This paper reports on a study conducted to determine the extent to which failing secondary school students can be identified in advance through analysis of student records. The research, conducted in an urban school district, utilized data such as achievement test results, school attendance, and course grades, as well as a survey of sample students and teachers. Study results showed that, despite the availability of large amounts of data and the fact that the analysis did identify some key differences between promoted and nonpromoted students overall, the discriminant analysis procedure was not useful in classifying students as probable failures. Conditions hindering the classification attempt included (1) the overlap of key factors such as attendance and achievement levels, (2) the school policy requiring a student to pass the fourth quarter in a course before passing the course, and (3) the promotion requirement in grades 9 through 11. Implications are that intervention program placement must be done by staff members with more detailed knowledge of student records and reports from teachers. Four tables are included. The appendix includes one page of references, a summary of results of a grade 9 and 10 student survey, and a correlation chart. (IW)
FAILING STUDENTS: CAN YOU IDENTIFY THEM IN ADVANCE?

FAILING STUDENTS: CAN YOU IDENTIFY THEM IN ADVANCE?

OVERVIEW

This study was conducted in an urban school district with an enrollment of approximately 50,000 students in grades K-12. The primary impetus for this research effort was the local Board of Education's concerns about high non-promotion rates at the secondary school level. The Board asked for a means of identifying probable failures in advance with the intent of providing an intervention which would increase passing rates in this group of students.

The research procedure utilized data such as achievement test results, school attendance, and course grades which were maintained in a central computer file for the school system's approximately 22,000 students at the secondary level (grades 7-12). In addition, a survey was conducted with a sample of students and teachers to provide potentially useful attitudinal data. The major issue addressed through the procedure was the extent to which failing students could be identified in advance through an analysis of student records maintained at the school system's central office level.

Data analysis included correlational and discriminant analyses in an effort to identify variables correlated with student failure and which might be used to classify students as likely to pass or likely to fail.

This paper contains a discussion of the research procedures utilized, a summary of the results, and a discussion of the study findings and their implications.

BACKGROUND

Despite lack of clear guidance from research, educators make decisions each year which result in non-promotions for large numbers of students. These decisions for the past several years have been made at a time when schools are under stress to have higher standards and to improve achievement.
levels of all students. At the school system in which this study was conducted, a sharp increase in failure rates (from approximately 3% in 1971 to over 9% in 1984) seems to have been a by-product of a very successful effort to improve student achievement. This increase in failure was especially apparent at grades 9 and 10 where failure rates jumped from about 7% to over 25% in this same time period. Locally developed standards for promotion at these grades required students to obtain at least a minimum number of Carnegie units by the end of each school year.

Following the local Board of Education’s requests for a study of student failure, a review of the literature was conducted to obtain information on this topic and to learn of existing methods for identifying probable failures at the secondary level in particular. Unfortunately, it was found that most of the reported studies had been conducted on students at the elementary school level and few studies have been reported on retention in secondary schools. Fleming and Zafirau (1982) examined grading issues at the secondary level in an urban school district and reported that failing grades and non-promotion rates were related to rates of class attendance and school suspensions. Osborn (1971), in an effort to determine the educational needs of secondary students who were high risk for failure, reported that these students did differ considerably from honor roll students on self-reported variables such as attitudes toward school, problems at home, completion of homework and the need to change one or more teachers. Neither study, however, had results which seemed adequate for classifying potential failures accurately.

The literature on school dropouts contains many studies which identify characteristics of dropouts. Findings from 45 such studies were summarized by a special study committee in Ohio (Ohio Department of Education 1981) which reported that dropouts were characterized by low reading and math skills, poor school attendance, previous school failure, lack of participation in school activities or sports, low economic status, unhappy home life, one parent households and drug abuse. These findings agree with earlier
literature reviews reported by Yudin and others (1973) and Tseng (1972), and they were utilized where possible, in this current study even though it was unclear just how strongly related these variables were to student failure.

Support was found in the literature for identifying likely failures as early as possible and providing interventions designed to decrease failure rates (Medway, 1984 and Norton, 1984), but a procedure for accomplishing these tasks successfully was not found.

STUDY OBJECTIVE

Consistent with the Board of Education's request, the following objectives provided the focus for this study.

a. To identify factors highly related to the non-promotion of students

b. To obtain student and teacher views on student failure.

c. To establish a procedure for early identification of failing students.

METHOD

Data for this study came from two major sources—a survey of students and teachers within the school system and the computerized records on all of the school system's secondary level students. These data were analyzed through the discriminant analysis procedure. The two data sources and the analysis procedure are discussed in detail in this section.
Survey Procedure

Following a review of the pertinent and readily available literature on student failure at the secondary level, it was decided by the researchers that additional data on the local population of students would be needed to address the study objectives adequately. A survey of students was selected as a means of collecting some of the necessary data, and it was decided that grade nine and ten students would be the student population to be surveyed due to high failure rates at these grade levels.

The review of literature had yielded a set of factors that seemed related to student failure, and survey questions were built around the following variables: family characteristics, attitudes toward school, involvement in school activities, and school records and plans. Additional questions were included in the survey to obtain student views on reasons why students fail.

The survey population was a 50% random sample of English classes at grades nine and ten with the exception of classes designed specifically for high achieving students. Following the selection of classes, survey answer sheets containing enough preprinted information to identify students (a student code number used for school system record keeping) were prepared from computerized class rosters. The coding information was important since it allowed the merger of survey responses with achievement and promotion data on individual students. Classes for high achieving students (roughly the upper three stanines in achievement status) only were excluded from the sample because the researchers wanted to maintain the likelihood of finding an adequate number of failing students within the survey population. It was felt that few high achieving students would be likely to fail and that the range of achievement scores would not be restricted too badly through this action since some high achieving students remained in the survey population.
The student questionnaire is shown in Appendix A. Responses were marked on the preprinted and machine scoreable answer sheets. The survey was conducted in March of 1985 on an eligible student population of about 3,000 students. Teachers were asked to administer the surveys to their selected classes within a one-week period with no requirement for following up on absentees. The completed answer sheets were scanned and recorded through the school system's data processing office, and the responses were added to a file containing other information by student.

Data Analysis

Analysis of the survey data included a factor analysis and the development of factor scores in addition to the computation of item data and chi-square analysis on item data versus promotion status. The factor analysis procedure utilized was the principal components method with varimax rotation available in the SPSS-X package.

The SPSS-X version of discriminant analysis was used also in an effort to classify students as promoted or non-promoted on the basis of all available data. Variables entered in this procedure included factor scores from the survey responses, student attendance data, reading and mathematics achievement status scores, reading and mathematics achievement gain scores, race, and overage status.

RESULTS

Survey Data

A total of 2,424 students responded to the survey for a return rate of approximately 80% from all students in the selected English classes. The respondents were about equally split between ninth and tenth grade (52% were from grade nine and 48% from grade ten) and by sex (50% male and 50%
female). Racial balance in the sample population matched the systemwide percentages at these grade levels (62% Black and 38% White), and as a group, the respondents were almost normally distributed on reading achievement status (22% in stanines 1-3, 59% in stanines 4-6, and 19% in stanines 7-9). A total of 423 (17.5%) of these students were not promoted at the end of the school year.

Appendix A contains a detailed summary of student survey responses including a breakdown of responses between students who were promoted and those who were not promoted at the end of the school year. The results of a chi-square analysis of responses between these two groups are also shown in this appendix. A discussion of some of the major findings are discussed below.

**Family Characteristics.** Promoted and non-promoted students differed significantly (a \( \chi^2 \) value with \( p < .001 \)) on eight of the eleven items in this portion of the survey (items 1-11). Non-promoted students were more likely to live with their mother only (55% to 40%), but their mothers were less likely to have any college training (31% to 41%). A higher percentage of non-promoted students (64% to 54%) reported that someone from their family had talked with their teachers during the year. Responses on the other items did not seem to differ between the two groups in any meaningful way.

**Attitudes Toward School.** Promoted and non-promoted students differed statistically on five of the ten items under this heading. Non-promoted students were less likely to indicate that they liked school (51% to 68%) and much less likely to indicate that they liked their particular school (39% to 59%). They were also less likely to feel that their teachers cared about them (35% to 45%) and to indicate that they had received praise or reward from a teacher during the year (43% to 60%). Non-promoted students were more likely to say that school was boring (34% to 25%), and less likely to indicate that they looked forward to coming to school (43% to 51%).
Involvement in School Activities. Non-promoted and promoted students differed statistically on four of the ten items under this section. Non-promoted students were less likely to be on a school sports team (19% to 24%), belong to a school club or organization (17% to 31%), attend special school events (59% to 68%), or to be involved in any organization outside of school (20% to 27%). They were also more likely to have been in serious trouble outside of school (22% to 11%), but they were less likely to hold a part-time job (21% to 23%).

School Records and Plans. The two groups of students differed significantly on six of the nine items under this heading. Non-promoted students were more likely to have failed a grade in elementary school (23% to 12%) or in junior high school (26% to 11%) and much more likely to have been suspended from school (61% to 34%). A much smaller percentage of the non-promoted students expected to be promoted (48% to 80%) and they were less likely to feel that they would graduate from high school (78% to 91%).

Reasons for Failure. An additional twenty-one items were included to ascertain student views on reasons for school failure. Responses differed statistically between the two groups on twelve of these items. Both groups agreed, however, on many of the reasons for failure, and the following reasons received the largest affirmative response—high absence rates, non-completion of assignments, not studying, doesn't care, doesn't take school seriously, not paying attention in class, and involvement with drugs and alcohol. These items were rated affirmatively by at least 62% of the respondents.

Prediction of Student Failure

Three separate analyses using the discriminant analysis procedure were conducted in an effort to predict student failure from the available data. These analyses included using survey responses only, using survey responses in addition to most of the other data readily available in the computerized
A factor analysis of the survey responses identified ten factors. Factor scores were computed using the procedure available in the SPSS-X package, and the factor scores were entered into the discriminant analysis procedure. This effort failed to yield a discriminant function. These scores alone were not adequate to classify the two groups accurately.

A follow-up discriminant analysis was attempted using selected item responses from the student survey with the intent of using these responses to classify students as likely to pass or likely to fail. Results of the analysis are shown in Table 1. This procedure classified 81% of the students correctly when the predictions of promotion or non-promotion were compared with the actual end-of-year status for each student. As can be seen, however, from Table 1, the predictions indicated that 84.3% of the non-promoted students should pass. It was concluded that survey responses alone would not be adequate to classify students accurately.

* Survey items included in this analysis were item numbers 1, 2, 7, 12, 13, 19, 23, 28, 32, 33, 34, and 39 from Appendix A.

A second discriminant analysis was attempted using factor scores and the
variables identified in Table 2. Also included in Table 2 are the mean scores by group for each of these variables. Complete data for analysis were obtained on a total of 1,447 students. Point-biserial correlation coefficients of 0.1 and higher between these variables and student promotion are shown in Appendix B.

Results of the second discriminant analysis are summarized in Table 3. As can be seen from Table 3, this analysis classified promoted students with 97% accuracy, but it failed to classify non-promoted students with an acceptable rate of accuracy. Over 81% of the non-promoted students were predicted to pass based on the available data, and it was concluded that these data were not sufficient for use in identifying students who were probable failures.

A third discriminant analysis was attempted in an effort to identify probable failures based upon student data that would be available routinely by the end of the first quarter of the school year. Variables included in this analysis were first quarter grade point average, first quarter homeroom attendance, reading achievement status from the previous school year, and mathematics achievement status from the previous school year. (Achievement status was determined from a score on a standardized achievement test.) A separate analysis was conducted for all students at each grade level (7-12).

Results of this analysis are summarized in Table 4. As can be seen from the table, this analysis was not very successful in identifying probable failures. The accuracy rate for predictions was highest at grades nine and ten (where the system's highest failure rates occur), but the rate is still
below 50%. Once again, it was concluded that these data were not sufficient
to identify probable failures with an acceptable rate of accuracy.

Discussion

Results of this study were somewhat disappointing in that no accurate
means of identifying probable failures was established even though a large
amount of data on students was available. The analysis did identify some key
differences between promoted and non-promoted students overall, but even with
these existing differences, the discriminant analysis procedure was not use-
ful in classifying students as probable failures. As the study was being
planned, it was hoped that the results could be used to identify students
clearly in danger of failing using data readily available in a central com-
puterized file. If it had been successful, lists of students by school in
this category of probable failures could have been generated centrally and
warning letters could have been sent to parents and students from the com-
puter center. In addition, it was desired that the results would be useful
in identifying the key factors that needed improvement by each student. This
information could have guided intervention efforts at each school.
A number of reasons seem likely as explanations for the lack of desired success in this study. First, there is an overlap of key factors such as attendance and achievement levels between groups of promoted and non-promoted students at the secondary school level. Overall, the promoted students were about one stanine level higher in achievement status, but many high achieving students (as measured by standardized tests) were not promoted and many low achieving students were. A partial explanation of this fact is that low achieving students usually take more basic courses at these grade levels while higher achieving students take more difficult college preparatory courses.

A second condition which hindered a clear distinction between promoted and non-promoted students was the school system's policy which required a student to pass the fourth quarter in a course before a passing grade could be granted for that course at the end of the school year. Other studies conducted by school system personnel indicated that many students who would have passed courses otherwise, failed because of this policy.

A third condition is caused by the promotion requirement in grades nine through eleven. At these grades, a student must have earned a minimum of 4.5, 9.0, and 13.5 of cumulative Carnegie units respectively to be promoted. Some students with a previous failure at one of these grades may need to earn only one or two credits to be promoted while another student who actually earned as many as four credits during the year, may fall short of the minimum number and be termed as non-promoted. The former student would be in a situation where an additional year of schooling would likely be needed for graduation even though promotion status was achieved for the year. The latter student should be able to graduate on schedule simply by taking one extra course at one of the higher grade levels even though this student was termed as non-promoted.

It does seem clear from this study that the identification of probable failures at the secondary school level cannot be done accurately using the
types of data available in this effort. This seems to indicate that efforts to identify failing students early for placement in an intervention program will have to be done by staff members at the local school level based upon a more detailed knowledge of student records and reports from teachers.

### About My Family

1. How far did your mother (or guardian) go in school?
   - **Elementary School**: 1% (N=423) vs. 2% (N=1890)
   - **Some High School**: 23% vs. 19%
   - **High School Graduate**: 45% vs. 38%
   - **Some College**: 18% vs. 20%
   - **College Graduate/Advanced Degree**: 13% vs. 21%

   \[ X^2 = 20.6 \quad p < .001 \]

2. Who do you live with?
   - **Legal Guardian**: 4% vs. 4%
   - **Close Relative**: 4% vs. 2%
   - **Father Only**: 4% vs. 4%
   - **Mother Only**: 55% vs. 40%
   - **Mother and Father**: 33% vs. 50%

   \[ X^2 = 40.5 \quad p < .001 \]

3. How many brothers and sisters do you have?
   - **None**: 10% vs. 9%
   - **1 or 2**: 41% vs. 46%
   - **3 or 4**: 25% vs. 25%
   - **5 or 6**: 14% vs. 11%
   - **7 or More**: 10% vs. 9%

   \[ X^2 = 4.5 \quad p < .05 \]

4. Has one or your parents (or guardians) been unemployed in the past year (laid off or looking for a job)?
   - **Yes**: 29% vs. 29%
   - **Not Sure**: 11% vs. 9%
   - **No**: 60% vs. 62%

   No significant difference.

5. My family encourages and helps me with my school plans.
   - **Strongly Disagree**: 3% vs. 2%
   - **Disagree**: 5% vs. 6%
   - **No Opinion**: 20% vs. 13%
   - **Agree**: 48% vs. 44%
   - **Strongly Agree**: 24% vs. 35%

   \[ X^2 = 27.1 \quad p < .001 \]

6. I get praise at home for good school work.
   - **Strongly Disagree**: 5% vs. 3%
   - **Disagree**: 8% vs. 6%
   - **No Opinion**: 21% vs. 16%
   - **Agree**: 46% vs. 45%
   - **Strongly Agree**: 20% vs. 30

   \[ X^2 = 20.0 \quad p < .001 \]
7. Problems at home have affected my school work.
   $\chi^2 = 29.2 \ p < .001$
   1. Strongly Disagree 16% 25%
   2. Disagree 30 30
   3. No Opinion 19 18
   4. Agree 20 19
   5. Strongly Agree 15 8

8. My family talks things over with each other very often.
   $\chi^2 = 13.9 \ p < .01$
   1. Strongly Disagree 9% 6%
   2. Disagree 15 14
   3. No Opinion 22 22
   4. Agree 43 40
   5. Strongly Agree 12 18

9. My family does not care whether I graduate from high school.
   $\chi^2 = 34.6 \ p < .001$
   1. Strongly Disagree 69% 81%
   2. Disagree 17 10
   3. No Opinion 6 3
   4. Agree 3 2
   5. Strongly Agree 6 4

10. My family both understands and accepts me.
    $\chi^2 = 21.9 \ p < .001$
    1. Strongly Disagree 5% 3%
    2. Disagree 9 5
    3. No Opinion 19 15
    4. Agree 35 35
    5. Strongly Agree 33 42

11. Has someone in your family talked with your teachers this year?
    $\chi^2 = 13.3 \ p < .001$
    1. Yes 64% 54%
    2. No 36 46

12. I like school.
    $\chi^2 = 57.7 \ p < .001$
    1. Strongly Disagree 12% 5%
    2. Disagree 10 7
    3. No Opinion 27 21
    4. Agree 42 54
    5. Strongly Agree 9 14

19. I find school boring.

\[ X = 14.6 \quad p < .01 \]

2. Disagree
3. No Opinion
4. Agree
5. Strongly Agree

20. I look forward to coming to school.

\[ X = 16.4 \quad p < .01 \]

2. Disagree
3. No Opinion
4. Agree
5. Strongly Agree

21. I wish I could change one of my teachers.

No significant difference.

Extra Curricular and School Activities

22. Are you on a school sports team?

\[ X = 4.9 \quad p < .05 \]

2. No

23. Do you belong to a school club or organization?

\[ X = 29.3 \quad p < .001 \]

2. No

24. Are most of your friends going to school?

\[ X = 18.2 \quad p < .001 \]

2. No

25. Do you have many enemies at school?

\[ X = 4.8 \quad p < .05 \]

2. No

26. Do you belong to any organization such as 4-H, Boy Scouts, Girl Scouts or church groups?

\[ X = 10.1 \quad p < .01 \]

2. No

27. Do you have a public library card?

\[ X = 34.5 \quad p < .001 \]

2. No
28. Have you been in serious trouble outside of school?
   \[ X^2 = 33.2 \ p < .001 \]
   No significant difference.

29. Do you have a regular part time job?
   No significant difference.

30. Do you feel you are a slow learner?
   \[ X^2 = 4.6 \ p < .05 \]

31. Do you attend school dances, ball games or social events?
   \[ X^2 = 12.1 \ p < .01 \]

School Record and Plans

32. Did you fail a grade in elementary school?
   \[ X^2 = 30.5 \ p < .001 \]

33. Did you ever fail grades 7, 8, or 9?
   \[ X^2 = 65.2 \ p < .001 \]

34. Have you ever been suspended from school?
   \[ X^2 = 99.9 \ p < .001 \]

35. Do you expect to be promoted this year?
   \[ X^2 = 172.3 \ p < .001 \]

36. Do you have any skills which will help you get a job?
   No significant difference.

37. Do you know what you want to do after you leave school?
   No significant difference.

38. Have you talked to a counselor about how you are doing in school?
   \[ X^2 = 10.1 \ p < .01 \]
39. Do you think that you will graduate from high school?
\[ \chi^2 = 56.2 \quad p < .001 \]

40. Will most of your friends graduate from high school?
\[ \chi^2 = 25.9 \quad p < .001 \]

Reasons for Failure

The factors listed below have been cited as causes for a student failing. Tell us which of the factors you believe are serious causes of failure.

41. High absence
No significant difference.

42. Slow learning
\[ \chi^2 = 38.4 \quad p < .001 \]

43. Poor teaching
\[ \chi^2 = 28.3 \quad p < .001 \]

44. Teachers expect too much
No significant difference.

45. Not completing assignments

\[ \chi^2 = 17.4 \quad p < .01 \]

46. Not studying

\[ \chi^2 = 23.2 \quad p < .001 \]

47. Marking system is too tough

No significant difference.

48. Bad behavior in class

\[ \chi^2 = 18.9 \quad p < .001 \]

49. Not paying attention in class

\[ \chi^2 = 39.7 \quad p < .001 \]

50. Problems at home

\[ \chi^2 = 19.4 \quad p < .001 \]
51. Involvement with drugs and alcohol

\[ \chi^2 = 57.4 \quad p < .001 \]

52. Doesn't care

\[ \chi^2 = 39.9 \quad p < .001 \]

53. Hanging around with the wrong crowd

\[ \chi^2 = 15.5 \quad p < .01 \]

54. Holding a part time job

\[ \chi^2 = 22.7 \quad p < .001 \]

55. Getting hard teachers

No significant difference.

56. Taking the wrong classes

No significant difference.
