A two-part study intended to investigate what constitutes successful teacher response to student writing is described in this report. The described study consisted of a survey of response practices of 560 elementary and secondary school teachers who were among the most successful in their communities as judged by directors of the sites of the National Writing Projects, and an examination of the day-to-day response practices of two successful ninth grade writing teachers in the San Francisco area. The report is divided into chapters that discuss the following topics: (1) survey design and procedures for conducting the survey and the ethnography; (2) survey results for the successful teachers and for their students at the secondary level; (3) results from observations in the two ninth grade classrooms; (4) the values that underlie the response process; (5) an analysis of the structure of the response that involves the entire class; (6) an examination of the written response, focusing on two students in each class and how they make sense of the written responses they receive; and (7) the study's conclusions. The report includes a separate volume of appendices containing, among other things, the student survey of the National Writing Project, the survey of Excellence in Teaching of the National Writing Project, a list of state projects that participate in the National Writing Project, samples of student writing and teacher response, and the teaching philosophies of the two participating ninth grade teachers. Acknowledgments

So many people beyond those named as authors and participants in this report contributed to this study that it is difficult to know where to begin the "thank you's." Without the Writing Project's full, even enthusiastic, participation, this study could never have been completed. Special thanks also go to James Gray, who gave 100% of his support, both intellectual and practical. Writing Project teachers, staff, directors, from all over the country, but especially in the Bay Area, all helped. We depended on Writing Project participants at every phase, from participating as a subject in the study—filling out questionnaires, testing questionnaires, opening up classrooms for observations; to giving technical advice about survey design and providing insights about the teaching of writing.

Special thanks go to Miles Myers, who helped conceptualize the project itself, and who, throughout, gave as much of his time as he could to the project.

Our consultants, Bob Calfee, Jenny Cook-Gumperz, and John Gumperz, all gave many hours beyond what they were paid. Their advice was invaluable. Selma Monsky of Berkeley's Survey Research Center also spent a number of hours with us, giving insights about the design of the survey.

Both Larry Lynch, Principal at Gunn, and Arthur Fibush, Principal at Lowell, facilitated our work in every way possible, from arranging for equipment storage to assisting with the installation of microphones, to writing special letters to the students' parents to explain the research and gain their support.
Finally, we thank Art Peterson and Mary Lee Glass, the teachers who so generously agreed to place themselves under our camera's eye, and their ninth grade students, who not only put up with us day to day but who also came in voluntarily for interviews during their summer vacations, not one missing an appointment. To them we owe the greatest debt. We only hope that we have communicated here the essence of what we learned from them so that our readers can experience some of what we experienced in our months in the ninth grade.

Finally, as Project Director, I would like to thank the research team. They are credited here as co-authors and chapter authors; however, even those credits do not express the full nature of their participation. Throughout, we worked as a team; at this point, although we divided the writing, it is often impossible to untangle whose ideas are whose. There's a bit of each of us in every piece of this project. It was truly a collaborative effort.

Sarah Warshauer Freedman
Berkeley, 1985
Executive Summary

Teachers of writing spend much of their time writing comments and grading their students' writing. Writing comments has been found to be both time-consuming and relatively ineffective. The question behind this study was: what constitutes successful response to student writing?

The first part of the study involved a survey of the response practices of 560 teachers who were among the most successful in their communities, as judged by directors of the sites of the National Writing Projects. The teachers came from all regions of the United States as well as a small percentage from other countries, and taught kindergarten through twelfth grade. In addition, 715 students in the classes of half of the secondary teachers (grades seven through twelve) completed surveys. The students told about their teachers' teaching practices and their own learning.

The second part of the study involved a close look at the day-to-day response practices of two successful ninth grade writing teachers in the San Francisco area: Mary Lee Glass of Gunn High School in Palo Alto and Arthur Peterson of Lowell High School in San Francisco.

Results

Successful response requires that students write a lot and have the opportunity to receive a lot of response. The surveys revealed that the students of these teachers wrote significantly more frequently and wrote longer pieces than the students of previously surveyed teachers (Applebee, 1981). The teachers in
the observational study spent weeks on a single assignment, providing for plentiful response of varying types (peer groups, conferences, whole-class discussions, written comments). Students benefited most when the response was redundant, explicit, and came from both the teacher and their peers. Both teachers coordinated their assignments over a period of months so that one piece of writing built toward the next. They also coordinated their response across time, with response on one piece leading to the next.

The next major finding is that underlying successful response is a goal of teaching students to think for themselves. The teachers, both in the survey and in the observational study, show that this primary goal guides their response practices and their teaching. The teachers in the observational study focused on teaching students to think deeply about what they were writing. They did not define teaching the writing process merely as teaching a set of procedures involving planning, writing, and revising but instead as teaching cognitive activities necessary to writing well. They stress the development of these cognitive activities through their response.

The third finding is that successful teachers agree that the most successful response occurs during the writing process; however, response during the process appears to be the most difficult to accomplish. The difficulties with in-process response surfaced in the survey when the teachers disagreed with one another about the effectiveness of all methods, other than individual conferences, for providing response during the writing.
process. Some found peer response groups successful; others did not. Some found written comments during the process successful; others did not. Some found helping students respond to themselves during the process successful; others did not.

Differences between the teachers in the observational study shed some light on the disagreement. Although both Ms. Glass and Mr. Peterson provided response during the writing process and stressed cognitive activities, they took their students on different routes to reach their similar goals. We have labeled Ms. Glass's route the "guided discovery approach" and Mr. Peterson's the "master-apprentice approach." Ms. Glass relied on teaching her students to label their activities, to become consciously aware of them. Mr. Peterson soaked his students in activities that would help them "intuit" what good writing is, that would help them feel it in their "gut."

To achieve her end, Ms. Glass worked to help her students become independent. They practiced responding to one another. To achieve his end, Mr. Peterson collaborated with his students on their writing. The students practiced writing and acting on response which Mr. Peterson gave.

Both approaches seemed equally successful. We do not know whether one or the other takes better. Teaching the writing process is widely advocated by the profession, but exactly what teaching the process means is ill-defined and has different meanings for different teachers. The differences we observed between Ms. Glass and Mr. Peterson point toward what we think is an unresolved debate in the profession: what level of conscious knowledge is necessary for learning to write?
To further complicate the picture, the secondary students reported in their surveys that the standard technique—written comments on final versions—was the most helpful to them. Their teachers found the standard method—teacher comments on final versions—relatively ineffective. The teachers in the observational study rarely provided response to final versions. Mr. Peterson, in particular, minimized the use of this type of response.

Student talk during the observational study focused the picture the students gave in the surveys. For many of the ninth grade students we watched, grades loomed larger than what they learned. These students seemed to be caught in an institutional bind; grades (the school's and society's measure of learning) and the response that accompanies grades (and often justifies) them was confused with and became more important than the feedback that was more important to helping them learn. The students were interested in the product of learning more than the learning process. This student focus created obstacles to the success of response during the writing process. Further, even when these highly successful teachers wrote comments, their students, for the most part, understood relatively little of what they wrote.

The last main finding is that the most successful response comes in the form of individual conferences during the writing process. The teachers in the survey stressed the importance of providing individualized instruction to writers during their writing process. Although they reported that the individual, teacher-led conference was the ideal method for providing
response, they had difficulty managing to provide individual conferences as frequently as they would like. Even the students placed individual conferences second after written comments on their final papers. Large class sizes and brief class periods at the secondary level make providing conferences especially difficult. In the observational study, Mr. Peterson arranged his class so that he could provide individual conferences to his students. The conferences were brief, generally supplemented written comments, and were often focused toward helping students apply a point made in class to their individual piece of in-progress writing.

The teachers in the survey and in the observational study had a clear sense of what they were teaching and why. However, there was little evidence that they felt that they could depend on their students coming into their classes with already learned skills in writing, beyond the most mechanical; and there was little evidence that they felt the students would build on what they were learning in future classes, in any specific ways. Both teachers were involved in curriculum reforms at their schools, but during our observations, we saw little evidence that they depended on the curriculum outside of their class. The students, too, seemed to feel that they had to adjust to each teacher individually.

Although we have learned a great deal about successful response, our concern is that successful teachers cannot continue to work in isolation if we want to see lasting changes and substantial improvement across time in student writing. These teachers are doing their share, but as a profession, we must
learn from them to develop ways for writing teachers to coordinate their efforts.
Over the past decade, there has been a renewed interest in writing instruction and research—from an emphasis on basic skills to the teaching of higher order cognitive skills to writing across the curriculum. Whatever the particular emphasis, as a nation, we expect children to learn to write in school. And many believe that an individual's success in a literate society is, at least in part, related to that individual's degree of literacy.

At the core of the teaching and learning of written language is a cycle of writing, receiving response, and writing again, taking the response into account. Pivotal to the cycle is the act of response. When students learn to write in school, response takes forms as varied as formal, written comments from the teacher (often in red ink) to casual remarks from classmates. Although response is critical to the teaching-learning process, we know little about the range of response practices, about what makes one kind of response more successful than another, about why teachers respond as they do, about how students are affected by the response that they receive.

There is evidence that in many school settings response does as much harm as good (e.g., Brannon & Knoblauch, 1982; Sommers, 1982). Most teachers have at least overheard the following typical student complaint about writing instruction: "But I used lots of details in this paper because Mrs. Smith told me that was a good thing, and now Mr. Jones tells me I have too many details." Students develop a folk theory about response; they
believe that the content of the response is dictated solely by the responder's taste. They are frustrated by what they perceive as a gross lack of consistency in "tastes" and the mixed messages they receive about their writing. They give up trying to learn to write, and often in frustration adopt a strategy of learning to please a particular teacher at a given time and then consciously, upon encountering the next teacher, try to forget everything they "learned" so that they can start anew, to meet the next teacher's taste. Teachers too express the same complaints, a feeling of having to "start over" with each new class, a feeling of lack of continuity in writing instruction.

Besides the feeling that response is inconsistent, writers are particularly sensitive about the feedback they receive because they often have so much personal, emotional investment in their writing. "Criticize my writing and you criticize me as a person." To protect themselves, if the response environment feels unsafe, students may refuse to invest themselves in their writing, and therefore will be unable to communicate effectively. Or they may shield themselves by not "attending" to the response, by shutting it out rather than learning from it.

A further problem with response is that it is often given in conjunction with grades and has been found to function more to justify the grade than to teach the student (Sommers, 1982). Teacher-responders take multiple roles (Purves, 1984), with the institutional role of the evaluator frequently making it difficult also to assume other reader roles (Applebee, 1984).

Given that response is theoretically central to learning to write, and that school-type responses often prove confusing and
discouraging to student writers, we need to understand more about how to make the response process constructive rather than neutral, or at worst, destructive. Such understandings could potentially lead to fundamental improvements in how writing is taught.

Although the picture is bleak in most school settings, we thought that it would be helpful, as a first step in trying to alleviate both teachers' and students' common frustrations about response, to examine how the most successful teachers of writing handle this most difficult and important area of teaching. From the start, we realized that even the best of teachers would not hold the key to all knowledge about how best to respond to student writing, but as a group, they would be able to tell us what they do and do not know about how best to arrange for students to receive response. In addition, we thought that their students might be able to tell us something about what types of response they do and do not find helpful to learning. Further, since the response that works "best" could vary from situation to situation—one age level to the next, the teaching of one kind of writing versus another, the teaching of one kind of student population versus another—we wanted to be able to account for such variation.

To learn about response, we designed a research project to seek answers to the following questions: Under the best instructional conditions, what is the range of responses students receive in school? What characterizes response that students and teachers feel is most helpful? What values about "good" writing
are being transmitted during response (what is the basis of the substance of the response)? How are different types of response coordinated to one another during the teaching-learning process? And how does variation in age of student, type of writing, type of student, affect the answers to all of the above questions?

To begin to answer these questions, we took two tacks: first a large-scale survey of the response practices of "successful" writing teachers and second a detailed study of how response is accomplished in the classrooms of two such teachers. The survey was designed to provide information from a large number of teachers and to help us focus our observations whereas the ethnography was designed to provide details about the workings of response that could not be obtained in the self-report form of the survey.

Theoretical Rationale for Importance of Response in the Teaching-Learning Process

It is first important to understand theoretically how response can function productively in the teaching-learning process. According to cognitive and linguistic developmental theory, learning theory, and studies of classroom response to writing, response is critical both to the learning of intellectual skills in school and to the acquisition of oral language. Acquiring skill in writing is uniquely both an intellectual accomplishment gained primarily in school and a linguistic accomplishment which is part of the more general acquisition of language. Thus, response must underlie the learning of written language.

Those who study intellectual skills learned in school see
response occurring mainly when the "teacher" gives direct and often value-laden, metalinguistic comments to the "learner" about his or her language and language production processes. Such direct response would include remarks like, "that's a good example" or "you ought to reread what you have written out-loud so that you will catch more of your grammar errors." General theories about how intellectual skills, presumably including writing, are learned in school (e.g., Anderson, 1982; Gagne, 1974) explain why this type of feedback is necessary for learning. Through feedback, learners come to distinguish for themselves when they are performing well from when they are not. Further, feedback helps them figure out how to take corrective action when they are not performing well. Theoretically, feedback operates in this way across intellectual domains, from the learning of mathematical problem-solving to the learning of writing. In a related vein, many who study reading (e.g., Brown, 1981; Flavell, 1981; Langer, in press) and writing (e.g., Bereiter & Scardamalia, 1982, in press; Flower, 1981; Langer, in press) advocate teaching learners of written language to become aware of their cognitive processes--to develop metacognitive skills for self-conscious monitoring of their process.

In the natural learning of oral language and in some language learning situations in school, response is also seen as something that can be quite indirect. Many linguists observe response in naturally occurring dialogic conversations. During these oral dialogues, the "teacher," whose qualification to teach
is simply expertise as a language user, indirectly and often unconsciously teaches language to a "learner," who, in turn, often is not self-consciously learning. The teaching dialogues have come to be called scaffolding dialogues. They do not necessarily contain value judgments but rather function to support learners in reaching beyond what they could do alone as the learner is gradually led to more expert production. Vygotsky (1978) notes, "what children can do with the assistance of others might be in some sense even more indicative of their mental development than what they can do alone" (p. 85). He goes on to assert, "learning awakens a variety of internal developmental processes that are able to operate only when the child is interacting with people in his environment and in cooperation with his peers. Once these processes are internalized, they become part of the child's independent developmental achievement" (p. 90). Scaffolding dialogues have been found to be typical of caretaker-child interactions (e.g., Ninio & Bruner, 1978; Wertsch, 1979) and certain classroom teaching-learning events (e.g., Applebee & Langer, 1983).

Clark and Clark (1977), in their review of research on how children acquire oral language, emphasize the importance of response in their model of language learning. Although they do not discuss the nature of the response, they imply that it is indirect in form, and may have a stronger evaluative effect than the scaffolding dialogue just described. They point out that children learn to talk by testing hypotheses and claim that children "use what people say to form hypotheses about how different ideas are expressed in the language they are
acquiring... Systematic 'errors' like mans or mouses provide some of the strongest evidence that children learn language, at least in large part, by testing their hypotheses about structure and function and by finding out how well they are understood by others when doing this" (pp. 336-337). As children test how well they are understood, they seem to look for the response of a listener—a communication from the language teacher to the language learner concerning the language learner's output; then by internalizing the feedback, they come to evaluate themselves. The children are not necessarily aware that they are testing hypotheses and generally cannot articulate the rules they formulate.

Another specialist in child development and language acquisition, Karmiloff-Smith (1979), argues for the central place of response from the point of view of a slightly different model of language learning. She counters the hypothesis-testing model as she stresses the importance of the learner's observing models of the language of others and comparing his or her own language to an internalized standard. In her view, response does not necessarily come from a human teacher per se. She presents evidence that children create rules for language production, not by testing hypotheses, but by identifying "the most consistent input pattern" (p. 237). In other words, instead of testing several hypotheses and choosing among the best, the language learner recognizes examples of consistent patterns and then seeks to conserve them. Overgeneralizing rules, as in the "mouses" example, is one way of conserving mental space; the child
simultaneously simplifies and unifies the language system. Language development, according to Karmiloff-Smith, is marked by an interplay between procedures looking both at linguistic input and at the child's own multifaceted approaches to the input. For writing, the input would include written texts that form models, teachers' direct and indirect responses, and knowledge of oral language.

None of these theories discussed so far has been developed specifically to account for the acquisition of written language, that curious blend of both language and intellectual skill. Those who study writing, however, often stress the importance of response or feedback to learning. For the most part, studies that focus specifically on the acquisition of writing skill emphasize the special role in the production of written language played by the writer's "sense" of a reader. Certainly response is embedded in the intersection between writer and reader. Gumperz, Kaltman, & O'Connor (1984), in contrasting writing with speech, note that natural feedback is exactly what is missing in writing, what differentiates writing from speaking:

The writer must carry out the communicative task without benefit of moment-to-moment feedback as to whether the listener is following the argument, understanding the point in general and various items in particular (although the writer does have the advantage of being able to look back at previously written material) (p. 3).

One wonders whether teachers, in giving response, provide substitutes for the missing on-line feedback so readily available to speakers. During the learning process, it seems that, as
Children first learn to write, they have difficulty imagining an absent reader (Cook-Gumperz & Gumperz, 1981) and thus depend on support provided by a present, responding reader. This support or response could take the form of the scaffolding dialogue suggested by Applebee and Langer (1983), Graves (1983), Vygotsky (1978), and Wertsch (1979), to the more direct forms of feedback suggested by Bereiter and Scardamalia (1982; in press) and Flower (1981). As the sense of audience develops, the imagined reader helps the writer gauge the appropriate way to communicate (Flower, 1979; Kroll, 1978). Throughout the process of learning to write, a real, responding reader seems to play a central pedagogical role. But little is known about the specific nature of that role. Further complicating the picture for writing is the fact that little is known about how writers use their experience with oral language and how they use the models that they form based on reading the works of other writers to help them predict what will please their own readers.

In spite of different views of how response might best be used in the teaching-learning process, all agree that response must be integral to that process. Response, however it is packaged, should function to allow language learners to solidify an understanding of how language works.

Overview

Given this background, we will turn to our investigation of the range of response; the characteristics of helpful response; the values about "good" writing that form the base for response;
the coordination of response during teaching and learning; and the effects of variation in student age, writing type, and student type. In Chapter II, we present the design and procedures for conducting the survey and the ethnography. In Chapter III, we present the survey results, for both the successful teachers and for their students at the secondary level. The last four chapters present results from our observations in the two ninth grade classrooms. In Chapter IV, we account for the response activities in each class during one focal assignment which gave the most complete picture which we observed of the response activities in the classrooms. In Chapter V, we discuss the values that underlie the response process, as communicated by the teachers and by their students. In essence, we examine what stands to be learned about what we call "Ideal Text" and "Ideal Process." In the sixth chapter, we present an analysis of the structure of response which involves the entire class. We turn from an analysis of the structure of classroom talk to an examination of how through talk, the class and teacher engage in collaborative problem-solving. This look at classroom discourse allows us to account for the pedagogical agenda. In Chapter VII, we turn to look at written response, focusing on two students in each class and how they make sense of the written responses they receive. Additionally, in this chapter, we examine how written response does and does not connect to other oral classroom response episodes. Finally, Chapter VIII presents a summary and conclusion.
CHAPTER II- Design

Overview of the Study

In this study of response to student writing, we shall examine how successful practitioners distribute response in their classrooms. We have chosen to conduct a large scale survey of a broad spectrum of teachers, teaching in different types of schools, to students of different types and ages. In addition, we have chosen to survey their students to assess their opinions about the response they receive to their writing.

Since surveys can only give a broad and general view of classroom practice, a view which is filtered through the accounts of the participants and which cannot capture the processes of teaching and learning, we have elected to supplement the surveys with an in-depth study of response in two ninth grade classrooms. We selected ninth grade for our narrowed focus because it is a transition time when students are often introduced to the more abstract and complex forms of academic writing. We hypothesized that response would be crucial in helping ninth-grade students with the transition to writing which relies on higher order thinking skills. Although we do not address directly the question of how students make the transition, we felt that we would have a good opportunity to find plentiful response, as the teachers tried to cope with the transition. Thus, we selected teachers who had outstanding reputations as teachers of writing, and whom we could observe introducing complex forms of academic writing to ninth graders.

A central aim of this study is to understand better the significance of different types of response that can lead to the
acquisition of skill in writing. A second aim is to define more precisely the concept of response, in the hopes of enriching the traditional views and definitions. A third aim is to understand how successful teachers accomplish response, to learn what they do and don't know about response to student writing. A final aim is to understand the role response plays at a time when students are likely to depend on it most, when they are at a transition point in learning to write. We focused our research questions for the survey and the observational part of the study to help us achieve these aims.

Through the survey, we seek answers to the following:

1. Do successful teachers have consistent views about what types of response are more and less helpful to student learners? Are some teaching practices considered more successful than others for providing for response? What response practices do successful teachers agree are helpful? Which ones do they disagree about?
2. What underlies the response process of successful teachers; that is, what are their reasons for teaching writing?
3. Do the teachers' opinions about response vary depending on personal or demographic characteristics, the age of their students, the type of writing they are teaching?
4. At the secondary level, how do the students' opinions compare with their teachers'?

Through the study in the two ninth grade classes, we look for answers to the following:

1. What types of response are set up by successful ninth grade
teachers of academic writing? Are there types of response beyond the usual categories of peer response groups, conferences, written comments and the like? What is the definition of response; when does it stop and start in the classroom?

2. How do different types of response function in the teaching and learning process? How do they function with respect to the rest of the teaching in the classroom? Are some types more successful than others—generally, for certain types of students, for performing certain types of functions? For encouraging students to use the response and transfer what they are learning to future writing?

3. What response practices do successful teachers share and which ones don't they share?

4. How do students understand the response they receive?

**Surveys of Excellence in Teaching**

**Procedures for Selecting the Sample**

To learn about the response practices of a wide range of successful teachers, we turned to the National Writing Project (NWP) Network to obtain a sample for the survey. The NWP has been a leader in dealing productively with the issues of the teaching and learning of writing. For the past ten years, the NWP has been identifying the "best" teachers of writing in the country and arranging for these teachers to share with others what works in their classrooms.

At the time of the survey, the National Writing Project consisted of 116 affiliated sites, located in 43 states and the...
District of Columbia, three foreign countries (England, Canada, and Australia), and segments of the Department of Defense School System and the private American schools in the Far East. Appendix 1 contains a list of the sites.

Each site is located at a university and is organized by a site director who is a member of the faculty of the university. The site director applies to the National Writing Project for affiliation privileges and start-up funds. If the site is approved, it receives help with the initial organization of the Project. James Gray, in a recent note about the Writing Project, describes how each site functions:

The site directors identify successful teachers of writing in their geographical areas from all levels of instruction. They invite these master teachers to come together on university campuses for intensive five-week-long Summer Institutes focusing on three closely interrelated activities: demonstration by teachers of their most successful classroom practices, study of current theory and research in the teaching of composition, and practice in writing in a variety of forms--personal, literary, persuasive, and expository. The aims of the institute are simple: to provide teachers a setting in which they can share classroom successes, to help them broaden and make more conscious the grounds of their teaching, to give teachers of writing an opportunity to commit themselves intensely and reflectively to the process of writing, and finally to identify and train a corps of writing teachers who can effectively teach the techniques and processes of teaching writing to other teachers.

The success of any Writing Project site depends on the
director's ability to identifying outstanding local teachers. The directors then work closely with these teachers. Thus, a Writing Project site director is in an excellent position to identify outstanding teachers, and so we relied on the directors to help select the national sample.

It is important to note that (although it is perhaps a reflection on the inconsistency of the field of literacy development as well as the relatively new research interests in written literacy as a pedagogical issue) although a certain folk wisdom about how to teach writing permeates the work of the Project, the wisdom remains, essentially, unspecified. What is not explicit, let alone known, is what Writing Project teachers, as a group, know and agree about, what as a group, they actually do in their classrooms, and how their collective knowledge can inform the teaching of writing more broadly. These teachers seem to be responding successfully and constructively as individuals to the problem of teaching writing. Studying their knowledge and their approach to teaching seems a worthwhile endeavor. Although they are expert and quite possibly among the ranks of those other talented teachers that have made their marks on generations of school children (see Ruddell, 1983), they cannot have the wider impact they might if they were to help inform a greater community of writing teachers and with them form an integrated group. This is not to argue that successful practice and knowledge about successful practice are sufficient to understand the nature of effective teaching or effective response to student writing, but they provide an important resource, and
one that we will begin here to take advantage of.

To gather the survey sample, we first sent every director of a National Writing Project site a letter (Appendix 2) asking for the names of six of the most expert teachers of writing in his or her region, two at the elementary level (K-6), two at the junior high level (7-9), and two at the senior high level (9-12). Ninth grade overlaps the junior and senior high sample because of the variable organization of American schools, with ninth grade frequently part of either junior/middle school or senior high school. Each teacher received a personal letter, explaining the purpose of the research and how he or she was nominated (Appendix 2).

The teachers themselves were the best source for gathering the student sample. To select a representative sample of students, we randomly selected two teachers from each site, one at the junior high level and one at the senior high level and asked each of these teachers to select four students in a class in which writing was taught (the letters to survey participants who received student surveys and the attached form in Appendix 2 contain more specific directions to the teachers for selecting students). The teachers were to select two males and two females and within each category, one high achieving and one low achieving student.

Special precautions were taken to insure that all responses on the surveys would be confidential. All forms were returned directly to the research staff in self-addressed, stamped envelopes. Respondents did not place their names on the forms. To avoid difficulties with return rates on the student surveys,
we had the teachers take care of mailing them; however, each student received his or her survey in a manilla envelope. Before returning the completed survey to the teacher for mailing, the student was asked to replace the survey in the manilla envelope and to seal the envelope. The teacher then placed the sealed envelopes from the students, along with his or her own survey in the envelope addressed to the research staff and returned all surveys. This procedure seemed to insure the students' privacy; at least, all student surveys were returned in their sealed envelopes.

Site directors received copies of all the materials sent to the teachers so that they could answer questions posed by teachers from their sites. They were instructed to call a member of the research staff if they had questions. Site directors were also responsible for seeing that the surveys were returned in a timely fashion.

**Development of the Materials**

Survey development took approximately six months. It involved an extensive process of deciding on the information wanted, formulating questions clearly in order to get that information, achieving a professional yet informal and informative tone and format, and piloting drafts of the surveys. Early in the process, we realized that we would need different but parallel forms to address the different audiences of elementary and secondary teachers, who are in different teaching situations, and students, who have a different language from their teachers' for talking about the educational process.
The original versions of the surveys underwent multiple drafts before pretesting began. A number of experts in writing research or survey design offered suggestions on various early versions of the surveys. As the forms were being reviewed by experts and discussed by the project staff, they were being piloted informally with local teachers and students who not only completed the surveys but also let us know when they were having difficulty interpreting or answering an item. According to their responses, we revised items and then tested them on more teachers and students.

After we had what we thought was a reasonably good version of all of the surveys, we performed a more formal pilot study, giving the teacher forms to 17 teachers from kindergarten through 12th grade and the student forms to 54 students. Response from the larger group helped us eliminate items which provided too little spread of response or which remained ambiguous. As mentioned earlier, the process of questionnaire development took six months of steady work. The three versions of the questionnaires can be found in Appendix 3.

Teacher Forms. To obtain answers to our questions about how these teachers responded to their students' writing and how their students interpreted that response, and to connect the teachers' practices to certain personal characteristics and to characteristics of their teaching situation, we designed survey items on the following six topics:

1. the teachers' perceptions of the effectiveness of different practices in the teaching of writing, with a focus on response episodes (Sec. and E1. Q1-3);
2. characteristics of the teaching situation, such as the number of classes the teacher teaches, the number of students enrolled in the class, the ability level of the students (Sec. Q5-10);

3. the teachers' reasons for teaching writing—a question that parallels one on the Applebee (1981) survey of secondary teachers (Sec. Q11 and El. Q10);

4. the kinds and amounts of writing emphasized in the curriculum (Sec. Q12-15 and El. Q11-14);

5. the teaching strategies emphasized, for example small group discussion, prewriting activities (Sec. Q16-28 and El. Q15-27); and

6. demographic information about the school and personal information about the teacher (Sec. Q29-39 and El. Q28-38).

Student Forms. The surveys for secondary students (grades 7 through 12) were designed to parallel the secondary teachers' form, and items were designed to help us learn, from the students' point of view, how they are being taught to write and what kinds of teaching help them learn. The student questionnaire did not ask for demographic data about the school or classroom or for the students' sense of their teachers' reasons for teaching writing. Categories of questions in the student questionnaire are:

1. students' perceptions of the effectiveness of different practices in the teaching of writing, with a focus on response episodes (Q28-30);

2. the kinds and amounts of writing emphasized in the current
writing class (Q1-2,9-14);
3. the teaching strategies emphasized (Q16-27); and
4. personal information about the student (Q3-8).

Response Rates

We counted on the strength of the Writing Project Network to help insure a high response rate both in the nomination of teachers and in the return of teacher and student surveys. Many of the site directors could conveniently be contacted personally about nominations when they gathered together at Writing Project meetings held during the annual meeting of the National Council of Teachers of English in November of 1983 and at the Conference on College Composition and Communication in March of 1984. In addition, the National Writing Project's National Advisory Board, consisting of ten site directors who are leaders in their regions, meets at these same professional meetings. The members of the Advisory Board helped explain the nature of the research to site directors. These Advisory Board members also often meet with other site directors in their region who may not attend national meetings and often helped by contacting those directors personally.

Besides relying on the strength of the Network, we also followed a standard set of procedures to insure high return rates on mail surveys. If directors who were contacted by mail and asked for nominations of teachers did not respond within a week, they received a reminder letter and then were telephoned. See letters to site directors in Appendix A.

The site directors proved extraordinarily responsive to our requests for names of teacher-participants, with 90.5% providing
names (only 10 out of 116 site directors did not respond) (Table 2.1).

Of those responding, all but a few provided six names in the specified categories. Of the directors who did not participate, several were from fairly inactive sites; several were away from their home campuses and could not be reached; only two indicated to us that they chose not to participate. The directors' response rates were fairly consistent across the geographic regions, divided according to United States Census categories (Bureau of the Census, 1980) and by American and non-American foreign categories. Response was slightly lower from the Southern region (84%) and still lower from the foreign American schools, although the small number of foreign American sites makes that figure somewhat unreliable.

Surveys were mailed in early April, 1984. Approximately two weeks after the mailing, reminder postcards were sent directly to the teachers who had not returned their materials. Two weeks later site directors were telephoned and asked to remind those teachers who still had not returned the forms to do so. A second reminder postcard was sent to teachers whose materials were still outstanding. Follow-up telephone calls were made again to those site directors who had two or more teachers from their sites who still had not returned surveys. No telephone calls were made to international sites. By the end of June, about two and one half months from the time of the original mailing, we stopped.
accepting surveys.

Table 2.2 shows the return rate for teachers and students, broken down by geographic regions.

A few surveys were not coded for geographic region before they were mailed; hence, although they were returned, we do not know from which site they come. These surveys are included as "missing region," and are calculated as part of the total response rate. We have no reason to believe that these uncoded surveys went to any one particular geographic region; thus, the percentages of response from the different regions are likely accurate.

Considering the length of the survey and the especially complicated task for those teachers who also received student surveys, we were gratified by the 87% teacher and 87.2% student response rates. As we expected, the response rate for elementary teachers, none of whom received student surveys, was slightly higher than the response rate from the secondary teachers, many of whom had the more complicated task. The response rates were fairly evenly distributed geographically.

In his survey of secondary teachers, Applebee (1981) reports an overall return rate of 68%, with a higher rate of 75% from English teachers (p. 20). In general, 50% is considered an adequate return rate for mail surveys, 60% is considered good, and 70% or over is considered very good (Babbie, p. 165). Thus, our return of 87% is extraordinarily high.

We received letters and telephone calls from many of the...
teachers who did not participate. One felt that she was not yet an excellent teacher; another said that she had nothing to say other than that she encouraged her students to write. Others missed our deadline for various reasons—from the personal to the logistical. We also received letters and lengthy explanations about answers to questions from quite a few of the teachers who did participate. One teacher noted that she had framed the letter asking for her participation as an excellent teacher, it being the only official word of encouragement she had heard in years.

**Data Entry**

To prepare the survey data for entry into the computer, members of the research team proofread each returned survey to clarify ambiguous responses and to note instances of missing data. The guidelines we developed for editing the surveys can be found in Appendix 5. Data first were entered into the computer at the Survey Research Center at the University of California at Berkeley with a specially developed data entry program. Every answer was entered twice, independently by different research assistants. Then the computer program detected discrepancies in the entries. When discrepancies were detected, the original items were checked and data entry errors were corrected. This process yielded a clean data set. Once the data had been entered, they were transferred to the IBM/CMS system where SPSSX programs were used for the analysis.

**Data Analysis**

First, basic frequency statistics were run for individual
items in all surveys. These data were used for describing the characteristics of the samples and for comparing the elementary and secondary teacher samples along demographic lines. To compute differences between individual variables across the elementary (1-6) and secondary (7-12) samples, we used either a Chi-square test, or a t-test following the Welch (1947) and Aspen (1949) model. The Chi-square compares categorical variables across the samples. The t-test following the Welch and Aspen model is used to compare non-categorical or continuous variables across the samples, when the two groups have separate variance. For this t-test the degrees of freedom are computed based on separate variance estimates. To compare two variables within the same sample, we used a matched-pairs t-test.

Factor analyses, paralleling Applebee's (1981), showed the teachers' values and helped in comparing this sample to Applebee's.

Reliability scales were computed for the remaining items on the teacher and student surveys, to group together those items that the respondents answered in a patterned way. The scales were tested for correlation with one another and then a final scale structure was determined for the different questionnaires. The scale structure shows the simplest structure for the data and forms the basis for t-tests and F-tests that show which variables contribute to how the respondents answer on the scales. When computing the scales, we coded missing data as the mean response; otherwise, if one item was missing the case could not be used for computing the scale. However, once the scales had been established, missing data was again included as missing.
Observational Study

Procedures for Selecting Teachers

To select two ninth grade teachers to participate in the ethnography, we engaged in an intensive search. We first generated a list of possible teachers based on the recommendations of those who direct the in-service training programs of the Bay Area Writing Project and come into contact with hundreds of local teachers each year. We also consulted local school personnel and known teacher-leaders in the community who are knowledgeable about the reputations of teachers of writing at the secondary level. Through this process we generated a list of 35 highly recommended teachers and conducted preliminary screening interviews by telephone. In these interviews, we had three aims: to find out whether the teachers were scheduled to teach or could be scheduled to teach ninth grade during the spring term when we would be observing, to find out whether the teachers would teach analytic writing to ninth graders as a normal part of their curriculum, and to find out whether the teachers would be willing to consider participating in this research project. No one whom we contacted was unwilling to participate, but only 17 of the 35 planned to teach ninth graders and analytic writing during the spring.

One member of the research team, either myself or one of the two ethnographers, observed each of the 17 teachers teach at least one class (if possible ninth grade) during the fall of 1983 and followed each observation with an extensive interview with the teacher about his or her teaching philosophy, curriculum,
response practices, and plans for the spring class that we would potentially observe. During the classroom observation, the researcher made extensive notes on the particular lesson. Objective events were placed in one column and subjective impressions in a parallel column. During the interviews with the teacher, the researcher also took extensive notes. As visits were completed during the fall, these notes and impressions were discussed at weekly staff meetings. Out of these discussions, the research staff placed each teacher into one of three groups: "yes, looks possible," "maybe possible," and "not possible." To group the teachers, we considered the number of "yes" answers to the following questions:

1. Is the classroom large enough to accommodate a team of researchers with video equipment?
2. Is the classroom located in an environment where ambient noise is insignificant enough for usable audio recordings to be made?
3. Will the teacher be focusing on the teaching of analytic writing to ninth graders at the times we can observe the classroom?
4. Does the teacher use a variety of response types, such as conferences, peer groups, and written response during the teaching of writing?
5. Does the teacher use class time efficiently, orchestrating student activities so that none seem superfluous or gratuitous to the writing being taught?
6. Can the teacher articulate a philosophical framework
for his or her course?

7. Can the teacher justify the concern in his or her course in relation to an overall philosophy about the teaching of writing?

8. Can the teacher explain how the course functions as part of the total school curriculum?

9. Is the actual curriculum consistent with the teacher's beliefs; or is the teacher bound to a curriculum that forces the teacher to spend large amounts of time on issues irrelevant to writing instruction?

10. Does the teacher cover a spectrum of writing concerns or does he or she emphasize certain concerns to the elimination of others? If there is such emphasis, can the teacher give a sound reason for it?

Teachers were placed in our "not possible" list for reasons ranging from the logistic to the philosophical. For example, one teacher's school was located at the intersection of three major freeways in San Francisco. It would have been impossible to collect clear audio tapes in that classroom. And at the other end of the spectrum, several teachers could not explain their curriculum in any way that we could understand, although the individual lesson that we had observed seemed successful.

In making our final choices, we also tried to consider the nature of the school site. We wanted sites as typical of our country's schools and as varied from each other as possible, as long as we did not have to sacrifice teaching quality. Thus, one teacher was eliminated because she taught in an elite private school and one was eliminated at the end of our selection process.
because his school resembled too closely one of the other schools that we decided finally to use.

As the observations progressed and as we considered the list of "possibles" and "maybes," we solidified a set of criteria for the teachers we would select. First, the teacher had to be able to express an understandable sense of purpose to us—a clear rationale for what was being taught and why. Second, in our observations we wanted to see evidence that students were engaged in the class and seemed to be learning what the teacher intended to be teaching. Third, we wanted to see teachers who were interested in having ninth graders stretch their writing, who had high expectations for their students, and who were teaching expository or academic writing.

We settled on three teachers, two males and one female, whom we thought would be excellent candidates for the project. At least one member of the research team who had not visited the teacher's class before had a chance to observe in the classroom. We compared notes and found that any of the three would be suitable. One male taught in a suburban school, the other in an urban school. The female also taught in a suburban school. To get maximal contrast, we selected the male from the urban school, and the female from the suburban school. Further, we sensed that the two teachers' classroom practices were different and that together they would offer a fuller picture of successful writing instruction than either could do alone. Thus, the two selected teachers, although both were judged outstanding, offered contrast along the lines of gender, teaching style, and community in which
the school was located.

The Selected Teachers

The selected teachers, Mary Lee Glass of Gunn High School in Palo Alto and Arthur Peterson of Lowell High School in San Francisco, are leaders among writing teachers, have participated in the invitational summer programs of the Bay Area Writing Project, have received special recognition in their school districts for their abilities as writing teachers, are considered by their principals and by the professional community to be model teachers. Both publish their own writing in journals and books.

Ms. Glass is chair of her English department and holds major office in state and national professional organizations. During the time we observed her class, she was the program chair for the National Council of Teachers of English Secondary Section Meeting, made a trip to Council headquarters for business, and was elected president of the California Association of Teachers of English. She also starred in the Gunn High School community musical, *Kiss Me Kate*, which ran to sell-out crowds for a two week period. She has taught for 24 years, the last 20 of them at Gunn. She holds an M.A. in English.

Mr. Peterson, who has taught in the San Francisco Unified School District for 23 years, has just completed a revision of the writing curriculum at his school, signed a contract with a publisher to write the teacher's companion to *The Preppie Handbook*, serves on the advisory board for teacher training programs at a nearby university, and has been selected to become a mentor teacher in the first year of the state of California's mentor teacher program. Before joining Lowell's English
department six years ago, he taught social studies and English in a San Francisco junior high school.

Both Ms. Glass and Mr. Peterson wrote statements about their teaching philosophies. Selections from these statements give a flavor of their views about how to teach writing (see Appendix 6 for full copies of their statements).

Ms. Glass writes about her teaching, "How can we expect children to learn their way into thinking coherently, expressing themselves effectively, speaking with authority and voice and transitions, polishing with grace and art, if all we have done is talk about writing, about topic sentences, about paragraph structure, but we have not practiced? Practiced what? All of it -- saying it, seeing it, saying it better, trying it out on others, becoming aware that we hear when one phrase says it better, learning that making mistakes is not only not fatal but necessary to becoming better."

She continues, "Simultaneously with practice, the student of writing must learn to evaluate -- his own, her peers', the masters' writing. And in that fact lies yet another dimension of practice and dilemma for the teacher of writing, for he must, like coaches and drill sergeants and counselors, be all things at the right time to all students. . . . . Clearly, evaluation must become an automatic part of the practice, an informal exercise in expression and revision as well as the formal statement translated into a grade at the end of the quarter, an easy and comfortable and non-threatening part of the process of growth and thinking, an acknowledgment that we can all see and hear and
judge what is 'better' rather than depend entirely upon the
teacher who grades the paper to tell us how good it is."

Mr. Peterson discusses his techniques for responding to
student writing and makes a point similar to Glass's about the
importance of non-threatening practice: "... learning to write
is not like learning to hang glide. The hanglider needs to learn
all of the "dos" and "don'ts" before he puts on wings and tries
to fly. But a writer can only learn to write by practicing, and
he needs to understand that, in writing, no crash is fatal."

Mr. Peterson continues on a somewhat different note about
evaluation, "I came to recognize that sharing and evaluating need
to be separated.... I saw my job to respond so as to help
students develop a common criteria for judgment.... I did not
then, nor have I since, found great gaps between my criteria for
good writing and the judgment of the students. The difference
between my judgment and theirs is that they know what they like
and I have the words to describe why I like what I like....
[Students may] appreciate the difference between a well-executed
dive and a belly flop, but if they are going to stop belly-
flopping they need to analyze the proper dive."

The Setting for the Observations

We observed both teachers teaching college preparatory
classes at high schools in which most students are headed for
college; however, the schools are strikingly different in many
respects.

Gunn High School. Gunn High School, where Ms. Glass
teaches, is designated as being one of the top fifteen high
schools nationwide.4 Gunn is located in Palo Alto, a culturally
A rich middle-class suburb of San Francisco whose character derives in large part from two sources: (1) nearby Stanford University, and (2) the high-tech industry that dots much of the surrounding area, known as Silicon Valley. Stanford imparts to the community an atmosphere typically associated with college towns -- bookstores, cafes, restaurants, and shops that cater to "academic tastes," not to mention the presence of music, drama, film, and art. Silicon Valley communicates, if only indirectly, the value our society places on science, technology, and "growth industry." Gunn draws students who, in good measure, come from homes connected to one of these two cultural sources. Another, smaller group of Gunn students, giving the school a bit of cultural diversity, come from a segment of Palo Altans who could be characterized as an upwardly mobile blue-collar ethnic mix of Caucasians, Asians, Blacks, and Hispanics.

Although one sees Asians, Hispanics, and Blacks at Gunn, one would not characterize the school as an ethnic or cultural melting pot. The students are mostly middle-class and upper middle-class Caucasians. Many of them enjoy the privileges associated with the type of suburb they live in, having read many books, experienced as observers or participants both sports and the arts, and traveled in this country and abroad. They come, for the most part, from homes that place great value on academic success. Students' scores on standardized tests tend to be well above the national average, and they come to Gunn with respectable grade-point-averages from feeder middle schools or
junior high schools, as well as from private schools.

Gunn High School itself is a modern structure of wood, concrete, and glass. Architecturally striking and built to allow students and teachers to be outdoors a great deal, the buildings are connected by covered outdoor walkways and are interspersed with stretches of well-cared-for lawn. In order to get from class to class, one traverses these walkways, often crossing from one building to another. The school site resembles, therefore, a small college. In fact, the architecture might be thought to echo the view held by many Gunn parents, teachers, and students, that this high school is getting students ready to attend colleges or universities.

Lowell High School. Lowell High School in San Francisco, where Mr. Peterson teaches, also is among the nation's top fifteen high schools. It is characterized as an "academic" school; that is, most courses there satisfy high school pre-requisites for college entrance; "non-academic" courses ("shop" courses, for example, or home economics) are not offered. Located in a middle-class residential neighborhood built up mostly in the late forties and fifties, Lowell has for a neighbor a large suburban-type shopping center. Its location, then, while in the city, resembles in some ways a modest suburb amidst neat row houses with trees and small lawns, and a shopping center nearby. Yet Lowell draws students from all over the city, not just the neighborhood in which it is located. For, unlike other San Francisco public high schools, it enrolls any student who meets its academic entrance requirements, currently a 8+ grade average from junior high school and high scores on the Comprehensive Test
of Basic Skills (CTBS).

Students at Lowell are, for the most part, academic achievers. While all ethnic groups are represented there, most students are Asian, followed by Caucasians. There are more females than males. Yet these students reflect diverse cultural backgrounds, coming from the wealthiest to the poorest of San Francisco neighborhoods and from working class as well as middle- and upper-middle-class homes. They have in common high grade point-averages from feeder middle schools and junior high schools (some are private and parochial schools) and above average scores on the CTBS. Yet there are students at Lowell who have problems in English classes because English is their second language and others who have difficulty because they came from less than rigorous junior high and middle schools from which they got unrealistically good grades. In a sense, then, there are two Lowell populations, (1) the struggling students and (2) the real cream of the San Francisco public schools. Lowell's reputation is based on the second group, who are, for the most part, students who plan to go to college or university when they graduate. In fact, Lowell is considered "college prep."

The building in which Lowell is located was built in the early sixties, although the school itself dates back over 125 years, being San Francisco's oldest "living" high school. The current building is a two-story concrete structure, punctuated by many windows and surrounded by lawn. All classrooms and offices are located along indoor halls. While the school is built around a central courtyard, much social activity, including lunch and
snack eating, occurs inside, in the hallways. Lining the hallway walls are bulletin boards and glass cases displaying, among other things, pictures of and articles about distinguished Lowell alumni. Lowell students are thus reminded that they walk in halls that echo 125 years of spirited tradition that has yielded much academic as well as professional success.

A Comment on Choices of Teachers and Settings as well as an Aside on the Teaching of Analytic Writing

Both Ms. Glass and Mr. Peterson, as well as most of the teachers we could locate who teach analytic writing to ninth graders, teach in predominantly college preparatory high schools. Every private school teacher we talked to teaches analytic writing to ninth graders, as do most teachers in wealthy suburban public schools with academic orientations. The teachers interviewed who were working with non-college bound students as well as most who work with inner-city students do not teach analysis or exposition at this grade level. Nor are they headed in this direction. Instead, they focus on the personal experience narrative. The teachers for the most part are following the dictates of the curriculum of their school and are unaware of the differential nature of their curriculum. Many believe it inappropriate to teach analytic writing to non-college bound students.

Before beginning this research, we were unaware of the distribution of the teaching of analytic writing in the local curriculum. Originally, we had hoped to study at least one teacher in an urban public school which does not cater exclusively to the college-bound student as Lowell does.
Unfortunately we were unable to locate a teacher in such a school who met our other criteria. We stuck with our criteria of studying analytic writing for two reasons. First, it was necessary to limit our focus and to establish points of similarity across the two settings. Thus, we elected to control not only the grade level but also the type of writing being taught during our observations. Secondly, we selected analytic writing because it is commonly thought to support teaching students the patterns of abstract reasoning necessary to success in school (Goody & Watt, 1963; Scribner & Cole, 1982). Without exposure to this type of writing, students will likely have diminished opportunities. Thus, it seemed important to study how students are initiated into academic ways of writing and thinking, both for those who routinely receive the initiation and for those who do not.

**Procedures for Selecting Focal Students**

Besides examining response from the teachers' points of view, we wanted to examine the students' learning. We thus decided to focus our observations on four students in each classroom, the maximum number we felt we could follow effectively. We aimed to examine both the interaction between these students and their peers and between these students and their teachers, to study their oral interactions as well as written comments on their papers. Neither the teacher nor the students were to know that we were focusing on anyone in particular until after all classroom observations were complete.

Within each class, we selected students who differed in
their academic predisposition to success in the class. We relied on scores from the California Test of Basic Skills (CTBS) in reading and vocabulary as well as grades in junior high and first semester of ninth grade to inform us as to which students were likely to have both little trouble and relatively greater trouble in the class. Of these two types of students, we chose those that differed along gender and cultural lines when possible, but strove for a mixture that was representative of the classes we were observing.

Descriptions of Classes and Focal Students

Ms. Glass's Class. Ms. Glass's class was an "honors" section in communication. The curriculum covered writing and speaking.

The class contained all high achieving students; however, some looked as though they would shine as the "top of the top" while others would clearly be below the average in this particular group. The class contained 33 students, 12 boys and 21 girls. Of these students 26 were Caucasian and 7 were Asian-Americans. All the Asians were of Chinese heritage except for one of Middle Eastern descent; 4 were female and 3 were males. We selected Julie, a highly motivated Asian American girl; Jim, a quiet but high achieving Caucasian boy; Allison, a very shy, lower achieving Caucasian girl; and Derek, a gregarious, lower achieving Caucasian boy.

Julie has an impressive student file and looked to us to be a representative high achiever in language arts and among the top students in this class. In the first semester of ninth grade, Julie made all A's on her report card, a pattern consistent with
that in her junior high years. Her scores on the CTBS ranged from 90% to 98%, with a 97% in vocabulary, purportedly the best single score for predicting achievement in language arts. These CTBS national percentiles are higher than the district percentiles. Julie's 97%, for example, translated to an 80% for the district.

Jim represented the high end of achievers also, different primarily from Julie in being a Caucasian male, with records only a hair-line below hers. On the CTBS, Jim's scores ranged from 88% to 98%, with a 98% in vocabulary, the district equivalent being 86%. His first semester ninth grade report card showed a B and two A-'s among the A's; however, in World Culture, the first semester English class, he received an A.

Just as Julie and Jim showed promise as high achievers, Allison, a female Caucasian, seemed to promise difficulties. Interestingly, her CTBS score hit a high of 95% in mechanics—we were not dealing with a limited-ability student here—but her low score of 77% was in vocabulary, equivalent to a district percentile of 33%. Also, her first semester ninth grade report showed two C's, one of them being in the English course, World Culture. Considering the nature of the rest of the students in Glass's class, Allison's past record was among the poorest.

Again keeping in mind that low achieving students in this honors course would not parallel the mainstream of low-achieving students, we chose our fourth focal student, Derek, a male Caucasian. Derek's CTBS scores ranged from 52% to 92%; his vocabulary score was 65%, translating to a district percentile of 20%. His first semester ninth grade report card showed one C+,
one A (in physical education), a B+ in World Culture, B- in science, P (Pas's) in Photography, C+ in Spanish, B- in European history.

**Mr. Peterson's Class.** Mr. Peterson's class was a regular ninth grade English class. The curriculum centered around literature and writing.

The class contained 27 students, 14 of whom were Asian, 1 black, 3 Spanish surnamed, and 9 Caucasian. Like the school population at Lowell, the great majority--21--were female. Thus, we selected focal students to represent this ethnic and sex imbalance--three females and one male; two Asians, one Black and one Caucasian. Lisa, was a highly motivated, gregarious, Chinese-American girl; Donald, a quiet but high achieving Asian American boy; Candace, a coquettish, lower achieving Caucasian girl; and Rhonda, a gregarious, lower achieving Black girl. Although Peterson's class was not designated as an honors group, he felt that they were similar to honors groups at Lowell. Further, unlike Gunn, Lowell is in fact an honors only school, since there are academic criteria for admission.

Lisa, the Chinese-American high achiever, had CTBS scores in language arts that ranged from 81 to 96%, with a vocabulary percentile at 86. She made all A's in her first semester at Lowell. At Lowell a straight A showing is not to be taken lightly; "grade inflation" does not seem to have afflicted this school. Lisa was thus a clear-cut choice for a high-achieving student. As an Asian-American female, she represents the majority at Lowell.

If records are any indication of ability, Donald's promised
us another high achiever. His CTBS scores in language arts ranged from 96 to 99% and his grades from his first semester at Lowell included only one B among all A's. His first semester English grade was an A. Like Lisa, Donald is a Chinese American.

Candace's records marked her as a low achiever. The only Caucasian in our group, her CTBS scores ranged from 59 to 81%, with her vocabulary score at 71%. Her first-semester ninth grade report card showed a C in English among three other C's and two D's. This was the lowest grade record of any of our focal students', and we were curious about following Candace's progress in our study, for, after all, she did make the grades to be accepted into Lowell the year before.

We chose our last focal student, Rhonda, primarily for her having received a D in English in her first semester at Lowell. This low grade was unusual for the students in Peterson's class but went along with the other D and two C's she received her first semester, although she did also receive two B's (one in physical education). Rhonda's CTBS scores in language arts, ranged from 60 to 92%, with an 81% in vocabulary. Like Candace, she appeared to represent an interesting combination of certain low achievements, but with the potential for a great deal of growth.

Procedures for Collecting Data

Overview of Data Collected. Two research assistants and the project director observed and made video and audio tape recordings in Ms. Glass's classroom from January through mid-April, 1984 and in Mr. Peterson's from mid-April through mid-
June. Every day at least two researchers were in the classroom, one video-taping (the Technician) and the other compiling ethnographic field notes (the Scribe). In each classroom, the following primary data were collected:

1. detailed field notes of all classroom sessions during the five month period written by a trained observer (the Scribe);
2. video-taped recordings of all class sessions during the three month period collected by a trained camera technician (the Technician);
3. audio-taped data collected by means of (a) an overhead microphone in addition to a wireless microphone attached to the teacher, both of which fed into a stereo audio recorder which was simultaneously fed into the audio portion of the video-tape, so that an audio-tape cassette duplicating the audio portion of the video-tape was created, (b) a backup audio cassette recorder placed in a different part of the classroom, and (c) mini-cassette recorders used for peer group discussions;
4. copies of all drafts of the focal students' writings, including drafts; and
5. copies of all written teacher or student comments about the pieces of focal students' writing.

The following secondary data were collected:

1. notes on informal conversations with teachers, students, and other school personnel;
2. two audio-taped, day-long interviews of the teachers by the investigators about the substance of the instruction and about the progress of each focal student (held after all
classroom data were collected;  
3. two two-hour, audio-taped interviews between the investigators and each focal student: one in which the focal students filled out the national survey while discussing each item and a second in which focal students discussed the effects of different types of response on their production of one, selected, piece of writing and also discussed their understandings of the different responses (held after all classroom data were collected); and  
4. written statements from each teacher about their goals for the assignment sequence we observed and about their teaching philosophy.  

Both classes were a semester rather than a year in length and began in January. Thus, students and teacher first met in January. In order to see how both teachers established the teaching-learning situation, we observed both classes for the first week. Since Ms. Glass's class met in the early morning and Mr. Peterson's in the late morning, it was possible to observe in both classrooms on the same day when necessary.  

Scribe's Procedures and Conventions. At staff meetings that took place before our observations began and during the first week of observations, we developed note-taking conventions and procedures for in-class data collection. These conventions and procedures were refined during the first few weeks of ethnographic observations.  

During class, the Scribe was situated away from the students' desks but with a clear view of the class as a
whole and, particularly, of the four focal students (see the diagram of Ms. Glass's classroom in Figure 2.1 and Mr. Peterson's in 2.2).

---

The Scribe, who also operated a back-up audio tape recorder, took notes on classroom activities throughout the class period. She noted everything she could about what the students and teacher were doing, how they were interacting, what the peer groups were doing (when the class divided into peer groups), what was occurring outside the classroom that might impinge on classroom activity. When possible, the Scribe focused her attention on the four focal students and on their actions, reactions, and interactions with other students and the teacher. The Scribe collected the same handouts as were given to the class by the teacher and attached these to her notes. The Scribe also helped the Technician set up and take down the audio and video equipment and helped her distribute tape recorders to the peer groups, if necessary.

A set of note-taking conventions was developed to streamline note-taking, to provide a written symbol system common to any person involved in note-taking, and to have an efficient and effective manuscript to refer to later when analyzing the data. Note sheets were divided vertically into two columns, one for objective observations and the other for reactions, opinions, interpretations, and hypotheses about what was occurring. Major activity shifts were noted as well as clock time at important junctures or for key episodes involving response. When the Scribe judged that an episode might need to be analyzed further, the
episode was marked by an asterisk. At the heading of each set of
notes was an identification code: teacher's last initial -
week number - day number. For example, for Ms. Glass's class,
week two, day four, the code would be "G-02-4."

This code was also used on the video tape and on the
audio tapes; in this way, we cross-referenced and indexed the
data. (See Appendix 7 for a sample set of daily notes and more
details on note taking conventions).

After class, another set of procedures were followed for
checking and adding to the Scribe's classroom notes. First, the
technician who operated the camera, using a contrasting pen or
pencil, so her additions could be distinguished from the
Scribe's observations, added objective details that the Scribe
may have missed, elaborated on points in the subjective column
from her own point of view and, in the left hand margin, filled
in the video counter numbers from her notes that coincided with
the activities that the Scribe had described, so that the
activities could easily be retrieved on the video tapes when
the data were analyzed.

Every night the Scribe read through the notes for the day
to locate those interactions between the teacher and students or
among the students themselves (in the whole class or in peer
groups) that would be described as “responses” to student
writing. Finding such response episodes, the Scribe then coded
them to indicate the responder and the recipient of the response,
the channel of the response (oral, written, non-verbal), and the
point in the writer's process when the response occurred (during
the process or to final writing). Appendix 7 contains a fuller description of the coding.

Finally, the Scribe wrote a summary sheet of the day's notes, including: (1) a list of the day's activities; (2) a list of assignments, both in class and homework; (3) a list of response episodes (listed by code and referenced to a page number); and (4) a short section of comments. Comments covered anything from classroom events worth noting to logistic problems in data collection.

Technician's Procedures and Conventions. The classroom duties of the Technician, in addition to making decisions about camera shots, included monitoring audio quality and possible problems, and taking supplementary notes. These notes comprised a brief record of on-going classroom events together with video counter numbers which could then be correlated with the more elaborate notes taken by the Scribe. The Technician also marked down video counter numbers when the camera was moved or the camera shot shifted. Finally, the Technician functioned as a supplementary Scribe, noting events in the classroom, student behaviors, and comments that the official Scribe might miss from her angle of vision.

Although one research assistant took primary responsibility for the audio and video recording, three other researchers did camera work at times. These researchers were trained by the head Technician. In order to assure continuity from day to day in taping procedures, Technicians daily left technical notes for one another, advising each other of decisions, and of any problems with the equipment.
The video camera and recording equipment was placed in the left rear of each classroom, a spot that afforded a view of the most of the classroom. The camera was sometimes moved a few feet to enable a better view of focal students during class or group activities, but in general it remained back as far as possible in the corner. An omni-directional microphone was plugged into a permanent extension cable which was attached to the ceiling of the classroom. Then a diversity wireless microphone was given to the teacher. Each microphone fed into one channel of a stereo audio recorder which was connected by cables to a stereo video recorder. A back-up tape recorder was placed in a corner of the classroom opposite the master audio tape recorder, in case of master recorder failure.

The video camera had a zoom lens with a focal length from 12.5 mm to 75 mm, which was normally placed at the widest angle setting of 12.5 mm. Although we could have fit more of the classroom into the camera frame with a wider angle lens, the loss of detail, such as facial expressions, with a wider angle seemed too great. With the zoom lens, it was possible to fit approximately one third of the classroom on the frame at a time.

On-line decisions about what to get on camera at a given time were guided by the following criteria:

1. In whole class activities the main channel of communication was between the teacher and the class. The teacher controlled this communication process, calling on particular students to participate, or directing class activities. In this situation, the camera followed the
teacher, framing the camera shot so as to get as much of the class as possible on camera with the teacher. Decisions about what portion of the class to include with the teacher were guided by the position of the four focal students in the classroom.

2. When students were working individually on an in-class assignment, camera time was divided among the four focal students as much as possible. Often two or more focal students could be caught on camera at the same time.

3. If, as often happened in Ms. Glass's class, students took turns giving speeches from the front of the room, the camera was focused on the speaker, again catching as much of the rest of the class as possible.

4. When students formed peer groups to work on class assignments, the Technician focused on those groups containing focal students. Often more than one such group fit on camera at a time. Since these groups often met over a period of days, the group on camera was rotated from day to day in order to catch each of the focal students interacting with his or her groups, to the extent that this rotation was possible. Sometimes in Ms. Glass's class, particular groups went outside of the classroom to work, and it was not possible to film them in this event. When the teacher traveled from group to group, engaging the group membership in significant teaching interactions, the Technician followed the teacher.

5. Above all, if focal students were engaged in any activity that seemed significant and important to document,
the Technician tried to catch it on video. The Technician’s attention had to be divided between the current camera shot and activities taking place beyond reach of the camera involving the focal students. Decisions to focus on focal students were often subjective, amounting to guesses about what might turn out to be significant. For example, a decision might be to focus the camera on a focal student instead of the teacher when the two were engaged in an extended dialogue, but when the teacher and the student were too far away from each other to fit on camera at the same time.

Whenever the class divided into small groups, separate audio recordings were collected of each group with small, rechargeable tape recorders. Also, the classroom teachers were provided a tape recorder and audio tapes and asked to record any conferences they held outside class with individual students.

A full description of the formal system for equipment set up and technical data collection can be found in Appendix 8.

At the end of each recording day, a daily recording log was completed which indicated the ending video and audio counter numbers for that day (see sample recording log in Appendix 8), as well as any technical problems encountered. In addition, a data log indicated the type and code numbers of data collected, including video recordings, master and back-up audio tapes, and additional recordings of peer groups, if any (see sample data log in Appendix 8).
An overview of the curriculum sequence that we observed in each class gives a preliminary view of the activities that became the subject of our ethnography.

Ms. Glass. During the eleven weeks that we observed Ms. Glass's classroom, the students wrote three major papers; gave oral presentations, some of which were based on the paper topics; and kept personal "process logs," running accounts of how their writing was progressing as well as what they thought about it and about their assignments. The four oral/written topics were (1) an interview with a fellow student (oral and written); (2) a group presentation of a commercial (oral); (3) a character study of an interesting place (Ms. Glass calls these "saturation reports") (written); and (4) "opinion" essays (written). Each of these written assignments included a series of pre-writing, writing, and final response activities. Interspersed were additional assignments, often short "practice writings."

1. Interview: 3 weeks

Students spent several days interviewing a classmate, first devising interview questions, then refining and focusing them. What was stressed during this stretch of pre-writing activity was finding a focus for an interview topic and gathering specific information for the topic, in the form of anecdotes about the interviewee.

Students then made oral presentations on their interviewees, with the teacher's stressing their being aware of audience and purpose. They evaluated each other's presentations.
While the students prepared their oral presentations, they were also deciding what to include in their written essays on their interviewees. Their rough drafts of these written essays were eventually read by each student to their peer group, with peers giving written and oral comments as feedback.

At this point, students were to make sure that their papers and the papers of their peers had a focus and that their assertions were developed with specific illustrations. In preparing their final drafts, students were to make use of the feedback they received from their peers as well as a "Writer's Checklist" given to them by the teacher.

On the day final drafts were turned in, students met in pairs to proof-read and make final corrections on their papers, and to fill in evaluation sheets on their own and on their partner's papers.

When the teacher returned these writings with her evaluations and feedback, the students re-read them, chose one paragraph for revision, and noted all their errors on "Needs Improvement" charts.

2. Commercials: 2 weeks

For this oral assignment, groups of students collaborated on written scripts. After reading about the persuasive techniques used in commercials, these groups wrote and performed commercials of their own. Groups spent several days developing ideas, writing, and
practicing. The students and the teacher evaluated these commercials on content and performance, evaluating both the individuals and the group as a whole.

3. Saturation Report on a Place: 3 1/2 weeks

Every student chose a place to observe which could be visited several times. They each had a week's time to make three to four visits, taking "copious notes" on what they saw there. The teacher emphasized, and had them write practice paragraphs on, capturing the "character" of their chosen places as well as of other places or people. Students read and evaluated in class two student-written essays on Disneyland and one professional essay on Las Vegas, all examples of writing that had the same purposes as those of this assignment.

Whereas during the first assignment (the interview) the teacher stressed, and had students practice eliciting specific illustrations that would develop their already-formed general assertions, the nature of this observation assignment was such that students had to concentrate on and practice making general statements that captured the specifics that they had gathered while taking notes.

Other activities for this assignment included students meeting in groups to discuss the problems they encountered doing the assignment; practicing making and critiquing focal statements; writing and responding to rough drafts as they had for the first assignment; writing, presenting, and evaluating
"public service announcements" about their places; and refining and evaluating final drafts as they had for the first assignment.

4. **Opinion Essay: 2 1/2 weeks**

Students began by generating a list of issues they had opinions about. They refined their lists by pulling out those issues that they knew a lot about. Of these, students were to pick a topic that they not only had an opinion and information about but with which they had had personal experience.

Pre-writing activities for this assignment included class discussion on techniques for gathering supplementary information—that students utilized in the previous assignments; observation; and practice with interviewing techniques. Students also learned procedures for generating a thesis and for developing the paragraphs in the body of the essay.

Students were to produce an opinion paper which included a thesis statement and topic sentences. For the first time, Ms. Glass stressed essay form. Students accordingly worked in groups on thesis statements. They produced rough drafts which were evaluated in groups as before.

In class, all students read their introductory sentences, which were then evaluated by class vote as to whether or not they sparked reader interest. The teacher emphasized the importance of the introductory paragraph that
leads to the thesis in an interesting way. The class discussed how to make their writing interesting to a reader.

Before handing in final drafts, the students identified their thesis sentence, the main idea in the introduction and body paragraphs, topic sentences, and transitional devices. Students then met in proof-reading pairs and did final editing and evaluation as they had done previously.

Throughout the eleven weeks, while working on the major assignments, students did several ungraded "practice writings," both in class and at home, and did some work on sentence combining and using appropriate pronouns. What stood out, however, was their working on generating and molding content for their essays. They moved from the concrete topic of writing about the interviewee to the more abstract topic of an issue about which they had opinions. They learned about focusing their writing, developing their generalities, getting an audience interested, and organizing their ideas.

Ms. Glass emphasized, through the process of peer-, teacher-, and self-evaluation, the effect writing has on a reader, reminding the students implicitly and explicitly that their writing and speaking was meant to communicate something to someone. She guided her students to make discoveries for themselves, frequently withholding her expertise. She did not collaborate with her students as they wrote; rather, she used her expertise to structure a learning environment that aimed to guide...
students through specific activities and procedures that would help them learn and that would teach them to evaluate their own writing as they produced it.

Mr. Peterson. During the seven weeks that we observed Mr. Peterson's classroom, the students wrote three major papers, all based on their observations, descriptions, and analyses of a person, either real or fictitious. The three major essay topics were (1) a character study of a friend or acquaintance; (2) a character study of a well-known contemporary figure; and (3) a character study of one of the figures in Dickens' Great Expectations. The students did library research on a well-known contemporary figure as the basis for the second of these papers; and they read, over the span of the seven weeks, Great Expectations as the basis for the third of these papers and as part of the literature component of this course. Each of these written assignments included practice writings and other pre-writing activities related to the topic, a series of rough drafts, and teacher-student conferences and peer response during the writing process. A major part of classroom activity was group work, especially that in which students worked with words, sentences and paragraphs, with groups competing with one another to produce the best writing in these categories.

1. Character Study of a Friend or Acquaintance: 5 weeks

Students spent several days practicing observations of people. They began by watching a segment of the movie North by Northwest and observing Cary Grant--his looks, his speech, his mannerisms, and the like. During
this time they began reading Dickens' *Great Expectations* and were assigned characters in the first chapters to observe in much the same way, noting what was said about their looks, speech, mannerisms, and so on. Using their observations of both Cary Grant and the Dickens characters, they discussed character traits in general and the difference between what one observes in a person and what one then infers about that person as a result of the observations. A distinction was made between observation and judgment. They also practiced writing paragraphs on people by writing topic sentences about a character in *Great Expectations* and developing it with supporting evidence from the book.

After these practice observations and writings, students began to find a topic for this first paper—someone they knew personally. When they had chosen their topic, that is, the person they would write about, they wrote an anecdote about the person. (During this time they continued to discuss the notion of character traits and they practiced observations, often in groups, competing for points as group activities were "games.") Mr. Peterson made copies of certain student anecdotes and the class critiqued them, paying attention to observations and judgments. Students revised their anecdotes, after having in-class conferences with Mr. Peterson and eventually critiqued them again in class.

Students then wrote rough drafts of an essay-length character-study, in which they incorporated, if they could,
the anecdotes they had been working on. There was class
discussion of rough drafts. Mr. Peterson held individual
conferences on them with students. The rough drafts were
eventually read by each student to the peers in their groups,
who filled in response sheets as feedback to each writer.
The students focused on finding good opening sentences,
topic sentences that indicated where the rest of the
paragraph would lead, paragraphs that were unified, good
descriptive passages, strong verbs, and transitions from
one paragraph to another. When final drafts were turned in,
Mr. Peterson responded to them in writing and held
individual conferences about those he felt needed to be
discussed. Only after the conferences did most students
get grades on their papers. Students whose papers had
been graded already made changes as indicated by Mr.
Peterson's written responses, without need of a conference.

2. **Character Study of a Well-Known Contemporary Figure: 3 weeks**

As a pre-writing activity for this second paper, students, in class, generated facts about the
contemporary rock star Michael Jackson and found common
threads that unified these facts. They each wrote a
paragraph about Michael Jackson and eventually critiqued
these paragraphs in class.

Mr. Peterson discussed finding and using
library information, especially that in periodicals, to
get data for this second character study. Students read
and discussed sample library material; they wrote paragraphs in groups, based on that information; they wrote group paragraphs on contemporary figures whom they chose to work on and shared their paragraphs with the class; and they read newspaper articles that exemplified the kind of papers that they were working on, viewing them as models for the writing of introductions and for the presentation of contrasting characteristics within one person.

Meanwhile, students chose the topic of their second paper, that is, a well-known contemporary figure; they compiled bibliographies; and they isolated qualities of their chosen characters to write about. All of this information was handed in to Mr. Peterson.

On the day students handed in rough drafts, they divided into groups, reading their drafts to their peers and getting feedback via response sheets. Later, Mr. Peterson gave students feedback in class about their drafts, as well as in individual conferences, and students worked on revising their drafts and eventually shared their revised rough drafts with their peer groups, who responded to them. Students then wrote final drafts which they gave to Mr. Peterson. The same procedures for revision and grade-giving were followed as for the first paper.

3. Character Sketch of Figure from Great Expectations: 7 weeks

Preliminary work on this character sketch began when students began reading Great Expectations and writing
their observations of selected characters from the novel. It was in the last two weeks of our observations in Mr. Peterson's class, however, that the intensive work began on this last major assignment. Students did a pre-writing activity in groups, each group writing a paragraph about Pip based on a topic sentence provided by Mr. Peterson and on supporting evidence that they found in the book. Later, Mr. Peterson made copies of some of these paragraphs, which students critiqued in class. They also discussed the kinds of information to include in the introductions, body paragraphs, and conclusions of these third character sketches. When rough drafts were written, the class divided into groups; students read their drafts to their peers; and peers responded to them, using a response sheet that focused on the characteristics they had written about and whether or not their papers were convincing. Students handed in revisions of these drafts to Mr. Peterson, who responded to them as he did for the other two papers in this sequence.

Throughout the seven weeks, while working on the above major assignments, students practiced inductive thinking. They practiced objective observation of characters and drawing inferences based on the evidence they observed. They moved from writing about the personal and familiar subject, a friend or acquaintance, to the more removed and abstracted subject, a character from a novel. They learned about providing evidence for their generalities, getting an audience's interest, and organizing
their ideas within Mr. Peterson's suggested outlines.

Mr. Peterson emphasized writing as a process of crafting and re-crafting text, developing with his students a kind of master-apprentice relationship in which he frequently conferred with individual students both in class and in his office, lending his expertise and modeling successful text through suggestion or specific examples from other writers, student as well as as non-student. Students practiced the craft as they wrote alone and in group collaboration, testing their products on each other and on the teacher, who rewarded them with points for their successes.

**Procedures for Interviews: Students**

At the end of the semester we conducted two interviews with each of the focal students in each class to get their point of view about the instruction they had received. Interview questions were first tested and refined in practice interviews with four students who were not focal to our study. A copy of the final version of the schedule for the student interviews can be found in Appendix 9.

The interviews were designed to serve two functions: (1) to help us see how students interpret the questions on the National Survey and thus to help us interpret the results of that survey, and (2) to provide us with the students' points of view on the teaching and learning we have observed, in particular on how different types of response function for student learners.

**Interview I.** For the first interview, we had each student
complete the student questionnaire which we used in the National Survey. While the students completed the questionnaires, they were asked to "think aloud" to verbalize their thoughts as they answered the questions. In particular, they were directed to explain why they answered as they did.

Next we asked the students questions about particular key activities we observed in their classrooms. We wanted to know how they understood the function of these activities and the role the activities played for them as learners. Finally, after asking several general questions about teaching and learning, we asked each student to select his or her best piece of writing for the semester and to justify the choice.

Interview II: For the second interview, we selected written comments on the student's writing and audio and video clips of the individual student receiving response. Each student was asked to comment on his or her response to the response, including his or her understanding of the meaning of the response and assessment of how helpful it was.

Procedures for Interviews: Teachers

In order to gain the teachers' perspectives of the two classrooms we observed, we conducted two interviews with each teacher during the summer of 1984, after the period of observation. Unlike the interviews with the focal students, we did not pilot an interview schedule. Rather, since we wanted these teachers to fill in gaps for us, we prepared discussion questions oriented to each teacher's class. Interviews were tape recorded and notes on the discussion were kept.
Interview I. For the first interview, the focus was primarily on their philosophies and approaches to teaching, and their assessment of the classes and focal students we observed. A list of questions asked during this session may be found in Appendix 9.

Interview II. The second interview was conducted with each teacher individually. At this time we asked for clarification of points raised in the previous meeting. We also asked the teachers to characterize each of the focal students for us, to assess their strengths and weaknesses and their progress during the semester. Again notes were taken and tape recordings made during the meetings. A list of points covered during the meeting with Ms. Glass can be found in Appendix 9. A similar set of points, though tailored to his situation, were discussed with Mr. Peterson.

Data Analysis

Data Reduction. Although all data collected served as background to the analysis, for more detailed analysis we selected one of the three assignments in each classroom. We chose the assignment on which response was most plentiful and which was, from the teachers' points of view, most problem-free. In Ms. Glass's class, we selected the second assignment, the saturation report. In Mr. Peterson's class, we selected the first of his sequence, the character sketch of a familiar person.

Decisions for Analysis. We decided on three separate analyses of these data, each evolving from the preceding one. The specific analysis procedures will be described in the chapter focusing on the results of the analysis. The first involves an
elaborated system for coding the ethnographic data and statistical analyses (Chapter IV), the second involves an analysis of what underlies the teacher's decisions with respect to response and involved a card sorting procedure to identify semantic networks in the classroom talk (Chapter V), the third involves an analysis of the structure of whole-class oral response and involved creation of a new system for analyzing the problem-solving nature of classroom talk (Chapter VI), and the fourth involves an analysis of written response, taking into account the students' understandings and the coordination of written to oral response (Chapter VII).
Footnotes to Chapter II

1 The experts included: Arthur Applebee, Robert Calfee, James Gray, Mary K. Healy, Miles Myers, Selma Monsky, Leo Ruth, Herb Simons.

2 In parentheses the numbers refer to the question numbers on the Secondary (Sec.) and Elementary (El.) versions of the teacher questionnaires in Appendix 3.

3 In parentheses the numbers refer to question numbers on the Student questionnaire in Appendix 3.

4 The ratings of the high schools were done for Fortune Magazine.

CHAPTER III--Results from the National Surveys of Excellence in Teaching

Characteristics of the Sample

Teachers and Schools

Table 3.1 describes the personal characteristics of the teachers who participated in the survey.

In this table, as well as in subsequent tables, chi-square tests are used to compare the differences between the elementary and secondary samples for all categorical variables. For non-categorical variables, t-tests following the Welch (1947) and Aspin (1949) model, are used to compare the samples.

Results show that most of the elementary teachers majored in education as undergraduates while their secondary counterparts majored in English. The subject area trends for their MA's were the same. Significantly more of the secondary than elementary teachers held master's degrees. In both groups, only a small number had or were working on PhD's.

The teachers were mostly female, 86.9% at the elementary level and 77.2% at the secondary level, a significant difference. The average number of years teaching experience was 14. These teachers were slightly more experienced than the English teachers in Applebee's (1981) survey who averaged 12.8 years of classroom experience (p. 23).

The average age of the teachers in the sample was 41. A comparison of the age distribution of these teachers and...
Applebee's shows that this group contains fewer teachers under 30—6.1% as opposed to Applebee's 24.1%—and many more in the 40 to 49 age bracket—39.5% as opposed to Applebee's 14.2% (Applebee, 1981, p. 22).

The teachers reported that the schools in which they taught (Table 3.2) were fairly evenly spread across the United States with a somewhat higher percent in the western states and a somewhat lower percent in the northeast.

Because the Writing Project began and remains headquartered on the west coast, this distribution may be an artifact of the larger number of active sites in the western states and the more frequent contact between the western site directors and teachers with the research staff. Only a small percent of the sample taught in foreign countries. Most taught in small towns or suburbs of large metropolitan areas. A substantial number taught in urban areas. U. S. Census statistics (1983) show that 74.8% of the U.S. population can be found in metropolitan areas (over 50,000 population) and 25.2% in non-metropolitan areas (p. 19). Our population is fairly typical with 39.4% coming from non-metropolitan areas (rural and small town), although some of those who classified their area as small town, may have been classified as metropolitan by the Census.

The schools in which the teachers worked were predominantly public. Enrollment patterns, not surprisingly, showed elementary schools significantly smaller than secondary schools. Census
statistics (1983) lead to the conclusion that "elementary schools tended to be substantially smaller in enrollment than secondary schools" (p. 64). The 1983 figures reported an average sized elementary school at 391 students, and an average sized secondary school at 730 students.

Teachers estimated the percentage of students in their class who fell into each of three very general socioeconomic categories. The percentages were scaled for each level of the variable so that the total across the three categories would be 100%. The socioeconomic distribution of the students of these teachers included mostly those from families that could afford the basic necessities, with the elementary schools having a significantly greater number of poverty level students. This trend may be correlated to a trend reported by the U. S. Bureau of the Census (1983), showing that the percentage of ethnic minority students decreases in the higher grades (p. 146).

The secondary teachers reported that the usual teaching load in their schools was between five and six classes, a load far above the four classes recommended for English teachers by the National Council of Teachers of English. However, 52.8% of the teachers in the sample taught fewer classes than was normal at their school while 44.7% taught a normal load. Only 2.4% taught above a normal load. Undoubtedly some of the teachers were part-time and others had administrative responsibility--factors that would skew the numbers of classes taught but information which was not gathered in the survey. Still, the fact remains that on the whole these teachers kept their teaching load relatively low.

Table 3.3 shows that the elementary teachers taught grades
one through six, with a few teaching a grade above sixth.

The central tendency was skewed toward grades four through six, perhaps because some Writing Project site directors, when asked to nominate teachers, understood that they were only to nominate from the upper elementary grades. Most elementary teachers taught a single grade; however, 19% taught combination classes, with most of those teaching upper grade combinations.

The teaching situation of the secondary teachers is reported both for the class selected as focal for the questionnaire and for all their classes (Table 3.4).

Their teaching situation across all their classes cannot be compared statistically with their teaching situation in a selected class which formed the focus for the questionnaire, because the selected class was one in the total number of classes and therefore was part of the figure for all classes. However, a look at the data on Table 3.4 does not reveal any apparently unusual trends for the selected class.

For the most part, the secondary teachers taught grades seven through twelve. The grade levels were relatively evenly distributed with a few more teaching eleventh and twelfth grade than tenth or ninth. There seems to be a slight tendency for these outstanding secondary teachers to gravitate toward the upper grades, with more teaching eighth than seventh, and more
teaching eleventh and twelfth than tenth. Ninth grade, often overlapping between junior and senior high, could have been included by the Site Directors as part of the junior or senior high group and so had the strongest chance of being sampled. Therefore, it is surprising that ninth grade was not better represented.

Most of the secondary teachers taught only one grade level in a given class. Combinations, which occurred less frequently for the secondary teachers than for the elementary teachers, were found mostly for eleventh and twelfth grade.

Like the classes taught by the teachers in the Applebee (1981) sample (p. 22), the classes these secondary teachers taught were usually required of students. Classes normally ran for the entire school year.

A comparison of the secondary and elementary teachers gives additional information (Table 3.5). The question about student ability level was asked differently to the secondary and elementary teachers. The elementary teachers were asked to report the percentage of students that they taught who were above average, average, and below average. The secondary teachers were asked to assess the students from just one of their classes and were asked whether these students were predominantly above average, average, below average, or of mixed ability. Although both groups reported that a larger percentage of their students were above average than below average, the two samples cannot be compared statistically because of the unequal number of
categories on the two questionnaires and because of the differences in the meanings of the categories.

Table 3.5 also shows that the elementary teachers reported using computers in their classes significantly more than the secondary teachers did. It also shows that only about 5% of the elementary and secondary students were non-native speakers of English.

Because the range of reported class sizes was great on the elementary surveys (some of these teachers may have been resource teachers), the median rather than the average proved the truest measure of class size. So that the two samples could be compared, the median was used for secondary classes as well. The elementary class size has a median of 26.41, not significantly different from the median for the focal class for the secondary teachers but significantly larger than the median of 24.98 reported by secondary teachers for the usual class at their schools.

Secondary Students

Approximately half the secondary teachers were asked to give surveys to students. They were to select two male and two female students in their focal class and one high and one low ability student within each gender. On their questionnaires, the students gave information about themselves (Table 3.6).

Insert Table 3.6 about here

According to the students' reports, the teachers followed directions. Students were not asked about their ability level,
but when asked about their gender, half reported that they were male and half female. Most of the students reported making A's and B's in the writing class taught by the teacher in the survey. Not surprisingly, the students were fairly evenly distributed across grade levels, and showed the same imbalances that the teachers did. After graduation, the higher achieving students were more inclined than their lower achieving peers to expect to go to a four year college and were less inclined to expect to enter a two year college or to have no plans for education beyond high school. Most of the students in both groups expected to complete four years of college.

How These Teachers Differ from Other Writing Teachers

The teachers in our survey were identified by Writing Project site directors as among the most outstanding teachers of writing in their regions. We had no other proof or measure of their superiority. We hypothesized that if these teachers were superior, they would answer certain questions differently from teachers who participated in other surveys. To test this difference, we paralleled two sets of items from Applebee's (1981) survey of secondary teachers, a sample selected to be above average but not necessarily outstanding. We included the paralleled items from Applebee's survey for both elementary and secondary teachers in our survey. We could get no better comparison for the elementary subsample since we knew of no similar survey of writing teachers that has included elementary teachers.

The first set of parallel items concerned the amount of writing students were asked to do. The second set concerned the
reasons teachers gave for teaching writing. Applebee found that his sample had students write infrequently and only brief pieces and that they had restricted reasons for teaching writing--that they did not combine the teaching of writing as craft with the teaching of writing as an instrument of thought or the teaching of writing to transmit information with the teaching of writing to connect students' school and personal experiences. We hypothesized that both our secondary and elementary teachers would have students do more writing and would teach writing for multiple reasons.

The Writing Their Students Do

Before presenting the comparison with Applebee's sample, we will give information about the amount of writing our teachers reported in their classes (Table 3.7).

Insert Table 3.7 about here

First, they claimed to teach writing in 95% of their classes. At the time of the survey, 96.9% of the elementary teachers and 87% of the secondary teachers had their students doing in-class writing and 59.8% of the elementary and 68.7% of the secondary teachers had their students doing out-of-class writing. Both groups were significantly more likely to assign in-class writing than out of class writing. The elementary teachers leaned more strongly in the direction of in-class writing than the secondary teachers did, and the secondary teachers had their students doing significantly more at-home writing than did the elementary teachers.
Table 3.7 also shows that for in-class writing, most of the teachers (both elementary and secondary) had their students producing one page pieces, followed by a substantial number also making use of writing for copying and note-taking and next a substantial number having students write one- to two-page pieces. There was only one significant difference between secondary and elementary teachers: more elementary than secondary teachers had their students writing in-class pieces of one page or less. For writing to be done at home, the pattern shifted dramatically toward longer works, especially for the secondary sample. The elementary teachers had students doing significantly more copying and note-taking and pieces of less than one page. The secondary teachers had students writing significantly more pieces of two to four pages. At home writing of more than four pages was occurring for relatively few students and significantly more for secondary students than for elementary students.

Table 3.8 contains the comparison with Applebee's sample.

To understand the comparison, one must know that Applebee asked his teachers whether they typically or occasionally assigned pieces of writing of the lengths we asked about (p. 56). Although the teachers in our sample reported assigning a piece of a particular length at the time of the survey, this assignment may or may not represent their typical practice; nevertheless, it seems reasonable to conclude that across the sample the question elicited some sense of what was typical for the group. A
comparison between these secondary teachers and Applebee's secondary English teachers was made since 95% of the secondary teachers in our survey taught English and since the English teachers in Applebee's survey proved to be the subset of his sample that taught the most writing.

The first set of paralleled items concerned the amount of writing that teachers assigned to students. Applebee found that teachers in his sample required little extended writing, usually less than a page. We hypothesized that at least our secondary teachers would require more. This comparison, in Table 3.8, shows that across the board, our teachers assigned more writing than Applebee's English teachers. It is important to note that in Applebee's sample, the English teachers assigned the most writing of any of the teachers. Applebee's teachers required significantly more writing of one page or less and of one to two pages. In contrast, the teachers in our sample required significantly more pieces of two to four pages and of over four pages.

The teachers in our sample also gave students a longer time to complete their writing, on the average 5.03 days for elementary students, and 5.21 days for secondary students, an insignificant difference across the two groups (t = .46 with 1 degree of freedom). Applebee reported that teachers in his sample expected written work to be completed in less than a week and often in less than two days (p.55).

Overall, the teachers in our sample assigned relatively long pieces of writing, assigned them often and gave their students...
adequate time to complete them. They assigned an especially great amount of in-class writing.

**Their Reasons for Teaching Writing**

We wanted to study why teachers teach writing both to compare our sample to Applebee's and to understand what was behind the teacher's response. What were the goals of their instruction? What did the teacher put forth as the kind of writing to which students should aspire? What set of values grounded the teachers' responses? Here we attempt to get a national picture of the purposes and philosophies that undergird response to student writing.

One of the questions Applebee developed for his survey allowed us both to compare our sample with his and to understand our teachers' reasons for teaching writing. The question proposed two bi-polar scales that contain reasons for teaching writing. The first scale contrasted teaching writing to help students transmit information with teaching writing to help students understand their personal experiences; the second scale contrasted teaching writing to help students understand concepts with teaching to help students develop skills. The two scales were refinements of the work of Barnes and Shemilt (1974) who, in a study of British teachers, found that some took a transmission view of the writing process and others took an interpretation view, in which students were to learn through the act of writing. Applebee's two-scaled version of the question expanded upon Barnes and Shemilt's initial sense of the differing reasons for teaching writing.

A list of items that make up the two poles of each scale...
follows, numbered to match the order in which each item was presented on our questionnaire:

List 1

Transmit information:
1. help students remember information
3. test students' learning of content
5. summarize material covered in class

Personal experience:
2. correlate personal experience with topic studied
4. share imaginative experiences
6. allow students to express feelings

List 2

Understand content
7. explore material not covered in class
9. force students to think for themselves
10. clarify what has been learned by applying concepts to new situations

Develop skills:
8. practice in writing mechanics
11. teach proper form for types of writing
12. test students' ability to express themselves clearly

From six items within each list—three representing each pole—the teachers were asked to select the two that were closest to their most important reasons for teaching writing and the two that were closest to their least important reasons.

For the analysis, the teachers' responses on each item were converted to three-point scales which indicated the possible combinations of checks for most and least important on each item. The data were analyzed first to see if the factor structure that Applebee found would hold for our sample. As we hypothesized and as Applebee suggested, "in effective instructional contexts the polarities might collapse: that most effective learning of writing skills occurs when concepts are being applied, or that subject-area information is learned best when applied in the

77 103
context of individual experience" (p. 72). We, thus, did not expect to find the two bi-polar scales that Applebee found.

For the elementary sample, teachers clustered into six factors and did not respond to the items according to the hypothesized contrasts (Table 3.9).

Rather, they created contrasts of their own, most of which were difficult to interpret. They seemed to do just what Applebee suggested expert instructors should do. Only two variables loaded on each factor. The first factor (form not thought) indicates that those who teach writing to teach the proper forms do not teach writing to force thinking; however, both groups may have had students apply concepts to new situations and both may have taught writing to test clear expression. The second factor (concepts not mechanics) indicates that those who taught writing primarily to have students apply concepts to new situations did not also teach so that the students will practice mechanics. Still, the group may or may not have taught writing to teach proper essay form. The third factor (material) contains one variable from each of the two lists and groups together those teachers who taught writing to have students explore and summarize material. The fourth factor (testing) groups together the testers, those who taught writing to test both the students' learning of content and their ability to express themselves clearly. The fifth factor (uses of personal experience) contrasts those who wanted students to correlate their experience with a topic with those who wanted students to share imaginative
experiences. The last factor (expressing feelings not remembering information) indicates that those who taught writing so that students would express their feelings did not also aim to have them write to remember information.

Throughout, information, skill development, concept development, and the relationship to personal experience are intertwined, even though aspects of the original contrasts that Applebee found do hold at certain points.

For the secondary sample, the teachers for whom the scales were designed, the teachers answered more similarly to those in the Applebee sample (Table 3.10).

Nevertheless, the contrasts are much weaker than those Applebee found. Our teachers created four rather than two factors. Applebee's first vector consisted of the list having to do with a stress on information versus a stress on personal experience. This factor is the weaker second vector for our group; furthermore, two of its six items did not load on the factor: testing content and sharing imaginative experiences. For our teachers, the distinction between stressing information and personal experience proved considerably weaker than it did for Applebee's. Applebee's second vector, the first in this analysis, proved more robust, but still showed two of the original items not loading. Although our teachers saw their mission either as helping students develop skills or as helping them understand concepts, both groups had students write so that they could test students'
use of clear expression, and both groups had students write so that the students would learn to apply concepts to new situations.

To better understand the meaning of these data, we examined the percentage of the sample on each side on each item. Table 3.11 indicates that both the elementary and secondary teachers agreed on the primary importance of teaching writing to force students to think for themselves.

Insert Table 3.11 about here

The elementary teachers also aimed to use writing to teach their students to share their imaginative experiences and express their feelings. The secondary teachers, on the other hand, also taught writing to help their students correlate their experiences with the topics being studied, and like their elementary counterparts, emphasized allowing students to express their feelings. The elementary and secondary teachers also differed in their emphasis on testing content, and differed somewhat in their stress on having students write to express their feelings, explore material not covered in class, and practice writing mechanics.

Table 3.11 dramatically shows that Applebee's secondary English teachers seemed to have a different set of values from the secondary teachers sampled here, placing significantly more stress on writing mechanics and writing as testing and significantly less stress on writing as thinking, as clarifying concepts, and as relating ideas to personal feelings and experiences.
Most of the teachers in our study aimed to teach writing to force their students to think for themselves. Teachers then wanted students to understand their personal experiences, and to connect those experiences to their learning. Writing became mostly a tool for making learning meaningful to the individual, for making the connections between the self and the academic world, and for creating pieces of art. Writing as an art form, as a way of sharing imaginative experiences, although valued at the secondary level, was most valued at the elementary level.

The Teachers' Views about Response to Writing and Other Classroom Practices: Pliability Scales

Having established that the teachers in our sample taught more writing and that they had broader views about why they taught writing than Applebee's secondary sample and understanding that underlying their response was a goal of teaching their students to think, we analyzed their views about the types of response to student writing that they saw as most and least effective in helping students learn. We also examined other related classroom practices that they found most and least effective in teaching.

Scaling Procedure

The remaining questions on the teacher surveys were first grouped into clusters of related items. Then statistical tests of reliability were performed on each cluster to see if the respondents answered the questions in the cluster in similar ways. If they did, then the group of items forms a scale. The original clusters that we tested for scaling consisted of those
questions that were of the same type conceptually—types of response given during the writing process, types of response given once a piece is complete, types of respondents, teaching techniques, types of writing included in the curriculum.

By looking at the reliability of the teachers' answers on these clusters of related questions, we can tell whether the group of teachers tended to answer the group of questions similarly. In other words, the items will form a reliable scale if teachers who circled very helpful on one question would tend to agree with one another in their answer for the next, and so on for the rest of the questions on the scale. If a scale holds together, that is if the respondents answer the items reliably, then we can conclude that there is agreement in the field about the helpfulness or frequency of occurrence of the set of items. If a scale does not hold together, there is disagreement. Lack of agreement can occur because teachers interpret questions differently; such questions then would be asking something different of different teachers and would not be good items. Alternatively, lack of agreement might occur because there is genuine disagreement in the field about the relative helpfulness of certain techniques.

Besides showing when the survey participants agreed with one another, the scaling procedure helps simplify the data. If the teachers responded to a group of items consistently, then if we want to measure the effect of other variables, say amount of teaching experience, on the response to items on the scale, it is not necessary to consider each individual item separately. Rather, the same trends would hold for all items on a scale.
The scaling was performed in several steps. First, items that had been grouped together in the design of the survey were clustered. Items that could be found on both forms of the teacher questionnaire were scaled for the entire group of teachers, for the elementary sample, and for the secondary sample. The analyses showed that the elementary and secondary samples differed on only one scale; thus, the results will be presented for the entire group except for that one scale.

Scales will be considered reliable when the alpha coefficient approximates .60. A corrected item-total correlation of above +.2 and below -.2 indicates that an item fits on a scale.

Before computing the scales, we substituted the means for missing data. Otherwise, if a respondent did not answer one item on the scale, the case would have been dropped and all of that respondent's answers for other items would have been eliminated from consideration.

Response: Scales 1, 2, and 3

During the Process: Scale 1. The first scaling was performed on a set of items on the questionnaire having to do with the types of response to writing that the teachers gave and how effective they found different types of response. Within that set was a group of questions about response during the writing process, response after a piece of writing is complete, and response from different sources--the teacher, parents, peers, and the like. The first scales checked for consistent trends in how the teachers answered these sets of items. These items were
grouped in the following combinations:

1. Helpfulness of response during the writing process (Q1 TO Q1E)
2. Helpfulness of response after the writing is completed (Q2 TO Q2E)
3. Helpfulness of response from different respondents (Q3 TO Q3E)
4. Helpfulness of response (Q1 TO Q3E)
5. Helpfulness of response during and after the writing process (Q1 TO Q2E)

Table 3.12 gives the item-total correlations first for a scale containing those items having to do with the helpfulness of response during the process (Q1 to Q1E). For this first scale, item-total correlations can be found in the next to the last column on Table 3.12. Only Q1, Q1A, and Q1C have item-total correlations over .20. The scale alpha is low, .45. When the three items with high correlations were scaled, the alpha rose to .52, still quite low. Q1C, concerning the helpfulness of peer response groups, had a correlation of .29 with the other items, but when it was dropped from the scale, the scale alpha rose from .52 to .62. Thus, the best scale, in the final column of Table 3.12, contains only Q1, the general question about the helpfulness of response during the process, and Q1A, the question about the helpfulness of individual conferences. For this scale, scale mean is 7.41, the scale variance is .82, and the standard deviation, .91.
The scaling for this group of items, asking about in-process response, shows that the teachers agreed only about the helpfulness of general response and conferences. The means for these items on Table 3.12 shows that both were considered extremely helpful (3.71 on a 4-point scale, with 4 being the most helpful). The teachers disagreed somewhat about the helpfulness of peer response groups, and a great deal about the helpfulness of written comments, grades, and student self-assessments. Overall, there was substantial disagreement among the teachers with respect to how helpful they found different types of response during the writing process.

Ironically, the teachers reported that response during the writing process was significantly more helpful to students than response after a piece of writing was finished. The general question asking about response during the writing process is compared to the parallel question asking about the helpfulness of response to final versions. (Table 3.13).

Insert Table 3.13 about here

After Writing: Scale 2. In contrast to the disagreement about the helpfulness about different types of response during the process, the teachers were consistent in their feelings about the relative helpfulness of different types of response once a piece of writing was complete (Table 3.14).

Insert Table 3.14 about here

All the items concerning response to finished writing scale well;
none has a low corrected item-total correlation. The scale alpha is .67, the mean is 18.85, the variance is 7.58, and the standard deviation is 2.75.

Paired t-tests show the significance of the differences in the means of the items on the scale. Figure 3.1 schematizes the hierarchy the teachers gave to the different types of response to final versions.

-----------------------------
Insert Figure 3.1 about here

The teachers believed that the most effective response came in individual, teacher-led conferences and peer groups, followed by student self assessments (which they considered significantly less helpful than conferences but not significantly less helpful than peer groups). These were followed at a significant distance by teachers' written comments, with grades coming last.

Responder: Scale 3. The teachers also agreed about who provided the most helpful response (Table 3.15), with all items scaling.

-----------------------------
Insert Table 3.15 about here

The scale alpha is .69, the mean is 19.60, the variance is 5.36, and the standard deviation is 2.32.

Matched pair t-tests of the items on the scale (Figure 3.2)

-----------------------------
Insert Figure 3.2 about here

show that the teachers found themselves the most helpful responders to their students' writing. Next came classmates.
Then came other teachers. And last were parents and other adults.
Rescalings. Items from these first three scales were combined to determine whether the scales could be made stronger, to see if these items scaled more reliably on a larger scale. Combining all items having to do with the helpfulness of response (the first column on Table 3.16) yields an alpha of .69, a scale mean of 56.80, a variance of 24.84, and a standard deviation of 5.0.

Combining only those items having to do with the helpfulness of response during and at the end of the process (the second column on Table 3.16) yields an alpha of .60, a scale mean of 37.20, a variance of 14.05, and a standard deviation of 3.75. Although the alphas for the combined scales are higher than for the separate scales, the change is about what would be expected with additional items. Thus, the boost is not significant enough to justify combining the scales in either combination. Further, for both rescalings some items show low corrected item-total correlations. The types of in-process response, response to final versions, and the responder indeed formed separate, independent sets of items; the teachers saw them as different from one another.

After eliminating the scales in Table 3.16, we were left with three scales for response to student writing (Tables 3.12, 3.14, and 3.15).

Types of Writing Taught: Elementary Teacher Scale

The next scales center around questions asking about the
amount of focus on different types of writing in the curriculum (Q11A to 11G on the Elementary Questionnaire and 12A to G on the Secondary Questionnaire—Appendix 3). For these items, no scale could be formed for the entire teacher group. It seemed reasonable that elementary and secondary teachers would teach writing in different configurations; thus, these items were scaled for each sample, separately.

Table 3.17 shows the scale for the elementary sample.

| Insert Table 3.17 about here |

If all types of writing are included in the scale, the item-total correlations (the first column of item-total correlations on Table 3.17) show that several types have low correlations, that is, do not scale well. The alpha is only .45. A rescaling with only those types of writing with high correlations (correspondence, personal experience, and discovery) only has an alpha of .36, but if writing for oneself is added, the alpha rises to .48. Thus, the revised version of the scale for the elementary teachers includes items A, B, C, and E (the last column on Table 3.17). The new scale has an alpha of .48, a mean of 8.52, a variance of 4.79, and a standard deviation of 2.19. It seems that the elementary teachers teach personal types of writing in essentially the same proportions. However, beyond personal writing, they did not agree about what else they emphasized. Even for this scale of personal writing, the alpha of only .45 shows that the agreement level is not terribly strong.

The secondary teachers, on the other hand, did not agree on
the types of writing they taught (Table 3.18).

The scale alpha is only .29. Other combinations of these items did not scale any better. Those secondary teachers likely to emphasize one type of writing were not necessarily likely to emphasize another.

**Teaching Techniques: Scale 4**

The final set of items concerns how often these teachers used different types of teaching activities (Questions 15 TO 27 on the Elementary Questionnaire and 16 TO 28 on the Secondary Questionnaire in Appendix 3).

When this entire set of items is grouped together, Q22 and Q23 show low item-total correlations (the next to the last column on Table 3.19).

Deleting Q22, the frequency of marking all problems on final pieces of writing, raises the scale alpha from .61 to .62; also deleting Q23, the frequency of assigning grades on final pieces of writing, raises the alpha to .65; and also deleting Q25, the frequency of sequencing assignments, raises the alpha to .69. Thus, for the revised scale, we delete those three inconsistent items. The revised scale has a mean of 31.81, a variance of 15.05, and a standard deviation of 3.88. The teachers agreed about the relative frequency of use of other classroom techniques.
Another Look at Teaching Techniques and Response: Scales 5, 6, and 7

After completing the initial scaling, we grouped together all questions having to do with teacher, peer, and self-response—both the perceived helpfulness and the frequency of use. This regrouping led to three new scales, containing combinations of items from other scales. The new scales are:

1. Teacher response—written comments and grades (Q1C, Q10, Q2C, Q2D, Q22, Q23) (Table 3.20)
2. Peer response (Q1B, Q2B, Q3A, Q2D) (Table 3.21)
3. Self-response by the writer (Q1E, Q2E) (Table 3.22)

Teacher Responder: Scale 5. Table 3.20 shows the scale for teachers' written responses.

Other items having to do with teacher response did not fit on this scale. The scale alpha is .70, the mean is 14.42, the variance is 12.06, and the standard deviation is 3.47.

Peer Responder: Scale 6. Table 3.21 shows the scale for peer groups.

The alpha is .66, the scale mean 13.19, the variance 4.39 and the standard deviation 2.10.

Writer Responder: Scale 7. Table 3.22 shows the scale for self-response.
Here the alpha is .53, the scale mean is 6.48, the variance is 1.42, and the standard deviation is 1.19. The alpha is relatively weak.

Summary of Teacher Scales

In the end there were seven scales for the teacher questionnaires:

SCALE 1--RESPONSE DURING THE PROCESS--TABLE 3.12
SCALE 2--RESPONSE AFTER WRITING--TABLE 3.14
SCALE 3--RESPONDER--TABLE 3.15
SCALE 4--TEACHING TECHNIQUES--TABLE 3.19
SCALE 5--TEACHER RESPONDER--TABLE 3.20
SCALE 6--PEER RESPONDER--TABLE 3.21
SCALE 7--WRITER RESPONDER--TABLE 3.22

An eighth scale holds for the elementary sample only and has to do with the types of writing taught (Table 3.17).

At the completion of the scaling, the only item on the teacher questionnaires that did not form a scale with any other was Q25, having to do with the sequencing of assignments.

Table 3.23 summarizes the scale alphas, scale means, standard deviations, and variance, and the mean of the average "item" and the average standard deviation.

Insert Table 3.23 about here

Scale Correlations

A Pearson Product Moment test of correlation showed the correlations across the seven scales. If the scales proved highly correlated, they would not be separate. It was expected
that there would only be sizable correlations between those scales with overlapping items (scale 1 or 2 or 4 and scale 5; scale 1 or 2 or 3 or 4 and scale 6; scale 1 or 2 and scale 7). For this analysis, the means were not substituted for missing data, since the scales had been formed. Table 3.24 shows the correlations.

---

Insert Table 3.24 about here

---

The scales proved relatively independent. For the scales with overlapping items, the correlations ranged from a low of .065 between scales of 4 and 5 to a high of .514 between scales 4 and 6. For the scales without overlap, the two most highly correlated were 2 and 3 with a correlation of .272 and scales 6 and 7 at .325.

The Secondary Students' Views about Response to their Writing and Other Classroom Practices.

The items on the student questionnaire also were divided into scales, and the reliability of the items determined.

The Writing Students Do: Scale 1

The first scale contains two items that are different ways of asking students whether the students felt that they wrote a lot in the class of the survey teacher (Table 3.25).

---

Insert Table 3.25 about here

---

The means for these items indicate that students consistently felt that they did a great deal of writing in this class. The scale alpha is .52, the mean is 6.86, variance is 1.63, and the standard deviat. 1.28.
Opinions about Response: Scales 2 and 3

The next group of items concerns how students perceive different types of response to their writing.

During and After Writing: Scale 2. The secondary students were more consistent than their teachers in their sense of the helpfulness of different types of response both during and after the writing process. The most reliable scale for the students included their answers to questions having to do with response both during and at the end of the writing process (Table 3.26).

When items having to do with response during the writing process (Q28) were scaled separately, the alpha was .69 and when response to completed writings (Q29) was scaled separately, the alpha was .71. The scale of the combined items in Table 3.25 has an alpha of .80, a significant enough boost to justify a single scale. The scale mean is 33.33, the scale variance is 63.11, and the standard deviation is 7.94.

The students had a different hierarchy of values than their teachers. A comparison of the means for the items on the student scale shows that the students consistently found some types of response more helpful than others (Figure 3.3).

Unlike their teachers, the students preferred written comments at the end of the process significantly more than any other type of response. They next preferred individual conferences during the
process. Then they preferred grades on their final versions, conferences on their final versions, and comments written by their teacher on their drafts. Significantly less helpful, they said, were responses from their peers on their drafts, followed by responses from their peers on their final versions. They did not find their self-assessments particularly helpful either during the process or at the end. And significantly less helpful still were grades during the process.

Unlike their teachers, secondary students found response after finishing writing significantly more helpful than response during the process (Table 3.27).

Insert Table 3.27 about here

Responder: Scale 3. The next scale has to do with who the students found the most helpful responders (Table 3.28).

Insert Table 3.28 about here

This scale has an alpha of .80, a scale mean of 17.58, a scale variance of 35.79, and a scale standard deviation of 5.98.

A comparison of the means of the items shows that the secondary students agreed with their teachers (see Figure 3.2) about who the most helpful responders were, except that they valued their parents' comments more than their teachers did. They placed their parents third, after classmates and before other teachers and other adults (Figure 3.4).

Insert Figure 3.4 about here

Types of Writing: Scale 4
Unlike their teachers, the students had a consistent sense of the types of writing they were producing. With the exception of report writing, the types of items formed a single scale. (Table 3.29).

The scale alpha is .63, the mean is 11.30, the scale variance 18.73, and the standard deviation is 4.33. Q14, about short report writing, had an item-total correlation of only .14 with the rest of the scale, and if it were included, would have dropped the scale alpha to .61.

Paired T-tests on the means for this scale (Figure 3.5) indicate that across the sample, the students said they wrote mostly analytic essays.

They reported next most frequently writing fiction and personal experience essays. They reported writing significantly less frequently to explore ideas. Less frequent still was correspondence with the teacher, and least frequent of all was writing journals for themselves.

Teaching Techniques: Scales 5 and 6

The next scales have to do with the amounts of different types of writing activities that students engaged in as part of the class, including the amounts of types of response. These activities are, for the most part, parallel to the teacher questions about teaching techniques.
Techniques: Scale 5. The first scale subsumes most classroom activities (Table 3.30).

All items asking about the frequency of different teaching techniques form this scale, with the exception of the two items concerning topic assignment. The scale without those items has an alpha of .71, a mean of 29.53, a scale variance of 25.72, and a scale standard deviation of 5.07.

Although Q22 (which asks how often the teacher gives grades on final versions of the student's writing), only has a correlation of .19 on the final scale, it is included because the scale alpha is not raised by removing it. The item probably does not scale well because there is so little variance in the responses to it. Students perceived that grades were universally given by their teachers on completed versions of their writing.

The means show that generally the students also reported that their teachers almost always wrote comments on their completed writing. They also reported a high frequency of their teachers' writing comments on what was strong as well as what was weak in their writing. Their teachers also held class discussions about topics before they wrote. Least frequent was their teachers' informing them about an audience. Other techniques between the extremes, in order of frequency from high to low, were: student talk during the writing process, teacher talk during the writing process, teacher talk about completed writings, teachers' written comments during the process, student talk about completed writing.
Topic: Scale 6. The separate scale concerning techniques of topic assignment showed that if a student reported that the teacher assigned the topic, the student did not claim to create the topic (Table 3.31).

Insert Table 3.31 about here

The correlation is .75, the scale mean is 5.42, the scale variance is .74, and the scale standard deviation is .86. 2

Another Look at Teaching Techniques and Response: Scales 7, 8, and 9

The next scales combine items having to do with the helpfulness of certain types of response and the frequency with which the students receive the response.

Teacher Response: Scale 7. The first set of items concerns response from the teacher (Table 3.32).

Insert Table 3.32 about here

The alpha is .77, the scale mean is 35.88, the scale variance is 48.52, and the scale standard deviation is 6.97. The students agreed that comments from their teachers written on their final versions were the most helpful and most frequent type of teacher response. In these comments their teachers almost always rated strengths as well as weaknesses. The frequency and helpfulness scores match. Students also found conferences with their teacher during the process to be helpful. They reported that their teachers held conferences somewhat frequently, and they perceived them to be extraordinarily helpful.
Peer Response: Scale 8. The next set of items has to do with the helpfulness and frequency of student response (Table 3.33).

Insert Table 3.33 about here

Students reported that peer response was used often but that it was only somewhat helpful. They preferred this type of response during the process and found that it occurred most frequently then. The scale alpha is .76, the scale mean is 13.41, the variance 13.82, and the standard deviation 3.72.

Self-Response: Scale 9. Two items form a scale about the helpfulness of self-response, which was seen as relatively unhelpful at any point during writing (Table 3.34).

Insert Table 3.34 about here

The alpha is .76, the scale mean is 4.18, the scale variance is 6.67, and the scale standard deviation is 2.58.

Summary of Student Scales

In the end, there were nine scales for the students:

SCALE 1--AMOUNT OF WRITING--TABLE 3.25
SCALE 2--RESPONSE DURING AND AT THE END OF THE PROCESS--TABLE 3.26
SCALE 3--RESPONDER--TABLE 3.28
SCALE 4--TYPES OF WRITING--TABLE 3.29
SCALE 5--CLASSROOM ACTIVITIES--TABLE 3.30
SCALE 6--TOPIC ASSIGNMENT--TABLE 3.31
SCALE 7--TEACHER RESPONDER--TABLE 3.32
SCALE 8--PEER RESPONDER--TABLE 3.33
Only three items on the student questionnaire did not fit into any scale: Q3, Q14, and Q22. Q3, which concerned the amount of writing students did, had a different number of categories from the other related items which formed scale 1; therefore, this item could not be considered parallel to the others. Q14 asked the students about how often they wrote short reports—book reports, news reports or short research reports. It is unclear why this item did not fit on scale 4. Q22 asked the students how often they received grades on their completed writings. There was probably not enough variance in the responses to this item to allow it to scale; 76.4% of the students responded that they "almost always" received grades on completed writings.

Table 3.35 summarizes the alphas, the scale mean, standard deviation and variance, and the mean "item" score and "item" standard deviation.

---

Insert Table 3.35 about here

---

Scale Correlations

A Pearson Product Moment test of correlation showed that the nine scales for the student questionnaire were relatively uncorrelated (Table 3.36).

---

Insert Table 3.36 about here

---

However, the student scales show higher correlations than the teacher scales (see Table 3.24). Scales 1 through 6 contained no overlapping items. Of these, scales 4 and 6 were least highly
correlated at .07, but 3 and 5, the most highly correlated, were at .53. For those scales containing overlapping items, the correlations rose as high as .86 between scales 5 and 8.

Influences on Scales

The next step in the analysis was to examine whether any variables influenced how the teachers and students responded to the items on the questionnaire. Since the respondents answered the items on a scale in a similarly patterned way, we examined whether the different variables influenced the scale means rather than each individual item mean. For these analyses, means were not substituted for missing data.

Teachers

The teachers' personal characteristics of gender, teaching experience, and age were tested for their influence on how the teachers responded to the items on the seven teacher scales. Also, aspects of their teaching situation were examined: the grade they taught, the socioeconomic status of the students, the geographical region of their school, the setting of the school (urban, rural, etc.), and the size of the school. When there were only two levels of a variable, as was the case with gender, a t-test was used to test the differences in the scale means for the two levels of the variable. When there were more than two levels, as was the case with the remaining teacher variables, an ANOVA was run and an F-test computed. The average item means for the different levels of the variables can be compared to the average item mean for each scale reported on Table 3.23.

Gender. In the case of gender, t-tests showed that for
scales 4 (teaching techniques) and 7 (self-response), the teacher
gender made a difference in how the teachers responded to the
items on the scales (Table 3.37).

On the whole, the average item means show that the female
teachers reported more frequent use of different teaching
techniques and thought student self-response more important than
did their male counterparts.

**Teaching Experience.** The variable, teaching experience, was
recoded into five categories: five years or less, 6 to 10 years,
11 to 15 years, 16 to 20 years, and over 20 years. The amount of
teaching experience affected responses only on scale 4: teaching
techniques (Table 3.38).

The means for each of the categories show that the more
experience teachers had, the more teaching techniques they used,
until teachers had 20 or more years of experience. At that point
there was a decrease in the use of different techniques (Table
3.39).

**Age.** The variable age, like experience, was recoded into
five categories: under 29, 30 to 39, 40 to 49, 50 to 59, over
60. This variable affected answers on scale 4, teaching
techniques, and scale 6, peer response (Table 3.40).
For scale 4, this time the relationship was linear, the older the respondent, the higher the scale mean (Table 3.41).

Table 3.39 also shows the trends for scale 6, peer response. Again the item mean for the scale shows a steady rise with teacher age which levels off after age 40.

**Grade Level.** We next examined the response patterns for teachers who taught different grade levels (K-3, 4-6, 7-9, 10-12). In the cases when teachers taught more than one grade level and the grades spanned the categories, the teachers were placed where they taught the most students; when that proved impossible to determine, their responses were treated as missing data. Table 3.42 shows that the grade level taught influenced responses on three scales: 4, 5, and 6.

The means for the different grade levels on these scales are reported in Table 3.43.

On scale 4, teaching techniques, teachers of grades 4 to 6 used the techniques more than the other groups. Teacher response (scale 5) was valued more and used more as the grade level of the students increased. Peer response was used most and was found most helpful by teachers of the 4-6 grade range, above the
average for the scale; it was used least and found least helpful by those teaching K-3 and 10-12, below the average for the scale. The teachers of grades 7-9 used peer response an average amount and found it helpful an average amount.

**Student Socioeconomic Status.** The next F-tests examine whether teachers teaching large numbers of students of low socioeconomic status answered items on any of the scales differently from those who teach fewer such students. Although it was only possible to obtain a gross sense of socioeconomic status on a questionnaire such as this, we were able to determine the percent of students at the poverty level, students lacking the basic necessities. We recoded this level of the variable as follows: teachers teaching no students lacking the basic necessities; teachers teaching from 1 to 10% such students; those teaching from 11 to 25% such students; those teaching from 26 to 50% such students; and those teaching from 51 to 99% such students. Then we examined how the different groups of teachers responded to the items on the scales (Table 3.44).

We found that scale 5, teacher response, was the only scale affected by the socioeconomic status of the students taught. Table 3.45 shows that teachers believe their response less helpful and give them less frequently if they teach more poverty level students.

The one exception is teachers of from 26 to 50% students at the
poverty level, who give and value their response as much as those who teach 10% or fewer. They both gave an average amount of response and valued it an average amount. The teachers of no poverty level students gave above the average and those teaching 11 to 25% and over 51% poverty level gave less than average and thought the response they gave less helpful to their students.

**School Region.** The school's location was grouped into the same six geographical regions as in Table 3.2. Region affected the ways the teachers responded only to scale 5, teacher response (Table 3.46).

-----------------------------
Insert Table 3.46 about here
-----------------------------

Table 3.47 shows that the scale means for the northeast and for non/American foreign schools were high.

-----------------------------
Insert Table 3.47 about here
-----------------------------

**School Area.** The other category having to do with school location examines whether the school is in a rural area, a small town, a suburb, a large urban area, a small urban area. Table 3.48 shows the effects of region on the different scales.

-----------------------------
Insert Table 3.48 about here
-----------------------------

School region affects answers on two scales, scale 1 having to do with the helpfulness of in-process response, and scale 7 having to do with the helpfulness of student self-response. The means for the different regions on scales 1 and 7 can be found in Table 3.49.
For in-process response, the regions which were not classifiable, valued in-process response most, followed by those from suburban areas and then those from rural and large urban areas. Teachers in small towns and small urban areas valued it least. Self-response was thought more important by teachers in rural areas and then by those in large urban and suburban areas. It was valued least by those in small towns, the non-classifiable areas, and small urban areas.

School Size. The school size had a significant effect only on scale 5, teacher response (Table 3.50).

Of the four categories of school size (schools with enrollments under 500, between 500 and 999, between 1000 and 2499, and over 2500), the larger the school, the more frequent and helpful was teacher response, with the exception of a drop for teachers in schools with over 2500 enrollment (Table 3.51).

Teachers gave their students more response than average and found it more helpful than average if they taught in a school with an enrollment of between 1000 and 2499. They found their response less helpful than average and gave it less frequently if they taught in a school with under 500 enrollment. Since the elementary teachers taught in smaller schools and since they...
valued response least, this analysis may, in part, be reiterated in the analysis for grade level.

**Students**

We examined how two personal characteristics of the students affected their responses on the students' scales: gender and ability level. In addition, we looked for effects caused by grade level and geographic region.

**Gender.** The students' gender had a significant effect on responses on five of the nine scales, four of these at the .001 level (Table 3.52).

The means on Table 3.52 show that across the board, the females gave the significantly higher scores. On scale 2 females reported that response to their writing was more helpful than males. On scale 3, the scale having to do with who the responder is, the trends were similar. On scale 4, the types of writing taught, the females reported being taught more writing; on scale 7 the females reported more frequent and more helpful teacher response; on scale 8, the females reported more frequent and more helpful peer response.

**Ability.** Student ability level influenced the students' responses on three of the scales, two at the .001 level (Table 3.53).

Table 3.53 also shows the means for the levels of ability for the scales. On scales where there were significant differences,
students of higher ability reported that they wrote more (scale 1), found peer response more helpful and received it more (scale 7), and wrote more in the different writing types (scale 9), than did their lower ability counterparts.

**School Region.** The geographical region of the student’s school only affected scale 9, having to do with self response (Table 3.54).

---

Insert Table 3.54 about here

---

The means for scale 9 (Table 3.55) indicate that the students in the South valued self response most; they were followed by students from the northeast and foreign American schools.

---

Insert Table 3.55 about here

---

**Grade Level.** Grade level affected responses on four scales: amount of writing (scale 1), classroom activities (scale 5), topic assignment (scale 6), and peer response (scale 8) (Table 3.56).

---

Insert Table 3.56 about here

---

The means for each grade level for the scales affected are reported in 3.57.

---

Insert Table 3.57 about here

---

Students reported an increase in writing (scale 1) from grade 7 to 8 to 9, then a decrease in grade 10 (back to the 8th grade level), and finally a steady rise after grade 10 to the highest
level in grade 12. Response on classroom activities (scale 4) followed the same trend. Students judged their peers more helpful (scale 8) as the students' grade level increased, except for the 10th graders who, more than students in any other grade, found their peers least helpful. This trend complements that reported by the teachers (Table 3.42) who indicated a decrease in the use and helpfulness of peer response in grades 10-12. Topic assignment (scale 6) was influenced by grade level but is difficult to interpret because the items were negatively related.

**Summary and Discussion**

The surveys were centered around finding out how successful teachers of writing (K-12) felt about the helpfulness of different types of response to student writing and how frequently they used different types in their classrooms. In addition, a set of surveys given to students of some of these secondary (7-12) teachers examined their students' perceptions of the helpfulness and frequency of the response they received. To place the teachers' and students' opinions in a larger context, we also asked questions about the backgrounds of the survey participants, the kinds of writing being taught, the amount of writing required, and the teachers' reasons for teaching writing. The last two types of questions (amount of writing and reasons for teaching writing) allowed a comparison between our sample of teachers and those surveyed by Applebee in his more general study of the teaching of writing in the secondary school.

Results revealed, first, that our sample of teachers was different from Applebee's in several important ways. First, our sample had their students writing a great deal, both according to
the teachers' reports and according to the reports of the secondary students. The teachers reported that the writing involved the production of extended pieces, often of a page or more, significantly more longer pieces and fewer shorter pieces than reported by the teachers in the Applebee sample. The students, as well, reported doing significantly more writing for the class of the survey teacher than for their other classes. They also reported an increase in writing from grade 7 to 8 to 9, then a decrease in grade 10 (back to the 8th grade level), and finally a steady rise after grade 10.

Whereas Applebee's teachers reported teaching writing for restricted reasons, our sample reported teaching writing primarily to help their students think, and in achieving this goal they valued both the form and substance of the piece.

We have reason to believe that our sample contains many of the most successful and dedicated teachers of writing in our country (and a few from abroad as well). As a body, they show off the best current practice and the most sophisticated "teacher knowledge." At the very least, they have their students write; there is "time on task."

We next turn to an analysis of these teachers' feelings about and practices with respect to response to their students' writing. We first examine what the teachers agree about and what they disagree about to gain a sense of the state of knowledge in the field. A look at what their students agree and disagree about and how their opinions coordinate with their teachers' gives further information about which aspects of these generally
successful teachers’ practices are considered most and least successful by their students.

The most problematic aspect of response proved to be response during the writing process. Our sample of teachers found response given during the writing process to be significantly more helpful to students than response to their final versions. However, they disagreed with each other about the types of response that were most helpful to students during the process. This aspect of response, judged most important, may also be the most difficult to accomplish. Certainly the profession is full of debates about what it means to “teach the writing process.” Perhaps adding to the difficulty is the fact that the secondary students believed that the response they received to final versions was significantly more helpful than response during the process. Marshall (1984) discusses the difficulties involved in applying the “process approach” in school settings. He concludes, “To speak of composing processes without reference to the school which shapes them may be to isolate an effect from its cause” (p. 119). Further Applebee (1984) pinpoints two reasons for the difficulties of process instruction in secondary schools. First, he notes that “process-oriented activities are not appropriate to the typical uses of writing in the high school classroom” (p. 187); whereas the teachers in our survey may be reaching for the atypical, the students are bound by expected school conventions. Further, Applebee (1984) feels that “the process approach to writing instruction has been inadequately and improperly conceptualized... [and that] instructional applications have
lacked a framework for integrating process-oriented activities with an analysis of the demands that particular contexts for writing pose for particular students" (p. 188).

The teachers in our survey, we hypothesize, understand the importance of individualizing instruction during the process, but have difficulty figuring out exactly how to accomplish the individualization, given the constraints of the school setting and the expectations their students bring with them. Even when they disagreed about how best to provide for in-process response, they agreed that in-process, teacher-student conferences were extremely helpful to their students. And their students concurred. Although the teachers and students thought conferences helpful at every point in the process, they did not report using them very frequently. It is likely that the organization of the public school, makes having conferences difficult. Undoubtedly the problems are exacerbated at the secondary level, with students on inflexible schedules and with class periods lasting less than an hour.

The teachers had no problems with response to final versions of student writing. They agreed about the relative helpfulness of different types of response to final versions of student writing. At this point in the process, they believed the most effective response came in individual, teacher-led conferences and peer groups, followed by student self assessments (which they considered significantly less helpful than conferences but not significantly less helpful than peer groups). These were followed at a significant distance by their written comments,
with grades coming last. The students, unlike their teachers, preferred written comments at the end of the process significantly more than any other type of response.

Peer response groups were definitely used more frequently and considered more helpful, under a special set of conditions, from both the teachers' and students' points of view. Most striking is the fact that as the teacher's chronological age increased, the more likely he or she was to make use of peer groups. Perhaps the older teachers, further removed from their students in terms of generation, achieved rapport with their students through more extensive peer work. It may also be that older teachers are more secure about their level of control and are both better able to manage the organization of come with small groups and are more willing to relinquish some of their own control. Also striking is the fact that peer groups are considered more effective and are used more with students of certain ages. Teachers of grades 4-6 and then 7-9 valued and used peer response most, and teachers for K-3 and 10-12 valued and used it least. Interestingly, students in grades 7 through 12 judged their peers more helpful as the students' grade level increased, except for the 10th graders who found their peers less helpful than did students in any other grade. Consistent with the trend for some of the other scales, females and higher ability students liked peer response more than their male and lower ability counterparts.

The teachers and students agreed that the most helpful responders were the teachers themselves, with classmates coming next. The students valued their parents' comments more than
their teachers did.

Written response was considered by the teachers more useful and was given more frequently as the grade level they taught rose. The teachers likely judged their students would be better able to comprehend their written comments as the students' age increased. The students, however, from grades 7-12 did not feel any differently about written teacher response according to their grade level. Somewhat disconcerting is the fact that for the teachers, their written response patterns varied depending on the socioeconomic level of the students they taught. Generally, the more students at poverty level that the teacher taught, the less frequent and less helpful teacher written response was seen to be. However, those teachers with classes of between 26 and 50% of such students offered an exception to this trend. It is important to note, though, that there was no other differential trend related to student socioeconomic status.

With respect to other particular classroom techniques, the teachers agreed on the importance of using talk about writing before writing and of responding to strengths as well as weaknesses in their students' work. The students agreed that their teachers carried out these activities. Surprising is the fact that the teachers reported relatively infrequent publishing of their students' writing. The teachers disagreed with one another about the importance of marking every problem in student writing, about how often they assigned grades to finished pieces, and about how often they sequenced writing assignments. The students reported that their teachers almost always gave them
grades and wrote comments on their completed writings. It is possible that fashionable trends in the field may at some points have gotten confused with actual practice. Certainly written comments and grades have received “bad press” lately in professional journals; however, the institutional pressures of schools and pressures from the community may in fact make it difficult to relinquish these practices. Thus, teachers may be confused in their reports of what they do in an area such as this.

Another area of confusion in the profession has to do with the types of writing taught, the curriculum. And this is another area where the literature in the profession and the pressures of the schools and the community may come into conflict. The teachers showed no patterns in teaching different types of writing. Those who said they were likely to emphasize one type of writing did not necessarily report emphasizing another. Curious is the fact that the secondary students, unlike their teachers, had a consistent sense of the types of writing they were producing. They said that they wrote mostly analytic essays, and then next most frequently they reported writing fiction and personal experience essays. They said they wrote significantly less frequently to explore ideas. Less frequent still was correspondence with the teacher, and least frequent of all was writing journals for themselves. They disagreed about the amount of short report writing. It seems ironic that the teachers, as a group, did not have a coherent sense of the types of writing they were teaching, whereas their students did.

In the next chapters, with the detailed look at response in
the classrooms of two successful ninth grade teachers, we attempt to understand the nature of the response process. We pay particular attention to response during the writing process, the type of response that comprised well over 90% of the response that we observed and the type of response that proved most problematic to the survey teachers. We focus on how in-process response is accomplished in the classroom context, how much of it is individualized, what values underlie the response that is given, and how the student and the teacher understand the classroom events. We aim to understand both points of conflict and points of agreement. We do not attend to the issue of the curriculum, types of writing taught; rather, we control our study and examine only the teaching of analytic writing, the type of writing the students agree they do the most.
Footnotes for Chapter 3

1 The numbers in parentheses refer to question numbers on the Teacher Surveys in Appendix 3. The numbers are keyed to the items that formed the basis for the original attempts to form the scale.

2 A Spearman-Brown split-half correlation coefficient was used for this scale instead of alpha. The negative relationship between the two items made the alpha uncomputable.

</table>
For the three questions asking teachers about their major, there were originally eight categories. Since relatively few teachers majored in any discipline other than English or education, the remaining six categories for major were collapsed into the category "other" for purposes of reporting percentages. For the Chi-square tests, all categories were used and so there are 7 degrees of freedom.

1 g < .05. II g < .01. III g < .001.

Chi-square test: $49.471$ (df = 3)

Differences between the students' and teacher's responses cannot be determined because the number of categories for this variable differed across the questionnaires. On the student questionnaire there were six categories, the additional categories being specifications of the category "none past high school" which included work-fulltime, work and then go to college, and military service. Percentage comparisons were made across the categories by combining these three student categories and including them in the category, "none past high school."

$\chi^2 = .361$.

</table>

The first T-test (a) measures the difference in the means of the elementary students doing in-class writing versus those doing out-of-class writing. The next T-test (b) compares the mean of the secondary students doing in-class writing with those doing out of class writing.

The first Chi-square test (a) measures the difference in elementary and secondary in-class; the second (b) measures the difference between elementary and secondary out-of-class.

</tbody>
</table>

\( a \) The first Chi-Squares (a) contrast the elementary and secondary teachers in this sample; the second Chisquares (b) contrast the secondary sample here with Applebee’s secondary English teachers. There are two degrees of freedom because there are two groups of teachers and a three point scale.

\( b \) For the second list, n=141 for Applebee’s sample.

As a profession, we generally think of response as a clearly circumscribed event characterized by such parameters as the participants of the event; the channel, oral or written, of response; or the situational context in which response can occur, such as peer groups or written comments by the teacher. Most studies of response focus on one type of event at a time (e.g., conferences [Carnicelli, 1980; Freedman & Sperling, in press; Jacobs & Karliner, 1977; Kamler, 1980]; peer groups [Gere & Stevens, in press; Nystrand, 1984]; written comments [Beach, 1979; Hahn, 1981; Hillocks, 1982; Marshall, 1984; Searle & Dillon, 1980; Sommers, 1982]). None have examined how successful teachers coordinate different types of response, although Dillon and Searle (1983) reported on a study of the response practices of usual teachers (K-12) whom they found responded almost solely in the form of written comments to final versions of their students' writing.

Besides having not examined how successful teachers coordinate response in the classroom context, we understand little about the features of different types of response. We have tended to assume a common understanding; in fact, in the National Survey for this project, we, also, assumed common understandings and focused many of our questions on the usual parameters. Categorizing response events in this manner can be
useful in the way that categorization is always useful—we get a systematic basis for discussion and analysis that has a certain efficiency in its abstraction as long as all parties understand the abstractions in the same way. However, as we had originally speculated, what the survey ultimately intimated, what the two teachers in our ethnography foreshadowed in our interviews with them, and what our field notes finally prompted us to closely consider, was that in actual practice response events are not all that clearly circumscribed. As Hayakawa (1939) rather succinctly put it, Cow₁ is not Cow₂.

As a first step in understanding what we had observed over the months in the two ninth grade classrooms, we decided, first, to attempt to identify the response that we observed and then to characterize the response as completely as we could. We wanted to depict the scope and character of the response we would be analyzing in more depth in future chapters. It was obvious to us, from the start, that the teachers we observed offered a rich range of response, unlike the teachers that had been described in past naturalistic studies (e.g., Applebee, 1981, 1984; Graves, 1978; Searle and Dillon, 1983). We thus refined a coding system and performed a set of statistical analyses on the response data. We were aware that coding and statistical analyses would still give only a general and abstracted picture of what was occurring, leaving out the kind of information that can add to our understanding of the workings of response in a particular classroom. Yet we decided that it was important to develop a coding system because it would allow us test hypotheses about the response patterns we had observed in the two classrooms. Our
observations had led us to the following set of hypotheses 1:

1. The teacher will be the most frequent responder to student writing.
2. The frequency with which students give response will vary depending on the teacher.
3. Whether response is most frequently aimed at one writer or at a group of writers will vary depending on the teacher.
4. The teacher will most frequently initiate the response.
* 5. Response will occur most frequently during whole-class discussions.
6. The frequency of response that occurs in conferences will vary depending on the teacher.
* 7. The frequency of response that occurs in peer groups will vary depending on the teacher.
8. The frequency with which students initiate response will vary depending on the teacher.
9. Response will occur most frequently during the writing process rather than to final versions.
10. The frequency of response directly or indirectly related to the assignment will vary depending on the teacher.
11. The frequency of response coordinated by a piece of writing (or a formal speech) will vary depending on the teacher.
12. Response will most frequently be cognitive-based.
**Procedures for Analysis**

**Preparation of the Data**

Although the Scribe daily had coded the observed response events that were recorded in the notes (see Chapter II), this approach to coding proved problematic. First, the coding system only partially characterized the nature of the response that we saw. Second, the coding, being based solely on the field notes, only captured those response events recorded in the field notes; many events that the recordings picked up were not in the notes. Thus, we began to use the other data sources to supplement the field notes, and then we revised the coding system so that it would more accurately capture the range of the response occurring in Ms. Glass and Mr. Peterson's classes.

The record of response, which was the data to be coded, consisted of the field notes supplemented by reviewing, sometimes several times, each day's videotape, as well as each audiotape that involved a focal student in a peer group. This reviewing procedure yielded a complete data base for explaining more precisely what happened in the classroom. In all cases where we identified some kind of response as taking place, the talk was transcribed verbatim. Besides yielding a complete record, the task of viewing and reviewing the tapes and supplementing the field notes helped to sharpen our impressions of response during the selected assignment sequence. The activity also served to expand our notions of how to devise a more complete coding system that would yield a clear picture of how response functioned in these classrooms.
Development of Elaborated Coding System

Unit of Analysis: The Episode. To develop a coding system, we first had to specify the unit of analysis. As we examined the data, it became apparent that response activities often come nested. That is, a small response activity may be embedded within a larger one. In a class discussion geared toward the teacher's giving a writer oral feedback, for example, the students might be asked to fill out their own written evaluations for the writer and then discuss them as a class. Or, on a finer level, the teacher might respond to a number of offerings from different individuals, these being part of a larger class discussion structured around a common topic. We called these smaller events "episodes." They can be thought of as topically-related chunks of talk, separated by well-marked change-of-subject intonation or lexical markers such as "OK, now...." These formed our unit of analysis as they captured the kind of information that we wanted from the data.

We recognized and considered, however, finer subdivisions of response events. For example, we found episodes to be made up of smaller events or "rounds" (to use the term that Garvey, 1977, gives to subsets of larger interactional episodes of adult-child interaction), and rounds to be made up of turns, and so on. None of these finer subdivisions, however, gave us any more crucial information than we could get from episodes, and agreeing on where they began and ended proved highly unreliable. (For more information on episodes, see Coding Manual, Appendix 11, and see Mehan's [1979] discussion of topically related sets, pp. 65-71.)

Categories for Coding. The next task was to decide on
coding categories that could be used to characterize each episode. We decided on the categories after carefully studying the elaborated field notes and tape recordings of the classrooms. We wanted a set of categories that would give us an accurate picture of what was occurring in the two classrooms, and also a basis for comparison between the two. The categories which we kept from the original coding of the notes included: (1) who was involved in giving response (Responder); (2) who was involved in receiving response (Recipient); (3) whether response was oral or written or some combination of the two (Channel); and (4) whether the response occurred during the writing process or afterward to a final draft (Time). The following categories were added: (1) who initiated events that yielded response (Initiator); (2) in what situational context--whole-class, peer group, conference--the response episodes occurred (Context); (3) whether the response was targeted so that it had the potential of being incorporated directly into the assigned writing (Target); (4) whether an already-formed piece of discourse such as a paragraph, essay, film, or speech, served to coordinate the response (Text); and (5) what the orientation for the response was--cognitive-based, text-based, procedural (Pedagogical Focus). The Coding Manual (Appendix 11) gives detailed descriptions and examples of all coding categories.

Reliability

To test coder reliability, three coders, independently coded 15 response episodes from each class, for a total of 30 episodes. Two of the coders were research assistants who were the main
collectors of the ethnographic data and who knew it well. The third coder had assisted from time to time with data collection and was familiar with the data, but did not know it as intimately as the other two. A weighted measure of reliability, Cohen's Kappa (1960) was performed to test the inter-coder reliability. Table 4.1 gives the reliability results for each coding category.

For all categories, the three raters were reliable, no one disagreeing significantly with any other.

Coding Procedures

After inter-coder reliability was established, the three coders divided the coding task in a balanced way. For each week of data coded, we assigned one primary coder and one secondary coder on a rotating basis. The primary coder coded all the data for the week while the secondary coder made randomly selected spot checks. This system of rotation is illustrated in Table 4.2.

Results: Response in the Two Classrooms

The results are based on 467 coded response episodes which occurred over an equivalent amount of lesson time in the two classrooms. Only response on the single selected assignment was coded for each teacher. The 467 response episodes can be grouped into two categories: those involving the teacher and students and that we were able to observe both in person and on video tape.
and those from focal students—in their peer groups and written responses to their writing.

The amount of data from each classroom was parallel. The focal assignment lasted for four and one-half weeks of 45-minute periods in Ms. Glass's class and for five weeks of 40-minute periods in Mr. Peterson's class. We coded data for three focal students in Mr. Peterson's class and four in Ms. Glass's. The number of focal students presented an equivalent proportion of the students in each classroom: 3 out of 27 for Mr. Peterson and 4 out of 33 for Ms. Glass. In Mr. Peterson's class, Candace was dropped because she was absent so often that we had too little data on her. She was absent because of serious personal problems beyond the control of the teacher.

The episodes, then, first consisted of all response captured by the room microphones as well as the teachers' wireless microphones and included all classroom discussion, all peer group discussions when the teachers were present, and all in-class one-to-one conferences between the teachers and individual students. In addition, the episodes included all tapes of peer groups which involved the focal students and all written comments to the focal students.

For each coding category, to test for significant differences across the two classrooms, we used a Karl Pearson Chi-Square Test for Homogeneity. When this omnibus test showed significance, post hoc pair-wise comparisons (Z tests) between the two teachers were made on each level of the variable. Results are reported in Table 4.3 and described below.
Responder

Who in each class gives response, and how often? The first hypothesis was confirmed; both teachers were the principle responders to their students. However, Mr. Peterson acted as sole responder for a significantly larger number of response episodes (86.5% of his) as compared to Ms. Glass (62.3% of hers). The reverse situation held when the teacher responded not alone but in conjunction with students, with Ms. Glass responding this way significantly more often than did Mr. Peterson (12.6% of her response episodes compared to 3.3% of his).

Also in Ms. Glass's class, students, alone without the teacher, acted as responders significantly more than they did in Mr. Peterson's class (11.5% of her response episodes as compared to 4.7% of his). Thus, the second hypothesis was confirmed; the frequency of students acting as responders varies depending on the teacher.

A similar situation held for writers giving self-response. In fact, while this kind of response occurred in Ms. Glass's class (7.9% of her response episodes), it did not occur at all in Mr. Peterson's. No difference was found in the two classes for situations in which either the teacher or student as responder worked in conjunction with one or more writers as self-responder.

Recipient

In each class, how often do response episodes include one student writer as recipient of the response and how often do they include more than one student writer as recipient? Response in
Ms. Glass's class tended to be geared more toward groups of writers or toward the whole class when all the students were being responded to at once as writers (63.9% of her response episodes) than to individual student writers (36.1% of her response episodes). In Mr. Peterson's class, although the ratio was reversed, with more of his response episodes geared toward individual writers than to more than one writer, his response episodes tended to be more evenly distributed between individuals (51.8% of his response episodes) and to larger numbers of students (48.2%). However, Ms. Glass devoted a significantly larger percentage of response episodes than Mr. Peterson did to groups of student writers, and Mr. Peterson devoted a significantly larger percentage of response episodes than did Ms. Glass to individual student writers. These results confirm the third hypothesis; whether response is most frequently aimed at one writer or a group of writers varies depending on the teacher.

**Initiator**

Who initiates response in each class and how often? There was, for the most part, no significant difference between the two teachers when it came to which party involved in a response episode was the one to initiate it. In both classes, more episodes were initiated by the person who was going to give the response (the Responder--and, generally, the teacher) than the person who was going to receive it (the Recipient--and, always, the student). Thus, the fourth hypothesis was confirmed; the teacher most frequently initiates the response.

In Ms. Glass's class the responder-/recipient-as-initiator ratio was 63.9:11.5%, and in Mr. Peterson's class, 71:16.3%.
This homogeneity between teachers is undoubtedly attributable to both teachers' being the class "leaders" as well as principle responders, taking lessons (and response) in the directions they had earlier planned for the students to follow, providing enough opportunities for response that the students seldom had to ask for it themselves. However, a significant difference did exist between the two classes for the situation in which someone outside the response episode, namely the teacher, set up response to take place between others within the response episode, namely two or more students, where one or more students acted as responder and one or more as recipient. Significantly more episodes were set up this way in Ms. Glass's class (21.5% of her response episodes) than in Mr. Peterson's class (9.4% of his).

**Context**

What contexts does response occur in for each class? There were significant differences between the two teachers regarding the contexts in which response occurred. For Ms. Glass, 44.5% of the response episodes occurred when the class met as a whole, compared to 21% of the response episodes in Mr. Peterson's class. Thus, the fifth hypothesis was not confirmed for Mr. Peterson's class; response will not necessarily occur most frequently in the context of the whole class.

For Mr. Peterson, 47.1% of the response episodes occurred as teacher-student conferences, both formal and informal, whereas only 18.8% of Ms. Glass's did, and these were mostly informal. Hypothesis six was confirmed; the frequency of response in
conferences will vary with the teacher.

No significant differences were found between the two teachers in the percentage of response episodes that occurred when the teacher interacted with students in peer groups (36.6% of Ms. Glass's response episodes and 31.9% of Mr. Peterson's). Thus, hypothesis seven was not confirmed; the frequency of response in peer groups did not vary depending on the teacher. This similarity can likely be attributed to their both consistently moving from group to group to confer with students whenever their classes had group work to accomplish, which in the case of both teachers was often.

Context by Initiation

There were no significant differences between teachers regarding who initiated response in a whole-class context. Both teachers, acting as responders, initiated the response in their class discussions well over 80% of the time (Glass, 88.1%; Peterson, 87.9%). This similarity between teachers is closely related to our finding for the single variable "initiator," which showed the teacher/responder-as-initiator to be the prevalent characteristic in both classrooms, where the teachers served as principle class "leaders."

There were differences in initiator characteristics, however, in the context of teachers interacting with peer groups. In this context, Ms. Glass initiated significantly more response episodes than did Mr. Peterson when they themselves were going to act as responders (59.7% of Ms. Glass's group episodes compared to 42% of Mr. Peterson's). There were no differences between the two teachers in the number of times they initiated response
episodes to occur in groups between student responders and recipients, that is, those times the teachers initiated response to occur in groups and then got out of the picture. But there was a significant difference in the two classrooms when teachers interacted with peer groups, and the recipient of response, that is, the student, acted as initiator. In these situations, recipients initiated significantly more response episodes in Mr. Peterson's class (25.9% of the group episodes) than in Ms. Glass's (9%). Thus, hypothesis eight was generally confirmed; the frequency of student-initiated response will vary depending on the teacher.

When the context was the one-to-one teacher-student conference, the differences between teachers were pronounced. As responder initiating response, Mr. Peterson initiated significantly more response episodes than did Ms. Glass, 86.7% of his conference episodes compared to 23.5% of hers. In this context there was no significant difference between teachers when recipients initiated response, even though this occurred in 26.5% of Ms. Glass's conferences compared to 13.3% of Mr. Peterson's. However, the situation in which the teacher initiated an episode and then got out of the way so students could then act as responders and recipients occurred for 50% of conference response episodes for Ms. Glass as opposed to none at all for Mr. Peterson.

Time

At what time in the process does response occur in each class? Each teacher allowed for response to occur both in-
process and at the time final drafts were returned to students. But while we coded response episodes to reflect this time variable, that is, (1) "process response" and (2) "final response," to think of as "final" the response that went to final drafts is misleading in both classes. Such response was, for the students, still really in-process, that is, leading into the next assignment. With this qualification of the time variable established, we can present the following findings that confirm hypothesis nine—that response will occur most frequently during the writing process. Both teachers devoted more response episodes to writing occurring in-process than to the final draft, yet significant differences were found between the teachers. Ms. Glass, compared to Mr. Peterson, devoted significantly more response episodes (25.7% of hers compared to 3.3% of his) to final draft response, with Mr. Peterson devoting significantly more response episodes than Ms. Glass (96.7% of his compared to 74.3% of hers) to in-process response.

**Target**

How much response is targeted to work that is directly related to the assignment? Indirectly related? Significant differences were found between the two teachers regarding the nature of the writing targeted to receive response, that is, regarding whether the writing being responded to had the potential of being incorporated into the writer's final draft (direct target) or whether it did not (indirect target). The tenth hypothesis was confirmed; the amount of response directly targeted to the assignment will vary depending on the teacher. Ms. Glass devoted a full 80.1% of her response episodes to
writing that was direct to the assignment compared to Mr. Peterson's 53.6%, while she devoted only 19.9% of her response episodes to writing that was indirect to the assignment, compared to Mr. Peterson's 46.4%. Interestingly, for Mr. Peterson response episodes were more evenly distributed between writing that was direct to the assignment and writing that was indirect to the assignment.

**Text**

How often does some kind of text— that is, a student paper, a speech, a film, a piece of professional writing— serve to coordinate response in each class? Again, significant differences were found between teachers regarding whether or not text served to coordinate response episodes. The eleventh hypothesis was confirmed: the frequency of response coordinated to text will vary depending on the teacher. While both teachers more often used text to coordinate response than not, Ms. Glass showed a significantly larger percentage of "non-text-coordinated" response episodes (24.3%) than did Mr. Peterson (12.2%), with Mr. Peterson showing a significantly larger percentage of "text-coordinated" response episodes (87.8% to Ms. Glass's 75.7%).

**Pedagogical Focus**

What is the predominant pedagogical focus of response in each class, and in what contexts do the foci occur? For both teachers, response episodes were more often comprised of "cognitive" focus than of "text" or "management" focus. Hypothesis twelve was confirmed; response will most frequently
be cognitive-based. For Ms. Glass, 42.7% of occurrences of pedagogical focus in response episodes were cognitive compared to 28.7% each being "text" focus and "management" focus; and for Mr. Peterson, 43.8% of the occurrences of pedagogical focus in response episodes were cognitive, compared to 31.7% being text focus and 24.4% being management focus. No significant differences were found between the teachers in the kinds or amounts of foci their response episodes took.

Focus by Context

When we analyzed these occurrences of pedagogical foci according to the context in which they appeared, we found virtually the same differences between teachers as our analysis of Context reveals. In Ms. Glass's class, each kind of pedagogical focus occurred significantly more in a whole-class context (44.5% of response with a cognitive focus occurred in the context of the whole class, 33.8% of response with a text focus did, and 48.8% of response with a management focus did) than they did for Mr. Peterson (26.9% of response with a cognitive focus occurred in the context of the whole class, 16.8% of response with text focus did, and 17.2% of response with a management focus did). In Mr. Peterson's class, each kind of pedagogical focus occurred significantly more in the context of the teacher-student conference (39.7% of response with a cognitive focus occurred in the context of the teacher-student conference, 56.6% of response with a text focus did, and 46% of response with a management focus did) than they did for Ms. Glass (19.3% of response with a cognitive focus occurred in the context of the teacher-student conference, 26.3% of response with a text focus
did, and 13.8% of response with a management focus did). Again, but with one exception, there were no significant differences between teachers in how pedagogical focus was distributed when the context was the small group (Ms. Glass, 36.1% of cognitive focus compared to Mr. Peterson's 33.3%; Ms. Glass, 37.5% of management focus compared to Mr. Peterson's 36.8%). The two teachers did differ in how much response with text focus occurred in the group context (40% of response with a text focus occurred in the group context for Ms. Glass, compared to 26.5% of response with a text focus for Mr. Peterson).

**Discussion**

We had hypothesized that the two teachers, Ms. Glass and Mr. Peterson, while both experts at teaching writing and both depending in large part on in-process response for positive results with their students, would present a consistent picture of this type of response in some ways but would differ in ways that would shed light on the survey findings about the confusing nature of in-process response. We further thought that the differences would reflect their philosophies about teaching writing and working with students.

We can roughly characterize Ms. Glass as guiding her students along a path of discovery, giving them cognitive tools for learning how, independently, to tackle specific writing problems. In this regard, she appeared to depend largely on instruction at a somewhat abstract level, developing with her students concepts and principles, for example, or creating hypothetical writing situations, which her students
then drew on to apply to their own writing. Further, she allowed for students to reflect on their own writing processes, again a way to abstract from specific experience with the aim of transferring these insights to future writing situations. And much direct response to student papers-in-progress came from peers, who worked in large part independently from her.

On the other hand, we can characterize Mr. Peterson as creating a collaborative, master/apprentice atmosphere in his classroom, in which he worked closely with individual students on the papers they were working on, giving frequent and direct feedback to them often on the specifics of their texts, holding one-to-one conferences in the classroom in order to do so. Practice writings often were geared to such specifics as sentence techniques or word choice.

Most of the categories on which we did statistical analysis bore out our original impressions and hypotheses about the two teachers. The analysis shows, on a concrete and verifiable level, the similar and contrasting ways in which their individual teaching approaches were actually accomplished in the classroom. It is not surprising, for example, that we found that Mr. Peterson responded to his students as "T alone" significantly more than did Ms. Glass, for this method works with the "master-apprentice" relationship that he sets up for his students, with himself alone the "master." Likewise the findings that Ms. Glass responded significantly more than did Mr. Peterson in conjunction with student responders and that more response occurred in her class with student responders acting alone.
supports her being more a "Cognitive guide," in this allowing for opportunities for her students to take the reader-responder's point of view and learn about writing through this complementary route. The fact that Mr. Peterson's students tended to receive response individually significantly more than did Ms. Glass's, and that Ms. Glass's tended to receive response in groups of more than one student at a time significantly more than did Mr. Peterson's, also matches their individual approaches—the former to work on a specific level, something that can only be successfully accomplished by working with one student at a time on a particular paper, and the latter to work on a general level, something that can only be efficiently achieved when large groups of recipients are present at the same time. Our findings for the categories of "Responder," "Recipient," and "Context" thus work together, as significantly more of Ms. Glass's response was accomplished in whole-class discussion and significantly more of Mr. Peterson's was accomplished in teacher-student conferences.

When we look at context and see how the initiating of episodes transpired, the results support even more strongly our sense of the two teachers. Both teachers-as-responders initiated more response episodes with groups than did recipients, but Ms. Glass, as responder, initiated more episodes with peer groups than did Mr. Peterson whereas student recipients initiated more episodes in Mr. Peterson's class than they did in Ms. Glass's. Used to working with their teacher as a collaborator, students in Mr. Peterson's class felt at liberty to call on him for group consultation. Such consultation was not in keeping with the
independence that Ms. Glass expected of her groups, so they were perhaps more reticent about calling her over. Initiating group consultations had to be her responsibility. The same picture, though with converse percentages, held for the context of the one-to-one conference. The one-to-one conference was the "modus operandi" in Mr. Peterson's class, a pedagogical approach that allowed him to work closely with each student and that he, naturally, would initiate to a great extent. Such conferences were incidental to Ms. Glass's approach, being initiated almost equally by herself as responder and by students as recipients. However, essential to her teaching was the notion of student independence, and unique to her class (set against Mr. Peterson's) was her arranging one-to-one meetings to occur between students, this type of initiating accounting for a full 50% of the one-to-one conferences in her classroom.

The "Time" variable also matches this profile. Mr. Peterson, working closely with students as they produced their drafts, needed to devote a great deal of in-process time to response, whereas Ms. Glass, letting her students work more independently, needed to provide her own response at the end of the process, even though she used this response to help her students transfer their skills to the next assignment. Student-responders shared her role during the process. In this regard, it is not surprising that in her class during the process, there were significantly more situations in which she initiated response episodes to occur but then got out of the way, with the students taking over as responders.
Our findings for the variables "Target" and "Text" perhaps reflect the essence of the two teachers' approaches to teaching writing. Ms. Glass teaching on a more general or abstract level, and Mr. Peterson on a more specific level. Mr. Peterson, working on lower levels of abstraction, needed multiple and diverse specific texts to respond to in order for students to be able to evolve their own generalities and make connections to future assignments. Thus response was often targeted to texts that were only indirectly related to the assignment but that provided these diverse sources. From Ms. Glass, students already had abstractions and principles, and it was necessary to apply these to the task at hand, getting for the assignment they were working on as much diverse feedback as Ms. Glass, their peers, and they themselves could provide. Our findings for the variable of "text" fits in with this profile. For Mr. Peterson's approach to response, text necessarily needed to be present to coordinate response episodes, as response tended to be directed and specific. For Ms. Glass, working with concepts and principles, effective teaching often demanded that hypothetical situations guide response, thus the frequent absence of text to coordinate response episodes.

We had expected that both teachers, in spite of their different approaches, would place most of their pedagogical focus on the cognitive level. Ms. Glass, with her emphasis on cognitive scaffolding, we had anticipated would tend to focus the content of her response on an abstract but cognitive level, and Mr. Peterson, the collaborative teacher, we had anticipated would
focus his on a concrete but still cognitive level. The academic agenda underlying the successful teaching of writing includes an underlying emphasis on the cognitive processes of the writer. As it addressed their students' writing, the content of our two teachers' remarks followed that prescript. It was not, then, the nature of the content of their remarks that differed, but rather their approaches, as the other findings illustrate. More detailed analyses in future chapters will help us understand the workings of their teaching in more depth, especially with respect to this category.

Before continuing to understand the workings of the in-process response episodes in the two classrooms, we will turn in the next chapter to an analysis of the values underlying the response process itself—the teachers' and students' notions of "Ideal Text" and "Ideal Process."
Footnotes to Chapter IV

1. The asterisks beside hypotheses indicate that the hypothesis was not confirmed.

2. We coded for two variables that, ultimately, we disregarded. Channel, the variable indicating whether response was oral, written, or both, proved an invalid parameter given our including only the written comments targeted to focal students and no one else. Role of Focal Students, the variable indicating whether our focal students were present as responders, recipients of response, both, or neither, proved unanalyzable because the numbers were too small to be meaningful.

CHAPTER V--Teacher and Student Models of Good Writing and Good Writing Processes

Introduction

During the first weeks of our observations in Ms. Glass's classroom, it occurred to us that the focus of our study--the role of response in learning to write--presupposed a whole other phenomenon crucial to teaching. The perhaps obvious question dawned upon us slowly: Just what was the response to? Or more aptly, what was the response toward? In the absence of a goal or criteria, feedback itself makes no sense. By definition, feedback adjusts student behaviors toward some valued end. We expect teacher or peer feedback to move the student writer towards a goal of better writing. Feedback is oriented toward a goal, and actually helps to orient students toward that goal. It seemed to us that much of the job of teaching that we were observing was that of putting forward the goals and objectives toward which the students would move, establishing the expectations that these teachers had for their students.

Over the course of the semester in Ms. Glass's and Mr. Peterson's classrooms we saw and heard these teachers' concepts of the goal of better writing unfold. We came to call this goal "Ideal Text," and it was almost tangible in class discussions and activities, in the talk and work of teacher and students. The teachers nudged their students patiently and tenaciously toward it, students reached for it and sometimes resisted it, and it permeated the classroom as an unseen judge, evaluative
criteria, that presided over every bit of text that stumbled unheedingly into its presence. The teachers struggled to insist upon it, the students came to wield it in their talk, in peer- and self-evaluations, and more or less tentatively approached it in their own writing.

We also watched a collection of writing procedures emerge in these classrooms--an "Ideal Process." The teachers structured class activities in drafting and polishing pieces of writing. Together, "Ideal Process" and "Ideal Text" formed a cohesive belief system, a set of expectations for the form and function of a piece of writing as well as the cognitive process that ensures its successful completion.

As teachers, Ms. Glass and Mr. Peterson were charged with transmitting knowledge about a particular domain: writing. Like all socially produced artifacts, knowledge realizes social goals and is valued by the society in which it functions. Anthropologists have long been interested in the structure and content of knowledge domains in particular societies. Knowledge about writing processes and products in contemporary Western societies can perhaps benefit from an approach that treats them as a system of values underlying and permeating classroom teaching, response, and evaluation.

Looked at from this socio-cultural point of view, these teachers had a message to transmit to their students about the goals of written language and how to achieve them. The question this chapter attempts to answer is this: What exactly was that message?

This chapter, then, is aimed at explicating the goals and
expectations, the theories and values, guiding the instruction and response practices of Ms. Glass and Mr. Peterson, as these ideals emerged in their communication to students in their classrooms. It is an attempt to bring what is assumed, "understood," and therefore unexplained in these classrooms to the surface, to render the ordinary goals and values promoted by these teachers "strange," and therefore available for reflection and analysis. Our attempt is similar to that of anthropologists who have studied "exotic" cultures largely by objectifying, by treating as "strange," aspects of cultural knowledge, structure, and skill that participants in the culture take for granted.

Explication of the values teachers hold about writing and written language will enable educators to discuss and evaluate social and cultural assumptions that underlie teaching practices.

This chapter also is aimed at examining the values about "Ideal Text" and "Ideal Process" from the point of view of the students. Important when considering students' values is the fact that in the classroom, students and teachers take different social roles, which carry with them different rights and responsibilities; whenever there are groups of people separated along status and power lines, and whenever values are being promoted, clashes in beliefs and values can arise. Such clashes are particularly important in helping us understand difficulties students may have in learning in school. The clashes are partly due to the different interests of the groups (Everhard, 1983; Marx, 1867). The values and uses of written language, in particular, provide ready-made hotbeds of debate. Specifically,
the "culture of reference" for the teacher and students are likely to differ. Peer culture and values may promote one kind of understanding of the forms and functions of written language, while teacher conceptions are likely to be consonant with academic uses of language, and with "schooled" tastes in literature--culture with a capital "C." (See Burnett, 1970; Goodenough, 1963; and Wilcox, 1982 for a discussion of the notion of "culture" of reference.)

In order to understand the function of feedback processes in learning, such as the giving of written comments on papers, peer group or conference interactions and whole-class response, we must understand what the basis of that feedback is. What are the values and ideals, explicit or implicit, that teachers are trying to guide their students toward in their feedback to student writings? What are the teachers' models of "Ideal Text," of ideal text creation processes? And what are the students' models?

**Background to the Analysis**

It is our assumption that teachers and students as cultural participants reveal the content of their culture to one another in their language and behavior. Ethnomethodologists investigate the local enactment of social structure--the roles and status of interactants, the grammar of social interaction as participants reveal it to one another (Mehan, 1979; Schenkein, 1978; Sudnow, 1972). We are assuming that participants in social interactions also locally enact cultural knowledge domains, revealing cultural beliefs and expectations about these domains. By watching interactions in school, focused on academic tasks and oriented toward domains of knowledge, and by paying attention to the
content of what people say to one another, we believe it is possible to see how they manifest the contents, and not just the structures, of their cultures. Teachers, as cultural experts relative to the novice status of their students, are likely to reveal in their talk the cultural ideals and expectations they hold about domains of knowledge, their uses, and the social values attributed to them. With respect to literacy, in general, and writing in particular, teachers undoubtedly transmit ideals about the forms writing will take, the procedures that will produce these ideal writings, and the social values of written language in general.

We found as we observed in the classrooms of Ms. Glass and Mr. Peterson that we couldn't interpret the meaning of the response episodes captured by our statistical analysis of response in Chapter IV without considering the teachers' and students' goals and expectations. Yet the ideals teachers communicate to students about written language and its production have not been carefully investigated in the pedagogical context. These ideals have been examined with respect to finished texts, in testing settings (e.g., Diederich, French, & Carleton, 1961; Freedman, 1979; Harris, 1977); however, no one has looked at values with respect to the writing process. Further, these same researchers have examined values as they are implicit in types of response, say written comments and holistic judgments, but not as they function in the overall curriculum and rarely as they are understood by students. Most important, no one has compared the values of teachers and students. For the most part we have
assumed that values are universals and understood by all teachers and researchers alike.

What seemed to be needed, then, was a content analysis of the communication that went on in the classrooms that comprised the curriculum of teaching and learning in those settings. Not only the content of talk, but the meaning such talk had for the students and teacher had to be culled from such an analysis, in order to characterize not only the environment of learning, but what stood to be learned in these environments. Further this talk would have to be examined across all classroom activities, including all types of response episodes.

Through a close look at what students in classrooms such as these stand to learn, in other words what is available to learn, we may better be able to understand the role of response in the acquisition of written language. We assumed that the official stance grew over time in interaction between the teacher's theory of written language and the theories 30 or so students bring with them to the classroom each semester.

Methods and Procedures

Talk: The Data Source

Talk in classrooms provides a window into the mind of the teacher and the students as they interact over classroom tasks. Through an analysis of student and teacher talk, we will be able to uncover and then compare their notions of "Ideal Text" and Ideal Process. Valued processes and products are communicated implicitly or explicitly.

In interaction, conflicts between teacher and student values and beliefs about written language may be negotiated away, as
students come to understand what the teacher is getting at, and as the teacher learns from his or her current batch of students how to best get the point across. Conceptual maps of academic domains such as writing thus enter the classroom with teacher and student, and are negotiated and modified in the on-line communicative interactions that compose the class (learning).

In addition to providing teacher and student with a window into the other's mind, classroom discourse itself comprises the very content the teacher is charged with transmitting. Talk not only transmits learning in academic domains (functions as a medium of transmission), but also is the very material of which that domain is built up in the process of interacting in the classroom. Classroom talk, then, provides a rich source of information to the analyst in search of better understanding of learning processes.

We have limited our data sources to the field notes and video tapes of classroom interactions, peer group tapes, and materials passed out in class. We have used comments made by students in interviews after the semester was over only to supplement the analysis. We limited the scope of analysis of these two teachers' and their students' ideals as shown during the focal assignment for each teacher.

We chose not to analyze the written comments teachers put on student papers or the writing the students actually produced. While written comments no doubt also transmit values to the students, these were looked at separately in Chapter VII. Further justification for looking at only those transactions
involving spoken communication comes from the fact that only Mr.
Peterson wrote comments on drafts, and those he did write, he
accompanied with in-class conferences in which he explained and
elaborated on the comments. Written comments for both teachers
that accompanied final versions no doubt function as value
statements and guidance for the next paper the student is to
write, but for the purpose of this chapter, which seeks to
produce a portrait of what counts as good writing for these
teachers for this one assignment, we decided not to use written
comments.

The one type of written language that we examined was the
use of samples from teacher-produced dittoes that constituted
value statements about text or text production. These dittoes
were often the support and focus of oral activities, and
therefore functioned much like oral instructions given by the
teacher in that regard.

Procedures for Extracting Values

In order to characterize the teaching of these two teachers,
we listened carefully to what they said to their students. We
particularly were interested in belief statements of the form
"What you should do is.." or "What I want is.." as they
externalized the teachers' system of values and expectations.
Our goal was to understand what the teachers actually
communicated to their students. Such an analysis required a close
look at the actual talk of the classroom wherein teachers frame
for their students a picture of the ideals they hold. It
necessitated listening to the talk about values that emerged
before the students.
In order to get at student understandings as well as teacher expectations, we listened to student contributions to classroom lessons as well as the independent remarks students made in peer group work sessions. We were interested in seeing how students responded to teacher values, whether these values would be consonant with student values, and how or if students took up the values and ideals teachers projected in classroom talk, activities, and curriculum materials.

Teachers plan and orchestrate classroom events around instructional goals, and promote and maintain discussions about topics that serve those goals. Mehan (1979) and Griffin and Humphrey (1978) show that the structure of teachers' talk can function as a gate through which only relevant student contributions may pass. In addition, teachers function as the gate-keepers or filters for their own instructional agendas. When "incorrect" student contributions hit the floor, teachers must effect repairs of some kind to ensure that the error will not be replicated by others. Students help to maintain this structure of talk, addressing their remarks to the teacher. Since the teacher's talk is pivotal in the structure of classroom interaction as it weaves in correct student responses to elicitations, marks incorrect responses as such, and guides the discussion toward instructional ends, whole-class interactions can be seen as teacher-guarded.

Both teachers in this study presided over class discussions, and even though students contributed to these discussions, their remarks were structured by the topic of discussion the teacher
had set up, and the specific question teachers asked them to address. (For an analysis of teacher-filtered, whole-class response episodes in these classrooms, see Chapter VI). Whole class discussions, therefore, were interactively accomplished, curriculum events wherein the teachers' values and beliefs reigned by virtue of their role as instructors.

The approach here was, therefore, to take the teacher's values as they were communicated in class as the background against which to compare and contrast independent student views which arose sometimes in that setting, but more often in peer groups.

The analysis required an inductive search for the categories of meaning used by the teacher and students, rather than those we may have generated independently. We were interested in a "native" participant's conceptual domain, that which stood for good writing in the classroom. The terminology and connections between terms used by participants in such a setting create a map or picture of the domain as understood by the teacher in his or her role as the authority in the classroom (See Spradley [1982] for a description of domain analysis).

Categories must therefore emerge from the talk of the teacher and students in classroom discussions, both from terms and from linkages between the terms that are made explicit in the talk. We expected such an analysis to yield a map of good writing for each classroom that accurately portrayed the teachers' notions of the acceptable and good. Against this background we came to understand where student conceptions of good writing both mirrored and resisted those of the teacher.
As the first step in generating the maps, we went through the supplemented field notes, extracting talk which externalized beliefs and values about written language, and the goals and purposes of these particular assignments. The criteria we used in located value or belief statements were the following:

1. Speakers often linguistically marked belief or value statements, using expressions such as "I think you should...," "You need to...," "What I want is...," "You need..." Verbs such as "need," "should," "ought," "have to," and "want" thus marked instances of value communication. "Good" or "bad" and their synonyms also often marked value statements. Participants used these descriptors in expressions of the form "That's a good X," or "My X is terrible."

Alternatively to these two types of linguistic marking, speakers simply voiced their opinions - "I like that X."

2. If participants did not mark statements as belief statements in one of the ways listed above, we counted as belief statements talk which showed that participants were behaving as though something valued was present or absent as they oriented to text. For example, a speaker might say "Where's your X?" thereby implying that an X is expected and should be present.

After locating these statements, we then placed them separately on index cards, each of which then contained one language sample. Entries for each teacher's class were color coded to keep them separate. During this process, both student and teacher talk was taken down, along with the context in which
the talk occurred, the class, week, day, and page number from the
field notes, as well as a video counter number, when one was
available. Interactants were identified by initials, except for
Ms. Glass and Mr. Peterson, who were known simply as T (for
teacher).

In addition to combing the field notes for ideals, criteria,
values, and the like, we also reviewed the peer group tapes for
the focal students in each class for group activities which took
place during the one assignment under analysis. During their
peer work, students often made value statements that closely
followed the criteria of the teacher, but also made independent
judgments and even statements that overtly conflicted with the
"official" classroom views on written language or writing
procedures. All student value statements were transcribed onto
index cards, color coded to distinguish the two classrooms from
one another, and the peer group interactions from those involving
the teacher in conferences or classroom interactions.

A veritable plethora of colored index cards was sorted and
placed into piles that reflected a similarity of content from
card to card in the pile. We began with the samples which
involved the teacher, working separately for each class. The
cards were sorted primarily by the terminology in the language
samples, noting that when multiple terms occurred in close
proximity, speakers were making the links between terms visible.
Peer group samples, where possible, were sorted into the
categories emerging from samples involving the teachers. Peer
group samples which could not fit into a teacher-based category
were sorted into separate categories, of which only a few
emerged. To say that most of the peer sample fit into teacher-based categories is not to deny the possibility of value clashes, however. In fact, overtly negative student reactions to particular classroom values were sorted into categories involving those values.

After living in these classrooms daily for a semester, we feel confident that the groupings reflect real categories at work in the classrooms themselves. As we mentioned, often there was a term that arose in the classroom that could be applied to a pile of cards to serve as a label. The language of teacher and students when voicing beliefs about written language often linked categories together. We followed these links between terms, relating categories to one another through these links. The task required few inferences; the cards virtually sorted themselves through the explicit semantic networks available in the talk of the teachers and students. Although a reliability check on the sorting procedures did not seem necessary, other members of the research team provided informal checks.

An example might suffice to show how little inference was necessary in this sorting process. In Ms. Glass's class, numerous language samples held the term "interesting," applying it as a criteria to writing samples and speeches that were read, heard, and discussed in class. Within the pile of cards containing the term "interesting," links emerged to other important classroom terminology. For example, Ms. Glass said, "Is it really interesting to the audience?" and "Would somebody else see it as boring or as interesting?" These comments, and others, linked
the criteria of "interest" to an emerging principle of "audience."

Other categories such as "using description" and "using strong verbs" formed independently from the category of "interest." Within these categories, though, the language of students and teacher linked them to "interest" and "audience." Marion, a student, said, "They didn't describe enough so that anybody else, y'know, would be interested in it." Ms. Glass asked, about a paper just read in class, "What made that more interesting than the last one?" A student, answered, "Well, he used a lot of descriptive verbs instead of adjectives."

From samples such as these, we could locate principles such as "be interesting," reasons for doing so, such as considering the needs of an "audience," and devices for making writing more "interesting," - "use description," "use strong verbs." In just this way, from the talk of the classroom itself, a hierarchical structure of principles and practices instrumental to those principles resulted from this sorting process for each classroom. Although the former examples are drawn from Ms. Glass' class, the process for sorting language samples for Mr. Peterson's class was identical.

The categories and linkages that resulted, then, compose a map, or model of the values, ideals, evaluative criteria, and beliefs at work in these two classrooms. Portraits that characterize the properties of "Ideal Text" and writing process, the type of writing and writing activity sanctioned and valued by teachers and students in each of these classrooms follow.
Results

Tables 5.1 and 5.2 comprise the portraits that emerged from the sorting procedures for Ms. Glass's class and Mr. Peterson's class, respectively.

Insert Tables 5.1 and 5.2 about here

These tables, being long and complex abbreviations of a living process unfolding over time in the two classrooms, require lengthy explanation in order to be understood. Thus, in the discussion to follow, we will divide each one into parts for ease of explanation and interpretation.

Ms. Glass's Classroom--A Model of "Ideal Text"

In Ms. Glass's class, the theme of the writer as a choice-maker emerged as paramount. Making decisions was the job of the writer, as the following quotation from Ms. Glass indicates:

How much invention? How much distortion to prove a point? How much use of information to prove a point? You have to make that kind of decision, whether you're writing or talking.

Here, Ms. Glass focused on the idea of appropriate evidence, but she nearly always stressed the importance of individual choice, limited or informed by writer perceptions of audience, focus, purpose, and voice, as an abstract of the main headings from Table 5.1 indicates:

Principles of "Ideal Text"

The job of the writer is to make choices
Controlled by audience
Communicate effectively
Be clear
Be interesting
Controlled by focus
Find a focus
Write a focus statement
Controlled by purpose
Write a saturation report in which you communicate the essence of a particular place
Controlled by voice
Base your writing on your point of view

Classroom talk about these principles guiding the choices of writers comprised a language, a special terminology, for commenting on writing and writing tasks. An expansion of the principle of "audience" shows ways stressed in Ms. Glass's class for meeting the needs of an audience:

Audience

Communicate effectively
Say something
Don't let language get in the way of communicating
Be believable and persuasive, not corny or overdone
Be clear
Don't depend on prior knowledge of reader
Avoid reader confusion
Be interesting
Be humorous or entertaining
Keep the reader's attention

The idea of "audience" permeated much of the classroom talk about writing, both evaluative talk about writing samples, and talk that projected the expectations and goals student writers were to meet. In classroom discussions, Ms. Glass and her students recognized the presence or absence of attention to audience needs as they evaluated pieces of writing that Ms. Glass brought in for that purpose. They also talked about the requirement of meeting an audience's needs as the students prepared to write and projected goals for their own papers.
Although Ms. Glass's class was rich in talk about "audience," the audience really was an imagined one--"audience" as a rhetorical category, rather than a flesh and bone readership. The talk about the "audience" or "reader" actually focused on the writer--the responsibility of the writer to engage an "audience," "be clear," and communicate something. Ms. Glass focused on teaching her students to imagine and evaluate the effect their writing would have on a reader, and to decide how to produce an intended effect.

Beyond this rhetorical category of "audience," Ms. Glass and the other students in the class provided real audiences for student writing. Students were encouraged to share with her before the class bits of the writing exercises she had assigned. They read drafts of their papers to each other in peer groups, and were invited to comment on each other's writing. The emphasis of this sharing and commenting was on producing a better piece of writing: meeting the evaluative criteria Ms. Glass set out. In other words, students functioned for each other as an academic community, helping each other with the school task of doing the assigned writing well.

One of the ways Ms. Glass had students form an audience community was by having them listen and comment on how effective writers had been in getting their point across. She explicitly focused on teaching her students to respond critically to writing. Below is an elaborated summary of classroom talk about effective communication and how to achieve it:

**Effective Communication**

Communicate effectively
Say something
Don't let language get in the way of communicating
Avoid Engfish - stiff, stilted language
Avoid sounding odd
Be believable and persuasive, not corny or overdone
Avoid cliches, insincerity, and phoniness

Ways to communicate effectively centered on making appropriate language choices. Ms. Glass had her students read two chapters of Macrorie's (1979) *Telling Writing* -- "The Poison Fish" and "Telling Facts." In "The Poison Fish," Macrorie gives examples of writing which obscures a message--either because the terminology covers up the ideas, or because language is used to disguise the fact that there is no message. Ms. Glass spoke negatively about "teacher-pleasing," academic-sounding prose, showing her students that she wanted something different from them, something that other teachers would perhaps not accept or reward. This message seemed particularly hard for students to take. We will discuss later the frustration and confusion that arose from the concept of Engfish.

In order to encourage her students to meet the needs of audiences, real and imagined, Ms. Glass emphasized the importance of clarity. "Being clear" in writing, for Ms. Glass's students, depended on consistency and explicitness in the text itself. By connecting ideas together, students were told they could relate the pieces to the whole:

**Clarity**

Be clear
Don't depend on prior knowledge of reader
Avoid reader confusion
Do one thing at a time
Make the connections between things explicit
Connect ideas together
Tie paragraphs together
Use key words from the focus statement
to make transitions
Relate the pieces to the focus
Make proper use of pronouns
Keep the narrative pronoun consistent
Do not use "you" to mean "anybody"
Use pronouns to refer clearly to one and only one noun
Maintain a consistent tense

Maintaining a consistent tense and pronoun were techniques for avoiding reader confusion, as was the use of pronouns that had a clear referent. Ms. Glass focused on pronoun use for half of one class period, using sentences from the students' first papers as illustrations of the problems that could arise for readers from "fuzzy pronouns." She announced this lesson as "official grammar lesson number 1," and it was the one and only lesson of its type that we saw in the eleven weeks we spent in her classroom.

Maintaining audience interest was an important element of writing for an audience in Ms. Glass's classroom. The devices for "being interesting" that were talked about in Ms. Glass's class are summarized below:

Interest

Be interesting
Be humorous or entertaining
Choose an interesting topic
Write an interesting focus sentence
Write an interesting introduction
Write an interesting first sentence
Use lots of description of people, things, scenes
Write tight sentences that are not choppy
Combine sentences
Use strong verbs that are more active and help the reader see better
Keep the reader's attention
Don't write pieces that are too long
Use only the important information
Leave out what isn't needed
Eliminate excess words (dead wood)
Don't be too general
Find better, more precise nouns and verbs
In order to "be interesting," student writers were encouraged to choose topics that were interesting, and to write focus sentences and introductory sentences and paragraphs that were interesting. "Being interesting" here clearly relies on the subjective judgment of the writers as they take into account what might potentially interest a reader. Ms. Glass helped her students see what others would be interested in. For example, she sometimes had her students "vote" as to how interesting a passage was—on a scale from "wow" to "ugh" or "ho-hum." Student writers could get a sense of what their peers found interesting from these occasions, and were asked to rate their own work on such a scale from time to time. They also spent a substantial amount of time working on their writing in peer groups (see Chapter IV).

Ms. Glass also emphasized the importance of using lots of descriptions to maintain reader interest. Using specific action verbs and combining sentences to make for smoother and livelier prose were also highlighted as devices for making written pieces more interesting.

Keeping the reader's attention, a goal quite synonymous with being humorous or entertaining, relied upon such tactics as cutting out excess information and excess words, being specific and precise, seeking simple ways to express ideas, and varying sentence structure. In general, being interesting and being clear actually could be accomplished in writing by attending to a few key notions, as the following selection from Table 5.1 indicates:
**Keys to Interest and Clarity**

In general, in order to be clear and interesting to your audience,

- Project enthusiasm
- Use the right word
  - Precise and sharp, not vague or fuzzy or dead wood
- Use lots of detail and examples to be convincing and persuasive
- Use lots of description to show the reader pictures
- Give smooth transitions

A topic of great importance in Ms. Glass's class was that of "focus." As Table 5.1 demonstrates, "focus" was a major feature controlling the writers' decision-making. The entire sequence of assignments we watched centered around the concept of "focus."

"Focus" was a noun, a label for something a paper did or did not have. It also was a label for a cognitive activity— that of generalizing from a lot of specific information. Ms. Glass was explicitly teaching her students to "find a focus"— a search through all of the information they collected for the underlying themes that they wanted to communicate. As the next section of Table 5.1 indicates, "finding a focus" was both a cognitive activity and an exercise of the writer's will—a focus was chosen, decided upon, as much as it emerged as a generality from the detailed texture of their subject:

**Focus**

- Find a focus
- Generalize from specific information
- Write a focus statement
  - Include the topic or subject and your attitude toward it

In addition to "finding a focus" which would tie together all the pieces of their observations and their writing, students...
were to express this focus in a statement that would communicate it to an audience. The "focus statement" was an illuminating fulcrum for the paper, a statement at once about the paper's topic and the writer's attitude toward it. The "focus statement" served to orient the reader in the writer's world of perception and sense.

The ongoing classroom meta-commentary about writing--the technical language Ms. Glass and her students used--also included a controlling category called "purpose." "Purpose" was a gloss for the writers' intentions as they serve to fulfill the assignment Ms. Glass gave. In other words, the assignment--a report which distilled the essence of a place--created the "micro-world" in which students discovered and expressed their message and meaning as experienced writers (see Papert, 1980). "Purpose" here goes beyond traditional rhetorical notions of the writer's goal in a piece of writing (that is, to persuade the reader, to describe an experience, etc.). It includes the assignment itself as an academic task in which the goals and purposes of the student writers could emerge. As the section of Table 5.1 shows, students chose the place they wished to investigate; while collecting information about that place, they should come to know what interested them as writers, what message about the place they wished to convey.

**Purpose**

Write a saturation report in which you communicate the essence of a particular place
Choose a place to investigate
Collect lots of information, data, material
Select important pieces that convey the feeling of the place
Order and sort details to show the
atmosphere best
Convey the focus - the essence of the place
and your attitude toward it - to a reader

Ms. Glass stressed the cognitive activities of sorting and selecting information, and producing an order out of the chaos of detail students collected in visits to their places. She mentioned the controlling concept of "voice" only once or twice, and did not attempt to teach it to her ninth grade students during the time we observed in her classroom:

Voice
Base your writing on your point of view

In general, two types of activities were encouraged in the classroom in order to accomplish the assignment ("purpose") -- conveying the essence of a place -- while attending to "audience" needs and the "focus" of the paper: "showing" and "structuring."

These activities are summarized below:

Keys to Audience, Focus, and Purpose

Showing
Use vignettes, scenes, images, pictures
Put the reader in the middle of something
Make the reader see, hear, feel, and sense the essence of the place (purpose and focus)
Piece together details, examples, and descriptions from observations to give the character of the place, make the paper come alive, and help to convince the reader

Structuring
Write a focus statement that has a strong verb that builds into the sentence your attitude toward the subject, shows the reader about the place, and says something about relationships between things
Place the focus statement prominently, at the end of the first or second paragraph
Order information in the paper to keep reader attention and interest for the purpose of communicating the atmosphere of the place
Write a good introduction and conclusion which catches reader interest and leaves the reader

165
264
with a feeling about the place

"Showing," a term taken from Caplan & Keech's (1980) *Showing Writing*, was used to describe the specific, descriptive evidence writers use to convey their meaning to an audience. For this assignment, the reader had to be made to "see, hear, feel, and sense" the essence of the place as the writer intended to convey it. "Structuring" or "ordering" had to do with the positioning of information in a text that created coherence, and that helped to get the writer's point across.

Ms. Glass summed up her goals for her students' writing on this assignment when she said:

Having visited this place, taken some notes, thought about what we talked about, looked at the assignment sheet, figured out who your audience is, what your purpose is, what your voice is—all those things, ... do the best job you can to come up with something that you think works.

She revealed her respect for her student writers, and her insistence on their autonomy over their text by creating writing "micro-worlds" for them to explore. She kept her distance from their individual writings until they turned them in for evaluation, preferring to guide them through the meta-commentary, the "Ideal Text" principles that lived in the talk of the classroom. Most often, Ms. Glass stressed "focus," "purpose," and "audience" as organizing principles, concepts underlying the act of writing. She told her students that what you keep in your head is "What's the focus? What's the purpose I'm going after? And what's this gonna do to an audience?"

Mr. Peterson's Classroom--A Model of "Ideal Text"
Two main organizing principles emerged from Mr. Peterson's classroom: anticipating the needs of the reader, and meeting the demands of the assignment. Mr. Peterson taught the character sketch as a genre, one that traditionally contained certain elements. He stressed the importance of "being interesting" and "being clear" in all of the writing students did during the seven weeks that we observed in his classroom. The selection from Table 5.2 summarizes the emphasis Mr. Peterson placed on the reader and assignment:

**Principles of "Ideal Text"**

- Anticipate reader reaction
- Be interesting
- Be clear
- Do the assignment
  - Write a character sketch which the teacher will show you how to do
  - Figure out what the person's about
  - Describe and explain the person to make her/him understandable to others
  - Follow the structure provided by the teacher

Mr. Peterson focused on teaching his students a set of tools for crafting their writing. Like a master chef, he tested the products of his apprentices, and was generous in his advice for their improvement on particular pieces. The analogy to a master chef runs deep: Mr. Peterson talked of "spicing up" student writing. "Needs more detail here" might easily have been "needs more salt" in the peremptory language and authority of master chef over apprentice cook.

Mr. Peterson actually mentioned the "reader" only a few times, focusing most of his classroom discussion on "being interesting" or "being clear," or on the assignment itself. The type of classroom discussion that went on in his class about ways
to "be interesting" is revealed in the following section from Table 5.2:

<table>
<thead>
<tr>
<th>Interest</th>
</tr>
</thead>
<tbody>
<tr>
<td>Be interesting (exciting, dramatic, spicy, involving)</td>
</tr>
<tr>
<td>Use an interesting topic</td>
</tr>
<tr>
<td>Use specific details and descriptions</td>
</tr>
<tr>
<td>Contrive these, if necessary, from your imagination to liven up your writing and make it more fun to read and write</td>
</tr>
<tr>
<td>Use strong verbs, chosen carefully to suggest action and to convey more</td>
</tr>
<tr>
<td>Get rid of excess words</td>
</tr>
<tr>
<td>To eliminate repetition</td>
</tr>
<tr>
<td>To get into your subject faster</td>
</tr>
</tbody>
</table>

Synonyms for "interesting" relate to both the work of the writer and the activity of the reader: the writer makes a text dramatic or spicy; the reader finds it exciting or involving. Implicitly, if not explicitly, Mr. Peterson included the concept of a reader/audience when he pushed students for greater clarity and interest in their writing. As the resident expert, however, Mr. Peterson was the audience and evaluator of the clarity and interest of student papers. While students read drafts of their papers to one another, sharing papers was an activity often embedded in one of the many problem-solving games Mr. Peterson hosted in his classroom. He served as master of ceremonies and as judge for these games, maintaining his position as the classroom authority. Students acknowledged Mr. Peterson's authority as teacher, but they did not always agree with his judgments, as we will later show.

To "be interesting," the writer must choose an interesting topic. Mr. Peterson was concerned that his students find a person to write about who was complex, somewhat unpredictable.
Some "tools" that could be used to liven up writing included using specific details and strong verbs, as well as getting rid of excess words that didn't add to a piece.

The focus in Mr. Peterson's classroom was overwhelmingly aesthetic, and linked closely to aspects of the text to be shaped, turned, and "spiced up" using reliable tricks of the trade. Trickery, in fact, was explicitly allowed in Mr. Peterson's class, as long as it helped to make a better piece of writing. Details, for example, were such an important ingredient of good writing that Mr. Peterson encouraged his students to make them up, to contrive them, if necessary.

Like Ms. Glass's students, Mr. Peterson's students were encouraged to "be clear" in their writing, as the following selection from Table 5.2 shows:

**Clarity**

Be clear (specific and concrete, not vague or general)
- Give specific examples
- Give descriptions that present a clear picture
- Make connections obvious

Between paragraphs (ideas)
- Order them to create the best transitions

Within paragraphs
- Write a strong topic sentence that gives direction to the paragraph and connects the sentences together
- Give evidence to support the point made in the topic sentence
- Relate all sentences in the paragraph to the topic sentence

Within sentences
- Combine ideas when possible into one sentence that makes the links and connections between ideas, and which avoids sentences that are too long and scattered.

"Being clear" relied on aspects of the content and the structure of a paper. To "be specific and concrete," the writer needed to
give specific examples and descriptions that presented a clear picture. Adding examples, like adding salt, made the product a better one. "Being clear" also relied on the structure of the text. Making the connections between ideas increased clarity, and Mr. Peterson taught his students to manipulate paragraph and sentence structure in order to make the connections that led to clarity. He exercised his students in crafting topic sentences and writing "organized paragraphs with connections." He gave them sentence-combining tasks to increase their facility with sentence structure.

Writing a character sketch in Mr. Peterson's class demanded elaborate preparation. Mr. Peterson had a definite idea of the type of thought that should go into producing the written product he was looking for from his students, and the processes needed to assure that they would be able to produce it. He had his students begin with an elaborate process of analyzing, or "figuring out," their character, as shown in the following selection from Table 5.2:

**Figuring Out the Person**

Analyze the person

- Know the character well
- Consider a range of possible subjects
- Choose one that you have a lot of information about

Make observations

- Take a close look at the person
- Distinguish between observation and judgment
- Defer judgment - collect lots of examples and descriptions instead

Interpret revealing behaviors

- Think about what they say about the person
- Make guesses based on your knowledge of the person

Discover and identify patterns in the person's behavior

- Identify a quality or characteristic of
the person, a trait, from the specific examples and evidence you have
Find traits which contrast with one another

The process of figuring out, of analyzing the character, included choosing a subject that the writer already knew well from a range of possible subjects. Mr. Peterson had the students list everyone they knew who also knew them, an exercise that he intended to extend the possibilities available to each writer. Beyond choosing the subject, students needed to make observations, interpret their characters' behaviors as they revealed important aspects of personality, and by doing so, discover the patterns that typified the person.

Mr. Peterson spent a lot of class time helping his students to "figure out" their characters. He had them practice making observations by watching and isolating behavior from characters on film clips, reading and noticing traits of particular Great Expectations characters, and even by observing his own style of speech, dress, and movement in class. He gave them a list of 32 questions, interpretive probes into personality traits. He had his students use questions from the list (topped by the question "Would you buy a used car from this person?") to aid their analysis of characters from Great Expectations, of Odysseus, whom they had read about previously, and of their own characters.

Mr. Peterson asked his students to see the traits, the generalized patterns of behaviors that emerged from particular actions and events. He gave them lots of practice making the observations and generalizations they would need to analyze their characters. The next job students were faced with was describing and explaining their characters, as shown in the next segment of
Table 5.2: Describing and Explaining the Person

Describe and explain the person to make him or her understandable to others
Give examples of traits and qualities of the person to convince the reader
Use instances that demonstrate the traits
Use stories that bring out the traits
Use anecdotes that catch the character of the person and give examples of behavior traits
Use specific things the person says, quotes or dialogues that reflect the personality of the character
Make these up or derive them from your feelings about the character, if necessary
Make language choices to catch reader interest and to get an idea across
Choose words carefully to:
Label or describe ideas and character traits
Spice up your writing
Simplify
Avoid ordinary, average, or vague words

Mr. Peterson also gave his students plenty of practice with describing tasks. They worked with vocabulary words from their reading, locating words which might be useful to describe a person. Mr. Peterson had them generate a list of words that would be useful for describing facial features, and then in their peer groups had them create descriptions based on magazine pictures of famous personalities. Other students tried to guess who the personality was, based on the description. Cultivating a descriptive vocabulary to add to his students' "bag of tricks," Mr. Peterson gave them practice making the language choices he would demand if their character sketches.

Some of the most important tools writers needed in order to make a character understandable to others were abundant examples of behaviors. Mr. Peterson explicitly asked students to find instances that would demonstrate the traits they wanted to get
across. Stories, anecdotes, dialogues, and quotations were the raw materials from which students built their character analyses.

Mr. Peterson helped students develop this material for their papers in two principle ways. First, he had them produce an anecdote before they began drafting the character analysis proper. The anecdote demonstrated one quality of their character, and was meant to be incorporated into the larger analysis paper. He thus structured the process of his students' work on the character analysis into two main phases--that of producing the anecdote, and that of producing the larger character analysis.

The second way Mr. Peterson provided support for his students' writing was through frequent, brief, individual conferences. He met with students to comment on their anecdotes, to help them locate character traits and contrasts, and to comment on drafts of their character analyses. The focus of all of these conferences was on developing the kind of content--traits, description, specific examples, anecdotes--that he wanted them to produce in the paper. Mr. Peterson therefore stressed the character analysis as a specific genre, and talked about the elements he saw as central to that genre.

The format Mr. Peterson asked his students to follow included the essential elements of the genre, and also met the principles of "being interesting" and "being clear." A sketch of the structure and organization of the character analysis that Mr. Peterson assigned his students follows:

Structure

Begin with an opening sentence that engages reader interest
Start with a picture
Start with an action
Start with a dramatic statement
Start with a quote that catches the
person's character or personality
Make the first paragraph an introduction to the person
Deal with his or her appearance as it relates
to his or her personality and makes a comment
on the way he or she chooses to portray her/himself.
Describe clothing
Describe looks
Describe manner
Describe movement
Write three paragraphs in the middle that each deal
with an aspect of the person
Make connections between the ideas
Use three separate but related qualities
Link the traits by contrast
Make links between qualities and examples
Write a conclusion

Students were asked to begin with a sentence that used
specific devices to engage reader interest--pictures, action,
dramatic statements, or quotes. The introduction was to provide a
description of the characters' appearance. The body of the essay
dealt with approximately three traits, each one illustrated with
examples and anecdotes, and preferably providing contrasts
against one another. The structure Mr. Peterson asked for
resonated with the other explicit teaching he had done, and with
his role as master craftsman.

Building the character sketch was like putting together a
gourmet meal. Certain aspects were expected elements of the
written piece-as-genre, just as aperitif, side, and main dishes
comprise the meal. The structure Mr. Peterson provided
orchestrated the pieces and elements, drawing them into the theme
and genre of character analysis, the wholism of the meal. Within
this structure, students worked to choose a person to analyze, to
discover what they wanted to say about that person, and to find
the language of expression that would say it. Mr. Peterson helped them in each of these tasks, building up their repertoire of tricks and devices, vocabulary and thought processes, and structuring their process of writing the analysis.

When introducing the character analysis, Mr. Peterson said, "The main thing we'll be doing with writing for the rest of the semester is writing about people. ...I will tell you how to do this in each case." Mr. Peterson was true to his word—he did tell his students "how to do this." He told them how to develop the content and structure, to meet the requirements of the genre of "writing about people." Even more, he was true to his role as a teacher as he perceives it. As craftsman he created the structures that allowed his students to put together a palatable product. As master to his apprentices he enriched their bag of tricks, the repertoire of devices that allowed them to "be interesting" and "be clear" in their writing. As a writer, he encouraged the invention and manipulation, the curious mixture of art and craft (wile?) that writers are made of.

Ms. Glass and Mr. Peterson: Is "Good Writing" "Good Writing?"

At the level of organizing principles, the two teachers' meta-commentary about writing and writing activities, clearly differs primarily with respect to level of abstraction, as can be seen by juxtaposing the selections from Tables 5.1 and 5.2 below:

Principles of "Ideal Text"—Ms. Glass

The job of the writer is to make choices
Controlled by audience
Communicate effectively
Be clear
Be interesting
Controlled by focus
Find a focus
Write a focus statement
Controlled by purpose
Write a saturation report in which you communicate the essence of a place
Controlled by voice
Base your writing on your point of view

Principles of "Ideal Text"--Mr. Peterson

Anticipate reader reaction
Be interesting
Be clear
Do the assignment
Write a character sketch which the teacher will show you how to do
Figure out what the person's about
Describe and explain the person to make her or him understandable to others
Follow the format provided by the teacher

Although both teachers emphasize cognitive processes (see Chapter IV), the frameworks they provide for their students differ. The maps show the top level cognitive processes that each sees as necessarily underlying the very nature of Ideal Text. For Ms. Glass, the emphasis is on making choices which are subject to a set of rhetorical controls. For Mr. Peterson, the emphasis is on anticipating reader response as well as genre-specific thinking skills. In both classrooms, these top-level processes guide the specific talk and activities which focus on the second and third levels.

These differences give some clues to what it means "to teach the writing process." The differences, in fact, imply their different pedagogies. Although both teachers are concerned with audience, for Mr. Peterson, audience or what he terms "reader reaction." is a top-level category, not something that gets explicitly talked about very much and is not part of the substance of the activities themselves. On the other hand, for
Ms. Glass audience is a second level category, one that gets explicitly talked about a great deal. Ms. Glass stresses rhetorical categories—audience, focus, purpose and voice—she teaches students to label. Mr. Peterson, who subsumes all cognitive activity under the audience category as he teaches his students to anticipate reader reaction, does not use rhetorical labels. Rather he spends his time relying on activities that will help his students create interest and achieve clarity, the routes to pleasing a reader. He, therefore, designs class activities that help his students "come to know" how to be sensitive to the goals of clarity and interest. Both teachers stress thinking, as did the teachers in the survey. They both want their students to think about audience; one also stresses thought about focus and purpose whereas the other stresses thought within the genre of the character analysis. Because they teach at different levels of abstraction, even when their goals are similar, they take their students on different routes.

The functions the teachers' talk serves in their classrooms, we hypothesize, is connected to the roles they see themselves in as teachers, and to the goals they have for their students' learning. For Ms. Glass, the goal is for her students to come to "see it for themselves," to discover the regularity and order, the principles of written communication, "what works for them." The guidance she gives in this discovery process cannot detract from her students' learning, which is ultimately an individual experience and ultimately mysterious. Ms. Glass defines learning in a way that demands that she keep her distance in order to keep from taking away from her students its magic and discovery.
For this reason, Ms. Glass does not offer individual students and individual papers a helping hand. Rather, she concentrates on creating a world of ideas that the students themselves can turn into guiding principles, the landmarks that help them through the maze and muddle of their own ideas and messages. In the creation of this idea world, Ms. Glass’s principle material is talk. She creates an environment for learning built of terminology and student experience using the terminology. Students work individually and in peer groups with the framework, the idea-world, the meta-commentary itself, and not with Ms. Glass. They apply the concepts to the writing they are doing for the assignment. Ms. Glass actively monitors the progress and difficulties of students and uses whole-class sessions to provide help when needed. The help offered, however, is always in the form of talk—abstract ideas couched in a specialized terminology.

For example, one day a student confessed in class that he was having difficulty with his focus on his saturation report. His paragraphs didn’t seem to reflect his focus. One student suggested that he change his focus rather than rewrite his paper. Ms. Glass added:

Yeah. Since you picked out the stuff you thought was interesting, you look at that—just like we looked at those weird objects and tried to come up with generalizations about what made them connected—look at the stuff you finally picked out, that you decided didn’t fit your focus. See if there isn’t something that you can do to generalize
about what's in there. Look at what you've already selected and see if there's something that puts those together. Since neither Ms. Glass nor the other students have read this student's paper, it is clear that they are working with ideas about writing at a level of abstraction one step removed from the writing itself.

Ms. Glass's terminology, therefore, is essential to her teaching. It serves as a guide to her students, it constrains their search for "what works," and it places the responsibility for their messages, their meanings, and ultimately their learning, on them. "You need to decide..." and "You need to see if you can figure out..." were two of Ms. Glass's most frequent remarks to students.

Beyond the use of terms, Ms. Glass wanted her students to come up with terms, to label their own ideas. She communicated this explicitly to her students.

The idea of putting a label or a name on the idea you're trying to work with is a very difficult concept for most people to learn when they're trying to learn to write. She pushed her students to label their own ideas, to find the words that fit the concepts they wanted to express. In an interview with the research staff, she once said that she saw labeling ideas to be the most important aspect of student learning. If they haven't named it, they haven't got it--such was Ms. Glass's philosophy.

Beyond the dictates of curriculum, then, it is clear that talk played a special role in Ms. Glass's teaching. Explicit labels for concepts became the medium of instruction for a
teacher who refused to take over her students' learning process, but who had time-honored criteria and expectations for excellence in writing, just the same. Labeling, moreover, was seen as valuable evidence of learning activity, of the cognitive work that Ms. Glass insisted was her students' responsibility.

By contrast, Mr. Peterson spent less time talking, and less time in whole-class activities than did Ms. Glass (see Chapter IV). From his classroom, we collected almost half of the amount of language samples that we did for Ms. Glass's. This disparity was great, even given that his class met for forty minutes, while hers met for forty-five and even given that he spent class time discussing Great Expectations, during which the focus of his talk, when he led class discussions, was not always writing (even though it may have been related to writing in some way). The importance in Mr. Peterson's class of the teacher one-to-one collaboration and peer group problem-solving activities clearly influenced the amount of time he spent in whole-class discussion, and the medium, if not the message, of cultural transmission in his class. Students worked in groups to interpret the behavior of film characters, to create revealing questions to add to the list of 32 questions, and the like. They competed, group against group, in a game-like atmosphere after these problem-solving sessions. Mr. Peterson served as master of ceremonies and as judge, presiding over the games and awarding points for successful group entries.

The problem-solving games gave students experience working with particular concepts of importance in Mr. Peterson's class.
The games ranged from the high-level, interpretive, question-generating sessions, to the mechanical manipulation of text structure. Sometimes the task was to generate a collaboratively written paragraph as a group entry to the competition. On the day rough drafts of character analyses were due, Mr. Peterson gave his students a list of elements of "good writing." They searched through their drafts in groups for "strong verbs," "opening sentences that engage interest," and other categories of competition. "Good writing has strong verbs" was the implicit and explicit message of this "search and reward" game.

These activities alerted students to the values operating in Mr. Peterson's class. By awarding points to group entries, Mr. Peterson gave his students feedback as to how well they were approximating those values. By providing opportunities to hear other group entries and Mr. Peterson's responses to them, Mr. Peterson increased the exposure of his students to his evaluative criteria, his ideals and expectations. The activities themselves, whether text creation, text structuring, or text interpretation, comprised the curriculum of ideals and values as much as the talk that accompanied them.

Mr. Peterson engaged his students personally and individually through frequent, individual contact. By writing comments on their drafts and meeting briefly with them in conferences, he intervened in their writing and in their learning, helping them structure their tasks and their texts. In conferences, Mr. Peterson would work to understand the message his students wanted to communicate, and would help them find the language to do so. He would tell students where they needed to
elaborate the content of their papers, and discuss ways to structure sentences, paragraphs, and whole texts.

The interaction between student and teacher was focused by the individual student's paper and the tasks explicit in the assignment Mr. Peterson gave. Giving help on all levels, from the explicit structuring of the assignment to one-on-one help with student papers, defined Mr. Peterson's role as master craftsman. His approach to writing was modular, a building block system, in keeping with this craftsman role. What was important was that his students understood how to make the pieces and then learned how to put them together. He taught the pieces, often through the group activities he created, giving his students a bag of tricks, a tool kit for writing. His approach revealed the logic of the local, of the particular, of the concrete.

Mr. Peterson said once, in an interview with the research staff, that he wanted his students to learn sentence structure and grammar on a "gut level." He wanted them to have an instantaneous, tacit understanding of grammar when they encountered a situation necessitating its use. This remark seems to capture an essential quality of Mr. Peterson's teaching and his goals for his students. He did not seek terminological explicitness as a measure of their learning, but wanted them to display understanding, even unarticulated, "gut level" understanding, where it was needed. He wants his students to "know," to taste when their writing "needs salt."

Since Mr. Peterson's role moved him close to individual
students and their learning, often involving his direct guidance of their individual next steps, terminology did not play the important role it had to play in Ms. Glass's classroom. Exposure to the values and expectations, the ideal, of each teacher was essential to the teaching and learning process in each class. That exposure was mediated differently in each case, however. The media of exposure in Mr. Peterson's class were both the activities he created and presided over and his meetings with individual students. Overwhelmingly, Mr. Peterson himself cultured his students and their tastes through frequent individual contact over their individual problems, successes, and next steps as apprentice writers. Ms. Glass created a medium of ideas, of abstract terminology, and provided opportunities for her students to use them as evaluative criteria in class discussions while they struggled independently with their own texts.

Beyond the frameworks these teachers constructed for their students, there are important, underlying agreements about the fact that deep thinking is necessary to good writing. Further, they agree about what constitutes good writing. The overall message is that clear, specific, descriptive prose is good prose, as the following excerpts from Tables 5.1 and 5.2 indicate:

**Good Writing—Ms. Glass**

Be clear
Don't depend on prior knowledge of reader
Avoid reader confusion
Do one thing at a time
Make the connections between things explicit
Connect ideas together
Tie paragraphs together
Use key words from the focus statement to make transitions
Relate the pieces to the focus
Make proper use of pronouns
Keep the narrative pronoun consistent
Do not use "you" to mean "anybody"
Use pronouns to refer clearly to one
and only one noun
Maintain a consistent tense
Be interesting
Be humorous or entertaining
Choose an interesting topic
Write an interesting focus sentence
Write an interesting first sentence
Write an interesting introduction
Use lots of description
Of people, things, scenes
Write tight sentences that are not choppy
Combine sentences
Use strong verbs that are more active
and help the reader see better
Keep the reader's attention
Don't write pieces that are too long
Use only the important information
Leave out what isn't needed
Eliminate excess words (dead wood)
Don't be too general
Find better, more precise nouns and verbs
Don't be too complicated
Don't be boring
Vary the sentence structure

In general,
Project enthusiasm
Use the right word
Precise, sharp, not vague, fuzzy, dead wood
Use lots of detail and examples
To be convincing and persuasive
Use lots of description
To show the reader pictures
Give smooth transitions

Good Writing- Mr. Peterson

Be interesting
Use an interesting topic
Use specific details, descriptions
Contrive these, if necessary,
from your imagination to liven
up your writing and make it more
fun to read and to write
Use strong verbs, chosen carefully to
suggest action and convey more
Get rid of excess words
To eliminate repetition
To get into your subject faster

Be clear

184283
Be specific and concrete, not vague or general
   Give specific examples
   Give descriptions that present a clear picture
Make connections obvious
   Between paragraphs (ideas)
   Order them to create the best transitions
Within paragraphs
   Write a strong topic sentence that gives direction to the paragraph and connects the sentences
   Give evidence to support the point made in the topic sentence
   Relate all sentences in the paragraph to the topic sentence
Within sentences
   Combine ideas when possible into one sentence that makes the links and connections between ideas, and which avoids sentences that are too long and scattered

"Being interesting" relies on similar activities in each classroom, from choosing interesting topics to conveying the message in an interesting way. Strong verbs, specific detail, and description are handy devices, ways to make writing interesting. Cutting out "excess baggage" helps, too.

"Being clear" relies on the structure of the text in each classroom, on making the connections between all the pieces apparent. It also relies on adequate evidence in the form of specific examples or descriptions, even if the source of evidence differs a bit in each classroom. Precise, descriptive language, then, counts in both classrooms as "good writing." The framework, or meta-commentary about writing, and the terms that are used in each classroom, differ, while the base structure, the devices, or "tricks of the trade" remain constant in the two classrooms.

In a joint meeting with the research staff, both Ms. Glass
and Mr. Peterson told us how much they liked Macrorie's book *Telling Writing*. As a prescription for writing, this book certainly reinforces the message these teachers convey, and Ms. Glass had her students read sections of it, as mentioned before. The "culture of reference" for these two writing teachers is probably well articulated in Chapter 3 of Macrorie's book--"What is Good Writing?" As we will later discuss, students may have alternative "cultures of reference" that may create difficulties for them in the classroom where values and ideals are intimately tied to grades and other rewards.

To conclude, these two teachers transmit a similar message about what good writing is, and they both teach students certain thinking processes in order to help them achieve similar sorts of "Ideal Text." However, the teachers take their students on quite different roads to help them achieve these ends. Further, their travels lead them through somewhat different cognitive processes which, in large part, are meant to achieve similar, although not completely overlapping, cognitive goals. We hypothesize that the roles the teachers perceive for themselves and their philosophies of how learning takes place in large part determines the differences in what they do to achieve their goals.

**Ms. Glass and Mr. Peterson: Is "Good Process" "Good Process?"**

Before beginning this section, it is important to note that the distinction between process and product that we have made for purposes of this analysis is somewhat artificial. Certainly, as the discussion in the previous section shows, processes guide the production of a product, and at the high levels the maps of
processes are inextricably intertwined with product."

In this section, our focus is more on the procedures the teachers stress as the ways to enact those processes that will lead to desired products.

**"Ideal Process"--Mr. Peterson's Class**

- Drafting a paper
- Handing it in to teacher
- Rewriting, revising, re-doing
- Handing it in again
- Jots and Tittles
- Getting Results

**"Ideal Process"--Ms. Glass's Class**

- Self monitoring
- Steps and stages
  - Information gathering
  - Labeling ideas
  - Forming associations
  - Drafting
  - Having other people critique your work
  - Revising
  - Evaluating
  - Re-reading

By looking at the categories of talk from Tables 5.1 and 5.2 that occurred with respect to "the writing process" in these teachers' classrooms, we immediately see that "the process" is enacted, or realized, differently in each class. While both teachers perceive of a cognitive process which involves certain procedures to be used for the development of a piece of writing, and while each provides for abundant response during this process, each does it differently. The message students receive about "the writing process" also seems to reveal the teachers' perception of the role they play in their students' processes, and stresses different qualities of those processes.

For Mr. Peterson, the "writing process" essentially involves a procedure of crafting and designing a piece of writing, as
discussed earlier. Mr. Peterson sees himself as the master craftsman, whose role is to help his students successfully produce each piece. Below is an expanded picture of the process of writing recognized in his classroom.

"Ideal Process"--Mr. Peterson

Drafting a paper
Making language choices
Including specific details
   Making it up, stretching the truth, if necessary
Finding an effective order
Handing it in to teacher
Rewriting, revising, re-doing
   Paying attention to teacher comments
   Trying to do better
Handing it in again
Jots and Tittles
   Appropriate length
   Conventions
   Of spelling and punctuation
   Consistency
   Of tenses
   Of style
Getting results
   Good grades
   A jump in writing ability

Although the top levels look only like a set of procedures, their cognitive content is made clear in the expansions. To "make it up," students are free to improvise, and "stretch the truth," if that is necessary for the success of the piece.

Drafting a paper involved working with content, such as specific details, making effective language choices, and ordering the parts effectively, as the discussion showed. Mr. Peterson structured the drafting process as his students produced the character analysis, giving them specific suggestions and advice about content, language choices, and effective ordering as they worked on the assignment. Before handing in a paper, students:

Mr. Peterson's classroom must attend to the "jots and tittles":

188 287
conventions of spelling and punctuation, paper length, presentation, and such things as consistency of tense and style.

Mr. Peterson enters the students' writing process as he reads and makes comments and suggestions on drafts. He follows up this written response with brief individual conferences in class. Students then redraft their papers and hand them in again. This procedure of rewriting, commenting, and conferencing repeats ’til Mr. Peterson feels the student can go no further with the piece. The procedures for students in this classroom recur around Mr. Peterson's comments and advice which are meant to stimulate cognitive activities. Mr. Peterson tells his students that if they go through the set of procedures and cognitive processes, they will enjoy good grades and a jump in writing ability.

Now I'm saying this because I know that you'll probably get tired re-writing these papers that don't have a grade on them. But there is nothing that will help as much as that, and if you go through the process, you will get a good grade, that's what it amounts to.

Mr. Peterson withholds a grade until the student's paper has gone through this circuit of draft and response to get it to a final, best state.

The point is that everybody who went through that process of getting the papers back, rewriting, and handing them in again now can write like (gestures) that much better than they did before they started. There was just a great jump in their ability to write.
Ms. Glass's "Ideal Process" also included the procedure of writing drafts and making revisions, but the essential quality that emerged from her talk about "the process" at the higher level was a more direct, explicit focus on the cognitive activity involved. Whereas Mr. Peterson promoted cognitive activities, Ms. Glass talked about them. Her role, as she projected it in this process, was to guide student perceptions of their own work and that of their peers, and to evaluate their attempts to do so. Students gathered information, worked to label and associate ideas, then drafted, revised, and proof-read to produce a final product. Below is a summary of this writing process, a mix of cognitive activities and procedures for accomplishing them.

"Ideal Process"--Ms. Glass

Self monitoring

Self assessment accompanies the entire process

Steps and stages

Information gathering
Collecting, not inventing information
Detail, material, notes, observations, conversations, atmosphere to distill the essence of the place
To have something to write about
To make the reader see

Labeling ideas
Giving names to concepts

Forming associations
Clustering
To get ideas, to gather material
Free-writing
To get into more detail

Drafting
Getting it out in whatever form it comes
Getting it out fast
Writing it down and seeing what you get

Having other people critique your work
Identifying strengths and weaknesses before it is put into a final form for evaluation

Revising
Re-seeing, polishing
Making it better
Picking words more carefully
Worrying about verb tenses
Combining sentences
Proof-reading
  Reading it aloud to find mistakes
Correcting spelling and punctuation
Evaluating
  Self-evaluation
    Deciding how well you did
Turning in the final form for a grade
  and comments from the teacher
Re-reading
  Reading returned paper, ignoring comments
    Seeing what you think of it now
Reading teacher's comments
  Making note of teacher comments in order
to do better in future assignments

In Ms. Glass's class, students dealt with information they were to have collected, rather than invented. They used writing activities such as "clustering" and "free-writing" to form associations between ideas. The procedure of drafting itself involved the cognitive activities that led students to get ideas onto paper, in whatever form they came. Ms. Glass said:

Don't let me confuse you. Writing takes place in several stages. The first thing you get out of your head and onto the paper is in any form you can manage. Rough drafts are to get it out as best you can.

While revising, students attended to language choices and errors of spelling, punctuation, tense, and grammar. Ms. Glass stressed the value of coming back to a piece of writing with fresh eyes in order to "make it better."

Then when you've put it away for a little while and go back to it, then you think about revising and tightening it, and getting rid of the lazy verbs.

Students in Ms. Glass's class met in groups to listen to one another's drafts. Throughout the semester, students learned Ms.
Glass’s evaluative criteria, and they practiced using them by critiquing speeches and pieces of writing in class discussions. Ms. Glass entered the writing processes of her students insofar as she had trained them to share and wield her criteria. She structured class activities in order to guide her students to “see it for themselves.”

Students advised one another on rough drafts and again on proof-reading, and Ms. Glass remained distant from their personal processes. She structured class discussions and activities to ensure that her message got across, but a large part of that message was that she expected her students to work to figure out what they wanted to say and how best to say it. Students monitored their own progress through entries in Process Logs, and through formal self-evaluations before handing in their papers.

On the due date, students handed their completed papers in to Ms. Glass. They individually decided how much feedback they wanted from her, and she gave each paper a grade and marginal and summary comments. When they received their graded papers back, Ms. Glass took class time for students to reread them. They then made note of categories of their writing that needed improvement on a form Ms. Glass provided, working from her comments on their papers. Ms. Glass asked her students to work to eliminate one of these categories on their next paper.

“The process” in Ms. Glass’s class was thus organized around the messages she gave about her expectations. It was also organized around the cognitive activity of individual writers as they worked to discover what Ms. Glass was talking about, and how to produce it for themselves. This process was recursive across...
assignments, as students worked to overcome their shortcomings from earlier papers, aided by Ms. Glass's feedback.

By contrasting the "process" as it came across in these teachers' classrooms, we do not mean to suggest that Mr. Peterson attended only to crafting text, and Ms. Glass only to labeling cognitive activity. It was more a matter of degree than such a dichotomy would indicate. Mr. Peterson created activities that exercised his students in both the cognitive and linguistic skills they would need to accomplish writing tasks. Ms. Glass took many opportunities to talk about structuring a text and "picking words carefully"--the craft of writing. But it is notable that each teacher stressed the aspects of text production that fit best their perception of their roles as teachers. Mr. Peterson, the master craftsman, taught his apprentice writers to craft text. Ms. Glass, the guide, set up an environment for her students to "discover" what worked for them.

**Student Writers--Constructs in Classrooms**

In their private talk in peer groups, and sometimes (rarely) publicly, students in both classrooms gave voice to opinions and values about writing. Some of these values conflicted with those officially sanctioned by the teacher. Others mirrored classroom values. Some of the remarks students made in their peer groups in both classrooms fell outside the categories of talk about writing used when the teacher was present. That is, some of their independent statements were truly independent from the criteria and values in "official" use in the classroom.

Throughout this discussion it will be important to remember
the complex social relationships and roles that students have in school settings that push them to express some views purely for the benefit of their peers or teacher. Also ninth graders are in the process of forming many of their values; and so expressed values may change rapidly or their expressions may be tests rather than indications of the students' actual values. What is of interest is that the students' value statements show the public roles they play, both with their peers and with their teachers. The students' value statements may reveal more about the social relationships and institutional structures inherent in schooling than about writing itself.

Remarks overheard in the two classrooms were similar in many ways. The summary tables here illustrate the similarities and differences:

Independent Student Criteria--Ms. Glass's Class

Good writing for this class
Is not normal
   Is not about books
   Is about real life things
Is hard, takes work and thought
   Requires finding information
   Requires choosing a focus
Is different from what's been expected before
   Is childish
Is whatever the teacher wants
   Is done the right way
The writing process
   Is the result of trying to meet requirements
   of the assignment
   Is the result of time and effort spent
   Is what is evaluated positively
   By having peers correct your paper
   Picked apart by the teacher as if it were make believe
   Not treated objectively
   Is to fight about, to challenge teacher about
   Should be evaluated (graded) quickly and generously

Independent Student Criteria--Mr. Peterson's Class
Good writing is writing that sounds right
Grammar
Word choices
Phrasing
Paper organization

Good writing is whatever is rewarded by the teacher
Plain, basic, straightforward
Different from mine
Harder to produce

For purposes of explanation, we will group the students' remarks into two categories: those that deal with the student and teacher roles within the institution of the school and those that deal with the content of the instruction in the two classrooms.

Roles in the Institution. Students in both classes saw their job as one of doing what the teacher wanted. In Mr. Peterson's class, he was the authority, and his criteria—"whatever is rewarded by the teacher"—were those that counted, even if theirs differed. Some students voiced resentment about having to produce what Mr. Peterson wanted, while many others seemed perfectly happy to do so. "Don't knock it," one student said about another's paper. "If he said he likes it, it's good." Mr. Peterson's students recognized his authority to decide what was good or not good.

Those who expressed resentment claimed to disagree with the type of prose that Mr. Peterson liked, and such disagreements were coupled with what was perceived by the students as a negative response from him to their writing. To one student, he liked writing that was "plain" or "basic," "straightforward." Her writing, however, was "frilly-dilly" because she used "big words." This student told her peers that she thought that styles other than those that Mr. Peterson explicitly valued were equally
valid, and that she would resist changing styles at this point to please one teacher among many. She also complained about the fact that grading accompanied Mr. Peterson's values and opinions, that his criteria were the ones that counted. She said to her peers:

I'm tired of writing. Everything I write he doesn't like. Every time I think it's pretty good, he always gives me something bad. And before if I had written it for some other teacher they would have said, "Ah! Beautiful!"

Later, the peer group talked about a paper Mr. Peterson had given this same girl a "C" on. The girl commented to her peers:

That was sad. He gave me a "C" on that. That was really sad. And then he put the "A's" on dittos so you could read what he wanted and then I read them. I almost had a heart attack.

Curiously, this particular student was one of the best, most versatile writers in the class. She frequently was singled out by Mr. Peterson to provide positive examples of writing or ideas during classroom lessons, and she usually received good grades. Yet her discomfort before her peers was evident, with his demands for her writing and with any feedback that was not laudatory.

In Ms. Glass's class, students also talked in their groups about doing papers the "right" way, that is, producing what the teacher wanted--"good writing for this class is whatever the teacher wants and is done the right way." One day, Allison, our lower achieving focal student, told her group that her paper was not done "the right way." A peer reassured her, saying, "No, she didn't say what it was supposed to be like." Allison wanted to know "one right way." Ms. Glass saw her role as purposefully
refraining from giving her students explicit directives about the form and content of student papers; such directives would have kept them from engaging in the discovery process. At this point, not a negative evaluation but her unfamiliar approach, seemed to lead students like Allison to feel insecure.

As another student said in Ms. Glass's class one day, "Well in other classes we just use the same format we've been using since the fourth grade. Here we're using all these revolutionary new ideas." On the same day, another remarked, "Yeah, well it's strange to me that we can learn one way of doing a paper you know for since like fifth, sixth grade, and now we get this class and we've got some totally different way of going about it." These students complained that the old formulas were not valued in Ms. Glass's class.

One day in class, the frustration of many students surfaced; their role as they perceived it and her sense of their role were at odds. They saw their job as "getting it right." To get it right, they perceived that they needed to be able to rely either on directives from Ms. Glass or on the old formulas. To get it right, she perceived that they need to engage in active discovery and to learn to think for themselves. Ms. Glass and these students approached "learning" differently.

On this day, Ms. Glass asked what kind of papers they had written last semester in English. She was working on getting them to notice the purposes behind writing that make a difference in presentation. At this point, students took the opportunity to express their anxiety. Jim, our high achieving focal boy, said the writing
they had done before this class was "normal," the implication being that the writing done for this class was not. When Ms. Glass probed for greater specificity of what "non-normal" meant, other students chimed in. The most vocal were a group of boys who sat together for the entire time we observed in the class, and worked together whenever possible. Jim and Derek, our high and low achieving focal boys, were a part of this group.

These boys claimed not to understand how they could be taught "one way" to write a paper for the whole of the eight years before coming to this class, and then suddenly be expected to do something "completely different." They found the assignment hard, and Derek claimed it was "childish" to go to a place and take notes. For these students, "normal" academic writing involved using formulas to write about books.

Even the high ability, teacher-pleasing girls, like Julie, joined into this discussion to air their perceptions of the assignment as hard. Julie said, "I think this class is a lot harder because before all of the information was right in front of me with a book." She sheepishly admitted that what was hard about this type of writing assignment was that you had to think.

Another high ability boy, said, "I thought it was a lot easier to write on books because you formed your own ideas easily as you read."

Remarks students made at other times in both classes gave additional hints about their sense of their role as learners. Generally, students wanted to be assured of rewards for time and effort. In both classes the teachers could only assure them of rewards if the time and effort were evident in the writing.
In Ms. Glass's class, the issue of time and effort was raised in several ways. In class, when offering critiques of the writing samples Ms. Glass brought in, students sometimes rose to the defense of a piece of writing by saying that the writer had spent some time and effort on the piece. "Effort counts," was a remark one of Ms. Glass's best students made one day, echoing a claim by Derek that the writer had worked hard and should get a good grade. Ms. Glass showed how she expected time and effort to be visible on the page. One student said of a piece of writing, "It seemed like, you know, there was some effort put into it." Ms. Glass asked, "Okay, how did you know that?" Ms. Glass's guided discovery approach encouraged her to think of her students' essays as "attempts," some more or less successful than others, but attempts just the same. Her implicit assumption was that hard work should show; her students were not so confident about this "fact."

At another time, Ms. Glass, trying to alleviate some of her students' anxieties about grades, said that an essay was just "an attempt, a try." Jim asked if she was going to grade them on how hard they had tried. Ms. Glass had to say no. She planned on grading them by the same criteria she had always used--namely, their degree of success in doing what the assignment asked. Again she implied that she expected that their efforts would "show."

Concern with time and effort took different forms in Mr. Peterson's class. His students were not so concerned that their
effort might not be rewarded. Instead, they, as did students in Ms. Glass's class, wanted to avoid putting forth as much effort as their teachers expected of them. But the students in neither class were willing to sacrifice their grades. In Mr. Peterson's class, the group tried to negotiate delays in quizzes and due dates for papers, and shorter length papers as well. One student (the one with the "frilly-dilly" style) said that she did not want to adhere to his demands for changing her writing because to do so would require work. She would have to think about what she was doing, whereas now she wrote automatically. She told her peers:

The thing is, I don't want to change because of him. You know, that's the way I do it. I mean, if I changed, I'd have to think about it. This way I just keep going, you know.

Some of Mr. Peterson's students tried to get by with strategies that hid their lack of preparation. Rhonda, our low focal girl, was good at taking remarks overheard from those around her, and using them as displays of knowledge at the appropriate moment. Some students complained about the amount of work assigned, remarking that this was not an Honor's English class, after all.

Covering-up strategies to avoid work were perhaps most apparent in Ms. Glass's class among the boys whom Jim and Derek hung out with. Several times we were privy, through overheard conversations or tape recorded peer groups, to student confessions. These boys shared, somewhat proudly, the fact that they had just "made up" their papers or speeches. Their
independent process, which minimized the work of collecting information, was to "make it up." They talked about their "make-believe" places. In a peer group, one student asked, as he read another's paper, "This is make-believe, isn't it?" The writer answered, "Can you tell?" The student reader hastened to say, "No, it's good, it's pretty good. But see you really don't have to go to the place. You just do it by memory." One might conjecture that "making it up" may require as much effort as actually observing, although these boys did not think so.

To conclude, in the peer groups that our focal students participated in and in whole-class discussions, the students often articulate their values as wanting to get the most reward for the least effort. Ms. Glass and Mr. Peterson equate the effort required to learn with rewards. The institution of schooling, with its graded reward structure, seems to encourage students to attempt to find alternate, "easier" routes to achievement than the official teaching and learning that was supposed to be going on. Even as students tried to "do it right," they often tended to search for rules rather than think through the problem before them.

Content of Instruction. In peer groups, Ms. Glass's students spontaneously used the terminology of the classroom. They helped each other find "focuses" looking for the "atmosphere" and "essence" of their respective places. They looked for more "showing," more "pictures" of "scenes." They relied on one another for help in pleasing the teacher. They relied on each other, too, to define terminology they did not
understand. "When you say Engfish, what do you mean by that?" Derek asked a girl in his group. "What's a vignette?" one girl asked another. Students thus displayed understanding and use of the terms that had currency in the classroom, and asked for help defining terms when they needed it. Their talk in peer groups mirrored the terminology Ms. Glass had used in class.

In Mr. Peterson's class, peer groups also reflected the terminology of the classroom. One student asked, "Didn't he say we were supposed to work with patterns?" reflecting an understanding of looking for the generalities as she worked on a paragraph about a Great Expectations character. Students followed Mr. Peterson's instructions, looking for "strong verbs" and "topic sentences that give direction to the paragraph" during group activities, repeating the language they had heard Mr. Peterson use, and that was written on the dittoes they followed. Independently, they came up with criteria all their own, but that seemed to reflect aspects of Mr. Peterson's teaching goals.

"Sounding right" was an invention of the students, and they applied this criterion to sentence structure, word morphology, phrasing, and even to whole papers. Rhonda once said about her paper, "Mine sounds funny compared to yours." The gut level reaction Mr. Peterson wanted to build in his students seems evident here. If something "sounds right," all is well. If not, students are alerted to the possibility that something is wrong. The undifferentiated quality of the criterion "sounding right" reflects the downplay of both specific terminology and the role of language in Mr. Peterson's class.

In both classrooms, student talk that fell into "official"
classroom categories sometimes reflected the students' lack of understanding and their negative reactions to classroom values. It is difficult to separate out the possibilities—did students simply misunderstand the concepts, or did they understand and value them negatively? In some cases, it was clear that a clash of values was occurring. In Mr. Peterson's class, students sometimes found topics interesting which differed from Mr. Peterson's opinions. Some students found his taste in prose difficult to accept, as mentioned above.

The boys in Ms. Glass's class, again at the hub of "resistance" to classroom practices, had a peer value system that clashed with the type of explicit, self-revealing prose valued in the classroom. The last thing these boys wanted to do with one another was be explicit and self-revealing. This led to the practice of disowning their work. Before reading to peers, these boys would characteristically tell how they "made it up," "It's not really real," "Don't think I believe all these things." Perhaps this was behind Derek's belief that "having other people correct your paper is dumb." For him, reading his paper to peers exposed him to unwelcome evaluation by people whose opinions particularly mattered.

The concept of Engfish was particularly hard for these boys to take. In his book *Telling Writing*, Macrorie blasts through empty prose, showing how academic-y Engfish communicates little, being profoundly inauthentic. Not only the writing that stacks big word upon big word to disguise a message, but the writing that has no message, that says nothing, is Engfish. In a system
of values that discounted, even rejected, self-disclosure, these adolescent boys wanted to say precisely nothing in their writing.

Similar conflicts arose over using strong verbs and vivid pictures. Some students, at least, found the examples Ms. Glass brought to class "contrived," "unbelievable," in short, inauthentic. What counts as authenticity is clearly at stake here. Saying nothing in their writing was probably an authentic expression of adolescent boyhood. Making a big deal out of very little—the vivid description of the mundane—smacked of contrivance, and not only to the boys. One girl commented on a paper, "I thought it was a little bit overdone." Many students agreed, citing places in the paper they thought were "contrived," "phoney," or "not believable."

In both classes, it seemed that through eight years of schooling, students had learned to have a taste and a flair for Engfish—strings of unnecessary, big words. They may have also learned to say nothing in order to comply with a writing assignment. That these practices were de-valued in Ms. Glass's and Mr. Peterson's classes seemed to surprise and confuse them. Derek asked a peer, "But, don't you think English sounds better that way?" The girl with the "frilly-dilly" writing in Mr. Peterson's class might have asked the same question.

Students in both classrooms had similar difficulties with the demands of written language, as it was presented by their teachers. "Showing," using strong verbs, and making explicit ties and connections between ideas were particularly difficult concepts for some of Ms. Glass's students to grasp. They seemed willing to accept written statements at their word and did not
ask for details or proof. If a writer stated that he had a good
time at Disneyland, most of Ms. Glass's students were convinced
that it was so. Similarly, they seemed to think they had
communicated adequately when Ms. Glass thought not. Derek
squirmed as Ms. Glass told him,

The connections between an example and something that you're
trying to show need to be made more explicit. In your head,
you think they're all connected, but you haven't said enough
from the words on the paper to show me how they are related
to what you're saying.

Being specific and concrete, giving clear pictures and evidence,
and using strong verbs was equally difficult for Mr. Peterson's
students. In a peer group, one student asked if "went crazy" was
a strong verb. She admitted, "I really don't know what he means
by that." In another group, a student argued that the verb
"ascertained" described an action, "kind of like." Mr. Peterson
had said it was not the kind of "action verb" he was looking for.

Making links between character traits and examples was a
difficult concept for many. These were the topics Mr. Peterson
found himself discussing time and time again as he responded to
student performance.

Discussion

Looking deeply into the language of two teachers and their
students for the values and expectations they held about writing
reveals several important aspects of life and learning in writing
classrooms. First, we have seen that both Ms. Glass and Mr.
Peterson are teaching their students to think deeply when they
write. The teaching philosophies and specific goals affected the roles they took in their students' learning processes and the level of abstraction of their teaching.

The students' values about the content of instruction show both what they will likely resist learning and what they will have to grapple hardest with (e.g., in these contexts, avoiding English and showing details). The approach to learning that we uncovered, although not necessarily affecting all the students, is troubling. The institutionally-imposed reward structure (grades given by the teacher) overshadows and even actively works against the kind of learning these teachers want to promote. Students take short-cuts to learning as they seem to forget that they are in school to learn, not just to capture good grades. They too often focus on strategies to avoid as much work as possible while maintaining acceptable grades, and at these points miss the instruction that is available.

It seems to us, in the light of what we have overheard from these students, to be a case of "magical thinking," as Emig (1971) put it, to think that grades in school reflect academic learning. Rather, grades, together with years of unavailable opportunities to learn, deflect many students from the express purpose of schooling, learning to think.

Indeed, students learn, alright, but what? Some students, working actively to "make it up," learn successful strategies for getting the grades they want. Derek spoke once about a strategy no doubt familiar to teachers. To get a good grade, you have to challenge the grade the teacher gave you, according to Derek. He followed this remark with a success story, an account of having
the strategy work.

Students know the "making it up" strategy, and this no doubt was behind the confusion of students in Mr. Peterson's class when he gave them permission, as part of the writing process, to "make it up." This seemed particularly wrong when they were writing about their own friends. They seemed embarrassed to admit to each other that they had made up some of the stories and details they were now associating with people who were important to them.

Students are clearly learning to navigate the institutional waters of schooling, and to keep as much as possible to their own interest. The question of why they define that interest as doing as little work as possible might provide some profoundly disturbing answers, if taken seriously.

Those students who willingly accept their role as teacher-pleasers, pulling out their good grades, give us even more reason to pause and reflect on the relationship between grades and learning. In peer groups, high achieving girls in Ms. Glass's class managed to turn Ms. Glass's non-formulaic approach to teaching into a set of rules for their behavior. "Ms. Glass doesn't like the verb 'is,'" they whispered to themselves. "Okay, she'll never see another 'is' out of me while I'm in this class." These girls managed to find alternate ways of phrasing their sentences to avoid 'is,' but did they learn anything productive, useful beyond the reach and sway of this one teacher?

By contrast, Derek, one of Ms. Glass's most headstrong (and authentic!) students, actively struggled with the idea of writing a good focus statement. He asked his group how to go about it.
A 'knowledgeable' girl answered, "Well, you can't use 'is.'" Derek was incredulous. He struggled for the next twenty minutes to find out why, and to explore alternatives. He never quite understood why using "is" was not as good as using other verbs or other ways of structuring sentences. He confessed to a buddy just before turning in his paper, "You know, I still use 'is.'"

Which student learned here? The agreeable girl who turned Ms. Glass's concepts into rules and precepts, or Derek, who knows, if nothing else, that he does not understand? The girl was more "successful" in the economy of the classroom, capturing more of the teacher's praise, and higher grades. Derek, disagreeable and troublesome as he was, on this point may have learned more authentically what Ms. Glass really wanted to teach.

The learning through discovery that Ms. Glass is so dedicated to seems to suffer under the institutional constraints of schooling, and student responses to those constraints. Students, relying on teacher-pleasing to ensure their success in school, are not likely to feel "safe" when given permission to explore, to make "attempts." Students aren't truly free to discover, to "find out what works for them," if doing so risks the grades they have learned how to make. In Ms. Glass's class, however, their frustration came partly as a result of the fact that reliable old strategies didn't apply--her assignments weren't "normal."

Another troubling aspect of teaching and learning to write concerns the authentic use of written language. In their talk, students were sometimes a variance with what the teachers accepted as authentic prose, writing that was alive. It is
tempting, although we think incorrect, to equate authentic writing with "good writing" as these teachers defined it. What counts as authenticity is clearly at stake here. Saying nothing in their writing was probably an authentic expression of adolescent boyhood. Making a big deal out of very little—the vivid description of the mundane—smacked of contrivance, and not only to the boys in these classrooms. In both classes, it seemed that through eight years of schooling, students had learned to have a taste and a flair for Engfish—strings of unnecessary, big words. They may have also learned to say nothing in order to comply with a writing assignment. Saying nothing, and having nothing to say within the constraints of writing for school may indeed be an authentic expression of self for these students.

At the points of difficulty that we have focused on in this chapter, it seems that it is the institution, not the most successful teachers within it, that is failing these students.

Summary

Perhaps it bears repeating here that this investigation has reconstructed models of "Ideal Text" and "Ideal Process" operating in two classrooms through the language used in those classrooms alone. We set out to investigate the content of the curriculum in these classrooms, recognizing knowledge domains, upon which curriculum rests, to be historical products of social and cultural activity. Perhaps it is not surprising then, that we should find that the social roles of these teachers, their goals and expectations for their students, and the maintenance of the teacher/learner relationships help to compose the content of the
curriculum itself. Perhaps, too, it is not surprising that the structure of schooling as a social institution is evident in the talk of teachers and learners in the classroom, talk explicitly oriented to the content of instruction.

Both teachers stress cognitive activities underlying text production. But they do so differently. Ms. Glass remains distant from her students, and guides their learning activity through talk. She teaches at a high level of abstraction, explicitly naming rhetorical principles underlying writing practices, using the terms "audience," "purpose," "focus," and "voice" to create the "idea world" in which her students work. Mr. Peterson personally enters the learning of his students, giving them specific individual feedback and direction as they work. He relies on learning activities and his own presence in the learning process to guide his students. Talk does not play the important role in his teaching that it does in Ms. Glass's approach, and he does not use the high level terminology that she does to talk about writing.

The role of talk in these two classrooms seems congruent with the teaching strategies of these two teachers. It is also consonant with the goals they hold for their students. Ms. Glass wants students to attain the "named idea," the explicit language that comes from conscious monitoring of mental activity. Mr. Peterson wants students to have a strong, intuitive grasp of what works in writing.

The language these teachers use in their classrooms frames the act of writing for their students. These frameworks make a difference in that both teachers' students use the terminology of the
classroom when working independently, and that terminology is different. Mr. Peterson's students go for what "sounds right" in their writing, a criterion that reflects the goal of their teacher. Ms. Glass's students label their activities.

The questions this study cannot answer are: Does this difference in language used and concepts learned in these classrooms make a difference in students' acquisition of written language? When teachers talk on different levels of abstraction, does it affect the ability of students to use knowledge learned in the classroom in new situations? Are the "logic of the particular" and the "logic of the universal" equally transferable? These questions deserve further study.

Regardless of teaching approach, evaluation involved value judgments, and this chapter reveals important value differences between teachers and students. Since writing involves the making and sharing of personal meaning, it is a particularly touchy domain where these value clashes may surface more readily than with some others. Teachers have the authority to enforce their values in the classroom. Students, as we have seen, have well-developed strategies for resistance.

Teachers' evaluations of student products are an essential part of "the writing process" in these two classrooms. In fact, we have seen that "the process" is recursive around these teachers as evaluators. Since Mr. Peterson sees and evaluates student drafts, the recursive cycles are shorter in his classroom than in Ms. Glass's, where response to final papers provides a springboard to the student's next writing performance. A
question to investigate is: Does the length of time between teacher evaluations, and the point in the process at which they occur, make a difference in the growth of student writers? While Ms. Glass's students receive feedback from peers on their drafts, they orient in their own talk to "doing it right" for the teacher.

An uninvestigated aspect of study is the effect of curriculum on teaching writing. Some of the differences in language observed in these two classrooms may be attributable to the differences in curriculum. Since we have no direct comparisons between the teachers as they teach the same class, we cannot know what the effect of curriculum is. However, our lack of security on this issue raises an interesting question. Educators interested in the field of writing call for "writing across the curriculum." It might be beneficial to know what effect the curriculum (English literature, science, communication) has on the messages students receive about writing.

One final note: The two teachers whose classrooms we investigated, when talking with one another, have enough shared language to communicate the sense that they do similar things in their classrooms. The variability in their teaching styles and goals for their students is not apparent as they talk about writing to one another. Some of the language they use, like "the writing process," is shared by a large community of writing teachers. The term has many meanings. We hope, additionally, that we have provided a description of a methodology that educators will find useful for investigations of
the local realization of content, the classroom construction of domains of knowledge.
Footnote to Chapter V

1 "We" is used throughout this chapter for the sake of consistency with the rest of the report. However, Greenleaf, the chapter author, conceptualized and carried out the data analysis.

</tbody>
</table>
Don't be too complicated
Don't be boring
Vary the sentence structure

In general, in order to be clear and interesting to your audience:
Project enthusiasm
Use the right word
Precise, sharp, not vague, fuzzy, deadwood
Use lots of detail and examples to be convincing and persuasive
Use lots of description to show the reader pictures
Give smooth transitions

Controlled by focus
Find a focus
Generalize from specific information
Write a focus statement
Include the topic or subject and your attitude toward it

Controlled by purpose
Write a saturation report in which you communicate the essence of a particular place
Choose a place to investigate
Collect lots of information, data, material
Select important pieces that convey the feeling of the place
Order and sort details to show the atmosphere best
Convey the focus - the essence of the place and your attitude toward it - to a reader

Controlled by voice
Base your writing on your point of view

In general, good writing speaks to all of these principles by:
Showing - Using vignettes, scenes, images, pictures
Put the reader in the middle of something
Make the reader see, hear, feel, and sense the essence of the place
Piece together details, examples and descriptions from observations to give the character of the place, make the paper come alive and help to convince the reader

Structuring
Write a focus statement that has a strong verb that builds into the sentence your attitude toward the subject, shows the reader about the place and says something about relationships between things

(table continued)
Place the focus statement prominently, at the end of the first or second paragraph.

Order information in the paper to keep reader attention and interest for the purpose of communicating the atmosphere of the place.

Write a good introduction and conclusion which catches reader interest and leaves the reader with a feeling about the place.

**Ideal Process**

**Self monitoring, self assessment accompanies the entire process**

**Steps and stages**

**Information gathering**
- Collecting, not inventing information
- Detail, material, notes, observations, conversations, atmosphere to distill the essence of the place
- To have something to write about
- To make the reader see

**Labeling ideas**
- Giving them names

**Forming associations**
- Clustering
  - To get ideas, to gather material
- Free-writing
  - To get into more detail

**Drafting**
- Getting it out in whatever form it comes
- Getting it out fast
- Writing it down and seeing what you get

**Having other people critique your work**
- Identifying strengths and weaknesses before it is put into a final form and turned in for evaluation

**Revising**
- Re-seeing, polishing
- Making it better
  - Picking words more carefully
  - Worrying about verb tenses
  - Combining sentences

**Proof-reading**
- Reading it aloud to find mistakes
  - Correcting spelling and punctuation

**Evaluation**
- Self-evaluation
  - Deciding how well you did
- Turning in the final form for a grade and comments from the teacher

*(table continues)*
Re-reading
    Reading returned paper, ignoring comments
    Seeing what you think of it now
    Reading teacher's comments
    Making note of teacher comments in order to
    do better on future assignment

Independent Student Criteria
    Good writing for this class
    Is not normal
      Is not about books
      Is about real life things
    Is hard, takes work and thought
      Requires finding information
      Requires choosing a focus
    Is different from what's been expected before
    Is childish
    Is whatever the teacher wants
    Is done the right way

The writing process
    Is the result of trying to meet requirements
      of the assignment
    Is the result of time and effort spent
    Is what is evaluated positively
      By having peers correct your paper
      Picked apart by the teacher as if it were
      make believe
      Not treated objectively
      Is to fight about, to challenge teacher about
    Should be evaluated (graded) quickly and generously

(table continues)
Make observations
Take a close look at the person
Distinguish between observation and judgment

Defer judgment - collect lots of examples and descriptions instead
Interpret revealing behaviors
Think about what they say about the person
Make guesses based on your knowledge of the person

Discover and identify patterns in the person's behavior
Identify a quality or characteristic of the person, a trait from the specific examples and evidence you have
Find traits that contrast with one another

Describe and explain the person to make her/him understandable to others
Give examples of traits and qualities of the person to convince the reader
Use instances that demonstrate the character traits
Use stories that bring out the traits
Use anecdotes that catch the character of the person and give examples of behavior traits
Use specific things the person says, quotes or dialogues that reflect the personality of the character
Make these up or derive them from your feelings about the character, if necessary

Make language choices to catch reader interest and to get an idea across
Choose words carefully to:
Label or describe ideas and character traits
Spice up your writing
Simplify
Avoid ordinary, average, or vague words

Follow the structure provided by the teacher
Begin with an opening sentence that engages reader interest
Start with a picture
Start with an action
Start with a dramatic statement
Start with a quote that catches the person's character or personality

(table continues)
Make the first paragraph an introduction to the person. Deal with his or her appearance as it relates to his or her personality and makes a comment on the way he or she wants to portray her/himself. Describe clothing, describe looks, describe manner, describe movement.

Write three paragraphs in the middle that each deal with an aspect of the person. Make connections between the ideas. Use three separate but related qualities. Link the traits by contrast. Make links between the qualities and examples.

Write a conclusion.

Ideal Process
Drafting a paper
Making language choices
Include specific details
Making it up, using imagination, improvising, and stretching the truth, if necessary
Finding an effective order
Handing it in to teacher
Rewriting, revising, redoing
Paying attention to teacher comments, suggestions
Trying to do better
Handing it in again
Jots and Tittles
Appropriate length
Conventions
Of spelling and punctuation
Of consistency
Tenses
Style

Getting results
Good grades
A jump in writing ability

Independent Student Criteria
Good writing is writing that sounds right
(Grammar)
(Word choices)
(Phrasing)
(Paper organization)
Good writing is whatever is rewarded by the teacher
Plain, basic, straightforward
Different from mine
Harder to produce
CHAPTER VI--The Structure and Content of Classroom Response Events

Overview

We have noted that the profession uses traditional, or folk, labels for different response situations, labels which are explicitly recognized and used by teachers and students who participate in the writing classroom. In Chapter IV, we characterized response in the two classrooms both in terms of recognized response situations--the peer group, teacher-student conference, written comments on papers--and in terms of the new insights about whole-class response that we gained from immersing ourselves in the classrooms and observing response events as they spontaneously occurred. Our observations of whole-class response frequently led to a better understanding of all types of response episodes, for the main channel of classroom interaction frequently anchored all other response. These discoveries caused us to break down categories of response into discrete variables, as reported in Chapter IV, designed to capture some of the fine distinctions we observed from episode to episode.

We began this research, then, by working with folk categories. We found that these categories inadequately described the richness of the response episodes we observed. We created analytical categories designed to catch as much of that richness as possible. Of the major response categories (namely, the whole class, peer group, teacher-student conference, and written comments), the one that has been least investigated is that of whole-class, or classroom response. Classroom response events have probably been overlooked largely because of the
difficulty of investigating them; few researchers have the resources to spend long hours in the classroom where this type of response occurs. Written comments on papers and teacher-student conferences are comparatively easy to investigate. However, this study has led us to believe that knowledge of the classroom context is often critical to making sense of the written comments and serves as a frame of reference for concepts discussed in conferences and peer groups. Crucial information is lost in any decontextualized look at response to student writing.

The whole-class response to be analyzed in this chapter only roughly captures the rich variation in response episodes that we witnessed. We have described the types of response we observed in Chapter IV. In Chapter V, we reported the values that underlay the response events occurring in our two classrooms. However, not only the context response occurs in, but the teacher's and students' interactions, the academic task at hand, and the teacher's overarching pedagogical agenda influence the content and structure of response events. Variations in these influences working on response events introduce variation among seemingly similar response contexts. The resulting generalization that can be made is that one peer group episode is not necessarily like any other. One conference, one whole-class response event, differs from another—both within the classroom of these two teachers and between them. Whereas in Chapter IV we compared the teachers according to broad characterizations of response events, this chapter comprises an in-depth look at the structure and content of one prototypical response event:
response during the classroom lesson. We seek to uncover differences and similarities of such events both within a given class and across the two classes. We hypothesize that some combinations of tasks, functions, and interactional styles work better in particular settings than others.

**Background to the Analysis**

To accomplish our goal of understanding what characterizes different types of response and what makes some response events more successful than others, we need a powerful system for in-depth analysis of the events themselves. Unfortunately, we know of no ready-made analytic tool which we could apply. In developing an analysis system, we begin with the insights of linguists who analyze the structure of classroom conversations. We then combine these insights with the concerns of educators who are interested in understanding not just the structure of classroom events but also the transmission of content, the effects of the pedagogical structure on the cognitive processes of the learner. Although we will apply our analysis to response events in writing classrooms, we are optimistic that the general principles will be useful for the analysis of teaching and learning in other content domains as well. Further, we expect that our analysis techniques will provide a basis for future looks at other types of oral response, in particular conferences and peer groups. We hope at some point to be able to compare the structure of these different types of oral response and to compare different events within the same types.

In the past fifteen years or so, conversational analysis,
influenced by studies of the social psychology of small groups, has been concerned with describing the structure of small group conversational interaction. These analysts sought to catalog what it is that people in verbal interactions must know in order to carry on successfully with one another. They wished to construct a grammar of verbal interaction entirely from data collected in real-life interactions, without recourse to any introspection on the part of the participants or the analysts.

The efforts of conversational analysts such as Harvey Sacks, Emanuel Schegloff, and Gail Jefferson (1978), have provided students of language with a set of analytical tools. In particular, by working exclusively with natural data, they have located and described many features of conversational behavior. They have isolated units of conversational interaction, such as "turns" at talk and have noticed regularities in the ways turns alternate.

These regularities seem to rest on the idea of "conditional relevance." Given a question by the current speaker, an addressee's answer is immediately relevant and expected, and any silence or hesitation will be noticeable and assigned some meaning. The concept of conditional relevance helps to explain sequences of turns. Some turn sequences are arranged in pairs—question/answer, greeting/greeting, offer/acceptance. Pairs of this type were first coined "adjacency pairs" (Goffman, 1967; Schegloff & Sacks, 1973), but it soon became clear that such pairs need not be strictly adjoint to one another in the flow of conversation. Schegloff (1968) describes "insertion sequences" in which one pair is embedded within another. (See also Merritt,
Conversations as described by ethnomethodologists, are locally composed of alternating turns and paired transactions which may be multiply embedded in one another. Complicating this simple picture of conversational discourse is the notion of "preference organization." There are multiple ways of constructing a response to the first part of an adjacency pair. Conversational analysts have described a ranking in order of these responses in terms of preferredness and dispreferredness (see Levinson, 1983). By "preferred," they mean expected, normal response, by "dispreferred," they refer to an unusual or unexpected response, a response that is "marked" in the linguistic sense.

It is important to note that conversational analysts do not refer to the psychological state of the speaker or addressee when they speak of preference organization. Rather, dispreferred responses are accompanied by structural complexity—delays, hedges, and explanations of some kind. While the injunction against interpretation restricts conversational analysts from hazarding guesses as to why dispreferred responses might be so marked, it is clear that the interactional (psychological)
difficulty of having to refuse a request or reject an invitation might account for such phenomena.

Conversational analysts have gone beyond the local level of paired utterances to describe some of the interesting features of discourse organization. "Openings" of interactions may include summons-answer or greetings-greetings pairs. Openings are typically followed by "topic sequences" which may or may not be introduced by "pre-sequences." Pre-sequences seem to function to pave the way for delivery of the first part of an adjoining pair, and to circumvent the occurrence of a dispreferred response. Finally, "closings" terminate the interaction.

Conversational analysts have extended their interest in interactional grammars to an interest in the structure of classroom interaction. The central questions in terms of education seem to be: What must a child know in order to interact successfully in classroom settings and thus gain access to learning? How does a teacher maintain interactions with a large group of students in order to pass on educational information, control student behavior, and diagnose student learning?

Classroom lessons, like other chunks of discourse, have both a local and a larger, global organizational structure. Researchers working independently have documented an essentially tri-partite local structure of classroom language. Sinclair and Coulthard (1975) describe a "teaching exchange," which consists of two or three moves: an Opening by the teacher, an Answering by the student, and sometimes follow-up to that answer by the
teacher (pp. 44 ff). Mehan (1979) similarly describes a three-part sequence of teacher Initiation and pupil Reply, followed by teacher Evaluation (pp. 37 ff).

Mehan sees the I-R-E sequence as the core of interaction during classroom lessons. He describes what happens when the reply called for by the teacher does not immediately appear in the next turn of talk. In such a case, Mehan notes that the teacher is able to employ strategies for getting the desired reply. These strategies include further prompting, repeating (reinitiating), or simplifying the initiation until the desired reply appears. Employment of these strategies results in an "extended sequence" of teacher-student interaction. Like an "insertion sequence," extended sequences are embedded into the normal three-part I-R-E structure.

The teacher strategies Mehan lists can be seen as tools for getting the teacher's agenda or the academic task at hand accomplished. Likewise, the minds of the thirty or so students at hand represent raw materials for construction of the lesson. Teacher talk seems well adapted to its multiple functions of maintaining control over classroom discourse in order to maintain control over the academic content of the lesson.

The equivalent of openings has been described in classroom settings as "set-ups" (Erickson, 1979). Closings of lessons have been called "wrap-ups." These structural terms allow researchers to describe the flow of interaction in a lesson, but not its content. As Mehan (1979) says, to be "right" in a classroom context, a child has to produce an utterance that is both "right" in terms of its content, and "right" in terms of its
fit in the classroom discourse structure. A "right" answer, offered at a wrong time, does not count as correct in the classroom. Answers given out of turn or without teacher permission are typically ignored or even greeted with reprimands, regardless of their content. Thus, the evaluation by the teacher can be an evaluation of how well the student has followed classroom discourse conventions and how well the student controls the content.

Even given its special adaptive qualities, teacher talk has been subject to the criticisms and concerns of educators, linguists, and conversational analysts alike. Particularly problematic to these researchers is the teacher evaluation or feedback part of the sequence. Griffin and Humphrey (1978) describe four main types of teacher evaluation: positive overt evaluation, negative overt evaluation, positive covert evaluation, and negative covert evaluation.

Overt positive and negative evaluations are easy to recognize, although overt negative evaluations are considerably more rare. Examples of overt evaluations are: "Good" or "No, that's not it." Covert evaluation is (by definition) more subtle, and operates tacitly in classroom lessons. An example of covert positive evaluation is when a teacher goes on to a next elicitation after receiving a response to a last one. By implication, the response was acceptable or the teacher would have begun an extended sequence to get at an acceptable reply. Similarly, a covert negative evaluation is delivered when the teacher does not go on, but repeats the elicitation or gives the
Collins (1983) found what could be called covert evaluation operating in reading lessons, where the teacher either took up and used student offers (covert positive) or did not (covert negative).

Evaluation sequences have been criticized and worried over by researchers concerned with the effect these evaluations might have on students' learning. Studies which have attempted to quantify positive and negative evaluations and correlate these with student achievement have generally not yielded a simple picture; the expected results in favor of the good of positive evaluation or the destructiveness of negative evaluation do not always hold (Brophy, 1981, reviewed this literature). Heath (1978) explains what such studies do not take into account. In particular, she questions the short, positive evaluation--e.g. "Good." She asks if something more useful--an elaboration, a further probe, or the like, designed to encourage the student to think more carefully--might not fill this "slot" in the discourse structure. One interesting type of teacher response Heath points out occurs when teachers make the thinking or problem-solving processes of students explicit, elaborating on their answers at the same time.

Not only the effect of these evaluation strategies, but also the effects of various teacher questioning strategies themselves have been called into question. Searle (1969) notes that most teacher questions are "known-answer questions," that is, teachers know the answer to the questions they are asking. Knowing the answer breaks the normal sincerity conditions for questioning, which include a need to know on the part of the questioner.
Heath (1978) notes that the vast number of teacher questions are of this type. Such verbal quizzing clearly functions to get the student to display knowledge, but is this all that it does?

Mishler (1972) introduced the idea that different teacher questioning strategies may have different effects on the thinking processes of students. He describes a "convergent" questioning strategy, where the task of students is to give the "right" answer that the teacher is looking for. He contrasts this style with a "divergent" strategy that results in a much more conversational atmosphere, where there are multiple right answers and students are free to have variation from the teacher. Mishler suggests that divergent questioning is likely to lead to more cognitively sophisticated processes than is the convergent, one-right-answer approach.

A survey of junior high English classes (Kluwin, 1977) showed that most teacher questions were introduced by wh-words, the most frequent of which was "what." "What" clearly directs the student to search for a label of some kind. The relatively rare "why" and "how" questions ask students to be interpretive and to extend their knowledge.

In another study, Heath (1983) found that teachers who held an "inquiry" or "discovery" approach to learning used "what" or "who" questions in whole class discussions, but used "why" and "how" questions in small groups or written tests. The interactive context seemed to affect the type of questions these teachers felt free to ask. Heath also found that classes in the humanities contained "more discussion of the reasoning process,
more latitude for varying interpretations, and more restatements of questions than did those in math or science."

Massialas and Zevin (1967) showed that "creative" classroom lessons, characterized by the use of questions to which there is no single right answer, increased student participation. They found more teacher-student-student-student sequences, and no immediate teacher evaluation of student responses. They described the teacher role as "dialectical" rather than "didactic."

While researchers have hypothesized that teacher initiations and teacher evaluations affect the thinking processes of students, at least one project researched the effects that extended sequences in classroom interactions have. The study was designed to determine the effect of the teacher's verbal strategies (Griffin & Newman, personal communication) on student learning. Presumably, extended sequences function to narrow the students in on possible correct replies to a teacher initiation after they have failed to produce a correct answer. Griffin & Newman found that the particular strategies a teacher used assumed that children in the class had sorted relevant subject matter categorically. The researchers had independently tested the class, finding a subset of children who had sorted information into functional relations between objects and concepts. For these children, the majority of the teacher's helping strategies failed.

Surveys of classroom interaction thus show the discourse structure to vary with the teacher's philosophy of learning, the subject matter, and the teaching situation (small-group versus
whole class). The success of various discourse strategies may depend on the thinking patterns of individual students.

Other researchers have documented the effect of variations in academic or interactional tasks on the type of discourse patterns children produce (Hall & Cole, 1977). Researchers agree that just as situational constraints affect classroom discourse structure, it, in turn, is likely to affect the type of cognitive activity children engage in, at least at the moment of interaction. No one has systematically studied the long-term effects of classroom interactional patterns, but the patterns of interaction, repeated over years in various settings, are more than likely to affect thinking processes, if only by mere redundancy.

The reason teacher talk is suspected of having far-reaching effects on cognition is revealed in Heath's comment: "teacher's questions point out the slots and fillers students must use to provide correct answers" (Heath, 1978). In other words, teacher questions orient the student's mental search for valid responses. Learning in classroom settings is dependent on communication--talk that hopefully not only transmits information, but that reveals the thinking processes used to arrive at that information.

Vygotsky (1978) spoke of the importance of communication in learning. Speech functions as a medium by which knowledge is passed from one generation to another, from one person to another. Unless such knowledge is externalized in the form of speech or activity, there is no hope of private knowledge.
becoming social, and thereby cumulative, knowledge. Vygotsky studied the process of what he termed "internalization," whereby the information, activities, and mental strategies present in the communicative interaction of teacher and learner are appropriated by the learner to guide his or her independent thinking.

Gal'perin (1969), following Vygotsky, closely investigated this process of internalization. He suggested that internalization takes place in several, distinct phases, which are marked by shifts in the language used by the learner. The most important aspect of Gal'perin's description of internalization for our discussion of classroom language is his analysis of what he calls the "orienting" phase of the process.

According to Gal'perin, the formation of an orientation to an action or task is a critical event. He describes three types of orientation to tasks: what could be called trial-and-error, procedural, and analytical. The trial-and-error orientation to a task occurs when the learner has a very nebulous notion of how to proceed. If the task environment is arranged so that "accidental" solutions are possible, the student may gradually organize operations that work to achieve task goals, but experimentation shows that these operations are unstable if anything in the task environment changes.

A more procedural orientation contains all the directions necessary to achieve the task. If the learner follows instructions, fairly error free performance on a task is possible. The operations developed are generally stable in the face of new conditions, and they transfer fairly easily to new tasks. The final type of orientation could be called meta-
cognitive in that learners absorb general methods of analysis of task domains at the same time they learn how to operate in the domain. Gal'perin found that instruction based on this kind of orientation to tasks proceeded much more quickly and transferred more readily to new tasks than either of the other types.

Gal'perin's central claim, stemming from this research and observation, is that the orientation learners receive to a new task critically determines the course of their subsequent learning. While he admits that additional experience in the task domain can effect changes in the learner's organization of the task, he cautions that this type of re-learning is always more difficult to achieve than initial learning. If we recall Heath's statement—that teacher questions point to the slots students must fill in order to give correct answers, it is possible to connect classroom language to Gal'perin's work.

Teacher questions can be seen at once to present students with a problem to solve, and to indicate what type of solution is likely to be a correct one. In Gal'perin's framework, teachers both deliver the task and orient the student to ways to proceed in its solution. They organize the student's search for an answer acceptable to the teacher. As Heath suggests, a "what" question calls for a label, a "why" question for an interpretation. The types of questions teachers ask about particular domains may affect student thinking about these domains. In effect, the questions teachers ask indicate what they deem to be important about the task, and serve as models of successful action in the domain.
Polyani (1964) and Leontiev (1981) independently describe mental activity in terms of the focus of attention at any given moment. Leontiev describes the process of learning to shoot at a target. Initially, the learner's attention is likely to be focused on many sub-goals like the position of the rifle, or squeezing the trigger. Through practice, these sub-goals fall away from center focus, and the learner is intent on hitting the target. The operations associated with holding the gun and pulling the trigger remain out of the focus of attention unless the target-shooter becomes aware of a problem in his shooting. The now fairly proficient marksman may return his attention to gun position while attempting to refine his aim. Similar discussions about the allocation of attention during the performance of complex cognitive tasks can be found in Anderson (1982), Bereiter (1980), Hayes and Flower (1980), Scardamalia (1981).

This image of mental activity as a roving focus of attention is a useful one for our purposes. The teacher's question helps to focus the student's attention on relevant information the student has in mind. The structure of the question predicts in turn the structure of the required response. To keep with the idea of mental focus, we would like to introduce the notion of the zoom lens, where the angle of the lens determines the amount of mental information focused on at once. A narrow angle may pinpoint tiny bits of information, whereas a wider angle includes in the focus more of the student's knowledge. As the lens zooms in the frame gets smaller but the objects are enlarged; conversely, as the lens zooms out the frame gets larger, but the objects get...
The teacher's questioning strategies effectively adjust the focus of student attention. The "what" question narrows in on a label, whereas the "why" question pulls back for a wider look. Clearly individual students will have differences in interpretation of facts from one another. The result of a broad frame may be a discourse style that is more discursive than Sinclair and Coulthard's teaching moves and Mehan's I-R-E structure suggest. In fact, the I-R-E type framework rests on the assumption that teachers ask questions to quiz students, as well as to teach them, and that an individual student can supply an evaluable answer. Student interpretations and judgments are perhaps not quite so easily evaluated by teachers. The purpose of interpretive questions may be to provide students opportunities to use mental faculties and to develop thinking processes, not to assess the state of their knowledge.

Structural descriptions of classroom discourse "grammars" have gone a long way towards revealing tacitly understood and accomplished behaviors that affect life in classrooms. However, such analyses have little to say about the delivery of the "manifest curriculum," about "taught cognitive learning" in classrooms (Erickson, 1982). It is the manifest curriculum, however, that is the primary charge of educators.

Since we have presented a body of theory that suggests that the structure of interaction in classrooms has effects on student learning, it would seem foolhardy to ignore the analytical tools developed by conversational analysts describing interactional
grammars. On the other hand, such analyses fall short of helping educators with the job of promoting student learning in academic domains. We are interested in developing a framework that combines the insights and interests of conversational analysts and educators.

The Basis for a New Analysis System

In the direction of building such a framework, we propose an analysis that includes not only the structure, but also the content of classroom interactions. We consider not only how talk is organized, but also what that talk is about, to be the minimum components of an educationally relevant analysis of classroom interactions. Analysis of these components together can allow us to see how talk functions pedagogically in the classroom.

How would one combine a look at the structure and content of classroom interactions? We propose that a substantial revision of the concept of preference organization reviewed above could give us the analytic tool we need. Preference organization, it will be recalled, has to do with paired utterances such as requests, invitations, and compliments and the responses to them. The "preferred" response to receiving a request, invitation, compliment or the like is the "unmarked," or expected response. Dispreferred responses are characterized by hesitations, false starts, and the like.

If we consider teacher questions or initiations and student responses to be paired similarly to requests or invitations and their responses, then we can begin to talk about preferred, unmarked student responses. Hesitations, false starts, and circumlocutions accompanying dispreferred responses can be seen...
as attempts to deal with interactional difficulties. As we have seen, side sequences, re-initiations, and the like function to get students back on track in lessons. In other words, these teacher strategies can be seen as attempts to deal with difficulties in the unfolding of a lesson.

If these discourse strategies mark dispreferred responses, then we can see that the unmarked, preferred responses are those that are on target in the lesson. In other words, preferred responses feed into the teacher's agenda in the lesson, move the lesson forward, in short, deliver the "right" answer, the "expected" answer.

In terms of classroom teaching, it is clear that preferred responses are precisely those that are correct not only in structure, but also the content of the response. Correct content is determined by both the background understandings about academic material that have been developed in classrooms, and the task or agenda at hand at a given moment. Chapter V of this report describes the background of values and assumptions about written language that developed in the two classrooms we studied. These values comprise the content of the domain of writing for the classes—the description of good writing lies therein.

"Right" answers, "expected" answers, answers to teacher questions that move the lesson forward, must draw on the "good writing" knowledge students have learned by living in the class so far. Preferred answers must also orient to the academic task at hand, and must be delivered appropriately in the structure of the discourse operating. We are suggesting, then, that preferred
responses be defined with regard to discourse structure, desiredness of content, and task orientation. An educationally adequate description of classroom lessons must deal with all of these aspects of preferredness.

An Analysis of Whole-Class Response

Segments of lessons were chosen for in-depth analysis that represented not only a range in the classroom but that also spanned the types of in-class response events and academic tasks we found characteristic of each teacher. The first section of the analysis will focus on two segments of classroom talk, one from Mr. Peterson's class and the other from Ms. Glass's. In both segments the talk involves response to student writing.

Mr. Peterson

This Monday Mr. Peterson is helping his students with drafts of their character sketches of famous people. Having held individual conferences with his students at the end of the previous week, he wants to make several points that he thinks will help the students, as a group, as they continue to refine their papers. In this particular lesson, Mr. Peterson begins with a discussion of: (1) the narrative past tense, and (2) the fact that anecdotes that make writing interesting are missing in many of their drafts (he read an example from a student draft that contained a good anecdote to illustrate its effectiveness).

In the third segment of the lesson, which we analyze here, Mr. Peterson presents the students with a paragraph that one of their classmates wrote about Rick Springfield. He enlists the students' help as collaborators with him in revising the paragraph. He marks the collaboration by asking all students to
get out their pencils as he distributes dittos of the draft. He says, "I think we can give this writer some help with her next draft on this." Then he goes to the board where he will write publicly.

The content of this segment of the lesson was motivated by Mr. Peterson's general response to the class's drafts--that, on the whole, they lacked sufficient specific detail. Although the class activity is not directly focused as response to each student's work, it is meant to show the students, as a group, how to revise successfully. Here, Mr. Peterson responds to in-process student writing through the medium of classroom talk and group problem-solving. He gives the response. Then he and the class solve the problem of acting on the response. He demonstrates response itself, but actually centers his teaching on how to act on response, not on how to respond.

We outline the structure of the classroom talk in this teaching segment, showing how it fits into Mehan's I-R-E sequence and then showing how the tri-partite turn-taking system is replaced at times by the adjacency pairs of less formal conversational interaction. A second analysis, using a modification of Levinson's "preference organization" as its base, helps to account for different conversational structures and to integrate the structure of the lesson with its content. Notes on transcription conventions, a full transcript of the classroom talk during this segment, and the Springfield paragraph can be found in Appendix 12.

The segment begins with Mr. Peterson stating his response
explicitly, "There are two things that are lacking from these two paragraphs." He goes on to clarify the nature of the problem, showing the students that the Springfield paragraph needs specific examples at a particular point and beginning a collaborative session for adding the examples.

Initiation

(1) T: There are two things that are lacking from these two paragraphs. Both of both of ... in both cases it's a little different. In the first case, ... um okay ... what's she talking ... what's she writing about here. She's writing about her mother. And her mother's excitement .. about .. going to this rock concert. All right. And actually, I, - you know, I have to tell you that when you read the whole selection, it's really, .. it's very nice. 

... But. B' beginning here, we don't have uh ... none of the uh

Initiation

.. very little of the excitement of this event,
is coming through.

all you have to do
is add a couple of
sentences... con-
detail, to
liven this up.
And make it make
it more exciting.

But where
... okay... after
sh- after she says,
SHE TELEPHONES
ALL HER FRIENDS,
AND INVITES THEM
uh TO THE CONCERT.
Right.
What could you do
there. What could
you do there.
... Before you go on
to the next
sentence.

(2) S1: (UC)

(3) T: What?

(4) S1: I don't see what
you're asking for.

(5) T: The question is
what could could
... is there a
sentence you could
add there.
...

(6) S1: Decides?

(7) T: Hmm?
... What's that?
Nothing but
blank expressions.

(8) T: Okay. So you don't
think... you can't
you can't... you can't
think of any sentence
that could possibly go
in between... uh th'
... I INVITES THEM TO
Initiation

THE CONCERT and SHE

Evaluation
TELLS MY YOUNGER SISTER AND ME. CAN'T THINK OF ANYTHING?

(9) S1: And then decides to... she then decides to ask me and my sister,-

(10) T: Well... before that..

(11) T: Right... Yeah.

(Calls on S2)

(12) S2: Um... even if you both went on to invite (uc).

(13) T: You're skipping ah

GETTING THE LESSON SET UP IS NOT SO SIMPLE. IN FACT, THE DISCUSSION CONTINUES IN THIS VEN FOR A WHILE LONGER BEFORE MR. PETERSON IS CONFIDENT THAT THE STUDENTS UNDERSTAND THE TASK HE HAS PUT BEFORE THEM. THE I-R-E ANALYSIS SHOWS THAT THE TEACHER ASKS QUESTIONS, THE STUDENTS REPLY, AND THE TEACHER EVALUATES THE REPLY. HOWEVER, IT IS OFTEN DIFFICULT TO DECIDE WHETHER MR. PETERSON'S TALK IS INITIATION OR EVALUATION; SOMETIMES HE SEEMS TO BE DOING BOTH AT ONCE. SOME INITIATIONS TAKE THE FORM OF WHAT GRIFFIN AND HUMPHREY CALL COVERT NEGATIVE EVALUATIONS; SUCH EVALUATIONS SEEM TO OCCUR WHEN THE STUDENTS ARE NOT UNDERSTANDING THE POINT. FOR EXAMPLE, IN (8) MR. PETERSON'S, "OKAY. SO YOU DON'T THINK, SO YOU CAN'T THINK OF ANY SENTENCE THAT COULD POSSIBLY GO IN BETWEEN," WHICH FUNCTIONS TO BEGIN AN INITIATION BY THE TEACHER, ALSO FUNCTIONS AS A CONTINUATION OF HIS NEGATIVE EVALUATION OF EARLIER REPLIES. THE INITIATION, THEN, FUNCTIONS, AT TIMES, BOTH TO INITIATE A REQUEST FOR ANOTHER REPLY FROM THE STUDENTS AND TO EVALUATE THEIR PREVIOUS REPLY. SIMILARLY, IN (3) WHEN MR. PETERSON ASKS, "WHAT?" BECAUSE HE DOESN'T UNDERSTAND THE STUDENT'S UNCLEAR REPLY, ONE COULD CONSIDER THE QUESTION A FORM
of covert negative evaluation of the student's lack of clarity. Likewise, when Mr. Peterson offers his first evaluation in (7), it does not come publicly but under his breath; it seems more his own tracking of how the lesson is going than classroom talk. But were it heard by the students, it would function as evaluation. Although we could arbitrarily assign utterances that function both as initiation and evaluation into one of the two categories, it strikes us as problematic and not very informative to do so.

Our other analysis system, based on a modified sense of preference organization, will account for both the structure of the discourse and its content. In our observations, the nature of the classroom activity affects the discourse structure; that is, some activities and parts of activities follow the I-R-E form whereas others either do not follow it at all or follow it less well. In these secondary classes, where the activities center around the teaching and learning of writing, the I-R-E structure is more variable than in Mehan's elementary classroom. Essentially, much of the talk during writing instruction follows the adjacency pairs of everyday conversation rather than the I-R-E sequence (see Freedman and Katz [in press] for a discussion of the non-I-R-E moments in writing conferences).

When examined from the perspective of the activity, all classroom lessons are dictated by an overall pedagogical agenda, in our classrooms to teach students to write better. Underlying the pedagogical agenda is the teacher's sense of "Ideal Text" and "Ideal Process" (Chapter V). Within this pedagogical agenda,
individual lessons and portions of lessons have a more specific set of activity agenda. In the case of Mr. Peterson's lesson segment that is analyzed here, the specific activity is to practice revising for specific details. The activity agenda is designed to serve the greater pedagogical agenda.

In these classrooms, the activity agenda follows a problem-solving model. Each well-formed activity consists of three parts: the Orientation to the Problem, the Joint Solution of the Problem, and the Packaging. During the Orientation, the teacher must delimit the problem space within which students will search for a solution. During the Joint Solution the teacher and students work interactively to solve the problem. The teacher provides support to the students in order to guide them to a solution. Finally, the teacher Packages the solution in some way, so that the students will be able to apply what they are learning during the particular activity to the larger pedagogical agenda.

The segment of talk that we analyzed in terms of I-R-E structure marks the Orientation to the Problem for one activity. Students, through their replies to teacher initiations, show either that they are or are not oriented. We use two labels for student replies: Preferred Reply and Dispreferred Reply. A Preferred Reply is any student talk that can be used by the teacher as a resource in accomplishing the goals of the lesson. To function as a resource, Preferred Replies must have appropriate discourse structure and content, and must be oriented to the proper place in the lesson. A Dispreferred Reply indicates that students are not oriented on at least one of these
planes; their reply cannot function to advance the lesson. Students show that they are oriented by giving Preferred Replies and that they aren't by giving Dispreferred Replies.

The following provides a reanalysis of the Orientation segment of the activity, and brings together discourse form and content:

Orientation to Problem

(1a) Orientation

T: There are two things that are lacking from these two paragraphs. Both of both of .. in both cases it's a little different. In the first case, ..um okay .. what's she talking .. what's she writing about here. She's writing about her mother. And her mother's excitement .. about .. going to this rock concert. All right. And actually, I, -
you know, I have to tell you that when youread thewholeselection, it's really, .. it's very nice. But. B' beginning here, we don't have uh .. none of the uh .. very little of the excitement of this event, is coming through.

All you have to do is add a couple of sentences .. of .. concrete detail, .. to liven this up. And make it make it more exciting.

But .. where .. okay .. after sh- after she says,
SHE TELEPHONES ALL HER FRIENDS, AND INVITES THEM uh TO THE CONCERT. Right. What could you do there. What could you do there. ... Before you go on to the next sentence.

(1b) Dispreferred Reply
S1: (UC)

(2a) Request for Reply
T: What?

(2b) Dispreferred Reply
S1: I don't see what you're asking for.

(3a) Reorientation
T: The question is what could could .. is there a sentence you could add there.
...

(3b) Dispreferred Reply
S1: Decides?

(4a) Reorientation
T: Hmm? What's that? Nothing but blank expressions. Okay. So you don't think .. you can't you can't .. you can't think of any sentence that could possibly go in between .. uh th' .. I' INVITES THEM TO THE CONCERT and SHE TELLS MY YOUNGER SISTER AND ME. Can't think of anything?

(4b) Dispreferred Reply
S1: And then decides to.. she then decides to .. ask me and my sister,-

(5a) Reorientation
T: Well .. before that. .. Yeah. (Calls on S2)

(5b) Dispreferred Reply
S2: Um .. even if you both want to invite (uc).

(6a) **Reorientation**

T: You're skipping ahead.

Essentially, because of the nature of the activity, the classroom conversation consists of the "a-b" adjacency pairs of a two-turn conversational structure in which the teacher tries to orient the class and after each dispreferred student reply, attempts a reorientation. Although these reorientations imply negative evaluation, they do not function independently as evaluations of a "correct" or an "incorrect" answer. The classroom work that is getting done demands a conversation between the teacher and the class, not a quiz-like structure. Mr. Peterson must listen to what the students are understanding in order to accomplish the orientation. There is little reason for him to evaluate their performance here; the lesson is not in a mode where students are being asked to perform.

Mr. Peterson is working hard here to orient his students to the problem he has set up, in particular to the place in the text that needs elaboration with specifics. Notice that in (1a) he defines the problem to be solved—something is lacking and "all you have to do is add a couple of sentences .. of ... concrete detail, .. to liven this up. And make it make it more exciting." The orientations are marked by lexical items that mark the place in the text. Again toward the end of (1a) he defines the orientation by telling the students where the details are needed, "after" a particular sentence, which he reads aloud, and "before you go on to the next."

S1 gives dispreferred replies; Mr. Peterson cannot use them
to advance the lesson. Rather they serve to halt the lesson because she does not understand the type of content he wants. Mr. Peterson first assumes that she can't think of anything to add. Then after S1's last turn (4b), Mr. Peterson reassesses his first assumption and seems to think that the students are confused because they are oriented to the "wrong" place in the text. He attempts to reorient them (5a), this time by telling them where to add the details--"before that." Then, after S2's reply (5b), he again attempts to reorient them in terms of place, "you're skipping ahead" (6a). In these reorientations, Mr. Peterson uses the students' dispreferred replies to help him decide how to clarify the problem to be solved.

If we continue to use the metaphor of the teacher as photographer, adjusting the focal length of his lens in order to teach, getting exactly the right frame for the problem, we can see that Mr. Peterson at first has the lens set for the lesson on quite a wide angle--"add sentences"; however, during the orientation he begins to zoom in somewhat as he orients the students to the text. The frame gets smaller and smaller as he gets them to attend to the place he wants. The frame is far from its smallest, though, because the activity itself allows students to create their own sentences; thus, theoretically there is an infinite number of acceptable answers.

After continuing in this vein for five more pairs of turns, Mr. Peterson, in the selection below, succeeds in clarifying the task:

(7a) Reorientation
T: I want to know something about these friends.

(7b) Preferred Reply

S3: The mother's friends?

(7c) Confirmation of Orientation

T: Shh.
   The mother's friends.
   Right.
   Yes.

(8a) Preferred Reply

Ss: O---h!

Once the students give preferred replies, the orientation is complete. The teacher and students have reached an understanding; not only is a preferred reply given, but the teacher "accepts" it to reinforce for the students that they have "got it." Then the students, with their extended "O--h," in an ah-hah tone of voice, make clear to the teacher that as a group they understand the nature of the problem to be solved.

The Joint Solution of the Problem begins. At this point, the teacher and students begin collaborating over the production of the needed details in the Springfield paragraph.

Collaborative talk is highly conversational and again falls into conversational adjacency pairs rather than the tri-partite I-R-E structure. The teacher, to establish a collaboration, generally asks "divergent" questions, to use Mishler's term. Instead of a single right answer, there is a frame for multiple possibilities of alternate preferred responses. The teacher uses the preferred replies rather than evaluates them. The lens on the classroom remains at a fairly wide angle:

Joint Solution of the Problem
(9a) Offer to Reply
Lisa: Can I read it [my solution]
     I did it the way you wanted me to.

(9b) Acceptance of Offer
T: Yeah.
   Good.
   How,
   okay.
   Right.
   Wh'what's what .. the mother's friends.
   Right.

(10a) Preferred Reply
Lisa: THE FRIENDS SHE INVITED .. THE FRIENDS
     SHE INVITES ARE ALL PRESIDENTS OF THE MANY
     RICK SPRING- RICK SPRINGFIELD FAN CLUBS
     AROUND THE BAY AREA?

(10b) Uptake of Reply
T: Okay.
   O'Okay.
   Well so so let's say .. w' w' well let's not say,
     .. let's not go over "she invites" again.
   Right.
   Let's not say the friends she invites.
   L' let's start with [Writes on board]
   SHE .. INVITES
   Scratch.
   ALL OF .. SHE INVITES ALL OF THE PRESIDENTS ... OF THE .. RICK,
   ..I'm going to abbreviate SPRINGFIELD.
   FAN CLUBS.

(11a) Request for Reply
T: Who else does she invite.
   [T continues writing on board]
   ... Anybody else?

(11b) Preferred Reply (?)
S4: (uc)

(11c) Uptake of Reply
T: [Chuckles]
   ... Or actually she might,
   ... actually we we're exaggerating.
   She might have a friend .. hu uh why don't we say,
   she invites her friend who is president of the Rick
Springfield Fan Club

[Reads while writing on the board]

SHE INVITES HER FRIEND.. WHO IS.. PRESIDENT OF THE RICK SPRINGFIELD FAN.. CLUB.

Right.

(12a) Request for Reply
T: Who else does she invite.

(12b) Dispreferred Reply
S5: The secretary.

(12c) Response to Reply
T: The secretary.

...Even the sergeant of arms.
(laughs)

During collaboration, the teacher does not function as an equal with the students; the teacher maintains control over the activity. In essence, the teacher makes use of student resources so that he and the students can work together to produce text. Both the teacher and student talk is labeled according to how classroom resources are distributed and made use of: the teacher requests resources with a Request for Reply, the student gives a resource with a Preferred Reply, or offers a reply which is not useful with a Dispreferred Reply. Students may Offer to Reply and the teacher may or may not give an Acceptance of Offer. When students give a Preferred Reply, the teacher makes use of the resource with an Uptake of Reply. When a Dispreferred Reply is offered, the teacher may ignore it or may give a Response to Reply, which is essentially an acknowledgment of the Reply, and may even be an appreciation of the Reply, but not a use of a resource to accomplish the goal of furthering the activity agenda.

Mr. Peterson marks the beginning of the collaboration in two
ways. First he introduces the first person plural pronoun in his "let's" in (10b), which he repeats five times in the first burst of talk for this turn. He also marks a strong conversational shift with his "okay's" and "well's." It is Lisa's preferred reply (10a) that allows the collaboration to begin. Lisa offers a resource that Mr. Peterson can use to further the lesson, to move the activity forward toward the successful completion of the revision. Lisa shows that she understands the place in the lesson, the content frame, and the discourse demands. And for a reply to be preferred, these are the three sets of demands that must be met.

Although some of the turns in the above sequence occur in tri-partite form (11 and 12), the mode is quite informal, with much calling out and infrequent, formal, teacher-allocation of turns to students who raise their hands. The uptake of the student replies, although sharing the properties of Mehan's evaluation, seem basically to function differently. They act more to advance the collaboration than to evaluate. Notice the "divergent" nature of Mr. Peterson's requests in (11a and 12a).

During Mr. Peterson's uptakes (10b and 11c), he models his own composing process as he responds to the ongoing stream he and the students produce. He takes the opportunity, here, to provide scaffolds for the students as they solve the problem he has posed. In (10b), as he begins writing, he switches the focus from "the friends" to "she" with the comment, "Let's not say the friends she invites. Let's start with "she ... invites." Notice that Mr. Peterson demonstrates decision-making without
explaining why he makes the decision. There is little emphasis on metacognitive awareness; rather the emphasis is on developing an "ear" for language.

In (11c), really a continuation of (10b), Mr. Peterson notices the exaggeration of "friends" and suggests the change to a single friend. Once the students are on the track of giving preferred replies, Mr. Peterson relaxes, and the lesson tone lightens; there is much laughter, jesting and joviality, with the students appreciatively enjoying their efforts at revising. However, even now, all student turns do not become useful in furthering the goal of the lesson, that is, the accomplishment of the revision. Although (12b) is preferred with respect to discourse form and although it is at the right place in the lesson, its content does not match Mr. Peterson's sense of "Ideal Text," and Mr. Peterson does not use it to help him move toward the creation of "Ideal Text" (see Chapter V). Mr. Peterson is getting choosy about what he accepts as preferred at this point; he is narrowing the lens angle. Although he may laugh with the students over a reply and even add to it jokingly with his "Even the sergeant of arms" (12c), if he does not take up the reply, that is incorporate it into the revision on the board or use it to get to a revision on the board, we label it dispreferred. Nevertheless, this type of reply could be considered useful to Mr. Peterson as a resource at the moment, and it could be argued that it should be labeled preferred for that reason. We have chosen a strict definition of preferredness, including as preferred only those resources that are useful in the long run.

The use the teacher makes of the student reply, in terms of
the activity agenda, thus ascribes the status of "preferred" or "dispreferred" to the reply. If there is uptake by the teacher, the reply is preferred. If the teacher responds to, but does not use the reply, it is designated as dispreferred. In terms of the problem-solving going on, this analysis is solution- or goal-oriented. Another way of saying this is that it is the goal of the activity, in this case the revision of the paragraph, that guides the teacher's response to student replies.

The talk continues after (12c) with another student suggesting that she could invite members of her high school alumni association.

(13a) Dispreferred Reply
S6: Members who are alumni.

(14a) Request for Reply
T: Oh just make somebody up. Come on, we're working on this together now.

(14b) Preferred Reply (?)
S6: (UC)

(15a) Teacher's Request for Clarification
T: Wh' wh what? What?

(15b) Preferred Reply
S6: Members of her high school alumni association.

(15c) Uptake of Reply

(16a) Request for Reply
T: Right?

(16b) **Preferred Reply**

S: Right.

(17a) **Request for Reply**

T: Friend?

(17b) **Dispreferred Reply**

S: Buddy from high school.

S: Chum.

(17c) **Response to Reply**

T: Chum (chuckles appreciatively)

(18a) **Uptake of Reply**

(writes on board)

.. I still want to say friends.

As long as the students are furthering the collaboration with Mr. Peterson, they are giving preferred replies (13a, 14b [?], 15b, 16b). Notice that the reply in (15b) is preferred, even though Mr. Peterson does not accept it as "ideal" because he is able to use it to begin to move toward the "ideal" word choice for the text they are creating. Thus, although this student does not give a "right" response in terms of content, the reply functions as a useful resource. Mr. Peterson accepts it for an uptake, and it contributes to the collaboration. Members of the high school alumni association (15b) forms the raw material that Mr. Peterson uses to get to "an old high school friend." We do not label the similar reply in (13a) as preferred because in its less elaborated form, it does not function as a resource.

Student reply (17b) is similar to (12b). Although the replies in (17b) are not taken up as a resource in the end, that
is, are not used in the revision, they are considered as possible by Mr. Peterson, but he rejects them. We consider them dispreferred because, like those in (12b), they are replies that Mr. Peterson appreciates, but does not seriously entertain. At this point, it is important to note that even dispreferred replies serve an important function; the students and Mr. Peterson together go through the process the students will need to engage in to write well. Because of the divergent nature of the questions, there is no one "right" answer. As long as the students and the teacher are working in the right frame, that's what matters. Together he and the students explore possible word choice--buddy, chum--but Mr. Peterson concludes, "I still want to say friend" (18a). The difference between (15b) and (17b), both of which are rejected, is that (15b) is useful in the collaboration, is the raw material for the text that evolves, whereas (17b) is not.

As a beginning attempt to analyze classroom discourse in terms of its structure and content, we are pleased with this formulation of preferred and dispreferred replies. It makes sense to us that teacher uptake should ultimately determine the status of student replies. However, we realize the product focus of this formulation obscures some important processes of interaction. Specifically, some student replies work towards, but do not become part of, the solution (such as 17b above). Ultimately, we would like to be able to distinguish replies like 17b, which helps Mr. Peterson and the class to explore word choice towards a revision, from replies like 12b, which are appreciated but do not contribute to the problem-solving process.
in this way.

As Mr. Peterson and the class collaborate, he publicly models his composing process for the group. He models his best instincts as a writer. He does not make the grounds for his choices explicit; rather he attempts to develop in his students an unconscious sense of good writing style. And he does so by modeling his decision-making process, in a way talking aloud, in a sort of protocol form, so that the students can hear his process and analyze it for themselves. Notice how Mr. Peterson switches from members of an association to an old high school friend, plays with buddy and chum with the students, and returns to friend. He chooses a specific person rather than a member of a group but articulates only that he selects the word that he likes best.

We see Mr. Peterson functioning as an adaptive expert in this collaborative revision. His intuitions as a writer inform his use of student replies. Where possible, he turns these replies into resources that advance the revision, but not without working with them first as a writer. We might characterize his role as one of class “filter.” He receives student replies and processes them, filtering out those replies that are not immediately useful, and altering replies that are workable. He works, then, with the content of student replies, attending at once to the academic task he has posed and to his own internal values and expectations regarding good writing.

Figure 6.1 depicts the process of filtering with one student reply to the revision task. Mr. Peterson, as filter, revises and
ratifies the reply; it becomes a recognized part of the solution to the task.

Insert Figure 6.1 about here

We have designated this revision and ratification process with the capital "R" in Figure 6.1; the small "r" represents a student reply.

Figure 6.2 shows what happens to another student reply.

Insert Figure 6.2 about here

In effect, although Mr. Peterson is able to appreciate the reply, it gets filtered out of the revision that is being made. Mr. Peterson's intuitions as a writer function here to move him away from continuing this trend, even if he can find it amusing to think about. Because "the secretary" is not written into the revision taking form on the blackboard, it is an example of no uptake.

Figure 6.3 shows how extensive Mr. Peterson's filtering role can be.

Insert Figure 6.3 about here

In response to (20b), Mr. Peterson gives what Mehan would call a negative evaluation (20c). However, he is able to use the reply as a resource that takes him in an interesting direction for the revision he and the class are undertaking. Therefore, we see
this reply as a preferred one, one that functions to move the lesson forward. Through many offered choices of wording (20a-22c), Mr. Peterson retains his authority as adaptive expert. He considers student offers in turn, responds appreciatively, and revises and ratifies on his authority as teacher (22c). This example of uptake in Figure 6.3 also reveals the power of the filtering role Mr. Peterson plays in the problem solving process. The original student reply (r) is altered extensively as it passes through Mr. Peterson’s filtering influence.

By continuing in this collaboration, the group comes up with the addition of “her dentist from San Rafael.” Then Mr. Peterson writes the following segment, on the board as the students write on their individual dittos:

MY MOTHER IS AN OUTGOING PERSON WHEN IT COMES TO CONCERTS. THIS TIME SHE PHONES ALL HER FRIENDS AND ASKS THEM TO GET TOGETHER FOR THE RICK SPRINGFIELD CONCERT AT CONCORD. SHE INVITES HER FRIEND WHO IS PRESIDENT OF THE RICK SPRINGFIELD FAN CLUB, AN OLD HIGH SCHOOL FRIEND, AND EVEN HER DENTIST FROM SAN RAFAEL.

Mr. Peterson then stops, and again modeling his composing process, says to the group, “let me just read it from the beginning.” And he reads aloud what he has written on the board. The students follow, rereading their revised copies silently.

Mr. Peterson concludes the segment with his final Packaging of the lesson:

Packaging

T: Now the point is..... all of a sudden, this becomes a lot more interesting to read. You see? Because she doesn’t just go on to the next point. We get interest up. A lot of you were getting that stuff into your writing. You know sometimes if you look through your papers, you’ll see a star or something. That means that you have got some stuff like this that I really like, some specific detail.
In the packaging, Mr. Peterson is careful to stress the point of the activity and to connect the practice in class to the writing the students are doing at home. Notice his positive approach, which shows his appreciation of their efforts, "A lot of you were getting that stuff into your writing. You know sometimes if you look through .. through your papers, you'll see a star or something? That means that, as I told you before, that means, that .. uh .. many of you have got stuff like this that I really like. ... Some specific detail." It is also interesting to note that the meaning of the written comments seeps into class discussion. If we only analyzed written comments, we might think the star meaningless, but when looked at in a larger instructional context, it takes on significance.

Packaging is an optional piece of the lesson from the point of view of discourse structure. However, when one considers how teachers accomplish their pedagogical and activity agendas, packaging seems essential to a well-formed activity.

Throughout the collaborative segments of the lesson, Mr. Peterson talks as the common reader; he tells his students what he likes, what interests him. His final conclusion to the segment is, "Just push yourself for details. It'll make- you'll have more fun writing and it'll be more interesting to read." The lesson continues with revision of another piece of student writing, which Mr. Peterson uses to have students practice another revising technique.

To summarize, Mr. Peterson gives response and then collaborates with his class to practice acting on the response.
The group focuses attention on an extended piece of the writing of one writer. Mr. Peterson teaches by modeling a revising process, a process of acting on response. He takes the role of "common reader" (Purves, 1984) and as he sheds his teacher-reader role, de-emphasizes the importance of conscious knowledge.

Ms. Glass

Ms. Glass's students, like Mr. Peterson's, are in the midst of writing their essay when the lesson segment to be analyzed takes place. Ms. Glass has spent the last few days discussing the type of focus students should work on developing in their saturation reports about a place. Throughout this assignment, Ms. Glass has been emphasizing the need to gather lots of specific details and then find a focus for those details. During classroom discussions, Ms. Glass and her students have discussed what sort of information should go into a focus statement for these papers. This Thursday morning, students were to come to class with a focus statement written down.

Ms. Glass begins the lesson by drawing a large grid over the length of the blackboard at the front of the classroom. She plays with the air of mystery she has created: "You may have wondered what those ominous looking things are for. Suppress your curiosity for just a few minutes."

Ms. Glass then collects pieces of chalk from the blackboards, and walks nonchalantly around the room dropping the pieces on students' desks as she passes by. She begins her orientation to the upcoming academic task thus:

(1) Orientation

T: If you find a piece of chalk .. put on your desk,
.. and you are tall, then put your focus sentence in one of the boxes high up.

If you find a piece of chalk put on your desk and you are short, you may use a short box.

As soon as you have finished putting your focus sentence in one of the boxes, give your chalk to someone who's sitting there thinking he's being smug and lucky, but he's not really.

Ms. Glass lures her students into the day's activity agenda by creating and sustaining suspense. She gives out pieces of orienting information bit by bit, and retains the mystery by not revealing her whole intent at once. With her talk, she presupposes student cooperation and involvement. Since up to this point she has not told her students they will be putting their focus statements on the board, her wording in (1) seems odd. Here she uses the linguistic technique of presupposition, delivering the news as if everyone had already known they would be writing on the board. This technique again functions to maintain the suspense. Students must listen well to determine what Ms. Glass expects of them today.

Ms. Glass ordinarily packs her fifty-minute class period with non-stop activity, accomplishing a great deal within the time limits. Perhaps her linguistic presuppositions do double duty--information is compressed into a concise statement of her activity agenda, and news is delivered as if it were already understood and agreed upon by her students. Presuppositions of this type may then function to push the lesson forward at a rapid clip, and also to control and manage student behavior. Ms. Glass has a heavy agenda, as usual, this morning. She circulates
written evaluations of student speeches, managing student time and attention to these as well as to the new activity she is preparing the class for. She is committed to this new academic activity, and remarks that even though it will be time consuming, it will be worthwhile.

Ms. Glass gives the next piece of orienting information to her students. They are to test the sentences on the board to see how they meet previously discussed criteria. Students are moving between their seats and the blackboard, and circulating the speech evaluations. The classroom is a hub of activity as Ms. Glass speaks out.

(2) Orientation

T: While you're looking at the sentences that are on the board, and you might have to even get out of your seat to go read, because it's a long way off, what you want to test those sentences for is whether the focus is clear.

... Do you know what to expect in the paper. If you don't, we want to know about it and talk a little about why not.

At Ms. Glass's invitation, students leave their desks and move up to the blackboard to read the focus statements written there. As students settle back into their seats, Ms. Glass has them move their desks "as quickly and quietly as possible" up close to the board. She wants to get on with her agenda, and presupposes their cooperation again when she says, "In 29 seconds you're going to be absolutely still, right?"

Ms. Glass asks her students to set aside the speech evaluations now, and give their full attention to the sentences on the board. Ms. Glass directs her students to their own resources as they review the sentences on the board. She
presupposes that they have written and kept notes on earlier discussions.

(3) Orientation

T: What I would like you to do
   is find.. some place in your notebook, somewhere where you wrote down
something about what a good focus sentence does.

As part of the process of orienting her students to the activity she has in mind, Ms. Glass now explains what they have done so far, and where they will be going with this lesson. She prompts them for the criteria they should use in their role of audience.

(4) Orientation

T: Now.
   .. What I wanna do.. is..
I'd like you to be an audience for a few minutes
   to a potential writer.
   ..
   The writers are in the class,
   I have put numbers on each sentence,
   so that we don't have to worry about whose it is,
   .. and unless you're the person who wrote it,
you probably won't remember whose it is and that's fine.
   ..
   What I want you to do as an audience
   is to react to ... the sentences that are up there.
   ... And to think about what you know
about what we said about a reasonable or a good focus sentence.

(5a) Request for Reply

T: Last night I asked you to think about two criteria.
   .. What were they.
   .. And I threw you one that you probably weren't expecting.
   ..
I asked you to think about two tests
   for what a good focus sentence is.

(5b) Preferred Reply

Sl: Interesting?

(5c) Uptake of Reply
T: Yeah,
   I said interesting,

(6a) Request for Reply
T: and I also said...
   what was the other one,
   that was probably more important.

(6b) Dispreferred Reply
S2: I'm not sure,
    but you said it had to tell.

(6c) Response to Reply
T: I said it would probably be a telling statement,
    that's right.

(7a) Request for Reply
T: What else does it have to do.
   what does the reader want to know
   by the time he got through reading that sentence.

(7b) Preferred Reply
S3: Well...
    what your paper's gonna be about.

(7c) Uptake of Reply
T: Yeah,
   what the focus is.

(8a) Packaging
T: Is the focus clear,
   first of all.
   ... Is it an interesting sentence
   or is it a dull one.

Above, Ms. Glass elicits the criteria she has in mind from
her students, spurring their memory of earlier discussions in the
process. On one level, Ms. Glass is asking her students to
recall past information, a set of explicit labels for criteria of
good focus statements. Her questions are not "divergent"; there
are "right" answers. And the talk follows the more classic tri-
partite classroom exchange. Whereas Mr. Peterson models process and relies little on the metacognitive, Ms. Glass has her students learn to articulate their responses. This preparation lays the foundation for her emphasis on self-consciousness on the part of her students. This talk between teacher and students forms a problem-solving exchange, but only as it is embedded in the larger problem that Ms. Glass is orienting her students to: the activity of responding to their peers' sentences and of keeping the criteria for good focus statements in mind.

During this orienting talk, Ms. Glass has managed the students' participation in the task: all the squares in the grid are now filled. She has directed their attention to the criteria they have discussed. She now initiates the solution phase of the lesson by requesting the responses that students are, by now, prepared to make.

(9a) Request for Reply

T: Are there any sentences up there
.. where you have a very clear picture
of what the focus is gonna be.
..Are there any which ..
probably is more important,
... maybe we ought to try to identify
some of those that are a little bit fuzzy
... in our heads.
... okay?

The lesson moves on with Ms. Glass and her students collaboratively calling attention to particular sentences, comment q on them, and going on to other sentences. As each new part of the activity begins, Ms. Glass reiterates the Request for New Reply. These new requests both mark the discussion of a new sentence (a new part of the activity) and keep the students on task. Classroom response to three focus sentences will be
analyzed below:

The following teacher request begins the first segment of the joint solution of the problem that we analyze:

Joint Solution of the Problem

(10a) Request for New Reply

T: Who has another one you want to ask a question about, or comment about.

... Look for places where you see, either something that looks kind of fuzzy, or you see something that looks quite clear. ...

Ms. Glass sets the angle of her lens wide, as she asks students to select sentences where something is "fuzzy" or "quite clear." Like Mr. Peterson, she now establishes a frame for preferred replies (there is no "exam" question and no single right answer). Ms. Glass's initial lens is set to a wider angle than Mr. Peterson's; she allows her students to select the sentence and to respond.

The joint solution of the problem gets underway:

Request for Reply

(11a) T: S4

(11b) Preferred Reply

S4: I guess in number 21 is he probably should have said the name of the place.

(11c) Uptake of Reply

T: [reading] THE FIRST THING THAT HITS YOU WHEN YOU WALK IN IS THE TACKINESS OF THE PLACE. ... Okay. ... Yeah. Maybe if this is a focus sentence, I might want to know what of the pl' ... what of .. what the name is.
The preferred reply (11b) shows that S1 is oriented. She establishes the particular frame which concerns the need for greater specificity—naming the place. At this point, it appears that the students have full control over the angle of the activity’s lens since Ms. Glass, in her uptake (11c), does not change the focal length S1 set. The student reply in (11b) is preferred because Ms. Glass uses it in (11c). At this point, she models her own response, saying what she, as a reader, wants to know. Her modeling of response parallels Mr. Peterson’s modeling of writing.

In the next part of the Joint Solution, Ms. Glass takes more control as she narrows the angle of the lens by beginning to specify, through her requests for replies, narrower frames for preferred student replies:

(12a) Request for Reply
T: Uh what do you think about the word tacky.

(12b) Preferred Reply
S5: I like it.
Derek: I lo--ve it. [sarcastic tone]
Ss: (uc)

(13a) Request for Reply
T: How does that compare to “unusual.” [a word they discussed earlier]

(13b) Preferred Reply
S6: It has some opinion in it.
S7: It gives you a picture.
Ss: (uc)

This zooming tactic is similar to the one Mr. Peterson uses to scaffold the learning during collaboration. In (12a), Ms. Glass gets the students to look more closely at sentence 21, to examine the choice of the word “tacky,” and in (13a) to
contrast "tacky" with "unusual," a word they had discussed in the previous part of the activity. The student replies in (12b) are useful to Ms. Glass in furthering the response process. They give an opinion which is all she has asked for. Whether the opinion is positive or negative is irrelevant here.

Ms. Glass continues the joint solution with her uptake in (13c):

(13c) Uptake of Reply
T: Yeah, there's more opinion in it, isn't there.
   It's it's made a judgment, and it has some load in it.
   It it it's loaded a little bit. "Unusual" is kind of fence-sitting.
/S8: Causes everybody (uc)/
"Tacky" is loaded.
And maybe that's what somebody meant.

(14a) Request for Reply
T: S9

(14b) Preferred Reply
S9: I mean,
tacky.
A real picture comes to my mind.
Without even knowing,
/Good./
I've been to a tacky restaurant before and.

(14c) Uptake of Reply
T: It ought to have a lot of plastic around.
/S9: Yeah./
Maybe plastic,
geraniums at the cash register,
/Ss: [laugh]/
or something like that.
Okay.

Once Ms. Glass has established the narrower frame, she and the students engage in increasingly more collaborative response. During the teacher uptakes (13c and 14c), students interrupt spontaneously, with backchannel cues, to indicate that they are
participating in the conversation. No longer is Ms. Glass maintaining such tight control of turn allocation.

The collaborative nature of the response is also marked by the content of Ms. Glass's uptake (13c). She attempts to bring the class into her judgment process and to join with them to get group consensus. With the tag question, "isn't there," she partially gives away her authority as both reader and writer. She tries to gain consensus about good writing. Notice next how Ms. Glass hedges her language, "some load" and "loaded a little bit" and "kind of fence-sitting." She leaves room for student opinion in this way. When she senses no disagreement, she asserts strongly, "'Tacky' is loaded." Then she hedges once again, but this time about the status of agreement in the class, the nature of the collaboration, "And maybe that's what somebody meant." Ms. Glass's uptake of student responses establishes them as preferred--they move the lesson forward and involve some of the criteria for good writing the class has discussed previously. Figure 6.4 depicts the incoming student responses and their ratification with Ms. Glass's uptake.

-----------------------------
Insert Figure 6.4 about here
-----------------------------

The preferred reply in (14b) shows that the collaboration is working as well. S9 expands, "I mean tacky. A real picture comes to mind. I've been to a tacky restaurant before." As Ms. Glass continues the narrow focus on the lesson, S9 seems to be led in her preferred reply in (14b) to get quite specific. S9
relates the content of the sentence on the board to her personal experience and discusses what is in her mind as a reader as she hears the word "tacky." This student response stimulates Ms. Glass to share her own personal experience of "tacky restaurants" complete with "plastic geraniums at the cash register" (14c).

Also marking the collaboration is the fact that throughout, every now and then, Ms. Glass drops her role as teacher-reader to take on the role of a common reader. As early as her uptake (11c), she uses first person, "I might want to know what of the pl' .. what of .. what the name is." Then again she drops her teacherly role in (14c) as she shares her restaurant experience with the class.

In these tri-partite turns, as in Mr. Peterson's class, the uptakes seem to function primarily to further the goals of the lesson rather than primarily to evaluate.

Finally, Ms. Glass packages this piece of the lesson (15a).

(15a) Packaging
T: Yeah.
The word "tacky" is .. is a little bit more specific, and it makes us see some pictures a little more clearly.

In this response activity, Ms. Glass's packaging follows a period during which students give responses to the sentences on the board and Ms. Glass reacts to and elaborates those responses. Ms. Glass's final remarks "package" or summarize the foregoing response, and can be seen as a form of final uptake. Ms. Glass, with her summary of the response, ratifies those responses that fit the criteria of "Ideal Text" operating in the classroom. She reiterates what S9 has said about what is in her mind as a reader.
and implies that she and the rest of the class also get a mental picture; "it makes us see some pictures a little more clearly." And that is the point; "Ideal Text" evokes pictures for the reader.

Although Ms. Glass and Mr. Peterson both collaborate with their students to solve a problem, Ms. Glass's packaging again shows that she depends more on explicit explanations unlike Mr. Peterson who relies on training the students' ears. In her packaging, Ms. Glass reminds her students that they need to find "specific" words; she uses labels for concepts the students need to master.

The next request for a new reply (16a) marks the beginning of the next part of the activity. The next students can practice responding and the practice can take another viewpoint; the camera can be repositioned.

(16a) Request for New Reply
T. Um ... ... what else do you want to ask about.
[St10 has hand raised].
St10.

(16b) Preferred Reply
St10: Um ... I'm a little confused about the peaceful and competitive feelings.
Uhm number eight [Derek's sentence].
Because that's ... (noise) I can't see how something can be peaceful and competitive (voice trails off as T overlaps) at the same time.

(16c) Uptake of Reply
T: Good.
Look at number eight.
Yeah, that is an interesting one,
Because somebody .. somebody went on -
There's some real confusion in that one I think.
Somebody might have been trying to do several things at once, but maybe all we end up with is a jumble if that happens.
THE PEACEFUL AND COMPETITIVE FEELINGS I GET HERE GIVE ME A TRANQUIL MINO.
/Ss: (laughing)/
That one's a little bothersome, isn't it.
Whatever somebody meant by that,

(17a) Request for Reply
T: ... what's confusing about that.
Let's help that writer out for a minute.
... S11. (T apparently calling on student with hand raised).

(17b) Preferred Reply
S11: Well for one thing, "I" is the subject.

(18a) Request for Reply
T: ... Okay.
The -
what is that -
What difference does that make.

(18b) Preferred Reply
S11: Well .. well .. "I" isn't the subject of the ... is not supposed to be the subject (voice trails off) of the sentence (laughs nervously).

(18c) Uptake of Reply
T: Okay.
Good.
Because the "I" is in there,
maybe .. maybe the focus is more on the "I" and not on the place,
that's one thing.

(19a) Request for Reply
T: What else is confusing about that to someone who finds it confusing.
S12. (S12 apparently has hand raised)

(19b) Preferred Reply
S12: Um ... peaceful and competitive are .. like opposite words.

(19c) Uptake of Reply
T: Okay.
These are opposites.
(20a) Request for Reply
T: And then where are you left at the end of the sentence.

(20b) Preferred Reply
Ss: Tranquil (uc).

(20c) Uptake of Reply
T: Back here which goes with that.
   And there's just something -
   what .: whatever it is that person is trying to do,
   there are so many elements thrown in there,
   now .. it may be that somebody wants to talk about the two
   sides,
   but then why do you say it leaves you tranquil,
   if some of it is competitive.
   I don't see -
   It's hard for me to see tranquil and competitive.
   .. Okay.
   There's something about that that just d'
   It's jarring,
   which maybe makes it interesting,
   but it's also a little bit confusing.

(21a) Packaging
T: So somebody needs to rethink "now exactly what was it I was
   trying to get at in that one."
   Okay?

At first (17b) seems dispreferred, in that it seems to lead
Ms. Glass away from the point of the activity. Ms. Glass has
asked the group to help the writer eliminate the confusion caused
by the apparent contradiction between tranquil and competitive.
The point in (17b) about the need to eliminate "I" as the subject
seems far afield. However, it is counted as preferred because in
(17c) Ms. Glass makes use of the point, looking at how the
subject provides focus for the sentence. It is impossible to
tell whether Ms. Glass actually ascribed the intended meaning
about "focus" to the student or whether this is her way of
salvaging a distracting student reply, without saying something
directly negative to the student. The talk is preferred, though, because Ms. Glass makes use of it during the response process.

In (18b) she explicitly guides the class back to the issue of confusion. In essence, she narrows the width of the lens's angle. She uses the student replies to get back to the point. By the time of the uptake in (20c), Ms. Glass gets an opportunity to model her thinking process as she responds. She marks her personal response with first person pronouns in "I don't see" and "It's hard for me to see." She also thinks through the use of the two words together, giving the writer credit for perhaps trying to make the point "interesting" but then concludes that it remains "a little bit confusing" to her. Again she models her response and scaffolds the response process, much as Mr. Peterson models writing. In 21a, Ms. Glass packages the response to this focus statement, and at the same time models the problem solving of the writer, taking the writer's point of view--"now exactly what was it I was trying to get at in that one?"

In this case, since Derek was one of our focal students, we will illustrate what became of this focus sentence. Derek wrote about a weight room, where he likes to go after school. The title of his essay was, "One Heavy Place." Although Derek reports that he was uncomfortable while the class and Ms. Glass collaborated in responding to his writing, he articulates his focal point about the weight room eloquently in his revision of his ideas, getting across the interesting complexity, that led him to write this apparently contradictory sentence. The first paragraph of his essay follows:

After a hard day of long, exhausting school I feel kind
of down. That is where one of my favorite places comes in very handy. It is a weight room at the Y.M.C.A. and it brings up my spirits. As I walk in the Y.M.C.A in shorts I am feeling a little better. The weight room is a peaceful place that also offers a great challenge, and that makes me feel both physically inspired and mentally at ease.

"Competitive and tranquil" become "physically inspired and mentally at ease."

In the next segment of this response activity, Ms. Glass initiates an episode during which the students practice writing. After they identify a problem with the word "variety" in the sentence, "The variety of people observed in McDonald's is extraordinary," suddenly and dramatically, in the middle of an uptake, Ms. Glass reorients the class:

(22a) Reorientation

T: Get a pencil in your hand. Find a piece of scratch paper real fast. Write down, THE EXTRAORDINARY VARIETY OF PEOPLE AT MCDONALD'S. . . . (class murmuring and shuffling paper) Now, I gave you a topic. Make up something in your head and finish the sentence.

(23a) Dispreferred Reply

S13: The extraordinary what?

(24a) Reorientation

T: I just, - I took everything in that whole sentence and put it into the subject. (T points to the board) THE EXTRAORDINARY VARIETY OF PEOPLE AT MCDONALD'S. Now I've got a subject. . . . Now make up a sentence, and tell me something about McDonald's. That has to do with the extraordinary variety of people. . . . . . . I know you're not all writing [for your own essay] about McDonald's. Invent. You've all been there. . . . Finish the sentence.
All you .. all that .. all that writer really has is a subject.
... "The wide variety of people."
Okay.
What about it.
Tell me something.
What does it do.
.. What does it create.
What does it cause.

As soon as you get one raise your hand.

(25a) Request for Reply
T: S10.

(25b) Dispreferred Reply
S10: Well I see a lot of just foolish,

(26a) Reorientation
T: I didn't say "see."
I said finish the sentence.
"The wide variety of extraordinary people at McDonald's"
... what?
Tell me about it.
What does it do.
Finish the sentence.

(26b) Dispreferred Reply (?)
Ss: (uc)

(26c) Response to Reply
T: No.
Not write another one.

(27a) Reorientation
T: Use that as the subject and finish it.
Give it a verb.
Say something about it.
... Somebody asked me what did I mean the other day,
when I said the "aboutness" in the verb.
That's what I'm trying to get at.
What about the wide variety of people there.

(28a) Request for Reply
T: .. S14

(28b) Preferred Reply
S14: Create a friendly atmosphere.

(28c) Uptake of Reply
T: Creates a friendly atmosphere.

(29a) Request for Reply
T: Who did something different?

(29b) Preferred Reply
S2: Provides a visual landscape (voice lowers) every time you walk in.

(29c) Uptake of Reply
T: Uugh (negative heavy sigh).

(30a) Preferred Reply
S2: I don't like the "landscape."

(30b) Uptake of Reply
T: Woo!
   I like the "landscape."
   But I don't like the "provides."
   Provides a visual landscape every time you walk in.
   /Ss: laugh/
   I don't know.
   That sounds kind of interesting to me.

(31a) Request for Reply
T: Derek.

(31b) Preferred Reply
Derek: Make me laugh.

(31c) Uptake of Reply
T: Make me laugh.
   /Ss: (laugh)/
   Sure.
   That's wonderful.
   It-

   Like Mr. Peterson, Ms. Glass spontaneously "revises" the "revisions" that the students make of this sentence. She models composition as she corrects subject-verb agreement problems
(28c) and comments on the word choices made (30b). Figure 6.5 shows how Ms. Glass filters (revises) student replies.

This rapid-fire composing and immediate teacher feedback, modeled publicly, continues for a few more turns. Interesting is a comparison of this composing activity with Mr. Peterson's. In Ms. Glass's class, every student composes, alone, independently. Once the sentence completer is written, the student can display his or her re-writing and receive feedback or response. What is public and shared is the response act, not the writing act. In Mr. Peterson's class the composing is public, with the group collaborating over the composition, and with Mr. Peterson giving the response by accepting or not accepting the student's offering to the group effort.

Like Mr. Peterson, Ms. Glass has to reorient her students several times. She too listens to the dispreferred replies so that she can achieve the orientation. In both classes, it takes some work to get the students not just to recognize a problem, but to know how to take action to correct it. This activity is similar to the revision step in the revision process described by Scardamalia and Bereiter (1982) and Flower and Hayes (1984)—identify, diagnose, revise. Only after the identification and diagnosis of the problem have been accomplished can the students revise. Once the students understand what to do, notice that there is no single "right" answer; rather, the preferred replies
are within the "right" frame.

Figure 6.6 shows how Ms. Glass explicitly filters out responses that do not contribute to the lesson.

Insert Figure 6.6 about here

Responses like those in (32b) and (32c) do not move the lesson forward because they lack content; they do not appeal to notions of "Ideal Text" developed in the class to date. These comments also do not fit into the carefully designed interactional structure Ms. Glass has built. She has protected writers by securing their anonymity. Now she filters out destructive comments as interactionally inappropriate.

In Ms. Glass's classroom, where the focus is on response rather than writing, it may appear that any student response, as long as it is response, is preferred. However, Ms. Glass disallows certain types of response. For example,

(32a) Request for Reply

T:  I THINK ALLADIN'S CASTLE CAN BE SUMMED UP IN JUST ONE WORD.
    ACTION.
    /Ss: (laughter)/
    What are we going to do with this.
    ... ...

(32b) Dispreferred Reply

S: Kill it.

(32c) Response to Reply

T: Why?
   No we're not going to kill Alladin's Castle.
   Now be nice.
   /S: Kill the writer./
   We're not even going to kill the writer,
we're going to talk friendly to the writer.

(33a) Request for Reply

T: S2.

Here the student gives a reply that is dispreferred in terms of content and that shows that the student is not properly oriented to the nature of the activity. Ms. Glass reorients, reexplaining the rules of the activity. And then the activity continues as before with S2 discussing the lack of necessity of the hedge "I think."

Ms. Glass, like Mr. Peterson, wraps up the lesson by tying the response activity to her students' future work. She thanks the class for their attention and careful responses to the sentences on the board, and "packages" the object of the lesson.

Packaging

You're doing a really good job.. of getting a start on what..where you find a focus. Now you're down to the really hard stuff. It is hard to find..exactly the right word. For what I'm trying to say. All these people made an effort ...and f- for that.. they get an A+ for today. That's what you were supposed to do. I said..get it on paper, ..and you did. ..Okay? Now go back..and look at what you have ..and see if you can .. find .. either a sharper word, or a less lazy one, or maybe a more active verb, or make it more interesting.

Ms. Glass here appeals to criteria of "Ideal Text." Good writing is sharp, active, and interesting, and is accomplished by choosing the "right word." Students leave Ms. Glass's class today with response to their writing and a directive: to revise
their focus statements by choosing the right word that will make their sentence active and interesting; to revise, in other words, in order to bring their writing into line with the criteria of "Ideal Text."

**Summary and Discussion**

Although these teachers have different teaching approaches, approaches which are revealed in the differences in preference organization, they are similar in several ways. Both teachers collaborate with their students: Mr. Peterson collaborates with them as they write; Ms. Glass collaborates with them as they respond to the writing of others.

Whereas Mr. Peterson sets up his lesson so that he can model composing processes as he guides students in acting on the response they receive, Ms. Glass sets up her class so that she can get her students to practice responding. The content of the segment is not motivated by her response to their drafts before the class. Rather, she has the students display their writing and initiates response episodes, on the spot, in class. Her hope is that by practicing responding to each other, the students will learn better to respond to their own writing. Ms. Glass wants the students to write independently; she does not want to take over their writing. She provides scaffolding in the form of classroom activities that will help them produce independently. In these ways, she is unlike Mr. Peterson who writes collaboratively with his students, all the while modeling his composing process for them and providing, through collaborative writing, the scaffolding he thinks they need to improve their
writing. In both classrooms, when teacher and student collaborate successfully, students give preferred responses. And the tri-partite turn taking system breaks down. Further, the teacher takes on a role more equal to the students' and gives the students some authority during the writing/response process. The students are led to believe that their opinions and ideas are valid.

In the segments analyzed here, only Ms. Glass asks traditional exam-questions and she does so to review past material, which may well have evolved from collaborative problem-solving which was not marked by exam-questions. In both classrooms, during problem-solving, the teachers set up a frame within which the students can respond. In Mr. Peterson's class, there are many different specific sentences that the students could suggest which would accomplish the goal of making the piece of writing more exciting. In Ms. Glass's class, there are many valid responses.

Both teachers focus their lessons much like the photographer sets the focus on the camera before taking a picture. As the teachers move from point to point, they continually adjust the width of the lens opening. She too sets up frames within which there are multiple, individual "good" ways to perform. At one point, she responds to her students, "I don't have one answer. How many students are there in here? 33. Then there are 33 different answers, all good." When Ms. Glass uses an analogy, she defines the term. Peterson uses the term and expects the students to understand, that is leads them to understand. The students show more confusion than in Ms. Glass's class, but Mr.
Peterson listens to his students so well that he eventually clears up the confusion through careful scaffolding. Mr. Peterson's discussions are much like those scaffolding dialogues that occur between young children and their caretakers during oral language acquisition (Ninio & Bruner, 1978).

Although both teachers have definite points to get across, they communicate them by setting up the type of problem-solving activity Heath alluded to in her suggestions about what is needed in classroom talk. And then they collaborate with their students, in a kind of scaffolding dialogue, to solve the problems that have been posed. When a question is asked, or rather when a problem is posed, there is not one right answer or solution. Instead, there are many ways to answer correctly; and each individual might have a different response. This is not to argue that there are no wrong answers. Indeed there are. Rather, the answers fit into a "frame" of right answers, not into a single "slot." In Mr. Peterson's classroom, he wants the students to come up with specific details to add to a piece of writing; there are many specific details that he in fact accepts to fill the frame. In Ms. Glass's class, she lets the students select, from the list on the board, which topic sentences to respond to. Then she and the students work together to come to consensus on both evaluation and grounds for evaluation of the sentence the student has selected to discuss. Both teachers seem to maintain control over the response event through the way they orient the students. The teachers constantly adjust the focus of the teaching lens to create just the right picture for their
students.

At this point it is important to evaluate the analysis system presented here. What advantages does it present over structural analyses used to date in studying classroom language? What short-comings does it have? What further steps are necessary in refining the system?

This analysis system arose from our sensitivity to the need to describe the pedagogical activities engaged in in classrooms in an educationally valid way. To this end, we attempted here to look at both the content and the structure of classroom teaching and learning events. We posed as elements essential to understanding the events (1) the activity agenda of the teacher at the time of the lesson, (2) the background of values and assumptions about the academic domain, in this case writing, that inform the participants in the lesson, and (3) the structure of interaction during the lesson.

Underlying this system of analysis is a more complex notion of a lesson than mere structural accounts would allow us to adequately portray. Within such a system, the locating of the activity agenda (as a problem space or task), the values and pedagogical agendas behind acceptable solutions, and the social interactional patterns are built in to the lesson-as-joint-problem-solving. We watch the problem-solving unfold, and can begin to ask questions about the importance of such interactions for what is learned in schools.

For instance, we can see how student contributions function in a lesson, and look critically at the type of content that a particular teacher values. By looking at the content of the
discourse, we can see the cognitive strategies being used and, as with Ms. Glass and Mr. Peterson, modeled for the class. We can see how the curriculum gets realized in various classrooms, and hopefully move closer to the goal of understanding the cognitive effects of classroom discourse.

By looking at classroom discourse as a problem-solving interaction, we see teacher questions functioning to pose problems and delimit the search for solutions, not simply to test student knowledge. The orientation to the problem is accomplished interactively with the help of the students, as teachers adjust and modify their understandings of the problem. The type of problem posed by the teacher presupposes the type of solution required, and we have seen how the width of the frame on the problem given by that orientation can vary. Further refining of this system may reveal Gal'perin's three-way distinction between types of orientations to problems useful here. Perhaps it is precisely the width of the frame that makes a given problem solution one of trial-and-error, following procedures, or thinking about thinking processes (meta-cognition).

The teacher's role, as we have seen it in these two segments of classroom lessons, is to set up the problems to be solved. We have also seen how teachers guide their students to valued solutions, in part through their role as filters on the classroom talk. They position and adjust the lens to focus student attention on the problem and its solution, and filter out "noise" on the part of the students that does not contribute to that focus. Through uptake, they operate on student contributions to
move the class toward a solution to the problem they have posed.

By not forcing teacher-student interaction into a tri-
partite I-R-E sequence, we can see that student replies that
receive a positive evaluation, in Mehan's sense, and those that
actually figure in the solution (preferred, as it is used in this
analysis) are not necessarily the same. Student replies that
are "evaluated" positively can be missing from the problem
solution. Similarly, student replies that receive uptake can
nevertheless receive overtly negative evaluations as well. There
is thus no neat one-to-one correspondence between uptake into the
solution, as we have described it, and the type of positive
evaluations seen by Mehan. Evaluations themselves play a very
limited role in the discourse we have analyzed here.

Further work needs to be done in refining this system,
particularly to make it sensitive to finer distinctions in the
process of joint problem-solving. By developing a system for
incorporating discourse structure and the teachers' agendas for the
task at hand and for student learning in general, we hope to
have moved closer to answering the question as to how the problem
frame affects student learning in particular classrooms and
domains of knowledge.

We began this study by choosing to observe successful
teachers of writing. We find, in the discourse in their two
classrooms, interactional patterns at variance with those
described to date. We observe less of a rigid, teacher-
controlled tri-partite turn-taking system, and more authentic
collaborative problem-solving.

When these teachers described to us their goals for their
students' learning, above all, just like the teachers' in the National Survey, they were dedicated to teaching their students to think. Indeed as the results of the analysis in Chapter IV show, both focus pedagogically on the cognitive. Perhaps the discourse patterns we observed in their classrooms are designed precisely with that primary goal in mind—by thinking collaboratively in class in order to solve teacher-posed problems, these students gain exposure to, and engage in, the types of thinking the teachers hope they will be able to use independently in the future.

CHAPTER VII--Written Response: A Contextualized Look

Introduction

Written response has received a lot of attention among researchers, partly because it is the traditional response mode (historically, as recently as 1963 the CEEB set forth the "ideal reading" of student writing to be one in which the teacher marked all "formal errors" on every paper and in addition wrote on them a "constructive" and "specific" detailed comment) and partly because a niggling fear has lurked behind that tradition that few students pay any attention to what teachers write on their papers, looking rather for the grade at the end before tossing them aside or into the trash. And as Searle and Dillon (1983) report, written comments remain the dominant mode of classroom response. In fact, the comments that teachers make on student papers often serve the teacher in justifying that grade rather than the students in developing their writing skills (Sommers, 1982). Yet writing comments on a student's paper allows feedback a permanency and transportability not otherwise possible, and gives students the opportunity to re-read the comments whenever they want (in part, this is Hirsch's [1977] argument in favor of teachers providing feedback in the form of written comments on papers).

Understanding, among other things, the pedagogical hazards of letting their students' papers, along with their reactions to them, keep idle company with kleenex wads and stale chewing gum, teachers and researchers have investigated ways that both supplement such response--teacher-student conferences, for
example—and improve it. Improvements include such practices as integrating written response into process-oriented classrooms, where it has been shown to be quite valuable (see, for example, Beach's [1979] study on the effects of between-draft response on revision, or Hillocks' [1982] look at the efficacy of written response that occurs in conjunction with other classroom activity). Improvements also reflect considerations such as Lees's (1979) for whether particular teacher comments place the burden of re-writing decisions (again, the assumption is of a process orientation) on the student or on the teacher; or Butler's (1980) concern that the "squiggles" that carry meaning for the teacher often carry none for the student; or Sommers' (1982) outcry about comments that can be "interchanged, rubber-stamped, from text to text" (p. 152); or Hahn's (1981) discovery that students often feel comments to reflect their teachers' confused readings rather than their own confused writings and so discount their value.

Through studies such as these, we have gained valuable insights about written response to student writing. Yet, as we mentioned earlier, much research on response methods, including written response, has tended to isolate response from most, if not all, of the learning environment in which it functions. Written response is particularly subject to such isolated analysis as it is easy and, for some purposes practical and desirable, to collect large samples of student writing complete with teacher comments and leave the teacher, the students, and the classroom behind. When one looks at written comments with this limiting lens, however, their meanings must be made and
their value must be judged almost entirely by the researcher in the laboratory. But a new perspective must be taken if one regards meaning and value as emerging not from the researcher but from the student to whom the comments are addressed, as he or she participates in a classroom that grounds these comments in daily learning activity. Then written response, like response that occurs in the conference or peer group or classroom lesson, can be seen as a response episode; as Chapter IV shows, response episodes occur in coordination with one another. We move, then, from regarding written response per se, and seeing it as "the good kind" or "the bad kind," to looking at written response episodes, and determining them successful or unsuccessful from the students' point of view.

What constitutes a successful episode? As we saw in Chapter VI, preferred student replies to teacher orientations were those that moved the lesson forward toward a desired end. In the case of student writing, the desired end is a piece that meets the criteria that, optimally, both student and teacher can share for "good" form and content, the criteria reflecting both the teacher's and the students' notions of "Ideal Text" or "Ideal Process" (see Chapter V).

A successful response episode moves the student's writing toward such a desired end. The teacher's written comment, then, serves as an "Uptake" (see Chapter VI) that either explicitly or implicitly moves the student to change or revise or rethink his or her writing, or, in the case of positive comments ("good introduction"), encourages the same writing in subsequent drafts.
or assignments. The "Reply" is made by the student--who either "gets" the teacher's comment or doesn't--and this student reply is (at least potentially) embodied in the re-write.

It is valuable for the metaphor it provides to consider whether teacher-written comments fit into Mehan's I-R-E structure either as Initiations, prompting student response in the form, ultimately, of a revised way of thinking about some aspect of one's writing, or as Evaluations, assessments of the student's performance on the draft the comments appear on. What we find, however, is that these two slots in the I-R-E structure are easily--and, we think, inevitably--conflated, as a comment, like the Uptake in classroom talk, usually seems to initiate problem-solving, while at the same time indicating whether what the writer has produced is acceptable. Furthermore, no matter what the teacher's intentions, a comment is not always read by the student as "initiation" or "evaluation"--that reading depends on the context in which it occurs.

The I-R-E metaphor, then, does not really hold for these response episodes. For this analysis, we will continue to allude to teacher Uptake which points the writer toward desired ends. It is clear that successful written response episodes depend on a student's complete understanding of the teacher's comments. Students must understand them on a semantic level, knowing, for example, that "agr" stands for "agreement," and they must understand them on a pragmatic level; that is, they must understand the teacher's reason for writing them, figuring out, to use the same example, what "agreement" has to do with a particular paper and a writing or re-writing of it.
What we present here, then, is a look at the written comments that students receive, both on their in-process drafts and on their final versions, focusing partly on the comments themselves, but seeing them through the eyes of the students, that is, in terms of what they do and do not understand about them. We also consider how the context of the classroom can fill out their meaning.

Methods and Procedures

Subjects

We selected two of our focal students from each class for this analysis, one who had problems writing toward "desired ends," and one who had few such problems. In Mr. Peterson's class, we selected Rhonda and Lisa and in Ms. Glass's class Derek and Julie. These were the students within each category and within each class who, in their interviews, provided the most revealing comments about their understanding of their teachers' responses.

Data Sources

In order to understand how these students interacted with the teacher's written comments, we used three data sources: (1) the students' writing, both in-process drafts and final versions, and the teacher's comments on it; (2) the students' second interviews with us after the semester was over, during which we asked them explicitly about their understanding of specific written comments on their papers; and (3) the rest of the classroom data that documented their daily interactions with the teacher.
In regard to classroom data, when understanding the students' interactions with the written comments, it was also important to consider "Ideal Text" or "Ideal Process," that is, to see whether written comments reflected the "desired ends" that had both implicitly and explicitly emerged in the classroom. To what extent the student assimilates the teacher's "Ideal Text," and to what extent it is in conflict with the student's own "Ideal Text," should influence, in some way, how the student is able to interact with the written comment.

Selection of Comments for Analysis

For each student, we selected a range of typical but important written comments to discuss as response episodes. When possible, we looked at "editing" comments, those teacher additions, deletions, or substitutions that changed the student's text. These reflect what some would call the teacher's "appropriation" of the student's writing (e.g., Michaels, 1985; Tannen, 1982). We wanted to see how different kinds of students interacted with such comments, hoping to gain insight about their efficacy by regarding them in the student's context for learning and not as isolated marks on paper.

We also looked at comments about grammar or usage that labeled the problem but did not edit or correct it. We wanted to find out how different students would interact with these often maligned markings (cf. Butler's [1980] argument for basic writers, that such esoteric marks tend to be understood only by the teacher; and consider the proliferation of handbooks and textbooks that devote pages to the deciphering and assimilation of "p" and "ww" and "awk"). We wanted to see on what level
different students would be able to make use of them, toward what writing ends these students would be oriented.

And finally we looked at comments that addressed content without editing or correcting it. "Content" is generally given high ratings as a value underlying teacher response (see, for example, Freedman [1979]; Harris [1977]; Siegel, [1982]), and we wanted to see how our different students interacted with comments on this valued response target.

We look first at Mr. Peterson's students, then at Ms. Glass's.

Results

Mr. Peterson's Class

Mr. Peterson's students were given the assignment to write about someone they knew. As we explained in Chapter II, this assignment entailed first writing an anecdote about the person, then adding to the anecdote enough other information to create a full character sketch. The students produced a rough and final version of the anecdote as well as of the character sketch. On each version, Mr. Peterson gave them written comments. In addition, he conferred about the comments he wrote with each student, one-to-one, usually in formally arranged conferences during class, but sometimes in informal conversation.

Rhonda. Rhonda, energetic and friendly, contributes a lot to class discussion when the topic is something she is "expert" about--rock music, for example, or the character traits of popular movie stars. She also contributes insightfully to on-the-spot analyses of sample writing when the class discusses
that. The problem is that she is not always up on class assignments, and so she cannot contribute as fully as she might like all the time. To get around this, Rhonda often uses her skills in picking up on what other students are saying, and she can sometimes "fudge" her way through a discussion by taking cues from other participants and appearing as if she knows what she is talking about. She also has a habit of having ready excuses for not bringing papers to class on time, something which happens often. Once, for example, Rhonda tells Mr. Peterson that her locker partner has borrowed some binder paper and grabbed the assignment along with the paper. For the character sketch assignment sequence, Rhonda always seems to be out of synch with Mr. Peterson's due dates. So, at the time the rest of the class confers with him about the final drafts of their anecdotes and begins to work on the rough drafts of their full character sketches, Rhonda has not yet conferred with him on the rough draft of her anecdote, and has not written the final draft. Yet Rhonda can write good narrative, and her anecdote revision, when she finally does write it, is an improvement, overall, over her much less detailed rough draft.

For her anecdote, Rhonda writes about her handsome friend Dominic, who likes to pull pranks and make people laugh. She tries to convey his CRAZY SENSE OF HUMOR as he talks his cousin Kevin into getting a haircut, an event that turns out to be a disaster.

Rhonda writes on her first draft of her anecdote:

1. DOMINIC'S DAD HAD FINISHED CUTTING HIS HAIR AND ASKED
KEVIN IF HE WANTED HIS HAIR CUT TOO. KEVIN REPLIED NO, BUT ENDED UP GETTING HIS HAIR CUT ANYWAY. BECAUSE DOMINIC TALKED HIM INTO IT. DOMINIC HAS A WAY OF GETTING PEOPLE TO DO THINGS THEY DON'T WANT TO DO. 2

Mr. Peterson circles the passage above and writes in the margin: "I need to know just how he did this. What did he say? Reproduce the dialogue." Later in the anecdote, when Rhonda says that unlike Kevin's, Dominic's hair LOOKS VERY GOOD, Mr. Peterson comments, "Give me a picture."

Rhonda tells us in our interview that these remarks helped her, "because there were points I could express more," that is, they were points that she could develop with more description. When asked what Mr. Peterson was looking for, she answers, "More detail, mainly." This written comment seems to touch in Rhonda a notion of "Ideal Text" in common with Mr. Peterson's. Thus it can propel her toward a mutually (though tacitly) agreed-upon desired outcome. His comment acts as a successful Request for Reply which elicits the Preferred Reply in a subsequent revision. The response episode is successful, as her revised (final draft) anecdote shows:

2. DOMINIC'S DAD HAD FINISHED CUTTING BOTH DOMINIC'S AND TERRENCES HAIR AND ASKED KEVIN IF HE'D LIKE HIS HAIR CUT ALSO. KEVIN REPLIED NO. DOMINIC WAS IN ONE OF HIS "PRANKING" MOODS, AND THOUGHT TO HIMSELF ABOUT MAKING KEVIN CUT HIS HAIR. "BUT HOW COULD I DO IT?" DOMINIC ASKED HIMSELF, GETTING A SMALL LIGHT BULB ABOVE HIS HEAD. DOMINIC HAS A WAY OF GETTING PEOPLE TO DO THINGS THEY DON'T WANT TO BY SIMPLY TALKING THEM INTO IT..."GET
IT CUT. IT'LL BE LIVE, MAN! YOU SAID BEFORE YOU WANTED
CUT, REMEMBER? MY DAD CAN DO IT!" SAID DOMINIC WITH AN
EVIL SMURK ON HIS FACE.

Mr. Peterson's comments reflect his needs as a reader. They also
reflect the "Ideal Text" that emerged in the classroom, to "use
specific descriptions." Mr. Peterson neither "appropriates"
Rhonda's text with his comment on (1) nor asks her to do
something that she has no procedures for changing. He touches
a responsive chord, and Rhonda gives him more detail. The angle
of the classroom lens is set wide--Mr. Peterson is simply asking
for more and not prescribing specifically what--so Rhonda's
chances of being successful are good as she has room to maneuver
within the wide angle. Almost any conversation between Dominic
and Kevin, for example, will bring desired results and reflect
Rhonda's "expressing more." In fact, the second draft of this
anecdote is filled with such dialogue and description. Mr.
Peterson's comment, in engendering a successful interaction, has
transferred to targets throughout Rhonda's text.

In contrast, the comments that label grammatical errors or
edit Rhonda's text are unsuccessful. Look, for example, at (3)
from the final draft of Rhonda's anecdote:

3. DOMINIC HAS A WAY OF GETTING PEOPLE TO DO THINGS THEY
DON'T WANT TO DO BY SIMPLY TALKING THEM INTO IT.

Mr. Peterson circles THINGS and IT, and writes "agr" in the
margin. Unfortunately, the "agr" is quite a scribble. In our
interview, Rhonda cannot decipher it, and our records do not
indicate that she and Mr. Peterson ever conferred about the
comment to clear it. Not only can she not decipher the "a-g-
r" but she also seems not to know that the mark refers to the
circled "THINGS and IT in her text. This notation does not strike
familiar chords for her. Even when we tell her that the scribble
says "a-g-r" for agreement, she fails to perceive any problem in
her writing and appears not to "get" the remark at all.

At least three factors seem to be involved in Rhonda's
difficulty here. One, "agreement" may as well be an alien
concept to Rhonda and "agr" a foreign word; two, Rhonda does not
recognize a problem in her writing; and, three, IT may in fact
refer to DO THINGS THEY DON'T WANT TO, a singular concept for
which IT is, if not the clearest reference, at least the
consistent one in terms of number. Rhonda's sentence, if
regarded as ambiguous, does not then merit the comment "agr," and
maybe Mr. Peterson has misunderstood Rhonda.

Unlike the comments made to (1), the frame for the comments
to (3) is narrow, serving to want from the writer a single right
answer about which not incidentally, no explicit "Ideal Text"
emerged in the classroom--that is, we observed no lesson or class
time on pronoun agreement, although such a lesson could have
taken place before our observations began. The writer not only
does not have the "answer"; she also appears to have had no
previous instruction by Mr. Peterson that could lead her to one.
It is also important to remember that for Rhonda, circumstances
in the class were such that she missed her chances to confer with
Mr. Peterson about his comments since she did not complete her
writing on schedule.

The next written comment, an editing comment, illustrates
her problem with these types of comments most clearly. On the rough draft of Rhonda's anecdote, she writes the following:

4. IT WASN'T VERY HARD FOR DOMINIC TO TALK KEVIN INTO IT FOR THE FACT THAT KEVIN HAS THIS WILD DESIRE TO BE LIKE DOMINIC BECAUSE DOMINIC HAS A WAY WITH THE LADIES.

Mr. Peterson crosses out FOR THE FACT THAT and writes in "because." He then writes "as" above Rhonda's BECAUSE. Rhonda remembers this comment when we interview her and brings it up even before she has her paper in front of her to look at and before we have mentioned it. She remembers Mr. Peterson's changing "because" to "as": "He just misunderstood the whole comment and the reason why I put it," Rhonda tells us. What she remembers is that her word choice was perfectly good in conveying her meaning and his was not. This rewording or editing does not touch anything in Rhonda's "ear," and Rhonda never knows either what Mr. Peterson is doing or why he is doing it. When the paper is finally in front of her and we address that comment again, she repeats, "I didn't get it [his comment]...I was saying the reason why he has this wild desire to be like Dominic is because Dominic has a way with the ladies and he [Mr. Peterson] kind of misunderstood that."

What Rhonda remembers from this comment, then, has nothing to do with Mr. Peterson's modeling good style or form. She has no sense of "Ideal Text" that indicates that "for the fact that" is wordy and that "as" is fairly interchangeable with "because." We never heard these points raised in class. She has difficulty fathoming Mr. Peterson's purposes. Her problem becomes clear to us when she focuses her complaint not on the whole correction but
on the spot where Mr. Peterson has changed "because" to "as." She appears not to see that, since he has changed "for the fact that" to "because," he has made the second change to avoid repetition. The upshot is that Rhonda feels that Mr. Peterson's purposes are served, but hers are not. As far as Rhonda is concerned, he has appropriated her text.

In truth, Mr. Peterson has not changed any meaning and has not misunderstood her. But for Rhonda, the written comment serves at once as a provocative offering of the unknown and a negative evaluation of her work. For this student no context for understanding this comment comes to her aid.

Interestingly, even when Rhonda thoroughly understands Mr. Peterson's editing comments, she balks at them; Mr. Peterson's way may be right, but so is hers. One such comment occurs in the following section of the final draft of her anecdote:

5. KEVIN RUNS HIS FINGERS OVER WHAT APPEARS TO HIM TO BE WAVES...

Mr. Peterson crosses out APPEARS and writes in "feels." When we ask Rhonda about this comment, she admits that since Kevin runs his fingers through his hair, "it may be should be 'feels'," acknowledging, implicitly, the correctness of this semantic consistency. Yet when we ask her what she would do if given the opportunity to rewrite the passage, she says, "I'd stick to my way. When I like my things, I stick to them."

Rhonda's interactions with Mr. Peterson's comments are complex, reflecting a mismatch of "desired ends" and a classroom context where misunderstandings and conflicting cycles for
writing to due dates occur regularly for her. In this regard, it is instructive to look at a brief conversation Rhonda and Mr. Peterson have in class the day he returns to her classmates final drafts of the character sketch. Mr. Peterson approaches Rhonda before class begins and asks:

T: Did you ever get a grade on your anecdote?
Rhonda: The first one?
T: Yeah, right.
Rhonda: No, you put a "see me" on it.
T: OK. Well, I'm gonna grade this [the paper he is holding] as if it were your anecdote. 'Cause that's what it is, an anecdote. You tell us one story, right?
(Rhonda nods. She does not look too pleased.)
T: So I'm gonna give you a good grade on it as an anecdote. I think I'll give you an 'A' as an anecdote.
Rhonda: OK.
T: But that still leaves you with another paper to write /What?/ Now you can choose--you understand the difference between what you did here and what--see, everything relied on that one story.
Rhonda: OK. OK. Now I'm supposed to write like a, just a thing on the person right?
T: You're supposed to deal with like two or three qualities of the person.
Rhonda: Oh. That's what I thought we did with these [indicating the paper that he is holding].
(At this point, another student, who has been listening, interrupts and says something about this character
sketch being like what they wrote as a group on Mr. and Mrs. Hubble from Great Expectations.

Rhonda: OK

T: OK. Now this, as an anecdote, is the best thing you've written. (He hands the paper to Rhonda and moves on to another student.)

Rhonda is clearly mixed up about the assignment, and Mr. Peterson takes what Rhonda intended as a bona fide character sketch for the second draft of her anecdote. It is true, then, that Mr. Peterson "misunderstands" Rhonda's intentions: in this case it is his interpretation of the assignment against hers; in the case of his comments on her paper, it may also come down to his version of her intentions against hers, at least in Rhonda's eyes.

In fact, Rhonda's appetite for writing any more papers for Mr. Peterson pretty much leaves after he returns this second draft of her anecdote to her. She never writes a draft of the character sketch and hands in few subsequent papers. Not surprisingly, when we ask her what method of getting feedback in her writing she finds most helpful, she says that getting opinions and comments from friends is best. "Your friends will be honest," she says, adding that it's better to get different opinions, and "if there are lots of the same comments (that is, a consensus), that helps." She interacts poorly with Mr. Peterson alone. He does not "understand" her writing like her friends do. And conferences, which she often misses because she has not
completed her writing, cannot enrich the written comments. The fact that her final draft anecdote receives an 'A' does not seem to change the last response episodes into success.

Lisa. Lisa, a high-achieving student, also contributes a lot to class discussions, but she comes to class prepared, always having done the reading and writing, sometimes even before an assignment is due. Perhaps the best insight into the type of student role she assumes comes from an early interview that we have with her when she tells us that her writing has changed over the course of the semester because she has learned to "write for other people." When we ask her to explain what she means by that, she says, "They're going to grade it. They're going to read it. You know. You're doing it because they want you to. So it's for other people." It is not surprising that Lisa has learned how to please Mr. Peterson, nor that she gets good grades. Lisa, recall, is the student in Chapter VI who, in responding to a request from Mr. Peterson in a class discussion, says, "Can I read it? I did it the way you wanted me to." Lisa is very much aware of Mr. Peterson's wants, and it is partly this awareness that makes her a successful student. Lisa provides a telling contrast to Rhonda; she equates pleasing the teacher with learning and she also equates good grades with learning. So for her, when she learns to "write for other people," that is for the teacher, whom she trusts, she is learning to write better.

Lisa's paper is about Sister Carolyn-Marie, her eighth grade teacher. In her anecdote, Lisa depicts a few moments from a memorable day in eighth grade when Sister Carolyn displays one of her characteristic mood shifts. First she loses her temper,
SNAPPING AT A BOY WHO HAD TURNED SIDEWAYS IN HIS SEAT: "RIGHT NOW YOU DESERVE AN F IN CONDUCT," SHE SCREECHED AT THE TOP OF HER LUNGS. And then she apologizes for being so irritable, realizing WHAT A FOOL SHE HAD JUST MADE OF HERSELF. Lisa writes two drafts of the anecdote, a rough and a final. Her full character sketch shows more of the many sides of Sister Carolyn.

We begin by looking at editing comments that Mr. Peterson writes for Lisa on the final version of her character sketch. Her interactions with Mr. Peterson's editing are markedly different from Rhonda's. On the final draft of Lisa's full character sketch, for example, she writes:

5. HAVING TO GUESS HER EVERY MOOD AND WHAT TO SAY AROUND HER FROM TIME TO TIME GOT TIROSOME AND TEDIOUS.

Mr. Peterson crosses out HAVING and writes in "We had." He crosses out the second TIME and writes "another, and this." His changes yield "We had to guess her every mood and what to say around her from time to another [sic] and this got tirsome..."

Mr. Peterson does not correct the spelling of "tirsome." Also, Mr. Peterson's "this" Lisa reads as "thus," an easy interpretation because of his unclear handwriting. We assume he meant "this" because "thus" would render a serious change in meaning (and logic).

When we ask Lisa what she thinks of this rewording--and to try to recall what she thought when she first saw it--she tells us that Mr. Peterson's version sounds "more polished," more like a high school student writing than a middle school student, especially (ironically) the "thus." Lisa accepts whatever he
says, without question, uncritically.

Lisa tells us that some students mind it when Mr. Peterson changes their wording, but she doesn't because Mr. Peterson "has more experience and he probably knows what he's doing." She tells us that once, when her group wrote a collaborative piece, Mr. Peterson changed the wording and another student got "really upset."Lisa thought that "she [the other student] was making too much fuss over it. Mr. Peterson came around and said, 'I wouldn't steer you wrong. I think this honestly sounds better.'" Lisa's recollection of the incident in class and her feelings about teacher editing indicate the student-teacher relationship she is willing to establish with Mr. Peterson that allows her to interact with his comments in a way that those who object to such comments cannot. Because of this willingness, she can engage with her interpretation of his rewording and is sympathetic to whatever she thinks he says is "Ideal Text." Whether or not editing Lisa's prose will have a genuine salutary effect on her writing can probably be assessed only by taking a long-term look at a number of such events and the papers she produces. We do not have enough information to know whether her non-critical stance keeps her from learning. Again, for these comments, we find no reference in the classroom.

We now turn to another kind of comment, the labeling of a grammatical problem. In the rough draft of her anecdote, Lisa switches verb tense:

6. **MY EIGHTH GRADE TEACHER, SISTER CAROLYN MARIE, WAS THE MOODIEST PERSON I HAVE EVER KNOWN. ONE MINUTE SHE CAN HAVE A GRIN STRETCHING FROM EAR TO EAR...**
Mr. Peterson circles WAS and CAN and draws a line from one to the other. In the margin he writes "tense." (In addition, he underlines STRETCHING FROM EAR TO EAR and in the margin writes, "Another way to say this?")

We ask Lisa about the circled words. She has no trouble recognizing the mark as referring to her switching verb tenses. It is important to keep in mind a remark Lisa made earlier to us indicating that one of the things she tries to remember when she writes is tenses, because, as she says, she "jumps all over the place." It's also important that she tells us that Mr. Peterson has more experience than his students and "knows what he is doing." Mr. Peterson's comments about verb tense touch upon Lisa's sense of both herself as a writer and of Mr. Peterson as a thorough and knowing authority. Also, Mr. Peterson has spent time in classroom lessons on keeping "consistency of tenses." (Recall that many of his students, like Lisa, are non-native speakers of English, mostly Chinese). This grammatical notation, then, means something to Lisa in a way that "agr" -- or even "agreement" -- could not mean anything to Rhonda.

Lisa's writing does not immediately benefit from Mr. Peterson's comment about tense, for the same reason that tense shift occurs on the final draft of her anecdote, and Mr. Peterson marks it the same way as he had earlier. (This time he also crosses off FROM EAR TO EAR, and marks a new verb [DIVERSIFY] as "ww" -- wrong word.)

In her interview, Lisa says that for this second draft she
"forgot" to change the verbs. Of note, though, is that the two drafts actually differ:

Rough: MY EIGHTH GRADE TEACHER, SISTER CAROLYN MARIE, WAS THE MOODIEST PERSON I HAVE EVER KNOWN. ONE MINUTE SHE CAN HAVE A GRIN STRETCHING FROM EAR TO EAR AND THEN THE VERY NEXT MINUTE THAT GRIN CAN TURN INTO A NASTY SNARL.

Final: MY EIGHTH GRADE TEACHER, SISTER CAROLYN MARIE, WAS THE MOODIEST PERSON I HAVE EVERY BEEN ACQUAINTED WITH. ONE MINUTE SHE CAN BE GRINNING FROM EAR TO EAR, THEN THE VERY NEXT MINUTE, THAT GRIN CAN DIVERSIFY INTO A NASTY SNARL.

While she knows on one level that her verbs "jump all over the place," she seems to have no procedures for correcting the problem. That is, she changes KNOWN to ACQUAINTED WITH; HAVE A GRIN to CAN BE GRINNING; and TURN to DIVERSIFY. Now, these changes, including the tense change to present progressive, may, in part, also be a response to Mr. Peterson's question, "Another way to say this?" Yet, the changes are not a satisfactory response to Mr. Peterson's request for re-wording either, as he edits out FROM EAR TO EAR, and marks DIVERSIFY as wrong too. So her lexical changes, her longer and fancier words, seem to make things worse.

Behind these verb changes may be another "Ideal Text" that Lisa has shown herself to have adopted time after time in class and in her writing, to wit, to "use vivid verbs." Lisa is interacting in the best way she can with a number of Mr. Peterson's requests and expressed ideals about verbs. It's just not always the right way.
The most beneficial kind of comment for Lisa seems to be the same as what is beneficial for Rhonda, namely, questions and comments whose scope allows her any number of responses that involve adding text to what is already there. Look, for example, at (7) from the rough draft of Lisa's anecdote:

(7) (Sister Carolyn) CAME UP WITH AT LEAST A DOZEN EXCUSES ... FOR WHAT SHE HAD JUST DISPLAYED (that is, her temper).

Mr. Peterson writes two comments about this, the first at the top of the paper, the second on Lisa's draft at the passage referred to:

Top of page: "This is on the right track. Get more into it by repeating her excuses."

In text: "This is the interesting part. What were the excuses?"

For Lisa, all these comments have value, partly because, as we said before, she values Mr. Peterson's reading: "He's pretty thorough when he looks over your paper and makes notations." But the comments also move her toward a response that she has procedures for giving, namely, writing more. Her revised text, the final draft of her anecdote, illustrates the success of this response episode:

AFTER A FEW MINUTES PASSED, SR. CAROLYN REALIZED WHAT A FOOL SHE HAD JUST MADE OF HERSELF AND SAID, 'I HAVE A COLD AND REALLY DIDN'T GET ENOUGH SLEEP LAST NIGHT.' ... SHE CAME UP WITH AT LEAST A DOZEN EXCUSES SIMILAR TO THAT TO JUSTIFY HER ACTIONS.

Lisa provides the examples that Mr. Peterson had suggested and still hangs on to the phrase "a dozen excuses," an expression
of her own that she seems to value here. She is able to incorporate his notion of "Ideal Text," in this case, "Use examples of traits and qualities of the person," and "Use specific things the person says," without giving up ownership of her original text.

Supplementing these written response episodes for Lisa are his one-to-one conferences. According to Lisa, the only reason to confer with Mr. Peterson is to have him clear up handwriting confusions. (But remember "thus.") Even Lisa's narrow view of conferences as handwriting clarification sessions admits of their being integral to the written response episode. The conference Mr. Peterson held with Lisa regarding the final draft of her anecdote lasted less than a minute. Unfortunately, we cannot say any more than that about the conference as the teacher's wireless microphone failed at that point in the taping and our records are therefore incomplete. Suffice to say here that his written comments were not without a conference supplement, and it behooves us to remember that when interpreting Lisa's reactions to them. We do not know which comments he went over with her and which he didn't.

One question that we ask Lisa, as we had Rhonda, is, "Given a choice of how to receive response or feedback to your writing, what one method would you prefer?" We then remind her of the possibilities: class discussion, teacher-student conferences, peer group discussion, peer group written response, and teacher's written comments. Lisa tells us she would choose working with the whole class, getting feedback through class discussion. She says you can get different opinions this way, honest opinions.
In her experience, the small peer group can go "overboard" in their criticisms, and all the teacher does in conference is to tell what he's written on your paper, which shouldn't be necessary if you can read his writing. We find this a puzzling statement in one respect: earlier Lisa told us that she always revises her papers exactly according to Mr. Peterson's written comments, yet now she ignores this response medium altogether. However, working with the whole class, getting feedback through class discussion, allows Lisa to show off to an audience of peers how well she pleases Mr. Peterson, and therefore, she may prefer this public mode of teacher-guided response.

Ms. Glass's Class

Ms. Glass's students are given the assignment to observe, several times, a place of their choosing, then to use the notes they have taken to write an essay about the place. Thus the students produce observation notes, a rough draft of their paper, and a final draft. The rough draft they read to their peer editing groups; Ms. Glass interacts with these groups as she goes from one to the other in class. The final draft receives brief written critiques from two peers--a proof-reading partner and another reader--before getting written comments from Ms. Glass. Since for Ms. Glass's students, her written comments appear on a draft that does not go through formal revision, our discussion will focus mostly on what the students say about these comments, as well as what they say about their peers' critiques of their rough drafts.

Derek. Derek is an energetic youngster whose classroom
behavior some, including Ms. Glass, would call "squirrelly." He behaves slightly less maturely than the boys he likes to pal around with, talking at inappropriate times in class, for instance, without knowing how to get away with it, as they seem to. Ms. Glass reminds him quite often to be quiet, to sit down, to get to work. Once, when the chatting apparently pushes her to exasperation, she raises her voice to an uncharacteristically high volume with a "Derek!" that seems to startle everyone in the room. Derek's transgression is, in fact, shared by his conversation partner, but the other boy's behavior slips by, unheeded. Still, Derek does his work on schedule and, from what we can see, sincerely tries to understand what Ms. Glass teaches the class about writing.

The place Derek writes about is the weight room at the Y.M.C.A., a good place to go AFTER A HARD DAY OF LONG, EXHAUSTING SCHOOL. Derek's approach to this essay assignment is to do only a little work and to try to produce a good essay in spite of it. He tells us, for example, that he visited the weight room for note-taking only once. He must therefore use his too-few notes to write his paper and at the same time convince himself that his procedure for this assignment is adequate. Interestingly, when he and a classmate are reading over each other's final drafts as proof-reading partners, they both seem to have concocted much of their observations for their essays, a strategy that Derek sums up to his partner: "Yeah... but see, like you really don't have to go to the place; you just do it by memory." In light of this remark, it is noteworthy that in
our interview with him, when we ask what his reaction is to Ms. Glass's summary comments (these appear on a critique sheet attached to the essay under the label, "Teacher Observations"), he tells us that he does not agree with any of them except one—"... it sounds as if you had few notes to work from." This comment clearly hits upon the truth of a procedural fudge, which Derek can implicitly admit to us has been unsuccessful, but which he does not admit to his peer.

We look first at Derek's interactions with the comments from his peer editing group. Derek's rough draft gets a reading from his peer editing group and they write their responses to his piece on an "editing sheet." Most of his group seems to have adopted Ms. Glass's "Ideal Text" of work that "shows" rather than "tells," and they incorporate this "Ideal Text" as they write that his piece needs "showing more of the place -- describe the weights"; "how does the color of the room affect your feeling?"; "more showing instead of telling." Derek tells us that he did not use any of this feedback to write his final draft: "I liked my paper. I didn't want to change it... I thought that I was showing." These peer comments are similar to those Mr. Peterson writes on his students' drafts. Both Rhonda and Lisa use this type of comment to good end, but Derek seems to resist them, perhaps because he distrusts his peers' assessments. Derek reveals another important piece of information for our understanding why these comments cannot serve to move him toward the teacher's -- and his peers' -- sense of a desirable paper: "I thought by telling about it that you're actually showing stuff. You're showing what it was like. So I didn't see any
real difference [between what he wrote and what the critiques ask for]." There is a severe mismatch, then, between Derek's "Ideal" for "showing" and his readers', and, no matter the amount of consensus among readers, they cannot re-orient his "Ideal" by making the kinds of comments that assume he shares theirs.

We now turn to Ms. Glass's comments to Derek's final draft. His responses to Ms. Glass’s written comments give more evidence for this problem of mismatch. Further, he articulates his stance in a way that explicitly indicates the complexity of the relationship he sees between himself and his teacher, between his writing and her responses to it: "I thought a lot of her comments were things that she thought she had to write. I mean, she says 'I don't understand this' and it makes perfect sense. I mean you'd think a person with normal intelligence would be able to understand... I don't see why there'd be so many comments. It [his paper] wasn't that bad."

His feeling that the burden of understanding is on the reader/teacher seems to contribute greatly to his reading of most of Ms. Glass's written comments, and as a consequence, the comments don't stand a chance of moving Derek toward a better understanding of good writing. Take, for example, the following:

(8) WITH MY BACK TO THE ENTRANCE, ON MY LEFT THERE IS A BEAUTIFUL PICTURE COVERING THE WHOLE WALL. IT IS OF A GREEN FOREST ON A CRISP MORNING.

Ms. Glass draws a line from the first sentence to the second and writes, "Combine sentences to eliminate unnecessary words." In addition, she underlines the words OF A GREEN FOREST, and draws
an arrow connecting them to BEAUTIFUL PICTURE. Her editing suggests a change from Derek's wording to "a beautiful picture of a green forest," and her comment about combining sentences serves as a metacognitive guide to the editing.

Taken together, these comments reflect an "Ideal Text" of Ms. Glass's that has been articulated in class many times, namely, one that reflects sentences rendered economical by having been combined. Yet Derek doesn't quite understand what Ms. Glass is after, and in fact brings to the passage and his reading of her comments what he seems to have incorporated as his own "Ideal Text," ironically, one that he likely has taken from Ms. Glass and that seems to drive his perception of this whole essay, as he brings it up several times in the interview and in his peer group; specifically, his "Ideal Text" "makes the person be there," that is, makes the reader experience the place as if she were there herself. Derek tells us "you can't make the person be there without saying that the picture covers the whole wall." Derek fails completely to perceive Ms. Glass's desired goal for a potential re-write to this passage, and in fact misreads her intent as being at cross purposes with another of her own often-articulated desired goals for this assignment. It is no wonder he believes her comments to be, merely, "things that she thought she had to write," reflecting nothing more than mechanical teacher conduct. It is true that this comment offers only narrow options for revision (we must speak, actually, of potential revision, as these papers, as we mentioned, do not ever get revised).

In contrast, we turn to a comment that seems, on a
superficial reading, to offer a wider scope for Derek to work within, yet, perhaps not surprisingly, the comment, like the one above, leaves Derek cold. Derek writes:

(9) THE RECENTLY CLEANED ROOM MAKES ME THINK OF CLEANING LIQUID.

Ms. Glass's comment on this is "Why? What does that smell like? Be specific." Derek tells us that he doesn't understand why he should have to explain what cleaning liquid smells like. In fact, Ms. Glass's comment asks Derek to do something he has, in a sense, already done and has no strategies for expanding on; that is, in mentioning CLEANING LIQUID, he is being, in his eyes, specific. If Ms. Glass's "Ideal Text" is, as she has mentioned in class, "to make the reader sense the essence of the place," f.., Derek, that ideal is already met. For Ms. Glass, it is not. When we ask Derek if he has ever gone to Ms. Glass for clarification on her comments, he says that if he were to ask about them, "she would say, 'It's just like that'," and nothing more. He has, in other words, predetermined that the conversation with her would be a dead-end and decided that it would not be worth having. So he interacts with these written comments, creating his own scenarios of their manifestations in oral, one-to-one conversation, never to know for certain what such a conversation would yield for him.

Derek's reactions to response episodes (8) and (9) above can be contrasted with his reactions to (10) below:

(10) THE AIR AND A PLEASANT BREEZE HIT MY BODY FROM THE FAN.

Ms. Glass labels a subject-verb agreement problem with
"agr," and also edits an "s" to the verb to make it a singular, "hits." When we ask Derek about these marks, he does not know what they mean. As with Rhonda, the symbol "agr" is meaningless to him, yet he also has the editing clue to help with teasing out the meaning, so he ponders over it and decides that it refers to a problem about "tense." He is on track, anyway, in seeing that it has something to do with verbs, and he tells us that he supposes Ms. Glass's comment is "right"; it should be 'hits.'" In fact, Ms. Glass may be wrong if one were to read AIR AND A PLEASANT BREEZE as a plural concept, but Derek is willing to yield here to her authority as a grammarian. He has misread the problem, assumed, uncharacteristically, the solution to be satisfactory, and put himself in the position of knowing less about grammar than his teacher, none of which are ends that one would call desirable. The response event is unsuccessful, but, ironically, Derek is not aware of this.

When we ask Derek our question about choosing one response method from among the many he and his classmates have participated in in Ms. Glass's class, the one he says he prefers is, surprisingly, having the teacher comment on papers. We probe him on this: "In spite of your not agreeing with most of Ms. Glass's comments?" Derek says that "maybe another teacher's" comments would be all right, and tells us about his teacher from the previous semester who "knew what he was talking about." Derek needs, it appears, interactions with the teacher, but the relationship that has evolved between himself and Ms. Glass prevents successful interactions much of the time, and her written comments on his work are simply fodder for a strategy.
that he tells us he follows when he receives them: he looks over all the comments, and before doing anything else asks himself whether or not each comment is "just," that is, fair. Clearly, to him, most of them are not.

Julie

Julie is a serious student whom we often see using the response she gets to her writing both from peers and from Ms. Glass to try to reshape her essays toward ends that she understands as both reasonable and desirable. One reason that she uses the response productively, it seems, is that she has a refined sense of the notion of audience and of the fact that this audience has needs that she, as a writer, must meet if her writing is to be any good. Julie often asks questions in class, the answers to which will steer her writing in useful, audience-sensitive directions. It is not unusual for Ms. Glass to pick up on these questions and respond to them at length, taking, at times, up to ten minutes of class time, turning her answers into small lessons embedded within the regular pedagogical agenda. Julie, then, works productively with the teacher in generating successful response episodes that the whole class can benefit from listening to also. Julie does all her work on schedule and often does more work than others in her peer groups, thereby contributing a great deal of writing content to group discussions. It is not unusual for her, either, to provide "Uptake" in her peer groups, moving the other students toward, for instance, finding ideas to write about or a focus for their essays. Thus, she plays an active role in response episodes with
her groups as well as when working with the whole class.

Julie's essay is about Mitchell Park, where people come for "recreation, gatherings, and picnics, for its large size and friendly atmosphere." To her rough draft, she gets mostly positive comments from her peers (written on their editing sheets), comments such as, "I think your paper is really good--don't need too much revision (or none)"; "great description"; "great descriptions, sounds, etc...." Yet Julie has definite views on such peer response. She feels that students are often just being polite when they give feedback about each other's writing and that they don't always mean what they say. The negative comments, however, she does pay attention to: For example, on one segment of her rough draft she writes:

One of her peers comments, "Too many 'smacks'". (Julie tells us that she has taken this strategy of repeating one short word over and over again from hearing Ms. Glass's reading of a Tom Wolfe essay on Las Vegas in which Wolfe repeats a number of times the word "hernia," creating an ironic sound-sense of that place, (ironic of course because of the meaning of "hernia"). To her peer's ear, Julie's repetition does not succeed, and when Julie reads the comment she agrees with it. The criticized passage is omitted entirely from her final draft, and her whole strategy for presenting the tennis balls changes:

(12) I CLOSE THE TENNIS COURT GATE BEHIND ME, LEAVING THE WORLD OF BOUNCING TENNIS BALLS.

She tells us that she experimented with the "smacks," they did
not work for her, and the peer comment confirmed her own sense of a weak spot in her essay. The comment works, then, because it touches Julie's own sense of what is good writing and what is not--the response episode is successful for this shared assumption.

On Julie's final draft Ms. Glass writes a number of comments, most of which Julie seems to understand and agree with. Interestingly, Ms. Glass, like Julie's peers, also writes comments such as "nice detail," "good detail," "nice picture," several times and adds a similar summary comment: "Nice paper! I really got the feeling of variety and detail!" Julie tells us that these remarks make her "really happy." And at one spot where "nice detail" appears, Julie unabashedly agrees with Ms. Glass: "I thought that was really great on my part."

In contrast to her reactions to such comments by her peers, she feels at liberty with Ms. Glass's not only to accept them, but to espouse them. We have evidence in this contrast for the strong social constraints on the response episode that, for example, prevent Julie from agreeing with her peers' compliments and that even, at times, seem to spark her insistence to them that her writing is actually bad: in her peer group on rough draft day for example, she says to them, "You'll know how bad it is when you hear it." No such constraints hold when she interacts with the teacher's comments. Self-effacement may be a social norm in interacting with peers.

It is instructive to look at those comments that Julie does not understand to see how and why a student who is on the teacher's wave length, and who shares, by and large, the
teacher's notions of "Ideal Text," can nonetheless participate in some response events that are not at all successful. Look, for example, at (13) from Julie's final draft:

(13) SITTING AGAINST THE WORN OUT WOODEN BENCH, MY CHEEKS WARM UP FROM THE HEAT OF THE SUN . . .

Ms. Glass writes in the margin by this passage, "Your cheeks are 'sitting'??" She also draws an arrow from SITTING to CHEEKS. Julie has no idea why this passage presents a problem. She tells us that she thought the sentence was "pretty clear" and that a reader would know it was she who was sitting in the sun and not her cheeks. She could not see what Ms. Glass meant by her remark, and Julie's implied "Ideal Text" for semantic clarity eclipses Ms. Glass's for one devoid of structural infelicities. In fact, Julie has her own agenda for desirable sentence structure here. She tells us that at one point she was considering writing, "As I was sitting in the sun . . .," but, since she thought she had used "I" too often already, she wanted to get away from it and thus wrote her sentence the way she did. Furthermore, Ms. Glass's comment does not draw on any classroom talk, at least not on any that we were witness to, about dangling modifiers, so Julie relies on her own semantic interpretation which is based on her experience of sitting with her face--and cheeks--to the sun. But she is also employing a tacit skill with grammatical transformations. Ironically, it is just the construction that Julie avoids using that would clear up the problem, and the clause she has avoided reduces grammatically to the phrase she actually uses.

The response episode thus does not lead to moving Julie
toward Ms. Glass's correct sentence structure. It is also not surprising that Julie fails to understand one of the comments that Ms. Glass makes on the final draft critique sheet under "teacher comments," where she tells Julie to work in her next paper on "sentence structures with dangling elements at the beginning." Julie tells us that she does not know what the teacher means by this, and does not know what the teacher is referring to. Using the schema she has for interpreting "dangling," she guesses that Ms. Glass means she did not write enough and so left the reader dangling.

In contrast to these unsuccessful episodes, consider the following from Julie's final draft where she writes:

(14) I SIT ON A GREY BLEACHER INSIDE THE COURTS AVIDLY OBSERVING TWO MEN PLAYING TENNIS, HOPING TO ABSORB SOME OF THEIR SKILLS. BOTH MEN HAD TAN, BRONZE COLORED SKIN . . .

Ms. Glass circles SIT and HAD, and draws a line from one to the other, implying a shift in verb tense. No other comment appears. However, earlier in the draft another tense shift occurs, which Ms. Glass marks in the same way, but with the addition of "tense shift" in the margin. Reading the earlier comment, Julie understands the problem as one of "tense," and tells us, much as Lisa does, that tense is "really hard" for her. She had wanted to write her essay completely in the past tense but she cannot control it to do so. Then when she comes to (14), Julie picks the comment out herself, saying "tense again." Because we have no revision draft to compare this to, as we do for Lisa, we cannot know whether or not Julie has procedures for correcting
the problem that Ms. Glass has pointed out to her. Yet Julie does articulate a general reaction to Ms. Glass's comments that sheds light on the efficacy for her when these weak spots are marked, and helps explain how she, as a writer, interacts with the teacher's response to experience a successful episode. She tells us, specifically, that it is very helpful to get comments on those parts of her paper that she has also felt are problematical though without knowing what the problem is exactly. She tells us that Ms. Glass helps focus the problem for her and that it is helpful to know someone else feels the same way she does about her writing. This is an important point, for it shows us the response episode as a verification of the writer's own cognitive process as she produced her text, and as a setting-up for productive change toward an end shared, if not articulated, with the teacher.

When we ask Julie what one way of getting response she would choose over the others, she tells us that she would prefer to get the teacher's comments to a final draft, although she acknowledges that in-process response from a teacher is helpful too. Her reason for choosing teacher written comments is that they reflect the teacher's "experience," and the teacher has "more experience" than anyone else. For Julie, this experience has proven dependable through classroom interaction as well as through written comments on her papers that steer her, by and large, toward her own goals for herself.

**Conclusions**

We have examined some typical written responses to the
writing of different kinds of students. What we find is that the written response episode, that is, the interaction between responder and recipient through the medium of the written comment, is a highly complex activity, constrained by the particular learning context in which it is embedded. And this learning context changes, not from classroom to classroom, but from student to student.

Let us reiterate briefly the constraints that we find operating on written response episodes. First, and perhaps most importantly, the response episode is socially constrained. Its success or failure, that is, depends in part on the relationship that has formed between the responder—most often the teacher but sometimes other students—and the recipient—invariably the student writer. If that relationship is positive and trusting, then written responses are seen by the recipient as dependable and trustworthy. If that relationship is at all negative and of questionable trustworthiness, then written responses, either positive or negative, are seen as bogus marks (remember Rhonda’s “A” from Mr. Peterson, for example, or Julie’s “good” from her peers). It is not enough, then, to look at the positive or negative nature of the written comments themselves (as did Gee [1972], for example) to decide whether written response is going to be effective.

Further, a written response episode is constrained by the definition of “reading audience” that the student has formed and brings to the interaction with the response. The episode’s success or failure depends in part on whether the student is moved toward further understanding and pleasing that perceived
audience. What we find in our focal students are, essentially, three levels of sensibility regarding audience: first, a “writer-based” sensibility (see Flower [1979] on “writer-based prose”), exemplified by Rhonda and Derek, that virtually dooms the written response episode to failure since students interpret corrective response as either reader misunderstandings or reflections of reader simple-mindedness; second, an uncritical acceptance of authority, exemplified by Lisa, wherein the teacher is always right and so she may, at times, not even think about the response she receives, and third, a reader-pleasing sensibility, as seen in Julie, that allows response to move the student toward satisfying a reader's cognitive and aesthetic needs for processing text.

In a similar vein, a written response episode is constrained by the students' sensitivity to "Ideal Text," both their own and the teacher's. If it happens that the students' schema for "Ideal Text" match the teacher's, then even what has been called a "rubber-stamp" comment can serve be meaningful to the responder and move the student toward a desirable end, as, for example, Julie's understanding of Ms. Glass's comment "tense" indicates. We also see, however, that the student's chances of matching the teacher's "Ideal Text" are greater if the frame of the comment is wide enough to allow for a range of Preferred Replies. Such comments (for example, "Give me a picture") tend to give response episodes "built-in" success. We also see, especially in Julie, that the student's "Ideal Text" does not have to be fully articulated for that student to interact
successfully with the teacher's response. The teacher's response can "bring into focus" what had been an unarticulated "feeling" in the student for "Ideal Text" and still move the student toward a desired end and the response episode toward a successful outcome.

Except for one student, Rhonda, all the students whom we talked to place a high value on teacher written response. Yet even for the best students working with excellent teachers, the written response episode is often unsuccessful. Too many constraints operate on the episode simultaneously, affecting the outcome. We feel, then, that even in the best teaching conditions, few written response episodes can safely stand alone. They need to be augmented by conference or in-class discussion of some sort between the responder and the recipient(s) in order to extend the episode boundaries and thereby increase the chances that it will lead to success. It is also important to note that these college-bound students seemed to be able to rely on little in the way of past experience, outside of this class, to help them interpret written comments.
Footnotes to Chapter VII

1 The full texts of the students' papers which are cited in this chapter can be found in Appendix 13.

2 Capital letters are used to denote quotations from student writing. These students had few capitalization problems. The writing otherwise is as the students wrote it.
CHAPTER VIII--The Role of Response in the Acquisition of Written Language: Conclusions

This examination of the response practices of successful teachers of writing has revealed as much about the teaching and learning of writing as about response per se. The national survey of 560 successful teachers from grades K-12 and of 715 of their students at the secondary level showed that these teachers were significantly different from the above average secondary teacher surveyed by Applebee (1981). They assigned more writing of more substantial length, and they had multiple reasons for teaching writing, chief among them being the teaching of critical thinking.

This focus on teaching thinking was also evident with the ninth-grade teachers in the ethnography, who stressed the cognitive activities underlying the writing process. When they provided for their students to receive response during the writing process, they defined the writing process not merely as a set of procedures involving planning, writing, and revising; but they focused on the problem-solving necessary to carry out those activities successfully.

In the survey the teachers felt strongly that response given to students during the writing process was significantly more important to their learning than response provided to final versions. The students felt just the opposite--they valued most written comments on their final versions.

The teachers in our ethnography provided response almost
exclusively during the writing process and an analysis of students' values within the institution of schooling may give some clues to this difference in the surveyed teachers and their students. Essentially, the students are oriented toward getting good grades with little effort; they care most about the final evaluation. The teachers are oriented to helping their students learn; they care most about the teaching-learning process itself.

Most interesting is the least successful student, the one who is not pleasing the teacher, who knows least well how to get by in school. These students, like Rhonda and Derek in our study, ironically may have difficulty in part because they don't know how to make school easy for themselves; on the surface they do not please the teacher but on the deepest level, they are sometimes thinking in ways that the teacher wants. Derek is not making oversimplified rules about "what's right"; although he is influenced by the peer culture to "make it easy" and not gather the information he needs to write a successful piece. Rhonda engages with Mr. Peterson's comments, learning from those that she can and thinking and sometimes rejecting those that do not make sense. Her lack of conformity to the institutional deadlines, however, makes her miss valuable instruction and leads her to misunderstandings.

Of further interest is the fact that the teachers in the survey disagreed with each other about the types of response that were most helpful to students during the process. This aspect of response, judged most important, may also be the most difficult to accomplish. Certainly the profession is full of debates about what it means to "teach the writing process."
The teachers in the ethnography had different approaches to "teaching the writing process" which may shed some light on the disagreements that surfaced in the surveys and which point toward what we think is an unresolved debate in the profession. Although both teachers focus on cognitive processes, they take their students on different routes. We have labeled Ms. Glass's route the "guided discovery approach" and Mr. Peterson's the "master-apprentice approach." Ms. Glass relies on teaching her students to label their activities, to become consciously aware of them. Mr. Peterson soaks his students in activities that will help them "intuit" what good writing is, that will help them feel it in their "gut."

To achieve her end, Ms. Glass relies on making her students independent; they learn processes which they apply to their writing collaboratively with one another, to each other's writing in whole-class collaborative problem-solving activities, and then independently and with their peers to their own writing. They must transfer concepts to their texts and they are "guided" in doing so. They practice responding to one another; even though Ms. Glass gives the grades, the students give their own self-assessments. Mr. Peterson relies on small group problem-solving activities and the writing of practice texts on which he collaborates with the students as individuals, in small groups, and in class. In addition, he and the individual students also work together on their writing; they practice writing and he models response. Both approaches seemed equally successful in the classroom context. We do not know whether one or the other
In the survey, the teachers and students preferred individualized, oral response from the teacher, that is one-to-one conferences. However, given the institutional constraints of the school, most teachers in the survey had difficulty providing as much of this type instruction as they would have liked. One of our two teachers, Mr. Peterson, relied a great deal on one-to-one instruction. He managed by having brief conferences, during the process, after he had read student drafts. The conferences generally focused on helping the students understand how to apply a general point he was making about how to think deeply about a character to their own piece of writing. They often supplemented and expanded written response. Both teachers also gave individual instruction "on the fly."

The teachers in the survey and in the observational study had a clear sense of what they were teaching and why. However, there was little evidence that they felt that they could depend on their students coming into their classes with already learned skills in writing, beyond the most mechanical; and there was little evidence that they felt the students would build on what they were learning in future classes, in any specific ways. Both teachers were involved in curriculum reforms at their schools, but during our observations, we saw little evidence that they depended on the curriculum outside of their class. The students, too, seemed to feel that they had to adjust to each teacher individually.

Although we have learned a great deal about successful response, our concern is that successful teachers cannot continue
to work in isolation if we want to see lasting changes and substantial improvement across time in student writing. These teachers are doing their share, but as a profession, we must learn from them to develop ways for writing teachers to coordinate their efforts.

Dear Gene:

During this 1983-1984 school year, the National Writing Project is participating in a research study of how the best teachers in the nation help young students acquire expository/argumentative writing skills. Sarah W. Freedman, Associate Professor of Education at the University of California, Berkeley, and Associate Director of the National Writing Project, is the principal investigator and director of the research project, and Miles Myers, Administrative Director of the National Writing Project, is the associate director. The purpose of the project is of great importance to the National Writing Project at this time. We have, I think, identified some critical strategies of the writing process in general and established a twofold purpose for writing in schools, both for communication and for thinking and discovery, but I think we now need to turn our attention to some of the specific problems which trouble the profession and public observers of the schools. One of these problems is the teaching of exposition. We are particularly interested in the way the best teachers introduce exposition in the early stages of acquisition.

Sarah and Miles will be contacting you about the need for the following information:

1. The names and addresses of six outstanding teachers of writing: 2 elementary, 2 junior high (7-9), and 2 senior high (10-12). These teachers will be asked to complete a survey on the types of writing they teach and some of their practices. You will be asked to help encourage the teachers to return the information.

2. Several students in the classes of junior and senior high teachers at each NWP site will be surveyed: a maximum of 4 students in a junior high class and 4 students in a high school class, a maximum of 8 students per local NWP site. 100 NWP sites will be involved in this survey: 8 x 100 = 800 students surveyed.

3. From the 600 teachers who return surveys (6 teachers x 100 sites), the teachers who teach exposition will be asked to complete a second survey. Again, your help with response will be requested if necessary.

Eugene Garber, Director
Capital District Writing Project
Department of English
SUNY - Albany
Albany, New York 12222

October 31, 1983
4. A selected group of teachers and students will be asked to rank, grade and make estimates of instructional techniques on a set of papers.

Sarah will report to the NWP directors meeting in Denver on the details of the study and be available for questions. Each director will be receiving a packet of materials outlining the study and the various surveys. Sarah and Miles will also be calling or writing you, and if you have questions after Denver, call them at (415) 642-4544. In any case, the surveys will not be sent to your teachers until January or February, and the names of your six teachers will be needed by December 2. Use the enclosed form for submitting the names of your six teachers in (1) above. If possible, bring the list of teachers to the NCTE meeting of NWP directors. Thank you for your help.

Sincerely,

James Gray
Director

</table>
You have been identified as one of the most outstanding teachers of writing in your region by the Site Director of your local National Writing Project. For this reason, we are now inviting you, along with other outstanding teachers from National Writing Project Sites, to participate in our National Survey of Excellent Teachers of Writing.

We feel this is a unique project, the first national survey of its kind ever done. We want to learn how excellent teachers across the country teach writing. We believe that by learning about your experience as a teacher and combining it with the experiences of other expert teachers, we will be able to obtain a picture of what the best teachers of writing really do in their classrooms.

Please spend a few moments of your time completing the enclosed survey questionnaire. It will probably take you less than 30 minutes. We know that you are busy, but we believe that your responses as an outstanding teacher of writing will be invaluable to us and to other writing teachers. We are counting on your participation in order to build a portrait of expert practices in the teaching of writing.

We have enclosed a self-addressed, stamped envelope in which you can return your completed questionnaire. We would appreciate receiving it as soon as possible. If you have questions, please contact your Writing Project Site Director.

We are hoping for a 100% response from the excellent teachers who have received the survey questionnaires. We will distribute our findings to your Site Director who will pass them on to you.

Sincerely yours,

Sarah W. Freedman
Principal Investigator
National Institute of Education Survey on Excellent Teachers of Writing
LETTER FOR TEACHERS WHO ALSO RECEIVE STUDENT SURVEYS

You have been identified as one of the most outstanding teachers of writing in your region by the Site Director of your local National Writing Project. For this reason, we are now inviting you, along with other outstanding teachers from National Writing Project Sites, to participate in our National Survey of Excellent Teachers of Writing.

We feel this is a unique project, the first national survey of its kind ever done. We want to learn how excellent teachers across the country teach writing. We believe that by learning about your experience as a teacher and combining it with the experiences of other expert teachers, we will be able to obtain a picture of what the best teachers of writing really do in their classrooms.

Please spend a few moments of your time completing the enclosed survey questionnaire. It will probably take you less than 30 minutes. We know that you are busy, but we believe that your responses as an outstanding teacher of writing will be invaluable to us and to other writing teachers. We are counting on your participation in order to build a portrait of expert practices in the teaching of writing.

We are also asking you to give questionnaires to four of your students. You will find these questionnaires in the four small envelopes which are enclosed. Please hand out these envelopes to the four students you select, according to the instructions on the attached sheet.

We have also enclosed a self-addressed, stamped envelope in which you can return the completed questionnaires, including the envelopes containing the student questionnaires. We would appreciate receiving the completed forms as soon as possible. If you have questions, please contact your Writing Project Site Director.

We are hoping for a 100% response from the excellent teachers who have received the survey questionnaires. Findings will be distributed to your Site Director who will pass them on to you.

Thank you for your cooperation.

Sincerely yours,

Sarah W. Freedman
Principal Investigator
National Institute of Education
Survey of Excellent Teachers of Writing
INSTRUCTIONS FOR STUDENT QUESTIONNAIRES

The four small envelopes in this packet contain questionnaires for four of your students. Please select the four students in the following way:

1. Choose two students who are having difficulty in your writing class and two students who are having no trouble.

2. Select one boy and one girl in each category.

3. Give the two students having difficulty the envelopes with purple writing on them.

4. Give the two students having no trouble the envelopes with black writing.

IT IS IMPORTANT FOR OUR ANALYSIS THAT THESE ENVELOPES NOT BE MIXED UP BETWEEN THE TWO CATEGORIES OF STUDENTS.

5. Have your students complete the questionnaires and allow them to place the questionnaires back into their respective envelopes. Then allow your students to seal the envelopes before returning them to you. WE ARE ASKING YOU TO DO THIS SO THAT YOUR STUDENTS WILL NOT FEEL INHIBITED BY THINKING THAT YOU WILL READ THEIR ANSWERS TO QUESTIONS.

We have enclosed a self-addressed, stamped envelope in which you can return all of the completed questionnaires: both yours and those from each of the four students.

If you have any students who you think will have difficulty reading the questionnaire, please ask someone other than yourself to help these students with the reading.

Thank you for your help.
Dear Colleague:

Besides conducting this survey, in another part of our project we are observing two excellent teachers of writing who are introducing expository/analytical writing to ninth graders. To supplement this observational study, we might like other expert teachers of writing who are especially interested in teaching analytic writing to give us additional information.

If you would be interested in participating in a follow-up survey or interview on the teaching of expository/analytical writing, please complete and return this form.

In order to protect the confidentiality of your survey responses, we will immediately separate this letter from your survey questionnaire.

Yes, I would be interested in participating in a follow-up survey of teaching practices for expository/analytic writing.

Appendix 3
Student Survey

The National Writing Project

This questionnaire is part of a nation-wide survey by the National Writing Project, a group of teachers dedicated to improving the teaching of writing. We have asked your teacher to give this questionnaire to four students. Your teacher will NOT see your answers.

With this questionnaire, we want to learn what you and other students like you think about the helpfulness of various teaching methods.

You can answer most of the questions by CIRCLING A NUMBER. For some questions, you will be asked to give a short written answer.

If you notice a problem with any question, please write us a note beside the question.

Read all directions carefully—ESPECIALLY THOSE IN LARGE TYPE.

When you finish answering all questions, put your questionnaire back in its envelope and SEAL THE ENVELOPE. When you seal your envelope, no one who knows you will see your answers.

All your answers will be strictly confidential.

Project sponsored by National Institute of Education
NIE-G-83-0065
1. How often do you write for this class (either at home or in school)?

0  Never
1  Hardly ever
2  Some of the time
3  A lot of the time

2. How often do you write for this class, compared to your other classes?

1  A lot less for this class
2  A little less for this class
3  About the same
4  A little more for this class
5  A lot more for this class

3. How often do you write just because you want to and not for school?

0  Never
1  Hardly ever
2  Some of the time
3  A lot of the time

4. On the writing you do for this class, what grade do you usually get? Circle the ONE that is most usual for you.

1  A  4  D
2  B  5  F
3  C  6  Other

(please specify):
Please answer these questions about yourself. Fill in the blanks or circle a number.

5. Birthdate: ____  ____ 19____
   Month   Day   Year

6. Grade: ____________________

7. Sex: 1 Male
   2 Female

8. When you graduate from high school, what do you plan to do first?
   1 Go to a four-year college or university
   2 Go to a job training program
   3 Go to a two-year college
   4 Go to work full-time
   5 Go to work and then go to college
   6 Go into military service
   7 Other (please describe): ________________________________
For each of the questions below, circle the number that fits best with the writing you do for this class. CIRCLE ONLY ONE NUMBER.

THANK YOU FOR YOUR HELP
Survey of Excellence in Teaching
The National Writing Project

You have been selected to participate in this survey by the National Writing Project because you have been identified as an outstanding teacher of writing in your region.

With this survey, we want to learn more about how excellent teachers across the country teach writing.

You can answer most of the questions by CIRCLING A NUMBER. In some cases, you will be asked to fill in blanks.

If you notice a problem in any question, please write us a note beside that question.

Read all directions carefully—ESPECIALLY THOSE IN LARGE TYPE.

Because this is the first national survey of its kind ever done, you are making an important contribution to professional knowledge. We appreciate your participation in this study.

All your answers will be strictly confidential.

Project sponsored by National Institute of Education
NIE-G-83-0065
We would like your opinions about the helpfulness of various kinds of responses students get on their writing. How helpful do you think each of the following is for secondary level students? PLEASE CIRCLE THE APPROPRIATE NUMBER FOR EACH QUESTION.

We want to learn about your practices when you teach writing and about the kinds of students that you teach. We will ask you to answer questions No. 5 through No. 28 about ONE of your classes. This class, identified in question 5 below, is selected arbitrarily to enable us to compare your answers with those of other teachers across the country.

5. Please think about your SECOND PERIOD CLASS ON MONDAYS (as you listed it in the chart in question 4). Do you teach writing in this class?

Yes  No

If NO, look at the chart in question 4 for the next class in which you do teach writing. Answer the questions below with reference to that class.

Indicate the period and title of the class you are focusing on.

period  title

6. What is the enrollment in this class? __________

7. In your school, what is the usual enrollment in a class of this type? __________

8. After students in this class leave high school, what percentage of them do you think are likely to get additional education or training? We recognize the exact percentage may be difficult to predict; just give your best estimate of the percentage of your students who are likely to go on to the following levels.

NOTE: YOUR ANSWERS SHOULD TOTAL 100%

No further education past high school.........................................................% [5-7]
Vocational training only.............................................................................% [8-10]
One or two years of college.......................................................................% [11-13]
At least 4 years of college..........................................................................% [14-16]

8
9. Approximately what percentage of the students in this class usually speak a language other than English outside of school?

__________% [17-19]

10. Approximately what percentage of the students in this class come from the following kinds of families?

NOTE: YOUR ANSWERS SHOULD TOTAL 100%

Well-to-do families with few if any financial problems ..................................................... % [20-22]

Families who can afford the basic necessities of food, clothing, and shelter ................................ % [23-25]

Families who cannot afford the basic necessities of food, clothing, and shelter ................................ % [26-28]

[29-39/b]
11. Below are two lists of reasons why teachers ask students to write. Within each list, please indicate the two most important and the two least important reasons for asking THIS PARTICULAR CLASS to write.

**LIST 1**

<table>
<thead>
<tr>
<th>REASONS FOR ASKING STUDENTS TO WRITE</th>
<th>MOST IMPORTANT (Check 2)</th>
<th>LEAST IMPORTANT (Check 2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>To help students remember important information</td>
<td></td>
<td>[40-41]</td>
</tr>
<tr>
<td>To correlate personal experience with the topic being studied</td>
<td></td>
<td>[42-43]</td>
</tr>
<tr>
<td>To test whether students have learned relevant content</td>
<td></td>
<td>[44-45]</td>
</tr>
<tr>
<td>To share imaginative experiences (e.g., through stories, poems)</td>
<td></td>
<td>[46-47]</td>
</tr>
<tr>
<td>To summarize material covered in class</td>
<td></td>
<td>[48-49]</td>
</tr>
<tr>
<td>To allow students to express their feelings</td>
<td></td>
<td>[50-51]</td>
</tr>
</tbody>
</table>

**LIST 2**

<table>
<thead>
<tr>
<th>REASONS FOR ASKING STUDENTS TO WRITE</th>
<th>MOST IMPORTANT (Check 2)</th>
<th>LEAST IMPORTANT (Check 2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>To explore material not covered in class</td>
<td></td>
<td>[52-53]</td>
</tr>
<tr>
<td>To provide practice in various aspects of writing mechanics</td>
<td></td>
<td>[54-55]</td>
</tr>
<tr>
<td>To force students to think for themselves</td>
<td></td>
<td>[56-57]</td>
</tr>
<tr>
<td>To clarify what has been learned by applying concepts to new situations</td>
<td></td>
<td>[58-59]</td>
</tr>
<tr>
<td>To teach students the proper form for a report, essay, or other specific type of writing</td>
<td></td>
<td>[60-61]</td>
</tr>
<tr>
<td>To test students' ability to express themselves clearly</td>
<td></td>
<td>[62-63]</td>
</tr>
</tbody>
</table>

PLEASE BE SURE YOU HAVE 8 CHECKS ON THIS PAGE, 2 FOR EACH COLUMN OF EACH LIST.
12. In your TOTAL WRITING CURRICULUM for THIS SAME CLASS, approximately how much of your focus is on each of the following types of writing? CIRCLE THE APPROPRIATE NUMBER FOR EACH QUESTION.

<table>
<thead>
<tr>
<th>Writing for oneself (lists, journals, diaries)</th>
<th>NONE</th>
<th>A VERY MINOR %</th>
<th>LESS THAN HALF</th>
<th>ABOUT HALF</th>
<th>MORE THAN HALF</th>

</thead>
<tbody>
<tr>
<td>Writing to correspond with others (letters, dialogue journals)</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>Writing to convey personal experiences (nonfiction personal narratives)</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>Writing to provide an aesthetic experience (poems, plays, short stories)</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>Writing to discover or generate ideas (free writing, learning logs)</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>Writing to present facts or events (book reports, news reports, short research reports)</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>Writing to analyze and synthesize ideas (critical or persuasive prose, literary criticism, longer research papers)</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>Other kinds of writing (please specify):</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

50
13. How much time does a student have to work on a typical writing assignment for this class? 

   ____ ____ days  

[73-74]

14. In your LAST MEETING with this class, did your students do any IN-CLASS writing? 

   Yes  No  

   1  2  

[75]

If YES, which of the following did they do? 
CIRCLE ALL NUMBERS THAT APPLY.  

   1  Copying, note-taking, or sentence-level exercises  

[76]

   2  Up to 250 words (one page)  

[77]

   3  251 to 500 words (one to two pages)  

[78]

   4  501 to 1000 words (two to four pages)  

[79]

   5  Over 1000 words (more than four pages)  

[80]

15. Are students in this class NOW working on any piece of writing AT HOME? 

   Yes  No  

   1  2  

[1]

If YES, which of the following are they doing? 
CIRCLE ALL NUMBERS THAT APPLY.  

   1  Copying, note-taking, or sentence-level exercises  

[2]

   2  Up to 250 words (one page)  

[3]

   3  251 to 500 words (one to two pages)  

[4]

   4  501 to 1000 words (two to four pages)  

[5]

   5  Over 1000 words (more than four pages)  

[6]
The following questions concern your teaching techniques in THIS SAME CLASS. We are interested in learning the extent to which you use different techniques. Please CIRCLE THE APPROPRIATE NUMBER FOR EACH QUESTION.

<table>
<thead>
<tr>
<th>Question</th>
<th>ALMOST NEVER</th>
<th>SOMETIMES</th>
<th>OFTEN</th>
<th>ALMOST ALWAYS</th>
</tr>
</thead>
<tbody>
<tr>
<td>16. When a topic is introduced, how often is there in-class discussion (whole class, small group, or individual) about it before students begin writing?</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>17. How often do you use examples of professional writing to help these students improve their writing?</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>18. For each writing assignment, how often do you try to make these students aware of the audience(s) for whom they are writing?</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>19. When responding to problems in the writing of these students, how often do you focus on a selected few of their problems?</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>

<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>
We need to gather background information about your school in order to compare teaching situations in different settings.

29. Which of the following best describes the area in which you teach? CIRCLE THE APPROPRIATE NUMBER.
   1. Rural (open country, not in a town)
   2. Small town which is not part of a large metropolitan area
   3. Suburb in a large metropolitan area
   4. Central city of a large metropolitan area
   5. City which is not part of a large metropolitan area
   6. Some other kind of place (please describe): ____________________________

30. In what kind of school do you teach? CIRCLE THE APPROPRIATE NUMBER.
   1. Public
   2. Private, non parochial
   3. Parochial

31. What are the grade levels at your school? Grade ______ through grade ______

32. Approximately how many students are enrolled in your school?

   ____________ students

33. What is the normal class load each term for a teacher at your school?

   ____________ classes

34. Sex: 1 Male 2 Female

35. Year of Birth: 19____

36. How many years of full-time classroom teaching experience have you had (including this current year)? ____________ year(s)
37. What was your undergraduate major? PLEASE CIRCLE THE APPROPRIATE NUMBER.

1 Education
2 English
3 Math or science
4 History or social science
5 Foreign language (please specify):
6 Other (please specify):

38. Have you completed a master’s degree (MA, MAT, MS, MEd)?

1 Yes
2 No

If NO, are you working toward this degree?

1 Yes
2 No

If YES, what is your specialty? PLEASE CIRCLE THE APPROPRIATE NUMBER.

1 Education
2 English
3 Math or science
4 History or social science
5 Foreign language (please specify):
6 Other (please specify):

39. Have you completed a PhD or EdD?

1 Yes
2 No

If NO, are you working toward this degree?

1 Yes
2 No

If YES, what is your specialty? PLEASE CIRCLE THE APPROPRIATE NUMBER.

1 Education
2 English
3 Math or science
4 History or social science
5 Foreign language (please specify):
6 Other (please specify):

40. Please use the space below to tell us about any other experience or training that you feel has been helpful to your preparation for teaching.
Thank you for getting this far. Please answer these last few questions so that you can help us complete our picture of expert teaching.

41. You were selected to complete this questionnaire because you are considered an outstanding teacher of writing. What do you think makes you so successful?

42. What advice would you give other teachers of writing to help them become more effective?
43. One of our main interests in this survey is to find out more about how expert teachers respond to student writing. Can you give us any additional insights on the topic of response to student writing that you think might be helpful to other teachers of writing?

44. Do you have a copy or description of a favorite assignment? If so, we would appreciate your including a copy or description of it in the packet in which you return this questionnaire.

45. Do you have an outline or any other information concerning the goals of the class on which you focused in questions 5 through 28? If so, we would appreciate your including a copy (or copies) in the packet in which you return this questionnaire.
46. Is there anything else you would like to tell us about how you teach writing or how you think it should be taught?

THANK YOU FOR YOUR HELP.
Student Survey

The National Writing Project

This questionnaire is part of a nation-wide survey by the National Writing Project, a group of teachers dedicated to improving the teaching of writing. We have asked your teacher to give this questionnaire to four students. Your teacher will NOT see your answers.

With this questionnaire, we want to learn what you and other students like you think about the helpfulness of various teaching methods.

You can answer most of the questions by CIRCLING A NUMBER. For some questions, you will be asked to give a short written answer.

If you notice a problem with any question, please write us a note beside the question.

Read all directions carefully—ESPECIALLY THOSE IN LARGE TYPE.

When you finish answering all questions, put your questionnaire back in its envelope and SEAL THE ENVELOPE. When you seal your envelope, no one who knows you will see your answers.

All your answers will be strictly confidential.

Project sponsored by National Institute of Education
NIE-G-83-0065
1. How often do you write for this class (either at home or in school)?
   0 Never
   1 Hardly ever
   2 Some of the time
   3 A lot of the time

2. How often do you write for this class, compared to your other classes?
   1 A lot less for this class
   2 A little less for this class
   3 About the same
   4 A little more for this class
   5 A lot more for this class

3. How often do you write just because you want to and not for school?
   0 Never
   1 Hardly ever
   2 Some of the time
   3 A lot of the time

4. On the writing you do for this class, what grade do you usually get? Circle the ONE that is most usual for you.
   1 A
   2 B
   3 C
   4 D
   5 F
   6 Other (please specify): ___________________________
Please answer these questions about yourself. FILL IN THE BLANKS OR CIRCLE A NUMBER.

5. Birthdate: _____ _____ 19_____  
   Month   Day   Year  

6. Grade: ________________________  

7. Sex:  
   1  Male  
   2  Female  

8. When you graduate from high school, what do you plan to do first?  
   1  Go to a four-year college or university  
   2  Go to a job training program  
   3  Go to a two-year college  
   4  Go to work full-time  
   5  Go to work and then go to college  
   6  Go into military service  
   7  Other (please describe): ________________________________

31. When you are trying to learn to write better, what helps you most and why?
32. Please use the space below for any other comments you would like to make.

THANK YOU FOR YOUR HELP
We are writing to let you know that we have sent the questionnaires for the National Survey of Excellent Teachers of Writing to the teachers you recommended. We have sent additional questionnaires to one of the junior high and one of the senior high teachers for some of their students. We are enclosing copies of all questionnaires so that you will know exactly what the teachers received.

We would very much appreciate your checking with these teachers as soon as you can, to make sure that they have received the questionnaires and returned them to us. For your reference, a copy of the list of names you sent us is enclosed.

If you or your teachers have any questions, please contact Charles Underwood, Leann Parker, or me at (415) 642-7005 or (415) 642-0963.

You will receive a summary of the results as soon as they are available. Again, thank you for your help.

Sincerely yours,

Sarah W. Freedman
Principal Investigator
National Institute of Education Survey of Excellent Teachers of Writing
TO: NATIONAL WRITING PROJECT SITE DIRECTOR  
FROM: Jim Gray, Sarah Freedman, and Miles Myers  
RE: N.I.E. RESEARCH GRANT INVOLVING NATIONAL WRITING PROJECT SITES  

URGENT REMINDER  

Recently, we asked you to submit the names of 6 of your most outstanding teachers of writing: two at the upper elementary level (grades 4-6), two at the junior high level (grades 7-9), and two at the senior high level (grades 9-12). As we noted, these teachers will become participants in our survey of the practices of excellent writing teachers. We still have not received your list.  

We feel that it is of utmost importance to the project to describe what the best teaching of writing looks like. We therefore need the names of teachers from all of the sites of the National Writing Project.  

We urgently need your cooperation.  

Again, if you have questions call Sarah Freedman at (415) 642-0963.

SURVEY EDITING

1. Use green felt tip pen for editing
2. Write MD for missing data.
3. No fractional data—round off to integers, as follows
   Elementary          Secondary
   #12—round down     #33—round up
   #13—round down     #7—round up
4. Force "other" in demographic question into a legitimate category where possible.
5. Code secondary questionnaire pages 6–7: "class title" as follows:
   1 = English, writing, reading
   2 = Social studies or history
   3 = Science
   4 = Math
   5 = Foreign Language
   6 = Other
6. Questions #36, 37, 38 elementary and #37, 38, 39 secondary: if 6 is marked, leave as is if writing related. Write in a category 7 for any other, unrelated subject.
7. Where "yes" or "no" is unmarked on questions 13 & 14 of elementary survey and questions 14 & 15 of secondary survey, but teacher goes on to circle descriptions of assignment, mark "yes" category.
8. Question #32 of elementary survey: consider question to be asking number of students in class. Mark as missing data if entry is "one."

STUDENT SURVEYS

1. Question #4—round down if "other"
2. Question #5—MD if year is 1984.
FURTHER GUIDELINES

1. Pick up questionnaires daily from BAWP office.
2. Write site code number and "El" or "Sec" on each piece of data.
3. Proof each questionnaire and then file in labeled boxes.

SURVEY EDITING

1. If there is a range, use the middle, e.g. 26.5.
2. If two numbers are circled:
   -if there is an arrow or some other indicator, choose the higher.
   -if there is no indicator and numbers are on both sides of mean, mark as missing data.
   -if marks are on same side of mean, select the one closest to the middle, rather than the extremes.
   -for questions that allow more than one answer, do nothing.
Appendix 6

Philosophies of Teaching: Mary Lee Glass and Arthur Peterson

Following is a statement from each teacher gathered after the observational part of the study was complete about their theories of the role of response in the teaching of written language. Although we gathered much of this information from them in our interviews with them when we were selecting teachers, we did not ask them to write these pieces until after we had collected all of our data. We did not want to make them unduly self-conscious about their teaching and our observations.

Mr. Peterson, discusses a type of response that occurs earlier in his semester, dialogue writing, that is crucial to his setting up of his teaching and that we do not analyze at any other point, because it did not occur during our observations.
Discipline, Delight -- and Fishing

Mary Lee Glass

Writing a statement about my philosophy of teaching writing gave me more than the usual amount of grief produced by that type of assignment. After all, it was summer, and what I wanted to do was sit on the balcony in the morning sun and wade through the stack of best-sellers piled up on my bookshelf. Thinking is definitely not part of my summer routine. In desperation, I even dragged out old papers, written for a variety of courses and audiences. Surely I must have said something worth noticing somewhere along the way, but they were a disappointment. They were out-of-date, dry, pedantic, overdone; none of them reflects exactly what goes on in my classroom right now or will in another few weeks.

In those tired, recycled papers, which I must remember to tell the next kid about when he tries to recycle a paper for a new assignment, only very little says anything about what my philosophy of teaching writing is right now, for teaching and learning writing are now, immediate, today, sometimes accidentally or serendipitously coincidental with so many other things -- the time of day, the season, the mood of the teacher or the kids, whether I'm rushing to catch a plane or worried about a parent conference, whether they had breakfast, whether what has been eluding them and me comes at me from a new angle as I walk in the door or a kid says something I didn't expect. Maybe the reason no one has yet produced a perfect "canned" workbook or program or textbook to teach writing, at least for me, is that the discipline is too varied, too individual, absolutely dependent on the uniquely human elements of the moment to be caught and marketed. Oh, we can talk about it, around it, suggest strategies, but that most human capacity, communication, in its most enduring and artistic form, writing, is not the stuff of which computer programs are easily, or perhaps ever, made.

But besides the elements of spontaneity and individual personalities, we must also consider the factors of calculated design and inexplicable hope in the teaching of writing, which is more than a little like fishing. The teacher must develop incredible patience, sitting or standing there while nothing visible happens -- the bait isn't visibly taken, the water remains still, unrippled, undisturbed, for hours, days, weeks, months even. In fact, it is an absurd act of faith even to toss out the bait -- we don't know if there's anything in there, we certainly don't know if it's hungry for the bait, and we can't predict when and if it will bite, how big it is, whether it's worth the tedious, repetitive, sometimes exhilarating effort of waiting. But the fact is that the fisherman, like Hemingway's Old Man, with memories or visions of catching the big one, with interminable schemes for how to bring it off, goes on dangling the bait, waiting them out, hoping against reason for a hit, and so does the teacher of writing. As I sit here thinking how easy it became to play out this statement once I had found the

metaphor, I remember how quickly some kids get inside the discipline of writing once they have "taken the bait," but how hard it is for others to find it in their own time and their own way, and how crucial for the teacher to devise the tactics, the times, the activities for all of them to do it.

The difficulty of developing the timing, of planning the strategies and knowing there will be results if only we are patient enough -- those are the challenges. For the teaching of writing must involve a wide range of experiences which encourage the beginner, or the expert, to learn to generate, collect, and articulate his thoughts and words, to organize and arrange them, revise and refine them and to evaluate the product before beginning the next excursion. We must find ways to develop the skills and capitalize on the talents, facilitate the craft and encourage the art, untangle the awkward and refine the florid, unleash the inarticulate and redirect the gushing. Not easy jobs, those, but they are what the teacher of writing to adolescents must be about.

The act and art of writing, for those students who will eventually learn to control it, even better to master it, must, then, become like Proteus a creature of many forms and shapes. Writing is practice -- frequent, varied, repetitive, unthreatening, developmental, exploratory, sometimes inconsequential, or, horrors, even fun, but never entirely unimportant. Children and adults learn to do everything better by practicing, from speaking to tying shoes to cooking souffles to controlling tennis lobs to manipulating computer programs. Most who improve at anything must pass the tedium of practice to discover the delight of accomplishment, and they pass that barrier often by finding out that practice is easy, fun, non-fatal, and necessary. Yet for so many years most of us neglected the idea of practice in the realm of teaching writing. Oh, we made them practice HANDwriting, those interminable exercises of concentric circles perfectly spaced, but we expected them, then, to know how to WRITE. That's about as clever as expecting the kitchen novice to execute a perfect souffle after you've taught him to beat the eggs. How can we expect children to learn their way into thinking coherently, expressing themselves effectively, speaking with authority and voice and transitions, polishing with grace and art, if all we have done is talk about writing, about topic sentences, about paragraph structure, but we have not practiced? Practiced what? All of it -- saying it, seeing it, saying it better, trying it out on others, becoming aware that we hear when one phrase says it better, learning that making mistakes is not only not fatal but necessary to becoming better.

This is not to say, though, that practice is quite the same as drill. We have all endured drills -- workbook lessons where we fill in the blanks, repetitions of piano scales or multiplication tables or vocabulary words. Practice in writing must go beyond that, although there are, certainly, those elements of drill and repetition in it. The practice exercises must be varied, timely, must find new angles into the corners of
the learning processes, must become, if necessary, spontaneous responses to unexpected or predictable situations and reactions if they are to capitalize on each child's readiness and receptiveness, his willingness to take the bait. And in making a typographical error the first time I wrote that statement, I remembered that he must learn, too, to take the bit, for writing remains always a discipline as well as a creative inspiration. Only when the student learns that he or she must endure the practice to experience the art, must surpass the tedium to know the triumph, to care about how it is said as well as what is said, only then does he or she begin to understand the reason for all that practice, and, what's more, to use what he or she has labored to learn. And finally, as the pianist and baseball player know perfectly well that not every practice is evaluated with a recital or a championship, so must the student writer learn that although evaluation is essential, that evaluation of practice writing is not always the reward or intimidation of a grade from the teacher.

For, simultaneously with practice, the student or writing must learn to evaluate -- his own, her peers', the masters' writing. And in that fact lies yet another dimension of practice and dilemma for the teacher of writing, for he must, like coaches and drill sergeants and counselors, be all things at the right time to all students. Some coaches produce winning teams by badgering and intimidation, but the danger there, with adolescents learning to write, is frightening them off with criticism before they ever find out they have something to say. Some piano teachers succeed by working meticulously on fingering and metronome-perfect rhythm exercises, but the danger there for the writing teacher is losing the art and excitement and inspiration of writing in the tedium. Some teachers of writing see their job as that of preserver of the language and corrector of the errors, but they often wear out themselves and their students before anyone has discovered that he or she can write.

The trick, then, is to find ways to allow students to evaluate their own work, for, after all, they will be on their own when they leave a particular classroom and must succeed or fail in the next writing situation on their own, just as any pianist or ballplayer must take practiced skills to the next audition or tryout. Clearly, evaluation must become an automatic part of the practice, an informal exercise in expression and revision as well as the formal statement translated into a grade at the end of the quarter, an easy and comfortable and non-threatening part of the process of growth and thinking, an acknowledgement that we can all see and hear and judge what is "better" rather than depend entirely upon the teacher who grades the paper to tell us how good it is. If as a result teachers must give up reading everything the student writes, and, rather, let the students do much of that reading and evaluating, so much the better. No, I did not say give up reading papers entirely, for the teacher cannot lose track of where the students are, but we cannot, and we should not, expect them to learn to write better if we are the only ones in the class whose responsibility
it is to evaluate.

If the practice and the discipline and the evaluation are the "how," then discovery must be the "why" of teaching writing to adolescents, for that is where we want them all to arrive in the end. They must discover first that they have something to say, and waiting for or motivating them to find it or care if they do is often the most difficult part of the entire fishing expedition for the teacher and takes every weapon -- or should I say bait or lure? -- in the teacher's box. If they do discover they have something to say, they must also discover that it matters how they say it, how they arrange it effectively and persuasively, and how they polish and revise and reshape it so that it says best what they intended. But most important, if the discovery of what we have to say leads us to explore our thinking, to uncover new ideas or relationships or insights that we had not seen before, that, I think, is the "big one." There can be no more exciting reward to the teaching of writing than to know that it led the student to discover something for himself or herself. Those discoveries do not come often, they are often quite small and quiet, but the process of discovery and consequently of learning is central to what is human and intelligent. Students must learn to ask questions, to explore and articulate thoughts, to postulate and revise answers, to develop reasons, in short, to think. Once they have discovered the ways to do those things, when they write they share a little of that which is uniquely theirs with others with whom they have the human condition in common. How exciting to have the confidence and the impulse to do that -- and what a major task for the teacher of writing to create the conditions under which that exchange occurs.

Of course, as lovers of language and literature, we would like our students to go one step further and say those things artistically or at least to recognize when they or someone else has said something well. Therein lies the last bit of what we would like to happen if this were the best of all possible worlds and if we were so lucky as to succeed with every student in every class. Unfortunately, we must also confront the fact that some will try but never arrive at that end, some will arrive easily and never know how much further they might go, and still others will live their lives quite happy and fulfilled without ever knowing the delight of a phrase well turned. But most of us go into the business of teaching writing with more modest ends than turning out clones of Shakespeare or Fitzgerald or Twain and find it quite taxing enough to help them discover they have something to say, hear that some say it better than others, articulate what they have discovered about their thinking, and explore some ways to say it effectively. The goal of encouraging adolescents to write artistically is a worthy one but probably far off for most, of little interest to all but a few, but the teacher of writing must encourage, cajole, perhaps even trick them into trying, if, finally, we want it all to be anything other than a series of dull practices and pointless drills.
If all of these seem rather grand goals for the teacher facing a class of thirty or thirty-five kids on Monday morning, so be it. I must confess they are not goals which I repeat to myself every morning as the alarm goes off at six or as I race to my first class at 7:59. But they are principles which are beneath the surface, like the fish I'm going after. Or perhaps they are the currents, the tides, the hidden power of the ocean of human expression. Without commitment to something like those principles, I'd be adrift in a sea of awkward expressions and red ink, disinterested kids and misinformed parents, media-mangled language, grammar-happy administrators, and boring papers. And that is not, thank you, a fishing expedition I care to take on.
Finding a Focus: Structure and Sequence

Mary Lee Glass

The Advanced Communication class which was the subject of a study of teaching expository writing to ninth graders was a new course in our curriculum, at least under that title. In that new course, however, we incorporated the same principles and focus I have used previously in teaching exposition to younger students. The major difference was that the course focused on two subjects our department had never before isolated in a separate course: writing and speaking. The semester-long course emphasized principles applicable to both means of communication: generation, development, and organization of ideas; focus and purpose; voice and audience; practice, revision, and evaluation. In fact, while we had planned the course to focus on those processes and principles, all of us who taught the course discovered some things we should have known before when we rediscovered how easy it is to teach all modes of communication at once; in fact, some of the "drudgery" of teaching exposition disappeared in the dual focus, for the variety provided by the speaking activities correlated with and reinforcing the writing assignments was an unexpected bonus in the pacing and interest level of the class.

The sequence of writing assignments was based loosely on a variety of sources and teaching experiences: Moffett, Macrorie, Bay Area Writing Project, and nearly twenty years of struggling with the problem and with the particular nature of students at Gunn High School, an affluent, academically-oriented school community. In general, the assignments were designed to move younger, egocentric ninth graders from that which is most interesting to them -- themselves -- to that which they express freely but often don't know how to examine -- their opinions. In other classes, I have begun with a personal writing assignment to develop both confidence and interest; in this class, we began with an interview assignment because of the oral part of the course, one step removed from the "self" but of equal interest because ninth graders are social, conscious of their peers, interested in talking.

The major problems identified by students in working their way through the interview were those of finding a focus and collecting enough information, both problems central to any beginning piece of expository writing. Students had to learn how to ask good questions, how to elicit sufficient information and detail, how to find a focus so that the paper did not become a boring, chronological list of facts, how to return for more information, how to make what, in some cases, seemed a dull person into something interesting enough to read about. They also experimented with voice, some taking on the guise of chatty sports columns, others becoming news reporters, others resorting to the first person because it was all they could handle.
From this assignment, students moved to a more difficult one in terms of collecting information and focusing it into a coherent whole, often finding it necessary to manipulate a variety of data -- sensory details, memories, interviews, descriptions, events -- in the "S-S" report, my version of what Ruby Bernstein introduced participants in the first BAMP summer session to as the "saturation report." My directions are much more explicit than those she gave us -- younger kids couldn't handle the assignment when I tried it her way, but they could handle it, and did, when I became more specific about what I directed them to use and look for. The object of the assignment was first to observe in detail, take voluminous notes, revisit, collect so much information as to be "saturated," and then to find a focus, select and discard, give some shape to that which was overwhelming, bulky, shapeless. Those students who followed directions, with frequent checking, and took pages and pages of notes found it a challenge to find a reasonable focus, but they wrote good papers and learned a good deal about generalization, organization, and transitions in the process, although I doubt we used those terms as they were working. Those who took superficial notes in one or two five- or ten-minute visits quickly discovered that they had little to say and their papers were dull. So much for lectures about support, detail, development, etc. etc. etc. Given the volume of information, the need to struggle with focus, students were ready to move on to "plan" -- my shorthand for identifying before one starts the major parts of the paper. Some who are clever enough will see in that Plan the renaming of the five-paragraph essay, but the fact is that kids don't know how much they need or how to deal with it unless they have some guidelines, the more concrete the better. They bite off too much or too little, they lose a sense of focus and purpose and drift into narration -- and a simple plan built into the focus sentence is a way to provide both a clear direction and a map of whether one has really figured out what he or she has to say. The challenge, of course, is to push them to name the parts of the paper in the plan rather than to write all they have to say about the subject in the focus sentence, but the result of struggling with that part of the process of abstracting and articulating an idea and its parts is necessary to making progress toward exposition and persuasion.

The final assignment in the sequence was an "opinion" paper, one in which students were asked to identify an issue, "local" rather than "global," about which they had an opinion they thought someone else should listen to. The assignment is meant to build on the lessons of the first two: identifying a subject, collecting information and detail from a variety of sources, clarifying a focus and developing a plan, with the added dimension of turning the detail toward showing "why" one's opinion is valid. That, obviously, is the hardest job of the sequence. Younger students may find it easy to identify a focus, on the subject of required physical education or a longer school day, for example, but difficult to go beyond what "is" to why "required courses" or "longer days" are good or bad. The lesson, then, becomes a matter of pushing students to examine what they
think and how their experiences and those of others relate to why
they think so. Some could go only as far as finding a focus on a
subject; others were able to find a focus and develop a tentative
plan; and some were able to push the plan of a paper's paragraphs
to articulating reasons and seeing how the parts of the puzzle
lead one to a strong statement of opinion with some punch in it.
Not all reached that goal, to be sure, but many had a glimmer of
an idea that will begin to make some sense to them as they go
about dealing with expository writing the next time from another
teacher. And that is really all I can expect them as ninth
graders, to do.

Along with these written assignments, oral assignments led
students to consider, though I never labelled them explicitly,
some of the same principles of rhetoric -- persuasion, audience,
voice -- as they developed commercials and free speech messages,
learned the difference between "once" and "always" in using
examples, explored "showing" and "telling" and their effect on the
reader or listener. Practice exercises encouraged them to work
with both memories and observations and to learn when they had
been specific and detailed and when they had not. Others were
designed to help students figure out when they had a focus and
when they simply were swimming in the haze, when they had thought
about what they said and when they had not.

Ninth graders who are just beginning to discover the world
of thought and ideas are not ready to cope just yet with advanced
theories of discourse and persuasion, but they do have opinions
and lots of ideas waiting to be explored. Before they can
generate and manipulate some of those ideas effectively in a
piece of expository writing, they must learn some simple but
useful strategies for attacking a very big subject. The juggling
act for the teacher, then, becomes identifying the parts without
losing sight of the whole, providing some form that does not
become formula, structuring the options without cutting out
choices and possibilities. No small tasks, those, but then
neither is anything else about teaching.
I have made up my mind on the subject of that old chestnut question, "Is it possible to teach writing?" The answer is, "Yes, but not everyday to everybody." Twenty-two years of classroom experience have humbled me. I have learned that the act of writing summons so many different skills and is so much the product of our students' needs, experience, and even biорhythms, that our chance of connecting with an individual student at any moment is a bet against the odds. However, in recent years, with the help of the Bay Area Writing Project, I have been able to sort out some sound principles for the teaching of writing. In this paper I wish to describe some ways I have converted valid academic theory to realistic classroom practice, particularly as these techniques relate to response to student writing. I wish to consider five areas: (1) responding to free writing; (2) structuring free writing responses to lead students toward exposition; (3) developing a response style; (4) using peer response groups; (5) teaching correctness through response.

Responding to Free Writing

Some truths about teaching and learning writing seem so simple-minded they are embarrassing to recite. For instance: Students learn to write by writing. What could be more obvious? Yet, for years I ignored this truism. I filled class periods with lots of talk about writing but very little writing. We would begin to write, (I seemed to be saying) when we learned to write better. This idea only sounds like it comes from Joseph Heller.

The Bay Area Writing Project helped me to reform. I began to see that if students write each day the process of writing, however painful, begins to feel natural. There may be no way to relieve the agony that comes with sorting out jumbled ideas. However, with practice, this process comes to be understood as a prelude to the emotional rush that accompanies an idea clearly expressed. The Writing Project made me understand that learning to write is not like learning to hang glide. The hanglider needs to learn all of the "dos" and "don'ts" before he puts on wings and tries to fly. But a writer can only learn to write by practicing, and he needs to understand that, in writing, no crash is fatal.

So with a tenth grade class I began to experiment with daily 10 minute free writings, usually a response to a word rich in connotations: popcorn, red, stairs. Students wrote reams, energetically, enthusiastically, often continuing to develop outside of class writings they had begun in class. Then one day a student asked the question I had been avoiding: "What are we going to do with this stuff?" In the years since, I have worked out several answers to this question.
First let me consider the answer which, while intellectually defensible, has, for me, been impossible. I could have said, "Nothing. We are going to do nothing. If you've written something you'd like me to read, I'd be pleased to read it. Maybe you'd like someone else to read it, but, for me, when you've written it, you've done it. What anyone thinks about what you've written is irrelevant. You learned from the act of writing." Unfortunately--or not--my intellectual baggage did not allow this response. I have learned that in school students produce work to be evaluated, and, as a teacher, my job is to direct and comment on this production. The no-response response, even to free-writing, has never been an alternative for me.

Another answer, provided I was prepared to take up a monkish life style, was, "I will read everything you write." I tried this for awhile. But after devouring the complete works of each student, I was still left asking, "What do I say about what I have read?" I understood that my options were limited. I could not ask students to write spontaneously, and then comment on their pronoun reference errors or even their deficiencies in logic. Good manners limited me to words of praise ("strong word choice") and an occasional empathetic remark ("This experience must have been very difficult for you.") But after awhile the empathy took on a rubber stamp quality, and the praise, not balanced by negative comments, seemed empty. One lesson American students learn right off is that no one is perfect, and they become suspicious of teachers who tell them they are.

Students expect there will be some difference between school and school vacation, and this classroom without judgments was becoming a kind of Endless Summer. I tried another way; I established student response groups. Each student in the group was to select two of five writings he or she had done during the week to read to the group, a kind of self criticism. The group would then let the student know which of the two pieces they preferred--more judgment. And the student would then give me one piece a week to read, not five.

This was my first experience with student response groups and I formed some impressions which have remained with me ever since.

1. To the students, the judging did not seem to be the core of the experience; it was the sharing that was important. I realized that many of these students had never read anything they had written in school to anyone.

2. As students at this point had no shared criteria for judgment, I did not insist that they give reasons for their preferences. I felt uncomfortable with this loose structure, but, in thinking about it, some ideas emerged that have guided my planning of response group sessions ever since. I came to recognize that sharing and evaluating need to be separated. In this regard sharing writing is not all that
different from sharing anything. If the students had baked chocolate mousses and brought them to class to share, the pleasure of the activity would be considerably dampered if they were then required to judge the texture of each concoction. In section four I discuss ways the sharing function of the response group may be separated from the evaluative function.

Now, with these papers, I saw my job to respond so as to help students develop a common criteria for judgment. I picked sections of papers and read them aloud--a paragraph, a sentence, a phrase. For me, the economy of this technique proved exhilarating. Instead of responding to one student with a few complimentary squiggles which she might or might not take seriously, I now used her successes to help thirty students focus on the qualities of strong writing. I sought out examples of honest expression, personal voice, strong verbs, specific detail, figurative language, uncluttered statement. I did not then, nor have I since, found great gaps between my criteria for good writing and the judgment of the students. The difference between my judgment and theirs is that they know what they like and I have the words to describe why I like what I like.

My goal, then, was to draw from these tentative, unrevised efforts some strong models, and then to describe their strengths. For some students a model is enough. Others appreciate the difference between a well-executed dive and a belly flop, but if they are going to stop belly-flopping they need to analyze the proper dive.

My focus when responding to free writing is on the proper dive, not the belly flop, on what to do, rather than on what not to do. Error finding can come later. It is a rare first draft that is not weighted with unclear statements, sloppy expressions and grammatical illiteracies. A first draft is an easy target, but not worth shooting at. It is easy for a writing teacher to diddle away time in uneconomical, unproductive ways. But it need not be that way.

I have described here one way I have made my response to free writing productive for my students and fulfilling for me. To summarize the key elements:

- students, with the help of a response group, choose from several pieces of writing their "best effort."
- my job is to respond by identifying and describing key elements of writing in these papers.
- this process needs to continue for at least two months, while class activities continue.
Structuring Free-Writing Responses to Lead to Exposition

Let us recall now how we began the free-writing exercises described in the previous section. Free-writings were inspired by a word. The word had to be the right word. Most fifteen-year-olds can write fluently, if not profoundly, about popcorn. Such fluency is not guaranteed when the word is "liberty." The words I choose for these free-writings have an equalizing quality: they are meant to appeal to common experience.

But free-writing assignments may also take the opposite tack. They may focus on a student's special concerns. The teacher's goal now becomes to establish a dialogue with each student. I use this dialogue technique to move students from personal writing toward expository prose.

The dialogue begins on the first day of class: "Write about your name. Where did it come from? What pleasures and problems has it brought you?" I have never had a student who could not write on this subject. When I collect these papers the ball has landed in my court. My job is ask each student a question, based on my reading of his response, that he will be able to answer during the ten-minute free writing period on the next day. If a student mentions he was named for an uncle he does not much like, I'll ask him what qualities the uncle has which irritate him. If the student then writes that the uncle talks but never listens, I'll ask if he knows others who do not listen and what he would like to say to them were he to get their attention.

Each day the student responds to the question, writing steadily for ten minutes, repeating the last word he has written when he becomes blocked.

For the teacher the challenge in this exercise becomes to motivate and direct the student. The process is a time-consuming one: two minutes per paper for twenty five students adds up to close to an hour. But the results of this exercise may be extraordinary. The teacher finds out how students are different: which of them sleep four to a bed room and who has a horse of her own. The student has a sense that the teacher is taking a personal interest in him, and as a writer he is moved to try his best.

But in addition to these affective results the teacher, who now knows what the student knows and cares about, is able to move the student from personal response to a more generalized consideration of his concerns. The student who is perceptive enough about communication skills to recognize that his uncle never listens, might be able to discuss some other ways communication breaks down, supporting his generalizations with examples from his experience.

The process of daily question, daily writing, needs to continue for at least a month to be effective. The goal may be an expository essay generated by the student's knowledge,
interests and concerns.

**Developing a Response Style**

We now move to another question: What kinds of written teacher responses are appropriate when student writing becomes more than an exercise in fluency? I've found the traditional method of response—meticulous correction of errors and an evaluative grade—seldom works. There are several reasons for the failure of traditional response:

1. Students seldom understand what the marks mean. On a returned paper "Pr. Ref." and "SF" appear to students as a kind of foreign language.

2. As, normally, the marked papers have been graded students are not motivated to study and learn from the markings even if they do understand them. Some few students are mature enough in their study habits that they can sit down with a "C" paper, study the mistakes, and resolve not to make these same errors again, but these students are a rare breed.

3. Even if a student is motivated to learn from his mistakes the process of "correct" writing is such a complicated one for the beginning writer that to learn from a specific modification mistake in one paper so he does not make the same mistake in the next paper assumes a talent for extrapolation that goes far beyond the maturity of most fifteen-year-olds.

For myself, I have developed some guidelines which minimize the problem I describe here.

1. Except for free writing, which I sometimes read for the reasons I have indicated earlier, I never read first draft work. Students must learn early on that the first draft is for them. They can only expect their audience to read revised work.

2. I avoid making marking symbols, a language made up by teachers and frequently incomprehensible to students. Teacher response should not be written in secret code.

3. So I write sentences that urge students to think and act: "How does this add to what you've already said above?...What is the central idea of this paragraph?...Try editing half the words out of this sentence." An English teacher has a responsibility to communicate with students in complete English sentences. The point of written response is to help students toward revision. Written comments are an aid in this process; marking symbols seldom contribute to understanding.

4. I've learned I can not assume students understand my clear and concise prose, so I no longer take chances. When I return a set of papers with my written comments I arrange a brief conference with each student, primarily to determine if he understands what I have written on his paper.
5. In evaluating a new draft of a paper my first concern becomes whether this new effort shows attention to my revision suggestions.

6. Theoretically, this exchange of drafts and revision suggestions takes place as long as a student can benefit from the process. However, the demands of the curriculum normally do not allow this degree of flexibility. But I make sure that, when the revisions stop, my comments stop. I do not comment on the paper I grade. If then, as teachers complain happens, a student "takes one look at a grade on a paper and throws his paper in the wastebasket," I am not emotionally crushed by his behavior, as I have already communicated with him in earlier drafts to which he has been required to pay attention. I should add, however, that my students are not as afflicted by the wastebasket syndrome as are some others because the attention they have by this time given to their paper generates a sense of proprietorship, and because there is a good chance that all this attention will have resulted in a paper that deserves, at least, a "C" grade. I do not worry much about grade inflation. My students need to understand that they can learn to write competently if they will learn to understand that writing is a process, not a slapdash task, and that good grades on written work are quite often a by-product of the care and attention this process demands.

Using Peer Response Groups

But the teacher as responder has his limits. If the teacher takes sole responsibility for asking questions which see students through the writing process, the students will be slow in learning to ask the right questions themselves. The peer response group is one setting in which students can get practice asking questions about their own writing and the writing of their classmates. As student response groups normally involve three to five juvenile human beings, it should be clear that setting up groups that work demands a variety of psychological understandings that go beyond the scope of these comments. However, I'd like to point out what I see as the strengths and weaknesses of student response and techniques I have developed to play to the strengths while avoiding the weaknesses.

The great strengths of the response group are that it allows students a peer audience for their writing and that it creates, in the classroom, an atmosphere of cooperative learning.

The major weaknesses of the student response group are that most students lack the critical faculties necessary to be truly helpful to one another, and to the extent students do have these skills, they often hold them under wraps as, except for those students who find little right about anything, students have great difficulty saying anything negative about each other's work.

I have already discussed one way to help students enjoy
sharing of their writing: They need to share without compulsory evaluation (See section 1). With regard to cooperative learning, I've found that the best way to get students within a group to cooperate is to set up some friendly competition with students in other response groups. The groups become teams competing to eliminate verbage from flabby sentences, or to contribute specific details in support of a generalization, or to combine sentences to form new grammatical and felicitous structures.

The team games, which continue all semester, serve a kind of "ice breaker" function for the response groups, an informal opportunity for group members to learn about each other. When the teams function as response groups I normally ask them to perform specific, usually non-evaluative tasks. My objection to evaluative student response is that it is seldom specific. Open-ended questions such as "What did you like best about this piece?" or "What didn't you like about his piece?" often bring vague responses: "It seems disorganized," or "It's funny." I prefer specific task assignments:

"Review the essays in your group, finding the linking verbs in each essay. Discuss how these linking verbs might be converted to action verbs."

"Review the essays in your group and find places where figurative language would be appropriate. Share suggestions."

"Read aloud the part of your essay with which you feel least comfortable. Explain what bothers you about this section. Take suggestions."

Sometimes the response function of the groups and the competitive team functions merge, as in a task such as the following: "Identify the strongest opening sentence from the essays in your group. Enter it in competition against the opening sentences of the other groups."

In my class, then, response groups give students a chance to engage in some friendly competition, share writing, work out revisions, and, sometimes, gossip.

**Teaching Correctness Through Response**

Regularly, the revision tasks I assign response groups require some knowledge of grammar. I will, for instance, ask students to look for the subject of each main clause, and, if it is an abstract noun, to revise the sentence so a concrete noun becomes the subject of the sentence. Clearly, students are only able to look at their writing in these terms if they have some basic understanding of grammatical function.

The teaching of grammar seems to have acquired a bad name because it has come to be associated with disembodied "who or whom" exercises. Teachers need to be careful that they do not throw out key grammatical understandings because they have come
to distrust "lie and lay" drills.

   The key elements of grammatical understanding are:

   a - a knowledge of the subject, verb, object sentence.

   b - an understanding of words, clauses, and phrases as modifiers.

I teach these understanding, then in my response to drafts of student papers, I regularly make comments that assume students' familiarity with basic grammar and build on this knowledge:

   "Try this sentence again with a person as the subject."

   "Move this group of words closer to the word it modifies."

   "Figure out a way to eliminate the 'which clause from this sentence."

To try to revise prose without a basic grammatical understanding is like trying to repair a Volswagan without an owner's manual. It can be done, but it is inefficient. The only efficient way I have figured out to help my students write stronger sentences is to communicate with them in grammatical terms.

Teachers need to sift out the essential grammatical understandings from the linguistic niceties, and, in response to student writers, focus on these key understandings, not in the context of 'correcting' student errors, but rather as a method of asking questions and making suggestions that will improve revision.

Conclusion

Are there guiding principles, then, which can help a teacher organize strategies for response?

   This paper has stated or implied the following guidelines:

   1. Response must begin with encouragement.

   2. The response audience needs to include others than the teacher.

   3. The teacher may use response comments as a way to help students focus their writing, to understand what they already know, and to move from personal narrative to exposition.

   4. The teacher's written responses should direct the student writer toward revision. A response that does not call for a revision is often a waste of the teacher's time and energy.

   5. A piece of writing should only be graded after the student has completed his revisions of it. In general, students
express little enthusiasm for revising work that has already been graded.

6. Student response groups, while they provide a valuable addition to the learning environment, can not replace teacher response which is more likely to be informed and objective.

7. Student response groups function best when presented with limited and specific tasks.

8. Students need to understand key principles of grammar and sentence structure if response dialogue between student and teacher is to function efficiently.

9. Written response needs to be accompanied by brief student-teacher conferences if it is to be effective.
Note Taking Conventions

Scribe: In-Class

1. Note sheets were divided vertically into two columns, the left taking approximately 3/4 of the page and the right 1/4. In the left column objective observations were recorded. In the right column were the Scribe's reactions, opinions, interpretations, and hypotheses about what was occurring.

2. Activity shifts in the classroom were marked by a short horizontal line extending from the left margin a few inches into the page.

3. The clock time was recorded periodically in the left margin, especially at the juncture of an activity shift or at the moment of what the Scribe judged to be a key event involving response.

4. Important events that the Scribe felt should be analyzed further through listening to the audio or video tapes were marked by an asterisk in the left hand column, usually accompanied by a notation of the clock time.

5. Everything written on the blackboard was included in the notes, enclosed by a box to mark it as blackboard material.

6. At the heading of each set of notes was an identification code:

   Teachers last initial - week number - day number

   For example, G-02-4 = Ms. Glass, week two, day four.

   This code was also used on the video tape and on the audio tapes; in this way, we cross-referenced and indexed the data.

Technician's Additions

After class each day the Technician read through the day's notes. Using a contrasting pen or pencil, so her additions could be distinguished from the Scribe's observations, she added objective details that the Scribe may have missed, elaborated on points in the subjective column from her own point of view and, in the left hand margin, filled in the video counter numbers from her notes that coincided with the activities that the Scribe had described, so that the activities could easily be retrieved on the video tapes when the data were analyzed.
Scribe's Review After Class

1. Preliminary coding of response events. Every night the Scribe read through the notes for the day to locate those interactions between the teacher and students or among the students themselves (in the whole class or in peer groups) that would be described as "responses" to student writing.

Finding such response events, the Scribe then coded them in the margin of her notes, using the following conventions:

responder/recipient of response:
- T = teacher
- P = peer
- W = writer
- C = class

channel:
- Or = oral
- Wr = written
- N = non-verbal

stage in writing process
- Pr = process
- Fn = final

For example, (1) if the teacher told the class that their last papers were not detailed enough, that remark would count as an oral response by the teacher to the class in general at the final draft stage of their writing. Or (2) if peer groups read each other's rough drafts and filled out evaluation sheets about those drafts, that activity would count as a written response by a peer to an individual writer in the process of writing a paper. The first example, then, would be coded (1) T/C/Or/Fn, and the second would be coded (2) P/W/Or/Pr

2. Summarizing the day's notes. Finally, the scribe wrote a summary sheet of the day's notes, including: (1) a list of the day's activities; (2) a list of assignments, both in class and homework; (3) a list of response events (listed by code and referenced to a page number); and (4) a short section of comments. Comments covered anything from classroom events worth noting to logistic problems in data collection.
CODES FOR FIELD NOTES as of 3/19/84

Codes for Response Events

For each response event put the following codes as appropriate:

for responder: T (teacher), P (peer), O (other - specify), C (class), Pf (peer-focal student), Wf (writer-focal student)

audience: W (writer-student), WC (writer + class), WP (writer + peers), C (class), PW (peer(s) + writer), O (other - specify), Wf (writer-focal student), P (peer-student), Pf (peer-focal student)

focal/non-focal student: F (focal), N (non-focal) -- as subscript to recipient or responder, e.g., Wf for a writer who is a focal student

channel: Or (oral), Wr (written), NV (non-verbal), O (other)

time: Pr (process), Fn (final)

interesting uncodable response events or sections: V (i.e., check mark)

parts worth listening to/viewing on tape: * (i.e., star)

Explanation:

Responder = who does the commenting
Recipient = audience for the comments
Focal/non-focal = whether the responder or recipient is a focal student or not
Channel = whether the comment is oral or written
Time = when in the process -- either during the draft stage or after the final draft -- the comment is made
Writer = student who has either produced a written product or delivered a spoken product (e.g., a speech)

Examples: (1) T/Wf/C/Or/Pr = teacher made an oral response to the writer who is also a focal student

(2) C/WC/NV or Or/PR = The class (C) responds to a writer in the context of a class discussion (WC), orally (NV or Or), to a work in process (Pr): See G-01-3, p. 1, students report on the person they interviewed the day before. The class is to rate them on a scale of 1 to 5, by a show of hands.
(3) W/C/Or/Pr = The writer (W) responds to the class (C), orally (Or), about her own writing that is in process (Pr): See G-01-4, p. 2, asked to discuss the free-writing done the day before, one writer offers that it was troublesome because the writing was too personal.

(4) T/WC/Or/Pr = The teacher (T) responds to a writer in the context of a class discussion (WC), orally (Or), to a work in process (Pr): See G-01-5, p. 5, after a S reads his free-writing, aloud, the teacher comments to him that this was a good example of stream-of-consciousness writing.

Other Codes

To tag management or other non-response event activities: M

To separate events in the lesson: draw a line between them

Blackboard information: draw a box around it

Lesson summary/synopsis (on a cover page): note the following:

Events of the lesson: e.g., introduces research
                                    takes attendance
                                    hands out permission forms
                                    hands out questionnaire
                                    has Ss select numbers
                                    for next session
                                    etc.

Assignments: e.g., in class: fill out questionnaires
                                    do interviews

                                    homework: generate 10 questions for
                                    furthering interviews

Response events: (give tally for each code + page numbers)
                                    e.g., TWCOrPr-3 (p. 4, p. 6)

Glass, Monday March 26, 1984

Summary

T. Reads bulletin

T. The class put their papers in order as:

- proofread paper
- do self-evaluation on paper
- do "other reader" reading of papers, w/ comments, minor corrections

Assignments

In class:

- be ready w/speech for tomorrow
- process log 10 min; write back what you thought of assignment: what could have been

Homework:

- be ready w/speech for tomorrow
- process log 10 min; write back what you thought of assignment: what could have been
Response Events

W/I/W/Or/Pr. Continue pp 3-5

8:51

T. needs bulletin.

T. asks to pay atten-

tion to the data.

Due to "low patience."

Very calm. Refers to

Lauretta, pencil, in

3rd person.

Please remove level sheet. Left to put in.

Final draft

Rough draft

Editing sheets

Notes.

Tells El. that they can

probably figure out the

order. Can't figure how.

They should

After all, do it to include praise.

I plan. Cause they're going
to be surprised by them.

Tells El. to fold line

sheet 1/4 printing fixture.

Tells El. to put home in space where it says

we're done.
Tells el to look for her and # of comments.

Tells el to turn over sheet once. Write in "self evaluation" at own paper.

Name of person reading section goes in after they sign and.

I reiterate all this.

251 Tells el that by 9:30 they should be finished, don't need to drag one to town.

Prospecting should be over

10 minutes for pa.

9:00 I take for Os.

Mary Jane asks if when prospecting I find the bear, should they court it? Yes.

I tells el to get prop.

Mary asks me to keep quiet in voice.
Jenny turns to JY & asks her if she wants to be the processing partner. JY & Cathy exchange glances; JY tells Jenny that she & Cathy are going to be the partners.

Partners:
John O & John Yearly  — AIC #6
JY & Cathy J.  — #7
AG & Alana J.  — #4
DS & Ron J.  — #5

9:02 T tells C to stop, lower voices, don't give them to partners to read. I need to do this myself to your partner.

9:03 T & V gives back-up lines to DS/DSJ.
### 3rd Q'some (5 pts, optional)

Max. 1 p., 1 side.

Doug says T is fell (asleep, asleep).

Write a T about what the work of 3rd Q. has shown you about the process of problems of effective communication.

---

| 9:14 | DS gets up to T, near her desk, & talks to her. | With T, they sit & talk. Returns to seat, grinning. |
| 9:15 | T walks over to him & they talk about what T put on. |
| 9:15 | DS goes up to T's desk & uses Ailene's cr. paper. |

---

9:30 T gets all of his papers together, & they discuss it.

---

7:53 T tells S they need help for next 15 min. & get an EJ/proof - 7:53 S tells the hilliners what they should be doing next - if finished Tuesday, then need to
Tells El if they’re through they can hand in their papers.
DS gave her the 2

JY & Cathy are still groupying

AB & Army are finished
JO yearly

9:20 T reminds partners all tape recorders to return them when finished.

30 A.M. T asks if Army is writing in the tender.

JY & Cathy still groupying

9:31 T tells El she’s asked to circulate a paper that they’re to read by “other side.” Tells them to pencil in spelling changes & read carefully, making comments on separate sheet of paper???

9:35 T tells El they’ll have 10 min. to do this.

T walks around room, distributing these papers.
She's next to Ty. Lady T is addressing the comments to them. They hang up.

They hand them their papers together, then give it to T.

Camera makes a click.

10:00

10:30

11:15

Class is quiet, really. T wanders around, looking over their shoulders.

9:30 T: When you're finished your paper, read, comment, you can give them to me. Also tell el that if the sheet is on backpage, Order, procedure, take it off and re-attach it.

130

130 T: DS, so...
Tells El to be quiet while others are still working.

9:31 "John...knock it off." low voice, this addressed to John Y., who smiles.

Tells El again not to talk.
Refuse to turn in on third if they have any Qs ask it, and tomorrow.

Tells El he'll give the assignment after all papers are in.
John N. + TV are last.
A.C. + David Ch. to hand in these papers now.

T., on board, speeches to be given tomorrow.

In process logs, were at 10 min. all you have to write is what you thought of lesson.
What you think could be done to make it more useful.
Being process logs to El to turn in tomorrow.
014 end Rob's camera

120 Bulletin over

120 Eval sheets

116 DS asks air process log

140 Directions air order for handing in papers

196 Eval sheet on top folded = give directions again

294 outline for time = by 9:20 finished w proof, self eval & comments = 10 min / paper

330 M, J & gst = partners

450 moved camera back

479 T to Rob

500 T to Sara J

530 John says got air 80 om paper = sold over

576 camera back to Jy. AG
838 Amr
Din
Thanks to all

852 SO can work from home.

908 - given papers to

933 - hands out papers

966 - due to this comment

990 - came to get Jackie's

1003 - Jackie staples

1030 - T. loads over

1045 - room silent

1050 - T. writes on bed - speaks Tusc.

1059 - Red shows DS their manuscript bed 1st
1090 - T. quiet directions

1159

1188 process log - interference on

1258 counter

Camera turned to T, DS, Jo as T receives papers
Seating Chart - MKG

Code: G-09-1
Date: Mon, March 26, 1984

[Handwritten names and symbols representing seating arrangements]
Procedures for Set Up of Recording Equipment

1. Recording equipment was removed from locked storage and placed on a wheeled cart for transportation to the classroom each day. Both the Scribe and the Technician checked connecting cables and machine settings, according to a fixed protocol (see attached sample protocol).

2. The video camera and the cart carrying the recording equipment was daily placed in the left rear of each classroom. In Ms. Glass's class, student seats were arranged in a long horseshoe. In Mr. Peterson's class, student seats were arranged in rows on three sides of the classroom, all facing the center. This positioning of the camera placed the Technician near the left rear of the horseshoe, facing the front of the classroom, towards the teacher's desk and the blackboard and away from the windows (see Figures 2.1 and 2.2). The Scribe sat in the right rear corner. This arrangement afforded two viewpoints on the classroom at large. The camera was sometimes moved a few feet to enable a better view of focal students during class or group activities, but in general it remained back as far as possible in the corner.

3. Each day, an omni-directional microphone was plugged into a permanent extension cable which was attached to the ceiling of the classroom. Then a diversity wireless microphone was given to the teacher. Each microphone fed into one channel of a stereo audio recorder which was connected by cables to a stereo video recorder. Both the master audio and the video equipment were under the control of the Technician.

4. A back-up tape recorder was placed in a corner of the classroom opposite the master audio tape recorder, in case of master recorder failure.

5. Whenever the class divided into small groups, separate audio recordings were collected of each group. Small, rechargeable tape recorders were placed in the center of each group.

6. The classroom teachers were provided a tape recorder and audio tapes and asked to record any conferences they held outside class with individual students.

7. For the focal students, student writings and teacher and peer comments on these writings were collected and photocopied as well as the comments of the focal students on the writings of others.
8. At the end of each recording day, a daily recording log was completed which indicated the ending video and audio counter numbers for that day (see attached, sample recording log). In addition, a data log indicated the type and code numbers of data collected, including video recordings, master and back-up audio tapes, and additional recordings of peer groups, if any (see attached, sample data log).
Protocol for room set up

TO BE CHECKED INDEPENDENTLY BY TWO RA'S

AFTER YOU HAVE CHECKED ALL ITEMS, INITIAL RECORDING LUG IN LAST COLUMN

PART I--BEFORE ENTERING CLASSROOM

1. Check settings on all machines:
   a. VCR:
      L&R
      NH on
      Mono
      Camera on
      Power on
      Tape speed slowest
      Standby
   b. Marantz:
      Dolby on (set later)
      EQ 120
      Bias low
      Manual limiter
      L&R
      Speaker monitor on
   c. wiretess:
      Line in
      Check connector cable for mike
      Power on
   d. Camera:
      Auto iris
      Indoor
      White balance
      Standby switch UN
      Plug in external mike jack

2. Check that tapes are labeled and in:
   VCR
   Marantz
   Sony back-up

3. Check all cable connections between video and auditor tightness

4. Check to see that wireless receiver cable is plugged to GREY (L) audio/ video cable

BE CERTAIN CONNECTOR IS PUSHED ALL THE WAY IN
5. Check to see that Sony mike's permanent cord is plugged into RED (R) audio/video Y cable
   BE CERTAIN CONNECTOR IS PUSHED ALL THE WAY IN

6. Set up wireless receiver:
   Put in antennas
   Check cable from A/V Y

7. Place wireless receiver in purse for Ms. G.

8. Screw viewfinder on camera
   Plug cable of viewfinder into camera

9. Remove lens cap

10. Extend tripod legs

10. Screw camera onto tripod

PART II--IN CLASSROOM
1. Plug in master cord for main recorders

2. Plug in Sony back-up

3. Plug Sony mike's permanent cord into RED (R) audio/video Y cable
   BE CERTAIN TO PUSH CONNECTOR ALL THE WAY IN

4. Plug Sony mike wire into ceiling cable in middle of room and drop
   mike to mouth level

5. TURN ON SONY MIKE

6. Turn on wireless receiver (2 switches) and give to teacher
   Make sure teacher isn't wearing jewelry that would interfere
   with mike

7. Set up tripod

8. At VCR deck screw camera cable in

9. Set white balance

10. Press PLAY AND RECORD BUTTONS on VCR

11. PRESS RECORD ON MARANTZ
    BEGIN VIDEO RECORDING
    PRESS RECORD ON BACK-UP SONY
    AFTER ABOUT 30 MINUTES
    CHANGE SIDE OF AUDIO TAPES.

Student Interview

1. Introduction of interview--follow up on observations; we’ve talked to T’s; we need to get S’s point of view; anonymous, so feel free to say anything. But before the particulars of your classroom . . . (see next question)

2. Survey--fill out this survey and tell me the reasons for answering as you do while you’re filling it out.

3. Do any of the teachers you’ve ever had stand out in your memory for having helped you a lot with your writing?

   If no, then how did you learn to write?

   If no, tell me about your writing instruction in junior high.

4. How does your writing instruction this semester compare to past?

5. When we were watching your class, we saw Ms. Glass/Mr. Peterson do lots of different activities. We want to get your point of view on them.

   (Follow with appropriate list of activities.)

6. (For Ms. Glass only): One day there was a discussion in class about how this class was different from past writing classes. What are your feelings about this issue? How is this class similar to other writing classes?

7. What do you think a writing teacher needs to know or be able to do in order to teach writing well?

8. What do you think a student has to do to learn to write?

9. What do you think someone has to know or be able to do in order to write well?

10. (Take out student’s folder) Look through your folder and select what you think is your best piece of writing. What made you choose that piece?

11. How do you think your writing has changed over the semester? Why do you think it has changed? Did the teacher do anything; did you do anything; did other students do anything to bring about this change?

12. (Get student’s summer schedule. Ask how to get in touch with him/her, what his/her best time is. We will be contacting you to meet again in order to look at some of the video tapes that we took of your class.)
Teacher Interview I
July 5, 1984

1. Throw the floor open for both T's to talk - ask for their agenda.

Were there things that happened before or after we came, or outside of class that we were unable to observe that you think we should know about? (Fill us in on what happened before or after we came.)

Address T's agendas.

2. Ask T's for guidance in dealing with data analysis.

Of the data that we collected this semester, is there any part that you are particularly interested in? We would like to be able to address some of your research questions.

In your teaching, what are the important moments, as far as response is concerned? How did these moments go this semester? Are there any incidents that stand out in your mind as being particularly important?

We have focused on four of your students (give names). We don't know much about these students' backgrounds. Do you have any information about them that would help us out? How do you think the semester went for each of these students - in your eyes, how (if at all) did they progress? Does anything stand out in the semester regarding these students?

3. General questions about class, teaching.

What role does response play in the teaching and learning of written language, in your view?

Describe the English curriculum at your school. How does this class fit into the overall sequence of things for these kids?

What do you see as important about your teaching?

4. Give teachers writing task:

Personal statement

Please describe your philosophy of teaching, including a historical (and personal) view on how this philosophy developed over the time that you have been teaching. Any sources of inspiration?

Please describe the sequence of writing assignments we have observed in your class this semester, and tell us how these
assignments (and this sequence) fit into your overall philosophy and view on things. Why this, and why now?
Teacher Interview II: Glass
July 13, 1984

CG - Clarify "philosophy of teaching" - MLG has gotten at teaching as a vocation. We want to know what her notion is of what teaching is to accomplish as far as the student's learning goes.

Specifically, we are interested in some things she has already alluded to in different settings, such as:

Function of good teaching is to get students to discover things for themselves - get MLG to comment on how she causes such discovery to come about, and what it is that she wants students to discover.

What does MLG mean about the function of "putting it in words?" What must the student be able to put into words in order to be able to use the knowledge in other situations? How does this work? How does she help students to put things into words, transfer?

MLG appears to feel strongly about "keeping the ball in the S's court." What does this mean for their learning? Are peer groups another way to keep the ball in their court, as response environments that are not teacher-centered (as opposed to conferences)?

MS - Have MLG look over school write-up, correct any errors, make any additions that need making.

Ask MLG to talk specifically about the English curriculum - what happens each year, how do the classes fit together? Where does this class fit?

MS - Ask MLG to characterize each focal student, give some background information on each one, her perceptions of their abilities, and her perceptions of any progress they might have made over the semester, and in which areas progress occurred.

SWF - Have MLG look carefully through writing folders of focal students, helping to come up with a system of categorizing and describing these comments that will be useful to other teachers.
CODING MANUAL

We have maintained three major data sources from which we have a record of the response that occurred to student writing during the observation period. While the record is not 100% complete--private events such as students' reflection on their own writing or unobservable conversations inside or outside the classroom escape the reach of the researcher--we do have records from (1) classroom field notes taken at the time of observation and supplemented by viewing of classroom videotapes; (2) research notes on audiotapes taken of focal students' peer response groups; and (3) focal students' notes, outlines, and essay drafts as well as peer and teacher evaluation sheets, on which written response appears. NOTE: Field observation data reflect participation by any and all students in a classroom while group data and written response data reflect only focal student participation.

Coding of these data sources captures what we have decided to call "response episodes." Response episodes are usually broad-based events in which some kind of response to student writing occurs, at any time during or after the writing process, for example, while ideas are being formulated, while a practice activity is taking place to which feedback has potential ties to the assigned essay, while an essay is being drafted, and so on. Response episodes are characterized by a common theme and a common function, with a marked beginning and end. So, for
example, one teacher-led class discussion during which both teacher and students give feedback to a sample of student paragraphs counts as one response episode; a meeting of one peer group during which, say, rough drafts get read and criticized, counts as one response episode (six such peer groups meeting for the same purpose at the same time, that is during the same class meeting, count as six response episodes); teacher comments on a rough draft of one student's essay counts as one response episode (four such essays from either the same or different students count as four response episodes). One response episode can follow another in rapid succession, one response episode can last an entire class period, or, as in the case of peer groups, several episodes can take place simultaneously. What is important for the coding is that response episodes are clearly discrete events with an "essence" that can, with high reliability, be described by our codes.

For each coding category we present an explanation as it applies to the field notes and classroom videotapes (FN/VT), the group tapes (GT), and the written comments (WC), as well as examples.

Cols. 1 & 2: Case number

FN/VT: Response episodes are consecutively numbered, beginning at 1, each day. "Case number" refers to the number of the response episode.

Example 1: Week 6, day 1 in MLG's class: there are two response episodes, numbered 01 and 02.

Example 2: Week 6, day 4 in MLG's class: there are six response episodes, numbered 01, 02, 03, 04, 05, 06.
GT: Case numbers are arbitrarily, but systematically, designated:

60's + peer group number = MLG's class
80's + peer group number = AP's class
Example 1: 66 = peer group number 6 in MLG's class
Example 2: 81 = peer group number 1 in AP's class

WC: Case numbers are arbitrarily, but systematically, designated:

50's + document number = MLG's class
70's + document number = AP's class
Document numbers follow chronological order and are as follows:

MLG:
50 = rough draft
51-54 = editing sheets
55 = self evaluation sheets
56 = proof-reading partner's evaluation
57 = other student's evaluation
58 = final draft + teacher's summary
59 = process log

AP:
71 = rough draft of anecdote
72 = 32 questions
73 = final draft, anecdote
74 = group response sheet
75 = final draft, character analysis
76 = Great Expectations character, paragraph rough draft
77 = Great Expectations character, paragraph

Cols. 4-6: Week/Day

FN/VT, GT: Weeks for each teacher are consecutively numbered from the beginning to the end of the observation period. Days within each week are numbered consecutively 1-5 to indicate Monday through Friday.

Example 1: 062 = Week 6, day 2 (Tuesday)
Example 2: 045 = Week 4, day 5 (Friday)
WC: For MLG, Week/Day refers to the date students receive response. For AP, Week/Day refers to the date that appears at the top of the written document.

Col. 8 & 9: Page

FN/VT: "Page refers to the number of the page in the original field notes that each response episode begins on. Note: In some instances, field note pages are supplemented by additional note pages, but these do not carry their own numbers. These supplementary pages are keyed to the field note page numbers.

Example 1: Week 6, day 1, episode 1 of MLG's class begins on page 5 of the field notes for that day. Page number code = 05.

Example 2: Week 1, day 3, episode 9 in AP's class begins on a page supplementary to page 4 of the field notes for that day. Page number code = 04.

GT: "Page" refers to the number of the page in the summary notes made of the audiotapes.

WC: This category does not apply. The column is left blank.

Col. 11: Teacher

FN/VT, GT, WC: Each teacher has a code number. MLG=1; AP=2.

Col. 13 & 14: Responder(s)

A responder is someone who gives feedback (response) to a writer or writers:

FN/VT, GT, WC:

1(0) = T (teacher)
2(0) = C (classmates)
3(0) = C (classmates)
4(0) = W (writer)
5(0) = Ws (writers)
Note: There can be combinations of responders. For example, 13 = both teacher and students responding during an episode.

Note: When responder = W, it indicates that a writer is responding to him or herself. When responder = Ws, it indicates that more than one individual writer is responding to him or herself.

Note: Because some response takes place in the classroom setting, and teachers typically manage classroom discussion by allocating turns and assuming the authority to comment on student contributions, teachers will often comment (repeat, elaborate, agree, disagree, and so on) on student contributions that are themselves responses to another student writer or writers. The primary responder is the student, but the teacher's comments can often be substantive and clarifying. It seems most reasonable to code these paired responses as "12" 1 for teacher, 2 for student, reflecting this situation.

Note: For more than one responder, the number moves left to right from lowest to highest.

Example (FN/VT): Week 6, day 4, p. 1 of MLG's class, episode 1: Students write an assessment of what they have accomplished so far in the assignment they are working on. Responder = Ws (many writers each responding to him or herself). Code = 50. Had the T also been involved as a responder in this episode, the code would have been 15.

Example (GT): Week 7, day 3, group 6, in MLG's class: The group discusses finding a focus for their papers, and all the student writers in the group participate. Code = 50.
Example (WC): Week 2, day 2, document 71 in AP's class: The teacher has written comments on the student's draft. Code = 1.

Col. 16: Recipient(s)

FN/VT, GT, WC: Recipient refers to the person or persons who receive the feedback (response) from the responder(s) during the response episode.

1 = W (writer)
2 = Ws (writers)

Note: For WC, recipient always = 1.

Example 1 (FN/VT): Week 1, day 3, page 1, episode 2 for AP's class: T confers with a group of students, two of whom receive feedback from the T. Code for recipient = 2 (or Ws: more than one writer).

Example 2 (FN/VT): Week 7, day 3, page 1, episode 1 for MLG's class: One student asks the teacher a question about how to proceed with the logistics for note-taking for their paper. The teacher gives her a response. While the student asks this question in class, with all the other students listening to both the question and the answer, recipient code = 1 because the teacher is giving direct feedback to only one student, the questioner.

Example (GT): Week 7, day 3, group 6 in MLG's class: Students are discussing finding a focus, and all participate in giving and receiving feedback from one another. Recipient code = 2.

Col. 18-24: Role of Focal Students

FN/VT, GT, WC: Each focal student has been assigned a column as follows:
col. 18 = JY
col. 19 = JO
col. 20 = AG
col. 21 = DS
col. 22 = LC
col. 23 = DY
col. 24 = RB

For each column, a code indicates whether the focal student belonging to that column is present, is a recipient, or is a responder in the response episode. These codes are as follows:

1 = not present
2 = recipient
3 = responder
4 = present, neither recipient nor responder
5 = present, both recipient and responder

Note: For MLG's class, cols. 22 - 24 will always be coded as 1's (because LC, DY, and RB are not students in that class). For AP's class, cols. 18-21 will always be coded as 1's (because JY, JO, AG, and DS are not students in that class). FN/VT, GT: If a student is absent, his or her column will be coded as 1. If a response episode occurs in either a group or a one-to-one context, a focal student must be present in the context to receive a code other than 1. WC: All columns will be coded as 1 except that of the focal student whose paper is being responded to. That focal student will always be coded as 2 (see example WC, below).

Example 1 (FN/VT): Week 1, Day 2, Page 1, Episode 1 in AP's class: T addresses the class and gives direct feedback to some of the students for their contributions, including LC and RB. While DY is present, he receives no direct feedback from T. This response episode, under the category Role of Focal Students, is coded 1 for columns 18 through 21, 2 for column 22, 4 for column 24. The 1's indicate that MLG's students are not present. The
2's indicate that both LC and RB receive direct feedback (i.e., they are "recipients"). The 4 indicates that DY is present, but is neither a recipient nor a responder.

Example 2 (FN/VT): Week 1, Day 2, Episode 2 in AP's class: T addresses the class and gives generalized feedback to everyone. This response episode, under the category Role of Focal Students, is coded 1 for columns 18 through 21, and 2 for 22 through 24, indicating that MLG's students are not present, and that LC, DY, and RB all receive feedback from T.

Example 3 (FN/VT): Week 7, day 2, page 2, episode 1 in MLG's class: The teacher tells the class that some of them did a good job on their papers, in this way generally addressing everyone present. This makes all the focal students 2's, recipients of response. Within this episode, however, JY and AG also speak as individuals and get response from the teacher. They are coded, still as 2's, along with DY and JO. The coding does not distinguish JY and AG's participation as marked recipients from the generalized participation of the rest of the focal students.

Example (WC): Week two, day two, document 71 in AP's class: The teacher writes comments on DY's paper and DY is the recipient of this response. He is coded as 2, all other ficals as 1.

Col. 26: Initiator

FN/VT: Response episodes can be initiated by either the responder, the recipient, or the teacher who then lets the students alone to give and receive response. Codes to indicate this are:

1 = responder
2 = recipient
3 = teacher as neither responder nor recipient

GT, WC: In every case the teacher is the originator of the response event because he or she sets up the contexts where response occurs. Therefore, code always = 3.

Example 1 (FN/VT): Week 1, day 1, page 4, episode 1 in AP's class: T asks the class to write their impressions of Cary Grant, after having watched a segment of the film North by Northwest. Students are to share their impressions with the rest of the class, and T will respond to them. Initiator of this response episode is the responder himself, T. Code = 1.

Example 2 (FN/VT): Week 7, day 3, page 1, episode 15 in MLG's class: The teacher tells the students to write down in their process logs how many visits they have made to their place. The students are both giving and receiving their own response, but the initiator of the episode, because she sets up the context in which response takes place, is the teacher. Code = 3.

Example 3 (FN/VT): Week 1, day 4, page 7, episode 4 in AP's class: A student approaches T after class to ask for feedback on an assignment she has been working on for his class. Initiator of this response episode is the recipient of the response, the student. Code = 2.

Col. 28: Context

FN/VT: Response episodes can occur in the context of the whole class, in the context of a small group, or in a one-to-one context such as a teacher-student conference or a pair of students working together. Coding for this category is:

1 = class
2 = group (three people or more)
3 = one-to-one (T + S or S + S)
GT: Groups of 3 or more will always be coded 2. Partners will always be coded 3.

WC: Code will always be 3.

Note: Peer groups present a special problem. Regarding FN/VT, what occurs in a group is only recordable when the teacher interacts with that group. Consequently, group episodes, coded 2, reflect only those during which the teacher is present to interact. Regarding GT, everything that occurs in a group is recordable. Consequently, a group episode, coded 2, reflects the entire group episode with one important exception: any interaction between the teacher and the group is omitted as it is in the FN/VT and thus is already coded.

Note: Sometimes the teacher will ask students to evaluate their work privately or to reflect in some way on the process they have been through in working on the assignment. Because these events take place in the classroom setting, they are coded 1.

Col. 30: Channel

FN/VT, GT: Response can occur orally, in writing, or non-verbally. WC: Response is only written. These channels are coded as follows:

1 = oral
2 = written
3 = both oral and written
4 = predominantly nonverbal

Note: Code 4 will occur rarely. It is used to indicate audible non-verbal response, as facial gestures and other non-audible responses are not captured in the data. Audible non-verbal response includes applause and laughter.
Example (FN/VT): Week 1, day 1, page 4, episode 1 in AP's class: Students offer ideas about how to observe people's personality traits. T gives oral response and also writes his response on the board. Channel code = 3, that is, response is both oral and written.

Col. 32: Time

FN/VT, GT, WC: "Time" refers to the point during the assignment that response occurs. Response can occur at any point up to the time students turn in their final draft (process), and it can occur after final drafts are returned to the student (final). Codes for this are:

1 = process
2 = final

Col. 34: Target

FN/VT, GT, WC: "Target" refers to whether or not whatever is being responded to has the potential of being incorporated directly into the assigned essay that all these writing activities are leading up to. In AP's class, the assigned essay is a character sketch of a friend. Response, however, can be to a character sketch of someone in Great Expectations, for example, or to notes and ideas about Cary Grant in North by Northwest. In MLG's class, the assigned essay is a report on a place. Response, however, can be to writing about a pet or about the courtyard outside MLG's classroom. These practice writings do not have the potential of being incorporated into the assigned essay (see code 2, below). In contrast, notes or paragraphs about the friend (in AP's class) or about the place (in MLG's class) do have the potential of being incorporated into the
assigned essay (see code 1, below). The target code is:

1 = target is direct to assignment
2 = target is indirect to assignment

Example 1 (FN/VT): Week 1, day 1, page 4, episode 1 in AP's class: T responds to students' observations about Cary Grant. Target code = 2.

Example 2 (FN/VT): Week 2, day 1, page 5, episode 10 in AP's class: T responds to student's question about making charts on the friend they are to write about. Target code = 1.

Col. 35: Text

FN/VT, GT, WC: Text refers to whether or not an already-formed piece of discourse (e.g., a written word, sentence, paragraph, or essay; a film; an orally-formed word, sentence, paragraph, or essay/speech) serves to coordinate the response episode. Codes are:

1 = no formed discourse coordinates response episode.
2 = formed discourse does coordinate response episode.

Example 1 (FN/VT): Week 2, day 1, page 1, episode 2 in AP's class: Focal student RB has not yet written her paragraph. T responds to this situation, giving RB feedback on how to manage the time schedule for her writing. While this exchange concerns RB's paragraph, there is no formed paragraph to coordinate this exchange, only a hypothetical paragraph. Text code = 1.

Example 2 (FN/VT): Week 2, day 1, page 1, episode 1 in AP's class: A student asks T to define a word that he has written on her paragraph. He gives her feedback by explaining the meaning of the word. This exchange concerns the student's paragraph, with a formed text, the paragraph, coordinating this exchange.
Text code = 2.

Cols. 37 and 38: Pedagogical Focus

FN/VT, GT, WC: Response can be focused on cognitive procedures (such as the need to develop and illustrate an idea), on specifics of a text (a writer's actual words), or on management procedures (such as the logistics of doing an assignment).

Note: Response episodes can, and often do, show more than one pedagogical focus. Codes are:

1(0) = cognitive procedures
2(0) = specifics of a text
3(0) = management procedures
4(0) = not interpretable

Note: Code 4 is used for remarks such as "that's good" or "good work." These remarks give too little information to be interpreted more closely.

Note: The distinction between 1 and 2 is quite broad, with 1 encompassing virtually any remark that does not make specific reference to something in the text.

Example (WC): Week 2, day 2, document 71 in AP's class: DY has written an anecdote on which the teacher comments. "Try this again with more picture words--make me see the race" is coded as 1 as the teacher is addressing a cognitive procedure that the student must undertake in order to come up with some text. T's circling the word "was" and remarking "tense" is coded as 2 as the teacher is addressing a specific word (text) that the student produced.

Note: In a given episode, different kinds of response events can happen and on occasion it is impossible to capture all of them. We have opted, in these cases, to capture what is
important about the event for our purposes. For example, an episode may include cognitive (1), textual (2), management (3), and uninterpretable (4) pedagogical foci. We are more concerned about whether 1 and 2 occur than whether 3 and 4 occur and would thus choose to code the episode "12." Order of priority for pedagogical focus, then, if more than two occur is: 1 and 2 first, then 3, then 4.

Example 1 (FN/VT): Week 2, day 1, page 5, episode 21, in AP's class: T is responding to student paragraphs in a one-to-one context. One student has not written a paragraph and T talks to him about this. Pedagogical focus of this response is "management," and response code = 30.

Example 2 (FN/VT): Week 2, day 1, page 5, episode 11, in AP's class: T is responding to focal student LC in a one-to-one context. T tells LC that her topic sentence, as written, doesn't say enough about the character she is describing. He elicits and offers ideas about this character. Pedagogical focus of this response is on both the writer's actual sentence and on developing ideas for that sentence, that is, cognitive procedures. Response code = 12.

Cols. 40 and 41: Coder/Role

FN/VT, GT, WC: Each coder is assigned a coder number:

1 = Cyndy Greenleaf
2 = Leann Parker
3 = Melanie Sperling

Each coder also assumes either of two roles: primary coder or checker. Role codes are:

1 = primary coder
2 = checker
Example 1: 11 = Cyndy Greenleaf as primary coder
Example 2: 32 = Melanie Sperling as checker
Example 3: 21 = Leann Parker as primary coder
Appendix IL, Student Paragraph on Rick Springfield Concert

My mother is an outgoing person when it comes to concerts. This time she calls up all her friends together for the night of Rick Springfield’s concert in Concord. She tells my younger sister and me to invite friends of ours who would like to go.

We all planned that we would go in two cars, which would be convenient. There were seven of us who went. We all went out to eat so that we would not have to stand in long lines at the concert, just to eat.
TRANSCRIPT: lc-p-4-1

FN: P-04-1, P4
V: 509-692

(T is helping class revise Rick Springfield paragraph which was written by one of the students.)

A179 T: Okay.
There are two things that are lacking from these two paragraphs.
Both both of .. in both cases it's a little different.
In the first case,
... um okay .. what's she talking .. what's she writing about here.
She's writing about her mother.
And her mother's excitement .. about .. going to this rock concert.
All right.
And actually,
I, - you know.
I have to tell you that when you read the whole selection,
it's really,
.. it's very nice.
I mean,
uh .. it's uh .. it's a good good .. shows a .. reveals a good relationship .. between the person and her mother.
and uh .. it was fun to read.
.. But.
B' beginning here,
.. we uh .. it uh .. seems to me.
beginning here.
.. we don't have uh .. none of the .. very little of the excitement of this event.
is coming through.
.. Um ... okay.
So.
.. and all you ha' .. all you have to do is add a couple of sentences .. uh ... concrete detail.
... to line this up.
And make it more exciting.
And so we're going to try that,
even though we don't know .. what the .. even though we don't know what the uh .. specifics are about the person's life.
We could still do this as if it were us.
... All right?
Okay.
(reads paragraph) MY MOTHER'S AN OUTGOING PERSON.
.. Uh .. WHEN IT COMES TO CONCERTS.
That's fine.
Just leave it at that.
All right?
... Uh ... THIS TIME,
She's putting this in the present tense,
but that's perfectly all right.
As long as she wouldn't tell the whole story in the
present tense.
... All right.
THIS TIME SHE CALLS UP ALL ALL ALL A' ..C' SHE ..
SHE CALLS UP ALL HER FR' ... SHE CALLS UP ALL HER
FRIENDS.
... I made a mistake in typing this.
Let's say,
(revising text) SHE CALLS ALL HER FRIENDS .. TOGETHER
... FOR THE N'..
Well we need to settle on some language here. (someone
laughs)
SHE TELEPHONED. - (laughs)
THIS TIME SHE TELEPHONED.
Let's say ... let's cross out these words.
We want to say this.
... Uh.
... THIS TIME ... SHE TELEPHONES ALL HER FRIENDS.
AND INVITES THEM TO .. THE RICK SPRINGFIELD CONCERT AT
CONCORD.
...or IN CONCORD.
Right.
THIS TIME.
Okay.
SHE TELEPHONES ALL HER FRIENDS.
AND INVITES THEM TO THE RICK SPRINGFIELD CONCERTS AT ..
IN CONCORD.
Okay.
SHE TELLS MY YOUNGER SISTER AND ME TO INVITE FRIENDS OF
OURS .. WHO WOULD LIKE TO GO.
All right.
... Okay.
Now that's .. there's nothing wrong with that.
But ... where .. okay .. after sh' after she says.
SHE TELEPHONES ALL HER FRIENDS.
AND INVITES THEM uh TO THE CONCERT.
Right.
What could you do there.
What could you do there. [class is quiet, looking at
their dittos]
... Before you go on to the next sentence.

Kam:  ***

T:  What?

Kam:  I don't see what you're asking.
T: The question is what could could .. is is there a sentence you could add there.

Kam: Decides?

T: Hmm? .. What's that?

No. (speaks in undertone) Not quite the expression. (uc) Okay.

So you don't think .. you can't you can't .. you can't think of any sentence that could possibly go in between .. uh th' .. I INVITES THEM TO THE CONCERT AND SHE TELLS MY YOUNGER SISTER AND ME. Can't think of anything?

Kam: And then decides to .. she then decides to .. ask me and my sister,-

T: Well .. before that. .. Yeah. (calling on Gaby.)

Gaby: Um .. even if you both want uh to invite. (uc)

T: You've skipped on ahead. (uc) Debbie. Got any ideas? (no response; T chuckles) .. Okay. (apparently Debbie indicated no) Okay.

If I say I'm gonna .. okay eh uh ... (buzzer sounds). I'm going to invite all my. - XXX (says in undertone -- talking to Nishan) Okay. When you're ready. [Nishan goes to his seat] ... Suppose I say. Suppose I say. Uh I'm going to invite all of my friends to this class with me. ... Invite all my friends to come to this class with me tomorrow. You you wouldn't have any questions?

Boy: What friends?

T: What .. what?

.. Yeah.

What are these friends like. .. I mean.

what are they .. what are they .. uh .. who who are these friends.

.. Now. Not to say. .. okay, .. so what I want you to do is. .. just make something up.

596
Write a sentence in there that might describe might give you some idea of who these people are.

Now we're not wr' not not here talking about the writer herself.

we're just -

.. Say it was you .. inviting all your friends to this concert.

Okay.

Write write a sentence that will uh .. write a sentence that will d' .. will will .. uh .. suggest .. some of the kinds of people you might invite.

That's all I'm asking.

... ... (Ss are writing)

Okay.

Who wants to read what you wrote in there.

God.

All that .. all that writing, and uh, -

Oh. (calling on girl)

Robin: I wrote um.

I didn't .. I just changed the form (uc).

I put,

(reading what she wrote) SHE TELLS MY YOUNGER SISTER AND ME .. TO INVITE SOME OF OUR FRIENDS FROM SCHOOL WHO WOULD LIKE TO GO XXX.

T: All right.

.. Okay.

Anything.

.. uh uh That really wasn't the point the point I was talking about.

I was talking about .. what she said. [Samantha & Beth raise their hands]

She she calls her friends, .. and invites them to the concert.

Uh .. yeah,

Samantha. (apparently had her hand raised)

276 Sam: Um .. (reading what s/he wrote) THEY ALL DROVE OVER AND,-

T: No .. no. [T shakes his head.]

You. -

Girl: (overlapping) Wait.

Wait.

Okay.

T: You're skipping ahead. (chuckles) [Linda raises her hand high]

I want to know something about these friends.

279 X: The mother's friends?
T: Shh.
The mother's friends.
Right.
Yeah.

279 Ss: Oh!

Robin: I thought you meant the kids friends.
That's why I said that.

T: Oh. [Linda & Beth still have their hands raised]
Sorry.

Ss: (overlapping each other) xxx.

T: What?

Linda: I said I did that just the way you wanted us to.

T: Yeah.
Good.
How.
Okay.
Right.

Wh' what's what .. the mother's friends.
xxx (uc -sounds like he's calling on someone else???)

282 Linda: The friends she invited .. the friends she invites
are all presidents of the Rick Springfield fan
club xxx?

T: O' okay.

Well so so let's say .. w' w' well let's not say.
.. let's not go over "she invites" again.

Right.

Let's not say the friends she invites.
L' let's start with she .. invites.

... Stretch (uc). (sounds like T is writing on board)
ALL OF .. SHE INVITES ALL OF THE PRESIDENTS .. OF THE

Rick.

.. I'm going to abbreviate Springfield,
FAN CLUBS.

Who else does she invite.

... Anybody else?

294 X: xxx

T: (chuckles) ... Or actually,

she might.

.. actually we we're exaggerating.
She might have a friend.

.. uh uh Why don't we say,

she invite her friend who is president of the Rick
Spring. _id fan club.
(reads while writing on the board) SHE INVITES HER FRIEND .. WHO IS .. PRESIDENT OF THE RICK SPRINGFIELD FAN .. CLUB.

Right.

... Who else does she invite.

?Gaby: The secretary.

T: (laughs) The secretary.

... Even the sergeant at arms.

(laughs)

X: xxx.

T: Oh just make somebody up.

We're working on this together now.

X: xxx.

T: wh' wh' what?

What?

X: Members of her high school alumni association.

T: Well no.

A friend.

.. An old high school f' buddy.

Right?

X: Right.

397 T: French (uc -- calling on someone???)

X: Buddy from high school.

X: Chum.

T: Chum. (chuckles appreciatively)

... I want to still say friends.

Ss: xxx

Sam: Dentist.

T: Okay.

Who else does she invite.

.. What?

Sam: Her dentist.

From San Rafael. (laughs)

T: (laughs) Okay.

Okay.

Okay.

And even.
... That's good.
And even her dentist from San Rafael.

... ... (apparently writing on board)
Rafael? (said as if he's wondering about the spelling)

... xxx

S: xxx

T: A-E-L right?

Ss: A-E-L.

T: A-E-L,
just like I, -
/Ss comment/

S: xxx you can't tell if we spell it right or wrong anyway. (laughs)

T: That's one of my tricks.
Okay.
... Now.
Okay.
Now.
What what ... let's ... let me let me just read it from
the beginning.

326
MY MOTHER IS AN OUTGOING PERSON WHEN IT COMES TO CONCERTS.
Uh ... THIS TIME SHE PHONES um ... ALL ALL ALL HER FRIENDS.
AND AND ASKS THEM TO GET TOGETHER FOR THE RICK SPRINGFIELD CONCERT AT .. CONCORD.
SHE INVITES HER FRIEND WHO IS PRESIDENT OF THE RICK SPRINGFIELD FAN CLUB.
comma,
AN OLD HIGH SCHOOL FRIEND,
... AND EVEN HER DENTIST FROM SAN RAFAEL.
Okay.
... Now.
The point is,
... how long did that take us.
it took us half a minute.
Right?
Well no.
Actually it took us about ten minutes. (laughs)
But if we had known what we were doing it would have
taken us half a minute.
And.
all of a sudden.
this becomes a lot more interesting to read.
You see?
Because she doesn't stop at ... she doesn't ... she
... doesn't just go on to the next point.
I mean.
we get interest up.
so uh ... now.
A lot of that. -
A lot of you were getting that stuff into your
writing.
You don't. -
You know sometimes if you look through ... through your
papers, you'll see a star or something?
That means,
as I told you before,
that means,
that .. uh .. many of you have got stuff like this that
I really like.
... Some specific detail.
The Ss have written their topic sentences on the board, and the class is now discussing them. The transcript captures part of the discussion.

Selected topic sentences:

429 (JO) The restful and peaceful atmosphere of Sol Park attracts many types of people.

428 (DS) The peaceful and competitive feelings I get here give me a tranquil mind.

426 (JY) Mitchell Park has a friendly, warm atmosphere serving many different kinds of people and recreational activities.

427 (AS)

421 (?) The first thing that hits you when you walk in is the tackiness of the place.

Audiotape #1, side B

B167 T: Okay. Who has another one you want to ask a question about, or comment about...Look for places where you see either something that looks kind of fuzzy, or you see something that looks quite clear...Joanna. (T's tone suggests she's called on someone whose hand was raised)

Jo: I guess in number 21 xxx the place.

T: (reading) THE FIRST THING THAT HITS YOU WHEN YOU WALK IN IS THE TACKINESS OF THE PLACE...Okay...Yeah. Maybe if this is a focus sentence, I might want to know what of the pl'...what of... what the name is...Uh...what do you think about the word tacky.

173 Various: xxx

Bov: I love it.

T: How does that compare to "unusual". (= a word they
Boy: XXX opinion in it.

?: It gives you a picture.

174 Various: XXX

T: Yeah.
There's more opinion in it,
 isn't there?
It's it's made a judgement,
 and it has some load in it.
It it it's loaded a little bit.
"Unusual" is kind of fence-sitting.

Girl: XXX

T: "Tacky" is loaded.
And maybe that's what somebody meant.
Serena. (tone indicates T calling on S whose hand is raised)

178 Ser: I mean, (uc)
tacky.
A real picture comes to mind.
/T: Good./
XXX a tacky restaurant before,
XXX.

T: Good.
It ought to have a lot of plastic around.
/Ser: Yeah./
Maybe plastic geraniums at the cash register,
/Class: laughs/ or something like that.
Okay.
Yeah.
The word "tacky" is .. is a little bit more specific,
and it makes us see some pictures a little more clearly.

181 Um ... ... what else do you want to ask about.
 ... Jenny. (T apparently calling on S with hand raised)

Jen: Um ... I want to know if (uc) there's a peaceful and
competitive feelings.
Uh number eight (= Dan's sentence).
Because that's ... (noise) I can't see how something
can be peaceful and competitive (voice trails off
as T overlaps) at the same time.

T: (overlapping) Good.
Look at number eight.
Yeah.
that is an interesting one,
because somebody .. somebody went on -
There's some real confusion in that one I think.
Somebody might have been trying to do several things at once,
but maybe all we end up with is a jumble if that happens.

(reading) THE PEACEFUL AND COMPETITIVE FEELINGS I GET
HERE GIVE ME A TRANQUIL MIND.

Class: (laughing)

T: That one's a little bothersome, isn't it.
Whatever somebody meant by that,
... what's confusing about that.
Let's help that writer out for a minute.
... Rachel. (T apparently calling on S with hand raised)

Rac: Well for one thing.
"I" is the subject.

T: ... Okay.
The -
What is that -
What difference does that make.

Rac: Well ... well .. "I" isn't the subject of the ... is not supposed to be the subject (then voice trails off) of the sentence. (laughs, nervously??)

T: Good.
Because the "I" is in there.
maybe ... maybe the focus is more on the I and not on the place.
That's one thing.
What else is confusing about that to someone who finds it confusing.
.. Sherry. (T apparently calling on an S with hand raised)

She: Um ... peaceful and competitive are .. like opposite words.

T: Okay.
These are opposites.
And then where are you left at the end of the sentence.

Various: xxx
Tranquil (uc).

T: Back here which goes with that.
And there's just something -
what .. whatever it is that person is trying to do.
they're are so many elements thrown in there,
now ... maybe somebody wants to talk about the two
sides.
but then why do you say it leaves you tranquil.
if some of it is competitive.
I don't see -
It's hard for me to see tranquil and competitive.
.. Okay.
There's something about that that just d' -
It's jarring,
which maybe makes it interesting,
but it's also a little bit confusing.
So somebody needs to rethink now exactly what I was
trying to get at in that one.
... Okay?
Any others you want to talk about?

V: 3377
Anything else that looks fuzzy ... to you.
How about,
(reading) THE VARIETY OF PEOPLE OBSERVED IN 'MCDONALDS
IS EXTRAORDINARY.

212
... What do you think about that sentence.
... Jackie. (T calls on her)

Jac: Isn't it (uc) kind of like the focus sentences with the
Burger King and the other McDonalds?
I mean,
"variety".
I mean it's like "unusual" (= another word class
discussed).
"Variety of people".
What kind of variety. (nervous laugh)

Class: (mumbling)

T: I have (uc) a hard time seeing "extraordinary".
"Tacky" I can begin to see.
"Extraordinary" is a little bit .. curious to me.
I don't know exactly what that means.
"Variety" is such a big word like "unusual",
that maybe there's a better way of doing it.
In addition to that,
... tell me what you think the most -
... Yeah. (acknowledging a bid)
Yolanda.
Go ahead.

223 Yol: No.
I wanted to talk about a different one.

T: A different one.
Okay.
Hang on just a minute.
In number eighteen.
the one where we said the variety is extraordinary,
what do you think the person,
what's the word in that sentence that's the key
operative word that somebody is trying to work on.
... Andy. (T calls on him)

228 And: "Variety"?

?: People. (sounds like from back of class)

?And: ... It could be "extraordinary" too.

229 T: That's two opinions.

Are there any more?

?: Uh huh. (uc)

T: Somebody said "variety".

Somebody said "people".

?And: "Extraordinary".

T: And "extraordinary".

And I'm not sure which it is.

... Among other things,

that lazy "is" verb in there,

doesn't help me.

It says that a condition exists,

... but I don't know what I'm supposed to do with it.

I don't know whether somebody's trying to focus on

"extraordinary",

and tell me something about the "extraordinary variety

of people",

in which case that's the topic and there's no verb yet,

if if the "extraordinary va'"-

(t to the Ss) Get a pencil in your hand.

Find a piece of scratch paper real fast.

Write down,

(reading) THE EXTRAORDINARY VARIETY OF PEOPLE AT

MCDONALDS.

... (class murmuring)

Now.

I gave you a topic.

Make up something in your head and finish the sentence.

Girl: The extraordinary what?

T: I just,-

I took everything in that whole sentence and put it

into the subject. [T points to board]

THE EXTRAORDINARY VARIETY OF PEOPLE AT MCDONALDS.

Now I've got a subject.

... Now make up a sentence,

and tell me something about McDonalds.

That has to do with the extraordinary variety of

people.

... ...

I know you're not all writing about McDonalds.

Invent.

You've all been there.

... Finish the sentence.

All you ... all that ... all that writer really has is a
subject.
... "The wide variety of people".
Okay.
What about it.
252
Tell me something.
What does it do.
... What does it create.
What does it cause.
... ... 
As soon as you get one raise your hand.
... ...
Jenny.

258
Jen: Well I see a lot of just foolish, -

T: (interrupting) I didn't say "see".
I said finish the sentence.
"The wide variety of extraordinary people at McDonalds"
... what?
Tell me about it.
What did it do.
Finish the sentence.

Boy: xxx

262
T: No.
Not write another one.
Use that as the subject and finish it.
Give it a verb.
Say something about it.
... Somebody asked me what did I mean the other day,
when I said the aboutness in the verb.
That's what I'm trying to get at.
What about the wide variety of people there.
... Afroz.

Afr: Create a friendly atmosphere.

266
T: Creates a friendly atmosphere.
Who did something different?

Girl: Provides a visual landscape (voice lowers) every
time you walk in.

T: Uugh! (negative, heavy sigh)

Girl: I don't like the "landscape".

T: Woo! [Dan raises his hand]
I like the "landscape".
But I don't like the "provides".
Okay?

Provides a visual landscape every time you walk in.
/Several Ss laugh/
I don't know.
That sounds kind of interesting to me.

Dan.

Dan: Make me laugh.

T: Make you laugh.

/(Class laughter)/

Sure.

That's wonderful.

It, -

Aileen.

Ail: I put,

"It creates a warm friendly atmosphere, that makes many people feel comfortable". (uc)

T: Creates a warm friendly atmosphere that, makes many people feel comfortable.

Okay.

Joanna.

Joa: I put,

"shows how popular fast food is". (uc)

T: Shows how popular fast food is.

Now look.

In less than three seconds.

Five seconds.

Ten seconds maybe.

You gave me about five different good focus sentences, that took a few lazy adjectives, put them into the subject, and then said something about it.

That's one of the tests that you want to apply to your own sentence.

Did I write a lazy sentence that just sort of lumped the adjectives in the end, and could I take those adjectives and modify the subject with it, and then say something important.

... Does that unusual, - Does that jungle atmosphere attract senior citizens and youth alike?

Or does it ... create a health hazard for the city of Palo Alto?

Or ... does it ... I don't know.

Let me see.

Jungle atmosphere (slides words as if using them to prod her thinking).

Transports patrons instantly to the other side of the world.

I don't know.

I hadn't thought about it.

But get your, - get some action in your sentence besides making it
interesting.

Take out those lazy verbs, and see if you can put the modifiers next to the subject, and then say something about your topic. Okay? .. Who else had a. - Uh Yolanda. You had a question about one.

Yol: No. I didn't have a question. I thought number thirty was pretty good, because it gave you a feeling of it.

T: Number thirty was pretty good, because it gives you the feeling. Maybe we should look at some good ones since we've looked at some that have some problems. (reading) THE POSITIVE ATTITUDES OF THE AUDIENCE AND THE WARM FRIENDLINESS OF THE BASKETBALL COURT .. ENCOURAGE THE PLAYERS TO PLAY WELL AND FEEL HAPPY.

Class: (laughs)

T: What do you think about that. ... Mary?

Mar: Well it’s it’s it’s reall’ it’s goo’ .. it’s good. But it .. it’s kind of wimpy (uc). I think the tense is wrong. "Encouraged him (uc)?"

T: Well "encouraged" is okay. I in fact that’s a stronger action verb than other .. than some others are. But, -

Mar: (interrupting) But is (uc) that a past tense? To say encouraged? (uc) (utterance may be = if it were past tenses, would that be ‘encouraged’?)

T: Well no. Somebody might want to write in the present tense. That’s okay too. [Dan & DB have their hands up] .. Doug?

Dou: I don’t understand “the warm friendliness of the basketball court”.

Class: (laughter)

T: You’re having trouble with “warm friendliness on a basketball court”? 
Dou: Well just .. it says "of the basketball court". And so.
I. -

T: (interrupting) You think the basketball court is warm and friendly?

Class: (laughter)

T: No. (apparently confirming something Doug or did). [Dan raises his hand higher]
You (another S) do?

Girl: Well see it's inside a church. And it's explained .. in the paper.

T: It's explained in the paper. [Dan's hand is still up]
So somebody really does feel like it's not a warm friendly puppy,
it's a warm friendly basketball court. As opposed to a ... competitive something or other, like that that we talked about before. Dan.

317 Dan: I don't see how the person knows that the players are happy.

Class: (laughter)

T: Oh ... that's .. that's easy. Maybe the person is one of the players.

?Dan: Well .. the point is. -

T: Okay?

?Dou: Maybe they're smiling.

?Dan: Well he doesn't really smile there. (uc)

331 T: Okay. (Class mumbling [JO, DS, DB])
V: You got the right idea there.
3475 At least you know how to ask some questions.

(continues)
The first part of this segment is transcribed on 1c-p-4-1; the present transcript takes up where that one leaves off.

The students have been revising a student's paragraph on the Rick Springfield concert.

345 T: Now.
   Let's see.
   ... ... (class laughs) Ah ... shall we go ahead with, —
   Yeah.
   SHE TELLS MY YOUNGER SISTER AND ME TO INVITE FRIENDS OF
   OURS WHO WOULD LIKE TO GO.
   Right.
   Okay.
   What what friends. —
   Okay ... now ... uh uh we got the idea,
   now.
   what friends might like to go.
   ...

x: (overlapping) Rick Spring', —

T: I think uh, —
   Sh.
   I think of who who might like to go.

Sam: xxx

T: What?

x: xxx (giggles)

T: I think of. —
   All right.
   Yeah.
   I think of uh ... I think of all the fir' Rick
   Springfield fans I know,
   and, —
   maybe on the other hand.
   Right?
   Some people have never heard. —
   Nuh ... and s' s' sometimes and others who have never
   heard of him.
   right?
   So ... you know.
   There's all kinds of possibilities.

358 ... So then ... in other words,
   always push yourself.
push yourself for details.
It'll just make.

It it it'll make .. it'll make .. you'll have more fun
writing,

and,
it'll be .. it's mo' it'll be more interesting to read.

... Okay.
Now in the next case .. though,
we have .. we have another pro' problem.
I think the reason I picked these .. uh paragraphs was
because of two things that we all need to work on.

Okay ...
WE ALL PLANNED THAT WE COULD GO IN TWO CARS WHICH WOULD
BE CONVENIENT.
THERE WERE SOME SEVEN OF US WHO WENT.
WE ALL WENT OUT TO EAT SO THAT WE WOULD .. uh .. NOT
HAVE TO STAND IN LONG LINES AT THE CONCERT JUST TO
EAT.

Okay.
.. Now.
.. What is there, -
Before .. bef' wh' wh' wh' wh' what do these, -
There ... how many sentences do we have here.

One two , -

Robin: Four.

T: No.
Actually three right?
Three sentences.
.. Right.
It could be mo' .. it could be more.
But we have three sentences.

Uh ... what do those ... what do those sentences have
in common.

What is the common idea that runs through them there.

Girl: xxx some people who are going to the concert.

T: Yeah.
But what idea do they have in common.

X: xxx

T: What?

X: xxx

T: No .. nah nah.

X: xxx

T: What?
.. No.

What idea do they have in common. 
Robin: What they .. uh .. what they did.

Gabv: (overlapping) xxx

T: Okay.
Why they can what.
Okay.
Why did they do what they did.
Shh.

Gabv: For convenience.

T: Ah!
Good.
All right.
So what they have in common is what.
... What?

Gabv: Convenience?

T: What?

Gabv: Convenience.

T: They ... y' they they have the i'. -
These are things that ... they they did that they ...
that make the trip more convenient.
Okay.

X: Oh.

T: Okay.
So I'm going to give you one sentence.
All right?
Um ... which would be ... ... we did what we uh,
let's see.
.. We did what we could to make the trip to make the
trip convenient.

Okay.
Now.
What I want you to do.
Okay.
You got that?
(repeating) We did what we could to make the trip
convenient.
Okay.
Now I want you to write one more sentence.
and get in all .. the ideas that ... are .. here.
Write it.
Write write it.
Don't talk.
Write.
Sh.
... ... (T writes on chalkboard)
Okay.
Robin. (calls on her)

Robi: Um also...

Wait.

What was it?

T: (repeating sentence) We did what we could to make the trip convenient.

Robi: WE DID WHAT WE COULD TO MAKE THE TRIP CONVENIENT. ALL SEVEN OF US PILED INTO TWO CARS AND THEN WENT OUT. - Wait. AND THEN WENT OUT TO EAT SO THAT WE WOULD NOT HAVE TO STAND IN LONG LINES AT THE CONCERT.

T: Good.

... Excellent.

Could you do better than that? (sound rhetorical)

(laughs)

Yeah uh ... read that again.

Robi: Oh um.

T: (interrupting) Okay.

(repeating sentence) We did what we could to make the trip convenient.

Right. (cue for Robin to go ahead)

Robi: ALL SEVEN OF US PILED INTO TWO CARS AND THEN WENT OUT TO EAT SO THAT WE WOULDN'T HAVE TO STAND IN LONG LINES AT THE CONCERT.

417 T: Okay.

Now let's talk about how she got to that. 'Cause it's sort of ... you know ... it's something to look for when you revise.

You want to pay at.

Look at this sentence.

THERE WERE SEVEN OF US WHO WENT.

What is the only word in that is ... done ... that moves the paragraph ahead at all.

x: Seven.

T: Seven. (confirming tone)

So we can just take that "seven" and make an adjective out of it.

the sh' ... the way ... uh ... Robin did.

All right.

Uhm ... ... and ... let's see.

WE ALL WENT OUT TO EAT SO THAT WE WOULD. - Actually the rest of it is uh ... is not. -

... oh.

Yeah.

Th' th' th' th'
Let's see.

So th'...

Let's see.

... WE ALL PLANNED THAT WE WOULD GO IN TWO CARS.

... and y'... so she made .. put the "seven" into the ...

... into that sentence.

And uh ... yeah.

That was good.

So.

So that's two things to ... uh ... keep an eye on.

whenever you can ... uh .. increase .. detail.

whenever you can ... add .. detail.

... and whenever you can ... uh ... combine sentences.

The ... we ... I think the drills we did earlier ... uh earlier you know.

with ... with uh ... combining sentences has helped you.

Because ... the .. we .. I don't get a lot of this now.

I get ... I don't get a lot of sentences that could obviously be combined.

I think you're making some kind of effort to make links and connection.
My friend Dominic has a crazy sense of humor. His cousin Kevin came over one day to visit him for the weekend, and waited in when Dominic and his brother were getting their hair cut. Dominic's dad had finished cutting his hair and asked Kevin if he wanted his hair cut too. Kevin replied, "No, but I ended up getting my hair cut anyway, because Dominic talked him into it. Dominic has a way of getting people to do things they don't want to. This set up for Dominic's little joke. What did he say? I forget. They weren't very hard for Dominic to talk Kevin into it (for the fact Kevin has this wild desire to be like Dominic because Dominic has a way with the ladies). He did so by telling
Kevin got his hair cut and needless to say it looked pretty awful. Dominic thought it was his greatest joke ever. His little 'joke' sent Kevin home crying, and left him rolling with laughter.

Dominic is the type of person who will joke around whatever the cost, to satisfy his hunger for laughter.
His first thing people notice about Domenic is how neat, clean, and how well he dresses. He wears nice, expensive, sometimes straight out of a department store. In fact, his features suggest he is a professional model; smooth, complexion (tan), wavy hair, deep hypnotizing brown eyes, and an extremely well built body. He wants us to be sure he looks "stately" if not his best. Each time I see Domenic I think of all the crazy pranks he's pulled on people. His outrageous sense of humor must sure to make you laugh.

For Domenic the essential thing in life is laughter and to satisfy this hunger for laughter he goes to the extreme to pull any pranks possible, even any pranks impossible. For example...

One day Domenic's cousin, Kevin, came over for a visit one weekend. When Domenic and his brother, Terrance, were getting their hair cut, Domenic's dad had finished cutting both Domenic's and Terrance's hair and asked Kevin if he'd like his hair cut as well. Kevin replied "Sure!" Domenic was in one of his "pranking" moods and thought to himself "what if I do my best?" Terrance asked him "Really?" Domenic said "Sure!" and began to make Kevin laugh. Domenic then a man of getting people to do things they don't want to do appealed making them into "defenders with their heads under water." Domenic set up a false hair salon, Kevin was unknowingly, let Domenic cut into it...
Demonic said, "Get cut in more, then. I'll lend you good look."

Kevin said, "Has he washed it off yet?" Demonic said, "We just took it out."

"No man, I changed my mind. I don't want it cut that short anymore. I can deal without one," Kevin replied. "Like you're tough. It was pretty rough."

Demonic said, "Get cut in more, then. I'll lend you real good look."

Kevin said, "Has he washed it off yet?"

Demonic said, "We just took it out."

Kevin said, "Has he washed it off yet?"

Demonic said, "We just took it out."

Kevin ran his fingers over it. "It looks great! Run your hand over it. Can't you feel the waves?"

Kevin said, "As he's away, you better take care of yourself on your way home! All the girls are going to follow you like a crazy!"

Kevin runs his fingers over what appears to him to be waves, but are actually wax and his hair shaven out. Demonic tries to wash it off, but Kevin's hand is all over it. Kevin's hand is the terrible sight. Demonic appears out of nowhere looking as tranquil as any other.
kevin angrily replies "what's the problem? what's the problem? my hair's the problem! you lied to me, Dom! I hate you, man! don't talk to me! get away from me! do not talk to me!"

Domonic tries to reassure kevin his hair doesn't look that bad, but kevin leaves in disbelief. this little prank sent kevin home in tears, and left Domonic rolling with laughter. Domonic thought this was his greatest joke ever.

Domonic's "little jokes" will someday backfire on him, but knowing how clever Dom is, he'll think of an even better joke to gain revenge on the person. Domonic's expensive taste of humor carries him to the extreme—just for the sake of humor—

[Text continues on next page]
My eighth grade teacher, Sister Carolyn Marie, was the moodiest person I have ever known. One minute she can have a grin stretching from ear to ear and then the very next minute that grin can turn into a nasty snarl. One day while teaching a math lesson, she preformed her Dr. Jekyll and Mr. Hyde routine. Sr. Carolyn was writing an assignment on the side board when she saw a student turn his chair to face the side board. She immediately snapped at the guy and made some real terrifying threats. "Right now you deserve an 'F' in conduct. Turn around and face the front of room!" I thought he had all the reasons in the world to turn his chair since his
desk faced the front of the room. After a while, Sr. Carolyn realized what a fool she had just made of herself and came up with at least a dozen excuses for the class for what she had just displayed. I shall always remember Sr. Carolyn as the nun with a split personality.
Dr. Carolyn,

My eighth grade teacher, Dr. Carolyn, was the most memorable person I have ever been acquainted with. One minute she can be running from ten to ten, then the very next minute, that gain can disappear into a nasty blaze. One day while teaching a math lesson, she displayed her Dr. Jekyll and Mr. Hyde routine. Dr. Carolyn was scribbling an assignment on the side board when she saw, in the corner of her eye, a little sharp, sharp eye. She saw a boy turn his chain to view the side board she had been gazing at all day long and pointed on this opportunity to snap at someone and made some terrifying threats at the guy.
"Right now you deserve an 'F' in conduct. A is 15 hours away right now!" she screeched at the top of her lungs. I thought the guy had all the reasons to turn his chair since he faced the front of the room and there was no way he could have gotten a glimpse of the side board otherwise. After a few minutes passed, Dr. Carolyn realized what a feet she had just made of herself and said, "I have a cold and really didn't get enough sleep last night...I apologize for being so rude, but don't annoy me and I won't get at you." She came up with at least a dozen excuses similar to that to justify her actions. I'll always remember Dr. Carolyn as the mean with a split personality.
My eighth grade teacher, Sister Carolyn Marie, had green eyes and short, curly brown hair which she loved to run her fingers through. She stood at height of five foot nine inches and towered over quite a few people. She possessed a dominating personality that could easily shatter any stereotype of nuns that Hollywood with the aid of its silver screens, molded into our minds. The first thing that came to mind when I thought of Sr. Carolyn was her moodiness and how they would change almost as fast as the speed of sound. Whenever infuriated, her fingers would twitch frantically by her sides while her eyes became glassy and cold. This stare of hers could send chills up the spines of almost everyone in our class.
At certain times, Sr. Carolyn could work herself into a mood where she is notably demanding. She would expect our home and school work to be nothing short of perfect, otherwise, we'd have to start over again. Everyone dreaded this particular mood for we knew it would result in many frustrating hours of doing and re-doing what we had done before. On one occasion, when more than half the class flunked a test on punctuation, Sr. Carolyn decided to reteach the material again in more detail. Again she gave the whole class a test, yet again some still failed. This caused her some concern, unfortunately for our class, concern made Sr. Carolyn edgy and positively mean. She promised
as that the whole class would keep studying punctuation until we got it right. Eventually every got squeaked by, but the price Sr. Carolyn had to pay for a class who understood punctuation inside and out was a class who was also sick and tired of punctuation.

In contrast to being demanding, Sr. Carolyn could also be, at times, kind and compassionate. She has shown her benevolence in several ways. For instance, the month before high school exams came out, she offered to tutor anyone interested in Algebra. Another time, when our regular volleyball coach broke her arm on a hazardous ski trip, Sr. Carolyn volunteered to help us out for the rest of the season. Once Sr. Carolyn really came through on compassion
when one of her former students had a personal
dilemma. The girl, Rita, lost her mother when
her father accidentally gunned down his wife
during a violent argument. Being a lonely fresh-
man at a new high school, Rita turned back to
her old school friends, and teacher, for comfort
and support. Sr. Carolyn was always there to
help her with homework in the afternoons and
made Rita feel less lonely.

One weird thing about Sr. Carolyn was
how interchangeable her moods were. One
minute she could be grinning, then the
very next minute, that grin could fade into
a nasty snarl. One day while teaching a
math lesson, she preformed her Dr. Jackie
and Mr. Hycle routine. While scribbling an
assignment on the side board, she saw, in the corner of her owl-sharp eyes, a boy turn his chair to view the board. Sr. Carolyn had been growling all day and pounced on this opportunity to snap at some. She screeched several terrifying threats at the top of her lungs. "Right how you deserve an F in conduct, Turn around!" After a few minutes ticked by, she realized what a fool she had just made of herself.

"I have a cold and didn't catch enough Z's last night," she said with a chuckle. "I apologize for being so irritable, but don't bother me and I won't yell at you, ok?" She came up with at least a dozen or so excuses similar to that to justify her actions earlier.
Sr. Caroline was a woman of many different kinds of moods, all of which contrasted each other and dominated her personality. Having to guess her every mood and what to say around her from time to time got tiresome and tedious. We would often get "chewed out" for the smallest things, yet we sometimes got away with murder in her class. One thing I noticed about her was that she only treated students like rejects, but she always spoke to adults with the upmost respect. To this day I still have not found the key that unlocked the answer to her strange assortment of moods. I will always remember Sr. Carolyn as the nun with the split personality.
The purpose of group work and these editing sheets is to help the writer identify strengths and needed improvements in his or her paper before it reaches its final form for evaluation. Please work hard to make your suggestions helpful and specific.

What did you think of the introduction? wow  
   
   Why?

What is the most interesting part of the paper?
   Why? Feel tense "sweat & cause pain"

What is the part that needs the most work?
   Why? Showing more of the place - decide the weights

Help the writer identify any places where there is not enough "showing" or too much showing.

Other comments: Needs a little work - I think. That's "perfect for communicating?"

Identify the focus of the paper as you understood it: Weight Room - etc.
The purpose of group work and these editing sheets is to help the writer identify strengths and needed improvements in his or her paper BEFORE it reaches its final form for evaluation. Please work hard to make your suggestions helpful and specific.

What did you think of the introduction? good, ok, ho-hum
Why? 

What is the most interesting part of the paper? none

What did you think of the introduction? **good**

Why?

What is the most interesting part of the paper? *can't decide*

Why? *can't decide*

What is the part that needs the most work? *can't decide*

Why? *can't decide*

Help the writer identify any places where there is not enough "showing" or too much showing.

Other comments: **little English**

Identify the focus of the paper as you understood it: **The weight room**
The thing I like most about this paper is: It makes you be there.

The thing I need to work on is: More doing instead of showing.

One thing I tried to work on in this paper is: Making the person be there who reads the paper.

One thing I learned from doing this assignment is: It was not as easy as I thought.

My evaluation of this paper is: Good.

I personally like it.

STUDENT COMMENTS:

Proofreading partner: Robert Schilling.

An excellent essay and it flows nicely. It is good simple. Good introduction, good title, interesting good topic.

TEACHER OBSERVATIONS

Comments: This is an interesting and unique essay. It lacks enough detail and activity that people feel like they understand the story.

The only two things I would change are:

1. More to work on in your next paper include you had less math, to work from.

Evaluation: 10

DIRECTIONS FOR TEACHER READER:

Please correct:

GRAMMAR/PHRASES: all major some few none

COMMENTS/CONTACT: all major some few none
ONE HEAVY PLACE

After a hard day of long, exhausting school I feel kind of down. That is where one of my favorite places comes in very handy. It is a weight room at the Y.M.C.A, and it brings up my spirits. As I walk into the Y.M.C.A in shorts, I am feeling a little better. The weight room is a peaceful place that also offers a great challenge, and that makes me feel both physically inspired and mentally at ease.

I walk into the weight room and find it pitch black with no noise at all. I flick on the switch and light bursts out everywhere with a rhythmic sound building up which is the fan. I stand in a room approximately 15 yards by 10 yards that has many different colors and a comfortable atmosphere. There are about 10 different weights that are machines, and all basically the same color. The cushions on them are light brown, and all the metal is stainless steel. The weights that are lifted are brick-shaped and black with white numbers on them to show the amount. There is a brownish yellow carpet covering the entire floor. With my back to the entrance on my left, there is a beautiful picture covering the whole wall. It is of a green forest on a crisp morning. It is not possible to see more that 20 yards ahead. However, with all the green leaves, massive trees and glimmering sunlight against all the shadows it adds a relaxing feeling to the weightroom.

To the right of me is a mirror covering the entire wall which is good because it lets you see all the surroundings while facing that way. The ceiling is white with metal fans sticking out. The air and a pleasant breeze hits my body from the...
fan. The recently-cleaned room makes me think of cleaning liquid. With all the different colors and the peaceful atmosphere, I feel relaxed mentally and lifting weights becomes fun.

With this peaceful background, the main course is what I like best, and that is weightlifting. That is what inspires me. It is a great challenge to push as hard as possible and not to know whether the weight will move or not. There is also the aspect that I will gain strength by lifting weights until I can't budge them any more. I feel tense looking at all the menacing weights, knowing they will make me sweat and cause pain. However, the satisfaction of completing a challenge is the best part for me. While lifting, I usually feel like quitting, but I look at all the positive notes on the subject and I always do my best.

Occasionally I meet people there, and I enjoy having conversations with them. We are all doing the same thing and our goal is the same: to improve strength. They usually feel the same way about the Y.M.C.A. weight room as I do, and they might enjoy the same hobbies, such as sports. So there is always something to discuss with people. Other times, there are people who are totally different from me. However, I can still communicate with them because the feeling I get here makes me feel comfortable with anybody.

This is an ideal weight-lifting place for me because there is more to it than just lifting weights. The feeling is comfortable, and it is perfect for communicating. There is also a major challenge. All this creates the most important aspect of this experience: the feeling of coming to the Y.M.C.A. feeling down, and leaving on top of the world.
The purpose of group work and these editing sheets is to help the writer identify strengths and needed improvements in his or her paper BEFORE it reaches its final form for evaluation. Please work hard to make your suggestions helpful and specific.

What did you think of the introduction? wow good ok ho-hum
Why?

What is the most interesting part of the paper? good descriptions
Why? of atmosphere, and people

What is the part that needs the most work?
Why?

Help the writer identify any places where there is not enough "showing" or too much showing.

Other comments: I think your paper is really good - don't need much revision (or none)

Identify the focus of the paper as you understand it: Mitchell Dorv - it < person atmosphere

[ ] All minor errors

[ ] None
"Mala! Mala!" yells a ruddy, dark-faced man. The words seem to roll off his tongue in a series of up-and-down tones. He is casually clad in a white T-shirt, shorts, tennis shoes, and a forest green baseball cap to complete his attire. It reminds me of Al Pacino with his hawk-like brown eyes sunken in thin sockets. He stands with his knees bent and arms out-stretched, bringing to mind a tightly coiled up spring as he waits for the volleyball to be served to his team. "Puff" the dull sound of a hand coming in contact with a ball echoes through the air. All the volleyball players spring up in action as the white volleyball sails over the orange, nylon net. A pleasant, excited gobble of Spanish flourishes through the air while the game continues. These volleyball players are just some of the many people who come to Mitchell Park for recreation, gatherings, and picnics for its large size and friendly atmosphere.

When someone says "Mitchell Park", what comes to my mind? I immediately see a large grassy area, divided into many fields by humpy red dirt paths, and dotted with artistic sculptures, tall trees, short trees, pine trees, and so on. All the dirt paths are lined with wooden benches and large, dumpling-shaped surrounding the park are nicely kept schools, street, and a library. Several playgrounds are enclosed in the park as well as picnic tables and barbeque grills.
"Just beat it! Just beat it!" blares a radio loudspeaker. Michael Jackson’s high pitched voice threatens to drown out the chirping birds, the pitter-patter of small footstep running past, the clink, clink of the trinkets, and the joyous laughter and shouting all around me. Clay my ears and wring as another radio is thrust on full blast playing foreign folk music featuring longhorns and strings. Sitting against the worn-out wooden bench, my cheeks warm up from the heat of the sun shining directly down me, and a warm breeze stirs my hair. Smoke smarts my eyes as a stronger breeze blows the flames from a redbound firebrick grill in my direction. My eyes water and blink rapidly to clear the faint pictures I was seeing. The wind keeps blowing and soon my nose flows up as the tantalizing aromas of hamburgers, hotdogs, and chicken quash visions of thick, juicy hamburgers, meat in a toasted bun float around in my mind. My pleasant picture shatters as the lunch of something burnt invades my senses. I tried to place myself as far away from this area as I could.

I walked to the opposite side of the park, arriving in the middle of a soccer game. Two men running full speed down the green field, toward a white wooden goal post. Chase intensity...
after a black and white soccer ball, with their
hair plastered against their faces, drooping
perspiration. Their muscles are clearly defined
through their socks as their cleats fly over the
field, kicking up dirt. One team wears dark
green shirts and the other light green shirts.
Static excitement quivers in their air as the two
men vie the goal post. All the spectators on
the green wooden bleachers by the sidelines lean
forward with their foreheads creased while
watching the two men.
"Let's go," shouts a man on the dark green team.
"Come on Mike! On the line on the line"
"Bill! Bill! Nice shot!" yells the man on the
light green team. Obviously pleased with the
goal just made. Do you need to put the container
continuing on around the park. I pass
another soccer game and a sand box. In the
sand box, two one-stripped swings, and two
sings are suspended attached to a four-legged
metal frame. A little boy of about five years old
plays on the swings, the wind rustling his light
brown hair. A blonde-haired girl of about the
same age plays in the sand with brightly
colored shovels and buckets. Two women similarly
dressed in blue jeans and a jacket watch the
kids from the edge of the sand box.
I walk on, tired of watching them play.
A stop by a wooden bridge which is over a creek.
On either side of the bridge are tennis courts. Look down even the slightly curved railing of the bridge, the slow stream of clean colored water moves through the creek, glistening as the sun shines on it. It's very peaceful here despite all the noise, a carefree mood seems to descend upon me as I bathe in the warm sun. A loud, roaring helicopter flies over, causing the bridge to tremble slightly. A middle-aged couple, the woman, short and plump, her husband (?) tall and skinny, walk silently together, holding hands, kissing each other every few minutes. Behind them a small blonde-haired girl struggles to follow them as she pushes a little stroller.

Soon, a woman dressed in a white T-shirt red shorts, white and blue jogging shoes jogs past the bridge. She has been jogging for some time now. (I feel admiration for this woman who has the will power and endurance to jog.) Meanwhile, coolly dodging little children, dogs on their sleek black dirt racing bikes, and other people constantly using the Red dirt path, her short brown hair and shirt are stained with sweat while droplets of water doff her upper lip. Her breathing comes in short gasps I decide to walk after this lady jogger for a little while since nothing spectacular was happening at the bridge. I stop following her as
I arrive at the tennis courts. Inside, almost everyone wears white with an occasional glob of color here and there. The court itself is green surrounded by pink pavement. Being a very bad tennis player myself, I sit in the grey bleachers inside the courts (initially observing two men playing tennis, hoping to learn about some of their skills. Both men had tan, bronze colored skin, but one man had curly, brown hair and the other had straight brown hair. Each stroke they made was graceful and smooth.

I close the tennis court gate behind me, leaving the world of bouncing tennis balls. I am back where I started my journey near the volleyball game, but the sun has gone down a bit in the sky, and the wind blows with more gusto.

Next to the volleyball game which I first observed is a sunken concrete seating area. Something is taking place there that wasn’t before. I decide to go in for a closer look. A group of adults are in the sink practicing something that looks suspiciously like kingfish in slow motion. The group of adults are all silent, with their brows furrowed in deep concentration. Each movement is performed at the same time. Each person of the group moved each part of their body slowly and deliberately. It seems as if these people are in a world of...
their own, because even children running around playing tag doesn't disturb them. I shiver as a cool wind ruffles my hair. The sun, not radiating any warmth, means time to go home, I muse. I unlock my bike and proceed to get on it. As I ride away, I look back and think how wonderful it is that so many different kinds of people come to Mitchell Park.
