EVALUATION OF STUDENT TEACHERS

ERIC DIGEST 13

ERIC CLEARINGHOUSE ON TEACHER EDUCATION
Evaluation of Student Teachers

Public criticism of teachers has put pressure on teacher educators to prepare their students better. Any process to strengthen teacher education programs must include a careful study of student teaching since it is usually the final education course taken by students and the most influential field experience in a teacher education program (Kingen 1984). Many teacher education programs use student teaching as the primary exit evaluation of student competencies (Ashburn and Fisher 1984). Yet factors such as questionable measurement instruments and untrained evaluators prevent effective evaluation. This digest discusses the purpose of student teacher evaluation, criteria, measurement tools, evaluators, and elements of success.

Purpose of Student Teacher Evaluation

There are numerous reasons for evaluating student teachers during their practice-teaching experience in a K-12 setting (Defino 1983). Programs usually state the purposes as screening students for entry into the teaching profession and informing student teachers about skills that need to be strengthened. Often, evaluation is used to prove to state or national program approval agencies that student teachers are doing what the institution said they would during the field experience.

Evaluating students for program improvement is another purpose (Ashburn and Fisher 1984). For example, a teacher education program may require student teachers to demonstrate the ability to plan instructional units. If evaluation shows most student teachers have problems in planning, then an adjustment can be made in the program.

Evaluation Criteria

Disagreement occurs among programs about what knowledge, skills, and attitudes are necessary in an effective student teacher (Ashburn and Fisher 1984). Research on teacher effectiveness has included attempts to identify "good" teacher characteristics. The belief that effective teachers possess universal traits is so strong that characteristics such as voice quality and sense of humor have become permanent items on student teacher evaluation scales. But no research has shown effective teachers to have specific characteristics in all teaching situations (Fant et al. 1988).

Research also has been done to relate effectiveness with degree of pupil learning. Wiersma and Gibney (1985) argue that the research base in this area is inadequate to support pupil learning as the sole basis for determining student teacher competence. They also contend that teaching is a profession like medicine and law; thus, practitioners cannot guarantee results.

Competency based teacher education (CBTE) programs that emerged in the 1970s consider student teaching performance to be a demonstration of competencies accumulated during the teacher education program. Thus, student teachers are observed in the classroom and evaluated based on competencies displayed such as subject matter presentation and planning skills. While there is a lack of evidence that one set of teacher competencies leads to more pupil learning than another (Moore and Markham 1983), competencies assessed by programs overlap considerably.

Institutions that use the same evaluation criteria often have different priorities (McIntyre and Norris 1980). For example, one teacher education program may consider classroom management the most important area to be evaluated while another may place the highest priority on personal characteristics and personality.

Evaluation Tools

Teacher education programs tend to develop their own evaluation forms to determine student teacher effectiveness. In a survey of 173 U.S. colleges and universities, Fant et al. (1985) found teacher education programs used rating scales, daily logs, anecdotal records, behavioral coding, and self-assessment for evaluating student teachers. More than half of the institutions surveyed used rating scales.

Two instruments used frequently in student teacher evaluation research have been adopted by some CBTE programs (Defino 1983). The Teacher Performance Assessment Instrument (TPAI) lists competency indicators and sets of descriptors. The evaluator decides how well the student teacher's performance meets the competency described. The Classroom Observation Keyed for Research (COKER) instrument requires the evaluator to record specified behavior demonstrated by the student teacher. Research shows these instruments to be reliable, i.e., the scores of an individual remain relatively consistent on repeated measurements. Validity, i.e., whether the instruments measure what they are supposed to, remains questionable, however (Defino 1983).

Research indicates that student teaching grades usually are high regardless of the evaluation instrument used. Inflated grades may be because of improved field experiences before student teaching (Defino 1988). In addition, many incompetent or marginal students elect or are counseled out of teacher education programs. The high grades could reflect an evaluation of the student teachers' potential rather than a measure of demonstrated skills. Other reasons, however, stem from the evaluators who judge student teaching.

 Evaluators

The effectiveness of the evaluation process is based on the person assessing the students (Ashburn and Fisher 1984). A faculty supervisor from the teacher education program and a "cooperating" teacher in whose classroom the student teacher is
assigned serve as evaluators of student teaching. Research on
the interaction of student teacher, cooperating teacher, and
faculty supervisor indicates the cooperating teacher has the
predominant influence on the student. Student teachers often
adopt the classroom management style and attitudes of their
cooperating teachers (McIntyre 1984). Thus, it is not surprising
that cooperating teachers tend to give positive evaluations to
these students.

Cooperating teachers avoid “unsatisfactory” and “below
satisfactory” ratings when using typical evaluation forms with
ratings ranging from a strongly agree/highly positive
assessment to a strongly disagree/highly negative assessment
(Phelps et al. 1986). The teachers seem to concentrate on one
skill that a student teacher demonstrates effectively and then
generalize to all skills. For example, a student teacher highly
competent in instructional procedures might have an
inadequate knowledge base in the subject being taught. The
cooperating teacher still would rank the student highly in all
areas because of the strong, positive impressions made when
interacting with pupils.

Faculty supervisors also have difficulties when evaluating
student teachers since the supervisors “serve as coaches as well
as judges. Very often we find ourselves judging the teaching.”
(Ashburn and Fisher 1984) Evaluation reports containing
supervisor and cooperating teacher comments become part of
the student teacher’s permanent record and can affect
employment opportunities. Comparisons between superior
and average student teachers cannot be made when reading the
reports because of grade inflation.

The lack of consistent procedures and criteria among
cooperating teachers further hinders the evaluation process
and can cause the student teaching experience to have a
negative impact on teacher education program goals (Ervay
1982). Teacher education programs must rely on public schools
to find the cooperating teachers. Forty-four states, however,
require no formal credentialing process for cooperating
teachers, and public school personnel usually select cooperating
teachers based only on teaching experience (Morris et al. 1985).

Elements of Success

Many evaluation tools used throughout the United States
have adequate reliability (Defino 1983). Validity, however,
often has not been established. Training cooperating teachers
to use evaluation instruments reduces judgment errors,
however, and can increase the tool’s validity (Phelps et al.
1986).

Evaluation instruments continue to be refined through
research. For example, South Carolina recently developed the
Assessment of Performance in Teaching (APT) instrument
after field study tests for objectivity, reliability, and validity
(Brooks et al. 1985). The APT measures minimal competency
rather than proficiency. It only determines whether teachers
use basic teaching skills in the classroom. Any educator who
uses the APT must successfully complete reliability training.

Additional training in supervision practices also ensures
that cooperating teachers are competent in other areas (Morris
et al. 1985). Good cooperating teachers must be able to analyze,
guide, and evaluate teaching as well as demonstrate effective
teaching (Kingen 1984). These abilities and adequate
measurement instruments lead to improvement in evaluating
student teachers.
