The document contains 20 ecological inventories (developed at the University of Minnesota and the University of Alberta) to help severely disabled students learn functional living skills. The ecological approach is designed to uncover the functions critical for success in specific environments which the student frequently encounters. Matching the student's current functioning against the needed skills produces an individualized listing of training objectives. Subenvironments are identified within each of 20 environments, and activities and functions for each are further broken down. Environments, as developed by teachers, multidisciplinary staff members, and university students, are grouped according to major domain areas, such as: domestic (group home kitchen); vocational and school (enclave work area, portable junior high school); recreation and leisure (art museum, zoo, swimming pool, movie theatres, and roller skating rink); and community (grocery store, bus depot, community hall). INTRODUCTION

Ecological inventory is the process of systematic identification of all of the functions critical for success in the collection of settings that one individual currently encounters and can be expected to encounter in the future. This process requires identifying the environments, often grouped into (major life areas or domains), determining the activities that normally occur in those environments, and subsequently determining the critical functions for the activities identified. Critical functions refer to the effects that the individual's behavior produce rather than the specific responses, since each person's unique set of abilities and disabilities will influence the precise forms of behavior used to accomplish a critical function. For example, all students in a given school may need to travel from classroom to cafeteria, but the specific behavior they use (e.g., walking, wheeling their wheelchair) will differ.

The purpose of Ecological Inventory is to generate the most relevant possible set of training objectives possible for each student. Once ecological inventory is completed and all environmental requirements have been identified, a discrepancy analysis compares the student's current level of performance to the required critical functions. Those that are not yet in the student's repertoire are then identified as the objectives for that student's educational program. Thus, each student's current and future environments become the basis for that individual's curriculum.

The use of ecological inventory to develop individualized educational programs is particularly important for students with severe handicaps, because developmentally normed curricula become increasingly inappropriate with the severity of handicap. Not only do students with more severe handicaps exhibit greater variability in sequence and speed of development, but the increasing gap that typically appears between their current function and that of their age-peers makes most age-appropriate objectives inaccessible through developmental curricula. There are simply too many basic objectives that remain to be mastered at early developmental levels and that have little current value to the individual for the more developmentally advanced objectives ever to be reached. If we spend our time trying to teach a ten-year-old how to behave like a two-year-old, there will never be time to teach the child things that other ten-year-olds do.
The ecological approach avoids this dilemma by its focus directly on current and future needs (ignoring previous needs as irrelevant). It provides an individualized set of objectives based on what the learner needs to do in the environments that he or she commonly encounters or can be expected to encounter in the future. This principle was put forward by Lou Brown, Mary Falvey and others in 1979 (Brown, Branston, Baumgart, Vincent, Falvey, & Schroeder, 1979) based on previous efforts at curriculum development. The ecological inventory procedures described required (1) determining the most relevant and functional current and future environments (commonly grouped into domestic, leisure, community and vocational domains), (2) identifying relevant subenvironments within those environments, (3) identifying activities that typically occur in those subenvironments, (4) determining the skills or functions required to participate in those activities. Critical functions have often been identified rather than skills since these allow any of a wide range of behaviors that accomplish the same effect rather than being limited to a specific form of the behavior (White, 1980).

Unfortunately, two obstacles have commonly impeded teachers from adopting the ecological inventory strategy. First, while the process has been well explained, examples are typically limited to brief excerpts. This has made initiation of the process difficult for many teachers who want more explicit and comprehensive models to follow. Second, preparation of complete ecological inventories appears to require a great deal of time and many teachers feel they cannot devote the required time to the process.

This collection of environmental inventories has been assembled to provide a more complete example for teachers and other members of program planning teams. It is not intended to represent a complete ecological inventory for any one student, but rather a variety of environments appropriate for many different students. Since the specific environments included are probably unique, they cannot generally be applied to other geographical locations. The similarity between environments in different locations, however, may allow the adaptation of some inventory content to new locations. For example, a MacDonald's fast food restaurant in Albuquerque, New Mexico will not be exactly the same as one in Portland, Maine, but there may be enough similarities in subenvironments, activities, and critical functions for a teacher assessing one to adapt some content from a previous environmental inventory of the other.
The environmental inventories that follow were developed by teachers, other multi-disciplinary team members, and university students at the University of Minnesota and the University of Alberta. They were selected for inclusion in this collection on the basis of overall quality, content, and format. They are grouped according to major domain areas. They include examples from large metropolitan areas, Minneapolis and Edmonton, and from sparsely populated areas, such as Cambridge Bay in the arctic. They provide useful examples of the process of generating individual curricula suited to the student and environment.

4- Check out equipment.

Functions:

1- Determine which section of counter has the service you want (i.e., downhill or cross country ski equipment).

2- Walk to that spot.

1- If other people are in line, wait behind the last person.

2- When person in front of you moves forward, step toward the counter to fill in the gap.

3- Optional: Initiate and receive conversation with other people around you.

1- When you are at the front of the line and the rental worker asks, "May I help you?" Say "yes" and state your request.

2- When given a rental form, correctly fill it out. Ask questions if necessary.

3- When rental worker asks for form, give it back to him/her.

4- When rental worker asks for fee change, pay attendant with a check or correct amount of money. Leave some type of I.D. (to be returned when equipment comes back). Put change back in pocket, if given some back in money exchange.

5- When worker asks you to move to the other end of the counter, do as requested.

6- When given equipment, listen to worker as he/she explains the use of the equipment.

7- Take equipment and go to seating area. (See Section C, number three).

8- Take boots/shoes off and put them under seat/bench or in shoe rack.
3. Downhill / Cross Country Ski Equipment Rental Area (continued)

Activities:
4- Check out equipment (continued).

Functions:
9- Put on ski shoe or boot.
10- Tell the worker if the shoe or boot does not fit properly. If necessary ask for assistance. If it does not fit, give them back to the worker. Tell them if they were too big or too small.
11- Wait for the different equipment.
12- Go to seat and try them on. (Repeat steps 10 and 11 if necessary).
13- Wait for friends to get ready.
14- Locate signs for the wanted ski area (i.e., downhill or cross country).
15- Pick up the rest of the equipment (poles, hat, gloves, etc.). Walk in the direction you want to go.
16- When done skiing, enter the building carrying the ski equipment.
17- Find the same seat or one close to the seat you took your shoes/boots off.
18- Remove ski boots/cross country ski shoes.
19- Locate your shoes/boots.
20- Put them on.
21- Bring rented ski equipment to rental check in spot, as identified by sign.
22- Get I.D. card back.
23- Wait for friends to get their equipment checked in.
24- Check to make sure everyone in your group has their gear (e.g., hat, gloves, etc.).
25- Leave the rental area by walking in the direction you want to go next.
4. Tubing Rental Area

NOTE: For this ecological inventory, the following assumptions should be made:

1. Movie-going is a sociable recreational activity, therefore we assume that the actor will have invited a friend to accompany him/her.

2. The movie theatre in Yellowknife offers a choice of two movies every night at 7:00 and 9:00.

3. The invitation and arrangements to pick up the friend have been made preparatory to the inventory; the 7:00 P.M. show has been selected.
