial loads that are as much as 18 percent above the national average. States with proportionately more students enrolled in four-year and two-year colleges have system support requirements that are as much as 12 percent below the national average.

This study distinguishes and emphasizes student related "education" appropriations (as opposed to total appropriations) which excludes state sums for sponsored research, agriculture, and health public service programs, and medical schools. The appropriation System Support Index (SSIA) consequently measures the relative student related appropriation requirements of a state's system of public higher education due to

differences between the state's enrollment pattern by type of institution and the national average pattern. A SSIA of 115, for example, means that the state's enrollment pattern, if funded at national average education appropriation rates, requires 15 percent more support per student than the national average enrollment pattern. Dividing appropriations per student by the SSIA relates appropriations to the system's financial needs.

Similarly, the tuition System Support Index (SSIt) measures the tuition that would be secured if the state's enrollment pattern received tuition revenues at national average rates. Dividing tuition per student by the SSIt relates tuition revenues to a level that would normally be expected.

The SSI (representing both education appropriations and tuition) is used to derive the SYSTEM LOAD measure.

The System Support Index and its two subcomponents are based on recognized differences in education appropriations and tuition support requirements for 10 types of institutions: four universities (major research, research, intermediate, and small); comprehensive and general baccalaureate four-year colleges; academic and occupational two-year colleges; and health professional and other professional schools. The validity of applying the SSI to a given state is based on the assumption that state's financial requirements for each type of institution are similar to national average education appropriation and tuition rates. Where this is true, the SSI establishes interstate comparability of system load. Definitions and a table of the percent distribution of enrollments for these institutions by state is presented in the technical appendix.

SYSTEM LOAD--SYSTEM FINANCIAL REQUIREMENTS Annual FTE students in public institutions of higher education adjusted for system support requirements per 1,000 population. (ENROL x #3)

This is a measure of the financial load of a state's higher education system resulting from the combined effects of enrollment and the design of the system itself. The load is reported in annual FTE students adjusted for the education appropriation and tuition funding requirements associated with the enrollment mix by type of institution within the state's system. Dividing education appropriations plus tuition by the SYSTEM LOAD (reported as the OUTPUT measure) indicates how well the system is being funded by these combined revenues.

#4--TAX CAPACITY Potential state and local tax revenue as measured by the "representative tax system" per capita. (D/A)

This index measures the ability or potential of state and local governments to obtain revenues for public purposes through various kinds of taxes. The wealth of local residents is only one source of tax revenues; therefore, this measurement is not equivalent to per capita personal income. Tax capacity is measured here by a representative tax system that defines the tax capacity of a state and its local governments as the amount of revenue they could raise (relative to other state-local governments) if every state and local system applied identical tax rates (national averages) to their respective tax bases. The sum of capacities for all states equals the U.S. total tax revenues collected.

#5--TAX EFFORT State and local government tax revenues collected as a percent of state and local tax capacity. (E/D)

Tax effort measures the percentage of state and local government tax capacity that is actually used. The tax revenues collected for all states equals total tax capacity nationwide. Since the nationwide effort measure, by definition, is 100 percent, the measures for individual states indicate how they compare in tax collection performance with the national average.

TAX--TAX REVENUES State and local tax revenue collected per capita.
(#4 x #5)

Collected tax revenues represent the wealth available to state and local governments for public use. The index essentially identifies "rich" versus "poor" states according to current tax income. However, these designations must be tempered by the fact that some states have greater social needs than others. This increases the competition for funding among alternative uses so that even "rich" states may experience scarce dollars in financing certain public programs. Some apparently "poor" states, on the other hand, may have less than average requirements for certain public services so that support dollars are more readily available. Also price differences among the states affect the purchasing power of government revenues. Although a "geographical price index" is not currently available, its importance warrants discussion, as is noted in the technical appendix.

#6--ALLOCATION TO PUBLIC HIGHER EDUCATION Percent of state and local government collected tax revenues that are appropriated or levied for education operating expenses of public institutions, $(F_a + F_b - F_c)/E$. The percent allocated for total appropriations is reported in parentheses.

This ratio suggests the relative importance and requirements of financing the education and related supporting functions of public higher education to the funding of other public services in the state and local government budget. The case for greater allocation must be made against competing claims of other public service programs. Accordingly, evidence that education should receive a greater share of the state budget is suggested by relatively lower education appropriations per student compared with more favorable unit funding of other public services.

The allocation rate for total appropriations, shown in parentheses, includes public service programs which are not comparable state-to-state. This measure should be used only as an indicator of the total allocation requirements of the state's higher education system.

APP--EDUCATION APPROPRIATIONS PER STUDENT State and local tax revenues appropriated or levied for current operating education expenses of public institutions per annual FTE public student (TAX x #6/ENROL). Also reported is an index of education appropriations relative to system financial load requirements (APP/SSIa), the seven-year trend in appropriations in constant dollars, appropriations per student relative to tax capacity per capita, and research-agriculture-medical appropriations as a percentage of total appropriations and in dollars per capita.

In this study, appropriations for research, agriculture and health care public services, and medical schools are subtracted from total appropriations to equal education appropriations. Education appropriations are essentially used for student related functions of instruction; libraries, computing, and other academic support; administrative services; student services; and operation and maintenance of the physical plant. Education appropriations per annual FTE student indicates the commitment of tax revenues of state and local governments to support these functions at public institutions of higher education consistent with available funds, competing public services, and expressed institutional requirements. It indicates the resources available from the state to provide educational services to the average individual student without taking into account the type of institution attended.

The level of education appropriations should be judged as the major source of funding for public institutions. However, since some states rely heavily on student tuition to offset lower appropriations, total funding from both sources as reported by the OUTPUT measure should be recognized as a more comprehensive and fair measure of support for comparison purposes.

In five states-- Vermont, New Hampshire, Maine, Colorado, and Delaware--having a high proportion of non-residents and high non-resident tuition charges, appropriations primarily support resident students and are set in large measure according to their enrollment. Reporting appropriations and tuition per unidentified student fails, in these instances, to describe the distinctive workings of these two revenues relative to resident and non-resident students. For these five states, and to a lesser degree for some other states, reporting low appropriations and high tuition per unidentified student masks the fact that just the opposite condition exists for resident students; viz., that appropriations are much higher and tuition much lower. This condition is identified in the tables by a □ symbol following the appropriation and tuition amounts involved.

Education appropriations are also reported relative to system financial load; i.e., per annual FTE student amounts are divided by the appropriation component of the System Support Index (SSIa) to reflect funding relative to what would be expected if national average education appropriation rates were applied to the state's enrollment pattern. Since this dollar amount per student is hypothetical, values are reported only as indexes relative to the U.S. average equal to 100. The index reports how well the education and related supporting functions of a state's

⁶ Medical schools, while academic in nature, are excluded because of their exceptional funding requirements and the inconsistent responsibility among state systems for providing medical education. Inclusion of the funding of these schools would distort per student amounts.

⁷ See "Basic Data Description" section for detailed description of these appropriation components.

public higher education system are funded relative to its own unique support requirements (as interpreted by application of national average dollar rates to enrollment mix). In this sense, state-to-state comparisons of index values are fair.

Note that a university oriented state system may have well above average education appropriations per student, yet the system, relative to its high funding needs, is poorly supported. Conversely, a system emphasizing two-year colleges and undergraduate education with relatively low support requirements may be well funded with only average per student education support. Both measures are interrelated but distinctive. Institutions and faculty may be more concerned with the index of support relative to system needs; students and parents may be more concerned with education support per student unadjusted.

Also reported is the FY 1978 to FY 1985 seven-year trend of education appropriations per student in constant dollars. The deflator used was the increase in the Higher Education Price Index (HEPI)⁸ for FY 1978 to 1984 and an estimated +6.5 percent for FY 1984 to 1985. The derived seven-year inflation is 72 percent. Dividing FY 1985 by FY 1978 education appropriations and then by 1.72 equals the seven-year percent change of appropriations in dollars of constant institutional purchasing power.

The ratio of education appropriations per student to tax capacity per capita indicates a state's funding achievement relative to potential ability to pay. High index values report a combined exceptional collection and allocation of tax revenues for a relatively small base of tax capacity and student enrollment load. Low values conversely suggest that taxing effort and/or allocation is low compared to a relatively large tax potential and/or student load.

Res-Ag-Med appropriations are for research, major public services, and medical schools, and are dependent upon state public service needs and their assignment to public institutions. They are restricted by legislative budget line-item identification or by institutional designation for the direct operations and administrative support of (1) organized research, (2) agriculture experiment stations and cooperative extension services, (3) teaching or affiliated hospital operations and public service patient care, and (4) schools of medicine, dentistry, veterinary medicine, and osteopathic medicine.

Res-Ag-Med appropriations are reported as a percent of total appropriations to indicate their relative importance in the total funding of a state's public higher education system. States have widely varying commitments and responsibilities for research, agriculture, and medical education and public service. Further, assignment of these responsibilities to the public higher education system versus other state agencies differs from state-to-state. Consequently the Res-Ag-Med appropriation percentage is useful only to suggest within a state the relative size and scope of the higher education public service program.

⁸ The Higher Education Price Index is published annually in September by Research Associates of Washington, 2605 Klinger Rd NW, Washington, DC 20008.

****Percentages should not be competitively compared state-to-state.****
 Since the research-agriculture-medical functions primarily serve state residents, the per capita measure (in parentheses) gives some indication of the size of these activities assigned to public colleges and universities relative to overall need as simply expressed by population count.

#7--TUITION FACTOR Ratio of state and local government education appropriations plus student tuition revenues to state and local government education appropriations. $(Fa + Fb - Fc / H) / (Fa + Fb - Fc)$

This ratio reports the relative roles of tuition and education appropriations in state financing of public institutions. A value of 1.25, for example, means that tuition revenues equal 25 percent of education appropriations. Higher ratios may reflect a large proportion of out-of-state students paying high non-resident tuition rates. To some extent, the ratio reflects the balance a state places on the returns of higher education to the individual versus society and the resulting expected proportional payment. High values reflect the position that the individual is the primary benefactor of his education and that students and their parents should, accordingly, pay for most of the costs. Low values reflect the position that large social benefits result from higher education and that state and local governments should recognize these returns through a high appropriation subsidy.

TUITION--ESTIMATED TUITION PER STUDENT Net tuition and fee revenues of public higher education per annual FTE public student. $APP(TUITION FACTOR - 1.00)$ Also reported is an index of tuition revenues per student adjusted for the types of institutions attended $(TUITION/SSIt)$,

Tuition revenues, net of state appropriated student financial aid and tuition waived, represent the student buyer's payment for education services received. The absolute level of tuition should be consistent with benefits derived, ability to pay, and interpreted balance between individual and state returns. Tuition at competing institutions may also have to be taken into account. High tuition can be justified during financial difficulties by the need to fully tap every source. Yet many states believe high tuition is inimical to the basic concept of equal opportunity, and they establish low charges to provide easy access and prevent financial hardship. States with low tuition generally have a higher percentage of high school graduates going to college. Lower income parents and students especially are very dependent on low-tuition to gain access to a higher education.

Tuition per student indicates the net tuition paid by a hypothetical average individual public student (including resident and non-resident, undergraduate and graduate students) without recognizing the type of institution attended. Below average net tuition indicates that student charges, in general, are less than the national norm. In five states--Vermont, New Hampshire, Maine, Colorado, and Delaware--tuition revenue is high because of high rates charged a large non-resident enrollment. This condition is identified by a \square symbol following the tuition amount for the five states involved.

Since tuition charges vary by type of institution, the enrollment mix within a state's higher education system will affect revenues from this source. To establish comparability while taking into account the organization of a state's public system, net revenues per student are divided by the tuition component of the System Support Index (SSI). Since the dollar amount per student so adjusted is hypothetical, values are reported only as indexes relative to the U.S. average equal to 100. The index indicates the degree of over- or under-charging in a state relative to the tuition level that would be obtained if national average dollar rates were applied to the state's enrollment mix. Indexes less than 100 indicate that tuition revenues in the state are less than the national average for the state's enrollment pattern.

Tuition revenues per student are also reported relative to personal disposable income per capita as a general indicator of charges relative to resident ability to pay. In the five states with large non-resident enrollments, this ratio is substantially overstated and should be so interpreted.

The seven-year trend of tuition revenues per student in constant dollars is reported for FY 1978 to FY 1985. The deflator used was the HEPI as previously discussed. A negative percentage indicates that tuition has not kept pace with the inflation affecting institutional operations.

OUTPUT--EDUCATION APPROPRIATIONS AND ESTIMATED TUITION REVENUES PER STUDENT

Estimated student tuition revenues and state and local tax revenues appropriated for current operating education expenses of public higher education per annual FTE student. (APP + TUITION) Also reported is an index of education appropriations and tuition revenues relative to system financial load requirements (OUTPUT/SSI).

Tuition and education appropriations reflect the primary financial commitment of state residents and enrolled non-resident students to support public higher education instruction and related academic and administrative support. Per student amounts indicate the average resources from these two sources available to provide educational services to individual students without accounting for the type of institution attended. These resources provide the ingredients of education and establish its quality--faculty, class size, equipment, library, student services, administration, and facilities. More efficient use and economies of scale extend these resources.

Education appropriations and tuition revenues are also reported as an index relative to system financial load. High index values indicate that revenues from these two sources are higher than the national norm for the types of institutions in the state. Low index values indicate that revenues are less than what would be expected if the state's system were funded at national average rates.

The seven-year trend of appropriations and tuition revenues per student in constant dollars is reported for FY 1978 to FY 1985.

INPUTS--POTENTIAL TAX REVENUES PER STUDENT Potential tax dollars per annual FTE student. ($\#4/\#1 \times \#2$) Also reported is an index of potential tax dollars relative to system financial support requirements (INPUTS/SSI).

The three input factors (resident student source, attendance expansion ratio, and tax capacity) together establish a state's basic tax potential to finance public higher education relative to student enrollment load. These factors are relatively stable inherent state conditions generally subject to only modest or slow alteration. States with high INPUT levels have great economic potential to finance public higher education through a combination of high tax capacity and relatively low student enrollment. States with a low capacity-load ratio must fully tap a modest potential if public institutions are to be adequately supported.

Potential tax revenues per student indicate the tax resources potentially available in the state to provide educational services to individual students without taking into account the type of higher education system involved. Potential tax revenues relative to the state's public system financial load requirements are reported as an index.

PROCESS--COLLECTIVE FINANCIAL ACTIONS. Percent utilization of INPUT factors to equal OUTPUT. ($\#5 \times \#6 \times \#7$). Also reported is an index of PROCESS factors relative to system financial support requirements (PROCESS/SSI).

The combined PROCESS factors (tax effort, allocation to public higher education, and tuition factor) are the financial actions that establish the degree to which the INPUT potential tax dollars per student are actually utilized to achieve the OUTPUT support level provided. These three factors are subject to modification through legislative and/or institutional decisions. States with high PROCESS levels are making a great effort to finance public higher education, often because of low INPUT conditions. States with low PROCESS percentages either can afford to do so because of excellent INPUT conditions or are satisfied with relatively low financing.

The three PROCESS factors relative to the state's public system financial load requirements are reported as an index.

General Macro Findings

The model is designed for individual state analysis by local higher education finance officers, legislators, and citizens. Beyond this micro focus, some general observations can be made regarding the overall (macro) role of state governments and students in financing public higher education.

Variance. Variance is defined here as the mean deviation (from the U.S. average) of the highest five and lowest five states for any given measure. Among the PROCESS factors, #6, Allocation, has the greatest variance, ± 48 percent ($+53\%$ to -43%), followed by #5, Tax Effort, ± 37 percent, and #7, Tuition Factor, ± 37 percent. This greater latitude in allocation practices among states contributes more to the variation in resulting funding levels than any other controllable fiscal factor.

The INPUT factor showing greatest variance is #4, Tax Capacity, ± 55 percent ($+85\%$ to -25%) which dramatizes the great disparity among states in tax wealth due primarily to recent increases in value of mineral deposits. The Attendance Expansion Ratio, #2, also has a large variance, ± 46 percent, showing that some states have become heavily involved in the "business" of higher education, while others have chosen to be "debtors" by encouraging their residents to attend out-of-state and private institutions as well as local public colleges. Low variance occurs for factor #1, Resident Student Source, ± 20 percent, and factor #3, System Support Index, ± 13.5 percent.

Relationship Between OUTPUT, INPUTS, AND PROCESS. INPUTS and PROCESS factors have an inverse relationship. States with high INPUTS can and generally do have low PROCESS values. Yet the INPUT conditions are so favorable that the resulting OUTPUT usually remains high. Thus, wealthy states with few students generally provide higher than average financing.

States with low INPUT conditions must and do have high PROCESS actions that produce a wide range of OUTPUT levels. Poor states with many students must struggle to raise even average-level appropriations and tuition.

Key INPUT Factors. States with high INPUT levels (high tax dollars per student) usually have a good Tax Capacity plus a combined low Attendance Expansion Ratio and low System Support Index resulting in a low student and system load. Low INPUT levels are usually the result of an above average Attendance Expansion Ratio and System Support Index resulting in a high student and system load, plus average to low Tax Capacity. The Attendance Expansion Ratio is the most important INPUT factor, since in large measure it is policy determinant, responsive to public preference and legislative action. The ratio correspondingly exhibits a wide range of values reflecting this dependency. These conditions establish remarkably different capabilities to fund education relative to student load, ranging from Alaska with \$124,000 potential tax dollars per annual FFE student, to Mississippi with only \$24,000 per student.

Key PROCESS Factors. Of the three PROCESS factors, the Allocation Rate, as expected, is the strongest financial action taken by states in

financing higher education. States with a high PROCESS level usually allocate an above average percentage of their collected tax revenues to higher education, although there are many exceptions (e.g., Michigan which relies on a high Tax Effort and high Tuition Factor). Low PROCESS states generally have below average Allocation Rates. Neither Tax Effort nor the Tuition Factor appears to correlate significantly with the final PROCESS level. No state has high values for all three PROCESS factors. Wisconsin and Alabama, the highest ranking states in PROCESS, rank 3rd and 32nd in Tax Effort, 25th and 1st in Allocation Rate, and 17th and 28th in the Tuition Factor respectively.

Wealth and System Cost. Alaska, New York, New Jersey, and California, all with high tax revenues, operate the least expensive public higher education systems. These low cost systems emphasize attendance at 4-year and 2-year colleges with resulting system appropriation support requirements (as measured by the System Support Index, #3) from 5 to 14 percent below the U.S. norm. Where funding requirements are high, the cause is often a historically predominant university structure and a relatively small 2-year college system rather than inherent state wealth.

Relationship Between Appropriations and Tuition. Higher education appropriations can be accompanied by either high tuition (South Carolina and New Jersey) or low tuition (District of Columbia). In states with a large proportion of out-of-state students paying high non-resident tuition nearly equal to costs, education appropriations may be set primarily to support the resident enrollment. Such is the case in Vermont, New Hampshire, Colorado, and to a lesser extent Maine, where appropriations relative to total enrollment are substantially lower because of this dependency on non-resident tuition.

Achievement Records. Four states--Wisconsin, Alabama, Arizona, and Minnesota--have done the most with the least and been successful. Ranking lowest in INPUTS and highest in PROCESS, these four states have done their best to respond to an exceptionally difficult financial challenge and have secured near or above average funding. New York also deserves special notice for having responded to high INPUT conditions (15th), not with a typically low PROCESS level but with an equally high PROCESS (15th).

In terms of performing least with the most with resulting low funding per student, Florida and Oklahoma have high INPUT conditions yet respond with a low PROCESS leading to a low OUTPUT.

Trends. The time span of seven years for which data is provided is sufficient to reflect important trends. The data of tables 4 and 5 for fiscal years 1978 and 1980 through 1985 generally reflect modest and irregular changes. Occasionally a sharper consistent change in one or more measures may occur in a particular state. These should be noted and the consequences of their possible continuation considered.

Of special importance is the maintenance of purchasing power. The seven-year change in education appropriations per student in constant dollars is reported in table 1. Inflation of 72 percent for 1978-85 was estimated based on the 1978-84 change in the Higher Education Price Index and a one year projection for 1984-1985 of 6.5 percent. Nationally,

education appropriations per student in constant dollars for the seven year period were stable (-1.6%). However, in 17 states the purchasing power of education appropriations per student declined more than 10 percent. In South Dakota education appropriations per student declined 28.6 percent during this seven year period!

A majority of states increased tuition faster than inflation, with a seven year nationwide improvement in purchasing power per student of 12.1 percent. There was tremendous variation among states in this factor demonstrating that tuition is a major policy issue subject to many considerations other than the objective of serving as a source of consistent financial support. In ten states, the real value of tuition to institutions declined.

A majority of states managed to increase appropriations and tuition sufficiently to offset inflation. Five states lost ground significantly--Wisconsin, Washington, Nevada, Nebraska, and South Dakota.

Erosion of the purchasing power of appropriations and tuition per student results in a reduction in the assets required to provide services to students and faculty salaries WHICH CAN NEVER BE MADE UP FOR THE PERIOD AND INDIVIDUALS INVOLVED.

TECHNICAL APPENDIX

The appendix material provides definition details of interest to financial officers and researchers.

Basic Data Description and Release Schedule

The nine elements of data used in the model are identified by an alphabetical letter and described in this section. The time relationships among data are shown below.

	1983.	1984	1985			
	<u>Jan</u>	<u>Dec</u>	<u>Jan</u>	<u>Dec</u>	<u>Jan</u>	<u>Dec</u>
A. Population	July					
B. High School Graduates		Spring				
C. Enrollment			Fall			
D. Tax Capacity	<u>FY</u>					
E. Tax Revenues	<u>FY</u>					
F. Appropriations					<u>FY</u>	
G. System Support Index	<u>FY</u>					
H. Estimated Tuition Revenues					<u>FY</u>	
I. Disposable Personal Income	Calendar year					

A. Resident Population, in thousands.

Source: Current Population Reports: Population Estimates and Projections, U.S. Department of Commerce, Bureau of the Census, Washington, D.C.

B. High School Graduates (public and nonpublic). Excludes equivalency certificates and graduates from other programs.

Source: High school graduate counts were obtained by State Higher Education Finance Officers (SHEFO) from state departments of education. Earlier data of this type is published in Statistics of Public Elementary and Secondary Schools, and Statistics of State School Systems, U.S. Department of Education, National Center for Education Statistics, Washington, D.C.

C. Annual Average Full-Time-Equivalent Enrollment in Public Institutions of Higher Education.

Source: Provided by State Higher Education Finance Officers (SHEFO). For other enrollment data see Fall Enrollment in Higher Education, 19—, U.S. Department of Education, National Center for Education Statistics, Washington, D.C.

Enrollment in this study is for the higher education universe consisting of public institutions listed in the Education Directory (1983-84) published by the National Center for Education Statistics. Institutions listed provide college-level studies, are authorized to award at least an associate degree, and are accredited. An exception is made for inclusion of non-listed state approved area vocational-technical institutes if they are an integral part of the higher education planning and budgeting effort; are funded as part of or in concert with the higher education system; have a mission, size, and academic program similar to community colleges; and are directing efforts toward achieving accreditation. Only the area vocational-technical colleges in Minnesota met these criteria. The inclusion of the Minnesota voc-tech enrollments is the only exception in this study to the institutional universe defined in the Education Directory.

Enrollment for the above universe consists of students taking work creditable toward an associate, bachelor's, or higher degree, and those students enrolled for credit or non-credit in a vocational or technical program that is normally terminal and results in some other formal recognition below the baccalaureate. Students in non-credit adult education courses and non-credit extension courses are excluded. Such continuing education courses are often of irregular length and are primarily supported by tuition payments as opposed to appropriations.

For the special comparative purposes of this study, enrollments in schools of medicine, dentistry, veterinary medicine, and osteopathic medicine (referred to collectively as medical schools) are excluded.

Reported annual average FTE enrollment is computed as follows: total yearly undergraduate credit hours (including summer sessions at the end of the academic year) are divided by 15 and for graduate students by 12; the resulting sum is divided by 2 if on a semester plan or by 3 if on a quarter plan. (These conversion factors are derived by dividing the total number of credits required for completing a degree program by the number of terms normally required of a fully-engaged student to obtain such credits.) Current FY annual FTE enrollment is estimated based on a projected ratio with fall headcount; e.g., FY 1985 annual FTE enrollment = FY 1984 annual FTE enrollment x (Oct 1984 headcount/Oct 1983 headcount). In a few states, not identified, credit hour count was not available. In these instances, FTE enrollment was determined by establishing the full-time-equivalency of part-time students.

For area vocational-technical institutes included in the institutional universe, credit-hours for non-credit enrollments are estimated as follows: 875 contact hours per year* = 30 semester or 45 quarter credit-hours per year = 1 annual FTE student. Only students enrolled

in an occupational or other program oriented course which results in some form of certificate or other formal recognition are included.
* 35 weeks x 25 contact hours per week = 875 contact hours per year.

D. State and Local Government Tax Capacity, in thousands.

Source: 19-- Tax Capacity of the Fifty States, Advisory Commission on Intergovernmental Relations, Washington, D.C.

Tax capacity for 1983 was estimated based on projection of an eight-year plot (1975-82) of capacity values.

E. State and Local Government Tax Revenue Collected, in thousands.

Source: Governmental Finances in 19--, U.S. Department of Commerce, Bureau of the Census, Washington, D.C.

Tax revenues collected for 1983 as reported by the Bureau of the Census were adjusted to conform to tax revenues as defined by the representative tax system used for establishing tax capacity.

F. State and Local Government Tax Revenues Appropriated or Levied for Operating Expenses of Public Higher Education, in thousands. (Includes appropriated financial aid for students attending in-state public institutions.)

Source: Provided by State Higher Education Finance Officers (SHEFO) based on modification of original data collected by M. M. Chambers. See Appropriations of State Tax Funds for Operating Expenses of Higher Education, 19--, M.M. Chambers, Office of Research and Information, National Association of State Universities and Land-Grant Colleges, Washington, D.C.

Total state (Fa) and local (Fb) government appropriations:

a. are from state and local government taxes. Funds from Federal sources are excluded. Tuition charges collected by the institution and remitted to the state as an offset to state appropriations are excluded (they are reported only once as TUITION).

b. are sums appropriated for current operating expenses at state public institutions. Sums for capital outlay (new construction and debt retirement) and for private institutions are excluded. Deleted from appropriations is an amount equal to any tuition used for debt retirement.

c. include sums for student financial aid to students attending state public institutions. Aid to students attending private or out-of-state institutions is excluded.

d. include sums destined for higher education but appropriated to some other agency; e.g., funds intended for faculty fringe benefits that are appropriated to the state treasurer and disbursed by him.

e. include sums for all activities and support elements of higher education including all non-credit instruction, medical centers and teaching hospitals, research institutes and

laboratories, agricultural experiment stations and cooperative extension services, public television, inter-collegiate athletics, board of regents, coordinating commission, centrally administered system support programs, fringe benefits, etc.

Res-Ag-Med appropriations (Fc) (Fc is included within Fa) are restricted by legislative budget line-item identification or by institutional designation for the direct operations and administrative (excluding indirect costs) support of:

a. research centers, laboratories, and ins~~titutions~~, and, sums separately budgeted by institutions for on~~going~~ research. Included is all health science research. This research is generally an on-going program. Excluded is discretionary use by faculty of unrestricted appropriations supplemented by other revenues for short-term research primarily an adjunct component of instruction (departmental research of an unsponsored nature). Tuition revenues used for research are identified as TUITION.

b. agriculture experiment stations and cooperative extension services.

c. teaching or affiliated hospital operations and public service patient care. Included are all medical, dental, veterinary, optometry, pharmacy, mental health, nursing and other health science institutes, clinics, laboratories, dispensaries, etc., primarily serving the public.

d. schools of medicine, dentistry, veterinary medicine, and osteopathic medicine.

Education appropriations equal total state and local appropriations less res-ag-med appropriations (Fa + Fb - Fc).

G. State Higher Education System Support Index.

Source: Derived from U.S. Department of Education, National Center for Education Statistics fall 1981 enrollment data, and finance data from Financing Higher Education in the Fifty States, (4th Edition, FY 1982), National Center for Higher Education Management Systems, Boulder, Colorado. Institutional classifications were reviewed by the State Higher Education Finance Officers.

The system support index recognizes differences in education appropriation support requirements and tuition revenues for ten types of institutions defined below. The definitions were used for initial classification of institutions, with subsequent verification and revisions in each state based on consultation with the State Higher Education Finance Officer.

The four types of universities are institutions granting a minimum of 30 doctoral level degrees (including first professional medical) on an annual basis in three or more program areas or interdisciplinary program areas.

Major Research Universities--Twenty-three doctoral granting institutions having sponsored research programs exceeding \$48 million.

Research Universities--Twenty-six doctoral granting institutions

having sponsored research programs from \$27 to \$48 million annually.
Intermediate Universities--Thirty doctoral granting institutions having sponsored research programs between \$11 and \$27 million and total educational and general expenditures greater than \$100 million.

Small Universities--Thirty-three doctoral granting institutions having sponsored research programs less than \$11 million and total educational and general expenditures usually less than \$100 million.

Comprehensive--institutions with strong, diverse graduate programs awarding primarily masters degrees. Must grant a minimum of 30 post-baccalaureate degrees in three or more fields or have an interdisciplinary program at the post-baccalaureate level.

General Baccalaureate--institutions that primarily emphasize general undergraduate education and are not engaged in significant amounts of graduate education.

The two types of two-year institutions confer over 75 percent of their awards for associate and/or certificate level study.

Two-Year Academic and Comprehensive--institutions emphasizing associate and certificate degrees. The number of degrees awarded in academic areas must be 20 percent or more of all degrees awarded.

Two-Year Occupational--institutions emphasizing occupational training. Includes state approved area vocational-technical institutes when these institutions are an integral part of the higher education system.

Health Professional--institutions which are primarily engaged in health science education and which confer first-professional medical degrees.

Other Professional and Specialized--a diverse group of specialized institutions such as education, engineering, divinity, business, art, music, law schools, and other health schools (not awarding any first professional medical degrees).

To compute the index, a constructed financial load per student is first derived for each state by multiplying the enrollment at each type of institution within the state by the respective national average education appropriation (estimated) and tuition rates, summing the derived products, and dividing by the state's total enrollment. This constructed load divided by the average education appropriations and tuition per student for all institutions for the U.S. equals the system support index. Separate indexes are developed for education appropriations (Ga), tuition (Gt), and education appropriations and tuition (G). The fall 1981 FTE enrollment mix for each state and the 1981-82 national average education appropriations (estimated) and

tuition rates⁹ per student used in index compilation are shown in the table on the following page.

National average education appropriation rates for each type of institution were estimated as proportional to expenditures for instruction, academic and institutional support, student services, operation and maintenance of the physical plant, and student aid. Expenditures for medical schools were deleted from the estimate.

H. Tuition Revenues.

Source: Provided by State Higher Education Finance Officers (SHEFO). For other tuition data see Financial Statistics of Institutions of Higher Education, U.S. Department of Education, National Center for Education Statistics, Washington, D.C.

Tuition revenues consist of all tuition and fee charges assessed against students in the public higher education universe. Included are tuition and fees which are remitted to the state as an off-set to state appropriations. Charges for room, board, and other services rendered by auxiliary enterprises are not reported.

To establish comparability, all tuition revenues are considered available for student instruction. Therefore any tuition and fees used for capital debt service is included as tuition (note that an equivalent amount is deducted from appropriations to avoid double counting).

Tuition revenues should relate to the public enrollment previously defined and therefore exclude amounts paid by students enrolled in schools of medicine, dentistry, veterinary medicine, and osteopathic medicine.

Net tuition equals total tuition as defined above less: (1) the amount of tuition waived or discounted by public institutions, and (2) state appropriated student financial aid provided students attending in-state public institutions.

I. Disposable Personal Income

Source: Unpublished computer print-out from Department of Commerce, Bureau of Economic Analysis, Washington, D.C.

⁹ Note that the appropriation and tuition rates associated with health professional institutions have been set equal to that of major research universities. This action has the effect of essentially cancelling out any differential effect of medical school appropriations and tuition. This simplified adjustment, as opposed to detailed exclusion of medical school enrollments and their rates, was necessary because of data limitations.

State public FTE enrollment distribution by type of institution and national average
state and local government appropriations and tuition rates per student, 1981-82.

Comparability of Data

To establish comparability, the differential effects of extraneous factors must be eliminated so that the measurement being observed is exclusively dependent on reported variables of immediate interest. In this study of appropriated support of public higher education, the variables of immediate interest are student load, system load, tax capacity and effort, allocation rate, and role of tuition. With regard to the extraneous factors, improvements have been made to reduce variations in accounting and reporting practices, and to provide data of greater detail to isolate desired comparable components. Full-time-equivalent student enrollment is now, for the first time, based on credit-hours and calculated by a standard formula. Also, student related "education" appropriations are now separately identified for a closer tie with student load.

While some technical problems of data comparability remain, the more serious concerns are with concept and theory. Six such areas are cited below. They are listed in order of presumed seriousness. Currently the author is investigating only the first three problems. The scope of the others may be beyond the capacity of this study. Also their complexity is likely to prevent any short term resolution.

1. This study presents education appropriations and tuition revenues per student without further identification of the student's residence status. These measures properly report the overall roles of the two revenues. However, tuition and appropriation rates are differentially set for resident and non-resident students, with some states charging non-resident tuition nearly equal to costs. Appropriations are set to nearly cover the costs of educating resident students with minimal tuition charge. Thus the two revenue sources have reverse roles for residents and non-residents. This distinction is critical in a few states charging high tuition to a large proportion of non-residents. Currently this condition is identified for five states in this study by a □ symbol (Colorado, Vermont, New Hampshire, Maine, and Delaware). Where this representation is a problem, revenues should be separately reported for residents and non-residents if an accurate picture of state financing based on the determinate factors is to be presented.

To secure the necessary resident and non-resident enrollment division would require an exceptional effort on the part of the State Higher Education Finance Officers. In some states the data are not readily available, in others with small non-resident enrollments the distinction is not important. With these conditions in mind, the feasibility of collecting such data is being investigated. Any collection of migration data is likely to involve only the five states where this issue is critical.

2. Three examples illustrate the inconsistencies among states in budgeting and accounting procedures that reduce comparability of appropriations. First, state governments have various practices regarding remission of certain revenues and receipts by public institutions to the state treasury. These remissions, in effect, lower actual funding from state sources. Student tuition payments, interest earned, and indirect cost recovery on sponsored research are examples of revenues received by

institutions which in some instances are remitted to the state. In the case of interest, the state may hold unexpended institutional appropriations, retaining the interest earned. The state also may retain interest on tuition revenues remitted by the institutions. To establish comparability of appropriations, amounts remitted, when an exception to common state practice, must be subtracted from appropriations. However, too much of this type of adjustment will result in appropriations losing their identity. The problem is to identify by state the major types and amounts of revenues remitted and thereby establish the magnitude and location of the inconsistencies. Use of a survey for this purpose is being considered.

A second example relates to state funding of public institutions by means other than appropriations, as, for example, receipt of lease income and mineral extraction fees on land set aside by the state for institutional benefit. All such non-appropriated state support, in effect, is a substitute for appropriations and should, for comparability, be considered and reported as if it were appropriated.

The use of "close-ended" versus "open-ended" funding is a third example of variation in state budgeting practice that affects the real level of appropriated support. In the close-ended case, institutions may not retain revenues received beyond the level projected on which appropriations were established. In open-ended funding, institutions may retain any amount of revenue received. This often encourages strong entrepreneurial efforts. The open-ended situation obviously "increases" the real funding consequences of a given level of state appropriations relative to the close-ended restraint.

Another inconsistency which may be mentioned here is the occasional presence of non-reoccurring major expenditures by institutions such as the start-up costs of a new program. The inclusion of large one-time-only appropriations distorts "normal year" amounts and reduces state-to-state comparability. An appropriate rule for exclusion of large atypical amounts should be established.

3. The prices paid for goods and services purchased by colleges and universities vary with geography. Because education is labor intensive, much of this variation is due to differences in the basic wages paid to faculty and administrators. Alaska, with a very high cost-of-living, may require as much as 45 percent more funding than average to attract and hold equivalent faculty. In the sun belt, competition for jobs may reduce comparable salaries to 20 percent below average. Other factors establishing geographical wage differences include unionization, profitability of nearby industries, urbanization, and climate and social attractiveness of the area. The prices colleges and universities pay for supplies, materials, utilities, and equipment also vary by location depending on proximity to supplier and local demand.

The comparability of state funding would be substantially improved if dollar amounts represented equal value; i.e., equivalent purchasing power. A geographic price index may be used to establish this equivalency by measuring the relative differences among states in prices paid by colleges and universities for a fixed group of typically purchased goods and

services. The representative goods of the "market basket" being priced must be of fixed description, and this requirement of constant quality prevents any easy derivation of the index.

4. This study does not take into account the private sector and its role in providing postsecondary education opportunities that complement and thereby offset state public higher education responsibilities. States with large private sectors recognize the shared responsibility to residents and design their public systems accordingly. The multiple effects of a strong in-state private sector on virtually all of the variables in this model are not now taken into account; and development of adjusting factors appears particularly difficult.

5. Tax revenues as reported in this study do not represent the total fiscal resources available to a state to support public services. Nontax revenues¹⁰ and Federal revenue sharing funds, which vary greatly from state to state, are not included. Although these revenues are often designated for special uses, they may offset the need for tax funds for other public service requirements including higher education. Thus, total revenues may be a more valid measure of state resources available to support public higher education than tax revenues alone. Arguments against inclusion of nontax revenues are based on two factors: (1) taxes are the near-exclusive source of revenues for appropriations for higher education, and (2) tax rates, and hence total tax revenues, are probably not significantly affected by the amount of nontax revenues collected.

A second problem with tax revenues is the lateness of the published data. This study uses FY 83 tax revenues as the base for FY 85 education appropriations, when, in reality, these appropriations are funded with concurrent (FY 85) tax collections. During stable periods this inconsistency causes no difficulty. But if tax revenues should rise or fall sharply, the immediate effect on education appropriations is not properly conveyed using the older tax data.

6. This study does not take into account the effect of population density on state support requirements. A "demographic factor" would adjust for the fact that sparsely settled states require cost duplicating, multiple, dispersed institutions, whereas heavily populated states permit large institutions with attendant economies of scale.

¹⁰ Nontax revenues are receipts from such diverse sources as fees and charges, rents, fines, interest earnings, and net profits from government-operated utilities, gas and water companies, lotteries, and liquor stores. Tuition payments are a form of nontax revenue and are taken into account in this study.

#2 Attendance Expansion Ratio Annual full-time-equivalent enrollment in public institutions of higher education per high school graduate (C/B). This ratio measures the degree to which a state provides attractive and accessible opportunities for higher education to both in-state and out-of-state students relative to the size of its resident student source. High ratios indicate states heavily in the "business" of higher education compared to their basic responsibility to high school graduates. (INPUT factor)

#4 Tax Capacity The potential of state and local governments to obtain revenues for public purposes through various kinds of taxes (D/A). Measured by a "representative tax system" that defines the tax capacity of a state and its local governments as the amount of revenue they could raise if all 50 state-local systems applied identical tax rates (national averages) to their respective tax bases. (INPUT factor)

#5 Tax Effort State and local tax revenue collected as a percentage of state and local tax capacity (E/D). Tax effort measures, as a percentage, how much of state and local government tax capacity is actually used. The tax revenue collected for all states equals total tax capacity nationwide, so that the national effort, by definition, is 100 percent. Effort measures for the individual states indicate how they compare with the national average. (PROCESS factor)

TAX Tax Revenue State and local tax revenue collected per capita (\$4 x #5). Collected tax revenue represents the wealth available to state and local governments for public use. The index essentially identifies "rich" versus "poor" states according to the size of their current tax income. State wealth such as nontax revenues from government fees and charges for selling certain public services are not included.

APP Education Appropriations per Student State and local tax revenue appropriated for current operating education expenses of public institutions per annual FTE student (TAX x \$6/ENROLL). Indicates average state support to individual students without taking into account the types of institutions attended. Educ. approp's. related to the state system's appropriation funding requirements are reported as an index (APP/SS1a). The ratio of educ. approp's/student to tax capacity/capita indicates a state's funding achievement relative to potential ability to pay. Appropriations for research, agriculture, and medical are reported as a percent of total approp's to suggest relative importance, and per capita as a need measure.

#7 Tuition Factor Ratio of state and local government education appropriations plus student tuition revenue to state and local government education appropriations $(Y_a + Y_b - Y_c + H) / (Y_a + Y_b - Y_c)$. This ratio suggests the relative importance of student tuition as a funding source compared to state-local appropriations. High ratios may reflect a large proportion of out-of-state students paying high non-resident tuition. (PROCESS factor)

TUITION Estimated Net Tuition Revenues per Student
revenues of public institutions per annual FTE student
APP (Tuition Factor - 1.00). Indicates average tuition (less state
appropriated student aid) paid by all resident and non-resident
students without recognizing the types of institutions attended.
Tuition related to the state system's tuition funding requirements
is reported as an index. Tuition revenues per student relative to
disposable personal income per capita indicates tuition level
relative to resident ability to pay. (TUITION/SSI)

PROCESS Collective Financial Actions The combined PROCESS factors are the financial actions that establish the degree to which the INPUT potential tax dollars per student are actually utilized to achieve the OUTPUT support level provided (#5 x #6 x #7). States with high PROCESS levels are making a substantial combined tax effort, allocation to education, and tuition charge to finance public institutions. PROCESS = OUTPUT/INPUTS The PROCESS actions related to the state system's financial support requirements is reported as an index (PROCESS/SSI)

• The payment of high non-resident tuition by a large proportion of out-of-state students, substantially increases tuition revenues and correspondingly reduces appropriation requirements.

• Res-Ag-Med appropriations have been assigned in Illinois and Ohio equal to the national average 16.6 percent of total appropriations. Education appropriations and other dependent measures are thus affected.
