METHODS OF ASSESSING TEACHER EDUCATION STUDENTS

Participants in this conference of educators, convened to consider methods of evaluating teacher education students, focused upon the relationship between candidate quality and teacher effectiveness. Questions under consideration included: (1) pre-admission field experiences students should demonstrate; (2) optimum scores on aptitude and achievement tests; (3) grade point average on entrance to teacher education programs; (4) screening processes during teacher education programs; (5) selection-out procedures employed in the programs; and (6) exit criteria. The agenda established for the conference asked participants to: (1) exchange information about current inquiry efforts regarding the quality of the teacher applicant pool; (2) understand what efforts are underway to determine reliable admission and exit criteria relative to successful teacher performance; (3) appreciate the various measures being used and the reliability they hold for making quality judgments; and (4) develop a tentative set of guidelines for further study of these issues and concerns. An annotated bibliography of 97 journal articles and documents in ERIC on assessment of preservice teacher education students is appended. (JD)
Methods of Assessing Teacher Education Students

INTRODUCTION

For the past two years there has been an intense interest in the characteristics of teacher education students. This concern is reflected not only in the popular press, but also in the activities of professional associations, institutions which prepare teachers, government agencies, and individuals who study in this area. It was this intense activity that motivated William Dunifon, Dean of the College of Education at Illinois State University, and David Imig, Executive Director of AACTE, to co-sponsor a meeting of individuals active in this area.

Fifty-five people came to the ISU campus on July 9 and 10, 1984, to work together to address common concerns regarding the assessment of teacher education students. Although most participants were from institutions which prepare teachers, there were also representatives from state and federal agencies. Representatives from 47 institutions or agencies in 27 states were present. A list of the participants is provided in the appendix.

The pages which follow provide a transcript of the conference. After introductory comments by Dr. Imig and Dr. Dunifon, the participants spent their time between small group discussions and larger group reporting sessions. Ron Adams, Cass Book, and Jim Raths were asked to listen to the group discussions and the reporting sessions and to provide overview comments. The pages which follow present the reports of the discussion groups and the remarks by the three observers. Also included are comments prepared in response to the conference by William Blakey, Counsel for the House Subcommittee on Postsecondary Education, and Joyce Stern, Senior Policy Analyst for the Department of Education.

This informal document is provided to encourage further dialogue and activity toward improving the assessment of students in teacher education.

  ERIC Clearinghouse on Teacher Education
Initially, I wish to extend a warm greeting from my colleagues and myself at Illinois State University. It is a delight to have you join us for this national conference which includes participants from Alaska, Maine, Texas, and virtually every other of the 49 continental states.

We are especially indebted to Bob Fisher and Betsy Ashburn who have labored long on behalf of the conference. Moving forward from a meeting in Washington in February at which I suggested the need for a gathering like this, Betsy and Bob have given form and substance to an idea. Thanks to each of you!

If the national reports on the quality of education in this nation had never been issued and if the nation had never been declared "at risk," there is a charge against those of us who claim we prepare teachers which would nonetheless be made: We are our own worst enemies! Mike Usdan has said that we have a genetic tendency to circle the wagons in times of crisis and shoot at ourselves. William Proxmire says it more bluntly when he tells us we spend much of our time shooting ourselves in the feet.

With the belated American attention to general systems theory in the middle 1960's came the growing understanding of the role which feedback loops play in health and vital organizations. Put simply, a feedback loop is a circuit or network which gives the system (in our case, those college or university units which prepare teachers) timely and accurate feedback regarding the activity of the system. A viable organization requires multiple feedback loops especially regarding the quality of its work.

Many of us in colleges and universities have spent a fair amount of time and much energy telling our colleagues in the public schools how important it is for them to establish feedback loops regarding a wide array of their activities. Many of our faculty have earned handsome if not generous consulting fees helping K-12 systems implement a systemic approach to management which includes feedback loops as an essential ingredient. We emphasized feedback regarding the quality of the work of the public schools.

Yet, when we examine our own "in-house" practices, we discover that those of us who prepare teachers have generally ignored the imperatives of general systems theory. Worse yet, we have failed to take the prescription we have tried to force on the K-12 sector. We have not, for the most part, undertaken serious and well-supported institutional efforts to establish feedback loops which will give us the ability to answer some simple and critical questions:
1. What exactly are we doing to prepare teachers for America's schools?

2. How well are we doing what we claim we do?

3. How can we do it better?

It is the business of this conference to try to determine what useful and effective feedback loops have been established at our respective institutions. We assume that by establishing and strengthening those feedback loops through carefully designed institutional research, we better will serve the nation and the nation's schools. We assume we can learn from each other and that none of us has yet developed the perfect, most comprehensive, and complete system.

It is also the purpose of this conference to move toward the development of paradigms which can be used by those not represented here or by those who have yet to take the initial step toward some sort of feedback system.

Until colleges and universities have gained clarity regarding what we ought to be doing to prepare teachers and are able to make our practice, we are detracting from education's status as a profession. No endeavors which claim professional status (including those which are adjacent to education) are devoid of systematic efforts to address these inquiries. We can no longer claim special privilege for education as if it were unique in the created order. Rather, we must pursue the question of how we can establish and enhance the feedback mechanism in our institutions which will strengthen our performance and the quality of our graduates.
Dr. David G. Imig, Executive Director
American Association of Colleges for Teacher Education

This past Spring, Education Times reported the results of the most recent administration of the California Basic Educational Skills Test (CBEST) to prospective teachers - with the predictable incidence of failure among a large proportion of candidates, particularly Hispanics and blacks; at nearly the same time they noted a study had been released by the California State College system that concluded that students recommended for teacher certification at 18 of 19 state colleges had slightly higher grade point averages than those who did not enter a teacher preparation program.

In recent weeks the University of Missouri-Columbia, reported that there was no statistically significant difference between the averages of education students and other campus majors in 24 common courses during 1982; earlier this year several of the reform efforts reported that prospective teachers were in the lowest quartile of the college-going population.

At one and the same time, a North Carolina official tells me that candidates recommended for certification are 70 points lower on the SAT than the national college-going mean; meanwhile, the dean at University of Nebraska at Lincoln tells me his students at graduation have the third highest SAT of all the colleges on that campus.

During the past year Weaver, Schlechty, and Feistritzer have become "popular" names to the press and colleagues as they have reported the low calibre of the education applicant pool. At the same time, institutional studies at places as diverse as the universities of North Dakota, Wisconsin-Milwaukee and Kentucky suggest that education students are the equal of, if not slightly better than, their peers enrolled in liberal arts and sciences.

Just what is going on? Why all the mixed messages? Are education students as bad as some in the press report? Or, have the screens and hurdles erected in the past dozen years weeded out the incompetents? One hears of an array of forthcoming reports from ED's office for Policy and Evaluation that say they are bad! At the same time, on more and more campuses one hears that education graduates are the equal of arts and science candidates. This raises a whole set of questions: What are we measuring? What instruments are we using? Has the quality mean really changed as a result of the loss of high quality women and minorities? Or, has this loss been offset by rising admission criteria and reduced numbers? Is there other evidence from
standardized tests (e.g., SAT, ACT, NTE, and GRE) that needs to be considered? What evidence is there and how should it be "packaged", analyzed, and compared?

It was a series of such questions and concerns that prompted us to ask our AACTE members in 1983 a set of questions regarding the quality of their candidate pool. The low rate of response to such questions regarding cumulative grade point average, high school rank, standardized test scores, etc., caused us to consider ways of helping member institutions deal with this information need. It led ultimately to both refinements in our annual report and to Betsy Ashburn and Bob Fisher designing this conference. A parallel but related concern was the current Redesign of NCATE in which one debate centers on developing an accreditation standard on students, i.e., what is an appropriate profile of the teacher candidate:

What pre-admission field experiences ought they demonstrate?

What scores on aptitude and achievement tests should they achieve?

What GPA should they bring to their teacher education program?

What screens should be used during the program?

What selection-out procedures should be employed?

What exit criteria should be utilized?

I believe that the public and policymakers will no longer tolerate our inability to respond to questions of candidate quality, and that we need to move expeditiously to both definitions of quality candidates and the determination of ways to assess the competence of our students. I recognize that we are caught in a terrible bind - if we raise our standards we lose both our students and our revenues (and invite a shortage that policymakers seem determined to circumvent through alternative certificates and abbreviated programs) - yet to maintain our current profile demeans our commitment to quality. If we do not assume a more vigorous "gatekeeper" function, we are threatened by a growing number of intervenors making judgments for us.

It is this set of problems that confronts us today. With it is the larger question of the relationship between candidate quality and teacher effectiveness. Just what relationship is there, and if one alters the quality of prospective teacher workforce, what will be its impact on schools? Schlechty's studies of employment in North Carolina suggest some real difficulties. It is to deal with these and other
similar problems that brings us to central Illinois on this warm summer day.

To exchange information about current inquiry efforts regarding the quality of the teacher applicant pool.

To understand what efforts are underway to determine reliable admission and exit criteria relative to successful teacher performance.

To appreciate the various measures being used and the reliability they hold for making quality judgments.

To develop a tentative set of guidelines for further study of these issues and concerns.

This is an ambitious agenda and a comprehensive set of aspirations. However, because you are the experts and we have come to learn from one another, we can achieve our objectives. On behalf of AACTE, let me express my appreciation for your participation and acknowledge the very significant role that Illinois State University, its faculty and administration have played in organizing and convening this conference. Dean Dunifon, we are most appreciative.

Today when teacher education is confronted with unprecedented demands for both excellence and quantity — when public leaders call for both better prepared candidates and lower cutoff scores on standardized tests — let us acknowledge that the quality of our programs will ultimately be judged by the quality of our products. Let us not use the forthcoming teacher shortage to curtail our efforts to raise the quality of the teacher applicant pool. Yet, at the same time, let us appreciate that with our renewed commitment to excellence, we also have a responsibility to produce a marketable product in sufficient numbers to meet demand. Let us do get on with the task of determining both the capabilities beginning teachers ought to possess and the knowledge, skill, and aptitude they will need to be successful in the classroom.
In small groups the workshop participants discussed present practices for assessment of students in teacher education programs. The objective of the session was to identify similarities and differences in assessment of students in teacher education programs. They were asked to include assessment measures used, reasons for using these measures, the timing of assessments and the use of assessment results.

The following reports were given to the full group of workshop participants by one member of each of the six working groups.

SESSION 1 - GROUP 1

Dr. Larry Freeman, Governors State University

Our group organized the discussion around the identification of assessment measures that are typically used, why they are used, and what happens as a result of them. We identified five categories of assessment measures that are used: (1) grade point average, (2) various kinds of examinations, (3) data concerning performance in clinical experiences, (4) screenings such as speech, language, medical, and personality, and (5) attitudinal kinds of data that are collected. We identified another area which we have not discussed yet—the development of demographic and follow-up data—but which we will briefly touch on in our next session.

The use of the grade point average appears to be a universal measure that is applied. There is not a whole lot of difference among the averages required. Nobody required an average lower than 2.0 or higher than 2.5 in overall grade point average, whether it is used for admission into programs, admission into student teaching, or a graduation. This measure appears to be used because it is tangible, and apparently objective, and because there is a feeling that there is some kind of correlation, low but positive, between performance and grade point average.

The kinds of standardized examinations used have been selected for a host of reasons, ranging from university policy to state mandates to a general desire to institute a process of assessing students' basic skills. We were not quite clear what that rubric includes, but
virtually every institution represented in our group uses some kind of examination process, usually for getting into a teacher education program, before completing a stated number of hours, or before graduation. Most of the institutions also require the submission of an ACT or an SAT score. These results are frequently used only for determining admission into the institution. The institutions were interestingly divided about 50-50 on whether there was a stipulated minimum that people had to achieve to enter a specific institution.

One institution reported using the MMPI, and as a result, referring 10% of all students to counseling. This process is not used as a means of excluding people, but to provide them with information that might lead them to seek counseling and sometimes to leave the teacher education program. Another institution is using a personality orientation inventory and a variety of vocational assessment instruments to learn more about their students as they proceed through the program.

The performance of students in clinical experiences encompasses a large variety of assessment techniques not easily given to categorization. Perhaps one of the most interesting operations reported in our group concerned an institution that uses a professional staffing system under which any faculty member associated with a particular student can raise questions about the student's continuation in the program. This triggers a staffing in which four staff members review the student's performance. It can result in the student being dropped. Another institution is experimenting with the possibility of creating permanent small groups which would stay together over the four year period. These groups should include students, faculty, and school supervisors who meet in part to provide informal assessments for students.

SESSION 1 - GROUP 2

Dr. Gary R. Galluzzo, Glassboro State College

We did not get nearly as far, and I applaud the first group for answering questions 2, 3, and 4. We at least got to assessment measures used, and I will talk about those.

The standardized measures identified were the ACT or the SAT according to institution. But we also noted that this is not typically controlled by the College of Education or the School of Education. It is an all-college policy that says you have an admission requirement. No one talked of any cut-off score or any line that was drawn that would exclude a student from being involved.

Another similarity is that all of us use high school rank in one way or another, and again it was all-college policy and not something
controlled by the education programs. The third area of similarity was the GPA. Typically, anybody who took in transfers had only GPA, so it was common for us all to use grade-point averages from community colleges, junior colleges, or within institution transfers. Some numbers floating around went from 2.0 to 2.5. GPA is also used for retention at a couple of institutions, ranging from 2.0 and 2.5 upwards as high as 3.0, both for cumulative and for major GPA.

A few institutions were similar in that they used retention counseling procedures. For example, early field experiences, freshman and sophomore field experiences, or interviews were evaluated and the data were used in building a portfolio for a student. In one institution students wrote up incidents that happened in their field experience each week for inclusion in their portfolio as well.

The last similarity, if we can call it a similarity, is course requirements. We all know that course requirements vary within programs and across institutions, but we do at least agree that students have to complete some identifiable sequence or content areas.

Some of the differences that we had noted were again in the area of GPA because the cut-off scores varied from one institution to another. Another outstanding difference was that one of the institutions used the ACT COMP test, which is given in the sophomore year, to identify the basic skills of prospective teacher education majors. Another difference was that some institutions use interviews for admission into the teacher certification track in the junior year and some institutions do not.

A third difference was that one or two of the institutions use what I will call social psychological measures, but you can throw attitude and some other affective kinds of things in there. To be a little more specific, I am including things like the Rokeach Dogmatism Scale, the Hunt paragraph completion method for Conceptual Level, and the Minnesota Teacher Attitude Inventory. We in New Jersey use a basic skills test that the state requires and another institution has developed its own basic skills test. Myers Briggs and the 16PF are used with some institutions. It might be helpful to note that, in our group, all of us graduate at least 500 students a year; this may reflect some of the kinds of differences in the data.

SESSION 1 - GROUP 3

Dr. Nancy Zimpher, Ohio State University

After my group hears this, some people may deny that they were in this group. It is group three. We started with some definitional issues. That is, did anybody have a problem with the notion of teacher assessment? We pretty much agreed that teacher assessment included a
range of qualitative and quantitative measures that were national and also that were in many cases, idiosyncratic or local. The range of reasons for using these measures tended to be concerned with measuring programs; this is different from measuring individual competence. Sometimes individual competence does not add up to program competence. We also agreed that there was a good enough reason for teacher assessment, if for no other reason than to describe what is, so the descriptive function of teacher assessment. That is the framework used to consider our ideas.

We came up with some similarities and some differences that are a bit more general than the notions already presented. I am going to go through them very quickly. We noticed that there was no one assessment measure, that institutions had multiple measures, and that reports were dominated by test measures.* We thought perhaps we were provoked by the sample given us and that we tended to respond in quantitative measures because those were the examples. That is, institutions may be collecting more qualitative data, but it may have been easier just to share quantitative measures on the form provided. Institutions tended to deal with data used for entrance and accountability, but we were not very effective in talking about how to make individual decisions about whether or not students should continue in programs. Institutions tended to report mostly national measures and feedback on student teaching. Institutions are a bit remiss on feedback information, measures about field experiences, and professional course experiences. Institutions like to measure the professional sequence, but we are not good at measures of the general studies' component and of academic courses, which are greater in proportion than the professional methods' sequence.

In follow-up studies, institutions like to measure the competence of our graduates as they reflect on program, but we are still not very good at measuring what supervisors think of the on-the-job performance of our graduates. We have a few instances of using data for counseling and for retention, a little bit repetitive of another point we made. Also institutions are similar in that there are few measures of attitude, personality and beliefs. Again, we do not know to what degree the report was geared to a quantitative, easy-to-report format rather than more difficult and complicated idiosyncratic measures. There was little recognition in the reports of decision makers using the data in difficult arenas, such as whether or not to retain students in programs or to dismiss them.

I am moving on to some differences now. Very few institutions report particular idiosyncratic measures that could be shared with other institutions. We tend to talk about the least common denominators, and therefore we cannot articulate to each other unique kinds of subjective measures.

I will conclude by saying that we moved ahead into the "issues" area. We are going to provoke you this afternoon because we have

* The "reports" mentioned here refer to the participants' lists, prepared prior to the conference, of their institutions' assessment methods.
gotten a head start. In other words, we could not stay on task. We moved very quickly from similarities and differences to issues to be reported later.

SESSION 1 - GROUP 4

Dr. James Algina, University of Florida

I will run quickly through these. I think most of the similarities and differences have been hit by other presenters here. All representative institutions are concerned with cognitive skills, meaning math and reading. For example, for entrance requirements no represented institution had a personality or affective measure that is used for all education students. The main rationale for using measures of cognitive skill seems to be that teachers must have some basic competency in these areas, but not all institutions had firm cut scores that they used with these cognitive measures. All institutions have checks on meeting course distribution requirements and GPA requirements. These checks are made both prior to admission and again during the program. All institutions have an internship, and if a student fails the internship the student is not certified. All the institutions reported using both formal and informal methods of providing feedback for the interns.

No institution had a counseling program aimed at advising students about their personalities and motivational characteristics that might hinder or help their effectiveness as teachers. No institution had a system for keeping all the data collected about a student in a single place so that it would facilitate the use of data in making decisions such as placement. Those were our similarities.

Our differences were that there was a variety of cognitive skill measures used. The timing of these measures varied. The variety was related to the fact that some institutions are open admissions universities and others are not. Some of the non-open admissions universities had minimum SAT or ACT criteria for admission, but they all could exempt a certain percentage of applicants. Open admissions institutions have some check on the basic skills of students. Two institutions have a basic skills test and others check for completion of courses as a surrogate for measuring basic skills. Some institutions with entrance requirements have additional basic skill requirements that are assessed during the education programs, so there is a two-tiered kind of thing going on. Some institutions have an introduction to education course that includes an early field experience. A small percentage of students seem to report making decisions to drop out of education on the basis of this experience. All institutions have clinical experiences other than student teaching and again some percentage of students, thought to be quite small, report that these experiences influenced them to drop out of
education. So it seems to be serving as some sort of self evaluation of students.

SESSION 1 - GROUP 5

Dr. James T. Ziegler, Miami University

Group 5 was composed of representatives from eight different institutions or agencies. Our discussion primarily focused on the assessment measures used and the timing of the assessments. There are not too many differences from the other groups. A similarity was that some kind of grade point average was used, a difference was that the level was quite dissimilar. Coursework completed was a similarity for assessment used, but there was quite a bit of difference between which courses and how many courses. Interviewing or counseling was a common characteristic; however, the format was not common. Physical characteristics (speech, hearing) and ratings of different types were used. Of course, the differences were what was rated and how it was rated. Various paper and pencil tests were used throughout the different programs with the differences being the types and areas that were tested. Grades for specific courses were a similarity among institutions. Basically we used the chart that is in the competency testing publication that you received. We agreed that a common assessment point was entry into the program and entry into student teaching.

SESSION 1 - GROUP 6

Dr. Deborah Osen Hancock, California State College

I would just like to comment on a few things that Group 6 came up with that were perhaps not touched on by our other reports. One of the things that we noted was that committees of faculty are making decisions about who is admitted into the teacher education programs, although on some campuses the individual advisor has major responsibility for that decision. It was found that few campuses are using anything but student teaching as an exit assessment of the student's competencies. We also noted that assessment measures that are being used are mainly ones that were selected a long time ago and that we have been using historically because "everyone has been using them for a long time."

However, there were a few campuses that are looking at their entrance criteria right now and are making some changes. One of the things that came up about GPA that you might be interested in is that teacher educators on California State University campuses in California right now are going to be looking for students in the upper half of the
total university as far as GPA is concerned, and they are going to use that as a criterion for entrance into teacher education. It looks as if they will be looking at what the student's GPA is at entrance into the senior year because that is the point at which students can enter into the teacher education program in California.

We also noted some problems with ACT and SAT scores, the fact that on many of our campuses these data are not available universally for all students coming into the program. This is particularly true for transfer students. We noticed that requirements for freshman students who are entering teacher education and for transfer students who are entering teacher education may differ on the same campus. We noted a particular problem with lower standards in community colleges, especially in basic skills courses where students were going to community colleges to take those courses, passing them, and then coming back and not being able to perform at a level that is acceptable once they got back to a four year institution.

We talked for awhile about the alternative routes to teacher certification that we are seeing and we are wondering about the impact that that is going to have on teacher education programs in those states. There was some feeling that it may not be all bad. We also discussed the fact that some schools of education are accepting responsibility for students who need remediation, while others are simply not accepting students who need remediation, believing that this is something that should be cleared up before they enter the teacher education program.

Problems In The Assessment

Work Session #2

In this session participants returned to the six small groups to discuss problems associated with the assessment of teacher education students. The objective was to identify problems associated with assessment of students in teacher education programs and then identify the three most significant to be reported to the larger groups.

The following are the reports given to the total group of participants by a member from each of the six working groups.

SESSION 2 - SPEAKER 6

Dr. Deborah Osen Hancock, California State College
We have brainstormed a whole lot of ideas and then ended up with about four that we would like to share with you as major problems and issues that we have identified. The first one was, "What are the common goals in teacher education? Are there any? What should these common goals include, not only in the area of knowledge but also skills, attitudes, and predispositions that people have about teacher education?" We were looking for common goals that would be stable over time. The reason that we felt that this was the place we had to begin was because of the old adage, "If you don't know where you're going, you will never know whether you got there or not." We do not apparently agree, nationwide, statewide, or even on our own campuses about what the knowledge, skills, and attitudes are, let alone the balance that we should be working toward among them.

The second problem or issue that we looked at was, "If we do identify these common goals, then how best can we measure them?" We talked about the need to look at both individual measures of student performance and group measures of student performance because they do result in different kinds of measurement problems. They have different roles not only insofar as admission, but also in regard to exit requirements. We were very much concerned that the measures be appropriate and efficient. We talked some about the cost to students, both in time and in money, that some of our measurement devices are taking.

The third problem we looked at was the question, "Why should we be assessing in the first place? For what purpose? And what difference will assessment make?" We realize that this is a philosophical question, but we said that we really have to decide on the purpose of the assessment. Will it be for the purpose of filtering students out, or for predicting students who are most likely to be successful in our program, or for finding out if students need to be remediated? Or are we gathering information which can then be used to publicize the nature of the product that we are turning out of our teacher education program? When we can deal with this question of why we should assess, then we will be able to know the kind of data that will have to be collected. We will also find that it will provide direction for the use of the data that will be collected.

The last question that we looked at, in our ranking of the most significant issues was, "How can the results of these assessments best be disseminated to the various publics, affected by and affecting, public education?" We talked some about whose responsibility it is to disseminate that information. Is it the teacher educator's responsibility or is it the educational researcher's responsibility? We noted that we are not seeing people from those areas on television or in the media talking about teacher education and the problems in education today. We also wondered if maybe we do not need an in between group of people who are trained perhaps differently from either teacher educators or educational researchers to help fill in this gap to disseminate this information not only to John Q. Public, but also to
educators. This question has significance because these results can help to shape, or at least enhance, the view that the public has of education and teacher education.

SESSION 2 - SPEAKER 5

Dr. James T. Ziegler, Miami University

We identified three problems or issues, the first being the assessment choice. In this category we placed predictive issues, criteria vs. norm-reference, validity and reliability, multiple measures, federal and state regulations which must be considered, and issues associated with a specialist as compared to a generalist. The context of the assessment was considered to be very important. We identified this as a problem for the following reasons: presently we see a very simplistic view of education, especially from the policymaker's view, the issue of accountability, a conflict between the systems model and the humanistic model, political aspects, the present technology of assessment, and the lack of identification of a knowledge base or the factors essential for successful learning.

Our second problem/issue was management. This whole process is very labor intensive, is very expensive, and assumes a very sophisticated records system. The causes for this particular problem are: lag time between mandates and methods, funding the needs vs. expectations of faculty, (this may need to be done, but their expectations are considerably different), lack of time due to teaching load and advising, and the relatively slow response in adopting and implementing a records system.

The third problem issue was the impact of assessment. Here we saw problems with assessment or test driven curriculum, issues on summative and formative evaluations, and communication problems. We saw this as a problem issue basically due to the lack of political savvy that we have, the type of information that we provide for the various publics, and the lack of time to create the information that various publics need.

SESSION 2 - SPEAKER 4

Dr. Mel G. Villeme, University of South Florida

We decided on about five assessment issues that we thought were important and we discussed three of them extensively. One of the things that is most important about our discussion was the consensus that we should continue to get into the political impact of assessment issues. I think we are all aware of how politically important the
things we do are.

We started off talking about cost benefit analyses and the discussion had to do with whether or not we should view benefits as eliminating people who probably should not be teachers or whether we should view benefits as increasing the competence in the people in the field. There was some agreement that we should get people to try to focus on the benefits of increasing the competence of people in the field, and not so much pander to the notion that we just need to get rid of people who are poor, incompetent teachers. I think the pressure seems to be for us to do that now. We also wanted to go about increasing competence, which seems to mean increasing standards in some fashion. We need to try to come up with ways that we can increase competence without reducing the number of candidates and graduates. This is true especially in light of the coming teacher shortage. Otherwise, we are going to find ourselves having to produce people very quickly, and we may not be very happy with that situation, particularly if school districts hire people even if they are not certified.

We moved on to validity where we essentially said that the question of validity was how should we assess, what should we assess, and how can we demonstrate the importance of that assessment. We talked a little bit about trying to avoid falling into the trap of having to demonstrate that everything has some sort of predictive validity. There are things that we teach people that are steps in a process and we do not have to have predictive validity for everything.

We also talked about the locus of control for assessment. We focused on whether or not we should try to avoid inconsistency of standards. In other words, should we have locally developed and enforced standards, or state-wide, or national standards? We determined that the major issue was, "How can we avoid an inconsistency of standards?" I think an important issue is related to the fact that if some colleges are enforcing higher standards, then students can go to another institution or another state where there are lower standards. There may be a tendency for students to do just that. The point was made that we are sometimes our own worst enemies in the sense that we do not present a united front when we talk as a profession.

We may assess what is taught early on in the programs, and it may not be sensible to require all the things we assess to have predictive validity for success in the field when they are just enabling kinds of steps. We need to tell people that this is going to be a long-term process before we can establish predictive validity for many things.

There is a need to make sure that people coming out of colleges of education have good reading, writing, and math skills. Those things may never have predictive validity, but we need to be able to say that people who are teachers are well-educated. That criterion alone should stand without having to show that there is some kind of predictive validity. This represents my own point of view and not necessarily
Group pressure has caused me in the space of five minutes to reduce eleven items to eight. I could reduce the list even more if we were last. We chose not to prioritize our issues. There are eight I would like to list for you.

One of our concerns is how do we formulate predictive measures, or use measures that predict effective teaching. As an aside, we think we have an epistemological problem in that we cannot agree on what we consider the knowledge base to be because we have such different ways of knowing, and therefore accepting, certain findings; this is particularly true in the research on teacher effectiveness, which is problematic because of our own orientation to knowledge.

Second, we think that toughening exit criteria (exams like the NTE) will, in effect, create more reliance on standardized entrance measures. That was just a position where we drew back and said that if we look at the end, we will probably be impacting as much on the front, probably mostly because institutions need to protect themselves.

Third, we need to arrive at measures that decision makers, the people who decide whether or not students will stay in the programs, will accept. We have had experiences where we take data to decision makers, and they throw it out because some of their own experiential data are more profound than the data we have been able to supply them.

Fourth, we want to evolve a set of measures that policy makers can accept, both in the quantitative dimension and also in the qualitative and more subjective dimension. We need to develop the legal protections to make our subjective decisions stick. We also want to convert decision makers from the "credit-hour mentality" (that if you take a certain number of courses for a certain number of hours, you will assure a quality product) to one where we look at quality indicators.

Fifth, we think that one of the reasons that we cannot build a common knowledge base or assessment system is because of local concerns and beliefs. So we need to incorporate or accommodate local belief systems in belief systems of institutions, and even program areas within institutions.

Sixth, we think we need to develop an extended internship or clinical experience that is assessed. Student teaching is just a minimal clinical kind of experience, and we do not do a very good job
of assessing clinical activities or experiences.

Seventh, we are worried about the future of program approval and the role of program approval in the face of creating assessment systems and models that focus on individual competence. What about programmatic competence or programmatic efficacy?

Eighth, we are concerned when the professor closes the door. That is to say, professors teach what they know, their own epistemology, their own experience. Do we, can we, control any of that, manipulate any of that, force any of that into any kind of conceptual framework and avoid redundancies or voids?

We chose not to prioritize these concerns. Instead we engaged in a simulation, which I suspect some of you may do tomorrow. We said, "Let us take the nine of us and see if we can agree on a model assessment system. Let us throw out the thirty-five pages or so of institutional models and even throw out some of the myths and cobwebs that are in our heads about our own institutions." I am not going to explicate that model, although we made some progress on it. I simply want to say that we decided on a set of assumptions about the model assessment system that may be of interest to you.

One, we assumed that the whole reason for creating some kind of measurement and assessment is because we assume we can raise the probability that our graduates will be of high quality by setting some standards and some measures.

Second, we are probably operating on the assumption that we can screen out persons who do not fit our notion of a good teacher.

Third, we can control, to some extent, what happens in our programs or find out if our programs have any impact or efficacy at all.

Fourth, we might be able to strengthen our own legal stance in regard to any kinds of retention decisions that we might want to make.

We developed two focal points, one on entrance and one on exit. It is a fairly simplified model in which we look at three concerns upon entry and three concerns upon exit. The concerns focus on academic competence, performative or skill demonstration competence, and dispositional competence, that is, attitudes and values associated with the act of teaching. It helped us come clean on some of our assumptions, and the group will continue to work on that tomorrow.
Dr. Gary Galluzzo, Glassboro State College

I will just give you the order in which we discussed the items. I asked at the end if these were the priorities and the group said it was the way in which we talked about them so they must have been important; number two, however, seems much more important by size than number one. Nonetheless, three impediments or issues or problems of evaluating teacher education programs or student assessment came up. As a preliminary note, it came to the point where we changed the focus for discussion to "assessment/evaluation," because we waffled sometimes in between student assessment and then aggregating data from a lot of students and putting them into a picture where we might get some sense of what the program evaluation looked like. I may use one or the other term interchangeably.

The first impediment that we found was in the area of identifying what to measure. We did no more than to say that there are probably four domains that we need to look at, or that there are problem areas right now.

The first one, of course, is the knowledge area, and we had some of the debates that you heard other groups mention already about the predictive validity of a knowledge instrument to performance or to some other measure. A second area or domain is behavior and the assessment of teacher performance in some setting and with enough observation. The third area is affect, which we did not define much more than to say we know there are a lot of people who are interested in the changes in affect and relationships of affect to teacher performance or to teacher knowledge. The fourth area is social psychological characteristics of the students. They are things like thinking style or learning style or teaching style, conceptual level, dogmatism and things of that sort. That was the first problem area.

The second problem area identified was the lack of literature on implementing and managing program evaluation. This was a very, very large area for us, as it included things like instrument development--such as psychometrically-sound instruments or practical, reliable, and valid instruments that we can use. Another area within this whole part of implementation and management is data collection. This includes such things as politics, of working around the campus and locating who has what information, determining how many keys you need to get to it and who holds the key to that information, access to the information, and, once you have all the keys, can you still break the computer code and get it out. This also includes analysis of the data and, of course, subsequent use of the data, and some issues in students' rights. Another issue is the research needed to conduct program evaluation. The thinking here is that there is little information you can go on to build an evaluation system that will try
to address all of these concerns, regardless of the fact that implementing program evaluation is situation-specific once you take it back to your campus.

Another sub-area in part two, managing an evaluation effort, is the ownership of the evaluation process or the assessment system and includes such things as timeliness and involving faculty along the way. An important concern is that the assessment program becomes institutionalized and recycled. You then have questions of trade-offs between designing longitudinal studies that may eliminate any new instrumentation which comes along or that you might want to incorporate into the evaluation plan. What kinds of trade-offs do you make in managing the evaluation system? A few others that I will quickly mention were faculty resistance, getting people to use the information, and timeliness. We work all year and collect the data and then it is summer time and few people are around to find out all the wonderful things you learned, the relationship of evaluation to policy decisions, who makes the decisions, and to whom the information is given. Another concern here is, "Why evaluate?" We have a few quick reasons for program improvement: for accountability, since we have a legislative representative in our group; for research and the developing of a research agenda; and, sometimes, just for the dialogue among ourselves as faculty members.

Part three is the relationship, a kind of tying together of assessment systems to program development and to program modification. For example, if there were no relationships, then accreditation and certification become mutually exclusive events. If that is the case, then the state, not the teacher education institution, becomes the gatekeeper. For example, if the NTE does not tie to what we think we are teaching, we might as well bring back the epistemologists from groups 3 or 4 and have them help us understand the logic that ties testing to program content.

SESSION 2 - SPEAKER 1

Dr. Larry Freeman, Governors State University

What I am going to do is list for you about five labels that serve to organize some of our talk and then make some further comments. There were five areas that seem to pose problems. The first one was the lack of a theoretical or conceptual basis to guide our efforts in the area of assessment. After much thought we ranked this among the first three of the more significant problems. There is not a second or a third since all the rest were declared to be of equal value or of equal importance. By this problem, the lack of conceptual basis, it seems that we were saying that we did not quite know what it was that we would be assessing or should be assessing.
The second area was the assessment of noncognitive areas or holistic assessment of individual students. There seemed to be an assumption that we could somehow assess cognitive knowledge that students possess or do not possess, but somehow the noncognitive area created problems for us in particular the business of making holistic assessments of individuals rather than relying on a kind of an aggregation of discrete, evaluative events over a period of time. That created problems. Much of this was described in nebulous terms. The areas we were referring to were regarded as being nebulous, to have more than shape allowing for at least conventional kinds of assessment.

The third issue regards the validity and reliability of assessment processes, the argument here being that the outcome of the assessment process is good or bad based on the competence of the person doing the assessment or the instrumentation that was being used, particularly when one was looking at assessment of actual performance episodes.

A fourth set of problems that was identified was a lack of institutional support or the institutional inertia that sort of responded to all of these efforts with a "so what," people indicating that even if we collected the data using impeccable processes when we know exactly what we are doing, frequently we are greeted with a "so what" from the faculty, from the administration or whomever.

The fifth area that we identified was a group of problems coming under the heading of the uses of data, and particularly the lack of reliance on professional judgement in the interpretation of the meaning of the data.

I now want to make a brief summary of a scheme by which we attempted to organize our conversation. At this point we became somewhat more simple minded and said that the problems were threefold from our point of view. One was what to assess, two, how to do it, and three, what to do with the assessment results once you have them. The difficulty we encountered was that what to assess is sometimes driven by what you intend to do with the assessment results. So we ended up talking in circles. Because we could not really come to grips with the question of why engage in any assessment processes because the why tends to depend upon the audience to whom the question is addressed, and since in the business of education the audience to whom we address that question is pluralistic, we get a lot of "whys." We ought to do it in a way which leads to a lot of "whats." We know that under the heading of what to assess, the conceptual framework that would guide us will probably include ideally the cognitive, noncognitive and holistic areas of performance. That is as far as we got in identifying those kinds of things. The question of how to assess involved, obviously, the question of reliability and validity, and we then took a sidetrip in our discussion about what is the criterion in how to assess. Is it job relatedness or is it some kind of picture of what the ideal teacher should look like and at that point we kind of bogged down.
The third question, what to do with the assessment results, led us into questions of how the results of the assessments get interpreted. Data are simply data until they are somehow interpreted and given meaning based on a series of judgements. One of the things we kind of kept coming back to was that there was a lack of nerve in rendering professional judgements, particularly individually and even collectively. We also addressed the question in the interpretation of the data, the continuing preference for judgement based on quantitative data rather than qualitative data. Then we are back again to the question of the audience and the seeming failure in the education community to be able to stabilize the audience so that we are all asking the same kind of question which would help to resolve the question of the "what."

Summary

Session 43

At the beginning of the conference three participants were asked to observe the activities of all six working groups, listen to the reports given from the first two work sessions, and then provide a reaction to these activities at the end of the first day of the conference.

The following three reports were given to the total group of participants by those individuals at the end of the first day.

SESSION 3 - SPEAKER 1

Dr. Ronald Adams, Western Kentucky University

Just a couple of observations in terms of the things I have seen and heard today in the groups and the reporting out sessions. I have been to many meetings of this kind in which there were groups of people getting together to discuss teacher education program evaluation. I am very encouraged by what I have seen today. I think we are no longer talking about what I call the instrument mentality. So many times we receive correspondence asking us for an instrument, saying, "I hear you have a pretty good evaluation program." In our particular system we use about fifteen different types of instruments over several different populations of people. I think we are beyond talking about instruments as evaluation and are looking more at systematic approaches to conducting program evaluation, so I am very pleased and encouraged to
see that. We are talking systems not instruments of evaluation. I also see some sophistication that is occurring in the discussions. We used to get together at similar meetings and people would compare what they were asking on their surveys. We were simply involved in mailing surveys and questionnaires to the graduate and/or their employer. Now I hear us talking more in terms of performance kinds of models, and I see that as a very positive sign.

The second thing that I have observed is the purpose of evaluation. I sense a real sincerity among the participants to conduct evaluation geared to program improvement as opposed to external forces such as, "I have NCATE coming up in two years so we had better hurry up and get an evaluation program in place," or "The state department is putting pressure on us. We have to have something as far as evaluation is concerned." I sense a real commitment to program evaluation and student assessment for program improvement purposes. I think that is very positive.

The third thing that I have picked up here that has not been present to much degree in earlier meetings, is a realization of the political climate in which we are conducting evaluation. In virtually every group that I sat in on today, politics and the political atmosphere in which we conduct evaluation came through as a concern, and I think we are beginning to realize that we are not by ourselves, that we have to operate in a political environment. However, there is one issue that I have not heard specifically in the area of politics. That is the whole notion of state mandated competency assessment for certification and the degree to which that is going to impact on our teacher education programs, and more specifically on how program evaluation will interface with a state mandated assessment. I do not believe that we in teacher education have dealt with this issue. I would like to hear more dialogue regarding how states intend to deal with teacher preparation and certification.

Finally, an area that I have not heard discussed but one which I think will be facing many of us is the evaluation of graduate and inservice programs. We have talked about entry assessment and preservice program assessment and about exit, but we have not talked much about in-service or graduate assessment. What are we going to do in terms of the graduate programs and in-service education of those teachers already in the field? Do we need to consider this aspect of our teacher education programs? For example, at what point do we not have a responsibility for our student's continuous professional development and to what extent do we assume responsibility for professional development of teachers who are not our graduates? Should colleges of education be the center of life-long professional development for educators?
As I was sitting here listening and reflecting on the many discussions that I sat in on today, I recalled the perennial question of "What do you call a person who graduated at the bottom of the class in medical school?" You know, of course, the answer to that is "Doctor."

Today, we have looked a lot at that whole issue of evaluation of individual students. I do not think that I have anything in particular to add to that. You have talked about GPA and ACT scores, you have talked about all sorts of assessments in terms of "individuals" and what that means in terms of entrance and exit criteria and so forth. I think this whole issue of assessment is a fairly recent phenomenon that has raised our defensiveness a little bit. Our best defense is a good offense. There are some things that we can do in that regard. From my own communication background, we need to do a better public relations job. Some people take that as a negative but I think public relations is very much in order at this point. We have just heard many reports about how adequate our students are in comparison to other non-education majors. We can certainly attest to that at Michigan State University as well. I think that message needs to get out. But it seems to me that the publics we need to inform and convince are both within the university, that is, our colleagues in other departments and maybe our own colleagues in Colleges of Education, as well as those legislators, those publics out there who are writing the National Commission Report On Excellence and those who repeatedly say that our teachers are from the bottom of the barrel. I think we have some ways of defeating those kinds of statements, but we need to get that information out.

I think we also need to focus on our programs. I hear some people saying their programs are not really programs, but instead are a series of courses in which individual faculty members exercise autonomy and teach whatever they want. We were talking at lunch about a study in which it would be possible to trace a student's coursework and realize that throughout every single course he/she was taught behavioral objectives, and for another student at that same institution, it would have been possible for him/her to take the whole series of similar courses and never have been taught behavioral objectives. We need to be in the business of examining very carefully what our programs are. Programs are not just a series of separate courses in education, but should be a series which adds up to something we can justify and, more importantly, that we can validate what we are instructing.

What makes us unique is that we know something about education. One of the things that happens with those publics out there is that they think THEY know as much about education as we know about education.
After all, they have all gone through the public school system! They are who they are because they have studied somewhere and they think they know what is going on. One thing a recent study at MSU revealed was that 32% of the non-teaching majors, at this point in time, as freshmen through seniors in college, have such a complete or high competence that they could go out and teach right now! That compares to only 9% of our preservice teachers. It seems to me that this is a quantitative expression of the belief that teaching is not difficult, that anybody can do it. Part of that belief is a communication problem. We do not let people know what we know about education. We need to establish a professional knowledge base and we need to communicate it to other people. We need to validate that what we teach in education makes a difference, and it makes a difference in terms of the knowledge and skills of those who teach. We are a long way from being able to demonstrate that knowledge in education makes a difference in performance. I think we have to demonstrate that there is some consonance with objectives of programs and teacher abilities to perform in the classroom, and that there is some consonance with what we, as teacher educators, hold as values about education and what we teach about what should occur in the schools.

When you ask teachers "What is important about teacher preparation?" they say that they ONLY value on-the-job-learning. We have validated over and over that people believe that the only thing worthwhile to learn about teaching comes from that which goes on in student teaching or on the job, that there is NOTHING in the education courses worthwhile. That is very different than what other majors believe. Students in other majors believe there is a research base and that they can learn from it. We need to identify what our research base is. We need to identify our professional knowledge, and we need to communicate what we know about effective teaching, about effective schools, about learning theory, about classroom management and so forth to those publics, so that it is clear we know something they do not know and that there is something we have to teach and offer prospective teachers.

In summary, we need to have something to say; we have to tell others what we know. We need to test students' knowledge in that knowledge base and then establish the relationship of that educational knowledge with performance in the classroom. We need to be able to establish that even those students who graduate in the bottom of their education class are called "teachers" with some high, positive regard.

SESSION 3 - SPEAKER 3

Dr. James D. Raths, University of Illinois

I would like to swing this conversation back a bit to the notion of assessing candidates and probably to the quality control issue. I
have some questions. Does it make sense to redefine the task in a way that will make it one that we can do, instead of defining it in such a way that we cannot do it? I want to commend Group Three for what I thought was a scaling down the aspirations of the task. They made use of a probability statement in saying, "What is the probability that these outcomes will be increased if we impose these standards or make these judgements?" Why I come to that is because one of the characteristics of a profession is that it is very difficult to define what a successful practitioner is. Is it how much money he earns, how many clients? No one knows. No one knows what a successful lawyer is. Or social worker. Or doctor. I think that the problem we have with teaching is that we do not have a criterion for success. I do not think we should either wring our hands or make one up, but we must live with that ambiguity and we should therefore make probability statements much like Group Three did. At the University of Illinois, we try to make a distinction between a standard and a criterion. Criterion is the name of the variable. Standard is the amount of the variable needed to pass the criterion. To be a policeman in Champaign there is a criterion of height and the standard is 5 feet; that is the cutoff. So height is the criterion and the standard is 5 feet, and, by the way, if you are not 5 feet tall you cannot be a policeman in Champaign.

One of the things that we often deal with is that we work with criteria without standards. I think when we have criteria and standards, clerks can make the judgements. When we were at the University of Maryland in the 1960's and we were suspicious of authority figures, we decided that we would set out criteria and standards for making promotion decisions. One criterion was research productivity and the standard was six refereed articles in specified journals, and there was a procedure for adding journals to this approved list. I am not kidding you, the secretary of the dean would call you up and say to you, "Congratulations, you got promoted." She knew. She applied the standards. By the way, we made some errors, I think, with that approach.

I just want to say to all of you who are reporting ACT, SAT means of candidates, I think one of the things about using that statistic as some kind of a bench mark is that you have to worry about what is the bottom score. That is, sure I am interested in central tendency, but how low can somebody be in GPA or in your English courses before they are allowed to graduate? The lowest person may not be somebody worthy of the title, "teacher." It seems to me that when you report your means, maybe the standard deviation and the bottom score are also important.

The second point is this notion of the difference between formative and summative evaluation and working with candidates. I think it is so difficult to be a coach to a student teacher and his judge too. We try to work with our students and get them up to a certain level, and by the way say, "I am trying to help." That is what we say. "I am out here to help you. I am from the university.
And I am going to do a good job." Then we turn our hat around and judge. Very often we find ourselves judging the coaching. I think that the notion that we have criteria without standards, and that we often serve as both coaches and judges suggests that we have to go to a model of evaluation that is different than the one used when a professor in liberal arts gives a grade. I want to push this notion and ask this question, "Does it make sense to use a staffing procedure where teacher educators get together and talk about candidates and assess them, perhaps like a doctoral oral examination, where there are some artifacts there and people make group judgements?" If we are working with criteria without standards we are going to have to harness the professional judgements of teacher educators with a staffing procedure similar to that found in oral examination.

I think the professional judgements that people make are "suit free." I think courts are hesitant to enter into where there has been due process and professionals are making judgements. I also like the idea that these judgements might not be applied to particular skills. I am really concerned about the metaphor about products and turning people out and training these people. I think, again, going back to Group Three, the notion about dispositions makes a lot of sense. I was intrigued by the opening to "The Paper Chase" sequence, where the professor said, "I am not going to teach you how to be a lawyer, you have to do that yourself. I am teaching you how to think like a lawyer." I think if we could work harder on making some judgements about the dispositions that our students acquire, dispositions to learn, dispositions to try things out, dispositions to look it up, dispositions to solve problems, we could do a much better job in what we are doing. Not to be facetious, but just last week, some teachers in an Illinois community conducted a strip search of junior high school kids because somebody had lost a five dollar bill. It seems the judgement of those teachers was suspect. The point is not "Do these teachers know how to use wait time?" It seems to be immaterial to their commitment to some kind of understandings of what the U.S. Constitution is and whether they thought about some alternatives to what they were doing. The disposition approach is more liable to get at that issue than the skills approach.

The other thing about staffing, and it is awfully hard to say this, but a lot of faculty at some distinguished universities who are located in east central Illinois, kind of wander away from evaluation. They may say they do not want to play God, or when you talk to them about the quality of their students, they smile and say, "How do you spell it?" They do not want to make these judgements. I think if we had a staffing program, we would draw those people into it and perhaps a staffing procedure would then give all of us courage to make these judgements. I think that in unity, there is some strength.

The last question was, "Is there a need for some kind of test for public confidence?" That is, test scores may not predict anything. I was suggesting in several groups that I was in, that I am not sure that
the LSAT exam predicts anything, or that the MCAT predicts anything, but they serve something of a public relations purpose. Now if the teacher exam is so easy that an eighth grader could pass it, then we have another kind of problem and we have to worry about that. Another element to consider is that when people go through a program and it is tough and rigorous, like in architecture when they have to produce all of their work in two weeks and they stay up all night, a tradition in most architectural programs, there is something about that suffering that pulls a group together and that makes them feel that it is worth it. We have student teaching, which in a sense is a suffering for some people. But I think too, that this idea of making them take some exams and sweating them out and having them study together might help, both in terms of the public and in terms of having the students feel better about themselves when they pass. I am not sure when we tell our students that they got an A in student teaching that it really means very much to them, but maybe passing some of these hurdles would in a sense create some meaning on their part. What I am asking in summary is, "Can we redefine what assessment is supposed to do, in some ways to make it more "Do-able." Is there some way that we can harness faculty judgments. Would it make sense to harness faculty in a group effort, to get at the evaluations and assessment of candidates, rather than doing it one on one. Will some kind of public ceremony, like taking a test, really solve the public relations problem that we are facing now?

Major Issues

Session #4

At the beginning of the second day of the conference participants were asked to identify the major issues confronting us as we seek to improve assessment of students. Following discussions in each of the six working groups, the group facilitators combined the separate lists and identified a composite list of nine issues.

The following report was provided to the total workshop group by one of the small group facilitators.

SESSION 4 - SPEAKER 1

Dr. Nancy Zimpher, Ohio State University

As you might guess even the six facilitators had some trouble articulating what the issues were among the six of us, so we may not be there yet. We will try to explicate each of the nine issues and then I
think there will be some ranking among us of which of those nine we really want to talk about.

#1 What assessment measures should be used to certify teachers?

The issue is how shall we test for licensure? The assumption is that many states have said that we are going to measure competence. The question is, how? What measures shall we use for certification or licensure?

#2 Most groups played off the creation of an assessment model or assessment paradigm. People want to get together to talk about a model for assessment.

#3 Third is the program efficacy issue. How do we know that the articulated program is the program that is, in fact, implemented? How do we assure that the program that is articulated is the program that will make a difference in the effectiveness of our product?

#4 Can we identify entry qualifications and exit competencies for teacher education programs? What should students come to our programs with; what should they leave with? We need a specification of characteristics or competencies.

#5 How can we assess dispositional attributes? We need a group to talk just about dispositional characteristics, attitudes, beliefs, affective attributes of teacher candidates, and the obvious implication, can we measure any of those, and if we do, do we make decisions about them?

#6 There is an issue of the relationship between institutional assessment and state-wide assessment. What do we mean by this? What is the institution's right or autonomy to assess vs. a regulatory agency's right to assess? We need to discuss the dynamics between regulatory agency assessment policies and institutional prerogative.

#7 What are the public relations issues associated with teacher assessment? By that we mean public policy makers have a sense of urgency. How do we respond to that? How do people in agencies buffer between our institutional needs and public policy maker needs? The question is what are the public relations issues associated with assessment?

#8 Should AACTE articulate a set of competencies for teachers?

#9 What are the implementation concerns in building assessment models? How do you implement an assessment system?
Summary

Session #5

The final activity of the conference was a second reporting by the three individuals identified to provide reactions to the comments made by conference participants.

SESSION 5 - SPEAKER 1

Dr. Nancy Zimpher, Ohio State University

Good afternoon. We have a challenge before us. One of the characteristics of these last two days is that we have been very vocal and provocative and interactive in our small groups, and when we come into this large room we tend to get quiet and reserved and private! And so for one hour we are going to attempt to break out of past habit and practice. We are going to do that by the following format. We have some reactions from Jim, Cass, and Ron, observations, stimuli. We would like to hear from each of the three of them. We trust we will be provoked by what they have to say. Then we might spend that last half of the session talking about what one is provoked to do at this stage in any conference, and that is to think about next steps. We may want to take issue with something that is said or extend something that is said. We may want to think about meeting again or what we would like to see as a documented piece of evidence from this activity. We might want to send a letter to AACTE, pose a charge. I have heard some themes today. We might want to follow-up on some of those. We have a challenge; our challenge is to see what kind of contributions we can work out of this last hour of energy. Shall we go in the order closest by starting with Jim?

SESSION 5 - SPEAKER 2

Dr. James D. Raths, University of Illinois

I have three topics I want to talk about.

#1 I was prompted to say something about Division K and AERA and it will relate to something that Ron Adams will speak to later. Some of you know we have been trying to get our SIG group promoted to a division in AERA and last Saturday and Sunday in Washington we finally got the teacher education division approved. It was approved on the condition that the title be amended and the delegation there had to
decide whether to go along with that. They amended it to "Teaching and Teacher Education." We did not have the 2/3 vote which we needed without making that change, so it was just one of those things where the SIG representatives there had to decide and they decided to go with it. The connotation of teaching was teaching as a career, not teaching as in instructional design. We felt that that was okay. What is going to happen now is that Lee Shulman who is president of AERA will appoint a vice-president to serve as the leader of this division and it could be within two weeks. It is within his power according to the By-Laws to name that person. That person then organizes an election that will take place after next February. In the AERA program, it will say Division K, and Division K will be assigned slots and have invited speakers and so on. I think it is a real plus; it is a chance for teacher educators to have a newsletter, to have some kind of staff support from AERA, and perhaps to have a say in the way AERA governs itself, to give teacher education more of a break.

#2 I was interested in our concern about finding instruments or measures to use to assess candidates. I am convinced that it is a fool's search. There are no paper and pencil instruments that are going to make those judgements. Combs used to say, "Use yourself as an instrument." I think the judgements we make as professionals are ones we should prize and also ones that we should research. As Bob Stake has reminded us all, judgements are data, and we can use those judgements as data to test out how well they work or how they do not work. Of course, if we are going to do that, use our own judgements, it means that we have to commit time to getting to know candidates and getting to know the candidates' work and spending time to share our judgements. So the idea is rather than do that, let us give them a test. One of the things about teacher education is how labor intensive it is. I think we found out that where we had successful programs we had professors engaged in long, hard work! I am not sure there is a short cut for it. Maybe that is a good thing.

I was reminded that very often when people come to meetings like this or when they go on accreditation visits or external review visits, they in a sense "go to church." They are more self righteous and more insistent upon good practice than they are back home. Maybe that is good. Maybe it stretches all of us, so that when we go back home we are a little more dissatisfied.

The point that I have been trying to answer here for myself is how can we get faculty more involved in the assessment effort and I do not have the answer to that. I did hear that other people were concerned about that as well. People used to say that changing a curriculum is like moving a cemetery or something on that order. I was once told, "You know how you change a curriculum? You change it!" It is not really that tough if you go about it. I just wonder if we do not know that there are some good practices about student assessment. Instead of falling back on the vague notions that are in the NCATE standards or in the state standards, I would suggest we advocate that admission to a
teacher education program needs to be separate from admission to the university. We should say it is good practice to separate the two. We need to do this because the data we get from the high schools are not good enough to make decisions about admission to teacher education. We just should say that to be an accredited program or an approved program, you ought to make a distinction between admitting to a university and admitting to a program.

Again, in student teaching, we should separate the formative and summative judgements; that is, the coaches should not make judgements about final grades. We need to make sure that we build into our programs the chance for a distinction between the coaching and the summative evaluations about student teaching. I was asking yesterday whether the staffing plan might be the way to go. The staffing would involve the faculty, so there is a way in which they are really engaged in it. It would make use of their judgements, and they would have to have multiple sources in order to make the judgements. We could have students develop portfolios; as Larry Freeman reminded us, there are programs in Illinois where students develop portfolios almost like the architecture or art students do, so faculty can see the kinds of lesson plans they have done, the kinds of tests they have written, the kinds of logs they have kept, and make some judgements about the quality of these people as professionals. We could be like Ohio State and build some triangulation into the system so that there are some independent judgements rendered, and the faculty can then make an assessment about how serious any discrepancies are.

#3 Maybe the last thing is that we actually cannot trust the entitlement program, we cannot trust the professors at institution A to say that the candidates in institution A are okay or not. It does not work because we teacher educators recommend almost everybody who comes through. We need some external check, such as the bar exam, as a check, as the medical boards is a check, as the CPA exam is a check. They do not solely take the word of the medical professors or dental professors or the law professors, but in addition there is an external check. We could say that's another standard in the accreditation process. If we are going to assess students let there be some external-to-the-faculty check about whether people should be entitled to licensure. I am just saying that these are very simple standards but they are at a level that I think are more concrete than what we have now. If we could agree that these suggestions make sense we could write them out, add others, or amend these. But at that level of abstraction, we could then assess our own programs and say how well we are doing. We could also go back to our faculty and to our deans and executive committees and say this is what a group of professionals say is good practice, and here is how we measure up. It seems to me that it is that kind of "development of norms" that is going to help us make some changes.
SESSION 5 - SPEAKER 3

Dr. Cassandra Book, Michigan State University

It is interesting to sit here and think about summarizing what has gone on over the last two days. I am attentive to my own feelings and maybe some of you are to yours as well. I find myself thinking in three veins. One is I feel reinforced about what I have done, we have done, and where we are collectively. I would like to elaborate on that. Secondly, I feel enlightened because I have learned some new things. I am pleased about that. Finally, I feel motivated to follow-up on things that I can take from our discussions. I would hope that others of you feel that way too.

To go back to reinforcement, one thing that our particular group spent time on was talking about models to systematically approach evaluation. In this model, we need to look at the inputs. We talked about entrance characteristics that we wish to assess. Another group came up with academic and cognitive skills or backgrounds in performance skills (which may not be assessed necessarily at the beginning) and dispositional attributes. Those are things on which there is a high level of agreement. We agreed we would look at grade point averages and scores on a basic skills test. (We noted that it does seem reasonable for preservice teachers to score at 12.9 grade level. After all, the comment was made that they should be at least as smart as the kids they are teaching in the twelfth grade.) Those are indicators that I have already been thinking about and that our program has been concerned about. But we have not implemented such screening measures yet. You have given me the impetus to implement more of those agreements.

It was useful for me to recall that other inputs in the model are program objectives and goals, the relationship of course goals to program goals, and the need for making those clear. One of the things that I feel was also reinforced, particularly by those of you from the southern states who are coping with competency tests imposed from external forces, is that those external forces are an input. Those external forces are going to make a difference in terms of what we teach, how we teach, how we assess, and how we prepare our students to pass the tests. One other input, that did not get as much attention as needed, is examining our faculty. At Michigan State we have examined the relationship between what faculty say the program goals ought to be, and given those goals, what educational beliefs they ought to insist upon and direct students toward. I think we need to look more at the fit between faculty input into our programs and what our products look like. I think that whole issue of program efficacy is important for us to look at, and while it got bantered about a bit, it may not have been hit as directly as needed.

Another piece of the model that seems to need additional attention is the interaction of what happens to students as they are going
through the programs. Some of us talked about ongoing assessments, portfolios of students and students' journals. I think these provide useful information. One area of research that needs to be articulated is how students come to think about teaching, how they put together all of the information they are getting. Regardless of their initial GPA or ACT score, how do they come to think about the interaction of student-teaching in learning context? How do they put together what we teach them about education psychology, school and society, and everything else into a coherent exercise of the role of the teacher in the classroom?

We need to examine where we are as a teaching profession, as teacher educators, and what we have to offer to "Joe Six-Pack." I really value the input of our "Joe Six-Pack" attendee here as well as Barry from the state department. I think we need interaction with these people and those other education department people to help us extend our thinking. I was enlightened at this conference because my thinking from time to time was pushed and probed, not only by other teacher educators, but also by others who come with a distinct group of people that they either represent or interact with daily. I think we need that kind of interaction, and I valued these exchanges over the last two days. I think we need to think about other audiences with whom we need to interact as we talk about teacher education, about assessment of students, and assessment of prospective teachers. Through these interactions we need not change our position, but we need to be better able to communicate with those people to help them to understand us.

I think the comment about a two page executive summary is something that we need to remember. We are prone to writing journal reports and monographs, maybe because we indulge ourselves in that kind of reading, but not everybody, especially those policy makers and decision makers, reads such prose. I think we need to be very clear about communicating to those publics. So, I was enlightened by the input of all of you who came from groups other than teacher educators.

Finally, I was motivated to look at some things that need to be done, and I am going to just highlight a couple of things because I know what Ron is going to say, and I share the perspective he is going to bring. I think that first of all, I was personally motivated to implement at MSU some of the things we have not implemented. For example, we have not increased our GPA requirement. You all gave me impetus to say, "Yes, there is some value in professional judgement." We can probably make the case so it will stand up in a court of law. I gained a few more arguments to go back to our teacher education council people who were dragging their feet on this issue. I think you have helped me in that way.

Second, I am motivated to share some of the instruments that we at MSU have developed and the information we have gleaned. I hope that some of you who have talents in meta-analysis will pull together the
many research projects that demonstrated the kinds of things we have already talked about, such as the fact that teacher education students are not the bottom of the academic barrel everywhere. We need to amalgamate such information and disseminate it. I think we need to share what we know in a way that goes beyond our individual institutions. It is clear to me that we have a great deal to share. I hope that we will be able to continue sharing.

For me, this has been a useful conference. I feel that I have learned from you. You have reinforced some of the things that I have already felt. I think we sometimes need the synergy of a group to move us, not only for the short period of time to feel good about what we have done and to feel that there are some positive things to come out of it, but to go that next step to make some things happen. I think that is our challenge and I think that Ron has some specific suggestions.

SESSION 5 - SPEAKER 4

Dr. Ronald Adams, Western Kentucky University

I have three points I would like to make very quickly, because I would like to challenge you and invite you to react to these and maybe other points as a total group. There are three things, that seem to me, that are next-step kinds of things that we may do to improve teacher education program evaluation.

One, I think we need to look towards some type of networking activities. It has been a real pleasure to be part of this group. I have enjoyed the discussion very much. I keep thinking that we should get this group together with the TEPFU studies group and maybe bring members in from the new AERA Division K group. If we could organize a critical mass of concerned and capable individuals who can really begin to look at program evaluation, I think it would be a tremendous activity to get program evaluation moving forward. I would suggest that we identify a meeting place; maybe in conjunction with a professional association annual meeting, where individuals who are interested in and active in program evaluation can meet. I would make a suggestion to AACTE to make room on their program for us and other individuals highly concerned with program evaluation. We may also want to think in terms of some type of a publication, whether it be a newsletter, as TEPFU is already doing, a journal devoted to teacher education evaluation, or possibly an electronic mail network. We now have the technology capabilities to allow institution to communicate via computer networks, and I think we need to explore this possibility. We must begin to strengthen the lines of communication so we do not go back to our programs, back to our homes, and let these ideas slide. We must continue to keep motivated, we must continue to learn from each other and build upon the energy and the enthusiasm of
The second point that I would like to suggest is directed to those of you who are thinking about changing your evaluation system or beginning a new evaluation system. With the current lack of funds to do research, particularly research in teacher education, we simply are not going to progress the professional knowledge base. I would propose to you that in thinking about program evaluation we also think about program evaluation as a means of increasing the knowledge base of teacher education. I think that the kinds of efforts we have talked about here and that others have been engaged in elsewhere in teacher education evaluation may be critical to producing knowledge about teacher education. We also need to do research on the teacher education program evaluation process itself. I think there has been precious little research that has actually been conducted on effective ways of evaluating teacher education programs. I would propose to you, one, that you think in terms of utilizing program evaluation as a means for furthering the knowledge base of teacher education, and secondly, that through networking we can begin to learn more about the process of evaluation itself.

The third point is the notion of being aware of the role evaluation may play in the political arena. What role does evaluation play in the process of political decision making, whether at the national level or the state level? Are political leaders aware of what is going on in teacher education that is positive? We have all indicated that we have heard enough bad news; let us get some good news for a change. How can program evaluation assist in keeping our politicians aware of what is going on in teacher education? The session we had this morning with Buddy Blakey was very enlightening to me as he gave a perspective from the legislator's point of view. He gives very good advice on how to make an impact on congressional legislators and how to interact with state legislatures. I think we have to become more aware of the political issues in our profession. I believe there are some aspects of program evaluation that need to be viewed from the political perspective. We tend to think of program evaluation as related to improving our programs or meeting some external demands, but there is a function that also related to getting the kinds of information to political decision makers to provide a possible influence on behalf of teacher education. We need to be more politically active, and we need to be more politically aware of what is going on around us both at the state and national levels.
When Dave Imig and Dean Dunifon first invited me to participate in the Conference on Student Assessment, I was anxious to participate but puzzled about the benefits to be derived. The subject matter appeared to be very technical, but was closely related to Chairman Paul Simon's active, personal interest in teacher preparation. I was looking forward to listening and learning from the experts and those on the 'firing line' in the colleges of teacher education, as a means of expanding our grasp and understanding of the issues in teacher evaluation and assessment.

My reactions to the conference might be viewed as an "outsider" looking in. From the perspective, it is absolutely essential that whatever assessing and evaluating of teacher education students is necessary for institutional purposes, that same assessment must make a contribution toward answering the basic questions being raised by education policymakers:

- What is a good teacher?
- How do you teach a teacher to be effective in the classroom?
- Are the people in the classroom competent, and how should that be determined?

These are the questions that professionals should be raising, but those are not the same issues on "Joe Sixpack's" mind as he and his family look at the local public school and the education provided his children. Joe Sixpack's concerns include: (1) Are the people teaching my children "good" teachers? (2) Who decides who can teach and whether the teacher is "qualified"; and (3) What can I do to be sure that the teacher who teaches my child is supported by the principal and rewarded for her/his performance?

These basic questions are at the heart of my reactions to and participation in the AACTE/ISU conference. They are important for the simple reason that formal teacher preparation, evaluation, and even certification are increasingly seen as irrelevant to producing high quality teachers for the classroom. This perception has been created and is contributed to by the following:

- the "merit pay" issue and the fact that teacher salaries are often tied to longevity and acquisition of post-baccalaureate degrees;
use of SAT/ACT entry scores as a measure of knowledge and competence and the fact that those scores (for education majors) have been declining;

the recent criticism in A Nation at Risk and High School, widely publicized negative commentary in the press and some electronic media about the teacher education curriculum, especially so-called methods courses; and

the perceived lack of a strong certification process, including reports of recent National Teacher Examination (NTE) test scores and the "weak" standards that are used to certify (or recertify) classroom teachers.

As teacher educators and evaluators debate and decide the many important issues we face in improving the quality of and equality in education, the debate must not focus on internal concerns or issues viewed from the perspective of those in the profession. One of the profession's basic problems is that it tends to talk only to itself. This is especially true of research and evaluation people in higher education. Increasingly, however, some are beginning to see, understand, and use their work to influence the public policy process. This is essential if current perceptions and institutional, state, and federal policymaking processes are to be influenced.

It is important to understand and keep in mind, from the outset, that good evaluation/assessment results must have at least two purposes: (1) to improve programs, and (2) to influence public policy decisions. Design it that way, develop it with those objectives in mind, and produce it in a form which allows it to be used by policymakers.

One of the most consistent criticisms I hear about educators is their inability to communicate effectively. Quoted here is one politician's partial list of "pet peeves" about educators. The language provides a sense of the public perceptions which must be overcome:

In order to frame effective social policy, we need facts, not generalities. We also need practical, not pie-in-the-sky, responses to immediate problems. Yet, rarely do educators have the information we need to make sound policy.

Educators ought to know how to communicate, but there are few groups that speak less clearly, less concisely, and with more obfuscation. Instead of precise, comprehensible, here-and-now language, what we get is usually too Olympian, too utopian, too abstract, or too fuzzy to be helpful. The
other side of this talking over our heads in jargon and verbiage is a tendency of many educators to talk down to us... In either case, real understanding is seldom advanced by the way educators communicate with us.

Educators have little understanding of the legitimacy and importance of the political process. This ignorance is expressed in many ways:

Educators view our difficult work of negotiating, compromising, balancing interests, and refining or fine-tuning public policies as dirty, underhanded, or even immoral.

Educators also run counter to sound political practice by splitting, that is, by playing off their part of education (higher, elementary/secondary, libraries, school boards, state education agencies, teachers, etc.) against other education interests. Instead of a united educational front, we are faced with warring factions, a situation in which almost everyone loses.

If politicians suggest that educators build coalitions with powerful non-educator groups, educators respond with righteous indignation that they are "above politics."

Educators give lip service to accountability but fail to do anything to bring it about. They are afraid to tell the-taxpaying public what it gets for its huge investment in education.

When it comes to the written word, especially when it is to be used by legislators or the media, try to keep the following in mind when you develop your findings, conclusions, and recommendations for public dissemination or advocacy purposes:

keep your written document to ten pages or less and provide a 1 - 2 page Executive Summary where possible.

develop graphs and other visual presentations of the facts, trends, etc., that you wish to present for use with the media and for public consumption.

be prepared to discuss (not debate) your findings with legislators and other policymakers, and always try and communicate with them on a regular basis (or through staff).

cultivate relationships with education reporters, editorial writers, public radio and TV journalists so that you have a ready access point. They will seek you out.
when an issue -- on which they respect your point of view or expertise -- arises and when they want background or an educator's viewpoint.

These suggestions or 'helpful hints' may be used in any legislature or policymaking process. They must, of course, be adapted to the circumstances and personalities involved. One of the most enjoyable aspects of the legislative process is its dynamic state; strategies change as the people, the policy, the purpose, and the politics change. "Ideas are great arrows, but they must have bows. Politics is the bow of idealism."

"A Guide for the Powerless -- and Those Who Don't Know Their Own Power." Adapted from the article, "Politicians and Educators", in Phi Delta Kappan, November 1974.
Joyce D. Stern, Senior Policy Analyst, U.S. Department of Education

Probably at no time in history has it been more of a challenge to be a teacher. The exponential growth of knowledge, new legal requirements, and family disintegration all conspire to broaden and deepen the responsibilities of a classroom teacher. We hear, too, of the terrible sense of isolation and the bureaucratic minutiae that impede the fundamental mission of today's teacher.

Many of these problems are beyond the scope of the teachers' college to address, though in an ideal world that would not necessarily be the case. Another system would allow the college advisor to counsel his or her graduates in their first teaching assignment as they become integrated into their own school's supervision and mentoring system. We lose good teachers, in my view, because rewards and support systems are in short supply—not because of any inherent flaws in the schools of education. Their policies do determine the quality of the graduates entering the school systems, however. And it is in this context that teacher education student assessment is critically important. It cannot be ignored.

As everyone well knows, this Administration has put the spotlight on teachers and teaching even prior to the issuance of the report of the National Commission on Excellence in Education. That report and the reports of other blue-ribbon panels, including that of the recent NIE-sponsored Study Group on the Conditions of Excellence in American Higher Education, identified upgrading the quality of the classroom teacher as central to the success of American education.

Reflecting former Secretary Bell's overriding concern about the quality of the Nation's teaching force, a special grant was made in 1983 to AACTE to examine teacher education throughout the country. The National Commission on Excellence in Teacher Education has concluded a series of five regional hearings and has commissioned papers on a wide variety of topics from the teaching professionals. Their report will hopefully clarify the issues and help focus the national debate.

In the context of this unprecedented interest in teachers, fostered not only by government but by the media as well, the AACTE/ISU Conference on Student Assessment was, at the very least, a timely event. I attended as an observer on behalf of Under Secretary Gary L. Jones and as a Senior Policy Analyst with the U. S. Department of Education with a longstanding professional interest in issues related to teaching and teachers.
It is my own personal view that the new and laudable drive by this country toward improving the quality of the teaching force will founder on the shoals of confusion unless, in a fairly short time, measurements of quality are developed or suitable proxies receive general acceptance. At present, because of the need to determine merit awards and advancement, public attention is largely focused on measures to evaluate teachers already in the workforce. At the state level, Tennessee and Florida are moving forcefully ahead in this arena. Charlotte-Mecklenburg's patient efforts to gain teacher and community investment in a plan to link teacher evaluation and progress on a career ladder exemplifies local-level involvement.

Recently, the RAND corporation, in a NIE-sponsored study, intensively examined four advanced teacher-evaluation plans at the local level and identified several components as essential to the process. These include: an appropriateness to the local setting, a commitment of time and money, a decision as to what the plan should accomplish, and well-trained evaluators. I would suggest that the study contains policy considerations that are transferable to the college setting and to student teacher assessment.

For example, in the information and brainstorming sessions of the conference, people were struggling with the issues of just what should be measured in the student teacher and why—to ensure quality or to weed out the incompetent early in the process. Everyone had a list of favorites and leaned one way or another as to a rationale. Again, my personal view is that finding the perfect list will prove an elusive goal. Just as there is strength in numbers, there is vitality in variety, and each school (and the districts it serves) should be comfortable with what it develops or adopts.

Mentioning the school districts leads me to another theme of this Administration—partnerships. Some 46,000 partnerships between schools and business/industry have developed since the President proclaimed school year 1983-1984 as the National Year of Partnerships in Education. One of this country's oldest partnerships exists between the college of education and the schools where the students practice their craft and, to some extent, the districts which receive the graduates. But few would disagree that stronger ties are needed to enhance the professionalism of that relationship. I would submit that if teacher educators would engage their local school district counterparts in the professional debate about appropriate indicators in student teacher assessment, each system of evaluation that emerges—that of the teachers' college and that of the school—will be better than any developed in isolation.

The American Association of Colleges for Teacher Education and Illinois State University are to be congratulated for creating a public forum for this issue. I appreciated the opportunity to attend together with this opportunity to express some ideas inspired by the conference.

Annotated Bibliography.

This annotated bibliography contains abstracts of journal articles and documents on ASSESSMENT OF PRESERVICE TEACHER EDUCATION STUDENTS which were added to the ERIC database from 1982 through December 1984.

The search strategy used in creating this bibliography retrieved all those citations indexed under the ERIC Descriptors PRESERVICE TEACHER EDUCATION and TEACHER EDUCATION PROGRAMS, only if they also had the descriptors:

- COMPETENCY-BASED TEACHER EDUCATION
- MINIMUM COMPETENCY TESTING
- NATIONAL COMPETENCY TESTS

In the bibliography, the documents are listed first, followed by the journal citations, both in chronological order. Journals cited in the bibliography (citations with EJ accession numbers) can be found in most research libraries. The full text of ERIC documents (citations with ED accession numbers) can be read on microfiche at any of over 700 ERIC microfiche collections or can be ordered from the ERIC Document Reproduction Service. Their TOLL-FREE NUMBER, (800) 277-3742, can be used to obtain cost and availability information.

An important aspect to understand about the ERIC system is that it is designed to be a comprehensive archive. It is the single source from which you can obtain "fugitive documents"—materials that are not readily found elsewhere, such as conference papers, research reports, curriculum guides, feasibility studies, federal, state, and local government reports, test instruments, lesson plans, and literature reviews. However, while ERIC is comprehensive, it is not all-inclusive. Some documents which you may have expected to appear in this bibliography may not have been submitted to ERIC. Also very recent materials may not appear, because it usually takes three to four months from submission to announcement.

Questions and document submissions are gladly received at:

Four paradigms have dominated the debate on teacher education in recent years: (1) the "behavioristic" orientation; (2) the "personalistic" mode; (3) the "traditional-craft" approach; and (4) the "inquiry" orientation. A heuristic device for organizing discussion about desirable teacher education practices is presented, which permits consideration of fundamental questions about objectives. (P)

Investigations in Science Education. Volume 10, Number 2.

Blosser, Patricia E., Ed.; Helgeson, Stanley L., Ed.

Ohio State Univ., Columbus, Center for Science and Mathematics Education.

(cont. next page)
Presented are abstracts and abstractors' analyses of seven studies related to science instruction and mathematics and three studies related to achievement. Analyses in the area of instruction are on studies of: teacher interventions in elementary science laboratory groups; variables accounting for success in an undergraduate science education course; the extended distraction approach to high school biology investigations; diagnostic-prescriptive teaching; the effects of the use of hand-held calculators; the effects of process instruction on problem identification skills; and the effects of Piagetian level on solving proportionality problems. Analyses related to achievement are on studies of: the prediction of achievement and success in an audiotorial (AT) biology program; the effects of the components of logical reasoning on physics achievement; and differences in achievement of inner city students. Responses by two authors to analyses of their studies are included. (JN)

Survey responses from 517 member institutions of the American Association of Colleges for Teacher Education are reported. The first section depicts the nature of the institutions (public non land grant, public non land grant, independent liberal arts, church-related liberal arts, private university, and predominantly black), and the patterns of education degrees offered by each type. Faculty information, presented in the second section, includes data on the number of faculty on hard-money contracts, the nature of their assignment to duties, their salaries, and degrees held. Ethnic and gender characteristics of student populations are reported in the third section. The fourth section summarizes data on (cont. next page)

A ten-year study on quantity, quality and personal characteristics of teacher candidates. Horton, Daniel, Jr.; Summers, Jerry

A study compares the quantity, quality, and personal characteristics of teacher education candidates for the 1982-83 school year with the teacher education candidates for the 1971-72 and 1972-73 school years. Subjects included students of secondary education at Indiana State University (ISU) who had applied to student teach. Data for the study were gathered from the existing files for student teacher applicants at ISU. The study did not find that teacher candidates who are graduating today are better than the ones who graduated a decade ago. However, the present groups of secondary school teacher education candidates at ISU are more mature (if age is a factor), better achievers (if grade point average is a factor), and more human (if concern for people is a factor). Study data are analyzed in detail and include charts and statistics and/or discussion on: (1) enrollment; (2) average grade point average (GPA) scores and Scholastic Aptitude Test (SAT) scores; (3) age of student teacher applicants; (4) student teacher applicants who commute; (5) major characteristics of both good and incompetent teachers; (6) academic credit transferred to ISU; (7) student teacher applicants who work; (8) factors influencing career choice of teachers; and (9) student teacher applicant profile. (JMK)

Learning about Learning: The Contributions of Ausubel's Assimilation Theory to a Teacher Education Program at the University of Vermont. Smith, Markley; Stowell, Mary Ellen

An experiment employed cognitive based teaching and learning procedures in an undergraduate educational psychology course. The procedures were strongly influenced by David Ausubel's theory on learning and related skills. Ausubel defines effective learning as a process by which humans understand the structure of knowledge and consciously make structures compatible with existing organization of concepts in the brain. Thus, the human nervous system, as an information processing and storing system, may be analogized to the conceptual structure of an academic discipline. An analysis of the students' conceptual structures employed in their writing established a learning how-to-learn phenomenon. There was indication of the presence of content understood and retained at a complex level and an ability to apply concepts to practical problems. This achievement was attributed to the thesis that the students were applying learning strategies which they had extrapolated from the Ausubelian learning theory. (Author/JD)

BEST COPY AVAILABLE
This booklet discusses changes taking place in the four major processes involved in preparing and certifying teachers: national accreditation, state program approval, state certification, and teacher preparation. Some of the major issues affecting these processes, such as teacher competency testing and teaching internships, are discussed, and the impact of changes in these four processes are examined. Three specific areas are identified as in need of strengthening: (1) evaluation of teacher preparation programs, including national accreditation, state program approval: (2) requirements for entering and remaining in the profession, including certification regulations and procedures: and (3) preparation of teachers, including program entrance and exit requirements.

Case studies are presented of successful reforms in Florida, Oklahoma, and the University of Louisville (Kentucky). (JO)

CBEST Performance in Relation to Personal Background Factors
California Commission of Teacher Credentialing. Sacramento, Jan 1984
EDRS Price MF01/PC02 Plus Postage
Language: English
Document Type: EVALUATIVE REPORT (142)
Geographic Source: U.S.: California
Journal Announcement: RIEAUG84
The California Basic Educational Skills Test (CBEST) was developed as the means by which applicants for teaching or service credentials could demonstrate proficiency in reading, writing, and mathematics. Demonstration of proficiency in these skills was required for the issuance of a credential starting February 1, 1983. When examinees registered for the test, they filled out a background questionnaire. Responses to questions were analyzed in relation to the pass-fail determination made on the basis of test scores. Factors which appear to have some relationship to CBEST performance are: (1) full-time vs part-time attendance for students working toward a baccalaureate degree: (2) attendance at a community college prior to enrollment in a four-year institution: (3) whether or not an examinee had received any tutorial work in these skills after graduating from secondary school: (4) country in which secondary school education was obtained, and facility in English compared with another language: and (5) freshman and senior grade-point averages. Eleven tables are included in the body of this report, which deals specifically with only some of the background questions. Appended are 14 additional tables and the CBEST background questionnaires. (JMK)

Will the nation have the trained teaching force required to deal with educational problems in the 1980s and beyond? Concern with the issues that relate to the answer to this question led the Council of Chief State School Officers to appoint an Ad Hoc Committee to investigate these issues. The committee sent a survey to 50 chief state school officers to document then current state policies which affected the quality of teachers and training. This report consolidates and synthesizes information from the survey into six chapters. Chapter I deals with attracting, preparing, licensing, and retaining persons for the teaching profession. The second chapter discusses attracting people to the teaching profession. Chapter III examines issues involved in preparing persons for teaching. The fourth chapter details the licensing of persons for the teaching profession. Chapters V and VI suggest ways to retain teachers and research recommendations respectively. The appendix offers a state by state breakdown on chapter topics. (JMK)

Journal Announcement: RIEJUL84

The monograph presents an assessment instrument that utilizes teacher and student behavioral indicators to assess the quality of inquiry instruction. The instrument provides teachers with feedback which not only assesses the presence of critical teaching skills, but also serves as a valuable training aid for helping them perceive how their own behaviors and responses could be modified to more effectively facilitate student learning. It is equally useful as a training aid for preservice teacher training. It is also being used in the Weber State College performance-based teacher education program, where validation studies are being conducted to evaluate its effectiveness in improving teaching. (Author)
Much concern has been voiced about the quality of teachers newly entering the profession, the teachers of tomorrow. This concern has focused either on teachers' low aptitude and achievement scores or on their low grade point averages. Numerous other personal and professional characteristics have been shown to be important to successful teaching, including empathy, flexibility, self-esteem, locus of control, conceptual level, educational preference, and teacher concerns. A study was undertaken to provide a comprehensive description of teachers for tomorrow, the student teachers of today. Subjects for this study were 93 student teachers and 88 cooperating teachers. Nine instruments and a background survey were administered to student teachers and cooperating teachers to measure the aforementioned qualities for successful teaching. Most of the instruments were administered at the beginning, middle, and end of the student teaching experience. Study results showed few substantive differences between today's teachers and tomorrow's teachers. Tomorrow's teachers remain predominantly Anglo and female. They come from predominantly middle class backgrounds, although substantial numbers of them attended ethnically mixed secondary schools, somewhat more than today's teachers. Differences that do exist are in the area of workplace concerns, as well as in the expected lower standardized intelligence scores. (JM)

In the many national studies and reports on improving the quality of formal education in the United States that have been published recently, the importance of quality teaching is emphasized repeatedly. Questions concerning the realization of this goal focus on recruitment, preparation, retention, and reward strategies. However, there is little mention of the importance of preparation in economics, which should be a fundamental component of teacher training. It is critically important that the Joint Council on Economic Education issue a new policy statement defining the role of economics in teacher preparation. Such a policy should state the following: (1) prospective teachers need to complete required formal study in basic economics; (2) economic concepts and knowledge should be made an integral part of general methods courses for elementary school teachers; and (3) a formal course in economics should be required for all secondary level social studies, business, and home economics teachers. In addition, states requiring competency examinations for prospective teachers should include an adequate number of general economics items as well as more complicated questions for social studies, business, and home economics teachers. (LP)

Traditional preservice and inservice training programs have

(cont. next page)
focused on specific techniques for teaching and testing specific aspects of the target language, usually grammatical structures. With proficiency as the organizing principle, both what teachers think and what they do in the classroom can and must be viewed from this new perspective. Obvious applications of the proficiency approach include student and instructor outcome focuses on establishing clear language requirements for completing, or entering, programs. Achieving curriculum articulation guidelines. But what is most salient in the approach is the orientation allowing placement of nonnative speakers, students and instructors, in a global framework for foreign language learning. It is now possible to view every aspect of a program, including materials, activities, and student and teacher behaviors, in a broader conceptual framework, constraining what occurs in the classroom and focusing on what learners must eventually know. The orientation clearly identifies the complementary factors of function, content, and accuracy, as well as the need to maintain balance among them at all proficiency levels.

Target Audience: Researchers; Teachers

The American Association of Colleges for Teacher Education (AACTE) appointed a Task Force on Shortage/Excess/Quality Issues in Teacher Education, which conducted a survey to (1) assess the perception of change occurring in teacher education programs to improve the quality of graduates; (2) investigate the perception of change in state teacher certification and the influence on teacher education programs; and (3) investigate the perceived influence of selected groups on state teacher certification change. Data were summarized for the total group (N=393) and across selected demographic variables. Analysis of total group findings indicated that: (1) Basic skills testing at entry into teacher education is highly regarded for improving student quality, while affective and attitudinal measures are less important; (2) Teacher education course content is the most important area influencing graduate quality; (3) The most important program support area affecting graduate quality is faculty/staff development; (4) Recent changes in state certification standards are positively affecting teacher education programs; and (5) State departments of education are most influential in changing teacher certification standards. Also discussed in this report are comparisons made among institutions from states requiring competency assessment for teacher certification and institutions from states which do not require individual scores on 20 tables displaying data are included. (CJ)

The past decade has been a productive era for classroom research. Recent investigations have yielded useful concepts for thinking about classrooms and about facilitating achievement. Research findings and concepts provide a way of considering classroom instruction, but they are not rules for classroom behavior. Some teachers believe (and behave accordingly) that they have little effect on students' learning. In fact, many teachers cannot simply and directly explain what they attempt to accomplish in their classrooms. Teachers need to give more attention to how their students perceive the role of the teacher and help teacher candidates develop a coherent teaching philosophy before they enter the classroom. Teachers who are confused about their role and goals and who hold low expectations for their classroom performance are unlikely to positively affect student learning and development. Recent research provides clear evidence that teachers do have important effects on students' performance. Furthermore, these studies provide important concepts for thinking about classroom teaching. This paper discusses research on: (1) teacher expectations; (2) teacher effectiveness (active teaching); and (3) classroom management. The paper discusses research on: (1) teacher expectations; (2) teacher effectiveness (active teaching); and (3) classroom management. The paper discusses research on: (1) teacher expectations; (2) teacher effectiveness (active teaching); and (3) classroom management.
effects of individualized audio-tutorial and frontal classroom-laboratory instructional methods on grade distribution, the relationship of teacher reinforcement and student inquiry behavior; an instrument designed to be used to obtain description about instructional methods and materials in a science laboratory; cognitive preferences of students related to a curriculum; classroom learning environment; students' difficulties in learning basic Mendelian genetics; pupil interest in presentation related to concept acquisition; evaluation of use of a zoo fieldtrip as an instructional method; and individualized instruction. Analyses in the second section (curriculum) are on: the aims of science laboratory courses; a longitudinal study of 5 years of Intermediate Science Curriculum Study (ISCS); and the influence of the use of the Biological Sciences Curriculum Study (BSCS) Elementary School Science Program on students' listening skills. Responses by three authors to analyses of their studies are included. (JN)

This paper examines (in separate sections) professional problems, proposed solutions, current trends, and needed directions related to science, mathematics, and technology education in the United States today. Professional problems and related issues focus on students, teachers, curriculum, and college science education programs (the latter listing eight problems, such as an uncertainty about the goals of science education). Proposed solutions to these problems are outlined and discussed as related to curriculum and policy development; and at the teacher, school district, business, community, university, government, and teacher education program levels. In addition to lists of characteristics of effective schools and of teaching competencies required by teachers of the future, the section on current trends points to several studies/surveys indicating, among other things, that the desirability of a background in science or mathematics will increase and that, as the number of emergency teachers goes up, the quality of science/mathematics instruction will go down. Needed directions from several sources are outlined and discussed in the final section. Among these directions are those suggesting a new view of science education and measures for eliminating the disparity between salaries of science/mathematics teachers and their counterparts in industry. In this report, the author reviews the actual and potential use of competence and performance based teacher education (C/PBTE) in regard to further education in England. He describes the concept of further education, reviews existing programs, and makes suggestions for future action. The author first outlines the development and use of this individualized modular system in the United States and then analyzes the arguments for and against such a behaviorist approach to teacher skills. He claims that much work is needed in adapting this system to the English system, especially elsewhere indicates the C/PBTE removes "some of the mystique and institutional restrictions which surround teacher education." The author notes that the development of these modules in the United States required an investment of $2 million and says that not all of the 100 modules available are relevant to the United Kingdom. He suggests, however, that various bodies, including the further education establishment, could valuably support developmental work based on the modular approach. (Two appendixes to the report describe the tentative approaches that have been made in the United Kingdom in this field, while other appendices describe modules that are available and how they are used.) The competency assessment of teachers using high and low inference measurement procedures is reviewed. A summary of past research and promising present practices is presented. This review includes the identification of competencies for different levels of education, the development of high and low inference instruments, and the use of these instruments in teacher evaluation and performance assessment. The following procedures were used in the review: 1) A review of research endeavors in the area of teacher evaluation and performance assessment; 2) A review of the instruments used in the area of teacher evaluation and performance assessment; 3) A review of the literature on the use of these instruments in teacher evaluation and performance assessment; 4) A review of the literature on the use of these instruments in the educational setting.
Inservice teacher education. Areas investigated in these studies include: effectiveness of some inservice practices; teacher perceptions of the importance of some teaching behaviors; questioning skills; teacher clarity; teacher vagueness; preservice training in environmental education; and local elementary school science practices. Four analyses of studies which examined factors affecting instruction are presented in the second section. Areas investigated include: student locus of control; thinking styles of students; self-concept and school achievement; the influence of mathematics ability on performance in physics; and student reading ability and the reading level of science materials. The final section contains a review of analysis of a single study. The study focused on attitudes and their influence on education in an informal setting. Authors responses to two analyses are also included. (JN)

Journal Announcement: RIENDV83 Government Federal Current facts concerning the teaching profession should be analyzed and acted upon. Most college students now entering the teaching profession come from the bottom quarter of the college entrance examinations. Schools and Colleges of Education are held in very low esteem on most campuses, therefore, when budgets are cut, they often suffer most. Many of the best teachers are leaving the profession for more promising work elsewhere. Taxpayer voting for "proposition 13" is a type legislation curb school finances and cut into the education budget. Many teachers' unions and education associations want equal treatment of their members; however, equality of unequals is the source of discontent coming from inside the teaching ranks. Viewed from the eyes of an ambitious, capable young person, teaching is a "dead end job." Teaching lacks a reward system for sustained effort. There are several ways in which the teaching profession can be renewed and revitalized. First of all, colleges and universities must give a higher priority to teacher education, make it a university-wide effort, and infuse the "teacher crisis" into the curriculum. Secondly, more academically talented students must be recruited aggressively for the teaching profession. Thirdly, the current teaching system must be enhanced with a Master Teacher Program, which is unlike merit pay programs, offers the teacher a promotion and a title in addition to a salary enhancement. (JMK)

The responsibility for ensuring that beginning teachers are competent to teach in the nation's classrooms should be that of teacher education institutions, according to the American Association of Colleges for Teacher Education (AACTE). Teacher education institutions must employ an assessment system that (1) assesses specific competencies as early as possible in the candidate's program; (2) employs multiple assessment methods; and (3) monitors student progress continually. Decisions based on multiple assessments should reduce the number of high-risk students while retaining students for whom potential for success has been manifested in a variety of ways. The AACTE document "Educating a Profession: Profile of a Beginning Teacher" outlines competencies that should be assured by graduation from an approved teacher education program and provides a framework for a competency assessment program. Recommended times for assessing prospective teachers' competency include: (1) admission into the teacher education program; (2) enrollment for each subsequent semester; (3) graduation into student teaching; (4) graduation from the program; and (5) first year of employment. The model described above is outlined in a chart that indicates what should be addressed, by whom, and by what methods at different points in the program. (JMK)

This paper presents the legal rationale for using the National Teacher's Examination (NTE) validation procedure which was used in Arkansas to determine cut-off scores for teacher certification. A review is given of the decision, by the United States Supreme Court, upholding use of the NTE by South Carolina in that state's teacher certification system. The points are made that it was not the intent of the testing system to discriminate and that graduation from an approved teacher training program was not a viable alternative to the use of the NTE for certification purposes. A review is also presented of Educational Testing Service (ETS) validation procedures that determine the validity of test questions as they relate to job requirements rather than to the quality of a teacher training program. The points are made that Uniform Guidelines on Employment Selection Procedures require identification of competencies important to a successful performance in the job for which candidates are to be evaluated. Actual directions given to educational experts who served on the judges for the Arkansas NTE study of area examinations are presented. Also included in this paper are descriptions of data analysis procedures used in the Arkansas study. (JD)

Journal Announcement: RIE0CT83

Schools, colleges, and departments of education are becoming increasingly accountable for the training and evaluation of competent teachers, and are developing new ways to evaluate their graduates and their programs. The National Council for Accreditation of Teacher Education (NCATE) has identified three areas for evaluating teacher education graduates: competency, entry, and effectiveness. Data for evaluation of teacher education graduates could be obtained from four categories: (1) career line data; (2) direct classroom observation; (3) pupil, peer, and supervisory evaluations; and (4) standardized measures. Each of these categories relates to an NCATE evaluation standard. At present standardized measures seem the most efficient and reliable evaluative data available to teacher educators for determining the quality of their graduates and their teacher education programs. These standardized measures take the form of competency examinations (before certification) and student achievement measures (after entry into the profession). Other measures of teacher performance include classroom observation and pupil, peer, and supervisory evaluations. More refined measures need to be developed to be used as admission standards to schools of education. (UM)

Language: English

Document Type: CONFERENCE PAPER (150); RESEARCH REPORT (143)

Geographic Source: U.S.; Illinois

Journal Announcement: RIE0CT83

An experimental preservice teacher education program was developed to train prospective high school teachers to increase academic learning time through identification and arrangement of instructional tasks of personal and social significance. Participants were 34 junior-level prospective teachers who were subjected to two treatments which culminated in a 3-week prestudent-teaching clinical experience at a university lab, an alternative high school, and an urban high school. Twenty high school classes, comprising approximately 280 students, were involved in the study. Random pairs of subjects, one from the experimental group and one from the control group, were assigned to high school classes. The supervising teacher of each high school class selected a chapter from the next being used by the class and one subject pair assigned to each chapter was given a semester to prepare to teach the chapter's content to students. Subjects in the control group received a traditional competency-based teacher education program. Subjects in the experimental group received task-significance training, which beginning with prestudent-teaching, proceeded to identifying educational levels, and then established appropriate behavioral objectives. Results supported the prediction that teachers in the experimental program would increase academic (cont. next page)

Document Type: RESEARCH REPORT (143); CONFERENCE PAPER (150)
Geographic Source: U.S.; Texas
Journal Announcement: RIESEP3

A study examined the effectiveness of university supervisors' feedback on the Academic Learning Time in Physical Education (ALT-PE) of students in two student teachers' classes. Subjects used in this study were secondary school pupils (chosen at random) in two student teachers' physical education classes. Students were observed for 13 times for a 40 minute period by two observers trained in the ALT-PE interval system. The results indicate that a behavior change did occur in both student teachers' classes as a result of the intervention, which was supervisory feedback. ALT-PE was found to be a valuable supervisory tool in helping student teachers improve instructional performance and in helping student teachers increase their pupils' achievement. The results are applied. The results are discussed in relation to the current literature.
Elementary Teachers' Attitudes Toward Science in Four Areas Related to Gender Differences in Students' Science Performance

Journal Announcement: RIESEP83

The objective of this study was to compare data on preservice and inservice elementary teachers' attitudes toward science and science instruction. Four attitudes were assessed: (1) science as a male domain; (2) science usefulness; (3) confidence in teaching; and (4) expected effect on motivation (liking of science). These measures were selected since they have been shown to be related to sex differences with respect to science/mathematics enrollment and achievement. Attitude measures were administered to preservice teachers (N=48) during their senior year in college and inservice teachers (N=777) in a southern Pennsylvania school district. Independent variables included levels of professional status (preservice/inservice), grade levels (preschool/2nd, 3rd/4th, 5th/6th, no preference), levels of instructional importance of science (high/low), sex (male/female), and levels of science courses taken in college (none, 1/2, 3 or more). Data were analyzed using multivariate analysis of variance, Duncan's multiple comparison test, and Tukey's HSD multiple comparison test. Significant differences were found for the main effects of professional status, science instructional ranking, and sex; and also for the interaction effects of professional status x college science, science ranking x sex, and science ranking x college science. Tables, references, implications, and recommendations for further research are included.

Journal Announcement: RIESEP83

A model for the systematic development of competent secondary school teachers of speech communication begins with the prospective teachers examining "who they are" and "what makes them confident and happy", in terms of motivational needs, and dominance-submission, anxiety-confidence, and rigidity-flexibility characteristics. The second stage centers on the prospective teacher identifying and understanding how a teacher is expected to function in many professional roles. The third stage stresses that whoever the person and whatever his or her role configuration, there are teaching skills to be developed for effective functioning as a teacher. The speech, language, and communications education programs at Kent State University have implemented changes in their program by following the model. First the students' personal needs and wants, hopes and fears, and strengths and weaknesses are assessed by student self-reports and the observations of instructors. Next, an awareness of educator role expectations begins by having the student spend 150 clock hours of practical exposure to real school settings and problems. In the refinement of teaching skills, the student gets another 150 hours of field and simulated practice plus 300 hours of full-time student teaching. Following the practicums, the student completes the full-time 10-week practicum in a secondary school speech program. This constitutes a culmination of the progression of practical practice from self-awareness to role awareness, to micropractive of specific skills, to macropractive of overall competencies in speech and drama teaching.

A study examined the characteristics of new students who were admitted as regular students in the Department of Adult Education at the University of the District of Columbia during the period from the summer semester of 1981 through the spring semester of 1982. To obtain a profile of the students, researchers drew upon data from the students' applications for admission and from a 20-item self-student questionnaire that contained questions on areas such as family status, current employment, educational objectives, participation in organizations, and methods of getting to and from classes. These data were then compared to data from two similar earlier studies. While the three studies do not provide sufficient data to establish any definite trends, they do point to some notable differences among the three groups of students studied. For instance, the proportions of female and part-time students are increasing. There is also an increase in the percent of new students with children. Furthermore, the most recent enrollees are more likely to be highly involved in an organization controlled by a federal or non-governmental agency opposed to a school system, and more likely to have enrolled in the program for the purpose of getting a teaching position rather than an administrative one. (MN)

Students during the period 1972 through 1976, patterns of movement to and from education were described, and causal models were examined which compare the effects of several variables on movement to and from different educational programs in other fields, those in similar, traditionally female fields, and those in dissimilar, traditionally male-dominated fields. Variables included ability, social class background, academic performance, residential background, self-concept, and college selectivity. Results indicated important patterns of influence during these early years of occupational staging which correspond closely with the characteristics of relatively open access, compatibility with traditional female roles, middle class status, and limited intrinsic and extrinsic rewards that are associated with the teaching occupation (Author/UM)

Teacher Perceptions regarding the Importance of Specified Teaching Competencies

Weber, Wilford A.: And Others

EDRS Price MF01/PC01 Plus Postage

Language: English

Document Type: RESEARCH REPORT (143)

Geographic Source: U.S.; Texas

Journal Announcement: RIEAUG83

A comprehensive analysis of preservice and inservice teachers identified teaching competencies that perceived to be the most important and self-administered questionnaires of those that perceived to be the most important and self-administered questionnaires. A comparison was made between the perceptions of preservice and inservice teachers and between the results of this study and of a similar study conducted at Bowling Green State University. Findings revealed that 16 competencies were viewed as important by preservice teachers and 25 were viewed as important by inservice teachers. Nearly all of the competencies were viewed as being of at least moderate importance. Preservice and inservice teachers held very similar perceptions regarding the importance of competencies that were rated particularly those that were rated as being of at least moderate importance. Respondents from this study rated the Bowling Green competencies lower than did the teachers who participated in that study. Tables present the rankings on the selected competencies from both studies. A copy of the questionnaire is appended. (Ji)

The study identified all K-12 and 1-12 public school districts in the United States enrolling less than 300 students (n=1,414) and those enrolling 301-990 students (n=2,711), collected and analyzed data related to superintendents, school districts, teachers, students, and school programs, and gathered data that might be useful to colleges of teacher education. A response and return rate of 79% (1,272, item questionnaires returned), of which 244 of the rural schools had less than 300 students and 398 had in excess of 300. Sections include discussion and statistics on district enrollments, district leadership, transportation, special school funding, primary occupation of people living in the district, district staff, teacher salaries, new teachers, secondary preparation, teacher recruitment, district problems, student performance, student programs, extracurricular sports offered, and selected course offerings. Concluding the report is a list of 18 findings that would be of interest to teacher educators in the preparation of teachers for rural America. I.e., teacher preparation programs should provide field experiences in rural schools, the mean beginning salary for teachers was $12,375 and overall average salary was $16,139, during the past year 40% hired no new teachers due to an increase in students, and teachers averaged three subject preparations. (AH)

The "Portfolio Process in Professional Development" is a competency based teacher education program recently mandated by the Florida State Board of Education as the central element of the Florida Beginning Teacher Program. It involves a probationary year of supervised teaching for the beginning teacher before certification is granted. This model for professional development, which has evolved over 12 years at the University of West Florida, focuses on both pupil learning and beginning teacher performance. The Portfolio Process includes three stages within a given cycle: (1) The beginning teacher collects useful information for his portfolio from multiple sources, possibly from personal writings about his work, students' work with teacher comments, or audiovisual recordings of classroom events. All data included in the portfolio is placed there to represent the teacher's competency. (2) The beginning teacher has conferences with his support team about the data in the folder. (3) A plan of action of how best to achieve the desired competencies is agreed upon by the support team and teacher. The teacher repeats the cycles until the desired level of performance in each competency level is reached as judged by the support team. (JW)

A Study of the Effects of Self-Instructional Modules on Achievement in College Social Studies.
Freeland, Kent
EDRS Price - MF01/PC01 Plus Postage.
Language: English
Document Type: RESEARCH REPORT (143)
Geographic Source: U.S.: Kentucky
Journal Announcement: RIEJUN83
The effectiveness of self-instructional modules in increasing the social studies knowledge of students in a teacher education program is reported. Students enrolled in social studies methods courses were divided into an experimental group (n=45) which used the modules and a control group (n=45) which read a textbook chapter dealing with the social sciences. The six self-instructional modules were constructed by consulting introductory college textbooks in history, geography, sociology, economics, political science, and anthropology, as well as social studies methods texts. Each experimental student read some material, answered a (cont. next page)
question, and checked it with a key. All students took the same test of Academic Progress. Students who used self-instructional modules achieved more than students who learned about social sciences from a textbook. The implication is that methods course instructors can augment regular instruction with self-instruction. (KC)

This monograph contains a description of continued research efforts in measuring and evaluating preservice teacher competencies, and effectiveness in the competency-based teacher education (CBTE) program at the University of Toledo (Ohio). Chapter 1 introduces the assessment rationale, and chapter 2 provides an overview of research literature on teacher effectiveness. Chapter 3 focuses on the identification of 40 teaching competencies and the methodology of classroom or teacher observation used at the University of Toledo. This chapter also includes a discussion of high and low inference observation and a description of the two measurement instruments: Classroom Observation Techniques (COKER) and Teacher Performance Assessment Instruments (TPAI). Chapters 4 and 5 provide the results of different types of data analysis—profile analysis and multivariate analysis of TPAI and COKER data. The final chapter presents conclusions, makes recommendations for further action, and outlines the uses of the data. (KJ)

Document Type: CONFERENCE PAPER (150); REVIEW LITERATURE (070)

Geographic Source: U.S.; Massachusetts

Journal Announcement: REBECA83

A series of five papers is presented. Sherry Rubinstein, and others, characterize the changes of teacher certification programs and reflect on the factors propelling and influencing the direction of those changes such as increased emphasis on the description and testing of the skills and knowledge of prospective teachers, and the adoption of criterion-referenced measures to assess teaching skills and knowledge. Karen Walker and James North present a general model for developing the formal testing component of a certification program. The model includes: (1) developing certification requirements; (2) deciding how to assess requirements; (3) defining measurement strategies and instruments; (4) handling logistical issues of assessment; and, (5) communicating and using assessment results. Michael Priestley explores various approaches to assessment for initial teacher certification. Conceptual issues are considered in relation to test design, assessment for entry to a teacher education program, exit credentialing, and classroom performance assessment. Patricia Nastico reviews and technical issues of teacher certification testing, focusing on standard setting and equating, and validity and job analysis. Scott Fiolet presents current applications of job analysis methodology to teacher certification testing (cont.-next page)
units, and the time devoted to teaching each unit. (JD)

A research program has been initiated at Texas A&M University College of Education to collect, analyze, and interpret data from a diagnostic prescriptive teacher preparation program. The project was undertaken to create a substantial data file containing multiple measures of learner attainment information that will provide alternatives for modeling teacher preparation. Effects through regression analysis. The program is a competency based program for secondary level teachers that conceptualizes teaching as a sequence of selective/retention steps described which are used to reduce the number of student teacher "wastage" in the Wright State University (Ohio) school of education. A 2.25 grade point average (out of 4.0 points) is required for admission to the school, and an entry level grammar/composition test, which identifies at the beginning of the sophomore year those students needing additional remediation, is given. Entry level sophomore students remain in the program for three quarters, with a mentor who serves as instructor, advisor, and observer. At the end of the first quarter, a "conference" about a student on the basis of academic or professional concerns; a student who collects three unresolved concerns may be advised out of the program following appropriate due process procedures. A recheck on grade point average, appropriate test scores, and course prerequisites is conducted prior to student teaching. Rigorous application of minimal competency standards is maintained during the student teaching experience. Extension of time from 2 weeks to a full quarter is required of students who need additional time to attain standards. Accompanying appendices detail these procedures and the forms used in working with the students. (JD)

(cont. next page)
The purpose of this study was to determine the status of teacher admissions in institutions which are members of the American Association of Colleges for Teacher Education. A concomitant purpose was to determine, by comparison with a national study in 1972, the same topic, emerging trends in teacher education. A questionnaire was administered to educators, to the instrument used in the 1972 study, in each institution. Replies from 122 institutions were studied. Information was sought about: (1) methods of admitting students to teacher education programs; (2) criteria used in admitting students to teacher education programs; (3) admission criteria for teacher education programs that students most often failed; (4) use of grade point averages in admitting students; (5) use of quotas in admitting students to teacher education programs; (6) initiatives being taken to change practices and policies of admitting students to teacher education programs; (7) number of students admitted to teacher education programs; and (8) recruitment efforts for highly qualified candidates for admission to teacher education programs. A summary of the findings includes comparisons between the 1972 and 1981 studies.

Geographic Source: U.S.; New Jersey
Journal Announcement: RIEDEC82

The quality of teaching, teachers, and teacher education is examined. An essay and a current research and public opinion on teacher competence, noting efforts by school districts, teacher education institutions, and professional teacher associations to improve the quality of teachers. Minimum competency examinations, provisional certification, and in-service training are discussed. A workshop program which trains school administrators in evaluating and improving teacher performance is described. The program, offered on a district level, focuses on creating a supervisory partnership between the administrator and teacher. Examples of the trends toward 5-year teacher education programs and competency based teacher education programs are given. (FG)

This study was conducted to determine differences between: (1) supervisors' ratings of instructional competencies of education majors and non-education majors in a semester of student teaching; and (2) evaluations by education majors and non-education majors of their morale during a student teacher program. Data were collected during a semester from 82 student teachers and their supervisors participating in a competency-based program for secondary level teachers. Data were collected through an evaluation of student teachers on two scales. One rated the instructional effectiveness of the student teacher, while the other rated the student teacher's performance in a curricular unit developed and implemented by the student teacher. All student teachers completed "weekly reflection sheets," providing information on their activities and their feelings of confidence or lack of confidence for each week. Findings revealed that non-education majors were rated significantly higher on instructional competencies during the first curricular unit, although this trend reversed itself during the second unit. Differences in morale ratings between the groups were minimal, and both groups displayed a common pattern: there was a drop in morale about 2 weeks into the experience, followed by a subsequent rise in self confidence. (UD)

This study examined: (1) the relationship between the fulfillment of expectations for the identification of rocks and minerals after experience with specimens selected to meet expectations and anxiety levels; (2) changes in anxiety levels after this experience was followed by experience with rocks and minerals which did not meet expectations; and (3) relationships between anxiety levels and achievement. Subjects (N=27 preservice elementary teachers) completed a demographic questionnaire, rock/mineral response sheets, and the State-Trait Anxiety Inventory (STAI), measuring state anxiety (transitory emotional state influenced by training) and trait anxiety (relatively stable individual difference in anxiety proneness). Results indicate among others that when students' expectations about rock/mineral identification were met their anxiety about teaching rocks/minerals as measured by the STAI (trait) was reduced significantly, suggesting that anxiety about science and science teaching may be reduced by classroom teachers identifying subject of procedures which evoke anxiety and providing conscious efforts for structured success. Correlations between achievement and trait anxiety were not significant. (Author/JN)

Several projects at the University of Georgia's College of Education provide information for program planning and design. The Diagnostic Teaching Cycle (DTC), which is being used to evaluate the undergraduate program of the Division of Elementary Education, has five components: identify, (cont. next page)
hypothesize, formulate goals and objectives, instruct and remediate, and provide formative and summative evaluation. Use of DTC determined program strengths and weaknesses for students, division faculty, department faculty, resources, and public school cooperation. In addition to the DTC evaluation, the university has a contract with the Georgia State Department of Education to develop performance-based teacher assessment instruments for beginning teachers. These instruments, called Teacher Performance Assessment Instruments, measure: (1) teaching plans and materials; (2) classroom procedures; (3) interpersonal skills; (4) professional standards; and (5) student perceptions. The first three tests are administered at 17 regional assessment centers. A computer-based application of the Teacher Performance Assessment Instrument is being planned to provide preservice teachers with diagnostic profiles of strengths and weaknesses in academic content, pedagogy, and curriculum. This formative evaluation will also be used to refine and improve the undergraduate program. (FG)

The proceedings contain the texts of 20 reports presented at a conference organized to review and assess the status of the following types of performance/competency-based approaches to the professional development of vocational teachers and administrators: performance-based teacher education (PBTE), competency-based teacher education (CBTE), competency-based staff development (CBSD), and competency-based administrator education (CBAE). Covered in the first group of papers are PBTE, CBAE, and CBTE programs at various universities in Pennsylvania. In an analysis of progressive PBTE practices various topics are discussed, including implementing an outreach program of professional development for industry trainers using the PBTE/CBSD model and developing learning activity packages. Also outlined is the further revision of the PBTE module series developed by the National Center for Research in Vocational Education. Following a progress report on the certification program for the competency-based materials for vocational administrators, various CBAE programs are described, including the Florida preservice and inservice vocational administrator training program, Project LIFE (Leadership Intern Field Experience), and competency-based vocational administrator programs in Ohio and Illinois. Also included are small group reports on PBTE pre-service, inservice, and individual competencies as well as postsecondary CBSD and CBAE. (MN)

To accomplish needed reform in education, this author recommends that a combination of purposes must be pursued; these involve the four major elements constituting an educational context, which are characterized as pattern, preparation, practice, and "compaction." Pattern is defined as Alliances: Professional Development and Configuration of Programs and roles represented at all levels of the educational spectrum, from courses, equipment, and teachers to yellow buses. Preparation is described as an element similar to pattern; the author explains that it requires that a particular teacher be involved and that it become preparation as it moves from common schools to postsecondary experiences. Practice, according to the author, is related to preparation in the same way preparation is related to pattern: it has to do with doing well what one was prepared to do. The author (cont. next page)
Describes "compaction" as involving educators' unifying around what they agree on. The paper concludes that one aid in accomplishing needed educational reform is the teaching of classes. This would be a six-year teacher training program, with three years of liberal studies studies and three years of education studies, that would make teacher education programs professional programs. Three teacher education programs developed at East Texas State University (ETSU) are characterized by a high degree of cooperation. The Bilingual Education Teacher Training Program was established with the collaboration of several departments and three colleges. Graduate and undergraduate degrees are offered in this interdisciplinary field-based systems approach to teacher education. Objectives for this program are competency based; the students acquire knowledge and skills in language proficiency, multilingual awareness, bilingual teaching methods, measurement of student progress, and research methodology. Undergraduate students are assigned to limited English proficient children enrolled in local schools and are supervised by the college faculty. The Teacher of Young Children Certification Program prepares students to work in child-related occupations such as nursery school management and to teach children aged three years to third grade. To receive a baccalaureate degree, students must complete the general university requirements, academic specialization core, a child development practicum, and a professional education early childhood sequence of ten courses through ETSU's Department of Elementary Education. Two of the courses require a split assignment with half of the experience being in a kindergarten classroom and the other half in an elementary classroom. The Mount Pleasant Project is a cooperative effort between ETSU and the Mount Pleasant Independent School District (Texas) that offers a comprehensive training program for public school supervisors of student teachers and to teachers wanting to supervise students in training in the future. The first level of this program provides initial instruction in clinical supervision, interpersonal communication, ideas and resources for the supervision of teachers, and planning. The second level is devoted to detailed clinical supervision study, classroom observation skills, analysis of teaching, and techniques for conferencing. The third level emphasizes research and skill development. Details on course content and degree requirements for each of these programs are appended. (JD)

University supervisors' evaluations of student teachers were assessed to determine if the cognitive attainment of pupils taught by the student teachers was a rating factor. The sample consisted of 82 secondary level student teachers participating in a competency based teacher education program. Data collected for the study included a summary evaluation instrument, developed by the student teachers, to ascertain their pupils' academic achievement levels. The student teacher supervisors recorded their ratings of student teachers' instructional effectiveness on an evaluation profile scale consisting of 20 instructional skills and eight personal competencies. Final ratings were obtained from a three-way analysis of variance among cooperating teacher, student teacher, and the cooperating teacher. Only four of the 28 ratings areas were found to relate significantly to learner achievement: (1) developing lesson plans; (2) using different levels of classroom questions; (3) performance while student teaching two-week units; and (4) personal energy level. These findings have implications for student teacher evaluation procedures, since they refute the assumption that high student teacher ratings by their supervisors is related to high learner achievement. A longitudinal study compared the academic abilities of undergraduate women students in seven college programs at a large university. Four questions were posed: (1) What are the academic qualifications or choosing education as a career? (2) How do these women compare with women choosing other programs? (3) What changes take place in the career choices of women during their college career? and (4) Are women who are unsuccessful in other programs choosing education as a last resort? Information was gathered on women choosing programs in agriculture, business, education, engineering, liberal arts, physical education, and science. The qualifications of the students were measured by Scholastic Aptitude Test averages for the math and verbal components for each of their four years and by their high school class standing. An analysis of the resulting data indicated that education attracts women who have lower academic qualifications than women in other fields. Large numbers of women with high academic ability chose majors in male-dominated fields. The greatest difference between women choosing education as a career and women choosing other areas was in verbal scores. The wider range in verbal scores that appeared at the senior year indicated that education was allowing women with marginal verbal skills to complete the program. However, the improved academic qualifications apparent at the junior year indicated that some women with high academic qualifications were evaluating their original career choices and choosing education as a career. By the junior year, women in education compared quite favorably with those in other fields. (Jd)
