The use of a model of an effective inservice program developed in Fort Thomas, Kentucky, revealed that in order to provide better inservice programs for experienced teachers, the programs should be an assessment of the needs and professional concerns of the teachers as directly expressed by them. Those developing the program should insist on collaboration among all participants in organizing and planning. The focus of the program should be on specifics that may be translated successfully into practice. Inservice should be designed so that it reflects the developmental stages of the teachers involved. For instance, beginning and developing teachers are willing to accept information and advice from authorities, but experienced teachers usually see little need for outside "experts" and would prefer to set up and carry out their own inservice programs. Effective inservice programs will provide opportunities for teachers to reflect and to discuss the merits of what they do and will encourage the establishment of a peer support system that will carry forward the benefits of the inservice. (A detailed schedule of a two-week writing workshop for teachers and students, which was used in the Ft. Thomas inservice program, is included.) (SRT)
EFFECTIVE INSERVICE: WHAT DOES IT TAKE?

EFFECTIVE INSERVICE: WHAT DOES IT TAKE?

We've all seen the scene, maybe even been participants in it—the annual review of what inservice has been planned for the coming year. Usually the review comes at the big faculty meeting prior to the opening of school when the superintendent, principal and curriculum coordinator all do their best to whip up enthusiasm for the year's inservice program. The undercurrent of faculty critiques sweeps through the room:

"Another Madeline Hunter series—I can cite that woman in my sleep."

"Oh, must be expecting drug problems again—we've got two sessions on dealing with controlled substances."

"Hey, here's one that should keep us awake—wellness and the burned out teacher."

"Why don't they ever ask us what we need or want to do with inservice time? We could offer some good ways to use our time that would benefit the kids and ourselves."

Why, indeed. Although a number of school districts do try to involve teachers in planning inservice, many others do not. Missing from many inservice programs is the basic understanding that adults learn differently from students, yet, like students, they too, learn in ways which, according to Siedow (1985), are "parallel to their age and developmental levels." Yarger and Mertens (1980), for example, suggest that as teachers move through six stages of development, experiences in each of those stages contribute to their professional knowledge and skills. See Figure 1.
Teachers in the final four stages tend to exhibit certain behaviors which have implications for inservice. In Stages 3 and 4, teachers, still neophytes in the field, look for "things that work" and are willing to accept information and advice from their preservice authorities. Typically, these teachers want to know the "best" or the "right" way to conduct their instruction in the classroom (Bents and Howey, 1981). Teachers who have reached Stage 5 tend to show more confidence in their own abilities, their content knowledge has increased, and they are more aware of themselves as professionals. Most often these individuals want to explore several alternatives in approaching a teaching situation and want to broaden their horizons as professionals. In the last group, the experienced teachers, we may find hints of complacency but also a desire to reflect and share experiences with other teachers in this category. Frequently these individuals see little need for outside "experts" and would prefer to set up and carry out their own inservice program, often independent of any other district efforts (Yarger and Mertens, 1980).

Scheduling certain types of experiences for those in stages 3 and 4 and other experiences for those in stages 5 and 6 makes good sense. Unfortunately, teachers in stages 5 and 6 rarely get the opportunities for
inservice that reflect their needs at this point in their careers even though Berman and McLaughlin (1978) and Lawrence (1974) clearly show that successful inservice most often comes from training that focuses upon participants' individual needs.

Putting together an inservice experience for teachers in the last two stages of development need not be a difficult undertaking, since it will tend to reflect the components of most effective inservice; the key difference is the role which teachers take in the planning and carrying out of the inservice. The process for developing these inservice experiences can be demonstrated by using a model developed in the Ft. Thomas, Kentucky, school system.

Assessing Needs

All successful inservice planning begins with a needs assessment (Wood, Thompson and Russell, 1981). Although the usual procedure is to send out surveys, construct checklists and then compile a list of topics from the results, the ideal assessment is the one done by the participants themselves. They perceive a need and communicate it to the appropriate authorities. In the case of faculty within the Ft. Thomas schools, they perceived a need to move beyond the knowledge they had accumulated since their participation in a summer institute conducted by the West Kentucky Writing Project, a part of the National Writing Project network. A number of teachers, therefore, approached the school administration and requested that a special inservice experience be developed that would meet their special needs in the teaching of writing.
Establishing Objectives

The Ft. Thomas teachers had used what they had learned in the summer writing institute for sufficient time—in most cases at least one or two years—to discover that they needed more time to refine their teaching skills in the area of writing. Of particular interest to them was a more thorough understanding of how the writing process works with students of different ages and abilities and a desire for more knowledge about setting up and carrying through writing experiences with students. These concerns quickly surfaced among the teachers requesting the inservice because the teachers knew each other and had worked with each other in the writing institute. In all cases, though, these teachers were either practicing or experienced teachers who had moved beyond the inservice experiences being planned for the younger or less experienced faculty. As a group, they reached consensus quickly on what the inservice experience they envisioned should do for them.

Planning Content

David Memory (1985) suggests that four features should govern the choice of instructional strategies for new content: relevance and potential effectiveness for the classrooms of the participants; (2) ease of learning by teachers; (3) ease of adaptation into normal teaching approaches; (4) the likelihood of having a quick positive influence in classrooms. If early sessions address these features, later sessions can call for more reflection and greater potential for long term change. Since the Kentucky teachers already had experienced the effects from the new content they had received in writing instruction, their interests had to be met in a way that promoted reflection, sharing, and long term commitment for change in their classrooms (Siedow, 1985). These teachers indicated
that they wanted time to develop completely new teaching applications and
to field test them before taking them back to their classrooms; they wanted
time to examine student writing in more depth and to refine their own
skills in evaluating student writing and in conferencing with students
about writing. In addition, they expressed a curiosity about seeing how
other teachers taught writing at different grade levels. The use of
computers in stimulating writing intrigued them as well, especially since
none of the teachers had any basic knowledge themselves about using
computers for generating writing. Finally, the teachers expressed an
interest in doing some professional reading in the field of composition,
something that their previous summer institute experience had not addressed
sufficiently.

Selecting Presentation Methods and Staffing

Anyone planning inservice programs has come to realize that for
successful inservice, teachers have to be involved. "Talking heads" rarely
work with teachers at any stage of development. Instead, demonstration of
strategies followed by opportunities for practice and feedback seem to
bring the highest degree of involvement and the greatest impact. Through
such experience, participants come to see the strategies and/or content as
being relevant and useful; they also gain confidence in their own abilities
to implement the strategies or introduce the content in their own
classrooms.

Zirkel and Albert (1979) found that teachers tend to prefer workshop
settings to conferences, particularly if incentives in the terms of credits
or stipends are involved; teachers want more emphasis on instructional
strategies and less on teaching philosophy; and they respond better to
demonstrations and presentations than to regular academic courses.
Reflecting on these preferences and seeking a way to meet the somewhat
complex combination of needs expressed by the Kentucky teachers, the
district set aside two weeks during the summer for a special inservice
experience. A limited number of teachers and students would come together
to work on writing; teachers would meet for one week by themselves and then
would work with students the second week. With that general format in
mind, the district requested that the director of the West Kentucky Writing
Project work with the interested teachers in designing the experience so it
would have clear benefits for both populations.

A call went out for interested teachers to sign up for the experience,
and parents received notification that their children could apply for the
one week student writing workshop. Sixty children and eight teachers
applied for the workshop. All eight teachers were accepted and 30 students
from grades 1-11 were selected on a random basis from the sixty applicants.
Teachers received a $200 stipend from the district and students were not
charged a fee for the workshop.

Upon acceptance, the teachers discussed with the director how they
would like to see their first week structured. They saw several basic
purposes in the first week's activities: meeting their own needs in terms
of developing more background in the field of writing, becoming familiar
with word processing sufficiently to generate acceptable text, and
developing plans for the second week of the workshop with the students.
Ultimately the teachers settled upon the following schedule for the first
week:

Day 1: A Review of What Has Worked for Us and What Has Not
Expectations and a Plan of Organization for the
Student Workshop
Dividing the Tasks of Planning and Implementation
An Introduction to Word Processing

*****
Day 2: Conferencing with Students--Problems and Refinements
How Others Teach Writing (viewing of selected videotapes of classroom teachers)
Discussion of Ideas for the Student Workshop
Research time--computer practice, small group work

Day 3: Looking at Errors in Student Writing--Patterns and Implications
How Others Teach Writing (viewing of selected videotapes of classroom teachers)
Team Planning Time for Student Workshop
Research time--reading, writing, computer practice

Day 4: Selected Problems in Teaching Writing
Refining Plans for the Student Workshop

Day 5: Review of Plans for Student Workshop
Materials Development
Setting up the Student Workshop Environment

During this first week, the teachers by consensus decided upon a curriculum focus for the student workshop. It would start with exploring various uses of language play, then move to applications of language and finally to the use of language in communication. The teachers believed this orientation would permit them to try a number of new teaching activities while also enabling them to study how students at different age and ability levels responded to the writing process. The teachers decided
to work in pairs, matching themselves with teachers from grade levels different from their own. They then grouped the students so that each team would be able to work with a different grade level combination each day:

Group 1: Grades 2-4 = 8 students  
Group 2: Grades 5-6 = 8 students  
Group 3: Grade 7 = 8 students  
Group 4: Grades 8-11 = 6 students

The final sequence of activities for the second week with the students can be seen in Figure 2 below.

**INSERT FIGURE 2 HERE**

Some special successes appeared during the second week of the workshop which might not have happened had not the teachers been the ones planning the entire experience. As a result of their own explorations of how to produce text on the computers, the teachers decided to experiment with the students, most of whom had not worked on computers before. With access to four Apple computers and two printers, the teachers arranged their work with the students so that all 30 had at least two fairly prolonged experiences with the computer; as a result, second graders produced simple sentence expansion exercises while third and fourth graders produced short poems and stories—all were student generated without benefit of specific assignments. All of the other students used the computer to produce rough drafts and some became proficient enough to edit on the computer. The quickness with which students adjusted to writing on the computer and the growth in text length and quality amazed teachers and quickly alerted them to a potential composing process they had not considered for students.
Another success which came from teacher collaboration was the creation of Ace, the Word King, AWK for short. The teachers, concerned because much of their work was activity centered and not always designed for a specific audience, wanted the students to develop a sense of how important audience could become in writing. As a result, Ace appeared in the form of a letter to each student on the second day of the student workshop. Ace was portrayed as a writer who happened to be passing through the area. Though he could not attend the workshop, he did have some time to write letters if the students were willing to write him. Each day, letters from Ace would be delivered to each student in the workshop; they, in turn, would compose their own replies which would be delivered to Ace at the end of the day. The amount and quality of writing, not to mention the intense interest this activity generated, amazed the teachers and taught them something about the value of audience in the classroom. In fact, students refused to start the day's other activities until they had written their letters, an activity that grew in length each day until it was taking 45 minutes to an hour. During this time, students rarely asked for any help and did not submit their letters to the teachers for critique. The letters went into sealed envelopes addressed to Ace. Again, teachers learned about the importance of commitment to writing, a principle they knew something about but which never had been demonstrated so graphically before.

Evaluating Inservice Effectiveness

The last day of the workshop, the teachers and students sat down for a sharing of ideas and impressions. Students uniformly requested that the experience be continued another year and insisted that they were going to tell their regular teachers about many of the activities the workshop had provided. The teachers, in turn, were amazed at their own abilities,
particularly in terms of teaching writing at grade levels where none of them had had any prior experience. The team approach helped immensely in building confidence and the collaborative planning and sharing which went on each afternoon after the students had gone home at noon turned out to be one of the most beneficial experiences. In fact, teachers expressed a determination to do more collaborative planning, sharing, and teaching in the future. In addition, each teacher took away from the workshop an extensive catalog of teaching applications for various grade levels; the students took home an anthology of their own writing to share with parents.

**Follow-up Assistance**

Even though follow-up is a critical element in the success of an inservice model, the assistance frequently gets overlooked (Bristow, 1985). In most models, the objectives rarely are met completely during the inservice, so the follow-up becomes important for implementation. In this case, however, the follow-up appeared in the content of the model itself, providing teachers with immediate opportunities to try out strategies and then to share with each other the results of their efforts. Building this component directly into the model sets a precedent for teachers when they return to their respective classrooms; in essence, a support system emerges as the teachers, having found the value of sharing and collaborating, find they want to continue the system during the regular year.

**The Final Characteristics**

The next time we plan inservice and we want to avoid as much as possible undercurrents of dissatisfaction, particularly among experienced faculty, we can find it useful to emulate the characteristics of the model portrayed in this discussion:
A. Base the inservice experience on assessment of the needs and professional concerns expressed directly by the teachers involved.

B. Insist on collaboration among all participants in organizing and planning.

C. Focus on specifics that may be translated successfully into practice.

D. Design inservice to reflect the developmental stages of the teachers involved; involve teachers as adults responsible for their own learning.

E. Provide opportunities for teachers to reflect and to discuss the merits of what they do.

F. Encourage the establishment of a peer support system which will carry forward the benefits of the inservice.
