Welfare programs and the people who use them have a bad public image. Any attempts at welfare reform should include the dissemination of factual information to eliminate the misconceptions. This information should include the following facts: (1) only 60% of poverty stricken households receive welfare; (2) most government services and funds to households are for social security, Medicare and veterans' benefits; (3) welfare programs require applicants to demonstrate need through a means test; (4) most welfare benefits are services rather than cash; (5) the groups most likely to receive welfare are minorities and women with dependent children; (6) states with more generous welfare programs do not attract recipients from other states; (7) only a minority of recipients become long-term welfare families; (8) welfare programs do not contribute to the breakup of families; and (9) welfare does not pull many families above the poverty line. Current initiatives to reform the welfare system are focused on more uniform state eligibility rules, and incentives and training for jobs. (VM)

Summary

Welfare reform is one of the most volatile social issues facing U.S. policymakers in the 1950s. Americans feel obliged to aid people who cannot care for themselves but disagree about just who those people are and how best to help them. And the public image of welfare programs and the people who use them is riddled with misconceptions.

Welfare programs are usually thought of as government handouts for poor people. In fact, only 60 percent of the population below the poverty level receive welfare, and many welfare recipients earn incomes above the poverty level.

Welfare must also be distinguished from other government social spending. In 1984, 47 percent of American households directly received funds or services from the government. Most of this was not welfare but Social Security, Medicare, or veteran's benefits paid regardless of recipient income or assets. Only 19 percent received welfare, that is, government aid to needy persons enrolled in specific welfare programs. Welfare programs require applicants to demonstrate need through a "means test" based on income, family size, age, or other factors. Means-tested programs, i.e., welfare, typically serve low-income families with children, the disabled, or the needy elderly, and account for about 11 percent of the annual federal budget. Most welfare benefits are not cash, but services like food stamps, medical care, or subsidized housing. Only 8 percent of households got cash welfare benefits in 1984.

Women, especially with dependent children, are more likely than men to receive welfare; blacks and Hispanics more likely than whites; and children and young adults more likely than the elderly. Three-fourths of the families headed by a black or Hispanic woman received welfare in 1986.

About 48 million Americans received welfare in 1986. The percentage receiving welfare is greater among Southerners, but they get far less in benefits than other Americans, even adjusting for the South's lower incomes and living costs. Migration into the Sunbelt has actually served to hold down the nation's welfare bill over the past decade because Southern states pay much less in benefits.

States with generous welfare programs don't attract welfare recipients from other states, dispelling a common belief. Between 1980 and 1985, the states gaining the most AFDC recipients were either those growing fastest, like California, or those suffering economic problems, like Ohio.

Divorce, an out-of-wedlock birth, and, less often, a decline in income are major reasons people seek welfare. Most recipients stay on welfare only a few months or years, but a significant minority become long-term recipients.

Welfare does not contribute to the breakup of families or promote out-of-wedlock births. But it does not pull many families above the poverty line either. The "poverty gap," or the funds necessary to bring the income of poor families up to the poverty line, persists despite annual government welfare expenditures of $130 billion or more.

The future welfare population will be shaped not only by the economy and politics, but by three major demographic trends: the aging of the U.S. population, the migration of population from the Frostbelt to the Sunbelt, and the growth of single-parent families and one-person households. While the first two trends will affect the face but not the size of the welfare population, the changes in marital patterns and living arrangements will add millions to the rolls because single mothers with children and nonfamily households rely on welfare at a much higher rate than married-couple families. Between 1986 and 2000, the number of welfare households could grow from 15 to 18 million.

Current welfare reform policy initiatives focus on more uniform state eligibility rules; extending child care benefits and Medicaid to ease reentry into the labor force; and job training.

Some states have innovative new work programs to enable welfare recipients to get and keep jobs—and stay off welfare. But results are mixed, and such programs wouldn't help recipients too young, too old, or otherwise unable to work—or poor adults not eligible for welfare.

Welfare reforms could make the system more equitable and efficient, but they will not cure poverty. Our responsibility to the needy will continue and will have to be met, however imperfectly, through some type of welfare system.
We are entering a period of serious debate about the role the U.S. government should play in caring for the needy. In 1986, President Reagan called for a study of the welfare system in his State of the Union address and a White House panel issued a major report on the topic within the year. A flurry of reports from prominent organizations and even popular books are challenging the conventional wisdom of government welfare. During 1987, Congress will be considering welfare reform legislation which could increase some benefits but tighten controls on current programs. More far-reaching reforms are also being discussed.

Today's welfare system evolved primarily from two historical movements. The first occurred during the Great Depression of the 1930s, when widespread loss of jobs and property led to the creation of President Franklin Roosevelt's New Deal programs: Social Security, Unemployment Insurance, and Aid to Families with Dependent Children (AFDC). The second movement was in the 1960s, when a rethinking of welfare issues brought about Lyndon Johnson's War on Poverty and the Great Society programs, such as Medicare, Medicaid, Food Stamps, and Headstart.

We appear to be in a new phase in the definition of the social contract between individuals and society which could alter the kinds of assistance those in need can expect from government. The current system has generated countless debates and public discussions, but it has not eliminated poverty, the aim of President Johnson's effort. Even worse, some critics claim that welfare programs perpetuate joblessness among recipients and disrupt the American family. The outcome of the current efforts to revamp the system is far from clear.

Because the welfare system is complex and data are not easily available, the public's image of welfare recipients is often shaped by myth, anecdote, and misinformation. An accurate profile of the welfare population is important to evaluate the relative merits of the current system, and it is of general interest because a significant portion of the public's taxes is spent on this group of citizens each year. Furthermore, the decision about who deserves government assistance and who does not is a philosophical issue which reflects our national character.

This report presents a demographic overview of the population relying on major welfare programs and provides insight into certain facets of those programs. Its purpose is to illuminate the discussion of reforms to some of our most prominent welfare programs.

Welfare versus Poverty

Welfare and poverty are closely linked in the minds of many, including policymakers, but there is little correspondence between the two concepts in government statistics. Many people who are officially poor do not receive welfare benefits and many people who receive welfare have incomes above the poverty level.

One reason for this paradox is obvious. The offi-
Families and people not living in families, or "unrelated individuals," are classified as being above or below the poverty level using the poverty index constructed by the Social Security Administration in 1964. The poverty index, which only counts money income, is based on the 1961 Economy Food Plan of the Department of Agriculture and reflects the consumption needs of families, depending on their size and composition.

It was determined from the Department of Agriculture's 1955 Survey of Food Consumption that families of three or more persons spent on average about one-third of their income on food. The poverty level for these families was therefore set at three times the costs of the Economy Food Plan. For smaller families and persons living alone, the cost of the Economy Food Plan was multiplied by factors that were slightly higher in order to take account of the relatively larger fixed expenses of these smaller households.

The poverty income thresholds are updated each year to reflect changes in the Consumer Price Index or inflation. In 1986 the threshold was $11,203 for an average family of four and the range was from $5,572 for a single person to $22,497 for a family of nine or more persons.

The official poverty level (explained above) is seldom directly used as a criterion for enrollment in government welfare programs. Only seven of the 59 "major" welfare programs use the poverty level to determine eligibility. Some 20 other programs use a multiple of the official poverty level as a means test. For example, families qualify for food stamps if their incomes are less than 130 percent of the poverty level. Not one of the four largest welfare programs—AFDC, Supplemental Security Income (SSI), Medicaid, or Food Stamps—uses the poverty index to determine eligibility.

Poverty and welfare statistics are not strictly comparable because the poverty measure is based on annual income, while most welfare programs use monthly data to determine eligibility. One recent analysis shows that the number of people whose income falls below the poverty level for at least one month during the year is nearly twice the number who remain in poverty for an entire year. The number of people in poverty in any given year is a very poor measure of the number potentially eligible for welfare because of low income at some point during that year.

From 1960 to the early 1970s, the number of Americans in poverty fell while the number in major welfare programs increased (see Figure 1, p. 5). But between 1975 and 1985, the poverty population grew by 28 percent while, except for Food Stamp recipients, the number of recipients in major welfare programs changed very little. In fact, three of the programs (AFDC, SSI, and Medicaid) served fewer people in 1985 than in 1975.

The number of welfare recipients has not kept pace with the growth of either the total U.S. population or the poverty population. Between 1980 and 1985, the number of U.S. households increased by 7 percent and the number of poverty households, by 8 percent, but the number of welfare households grew less than 2 percent.

These trends, spanning six presidential administrations, suggest that economic conditions, Congress, and legal decisions are at least as important as who is in the White House. For example, Supreme Court decisions in the 1960s increased the population eligible for welfare by allowing states to eliminate the "man-in-house" rule which had disqualified a single mother from AFDC if evidence was found of a man living in her home. Also, the sharp rise in the poverty population in the early 1980s was mainly due to an economic recession.

What Are Welfare Programs?

We generally use the term welfare to refer to government programs which provide money or services to people with low incomes. Since most welfare programs admit only those who meet certain conditions, i.e., they lack the means to support themselves—welfare programs are called "means-tested" programs. In this publication, the term welfare refers to means-tested programs and distinguishes "welfare" from the many other types of government assistance.

The bulk of government spending on social programs is not for welfare but for "nonmeans-tested" programs such as Social Security, Unemployment Insurance, and Medicare. For example, federal outlays for Social Security in fiscal year 1985 totaled $137.9 billion while only $79.4 billion of the public's funds were spent for AFDC, Medicaid, SSI, and Food Stamps combined. In 1985, about 11 percent of the $950-billion Federal Budget was spent on welfare. Federal, state, and most...
local governments operate welfare programs, but 75 percent of the funding is federal.

The welfare "system" consists of a vast number of programs, split responsibilities, and conflicting eligibility rules which make analysis of the system difficult. Even identifying which programs are "welfare programs" is often a matter of judgment. Recent reports issued by three branches of the federal government all disagreed on the number of welfare programs: the tally of cash assistance programs ranged from 10 to 14, and the count of educational programs varied from 8 to 23.

**Who Gets Welfare?**

Government assistance flows into more American homes than many people realize, but relatively little of this is welfare. In 1984, 47 percent of all American households had one or more members who received some type of direct cash or in-kind government assistance, but only 19 percent received means-tested benefits. Only 8 percent of

---

**The Big Four Welfare Programs**

These four means-tested or welfare programs account for over 60 percent of all government spending on the poor or near-poor. The costs and number of recipients given are for fiscal year 1985 (October 1, 1984 through September 30, 1985). The federal government pays about 55 percent of the costs of Aid to Families with Dependent Children and Medicaid with state and local governments picking up the other 45 percent. Federal funds cover all but 20 percent of the costs of Supplemental Security Income and virtually all the costs of the Food Stamp program.

**Cash Assistance**

Aid to Families with Dependent Children (AFDC). This federal-state program, established by the Social Security Act of 1935, encourages the care of dependent children in their own homes by providing cash to "needy" families, with need and payment levels determined by each state. In all states, eligible families are those with children under 18 where one parent is absent owing to death, desertion, divorce, incapacitation, or incarceration. In addition, about half of the 50 states aid two-parent families with the father out of work. Each state administers or supervises its own program.

Costs: Total, $14.8 billion; federal, $8.0 billion; state and local, $6.7 billion. Average monthly number of recipients: 10.8 million individuals.

Supplemental Security Income (SSI). Established by 1972 amendments to the Social Security Act, this program provides monthly cash payments to needy aged, blind, and disabled persons to help bring their incomes up to a federally established minimum level. The payments are administered nationwide through local offices of the Social Security Administration. Costs: Total, $10.9 billion; federal, $8.7 billion; state and local, $2.2 billion. Average monthly number of recipients: 4.1 million individuals.

**Noncash Benefits**

Medicaid. Under this program, established by 1965 amendments to the Social Security Act, the federal government provides open-ended matching payments to states to help cover the costs of medical services for members of AFDC families and most individuals eligible for Supplemental Security Income payments. Within broad federal guidelines, each state designs and administers its own program, with considerable latitude to determine eligibility, benefits, and levels of payments to service providers. Costs: Total, $41.3 billion; federal, $22.7 billion; state and local, $18.6 billion. Average monthly number of recipients: 21.8 million individuals.

Food Stamps. Begun in the 1960s and currently operating under the Food Stamp Act of 1977, this program distributes coupons redeemable for food to individuals and families with incomes below 130 percent of the poverty line. State welfare agencies are responsible for the day-to-day administration of the program within broad federal guidelines. Costs: Total, $12.5 billion; federal, $11.7 billion; state and local, $0.8 billion. Average monthly number of recipients: 19.9 million individuals.
all households received some form of means-tested cash assistance.

Welfare programs serve all types of people, but most means-tested government aid targets two distinct population groups. One is low-income families with children, served by AFDC, School Lunches, and related programs. The other, less numerous, group consists of the blind, the disabled, and the needy elderly—the typical SSI recipients. Many of the poor receive no government benefits. In 1985, only 35 percent of the households with incomes below the poverty level received cash welfare benefits and only 59 percent received any kind of means-tested benefits.4

The welfare population, 48 million in 1986, is diverse. However, because program eligibility rules in most states favor mothers with dependent children and because poverty is more concentrated among certain minorities and in some geographic regions, the chances of going on welfare are much greater for those who are black or Hispanic, under age 25, or female. Also, Southerners and residents of central cities and non-metropolitan areas are more likely to be receiving welfare than persons living elsewhere.

Women account for 56 percent of the welfare population. A manifestation of the so-called "feminization of poverty," this large female majority among welfare recipients is mainly due to single mothers with dependent children and elderly widows below the poverty level. It is also partly a product of a system which, in many states, denies assistance if there is an able-bodied man in the family. Almost half of the women heading a family without a husband in 1984 received welfare, compared to only 12 percent among women sharing that duty with a spouse.

About half of all those receiving welfare are under age 25. While most of the elderly do get non-means-tested government aid, like Social Security and Medicare, only 20 percent of those 65 or older received welfare in the first quarter of 1986.

---

comparison, 30 percent of the children under age 16 and 23 percent of the 16- to 24-year-olds received welfare. During the same months only 16 percent of those in the primary working ages, 25 to 64, were on welfare (see Figure 2).

Blacks and Hispanics have a much greater likelihood of going on welfare than whites. Over one-half of all blacks and 43 percent of Hispanics, but only 16 percent of white Americans received welfare in the first quarter of 1986. Blacks are also three times more likely than whites to be poor. Blacks and Hispanics have a much greater likelihood of going on welfare than whites. Over one-half of all blacks and 43 percent of Hispanics, but only 16 percent of white Americans received welfare in the first quarter of 1986. Blacks are also three times more likely than whites to be poor.5

Blacks and Hispanics have a much greater likelihood of going on welfare than whites. Over one-half of all blacks and 43 percent of Hispanics, but only 16 percent of white Americans received welfare in the first quarter of 1986. Blacks are also three times more likely than whites to be poor. Blacks and Hispanics have a much greater likelihood of going on welfare than whites. Over one-half of all blacks and 43 percent of Hispanics, but only 16 percent of white Americans received welfare in the first quarter of 1986. Blacks are also three times more likely than whites to be poor.

Families headed by a black or Hispanic woman often fall into the three highest risk groups: the young, minorities, and female-headed households. Almost three of every four persons living in a family headed by a black or Hispanic woman received welfare at the beginning of 1986.

The share of population receiving welfare is highest in the South, where local economies are supposedly booming, and lowest in the Midwest. Also, the percentages on welfare in 1986 were higher in nonmetropolitan areas (23 percent) than in metropolitan areas (20 percent). Recent economic problems in rural-based industries such as farming, lumbering, and energy production explain some of this geographic difference. Since the poverty rate in nonmetropolitan areas is actually 50 percent higher than in metropolitan areas, the difference in use of welfare is smaller than expected. The urban poor may have better access to government programs than their rural counterparts and are perhaps more willing to seek help.

Within metropolitan areas, 27 percent of central city residents received welfare compared to only 15 percent of suburban residents.

People raised in welfare families are at high risk of going on welfare. Between 1970 and 1979, about 59 percent of the women brought up in families that received some welfare became recipients themselves as young adults, compared to 27 percent of women from other families. The reasons for this “intergenerational transmission” of poverty and welfare dependence are complex and often debated among welfare reformers.
AFDC Recipients

The oldest of our major welfare programs, AFDC was established by the Social Security Act of 1935. This program is a target for much of the criticism of the system as a whole, and AFDC recipients typify the welfare population to much of the public. Perhaps because the aid is distributed to able-bodied adults who can’t support their own children, some view AFDC recipients as costly freeloaders. Much of the proposed welfare reform before the 100th Congress concerns AFDC.

Since the mid-1970s, the number of AFDC recipients has remained fairly constant. The proportion of AFDC recipients who are black or Hispanic—43 and 12 percent, respectively, in 1983—has remained about the same, but other AFDC characteristics have changed. Compared to 1973, AFDC families in 1983 had fewer children; those children were more likely to be under age 6 and less likely to have a father living with them.7

Dispelling the image of welfare households teeming with children, the average AFDC family had only two children under age 18 in 1983, just about the same as in an average American family. But 60 percent of the AFDC families had a child under age 6, compared to only 22 percent of all families. The preponderance of young children among AFDC families reflects the fact that many mothers return to work and become self-supporting after the youngest child enters school. Some research suggests that many of these mothers would return to work sooner, possibly leaving the welfare system, if affordable child care were available to them.8

Blacks, only 12 percent of the U.S. population, make up 43 percent of the AFDC population. Because blacks have higher rates of teenage childbearing and are more likely than other minority groups or whites to be poor, they form a disproportionate share of the AFDC population (Table 1).

AFDC recipients have fewer assets than the average American family, leaving them no financial cushion for the lean months. In 1983, only 20 percent of the 3.6 million AFDC families claimed any assets. For those families, total assets averaged $876, compared to assets near $30,000 for all households. And the Cadillac-driving welfare queen is a rarity; only 7 percent of AFDC families owned a motor vehicle, averaging $2,261 in value.9

In sharp contrast to the AFDC recipients, only 5 percent of the 4.2 million SSI recipients were under age 18 in 1986, and women outnumbered men two to one. About 64 percent of SSI recipients were white, 30 percent black, and 6 percent other races. Sixty-three percent of enrollees qualified because they were disabled, 35 percent were needy elderly, and only 2 percent were blind.

Welfare—a Way of Life?

Do most families use welfare for short time periods to deal with a crisis such as sudden unemployment or a divorce, or do they stay on welfare for long periods, making it their way of life? If the first is true, then welfare creates an important bridge from one stable situation to another; if the second, then welfare could be considered a trap, sapping the will for independence and discouraging recipients from working.

Fortunately, welfare is most often used as a bridge. The majority of people who enter the AFDC program stay on welfare for a relatively short period of time—less than three years—but a significant minority become long-term welfare recipients.10 Between 1970 and 1979, about 15 percent of AFDC recipients spent 8 to 10 years on welfare. In 1983, about 61 percent of the AFDC recipients surveyed had received AFDC for less than three years, but almost a quarter had been receiving it continuously for at least five years.

While a relatively small share of people entering the welfare system are likely to end up as long-term users, this group has a big impact on welfare

costs. According to one study, about one-half the welfare recipients at any point in time will experience a spell of welfare of ten years or more. Women, blacks, and residents of large cities are more likely to become long-term welfare dependents than are men, whites, or rural residents.

The movement into or out of the welfare system is usually tied to a change in family or living status. During the 1970s, 45 percent of the new AFDC recipients entered the program because they had recently divorced or separated; another 30 percent were unmarried women with a new baby. Only 16 percent required assistance because of loss of income. Conversely, 35 percent of those leaving the rolls did so because of marriage, and 11 percent because a child left home. Over one-quarter left because their incomes increased.

How Much Do They Get?

In January 1987, the average AFDC cash grant for a single-parent family with two children was $354 per month, but this is only a portion of the aid a family might receive. It is difficult to calculate the total value of benefits received by a typical needy person since benefits vary by state of residence and much of the federal aid is noncash assistance such as public housing and medical care. However, available data from 1965 to 1985 reveal two interesting points: (1) the total amount spent on welfare rose rapidly until 1980, but has leveled off since then; and (2) the primary type of welfare benefits has shifted from cash to noncash assistance. In 1985, 65 percent of federal means-tested benefits were in the form of noncash benefits, compared to only 24 percent in 1965.

Means-tested cash assistance actually declined by about 10 percent between 1980 and 1985, while noncash benefits continued to rise (see Figure 3). The main reason for the slight upturn in welfare expenditures in the early 1980s was the dramatic increase in health care costs, causing a 15 percent increase in Medicaid outlays.

The distinction between cash and noncash benefits is important because only cash benefits are counted as income in poverty statistics. In addition, the political choice of delivering assistance as cash or in services such as public housing or free medical care raises deep philosophical questions about the relationship between government and welfare recipients. Cash assistance allows recipients to decide what goods or services to purchase, but it carries an enormous potential for misuse. Noncash benefits allow recipients no choice of how to spend their resources and places the government in a paternalistic role.

The average expenditure per AFDC recipient, in constant 1985 dollars, fell significantly between 1975 and 1985, reflecting the overall decline in cash welfare payments, but also revealing the extent to which inflation has eroded the real value of AFDC benefits (see Figure 4). Unlike Social Security and SSI, which are pegged to the Consumer Price Index and updated annually, AFDC benefits are not regularly adjusted to reflect inflation. The failure to adjust AFDC benefits for inflation is a major reason why the poverty rate for children has increased in recent years while the poverty rate for the elderly—whose Social Security payments increase with inflation—has decreased.

To estimate the financial trade-off between working or going on welfare, the 1986 White House welfare reform study calculated the value of a welfare package combining six different programs—AFDC; Medicaid; Food Stamps; Section 8 subsidized housing; the nutritional program for Women, Infants, and Children (WIC); and School Lunches.
Meals—and compared it to likely earnings if a recipient were to get a job.

While all these welfare programs may be available in theory, relatively few poor families receive benefits from many programs simultaneously. In 1985, only 5 percent of the nearly 12 million poverty households received cash assistance plus benefits from four noncash programs. Comparing the value of welfare benefits from a combination of six programs to the benefits of working is not a realistic comparison of the work/welfare trade-offs actually confronting most poor families.

But enrollment in one welfare program, especially AFDC, increases the chances of receiving assistance from two to three other programs. In most states, participation in the AFDC program automatically makes family members eligible for food stamps and Medicaid. In 1985, about 80 percent of those receiving AFDC also received food stamps, 95 percent received Medicaid, and 26 percent used public housing.

In 1985, about 80 percent of all AFDC recipients also participated in the Food Stamp program.

**Demographics and Welfare Programs**

The links between demographic change and welfare programs are many, but it is not clear which has the greater impact on the other. For example, an increase in the elderly has swelled the number of SSI recipients. On the other hand, some contend that generous welfare benefits in some states attract migrants from other parts of the country. In fact, the migration of millions of Americans out of the Northern states, where AFDC benefits are highest, into the South, where they are lower, has held down overall welfare costs during the past 25 years.

Some analysts allege that demographic changes within the American family have boosted welfare costs. Specifically, they say that the dramatic increase in single-parent families, tied to high divorce rates, along with the rising rates of out-of-wedlock births has created a larger population in need of AFDC and associated programs. Although teenage mothers produce only a small share of all U.S. births, they often are not married and need welfare. According to one recent report, in 1986, “Taxpayers spent nearly $18 million on food stamps, medical care, and cash assistance for families begun as a result of teenagers giving birth...” However, most increases in social program expenditures have gone to aid the elderly, not female-headed families.
Does Welfare Break Up Families?

While some researchers contend that demographic changes have had an impact on welfare programs, others believe these programs have had a profound impact on the composition of American families.

Since federal funds for social programs and the number of female-headed families have both increased dramatically over the past 25 years, there is a temptation to blame federal welfare programs for fostering family instability. Recently, President Reagan stated, "There is no question that many well-intentioned Great Society-type programs contributed to family breakups, welfare dependency, and a large increase in out-of-wedlock births." However, most of the scientific evidence suggests otherwise.

The most comprehensive statistical study in this area found that welfare benefit levels do not encourage out-of-wedlock births or the breakup of families. However, researchers have found that young unmarried mothers in states with high welfare benefits are more likely to set up their own households, while those in states with low benefits are more likely to live with the mother's parents.

States with generous welfare payments have about the same percentage of households headed by women as states with very low average welfare payments, probable evidence that welfare benefits do not encourage the formation of female-headed households. In 1980, monthly AFDC payments for a family of four were lowest in Mississippi ($160) and highest in New York and California (above $500), but the percentage of households headed by women in these states were almost identical in 1980: 16 percent in Mississippi, 18 percent in New York, and 15 percent in California.

While the number of single-parent families increased by 42 percent between 1975 and 1985, the number of AFDC families has stayed about 3.5 million since 1975. If women are leaving their husbands or having children out of wedlock to collect welfare, why don't they show up on the AFDC rolls? Also, the real value of welfare benefits has been shrinking at the same time the number of female-headed families has been expanding dramatically. The value of the combined benefits of AFDC and food stamps, adjusted for inflation, decreased by 20 percent between 1972 and 1986. If welfare caused families to break up, the number of female-headed families would be decreasing along with the value of welfare benefits.

Variation Among States

The bewildering nature of our welfare system stems from the fact that the funding and administration of programs often involve several layers of government. Some programs, notably Food Stamps, are run solely by the federal government, while others are completely state administered (e.g., General Assistance). But many, AFDC for example, involve shared federal/state responsibility. The states may extend some benefits to needy groups not covered under federal rules, causing significant variation among them in who qualifies for which programs. For example, federal guidelines require states to provide AFDC assistance to needy children in single-parent families, but states may expand eligibility rules to include children in needy married-couple families. Only about half the states have done this.

Currently the U.S. government pays about 75 percent of the cost of welfare programs, but the state share is likely to increase as the federal government conforms to the spending restrictions of the Gramm-Rudman-Hollings balanced-budget legislation. Because costs of living and personal incomes vary greatly among states, more state involvement may mean even less uniformity in welfare eligibility and benefits.

The value of benefits already varies wildly among states. In January 1987, the maximum monthly AFDC grant for a family of three in Mississippi was $120, but in California, it was $617 a month. On average, the combined value of AFDC payments and food stamps equals just 74 percent of the official poverty level. But in Alabama and Mississippi, AFDC cash payments plus food stamps provide a needy family with only 46 per-
cent of the poverty level. The most generous state (other than Alaska) is California, where the combined benefits bring a family up to 99 percent of the poverty threshold.

The average AFDC payment per recipient in the Southern states is a little over half the average payments in the other states, after adjusting for the lower incomes in the South, as shown in Figure 5. In Alabama and Mississippi, per capita welfare payments are less than 5 percent of the state per capita income. In California, they equal 13 percent of state per capita income, and in New York, 11 percent. Since blacks are overrepresented in the South, particularly the deep South where benefits are the lowest, they suffer the worst consequences of these regional disparities.

The national AFDC caseload has been relatively constant since 1972, yet important changes have occurred among the states (see Figure 6, page 12). Two kinds of states had big increases in AFDC caseloads between 1980 and 1985: fast-growing states and states hit by hard times. California gained the most AFDC cases between 1980 and 1985 (206,277), primarily because of its rapid population growth over that period. On the other hand, large increases in AFDC caseloads in Ohio, Illinois, and Wisconsin were due to economic problems in those states, not population growth.

Between 1980 and 1985, the 28 states with below-average AFDC benefits attracted, on average, 97,000 more migrants than states with high benefits, largely reflecting the greater economic strength of the South relative to the Northeast and Midwest. Clearly, the attraction for those willing to move to another state is the promise of jobs rather than the potential for generous welfare benefits.

The Poverty Gap

Does welfare reduce poverty? The number of people lifted out of poverty by welfare is one measure of this; another is the extent to which welfare closes the "poverty gap." The poverty gap is the amount of money needed to raise an individual's income to the poverty level. The aggregate poverty gap is the amount of money it would take to raise the incomes of all poor persons up to the poverty level.

In recent years, the "poverty gap" has been around $50 billion, which means that if $50 billion in public assistance were added to the amount already spent on cash welfare and distributed with perfect efficiency, no American would have an income below the poverty line.

The failure of the current system to fill the poverty gap, that is, to bring every family's income up to the poverty line, provoked harsh criticism in the 1986 White House welfare reform study. The study concluded that welfare expenditures have been sufficient to eliminate poverty but they have been off target, missing the very population they are intended to help. In fiscal year 1985, the government spent at least $130 billion on welfare, but we still had 33 million people in poverty.

There are several reasons the poverty gap continues despite the billions spent on welfare. First, noncash welfare expenditures are not reflected in official poverty statistics because they are not counted as income. However, even when the value of noncash benefits is added to recipients' incomes—using any of the three popular methods for doing this—the number of Americans below the poverty threshold remains between 22 and 30 million.

Second, most government programs are designed to provide minimum subsistence for the needy, not to raise incomes enough to move families out of poverty. For example, the median value of monthly cash welfare payments plus food
stamps for a family of three in January 1986 was $524, equaling an annual income of $6,288. The government's 1986 official poverty level for this type of family was 39 percent higher than this: $8,737. Only in Alaska do the combined benefits of AFDC and Food Stamps provide families with an income above the poverty level.

Third, because the poverty index is seldom used for eligibility, many programs provide benefits to people with incomes above the poverty line. These welfare expenditures understandably don't reduce the poverty gap.

Finally, some welfare benefits, particularly Medicaid, go to people living in nursing homes and other group quarters or to the homeless who are missed by the poverty statistics.

Government assistance helps reduce poverty, but mainly among those who receive nonmeans-tested assistance. The Congressional Budget Office estimated that, in 1985, 17.4 million people were pushed above the poverty level by direct government payments. Without this aid the poverty population would have reached 51 million. But most of these payments were through Social Security, unemployment benefits, and other nonmeans-tested programs. In 1985, only two million persons were lifted out of poverty by means-tested cash welfare payments.

Finding and Keeping Jobs

Most public assistance programs have some form of work requirement for recipients unless they are ill, disabled, or have caretaker responsibilities. The main thrust of the welfare reform movement has been to expand and enhance this program component in an effort to reduce long-term welfare dependency.

Many long-term welfare recipients are handicapped by their low levels of education and lack of work experience. Many never finished high school and have basic reading skills below the ninth grade level. For these people, occupational training must be preceded by remedial education if they are expected to hold a job which pays enough to support a family. But these programs can be time-consuming for the student and costly for the government. One experimental program cost $5,833 (1976 dollars) per participant and required an average enrollment period of nine months. Even then, the program reported only mixed success.

Unfortunately, job training and placement services would reach only a fraction of all poor adults, especially if they are tied to AFDC as proposed under current legislation. Less than one-fifth of the

Job training programs attempt to reduce welfare dependency through employment.

20 million adults in poverty participate in the AFDC program. Even if such programs cut the number of AFDC recipients in half, the number of adults in poverty would fall by less than 10 percent.

Although formal evaluations of the most recent work/welfare initiatives have not been completed, initial findings suggest that the programs do increase employment and earnings for participants, but not by very much. For many participants, earnings are not increased enough to shake free of welfare dependence or rise above the poverty line.

Since most people move off welfare after a short time anyway, the work-related programs would not affect their long-term welfare dependency and would probably have only a trivial impact on the time they spend on welfare.

The Future Welfare Population

The number and type of welfare recipients in future years depends on the health of the American economy and the course of welfare reform. But population growth, along with changes in the age structure, geographic distribution, and living arrangements of Americans will also have some impact on the need for welfare programs.

The Census Bureau projects that we will add 29 million Americans between 1985 and the year 2000. With no changes in the distribution of people and households, the number of welfare recipients
Between 1986 and 2000, the welfare population will grow older along with the total population.

in the year 2000 would be about 53.5 million, up from 47.5 million in 1986.

However, the characteristics of people and households will change between now and the year 2000. Three major demographic trends affecting the welfare population are (1) the aging of the U.S. population; (2) continued migration from the Northeast and Midwest into the Southern and Western states; and (3) the increase in single-parent families and nonfamily households.

Between 1986 and the year 2000, the large cohort of Americans born during the baby boom, 1947 to 1964, will move into the 35-to-54 age group, and the median age of the U.S. will creep from 32 to 36 years of age. The welfare population will also grow older, but the loss of welfare recipients among the young will be offset by increases among the middle-aged and the elderly. The number of welfare households headed by an adult under age 35 will actually decrease by 500,000 between 1986 and 2000, but the number headed by an adult age 35 to 54 will swell by 2.5 million, and the number headed by an individual age 65 and over is likely to expand from 3.8 to 4.8 million.

Current migration trends are likely to significantly increase the population of the South and West while the Northeast and Midwest remain about the same. If 1986 rates continue, the number of welfare recipients would change little in the Northeast or Midwest, but would increase by almost 5 million in the South and by nearly 4 million in the West by 2000. This could lower the nation's overall welfare bill, because Southern states, where the largest increase is likely to occur, offer far lower benefits than Northern states.

By the end of this century, the traditional married-couple family may account for less than half of all households because single-parent families and "nonfamily" households (primarily, persons living alone) are growing faster. Since single-parent families and nonfamily households use welfare at higher rates than married-couple families, these trends will increase the welfare rolls.

The number of married-couple family households is projected to increase by 6.9 million between 1986 and 2000. But since only 12 percent of these households receive welfare, they will add only 800,000 households to the welfare population during that period. In sharp contrast, 42 percent of the other types of families received welfare in 1986. Projected to grow by 3.3 million between 1986 and 2000, they will add 1.4 million welfare households in only 14 years. Nonfamily households are expected to add another 1.4 million households to the welfare system by 2000 (see Figure 7).

Immigration to the U.S. is another demographic trend which will affect the welfare population, particularly in areas like southern California and southern Texas which attract many migrants from Asia and Latin America. However, because little is known about the current use of welfare by immigrants, especially illegals, it is difficult to forecast the national impact of future immigration. The flow of illegal immigrants may be slowed by the 1986 Immigration Reform Act which instituted fines for employers who hire illegal aliens.

Policy Initiatives

While few people are happy with our current welfare system, there is little agreement on how to improve it. Most of the suggested policy reforms focus on efforts to increase a recipient’s chances of getting off, and staying off, welfare through steady employment and to strengthen federal involvement in order to narrow differences between states and expand benefits. Another concern among policymakers has been reducing the needless costs of welfare fraud and inefficiency.

There is a growing consensus that welfare recipients have an obligation to work if possible and that the system should promote work over welfare. States have been encouraged to incorporate employment incentives into their welfare programs. The types of programs initiated include:

- **Work Incentive (WIN) projects to educate, train, and find jobs for AFDC recipients**
- **"Workfare" programs which require AFDC recipients to work on community projects**
- **Structured job search efforts, sometimes through a "job club"**
- **Work Supplementation which diverts welfare benefits to job training**

The success of these programs in helping welfare recipients stay off the rolls is inconclusive, but these are relatively new initiatives and all the evidence has not come in. Among the new programs which might provide better data to evaluate these efforts are California’s GAIN, launched in 1986, and the Boston area’s ET program.

Welfare-to-work schemes enjoy broad bipartisan support. Legislation being considered by the 100th Congress includes various approaches to encourage welfare recipients to work, such as:

- **Pay part of the child care and transportation costs of employed recipients**
- **Allow employed recipients to keep more of their earnings without losing benefits**
- **Extend Medicaid and child care benefits for several months after a recipient leaves welfare to start a job, lessening the financial risk of giving up welfare eligibility**

States will probably be required to incorporate broader job training programs in their welfare systems and to make it mandatory for more recipients to participate in them. In 1983, about two-thirds of the women receiving AFDC were exempt from work programs. The new programs may excuse only parents with children under age three or those with no access to child care. But the potential for reducing the size of the welfare or poverty populations appears to be fairly minor.

There are strong opposing views on the relative roles the states and the federal government ought to play. Many observers, including the White House welfare reform panel, think the states should be free to design unique, experimental programs with minimal federal control. Others feel that our haphazard welfare system requires federal oversight and coordination. Some of the reforms currently before Congress would intensify the federal presence by requiring states to:

- **Extend AFDC to needy children from two-parent families**
- **Intensify efforts to identify and contact fathers of welfare children**
- **Authorize deduction of child support from a parent’s (often an absent father’s) paycheck**
- **Offer welfare eligibility to unmarried parents under age 18 only if they live with their own parents or in a state-regulated home**
- **Boost state benefit payments, with the U.S. government absorbing most of the increase**

Critics claim these proposals will cost too much—an estimated $2.3 to $5.2 billion over 5 years, depending on which proposals are actually implemented—and probably wouldn’t work. Estranged fathers of AFDC children, for example, may deny paternity and, even if it is proved, may not earn enough to help support their children.

Other welfare reformers want to adjust AFDC benefits to keep up with inflation and set a national minimum for program benefits.

The large difference between the welfare and poverty populations is another area of concern. This gap arose partly because welfare programs target only those needy people who cannot care for themselves: children, the disabled, the elderly, and their caretakers. Few reformers want to extend eligibility to every poor person, but some do propose including the “working poor” in job training programs to erode the causes of poverty.

But part of the gap between the welfare and poverty populations is purely statistical. The poverty index was developed hurriedly 20 years ago, and few welfare programs rely on it anyway. Some experts contend the index needs major revision.

However, regardless of what welfare reforms are initiated or how precise we become in the measurement of poverty, welfare and poverty will be with us for many years to come.

The Population Reference Bureau is a private, nonprofit educational organization founded in 1929. PRB members receive more than 25 informative publications each year: Four annual POPULATION BULLETINS written by recognized authorities; the lively monthly news magazine POPULATION TODAY; the annually updated WORLD POPULATION DATA SHEET wall chart; the quarterly population education newsletter INTERCHANGE, accompanied twice a year by a self-contained student reading; and POPULATION TRENDS AND PUBLIC POLICY reports on the policy implications of current demographic trends, as they appear.

PRB also publishes the POPULATION HANDBOOK, a handy reference to the basics of demography, in a standard edition, International and Caribbean-oriented editions (in English), and Arabic, French, and Spanish editions, as well as other special publications. Write for a listing and prices of publications in print.

For more information, PRB’s Information Resource Center responds to population-related inquiries by mail, telephone, or in-person visit. PRB’s Demographic Information Service Center (DISC) offers personalized, in-depth data and analyses for individual clients seeking professional interpretation of population trends.

Members of the Population Reference Bureau support an organization dedicated to the objective analysis and reporting of one of the world’s most compelling concerns.
