A study examined the career aspirations of disadvantaged students enrolled in vocational education programs. During the first phase of the study, the researchers reviewed the literature pertaining to the phenomenon of job aspirations as it pertains to or explains the disproportionate enrollment of disadvantaged students in low-level programs. Next, data were collected from 2,348 students from 29 secondary and postsecondary vocational and technical schools, and telephone interviews were conducted with 201 parents. These data pointed to four potential barriers to enrollment in high-level programs—parental influence, the prestige value of a student's occupational environment, the nature of the student's personal development, and sources of information for making educational choices. The following conclusions emerged from the study: the negative effects of disadvantagement are rooted in the experiences of students before they pursue vocational programs; the negative effects of disadvantagement are reinforced by the educational system; and recruitment procedures sometimes alienate disadvantaged clients. (Appendixes to this report include the survey instrument, descriptions of the data collection methods used during the study, and responses to 10 open-ended questions included on the survey instrument.) An Analysis of the Career Aspirations of Disadvantaged Students Enrolled in Vocational Education Programs

FINAL REPORT

Project No. DVE 3-2031

and

Project No. DVE 4-2031

From July 1, 1982 to August 31, 1984

Clyde Maurice, Project Director
Delcine Townes, Research Assistant
Rosalie Hill, Research Assistant

Comprehensive Vocational Education
Department of Educational Leadership
College of Education
Florida State University

The project reported herein was conducted pursuant to a grant from the Division of Vocational Education, Florida Department of Education. Contractors undertaking such projects are encouraged to express freely their professional judgments in the conduct of such projects. Points of view or opinions stated do not, therefore, represent the official position or policy of the Florida Department of Education.
Acknowledgments

This project report is the culmination of two years of devoted service by a project staff whose assistance, dedication, and competence were invaluable to the success of the research effort. I wish to thank Max Zurko and Lydia Rydell: Max for his creativity, questioning posture and the endless hours he spent on the road collecting data; and Lydia for her flexibility, insightfulness and organizational skills. I would like to express my gratitude to data analysts Ellen Leddy and Linda Shrader for their willingness to work with a complex data base and their willingness to produce under frustrating circumstances and occasionally very short notice.

The co-authors, Delcine Towne and Rosalie Hill, provided dedicated assistance in instrument development, data collection and coding, and the development of a literature review. Their willingness to volunteer their valuable time and skills to the project even after financial compensation was not available is to be admired and deeply appreciated.

Thanks are extended to Lynn Ilon for her care and creativity in the production of the tables, and to Sue Flieder for her patience and skill in preparing them.

I am especially grateful to the personnel in the vocational schools and community colleges who made arrangements for students to respond to the questionnaire. I hope the results are of some use to them.

CHAPTER 1

INTRODUCTION

The Problem

In the last decade, progress in the area of equal opportunity has created the legal and institutional mechanisms to enable all individuals full participation in the social system. The nation had come to the realization that all individuals can be productive and should be given the opportunity to advance. Disadvantaged students were suddenly faced with a wide field of educational opportunity which was complemented by necessary support services so that these students could better themselves. While some students took full advantage of the opportunity, others did not.

Enrollment data show that the majority of disadvantaged students enter vocational education training programs primarily at the lowest levels. In support, related research has shown that most of these students do not aspire to more than subsistence level jobs. The problem is one of low aspirations and expectations among disadvantaged students that deter them from capitalizing on the educational opportunity afforded them. To the extent that these students can be successful in programs leading to high-paying occupations, then their participation...
in low level programs represents a waste to society, a waste of their
talents, and a denial of opportunity—self-denial.

Every effort must be made to understand and alleviate the problem.
We live in an era where the unemployment rate for the disadvantaged
is substantially higher than the norm, and in an era where the voca-
tional educational system is continually and increasingly being accused
of perpetuating class differences in our society. A responsible voca-
tional education system must conduct the necessary self-examination
to ensure that equality of opportunity is more than mere legislative
idealism.

Purpose of the Study

The prime purpose of the study is to identify barriers to high-
paying occupations as perceived by disadvantaged students. Specifi-
cally, the study seeks to accomplish the following objectives:

1. A thorough review of the literature to examine the phenomenon
   of job expectations or job aspirations as it pertains to or
   explains the disproportionate enrollment of disadvantaged
   students in low level programs;

2. Identification of reasons for low job expectations and
   aspirations among selected subgroups of disadvantaged students,
   specifically minorities, the socio-economically disadvantaged
   and the academically disadvantaged; and

3. Identification of barriers to high-paying occupations by each
   subgroup of disadvantaged students.
Essentially, this research effort will seek to acquire an understanding of the factors which contribute to the disproportionately high enrollment of disadvantaged students in low level programs.

A Preliminary Examination of the Problem

Though we are clear about the purposes of vocational education, and although we can select course content with much proficiency, the dynamics of students' choice of programs often elude us. This is not surprising since the choice of a vocational program by any student is the implementation of a lifetime of experiences which shape occupational values and perspectives. Because experiences are different for different individuals, and because they vary substantially for different subgroups in our society, the act of choosing an occupational program is a manifestation of individuality that is somewhat difficult to completely explain or control.

It is important, however, that students make an appropriate choice of vocational program to enable a smooth transition from school to work. The availability of vocational education in public schools helps students to make such a transition. But making that transition is by no means automatic; it requires some effort on the part of students. Before students enroll in programs, develop salable skills or seek employment, they must choose from a wide spectrum of vocational programs that differ in terms of academic requirements, status allocation, and probability of lucrative salaries after training. This decision to choose from a variety of vocational programs is a critical decision.
in the educational experience of any student. Yet, inadequate and suboptimal choices are frequently made.

Although these choices may be inadequate, one has to empathize with such students since improper vocational choice is not an act of being irresponsible, but rather it is the result of a variety of factors which tend to shape the student's perception of jobs, and which certainly influence the selection of training programs. Such factors are documented by Roe (1956) who has evolved a theory of occupational choice which postulates that childhood experiences and the psychological climate created by the influence of early parent-child relationships influence the occupational choice of the individual. Even Holland (1966) noted that vocational choice is influenced by heredity as well as a variety of cultural and social forces which include peers, parents and significant adults. But while most theorists have subscribed to the influence of personal and environmental forces on occupational choice, other factors have been noted as having an effect on vocational decisions: for example, Tiedeman's (1961) ego identity and Super's (1957) self-concept, among others. The research on vocational choice has clearly demonstrated that an individual's experiences are significant in determining occupational preferences.

Different subcultures in our society, however, will have differential life experiences and, hence, will possess unique occupational choice characteristics. This is also clearly demonstrated in related research. The female, minority and disadvantaged segments of our society each possess unique characteristics which influence their decisions when selecting occupations or training programs. These
characteristics may tend to explain the low job expectations and aspirations of disadvantaged students.

The interest, curiosity and breath of occupational possibilities that females have in the preadolescent years are submerged by pressures of peer conformity, by interest, and by curiosity and anxiety about sex role expectations (Matthews, 1974). Matthews notes that at the secondary school levels females give little thoughtful attention to the vocational aspects of education that are unrelated to homemaking and "feminine" occupations. To do so will induce guilt about not conforming with societal role expectations. Even if this guilt is overcome, a relatively low level of occupational aspiration (career undershooting) still exists. This behavior is ascribed to occupational stereotyping, early childhood conditioning, fear of failure, fear of success and a variety of other subtle and blatant child-rearing and socialization practices" (Herr & Cramer, 1979).

But we cannot overlook the fact that there are females with high aspirations. However, they belong to a select subgroup. They are usually more intelligent, come from more advantaged homes, have been exposed to a maternal model of work competence and are more achievement oriented (Moore & Veres, 1976). Hence, the disadvantaged female is in a position of double jeopardy. Generally though, there are generic characteristics of females as a group that are applicable to all subgroups of the gender.

Likewise, there are characteristics of blacks that are generalizable to other racial minorities. Here, too, there are factors that can explain low career aspirations and expectations. Lo Casio (1967)
notes that "the career development of black students is more likely to be delayed or impaired than that of more advantaged populations." This deficiency manifests itself in a variety of ways: the discrepancy represented by their choice of education and a career choice for which that level of education is inappropriate; a general lack of knowledge of alternatives; possible skill deficits; an unclear picture about themselves in relation to the world of work; and a constricted choice of curricula (Herr & Cramer, 1979). Smith (1975) summarized the research on the career development of blacks and has supported and extended Herr and Cramer's (1979) conclusions. He noted, among other things, that the average black lacks positive work role models, has a negative self image, has high aspirations but low expectations, and is vocationally immature. It is not surprising then that blacks and other lower class children set estimates of their ability to do school work lower than do white, upper-class children (Wylie, 1963).

Since disadvantagement is described as a "condition which prevents persons from being educated to the maximum of their genetic potential" (Herr & Cramer, 1979), females and minorities are disadvantaged, if for no other reason, because of the adverse conditions which inhibit their vocational development--conditions which, in fact, result in sub-optimal career aspirations. Disadvantagement, although used here in its general sense to mean deprivation, creates a nurturing atmosphere which breeds low aspirations and expectations among all deprived sub-populations.

Gordon (1974) noted that disadvantaged students had motivation deficits which made it necessary to include re-motivation activities.
in guidance programs. These deficits may have resulted from what Deutsch's (1962) observed in the disadvantaged child: lack of parental encouragement to achieve academically and poverty conditions which result in cognitive and learning deficits. As Deutsch further observed, learning deficits contribute to a lower self image and hinder a sense of competence. This is the heart of the problem, for as Edwards and Webster (1963) stated, favorable self-concepts are related to higher aspirations and academic achievement.

This brief overview aptly demonstrates that the choice of a vocational program (and, hence, an occupational track) is a complex one. Hence, the issue of barriers to high-paying occupations is not merely a question of what students perceive to be the hurdles that prevent them from obtaining high salary jobs. Occupational preparation must precede employment; and occupational choice and program selection naturally come before preparation. If the act of choosing is affected by the many factors as noted above, then understanding the barriers to opportunities for disadvantaged students to enter high-paying occupations requires an understanding of the socio-economic and psychosocial factors which cause individuals to develop and exercise particular occupational choices.

This is the course that was taken in this investigation. There was a thorough review of the literature to abstract variables and concepts that can help explain differences in career aspirations, between advantaged and disadvantaged students and these concepts were used to secure information from students who attended vocational schools to ascertain the effect these factors may have had on their selection
of programs. The following chapter (Chapter 2) discusses that literature which was reviewed and summarizes the factors that seem to influence or explain the differential choice of programs among disadvantaged and advantaged students. Chapter Three (3) details the methodology that was used in responding to the central questions of the study; Chapter Four (4) presents and discusses the findings; while Chapter Five (5) discusses what the findings may imply for changes in the delivery of vocational education.
CHAPTER 2

REVIEW OF RELATED LITERATURE

The prime purpose of this study is to identify the barriers to high-paying occupations as perceived by disadvantaged students. Since what students perceive to be barriers may not actually be the hurdles that exist, and since entrance to any "high-paying occupation" must be preceded by the selection of an academic program and the choice of an occupation, the real problem addressed by this study is securing an understanding of the dynamics of occupational choice as exercised by disadvantaged students. Essentially, this research effort was directed at acquiring an understanding of the factors which contribute to the disproportionately high enrollment of disadvantaged students in "low level" programs.

To accomplish this, it is essential to understand the nature of disadvantage as well as the deficits which emerge from such a condition. More importantly, however, it is necessary to also understand the operational factors which result in the apparently suboptimal occupational and academic program decisions made by disadvantaged individuals. Consistent with this, the chapter is divided into the following sections:

(a) The nature and characteristics of disadvantaged populations;
(b) The deficits emerging from disadvantage;
(c) Conditions which engender career related deficits;
(d) The development of occupational aspirations in the disadvantaged;
(e) Alternatives for a vocational development process with minimal barriers; and
(f) A summary of critical factors to explain career aspirations under conditions of disadvantagement.

The Nature and Characteristics of Disadvantaged Populations

There are many legal, psychological and social definitions of disadvantage. Of whom do we speak when we refer to the disadvantaged in the field of education? Disadvantage is described by Herr and Cramer (1979) as a condition which prevents persons from being educated to the maximum of their genetic potential. Such persons include racial minorities, the poor and socially deprived. These disadvantaged populations are primarily products of low socio-economic environments (Amos, 1968; Gordon, 1974) which are characterized by deleterious life conditions (Gordon, 1974). The conditions are, namely, poor housing, disorganized home and family, minimal parental motivation for youth, damaged and low self-concepts, and inadequate forms of social protection. Due to the economic and political structure in our society, the disadvantaged population typically becomes victims of "relative social disability," a position created by disproportionate distribution of resources, socially created barriers to opportunities and geographical isolation (Gordon, 1974). As a result, the experiences differ from that of white or middle class populations. These differences
are labeled by the literature as deficits. Individually and collectively, the deficits become important aspects of the disadvantaged individual's world in general (Amos, 1968, Stevic, et al., 1967), and his/her vocational self in particular. The following section describes some of the deficits.

Deficits Emerging from Disadvantagement

The conditions under which disadvantaged populations live create certain behavioral and intellectual deficits which ultimately affect their vocational behavior. These conditions result in poor communication skills (Amos, 1968); low academic achievement; low cognitive and learning skills; and deficits in attitudes, morals, and motivation (Gordon, 1974). All of these factors have been found to be important attributes of academic success and vocational maturity. When the deficits are coupled with the many environmental encounters resulting from few resources, minimal flexibility and few options, Gordon (1974) contends that the disadvantaged individual becomes overwhelmed because progress is inhibited and feelings of powerlessness emerge. As an outgrowth of these feelings, a number of behaviors and attitudes are displayed that have been associated (rightly or wrongly) with the nature of disadvantaged youth.

According to Amos and Grambs (1968), they include:

1. attitudes, behavior, motivation, aspiration and levels of responsibility that are encouched in resentment and hostility;
2. preoccupation with immediate needs (i.e., basic needs—money, food, clothing, and shelter);
3. increased distrust for others resulting from frequently experienced failure;
4. an apparent inability to grasp problems in the abstract;
5. apparent immaturity about financial matters;
6. a tendency to reject middle class criteria for achievement and to preserve their own concept of worth;
7. a tendency to associate the lack of success with limited opportunities in the labor force;
8. a preference for working with hands;
9. an aspiration to be their own boss;
10. a lack of social skills requisite in urban jobs;
11. aspirations for college attendance at rates that are not commensurate with that of other groups;
12. a tendency to express unrealistic ambitions; and
13. a tendency to be in an environment with a limited number of adult professional role models.

These characteristics in some instances overlap the characteristics of the "vocationally handicapped" as compiled by Smith (1975) from many studies of vocational behavior of blacks. According to Smith (1975) the "average black":

1. lacks positive work role models;
2. is not committed to a career as a way of life;
3. is work alienated;
4. prefers job security over self-fulfillment in an occupation;

5. possesses a negative self-image which fosters identity foreclosure;

6. has high aspirations and low expectations;

7. has limited occupational mobility because of race;

8. is vocationally immature; and

9. selects traditional occupational and academic programs known to blacks.

These characteristics can be easily traced back to the socio-economic environment and the constraints placed on its population due to the inherent characteristics of the environment. As was indicated earlier, the disadvantaged is victimized by his/her environment and the resulting behavior and attitudes are merely reflective. It is a popular notion among individuals who have concern for the plight of the disadvantaged in the emerging technological age, that the deficits to a large measure attribute to the propensity of disadvantaged students enrolling in "low level" programs, and consequently, the disproportionate representation in high level programs. However, it is not clear how these deficits translate into inappropriate program choice.

Conditions Which Engender Career Related Deficits

It cannot be assumed that the career-related characteristics and career inclination of any group are natural outcomes of membership in that group (i.e., racial minorities or economically deprived persons
do not possess certain characteristics and perspectives because of their minority group membership or their economic status. What does happen, for example, is that minority group membership aside, the individual uses group membership to compare him/herself with others. The comparisons can be damaging. Thus, the black may have low esteem, for example, not because he is black, but because he is more likely to be an occupational failure because of prejudice and discrimination against blacks (Rosenberg, 1979). The reactions to persons of derogate groups shape and influence the values and perceptions of the individuals. Hence, the problems of career aspirations of the disadvantaged can best be understood by recognizing the variety of factors that influence the characteristics and choices of the individual.

The works of Murray (1938), Super (1957), Ginzberg (1957), and Gottfredson (1981) contend that individual behavior and perspectives are shaped from infancy to adulthood by the experiences gained from interacting with one's environment. Roe (1956) probably presented one of the most important theories concerning the effects of the environment in early childhood experiences. According to Roe, the adult (including parental) behavior is important to shaping personality. The three primary practices in this regard, include (1) emotional concentration on the child, (2) avoidance of the child, and (3) acceptance of the child. Roe contends that the shaping of individual styles and behavior, ultimately affects vocational choice. Thus, the early years are important to the occupational development process (Ginzberg & Associates, 1957; Gottfredson, 1981; Roe, 1952).
To the extent that disadvantaged children are subjected to negative childhood influences, they may experience retardation in the process of occupational development. Literature in the social sciences aptly support the position that the environment of minority and low income families generally produce fewer positive influences during their childhood experiences for supporting career development than other populations. Thus, career related deficits commence early in their lives.

The behavior of minorites and low income populations have also been associated with the environment. Gordon (1974) and many other theorists have postulated that human behavior, including academic and vocational performance, is crucially influenced by environmental encounters. The impact of the "environmental press" on the experiences of the disadvantaged is a phenomenon frequently mentioned in the literature, even though not always isolated from questions of genetic origin.

Parents, schools, and neighborhoods have been identified as environments that reinforce some behavior more than others (Gottfredson, 1978, Holland, 1966). Sewell and Hauser (1980) are noted for findings that have been significant in relation to this proposition in their study which began in 1957 of 10,317 seniors in the Wisconsin school system.

The study focused on the influences of community and neighborhood background on the educational aspirations of youth. The study focused on (a) socio-economic origins and measures of academic ability as major factors in educational aspirations of youth, and (b) the tendency for
females to have lower aspirations than males. Both of these assumptions had been verified by previous research. Sewell and Hauser (1980) concluded that (a) students found it difficult to escape the effects of their socio-economic origins in the attainment of higher education, and (b) that at every stage of the higher education process, the effects of socio-economic background operated independently of ability. Yet, at the high school level, socio-economic status had no effect on performance, independent of measured ability.

Socio-economic status also directly and indirectly affected "perceived encouragement from significant others and educational and occupational aspirations" (p. 71). In this regard, some effects of the socio-economic background were independent of ability and goals. Yet, most of the effects on educational attainment were mediated through their influence on the perceived encouragement of significant others and on educational aspirations. Thus, socio-economic background affected aspirations directly and indirectly, through their effect on parents and peers. Concomitantly, "Parental encouragement is a powerful intervening variable between socio-economic class background and intelligence of the child and his educational aspirations" (Sewell & Shah, 1967, p. 559).

Sewell and Hauser (1980) disaggregated socio-economic status into father's education, mother's education, father's occupational status and parent's income. They found that each of these variables "had an approximately equal effect on educational attainment and on all the intervening variables in the model" (p. 73).
There were "substantial effects of ability on occupational status both directly and through grades, significant others and educational occupational aspirations, but particularly through education" (p. 74). As expected, education, to a large measure, directly affected occupational status and both educational and occupational attainment largely and directly affected occupational aspirations and ultimately earnings (see Figure 1).

Sewell and Hauser's findings significantly support the conclusion that the socio-economic background, based on its potential for affecting educational and occupational attainment, is a crucial factor in the vocational development process. In this regard, it can and does create deterrents or barriers to vocational decision making. The fact that the disadvantaged individual's socio-economic background is derelict is one that sets the disadvantaged apart from the non-disadvantaged. Moreover, as discussed above, it has a high propensity for creating barriers and obstacles to the vocational development.

There are studies that also depict the relationship of social class and aspirations. Rodman and Voydanoff (1978) found the level of aspirations to be positively related to the social class of the parent, and Haller and Butterwork (1960) found it to be related to the situation in which the individual is reared. More specifically, Rodman and Voydanoff (1978) found that "social class factors exert more influence upon aspirations as blacks acquire experience in the educational and occupational worlds" (p. 341). Further, it was found that the aspiration level of lower class, working class, and middle class are similarly high at an early age, but become more differentiated
Schematic Diagram of Wisconsin Model of Status Attainment

(Sewell and Hauser p. 72)
by social class as the individual matures. This could logically be due to the fact that as the individual matures, he/she has more encounters with his/her environment. For the disadvantaged, these encounters are more deterring than encouraging. Moreover, Rosenberg (1979) contends that as a child becomes older, he/she becomes increasingly conscious of economic inequities. Moreover, the meaning of social class is interpreted within frameworks that are different for children than for adults, primarily because they relate to interpersonal experiences. In this regard, "the actual experience of an adult in the world of work, inevitably calls his attention to his place in a recognized stratification system" (Rosenberg, 1979).

The findings of the aforementioned studies suggest that perhaps the disadvantaged or lower class individual is better characterized by high aspirations and low attainment which to a large measure is impacted by his personal experiences with his environment. This notion does not fully support the assumption undergirding this review that disadvantaged and low socio-economic class individuals had low aspirations which is the basis for low expectations and attainment with respect to occupational and educational achievement. Experiences with the environment, and not necessarily low aspiration, may account for low expectations and attainment.

Gottfredson's (1981) findings further challenge the basic assumptions of this study by observing that the same general patterns of development and differentiation in aspirations have been found for blacks as for whites. Gottfredson (1981) contends that "many of the racial differences reported in the vocational literature were probably
due to the frequent failure to control for differences in social class and intelligence" (p. 563). Gottfredson's review of the research and anomalies found that a number of distinguishing factors related to the disadvantaged and advantaged relates to social classes. The findings indicate that:

1. within ability groups, the higher social class youngsters have higher aspirations (p. 562);
2. lower class children tend to orient to the lower class and adopt its standards for success, as does the middle class child orient to middle class standards (p. 563);
3. lower class and lower ability youngsters aspire to lower level jobs more than other youngsters, even though they share the same images about which jobs are desirable (p. 564); and
4. parents have and youngsters adopt different views about what an acceptable job is for people like them and these views are akin to the social level (p. 563).

Gottfredson's findings support the notion that typically individuals accept, and respond in a manner acceptable to the values and standards of his/her social class. Thus, social class is a distinguishing factor between disadvantaged and advantaged population. Logically, social class could be a deterrent associated with exercising appropriate occupational choice, and therefore could foster a potential explanation for high or low level vocational program selection among disadvantaged and advantaged students.
The Development of Occupational Aspirations in the Disadvantaged

From the foregoing analysis, it is clear that the literature associates vocational aspirations and choices with socio-economic conditions, as experienced in the physical and social environment. Such conditions determine socio-economic status, and ultimately the barriers/deterrents to academic and vocational aspirations. The literature also suggests that the barriers increase as the experiences with the environment increases. Therefore, understanding the process by which occupational aspirations develop is important to determining when barriers invade the process, and is essential to developing precautionary measures to stem the ill-effects of deficient socio-economic conditions. This section discusses two conceptual models to describe the development of career aspirations among disadvantaged populations. Each model tries to point out in a broader context the source of deterrents to making appropriate career decisions.

Model 1

There are critical components of information to explain how socio-economic status results in low career aspirations. The conceptual model discussed in this subsection identifies these critical components to demonstrate the source of deterrents. Deterrents may conceptually be viewed as an outgrowth of the socio-economic conditions with which one interacts. Given this concept, deterrents may be categorized under two main headings: environmental and personal. Environmental deterrents are aspects of the social, economic or physical context which directly or indirectly affect career aspirations. For example, the
values of an individual's social class will be an environmental deterrent. A personal deterrent, on the other hand, is a condition possessed by the individual which may affect career aspirations. Sex role, for example, is a personal deterrent.

These deterrents may be further characterized as being assigned or imposed. Assigned deterrents are those over which the individual has no control and are closely linked to the social class or genetic characteristics of the parents. These include assigned environmental deterrents such as social and economic class or geographic origin and culture; they may also include assigned personal deterrent such as race. Imposed deterrents result from external influences and are capable of being changed with exposure to and acceptance of other influences. These deterrents are associated with values, occupational and educational attainment, status and perceptions of significant others, primarily parents; but may include role models, teachers, and intra-class peer groups.

Personal deterrents disaggregate into elements of the individual's personal conditions which are assigned, as well as attitudes and experiences (or the lack thereof) which are imposed. Deterrents associated with personal characteristics that are assigned include race, sex role, measured ability and career maturity. Those associated with attitudes which are imposed include self concept/image/esteem, foreclosure, predetermination, perceived consequences (including the fear of failure, perceptions of success and perceptions of work values. Imposed environmental deterrents are associated with experiential factors which can include minimum academic achievement and exposure, insufficient
information, minimal interaction with and knowledge of helping agents (e.g., counselors), social disability, limited or unobtainable training, few occupational options and opportunities.

The illustration in Figure 2 on the following page shows schematically how socio-economic status can result in negative career inclinations for the disadvantaged. The assigned and imposed conditions in the social-economic environment create negative attitudinal or developmental characteristics which result in ineffective career exposure.

Model 2

Gottfredson (1981) developed a concept of occupational aspirations that resulted from an extensive review of findings and anomalies that shed light on the occupational aspirations and vocational choice behavior of lower-class, and lower-ability children. The theory capitalized on self-concept development during early childhood and adolescence years, and as an experiential process, linked with social abilities and sex. It projected a continuum that progresses from self-concept through occupational images, occupational preferences, aspirations and vocational choice. Drawing from the concepts of Gottfredson (1981) and Super (1953) and the literature supporting the importance of the socio-economic status and self-concept in the vocational development process, the aspirational development of the disadvantaged may be viewed schematically. The concept focuses on development that originates during early childhood. It assumes that there are phases which are each dependent upon the other, and recur as it needed, but do not necessarily occur in isolation.

Personal attributes--height, etc.
Race

Environmental Characteristics--Assigned Conditions
Values of one's social class
Conditions and experiences of one's economic class
Limitations on opportunities in one's geographic origin
Values, support or expectations imposed by one's culture

Imposed Personal/Environmental Conditions
Parental attitudes, influences and encouragement
Parental educational attainment and occupation
Role models
Counselor/teacher selectivity, encouragement and referral
Intra-peer group attitudes, influence and encouragement

Attitudinal Developmental Outcome Affecting
Career Aspirations
Self-concept/image/self-esteem
Predetermination
Preconceived consequence: (fear of failure)
Perceptions of success
Perceptions of work values
Foreclosure
Career maturity

Resulting Experiences
Low career aspirations
Minimum academic achievement and exposure
Few occupational opportunities and options
Insufficient information and exposure to occupational information
Minimal interaction with and knowledge of helping agents
Social disability
Training inaccessible
Low paying occupations
Self-concept development - is a continuous process. It is a process by which one learns to recognize and respect one's personal characteristics and appreciate one's abilities. As the individual matures, personal characteristics and self-appreciation begins to crystallize, and the individual is in the process of developing an active self-concept. It is during this phase that the "assigned" personal characteristics are defined and take on meaning. During this phase, the individual is probably most vulnerable to interaction with significant others and environmental institutions. Since significant others have great potential for imposing barriers, this phase consequently takes on significance with regard to imposed deterrents.

Occupational imams - Through this phase, the individual learns to recognize the characteristics and roles of others (Gottfredson, 1981). He/she tunes into life styles, including occupational life styles, and consequently the magnitude of the environment. During this phase attitudes begin to formulate, and therein lies the special significance to the disadvantaged with regard to attitudinal deterrents. If occupational debilitating attitudes are formulated, then occupational aspirations and choice will be suboptimal.

Occupational preferences - During this phase, the individual links himself/herself to others and distinguishes relationships and compatibility as reflected in values, desires and motivation (Gottfredson, 1981). It is the stage where individuals begin to formulate answers to what they want to be and do when they grow up. During this phase, individuals may be significantly impacted by assigned deterrents (i.e., sex, age, intelligence, socio-economic status, race and geographical
region). This is important in light of studies that have shown that lower-class tend to have more sex-typed views of occupations.

**Aspirations** - This phase is a pivoting point in the process of occupational development. Individuals based on their perceptions about the accessibility of their preferences, develop expectations and as a result may set goals or refrain from doing so. The accessibility of the occupational aspirations (or some desired work role) is an important factor, and is determined by personal attainment where necessary, as well as social circumstances. One must be aware, however, that there are circumstances or societal dictates that may distort these expectations. For example, Drucker (1969) credits technological advancement (i.e., television) for being a leading distorber. According to Drucker, the disadvantaged child may learn too much for television, since the child spends so much time with the television and so little time with other experiences. He further suggested that the television experience accounts, to a large measure, for the high expectations and the low levels of literacy found among disadvantaged individuals. High expectations and illiteracy are incompatible situations, and result because of an accumulation of assigned and imposed, personal and environmental deterrents that impede success when testing for reality. Reality testing is essential in developing realistic career aspirations.

**Alternatives** - This phase overlaps with the aspirational phase. It is a process of reality testing. Consequently, it is the point of which determinations are made about whether experiences are compatible with expectations. During this phase the individual becomes increasingly aware of personal limitations as well as environmental
constraints. This phase may emerge in response to fulfilling an urgent need. In this regard, Herr and Cramer (1979) contend that "the strength of a particular need, and amount of delay between the arousal of the need and its satisfaction, and the value that the satisfaction has in the individual's environment are the conditions--shaped by early childhood experiences--that influence career development" (p. 88). Hersey and Blanchard (1982) complement this thinking by contending that a need tends to "decrease in strength if it is either satisfied or blocked from satisfaction" (p. 16). Their need-blockage concept postulates that when goal attempts are continued without success, the individual may substitute goals that can satisfy the need, and thus develop coping behavior as is graphically illustrated in Figure 3.

Hersey and Blanchard's concept explains somewhat the interaction between aspirations and alternatives and provides an explanation for the reversed aspirational levels of disadvantaged individuals who are adversely impacted by their environment. It also provides a way of viewing the dynamics of experiences attendant to the disadvantaged students' interaction with two environments. In this regard, it has been observed that the disadvantaged individual is exposed to the middle class environment of his/her school setting by day, and consequently developed expectations which emerge as learned behavior. However, the disadvantaged individual, who does not recognize his socio-economic constraints when attempting to apply this learned behavior in the middle class setting may encounter blockage. Similarly, the disadvantaged individual who attempts to exemplify middle-class behavior in lower-class environments when he/she returns home may also encounter
FIGURE 3

blockage. Consequently, if the behavior is not rewarded or reinforced, the results are the same. Thus, coping behaviors in the form of regression, rationalization, fixation and resignation are exhibited (see Figure 4).

**Vocational choice** - During this phase, individuals make determinations that evolve from a refinement of prevailing perceptions, attitudes and experiences from the previous phases. Thus, with regard to the disadvantaged individuals, these determinations may be derivatives of coping behavior in response to the various deterrents. The choices may be more congruent with immediate needs. Applying the Maslovian theory, these needs can include a goal to satisfy a security need, self-actualization need or somewhere inbetween. Sewell and Hauser (1980) suggest that choices may be linked to opportunities available based on one's educational attainment, measured ability, and aspirations; all of which are significantly influenced by the socio-economic background. Gottfredson (1981) contended that choices are also moderated by sex-type, prestige and effort required, when major considerations about alternatives and compromise enter into the process. Galinsky (1966) ties this phase back to the self-concept with the assertion that it makes the choice easier. Thus, choosing an occupation is an implementation of one's self-concept (Korman, 1966), and "the self may change ... as it interacts with its environment" (Super, 1963, p. 17).

**Alternatives** - "The environment ... of any particular person defines the range of alternatives available as well as the value complex which he is likely to apply in his ranking of those choices" (Herr
COPING BEHAVIORS

HIGH STRENGTH NEEDS

Hersey and Blanchard 1982, p.17
& Cramer, 1979, p. 81). The literature suggests that disadvantaged populations "either being forced to accept or they are willing to accept the vocational patterns the class system holds out to them" (Hollingshead, 1949, p. 287). These patterns are characterized by limited opportunities, limited flexibility and few resources. Even within this scenario, Rodman and Voydanoff (1978), based on their research, projected that "to the extent that lower class individuals have a wider range of aspirations, with a peak as high as the middle class peak, there is a built-in potential for mobility . . ." (p. 342).

This proposition, however, is only as good as is the individual's capability for broadening his/her aspirations and changing his/her perceptions about the accessibility of opportunities that are available. However, as Herr and Cramer (1979) have indicated, the environment dictates the terms under which these may be accomplished. Therefore, in order to change the perceptions of the disadvantaged, the environment offers some sense of certainty about the provision and attainment of opportunities. Therefore, while change is recommended, it can be affected only to the extent that the individual's environment changes, or to the extent the individual is capable of fitting into other environments.

It is obvious from the models presented, as well as from the foregoing discussions about the nature and deficits of the disadvantaged, that the socio-economic status and accompanying environment are the primary deterrents to the aspirations, alternatives, and vocational choices of disadvantaged individuals. Further, as disadvantaged individuals compare themselves with members of other groups, their
concept of self is lowered, not because they are black or female, but because of the disdain that society projects toward them and as a consequence, the likelihood of their occupational failure (Rosenburg, 1979). While it is recognized that the environment of the disadvantaged individual is overwhelming, it is also recognized that viable alternatives are essential in order to enhance the quality of their vocational development.

Alternatives for a Vocational Development Process with Minimal Barriers

The literature presents a number of suggestions as possible alternatives for creating a more positive and barrier-lessened vocational development process for disadvantaged individuals. These include: (1) changing values to change aspiration levels; (2) creating a system that matches one's life style, thus matching people with occupations and occupational environments that match their personality characteristics (Holland, 1959); (3) improved delivery techniques and strategies to foster vocational development (Gottfredson, 1981; Smith, 1975) to include: (a) using tests inventories, etc., to assist the individual in discovering and verifying interests, abilities, and personalities; (b) assessing ability for diagnostic purposes; (c) assisting with goal exploration and related standards to be filled; (d) assisting with developing and improving information gathering skills; and (e) rethinking the counselor's role and views about counselor ethics; (4) creating career guidance programs that de-emphasize correlations between socio-economic membership and success and recognize individual
competence and desire as criteria by which information should be pro-
vided (Herr & Cramer, 1979); and (5) developing a system that emphasizes
that learning experiences and task approach skills are instrumental
in producing preferences for activities (Herr & Cramer, 1979). This
approach recognizes the dynamics of complex environmental factors that
are beyond the control of the individual and affects decisions and
choices.

These approaches should not be considered to be exhaustive and
it should be remembered that they all fall short in providing an
immediate impact upon the intra-culture values and beliefs held by
families and peers of disadvantaged individuals. Therefore, it should
not be expected that this matter can be addressed effectively through
short range goals.

The approaches, however, are applicable throughout educational
systems at all levels. They have significant implications for instruc-
tional and academic support staff. They would probably work best with
improved information processes, and unbiased information sources.
They focus on opportunity attainment, unbiased intervention on the
part of helping agents, a change in measurement of occupational readi-
ness that emphasizes capabilities and learning experiences, and
demeanorizes socio-economic status. In short, these approaches
suggest unencumbering the experiences of the disadvantaged individual
by negating the effects of factors not relevant to personal growth
and development.

In the absence of deliberate attempts by the school system to
ensure that students pursue opportunities that are consistent with
their genetic potential, we will have to assume that students do not decide what programs they would enter. They are processed through an environmental maze, and receive the sociological, psychological and economic conditioning that more or less ensures program participation that perpetuates the existing class structure. Under such circumstances we cannot speak of vocational education opportunities for all who can benefit. Moreover, under these circumstances the school becomes a discriminatory agent instead of a provider of opportunities.

If the foregoing is an accurate conclusion, it is conceivable that the educational system is secure in the knowledge that with respect to disadvantaged students, what was done in the past, will work in the future. This notion is no more viable than the notion that work in terms of the occupational structure of the past and present is realistic for occupational opportunities of the very near future. Minority groups and other disadvantaged groups "have equally serious problems in overcoming past-oriented occupational stereotyping . . . their image of their place in the future is critical to the determination of their future; educators have a strong role in helping them shape that image" (Maton, 1976, p. 247).

Summary of Critical Factors to Explain Career Aspirations Under Conditions of Disadvantagement

In order to assist with developing an approach to helping to shape the image of the disadvantaged, a series of factors which can contribute to an explanation of the career aspirations of the disadvantaged was summarized (see Appendix A). These factors are enumerated under various
categories, within which specific aspects of the behavior of the disadvantaged could be discussed and understood. They formed the basis for the development of a survey instrument that was used to collect data from students who were enrolled in vocational programs.

The barriers and concerns derived from the literature provide a basis for analyzing the data and a basis for understanding the program and occupational choices of the disadvantaged. They are associated with major factors, namely, social and environmental, significant others (including parents and other role models) personal ability and characteristics, economic and institutional. The specifics are as follows.

Social and environmental factors:

* The socio-economic background is difficult to escape in the attainment of higher education and operates independent of ability at every stage of the higher education process.

* Lower class children adhere to low class standards for success; they aspire to lower level jobs more than other social classes, even though they share similar images about success.

* The socio-economic background directly and indirectly affects the individual's perception of the kind of encouragement received from significant others as well as his/her educational and occupational aspirations.

Significant others:

* Parental encouragement is a powerful intervening variable between socio-economic class background and intelligence. For example, educational attainment is dependent somewhat
upon the influence of perceived encouragement of significant others.

* Since parents and youngsters adopt different views about what are acceptable jobs, there is the potential for conflict for the child making educational and occupational decisions.

* Minorities and low economic individuals lack positive work role models. This void limits the range of occupational images to which they are exposed, and affects their occupational attitudes and development.

**Personal ability and characteristics:**

* The average black has a negative self-image, high aspirations and low expectations. Their poverty conditions give rise to cognitive and learning deficits; the learning deficits contribute to lower self-image and hinder the sense of competence.

* With regard to the career choices of the disadvantaged, there is a general lack of knowledge of alternatives, possible skill deficits and an unclear picture about themselves in relation to the world of work. They tend to make career choices that are incompatible with their educational choices.

* Blacks are also more likely to be an occupational failure because of prejudicial attitudes and discriminatory acts against blacks. Consequently, they develop low esteem as a result of the impact of these attitudes and actions.
rather than because of their race. Ultimately, they are vocationally handicapped.

* Disadvantaged clients are preoccupied with immediate needs, namely, food, shelter, clothing, and money.

**Economic factors:**

* Economic factors function as barriers where the disadvantaged does not have the necessary funds to participate in training or employment, e.g., fees, transportation. Associated with the economic factors are labor market factors which pose hurdles to employment primarily as a result of induced occupational failure resulting from prejudicial and discriminatory acts.

**Institutional factors:**

* Institutional factors impose barriers when the policies of educational entities cause certain subgroups, because of personal social, or economic characterizations, to be more privileged than others.

These critical factors, individually and collectively, shape and influence attitudes, values and perspectives that are detrimental to career decision making and impose limitations to preparing for occupational roles.
CHAPTER 3

METHODOLOGY

The project as originally conceived was intended to identify the perceived barriers to high-paying occupations as identified by disadvantaged students. The research direction was based on the observation that a disproportionate number of disadvantaged students were enrolled in lower level vocational programs. It was assumed that enrollment in lower level programs will lead to the acquisition of jobs that are not considered "high-paying" occupations. It was further assumed, that if those individuals expressed their reasons for enrollment in such programs, then measures could be taken to promote the enrollment of disadvantaged clients in programs that would lead to more lucrative jobs. The latter assumption, although plausible, is somewhat weak if it were to be used for such a remedy. The students' perception of barriers or their notation of the reasons accounting for their enrollment in lower level programs may not reflect the complexity of the occupational decision-making process. The barriers that students perceive may not account for the variety of personal and environmental influences that can be brought to bear in the decision to enter a program or an occupation.

Given this basic concern, the project was conducted in a manner so as to derive the widest array of defensible evidence which could
be used in understanding the dynamics of occupational and educational choice among disadvantaged students. Efforts were also made to elicit the type of information that could be the basis for planning intervention strategies to ensure that disadvantaged clients have the opportunity to pursue academic programs in which they can be successful.

This chapter details the procedures used in responding to the objectives of the study. The discussion is organized into eight subsections, each addressing some aspect of the research effort which culminated in the accomplishment of the research objective. These subsections are entitled as follows: (1) methodological concerns; (2) utilizing existing knowledge—the literature review; (3) instrumentation; (4) sample selection; (5) data collection; (6) preanalysis; (7) data analysis; and (8) evaluation/validation.

Methodological Concerns

There were several concerns which formed a basis for the methodological approaches selected. These concerns are enumerated and described below with some indication of the subsection of the methodology in which they were addressed. The concerns are as follows:

Defensible evidence: As noted before, data on individuals' perception of barriers were not sufficiently valid to enlist any confidence in attempting to implement measures that would remedy the situation for disadvantaged clients. Any data that would support intervention had to be theoretically rooted and statistically defensible. In the literature review, instrument development and data analysis aspects of the methodology, measures were taken to assure a degree of
defensibility that was beyond the mere specification by disadvantaged clients of barriers to high-paying occupations.

**Representation of theoretical content:** The phenomenon of career aspirations is not a new area of inquiry among educators, psychologists and other social scientists. Several investigations have been conducted in the areas of career development, career aspirations and other content areas that can be directly or indirectly brought to bear on the topic addressed by this report. Adequate representation of the theoretical content was important. It was essential to develop some preliminary theoretical understanding of career aspirations of the disadvantaged before any attempt was made to collect data or make any conclusions regarding the barriers to adequate program selection or entry into high-paying occupations. The literature review aspect of the research effort attempts to secure adequate representation of theoretical content.

**Program representation:** An adequate sampling of programs had to be represented as the source of empirical evidence. There is such a diversity of vocational programs in the State of Florida (as in most states) that generalizable judgments could not be assured unless some of the diversity was captured in the procedure for sample selection. Diversity results from the fact that programs are offered at community colleges and area vocational technical centers; programs have different levels of technical content; they attract different populations; and in many cases, they reflect the business and industrial structure of the immediate community. To the extent that the dynamics of the behavior of disadvantaged clients are associated with some of the unique
characteristics or geographic location of programs, the description
of their career aspirations will be incomplete without adequately
representing the array and diversity of programs. The sampling strategy
accommodated this concern.

Population representation: The study is primarily concerned with
the career aspirations of disadvantaged students. This, however, does
not mean that the sample will be comprised solely of disadvantaged
clients. A more in-depth understanding of the behavior of disadvantaged
clients could be derived by comparing them with other populations,
particularly the advantaged population. The differences between groups
can highlight their unique characteristics. But even beyond this,
evidence must be derived from a diverse population to be generalizable.
Factors such as geographic location, age, minority status and gender,
for instance, are essential in assuring an acceptable level of gener-
alizability. In addition, key persons who influenced the career aspira-
tions of the disadvantaged were also considered part of the popula-
tion. Here again, the sampling strategy accommodated this concern.

Validation evidence: To avoid the possibility of misinterpretation
of data, it was essential to employ measures to ensure that conclusions
were appropriate drawn. Corroborative measures were taken in the study
to substantiate the basis for deriving conclusions. All these concerns
were addressed in the subsections that follow.

Literature Review

Manual and computer searches were done to identify relevant sources
of literature pertaining to the career aspirations or career development
of the disadvantaged. Both searches revealed a variety of books,
articles and monographs that were directly or indirectly related to the phenomenon under study.

Recognizing that there may be fugitive materials that may not get into the formal data retrieval systems, letters were sent to professionals around the nation requesting information on literature that may enlighten the project staff in the conduct of their study. Letters were sent to guidance professionals in state departments, school districts and universities around the nation. Names were obtained from available mailing lists and from journals and other publications. This strategy proved to be quite productive since over 70% of those who were contacted responded via letter or telephone, and most of the respondents conveyed information that could be potentially of some use.

A format was designed for abstracting information from the literature. In addition to citation information, data were abstracted concerning (a) theoretical models that can foster an explanation of career aspirations, (b) factors and variables that can explain the career aspiration behavior of the disadvantaged, (c) alternative definitions of disadvantage, (d) the unique career-related characteristics of specific disadvantaged populations, and (e) measures that have been taken to facilitate appropriate career decision making by the disadvantaged. This content was used as a basis for developing explanatory models, constructing data collection instruments and recommending measures that could more appropriate cater to the needs of disadvantaged clients who have the desire to enroll in vocational education programs.
Instrumentation

The literature review identified several theoretical constructs that could contribute to an understanding of the career aspirations of the disadvantaged. These constructs were noted, and a list was prepared enumerating specific theoretical items that could be used as the basis for developing questions in a survey instrument. These items were categorized according to sources of influence upon the individual; categories included personal factors; environmental factors—relatives; environmental factors—peer group; social factors; psychological factors; and economic factors. Questions were developed to elicit information from the respondent on each theoretical item within each category. After several modifications of the questions and some experimentation with alternative formats, a first draft of the survey instrument was developed.

Project staff evaluated the questionnaire for flow, clarity of questions and concepts, and appropriateness of directions. The questionnaire was again modified and then subjected to pilot testing.

The questionnaire was pilot tested with students who are enrolled in vocational programs at the Tallahassee Community College and at the Lively Area Vocational Technical Center. These students represented "high" and "low" level programs (see definition in Appendix 1), different minority groups, different academic background, and different lengths of tenure in the vocational program. The project staff noted the problems experienced by these students, and recorded the concerns expressed as they responded to the questionnaire. This input was used to make yet another modification to the questionnaire. The final draft
of the questionnaire was administered to a group of students before actual data collection ensued. The final draft of the questionnaire is in Appendix 2.

The procedure for the administration of the questionnaire was prepared (Appendix 3), and the project staff became acquainted with the procedure before engaging in subsequent data collection efforts.

A questionnaire for parents was also developed to secure data from a subsample of the parents of student respondents. Factors and variables which could potentially explain the nature of parental influence on student's career aspirations were identified in the literature. These factors were used as a basis for developing questions. After pilot testing the instrument via telephone, modifications were made before the final draft was prepared.

Sample Selection

Although there was concern for geographical representation and for the representation of individuals possessing a variety of characteristics, the sample was selected to represent program types and levels, and to represent institutions at which vocational education is offered in the State of Florida. Program types here refer to the Department of Education's System for the classification of vocational education programs; program levels refer to whether programs are considered high level or low level programs. Appendix 4 lists the universe of programs in AVTCs by program type and level. Appendix 5 lists the universe of programs for community colleges. The courses listed in these appendices represent the offerings of vocational programs in the State.
All community colleges and area vocational technical centers were invited to participate in the study. Programs were selected from these institutions to properly represent the variety of programs in the State. As a basis for sample selection, an institution by program matrix, was developed. The matrix noted program level and program type in addition to the institution(s) at which the program is offered.

The sample selection procedure was both purposive and random. Unique programs that were offered at only one institution in the State were automatically included in the sample. The remaining programs were randomly sampled such that each institution had high and low level programs represented. Among all institutions, programs were proportionately sampled according to the number of such programs in the State. Appendix 6 shows the sample selection frame used in the study. A total of 153 programs were sampled; and, with an average of 20 students in each program, the anticipated sample of students was about 3,060. It should be noted, however, that since the size of programs varied, the actual sample of respondents was 2,348. In addition to variance in the size of programs, other factors affected the size of the actual sample. These factors include scheduling conflicts, refusals by respondents, and absences from classes.

Since all of the institutions invited did not participate in the study, adjustments were made such that the same program representation could be applied to a smaller sample of institutions. The programs were divided among the 29 institutions that participated in the study. The list of participating institutions is in Appendix 7 and the list of sampled program in Appendix 8.
In order to collect supplemental information from the home, a subsample of 201 parents were selected to secure data via a telephone survey. The sample was a proportional random sample by institutions. Program levels were represented such that 100 were selected from high level programs and 101 were selected from low level programs.

Data Collection

Project staff visited vocational institutions to collect the data. Before each site visit, arrangements were made with the representative at the institution to assemble all students who are enrolled in the sampled programs. Usually these students assembled in the school's cafeteria. Project staff then administered the questionnaire and remained in the vicinity to respond to questions that would further clarify the content of the questionnaire. The procedures for site visitation are in Appendix 3.

Two other data collection strategies were used. Namely, the selection of hold out sample, and the acquisition of information so that a sample of parents could be contacted. Ten (10) percent of the total number of students sampled in an institution were selected to be part of the hold out sample. The hold out sample was used for the purpose of validating the findings derived from the persons who responded to the questionnaire. To procure parental information, a small card was attached to the student questionnaire. The card was designed so that students could list the name, address, and telephone number of their parents, in addition to their own name, address and telephone number. When the questionnaires were collected, the cards were removed and filed separately. This measure helped to maintain
the confidentiality of the student's response. The student's name and address on the card served to inform the project staff about the location of students so that students with incomplete questionnaires could be contacted.

From the subsample of two hundred (201) parents, information was secured via telephone interviews.

Pre-Analysis

After the questionnaires were collected, the project staff conducted a visual edit of the data to ensure that responses were complete. The completed questionnaires were filed for coding and those that were incomplete were completed via telephone conversations with the respondents. The completed questionnaires were then coded and prepared for data analysis. Instructions for initial codes are noted in Appendix 9.

A code book was developed so that the following items could be coded: occupations, occupational prestige, vocational programs, relationships and open-ended responses. When the questionnaires were coded, information was keypunched onto a magnetic tape and the necessary materials were prepared so that the data could be analyzed via the Statistical Package for the Social Sciences.

Data Analysis

The analysis was basically descriptive. The analyses were done to highlight the differences between advantaged and disadvantaged groups on variables which were noted as items that can potentially influence the career aspiration of the disadvantaged. T-tests were performed
to denote the statistical significance of some of the more critical variables.

**Evaluation/Validation**

A selected number of individuals were contacted to assess the validity of the results. About 20 students were contacted to determine whether the barriers that were derived from the study are indeed barriers; and the results of this study were shared with five professionals in guidance and related fields to determine whether the results seemed plausible. This provided a basis for having confidence in intervention strategies using the findings of this study as a basis for action.

Attempts were also made to secure corroborating evidence from available documents to detect whether any written policies provided evidence of the existence of barriers.

**Summary**

These procedures addressed the concerns not addressed in the first part of this chapter. The following chapter examines the data that were secured.
CHAPTER 4

FINDINGS

The prime purpose of this study was to identify the barriers to high-paying occupations as perceived by disadvantaged students. The problem motivating the study was the preponderance of disadvantaged students who enrolled in "low level" programs in the State's Vocational Education Institutions. The stream of logic used in specifying the purpose of the study was that since low level programs lead to low-paying occupations, then students who opted for these programs were not on a pathway which lead to occupations with high level of renumer-ation. As such, circumstances which encouraged enrollment in low level programs were indeed barriers to high-paying occupations. But since students voluntarily select programs in which they will enroll, these barriers did not seem to lie solely in program selection policies, but more so in the career aspirations of those who participate in these programs and the variety of influences that shape an individual's career aspirations.

With this in view, the study sought to compare advantaged and disadvantaged students, on a variety of factors which are purported in the literature to affect career aspirations to the extent that the advantaged and disadvantaged students are different when compared on these factors, then the source of barriers could be identified. In
this case, as was pointed out in the previous chapter, barriers could be rooted in a compendium of psychological, social and economic factors which influence program choices. In presenting the results, these factors are addressed in four major sections: pre-enrollment, the enrollment decision, program participation and employment outlook. But before these are addressed, the distribution of disadvantaged groups in high and low level programs will be examined.

The Distribution of Disadvantaged Groups in High and Low Level Programs

Table 1 shows a breakdown of advantaged and disadvantaged groups by program level. The distribution of advantaged and disadvantaged in the sample raises serious questions about the preponderance of disadvantaged students in low level programs; or perhaps questions can be raised about the definitions of disadvantagement and the criteria for determining high and low level programs. Notwithstanding, Table 1 does not bear out any disproportionality—at least not significantly in the expected direction. There are slightly more minorities in low level programs; and more of the economically disadvantaged students participate in low level programs. But the distribution of the educationally disadvantaged and the advantaged is not as one expects. If one looks at the 168 students who fit into that group, the majority (60%) are enrolled in high level programs. Alternatively, the majority of the advantaged group (56%) is enrolled in low level programs. One would expect the opposite to be true.

</table>
There are advantaged and disadvantaged students in both high and low level programs. However, there are various levels of disadvantage. Similarly, there are varying degrees at both high and low level programs. To detect differences, perhaps, criteria must be designed to detect the extreme in each of these cases. Only then could a clear line of demarcation be found. The results, however, should be interpreted within the context of the table. Because of the imprecision of definitions, some of the anticipated differences will be clouded. Results are presented in the four sections as noted before.

Pre-enrollment

This is the major source of potential barriers since it embodies the influences that the student brings to the enrollment decision. Everything that occurs in the student's life which may shape his/her view of how he/she relates to the world of work affect that decision to enroll. To the extent that there are differences between the advantaged and disadvantaged student with respect to these early influences, then the factors which impede proper decision making can be detected in their embryonic stages. Some of these factors addressed in this study are as follows:

1. parental influence;
2. prestige value of occupational environment;
3. nature of personal development - self concept, career maturity, motivation/drive, aspirational confidence level, parental support, self
evaluation skill, status improvement inclination, coping skills; and

4. Sources of information for making educational choices.

The study's findings with respect to each of these will be addressed in turn.

**Parental Influence**

The aspirations of children are determined to a large extent by their home environment—primarily by the parental influence. The extent to which parents are able to positively influence the occupational goals of their children is limited to a large degree by their own occupational pre-disposition. In comparing advantaged and disadvantaged groups, it was found that both the prestige of parents' occupation and parents' level of education were significantly different between groups (Table 2). The average prestige of the occupations of parents of members of the advantaged group was 15.98, compared to 32.93 for the disadvantaged. Although there are differences in results when "current occupation" is compared with "last occupation," the conclusion can be drawn that there is a difference in the occupational prestige of jobs held by parents of advantaged students when compared with the disadvantaged.

Table 2 also shows that the parents of advantaged students generally have a higher level of education than the parents of the disadvantaged. When the number of years of schooling is compared, the parents of the advantaged students average 13 years while the parents of the disadvantaged average 11.20.

There were other slight differences, but as shown in Table 2, these were not statistically significant.

</table>
Prestige Value of Occupational Environment

To the extent that occupations common to one's immediate environment affect one's perspective of the world of work, then the occupational contacts (real or imaginary) of students will have affected their occupational aspirations, and hence, there will be a consequent effect on their choice of a vocational program. Table 3 tries to compare the prestige of occupations in the environment of the advantaged and disadvantaged student, respectively. Will the result of some of the comparisons be questionable? There are significant differences in prestige that veer in the expected directions. For instance, the prestige of the current job of advantaged and disadvantaged students who were employed were significantly different. There were also notable differences of the following dimensions: first job held by respondent; typical jobs in the neighborhood; occupation of person admired. In all these cases, the advantaged students are generally exposed to jobs that are of a higher prestige value than those of their disadvantaged counterparts.

Generally, it can be concluded that the occupational aspiration of the disadvantaged students is impeded by the low prestige value of the occupations in their environment.

Nature of Personal Development

There are several personal characteristics which affect career aspirations and academic program selection. When various groups of advantaged and disadvantaged students were compared on these characteristics, several items of interest were noted.

</table>
On the self concept dimension in Table 4, the disadvantaged group generally exhibited a lower self concept than the advantaged; but these differences were even more pronounced when the advantaged who are enrolled in high level programs were compared with disadvantaged who were enrolled in low level programs. On the first item, for instance, the advantaged in low level programs had a mean of 6.1 when compared to the mean of the disadvantaged in high level programs with a mean of 5.2. It does seem that the disadvantaged students who are enrolled in low level programs exhibit a slightly lower confidence level than their disadvantaged counterparts, and a significantly lower level of confidence than the advantaged students, especially those who are enrolled in presumably less challenging programs.

Career maturity is another area of personal development that affects career aspiration and program choice. Students who are more mature select programs and aspire to occupations that are consistent with their level of intellectual development and their personal characteristics (e.g., personality). All respondents were asked a series of questions related to career maturity. The mean of the responses of various groups are shown in Table 4. Here, again, the advantaged students have means that are consistently higher than those that are disadvantaged; indicating, therefore, that the advantaged students have a higher level of career maturity than the disadvantaged and, as a result, will demonstrate more planful program selection and more realistic career aspirations.

Again in this dimension, the advantaged group who were enrolled in low level programs exhibited the highest level of career maturity.

</table>
However, the disadvantaged students in high level programs exhibited the lowest level of career maturity. More information is needed to truly understand the relationship between advantagement, program enrollment (high/low level) and career maturity. Although the findings are significant, the relationship is still unclear. Although individuals with a high level of career maturity are dispersed across programs, the disadvantaged in all programs seem to possess lower career maturity levels.

On the dimension "motivation/drive," the same general trend is also evident. Generally, the disadvantaged have a lower level of motivation than their advantaged counterparts, with the advantaged in low level programs having the highest motivation levels and the disadvantaged in the high level programs having the lowest levels of motivation. There is definitely a "program-effect" which relates to the degree of challenge in the program and the level of personal development of the enrollee. The challenge of the high level program, when combined with the career development deficits that are attendant to disadvantagement, consistently place the disadvantaged student at the lower end of the scale on these theoretical dimensions. The opposite is true for the advantaged student in high level programs.

Another dimension examined was entitled "aspirational confidence level." This dimension assesses the positivity of the student's outlook with respect to educational and career opportunities. Both advantaged and disadvantaged students at all levels generally thought that they will be successful in the programs in which they were enrolled; and they both thought that they could have entered other programs if they
desired. But apart from these, two differences emerged. The disadvantaged were more inclined to avoid situations in which they could experience failure; and they were also more inclined to believe that opportunities for success are difficult to come by. These preceptions can have a debilitating effect on educational and occupational success.

As demonstrated in Table 4, there were other areas in which differences were obvious. The advantaged students generally had better relationships with their parents; they generally thought of themselves as successful in school to a greater degree than the disadvantaged; and they evaluated themselves as having a higher level of coping skills than the self evaluation of the disadvantaged group. Again, all these differences were more pronounced when the advantaged in low level programs were compared to the disadvantaged in high level programs.

The nature of personal development affect career aspirations and academic program selection. This was borne out by the findings detailed in Table 4. The factors that act as barriers are those integral to the personal development of the student. When the students opt for a vocational program and place themselves within a career stream, many of the barriers have already been set in place by the social and psychological influences which forge personal identity.

**Sources of Information for Making Educational Choices**

If students are to select programs which commensurate with their abilities and aspirations, then the source from which they seek educational counseling is critical. The scope of information that is available from that source will affect the wisdom of the student's choice.
If advantaged and disadvantaged students are compared, to the extent that the disadvantaged students seek information to a disproportionate degree from less informative sources of advice, then that group will be at a disadvantage in making career choices.

In Table 5, both groups were compared on the sources from which they seek educational information. If students responded that they did not know, or if they depended on friends or parents for information, then they were categorized as not exploring informative sources of advice. The groups were assessed to determine the extent to which they differentially utilized sources of educational information. The results in Table 5 do not point to any significant difference.

A slightly higher percentage of disadvantaged students (13%) responded that "they did not know" than advantaged students (11%); and the advantaged students seem to have a greater dependence on their parents for information (11.2%) than the disadvantaged (6.5%). Apart from these differences, the sources of information which both groups utilize seem to be similar. From this data, the availability of information does not seem to be a barrier to the selection of appropriate programs and occupations among the disadvantaged.

The results related to pre-enrollment influences seem to indicate that some barriers are inherent in disadvantage. This, I believe, is consistent with the literature reviewed. There are social and psychological influences which dictate the career path selected by students. Disadvantaged students, however, are exposed to influences which direct them to careers that are on the lower rungs of the career ladder. The influence of their history places the proverbial yoke

around the necks of the disadvantaged. If left unattended, the yoke becomes a burden to be borne through life continually improving negative influences on the career through educational and occupational choices.

The Enrollment Decision

Another way of examining barriers to participation in high level programs—and, hence, barriers to high-paying occupations—is to study the enrollment decision. If students enter programs for the wrong reasons (e.g., they had friends in the program) or if they entered a program because they could not gain access to another program, then different kids of barriers may exist. In the first case it may be a personal development barrier—career maturity—and in the latter case it may be an institutional barrier. Regardless of their label, they both contribute to the same outcome.

Table 6 compares the reasons why advantaged and disadvantaged students enroll in vocational programs. Except for three reasons, both advantaged and disadvantaged groups expressed similar reasons for enrollment (i.e., there did not appear to be significant differences between the groups except for three reasons).

The disadvantaged group had a greater desire to enroll in what can be referred to as an "easy" program. When the groups were compared, 10% of the disadvantaged as compared to 4.7% of the advantaged expressed this as a reason for program choice. This can be accounted for by the career maturity deficit among disadvantaged clients. But there were differences on barriers which could be labelled as institutional barriers.

1Description of specific open-ended responses coded from the "other" category appears in Appendix 11.
More of the disadvantaged indicated financial assistance as the reason for enrollment (32.5%) than did the advantaged group (4.9%); and more of the disadvantaged group indicated that they could not gain entry to their preferred program (3.6%) than their advantaged counterparts (1.4%). The availability of financial assistance as a reason for entering a vocational program may be a significant barrier. Since in some institutions students may not be eligible for financial assistance to enter certain programs if they do not receive adequate scores on required entry exams. Many disadvantaged students do not perform well in these exams and, hence, they are denied financial assistance and, hence, entry to the program. But even further, this large difference may infer that the unavailability of financial assistance could deter a large percentage of the disadvantaged from participating in vocational programs.

Table 6, as noted before, indicated that their preferred program was not available to a larger percentage of disadvantaged students. If one looks at the percentage of students who considered another program but did not enroll (Table 7), then another significant difference seems to emerge to substantiate the findings in Table 6. In Table 7, a larger percentage of the disadvantaged group (28%) considered another program in which they could not enroll than did their disadvantaged counterparts (15%).

Table 8 notes the reasons that were given for not enrolling in a preferred program. The reasons that were expressed by a larger percentage of the disadvantaged which accounted for their non-enrollment in a preferred program are quite revealing. A higher percentage of

disadvantaged clientele indicated the following reasons: program was too expensive; they did not have the ability; program was too long; program required too much work; they could not meet the entrance requirements because scores were too low; and, there were barriers to program entry. The barriers evident in these reasons are clear: the lack of motivation among disadvantaged clientele; and institutional mechanisms such as tests, limited space in programs, and the availability of financial assistance.

Another difference with respect to program enrollment is shown in Table 10. When advantaged and disadvantaged students were compared on "Scope of Choice," the disadvantaged student group seems to have seriously considered significantly more programs than those that were advantaged. However, when the disadvantaged group which was enrolled in low level programs was compared with the disadvantaged group in high level programs, there was not a significant difference in the "Scope of Choice" (Table 11). But when this same group (the disadvantaged in low level programs) was compared with the advantaged in low level programs, again, a significant difference emerged (Table 12). Generally, disadvantaged clients examine or seriously consider more programs than their advantaged counterparts. This may be explained by differences in levels of career maturity. If the advantaged student exhibits a higher level of career maturity, then there will be greater certainty in the selection of a vocational program. Hence, the advantaged student will consider fewer programs in making a decision to participate in vocational education.
On the other hand, the disadvantaged student who is less certain about career pursuits will explore a greater variety and a larger number of programs before the decision to enter a program is made. This is evident in the findings as detailed in Tables 10 to 12.

Program Participation

Once students have enrolled and have entered a program, most of the pre-enrollment influences have already had a major effect, and the student has entered a pathway that restricts occupational choice. One can readily conclude that at this point the damage has been done. But there may be the potential for even more damage to occur in the nature of the students' exposure to the vocational program. If students participate in programs "half-heartedly" for any of a variety of reasons, or if their performances are not up to some desired standard (one of the results of the former) then the probability of success will be decreased and occupational choices will be even more restricted. This study attempted to determine the extent to which there were influences which may potentially cause disadvantaged students to exhibit attitudes that are inimical to success in vocational programs. To the extent that these influences were more intense among the disadvantaged, then these influences could be barriers in themselves or they could be the source of barriers. Related information is presented in Tables 9 through 12.

An attempt was made to evaluate students' satisfaction with their program as a variety of dimensions. For instance, students were asked, "If given another opportunity, would they choose another program."

</tbody>
</table>
To the extent that students are inclined to choose another program, then it can be inferred that they are not satisfied with the program in which they were currently enrolled. As shown in Table 9, 28% of the disadvantaged as compared with 14% of the advantaged had preference for another program. More of the disadvantaged students were dissatisfied with the programs in which they were currently enrolled. The basis of the dissatisfaction is evident in Tables 10, 11, and 12.

Disadvantaged students had a significantly lower interest in the programs in which they were currently enrolled; they generally perceived their programs to be less prestigious than did the advantaged group, and the extent to which they felt that their friends placed a high value on the program was significantly lower than that of the advantaged group. In addition, they were not as satisfied since they were less inclined to recommend their program to their friends; and they assessed themselves to be doing less well academically than the advantaged group. All these are evident in Table 10.

When the disadvantaged in the high and low level programs were compared (Table 11) the disadvantaged enrolled in high level programs generally perceived their programs to be more difficult, less prestigious, and of less value to their friends and parents. Generally, the disadvantaged in the high level programs were less satisfied with their programs than those who were enrolled in low level programs. This raises the suspicion that the disadvantaged in high level programs were misplaced, alienated or denied essential academic or psychological supportive services.

</table>
However, when the advantaged and disadvantaged in the low level programs were compared, a different pattern emerged. The low level advantaged group showed a significantly more healthy level of program acceptance (Table 12). They had a higher perception of program difficulty; they were more pleased with the difficulty level; they had a higher interest in their programs; they felt to a greater degree that the program was prestigious, and that their friends and parents placed a high value in the program; and they generally assessed themselves to be performing better in their programs than did their disadvantaged counterparts.

The differences revealed in Tables 10 to 12 again point to differences in career maturity between the advantaged and disadvantaged students. The advantaged students may feel more assured in their program choice, and as a result, represent a higher level of satisfaction and acceptance of their programs. The disadvantaged, on the other hand, may have opted for their programs for the wrong reasons, or may have career aspirations that are not consistent with their program choice. The result is a general level of dissatisfaction, which creates an attitude that is a significant barrier to occupational success.

Employment Outlook

Another area in which barriers may be evident is the occupational/employment outlook of disadvantaged students. The extent to which they had realistic plans, and a realistic outlook on the world of work, or the extent to which they were mature in their decision making and

</table>
hopeful about employment opportunities will comment on existence or non-existence of barriers related employment.

Table 13 reveals that, generally, advantaged and disadvantaged students have similar post graduation plans, except that a slightly higher percentage of the disadvantaged group (8.3% compared to 7.0%) planned to take a break from school and work after graduation.

Tables 14 and 15 assessed the students' perception of the desired characteristics of an occupation and their perception of the characteristics they desired in a job. As evident in Table 14 there were very slight differences among advantaged and disadvantaged groups in the perception of characteristics desired in a job. The disadvantaged seem to place a higher value on dealing with people, while the advantaged group placed generally higher values on data manipulation, managing stress, solving problems, assertiveness, manual dexterity and ability to remain on task with distractions.

Table 15, however, revealed differences that were more significant. While the advantaged group placed a significantly higher value on pride in work, good working conditions and monetary benefits, the disadvantaged group place high values on activity, opportunity to gain respect and social status. This may be indicative of an inclination among the disadvantaged to remedy social deficits in their occupational choice.

When advantaged and disadvantaged groups were compared on sources of information (Tables 16 and 17) slight differences were obvious. For instance, advantaged students depended on their parents to a greater extent as a source of advice on occupational plans (Table 16), and

for job search information, a higher percentage of the disadvantaged indicated that they had no knowledge of sources. The disadvantaged were more inclined to seek job search information from the State Employment Service, the newspapers, and to a lesser degree, the guidance office, while the advantaged were more inclined to seek this information from less formal sources like friends, relatives and teachers. While the disadvantaged must depend on traditional sources, the advantaged can rely on the less formal (and usually more dependable and effective) sources of information (Table 17).

Table 18 notes the problems both groups anticipate in the job market after graduation. Generally, the same pattern of expectation exists for the advantaged and disadvantaged, except a greater percentage of the disadvantaged anticipated discrimination in the job market after graduation. Most of them anticipated discrimination with respect to race. A higher percentage of the disadvantaged also anticipated problems, getting to the place of employment and were concerned that they lacked the desired level of training.

The employment outlook of disadvantaged students is affected by their social and psychological history. The effect of early influences taints their perception of occupational requirements, and they are generally not privileged enough to have access to dependable and effective sources of information, i.e., the informal network of information. These constitute barriers to effective participation in the world of work.

Content Analysis

In addition to information acquired through the survey of respondents, documents were reviewed to abstract procedures that could in fact present barriers to disadvantaged students. The type and nature of these barriers are presented in Table 19. There were economic barriers (e.g., unavailability of financial aid); barriers related to screening procedures (e.g., the administration of diagnostic tests); and barriers in the form of program inaccessibility (e.g., filled classes).

Some of the most striking barriers in this regard were the screening through diagnostic, interest and aptitude tests; programs not meeting the financial capacity of disadvantaged students; and brochures and other recruitment materials which discouraged the disadvantaged from participation in selected programs. In the case of the latter, project staff reviewed brochures which used photographs of minority candidates on brochures for low level programs and excluded these photographs for the higher level programs. Also evident in some of the brochures were language barriers. Disadvantaged candidates could be easily turned off either because of the level of reading difficulty, the formality or because of the inadequacy with which these brochures addressed the questions/concerns that would naturally come from disadvantaged and hesitant clients.

Therefore, in addition to the more fundamental barriers related to personal development (e.g., career maturity) there are barriers which are imposed by institutional policies related to the delivery of vocational programs.

Summary

As can be ascertained from these findings, the disadvantaged clients who are enrolled in vocational programs are faced with hurdles which hinder their entry into high-paying occupations. The most significant of these hurdles are those which shape the individuals' perception of self and their perception of the world of work. Unfortunately, these hurdles are brought to life long before the students enter a vocational program. While some effort can be made in vocational institutions to arrest the problem, most of the inroads must be made in the extended period preceding enrollment in a vocational program--the period between birth and graduation from high school. Conclusions and recommendations are presented in the chapter which follows.
CHAPTER 5

CONCLUSIONS AND RECOMMENDATIONS

Disadvantaged students, for the most part, have come from environments where the social and economic circumstances have imposed deficits in their development, and these deficits have negative effects on their occupational choices. When the advantaged and disadvantaged groups were compared, differences were consistently found in areas that could enlighten and inform students in their academic and occupational choices. The advantaged students seem to have a better facility for making these choices.

These deficits are the true barriers to high-paying occupations since they lead to the selection of lower level programs and, as a result, place students on the pathway to low-paying jobs. The following conclusions can be derived from the study:

1. The negative effects of disadvantage are rooted in the experiences of students before they pursue vocational programs. The most significant barriers to these students are those imposed by the economic, social and psychological influences that shape their occupational desires. While educational deficits do constitute a significant barrier, the influence of their socio-economic environment on the values
and self perception of the disadvantaged play a significant role in their choices of educational programs and occupational pursuits.

2. The negative effects of disadvantagement are reinforced by the educational system. By and large, students are not counseled into courses. They do not have the desired mobility to move from a low level program to the high level program of their desire. They are screened into programs through diagnostic testing, and once they have enrolled in these programs, they are essentially locked in until graduation. They are locked in, sometimes because of their own desire not to waste time and resources, and other times, because of the unavailability of places in other programs or because of stringent program intake procedures.

3. Recruitment procedures are sometimes alienating to the disadvantaged clients. The content of brochures in terms of language level, formality and sometimes the pictures used, may help to discourage the disadvantaged from enrolling in higher level programs.

Recommendations

1. Since the home environment plays a significant role in the educational and occupational choices of students, and since the children of disadvantaged backgrounds are denied the privilege of a career enriching home environment, some attempt must be made to educate parents about their role in the educational and occupational choices of their children. This will encourage parents to employ the necessary measures which will supplement the experiences children have at home.
Social service agencies should implement a career social service program with the responsibility for conducting career outreach services to disadvantaged families. It may be possible for such a program to be initiated by the career guidance unit in the Department of Education or the Division of Vocational Education.

2. Disadvantaged vocational students should receive career counseling to enable them to make program choices that are consistent with their academic potential.

3. Recruitment procedures should be structured to encourage disadvantaged clients to enroll in programs which lead to high-paying occupations.

4. Support services such as IMTS should be expanded so that students can acquire the prerequisite competencies that are necessary for success in high level programs.

If disadvantaged students who are enrolled in Vo Ed are to benefit from the educational resources that are available to them, some systems must be put in place to make up for the deficits that result from the influences of their social and economic background. Most of the impact can be made by ensuring that the students have the proper information, experiences and exposures before pursuing an occupational path. This, however, is a large undertaking for the Vocational Education Community. Instead, measures must be taken to ensure that the Vo Ed delivery system affords the disadvantaged maximum opportunity to succeed. Opportunities for success do not come from channeling students into programs based on diagnostic costs, but on helping them to understand themselves,
helping them to understand the world of work, and creating for them necessary structures that will assist them in overcoming their deficits.
REFERENCES

Appendix 1

DEFINITIONAL CRITERIA

1

Low Level-High Level Program Criteria:

1. Academic entrance requirements (test scores).
2. Course prerequisite requirements.
3. Duration of program.
4. Open-entrance/open-exit or lockstep program design.
5. Cost of supplies, materials, texts, etc.
6. Type of degree or certificate awarded upon completion of program.
7. Placement potential.
8. Salary when employed after completion of program.

2

Criteria for Disadvantagement:

The disadvantaged groups will include minorities, females, non-English proficient and the socio-economic and academically disadvantaged. Criteria for socio-economic disadvantage include: (1) participation in work-study or receiving financial aid and (2) receipt of Government entitlements. Criteria for academic disadvantage include: (1) enrollment in IMTS (Individualized Manpower Training) and (2) enrolled in other remedial programs.
OCCUPATIONAL ASPIRATIONS QUESTIONNAIRE

This questionnaire requests information which will allow us to understand your choice of Vocational Programs and your choice of occupations. It is divided into four sections: (1) Program Characteristics, (2) Educational Background, (3) Vocational/Occupational Characteristics, and (4) Personal Characteristics. Please read the instructions and questions very carefully and try to respond as accurately as you can.

PROGRAM CHARACTERISTICS

1. In what Vocational Program are you presently enrolled?

2. How long is this program? (Choose one)
   (clock hrs.) (sem. hrs.)

3. How much of the program have you completed?
   (clock hrs.) (sem. hrs.)

4. Why did you enroll in this program? (Circle all responses that apply)
   a. Had always hoped to enter such a program.
   b. Had friends enrolled in the program.
   c. Heard many good things about the program.
   d. High salary potential after completion of program.
   e. Convenient hours of work.
   f. Program offered at convenient time. Check one: Day Evening
   g. Program appeared to be an easy program.
   h. Program presented a challenge.
   i. Program length was attractive. Check one: Long Short
   j. Financial assistance was available.
   k. Parental encouragement.
   l. Friend's encouragement.
   m. Counselors/teachers encouragement.
   n. Leads to prestigious occupations.
   o. To get respect from others.
   p. Program was not costly.
   q. To become an important person.
   r. Other. Please specify:

5. If given the opportunity, would you choose a program other than this?
   Yes No

6. Did you consider another program but did not enroll in that program?
   Yes No (If your answer is Yes, go to the next Question. If your answer is No, skip to Question #9.)

7. What is the name of the other program you considered?

8. Why did you not enroll in this program? (Choose all responses that apply).
   a. Program was too expensive.
   b. I did not have the ability.
   c. Program was too long.
   d. Program was too short.
   e. Had no friends in program.
   f. Program required too much work.
   g. Heard bad things about program.
   h. Salary after graduation not attractive.
   i. Lack of transportation.
   j. Could not meet entrance requirements: low test score.
   k. Other. Please specify:

9. If the programs at this institution can be divided into "high" and "low" level programs, in which category do you think that your present program will fit? (Circle one).
   a. "high"
   b. "low". (If your answer is "high, skip to Question #11.)
10. If your answer to the previous question (#9) was "low", why did you not choose a "high" level program? (Circle all that apply)
   a. Easier to find jobs after graduating from present program.
   b. Did not have the necessary background.
   c. Too much work is required.
   d. Programs are too long.
   e. Programs are too demanding.
   f. Friends are not in the program.
   g. Was not allowed to enter the program.
   h. Did not get the necessary information beforehand.
   i. Discouragement from others.
   j. Fear of failure.
   k. Other. Please specify:

Instructions: Respond to the following items by circling the appropriate number to the right of each question which best indicates your feeling about your present program.

11. How difficult is your present program? 
   Very difficult  5 4 3 2 1 Easy

12. Are you pleased with the difficulty level of your program? 
   Very pleased  5 4 3 2 1 Not pleased

13. How will you rate your interest in the program? 
   Very interested  5 4 3 2 1 Not interested

14. Do you feel that this is a prestigious program? 
   Very prestigious  5 4 3 2 1 Not prestigious

15. Do your friends place a high value on this program? 
   Very high value  4 4 3 2 1 Low value

16. Do your parents place a high value on this program? 
   Very high value  5 4 3 2 1 Low value

17. Would you recommend this program to your friends? 
   Highly recommended  5 4 3 2 1 Will not recommend

18. How well are you doing in the program in which you are presently enrolled? 
   Very good grades  5 4 3 2 1 Very poor grades

EDUCATIONAL BACKGROUND

1. Did you graduate from high school?  
   Yes  No  (If Yes, continue with the following question. If No, skip to Question #4.)

2. What was the size of your graduating class? 

3. Where did you rank in your graduating class? 

4. What was your high school Grade Point Average (G. P. A.)?
   a. 1.5
   b. 2 (C average)
   c. 2.5
   d. 3 (B average)
   e. 3.5
   f. 4 (A average)

5. About how many hours of Vocational courses did you have in high school? (e.g., Industrial Arts, Home Economics Auto Mechanics, Drafting, Typing, etc.) 
   _______ hours

6. How many times did you visit the guidance counselor in your junior and senior high school? 
   _______ times

7. How difficult was your high school curriculum? (Circle as appropriate).
   Easy  1 2 3 4 5 Very Difficult

8. What is your present Grade Average?  
   (Omit if you do not currently receive grades). 
   _______
1. How much difficulty do you think you will experience finding this job? (Circle appropriate number).
   None 1 2 3 4 5 Very Much

11. What are your chances of getting the job you really like? (Circle appropriate number).
   Good 1 2 3 4 5 Impossible

12. What job do you think you will obtain after graduation?

13. Do you think that this job will be a prestigious occupation?
   Not Very
   Prestigious 1 2 3 4 5 Prestigious

14. To what extent do you think you will be pleased with this job?
   Not Very pleased
   1 2 3 4 5 Pleased

15. What problems do you expect to encounter in getting the occupation you desire? (Circle as many as appropriate).
   a. Discrimination (Check One): Race Sex National Origin Age
   b. Availability of jobs
   c. Too few jobs relating to training
   d. Low income
   e. Not enough experience
   f. Too many persons seeking jobs in the area
   g. Place of employment not easy to get to
   h. Not enough training
   i. Other. Please specify:

16. Where will you go to get information about available jobs? (Check the two most important sources).
   a. Don't know (go to next question).
   b. Guidance Office
   c. State Employment Office
   d. Newspapers
   e. Friends
   f. Parents
   g. Teachers
   h. Other.

17. Where will you go to get information for continuing your education? (Check the two most important sources).
   a. Don't know (go to next question)
   b. Guidance Office
   c. State Employment Office
   d. Friends
   e. Parents
   f. Teachers
   g. Other:

18. What characteristics do you think are necessary to be successful in the occupation of your choice? (Check all that apply).
   a. Ability to deal with people
   b. Ability to manipulate data
   c. Ability to manage stress
   d. Ability to solve problems
   e. Assertiveness (Ability to state opinions openly)
   f. Manual dexterity (Ability to use your hands)
   g. Ability to remain on task with distractions in environment
   h. Other. Please specify:

19. What job did you want as an adult while you were in:
   a. Elementary School
   b. Junior High
   c. Senior High

20. What do you look for in the occupation you choose? (Place 1 in front of the most important; 2 in front of the 2nd most important; 3 in front of the 3rd most important).
   a. Activity
   b. Involvement
   c. Pride in work
   d. Need for responsibility
   e. Opportunity to provide services
   f. Prestige
   g. Opportunity to gain respect
   h. Good working conditions
   i. Monetary benefits
   j. Social status

20. Name three jobs that are typically held by individuals in your neighborhood.
   1.
   2.
   3.
22. What is the occupation of each family member?
   a. Father: ____________________________
   b. Mother: ____________________________
   c. Brothers: __________________________
   d. Sisters: ____________________________

23. What are the occupations of three persons whom you admire.

24. Is there someone whose footsteps you would like to follow?
   Yes __ No __

25. If Yes, what is the relationship of this person to you? ____________________________
   What is this person's occupation? ____________________________

26. From whom did you receive the most encouragement in pursuing your chosen occupation?
   a. Parents
   b. Teachers
   c. Friends
   d. Counselor
   e. Other. Please specify: ____________________________

27. Have you received any discouragement from any of the following people?
   a. Parents
   b. Teachers
   c. Friends
   d. Counselor
   e. Other. Please specify: ____________________________
   f. No one

28. Is there anyone who is dissatisfied with your vocational choice?
   Yes __ No __

29. If your answer to the above question was Yes, please specify the relationship of the person(s) who is dissatisfied with your vocational choice and specify the occupation of the person(s).

*************************************************************************************************

PERSONAL CHARACTERISTICS

1. Check the responses that best describe your present status. Are you:
   a. Enrolled in IMTS __
   b. Receiving financial aid __
   c. On academic probation __
   d. About to drop out of school __
   Yes No __

2. What is your age? ____________________________

3. What is your birth order? (Check one).
   1st child __ 2nd child __
   3rd child __ 4th child __
   Other ____________________________

4. Circle the appropriate racial category.
   a. Black
   b. White
   c. Hispanic
   d. American Indian
   e. Other: ____________________________

5. How many persons live in your household? ____________________________

6. What is the annual income of your household?
   a. below $5,000 per year __
   b. $5,000 - $10,000 __
   c. $10,000 - $15,000 __
   d. $15,000 - $20,000 __
   e. $20,000 - $25,000 __
   f. $25,000 - $30,000 __
   g. above $30,000 __

7. How many times have you changed residence since you started attending elementary school? ____________________________

(PLEASE CONTINUE ON THE NEXT PAGE)

THANK YOU FOR YOUR TIME. WISH YOU SUCCESS IN YOUR PROGRAM!
APPENDIX 3
PROcedures for On-Site Visitation

Pre-Visit Responsibilities:

Before each site visit, the project staff will, with the cooperation of the coordinator at each institution, accomplish the following:

1. Obtain and acknowledge permission to collect data at the institution. With the acknowledgement letter, include a copy of the questionnaire and a copy of the data collection procedures.

2. Select the programs at the institution from which students will be identified for responding to the questionnaire. At least four programs will be selected from each institution. Two of these programs will be "high level" programs and two will be "low level" programs.

3. Contact on-site coordinator and obtain information on the programs selected.
   a. Whether the "high" or "low" level labels are appropriate.
   b. Enrollment in these programs.
   c. List of names of students enrolled in these programs.
   d. Name of instructor responsible for the program.
   e. If possible, identification of the disadvantaged students in each program.

4. Obtain the names of the following school personnel: Guidance Counselor, IMTS, Occupational Specialist, Financial Aid Officer.

5. Schedule the day and time for the site visit. Check with the site coordinator to confirm the date and time designated.

6. When the list of students is obtained from the institution, randomly select students for the holdout sample.

7. Request cooperation from the site coordinator to establish contact with the members of the holdout sample.

8. Obtain information from site coordinator as to the best procedure for data collection (Alternative A, B, or Other). See #3 below.

Site Visitation:

1. Arrive on site at predesignated date and time. Contact site coordinator for briefing and to identify the location for data collection.

2. Collect appropriate policy documents at the site. Documents are to include:
a. Catalog.
b. Information on recruitment and admission policies.
c. Any reports developed on the disadvantaged.
d. Financial aid application.

3. Collect data from students. (Note: The questionnaire takes between 35 minutes and 1 hour to be administered.)

a. Alternative A: Students are assembled in one location by program area; or students representing all programs are assembled in one location.
   1. Monitor states the purpose of the study and reads instructions.
   2. Names of individuals in the holdout sample read, and these students are requested to assemble in one location.
   3. Questions administered with the ID Card.
   4. ID Card filled out and the card number is noted on the questionnaire.
   5. ID Cards collected by monitor.
   6. Students respond to the questionnaire.
   7. While students are responding to the questionnaire, members of the holdout sample will be notified of the nature of their participation and their names and addresses will be recorded.
   8. Questionnaires collected.

b. Alternative B: Students who are in a program area (or in similar program areas) are assembled to take a common core course. (Use same data collection procedure, but code "high" or "low" level from the program designation on the questionnaire. Also, check original list to note the number of original respondents present in class).

   *Same procedures as Alternative A, 1-8.

4. Chat briefly with other personnel at the institution: IMTS, Counselors, etc.

Low Level-High Level Program Criteria:

1. Academic entrance requirements (test scores)
2. Course prerequisite requirements.
3. Duration of program.
4. Open-entrance/open exit or lockstep program design.
5. Cost of supplies, materials, texts, etc.
6. Type of degree or certificate awarded upon completion of program.
7. Placement potential.
8. Salary when employed after completion of program.

Criteria for Disadvantage

The disadvantaged groups will include minorities, females, non-English proficient and the socio-economic and academically disadvantaged. Criteria for socio-economic disadvantage include: (1) participation in work-study or receiving financial aid and (2) receipt of Government entitlements. Criteria for academic disadvantage include: (1) enrollment of IMTS (Individualized Manpower Training) and (2) enrolled in other remedial programs.

Holdout Sample:

The Holdout Sample constitutes 10% of the total number of students enrolled in a given sampled program.

NOTE: Project staff is willing to modify the data collection procedures at the institution so that it will be convenient for those who are involved or affected. When we call to schedule our visit, we will elicit ideas that will make the process least disruptive.

### Appendix 5

**UNIVERSE OF OFFERINGS IN COMMUNITY COLLEGES**
**FROM WHICH PROGRAMS WERE SAMPLED**

#### LOW LEVEL COURSES

**Agriculture**
- Agriculture Inspector
- Beef Production
- Citrus Production
- Forestry
- Nursery Operations
- Ornamental Horticulture

**Distributive**
- Bank Teller Training
- Beef Production
- Cashier Sales Checker
- Hotel/Motel
- Insurance Agent
- Merchandising
- Storekeeping & Parts Sales
- Travel Agency Operation
- Vending Facilities Mgmt.

**Health**
- Emergency Med. Tech. I
- Emergency Med. Tech. II
- Health Service Aide
- Hospital Housekeeping Mgmt.
- Human Services Aide
- Medical Term/Transcription
- Nurse's Aide
- Nurse Assistant Aide
- Nurse Assisting
- Ward Clerk

### HIGH LEVEL COURSES

**Agriculture**
- Agribusiness Mid-Management
- Agribusiness Technology
- Agricultural Business
- Agricultural Mechanics
- Agriculture
- Animal Science
- Assoc. In Science-Agriculture
- Biological Parks
- Citrus Technology
- Crop Technology & Production

**Distributive**
- Banking
- Business Management (Banking)
- Business Mgmt. (Real Estate)
- Business Marketing/Distribution
- Commercial Banking
- Cooperative Dist. & Marketing

CODE DEVELOPMENT FOR
OCCUPATIONAL ASPIRATIONS QUESTIONNAIRE

CODES USED

DVE - Disadvantaged Status
PGC - Program Characteristics Section
EB - Educational Background Section
PVOC - Personal Vocational-Occupational Characteristics Section
PC - Personal Characteristics Section
Q - Question, usually followed by a question number

1. CODING DVE STATUS:

Column 1: Minority status--PC Question 4

Codes: 1 - White (non-minority)
        2 - Black, Hispanic, American Indian or other (minority)

Column 2: Economic disadvantaged

Codes: 1 - Economically disadvantaged
        PC Q 5 and 6: 1 member household
                        annual income $5,000 or below
                        or  Multiple member household
                        annual income $10,000 or below
                        or  PC Q 1: Response of "yes" receiving financial aid

2 - Not economically disadvantaged
   Where responses are not indicated as above

Column 3: Educational disadvantaged

Codes: 1 - Educationally disadvantaged
        PC Q 1: on academic probation
                enrolled in IMTS
        or  EB Q 4: High School GPA of 1.5
        or  EB Q 8: Present grade average (GPA) 2 or below (or equivalent)

2 - Not educationally disadvantaged
   Where responses are not indicated as above
Column 4: Sex
Code from ID Cards
Codes: 1 - Female
2 - Male

2. CODING VOCATIONAL PROGRAMS

List all vocational programs noted on the Questionnaires, then assign numbers to the list of unduplicated programs. One unduplicated list should result. Check the following questions for program designations.

PGC Q 1
PCC Q 7

3. CODING OCCUPATIONS

List all occupations noted on the questionnaires, then assign numbers to the list of unduplicated occupations. One unduplicated list should result. Check the following questions for occupational designations.

PVOC Q 4  PVOC Q 19  PVOC Q 29
PVOC Q 6  PVOC Q 20
PVOC Q 8  PVOC Q 22
PVOC Q 9  PVOC Q 23
PVOC Q 12 PVOC Q 25

4. CODING RELATIONSHIPS

List all relationships noted on the Questionnaires, then assign numbers to the listing of unduplicated notation of relationships. One unduplicated list should result. Check the following questions for relationship designations.

PVOC Q 23
PVOC Q 25
PVOC Q 26
PVOC Q 27
PVOC Q 29

5. Coding responses to open-ended questions (i.e., "other" categories to specific questions). Look at each question where "other" is an alternative response. For each question where students responded in this category (volunteers written information) copy the statements indicated. Develop an unduplicated list of responses for each such question. Assign a numerical code to these responses making sure that the numerical codes continue from the pre-designated set of responses. Place categories for each question on a separate page. Check the following questions for responses to open-ended questions.

PGC Q 4  EB Q 9  PVOC Q 1  PC Q 3
PGC Q 8  PVOC Q 15  PC Q 4
PGC Q 10 PVOC Q 16
           PVOC Q 17
           PVOC Q 18
Appendix 10

PERSONAL VOCATIONAL - OCCUPATIONAL CHARACTERISTICS

SPECIFICATION OF "OTHER" RESPONSES
BY RESPONSE CATEGORIES

Section of Questionnaire: PROGRAM CHARACTERISTICS

Question #4: Why did you enroll in this program?

Category a: Had always hoped to enter such a program.

Responses: Program electronically oriented.
What I've always wanted.
Enjoy this type of work.
Help in understanding art or landscaping and types of plants to use.
To learn about plants.
Wanted outside occupation with creative aspect.
Wanted skill that required skillful use of the hands.
Interested in alternative energy.
Program not available in previous geographic area.
To be qualified in interesting line of work.
Become interested in subject matter.
Program excellent followed from previous experience.
Previous work experience.
The only thing I know.

Category b: Had friends enrolled in the program.

Responses: No "other" responses.

Category c: Heard many good things about the program.

Responses: Got to learn teacher better and able to work better without switching classes every hour--able to work at own pace.

Category d: High salary potential after completion of program.

Responses: To ensure long-range employment.
Make more money. Good employment available.
Growing job outlook.
Job placement.
To get a better job.
To prepare for work.
Job opportunities numerous.
Good future in this area.
Couldn't find a well-paying job/B.A. in Social Science.
Wanted out of Social Science.
Need the good money and good education because I'm a single parent.
To improve education and widen range of job opportunities.
To be financially independent.
Secretarial skills an asset in any field.
Needed something to get a job quickly.
Job security.
Occupation always in demand.
To learn a skill that would save me money.
Category e: Convenient hours of work.
Responses: No "other" response.

Category f: Program offered at convenient time.
Responses: Conflict/work hours.

Category g: Program appeared to be an easy program.
Responses: Common sense area
To learn a skill without taking preliminary courses.

Category h: Program presented a challenge.
Responses: Program standard is high.
Program appeared interesting.
To contribute something special to world of electronics.
I like to think.

Category i: Program length was attractive.
Responses: Program isn't long.

Category j: Financial assistance was available.
Responses: MFT Scholarship.
CETA pays me as if I was working.
This program provided an income as well as an educational opportunity.
I made $40 a week for my babysitting.

Category k: Parental encouragement.
Responses: No "other" response.

Category l: Friend's encouragement.
Responses: Husband's encouragement and wanted skill to fall back on.
Many friends in the construction field.
Have a relative in the field and would be able to help him.

Category m: Counselors'/teachers' encouragement.
Responses: Coerced into it by counselor.

Category n: Leads to prestigious occupations.
Responses: No "other" response.

Category o: To get respect from others.
Responses: No "other" response.

Category p: Program was not costly.
Responses: No "other" response.
Category q: To become an important person.

Responses: No "other" response.

Category s: Need for retraining/upgrading.

Responses: Was hurt in previous job (drove tractor-trailer)
Retrain for job.
Rehabilitation.
Physical limitation required I change occupations.
Physical requirements.
Second trade, in case I fail in painting.
Got hurt on job and needed to pay bill and in a pinch.
Job certification.
Trained in this field and was laid off.
To become more effective employee.

Category t: Preferred program had no vacancies/was unavailable.

Responses: Only program opened (wanted auto mechanics)
Rather take welding.
Welding meant more.
Desired program not available.
Not VA-approved.
Didn't have enough credits from high school.
First choice full, and anticipated discrimination in sex in 2nd choice.
I was too young.
Not chosen for admission.
Had no choice.
A loser.

Category u: Personal growth.

Responses: To have a trade.
Support occupational skills.
Personal needs.
Broaden skills and observe teaching materials.
New field different from others.
Self-initiated.
Self-betterment.
Need some kind of specific training.
Gain more knowledge about the field.
Helps me with my drafting.
Waited 30 years--self-employment, self-satisfaction, desire to find my potential.
Self-fulfillment.
To become better educated.
To stay active in life.
This program provided an income as well as an educational opportunity.
Opportunity for learning was available without interfering with raising of family.
Program will bring out hidden talents that'll help in future career.
Lack of job skill.
Wanted to build up my own skill opportunity.
New developing field.
Wanted to receive remuneration according to my worth and not my sex.
Wanted to learn more in this area.
Preparation for more advanced program.
To turn a hobby into a business.
Therapy.

Category v: Hobby/personal project/personal interest.

Responses:
- Building a home.
- Ecology.
- Hobby.
- To sit on fire department.
- Self-employment.
- Fix my boat.
- To work away from home.
- To discover secrets and knowledge of the universe for survival.
- Seeking radio license.
- Enjoyment--to get a job at space center.
- Prove to myself that I could learn.
- Learn skill in heavy equipment to beautify my country.
- To graduate from high school.
- To decide if I wanted a medical career; if it isn't so, what career.

Category w: Training required.

Responses:
- Part of job training.
- Job required it.

Category x: Dissatisfaction with previous program/work, etc.

Responses:
- Teacher thinks he's the Lord.
- Too many high school students enrolled.
- Dangerous, "grody" position.
- Boredom.
- Tired of retail.
APPENDIX 12

SPECIFICATION OF "OTHER" RESPONSES
BY RESPONSE CATEGORIES

Section of Questionnaire: PROGRAM CHARACTERISTICS

Question #8: Why did you not enroll in this program?

Category a: Program was too expensive.
Responses: Couldn't afford tools for the class (auto mechanic)

Category b: I did not have the ability.
Responses: Enrolled before, but didn't complete it.
New math presented problem.
Wasn't mentally ready (bookkeeping)
Not sure I would do it at my age (48) (data processing).
Inconvenient and lack confidence in ability.

Category c: Program was too long.
Responses: Had too much time in this program.
Needed less hours to graduate for drafting, then needed to go into
Started too late in life: need job quickly.
Needed a college degree to work.
Location and money -- needed to work earlier.
Didn't want to sit in classroom for six hours.
No time.

Category d: Program was too short.
Responses: No "other" response.

Category e: Had no friends in the program.
Responses: No "other" responses.

Category f: Program required too much work.
Responses: Too many lab reports.

Category g: Heard bad things about program.
Responses: Too dirty and too easy.
Poor teachers in that area.

Category h: Salary after graduation not attractive.
No jobs.
Better opportunity to run my own business.
Thought I would learn more in present program.
Better opportunity in the area.
Market saturated/artists.
This program offers more--I will pay off debts.
More jobs in other fields.
Not much motive in this occupation.
More money in other field.
It gets cold outside (carpentry).
First choice had better hours and benefits upon graduation.
Not considered an employable skill.
Pay and prestige not acceptable for amount of work and abuse.
Not feasible to leave present employment.

Category i: Lack of transportation.
Responses: Bad school bus.

Category j: Could not meet entrance requirements.
Responses: Math scores too low.
Lacked qualifications.
Didn't have prerequisites.
Didn't offer it to high school in attendance.

Category k: Other. Please specify:
Responses: No "other" response.

Category l: Retraining/upgrading.
Responses: No "other" response.

Category m: Dissatisfaction with programs.
Responses: Didn't get along/teacher.

Category n: Barriers to program entry.
Responses: Only course open.
Course closed.
Not offered at this school.
Program started too late.
Program acceptance only twice a year.
Unable to enter first choice.
CETA wouldn't let me.
Not physically able.
Program started later in the year.
Didn't think I can stand to see blood and open wounds.
Enrolled too late to complete this year.
No financial aid.
General office all CETA had.
No place to live while taking course.
VA won't let you change course.
Nontraditional job for women.
Didn't understand English (Hispanic-nursing)
Course had already started.
Problem/language.
Category o: Program not challenging.

Responses:
- Coerced into drafting by counselor.
- Wasn't challenging enough.
- Other areas more challenging.
- Theoretical rather than practical interest.
- Not interesting enough.
- Not physical enough.
- Too boring and repetitive.

Category p: Lacked interest in the program.

Response:
- Not interesting enough.
- Didn't like the courses.
- Lost interest.

Category q: Preferred current program.

Responses:
- Higher interest in this area.
- Thought I would learn more in present program.
- Wanted to go ahead with auto body repair first.
- If things go okay, I will.
- I found out the program I'm in.
- I like this area better.
- I found out about the program I'm in.
- Second choice.
- More suited for future in business.
- Surgical technician more appealing.
- Not able to complete both programs.
- Chose data instead.
- Other program geared toward future.
- Data processing had same curriculum.
- Wanted out of social science field.
- Changed my mind.
- Wanted basic knowledge of all office machines before higher administrative programs.
- Wanted to devote all time to carpentry.
- Didn't like job.
- Already enrolled in law enforcement area.

Category r: Lack of self-confidence.

Responses:
- I was afraid.

Category s: Advised to choose alternative.

Responses:
- Mom recommended other.
- Teacher encouraged otherwise.
- Instructor said my health was too bad.
- Husband didn't want me to enter police work.
- Parents withdrew me from program.
- Sheriff said I need more training.
Category t: Lacked knowledge for choosing/undecided.

Responses: Didn't know what to choose.
Decided on another.
Felt current program was more beneficial.
Not sure it was what I wanted to do.
Wanted to make sure dentistry was the field I'm interested in.
Didn't know CETA paid for it.
Wasn't sure I'd like it.
Program was in its last year.
Will go one-half through first choice to decide if I like second choice.
Didn't know anything about the area.
Didn't know this area existed.
It was a toss, and I lost.
SPECIFICATION OF "OTHER" RESPONSES
BY RESPONSE CATEGORIES

Section of Questionnaire: PERSONAL VOCATIONAL-OCCUPATIONAL CHARACTERISTICS

Question #1: What will you do after completing your program?

Category a: Seek employment/already working.

Responses: Self-employment.  
Auto mechanic.  
Try to work up to large commercial company.  
Continue working.  
Continue my business.  
Start own business.  
Branch of service--Army, Navy, Marines.  
Continue/solar.  
Already working.  
Join Navy.  
Self-employment in this area.  
Work at home.  
Moving to it.  
Move.  
Would like to continue school, but can't afford it.  
Get contractor's license.  
Have full responsibility. 

Category b: Pursue further education.

Responses: Take another class.  
Army for further education.  
Maybe pursue further education.  
Personal knowledge. 

Category c: Take a break from school and work.

Responses: Marry.  
Vacation.  
Have a baby.  
Housewife/mother and later work.  
Travel. 

Category d: Work while pursuing further education.

Responses: Work and pursue further education.  
Try for A & B. 

Category e: Uncertain.

Responses: Not sure.  
Don't know.
Category f: Already retired/retire.

Responses: Already retired.
            Part-time, semi-retirement.

Category g: Engage in personal project.

Responses: To build a home.
            Complete personal projects.
            Build a home.
            Hobby.
SPECIFICATION OF "OTHER" RESPONSES
BY RESPONSE CATEGORIES

Section of Questionnaire: PERSONAL VOCATIONAL-OCCUPATIONAL CHARACTERISTICS

Question #18: What characteristics do you think are necessary to be successful in the occupation of your choice?

Category a: Ability to deal with people.
Responses: Getting along.
           Pleasant personality.
           Attitude.
           Motivation, maturity, manners (also in "k" category).
           Always wanted to do something that was helping people.
           Timing of ideas and preparation of acceptance.
           Good contacts.
           Tactful.
           Diplomacy.
           Smile and be forgiving.

Category b: Ability to manipulate data.
Responses: No "other" response.

Category c: Ability to manage stress.
Responses: Experience.
           Be crazy to put out excellent food on busy nights (also in "g" category).
           Pressure.

Category d: Ability to solve problems.
Responses: No "other" response.

Category e: Assertiveness (ability to state opinions openly).
Responses: No "other" response.

Category f: Manual dexterity (ability to use your hands).
Responses: Five arms (surgical technician).

Category g: Ability to remain on task with distractions in environment.
Responses: Be crazy to put out excellent food on busy nights (also in "c" category).

Category h: Technical knowledge/intelligence.
Responses: Knowing electronics knowledge.
           Concentration and intelligence (also in "j" category).
           Talent, productivity, output.
           Good work, so people will advertise for me.
Ability to learn.
Application of knowledge.
Ability to get the job done.
High IQ.
Ability to deal with blood.
Time to complete design on time.
High math skill.
Common sense.
Talent.
Being able to work.
Increasing speed.
Accuracy.

Category i: Creativity.
Responses: Creativity for hairstyling.
Controlled creativity.

Category j: Ability to concentrate/persistence.
Responses: Concentration and intelligence (also in "h" category).
Listen to instructions.
Persistence.

Category k: Self-initiative.
Responses: Ability to set and achieve personal goals.
Strong ambition and determination.
Desire to succeed.
Motivation, maturity, manners (also in "a" category).

Category l: Experience.
Responses: No "other" response.

Category m: Commitment.
Responses: Love of work.
Willingness to work.

Category n: Self-confidence.
Responses: Desire and confidence in oneself.

Category o: Personal integrity.
Responses: Reliable and trustworthy.
Honesty and dependability.
Responsible and on time.

Category p: Keeping abreast of knowledge.
Responses: Continuing education.

Category q: Patience.
Responses: Patience.
Category r: Ability to work alone.
Responses: Ability to work well alone.

Category s: Organizing skills.
Responses: Organization in units.

Category t: Communication skills.
Responses: Good English.

Category u: Leadership traits.
Response: Leadership traits.

Category v: Physical endurance.
Responses: Physical endurance.
Wear all hats on the street.

Category w: Ability to follow instructions.
Responses: Listen to orders and do work.
SPECIFICATION OF "OTHER" RESPONSES BY RESPONSE CATEGORIES

Section of Questionnaire: EDUCATIONAL BACKGROUND

Question #9: From whom did you receive advice about your occupational/educational plans while in high school?

Question #26: From whom did you receive the most encouragement in pursuing your chosen occupation?

Question #27: Have you received any discouragement from any of the following people?
