This trainer's manual was developed for two purposes: (1) as a record of what was done with the 1984 Test of English as a Foreign Language (TEFL)/Crossover Agricultural Training program in Thailand, and (2) as a resource to share with other Peace Corps countries where in-country basic tropical agriculture training is conducted. Throughout the manual, pages providing information for the trainer are marked with a "T" preceding the page number and are interspersed with pages for the trainee. The manual is organized in four parts. Part I contains a lengthy introduction that describes some aspects of the design that focus on hands-on experience, small-scale projects, community focus, a strong general foundation, independent learning, training responsibility, and integration of the training components. A list of performance objectives by skill group is included, and information is also provided on staffing and the training farm. Part II includes the overall training schedule, which lists session by session, week by week, the titles, the times, and the place of each training session. It also includes notes about contingencies, livestock care, and revisions in the schedule. The training program calendar lists tasks that must be accomplished by the week. Part III is divided into weeks. Each week includes the schedule and the session designs for that week. Part IV includes the program specific training sessions for the TEFL/Crossover program (as Appendix A), an alternate schedule, job descriptions, an alternate staffing pattern, evaluation forms and tests, a glossary of technical vocabulary in Thai and English, and a section on language sessions, cross-cultural sessions, role in development sessions, home-stay, and a list of resources. (KC)
Peace Corps' Information Collection & Exchange (ICE) was established so that the strategies and technologies developed by Peace Corps Volunteers, their co-workers, and their counterparts could be made available to the wide range of development organizations and individual workers who might find them useful. Training guides, curricula, lesson plans, project reports, manuals and other Peace Corps-generated materials developed in the field are collected and reviewed. Some are reprinted "as is"; others provide a source of field based information for the production of manuals or for research in particular program areas. Materials that you submit to the Information Collection & Exchange thus become part of the Peace Corps' larger contribution to development.

Information about ICE publications and services is available through:

Peace Corps
Information Collection & Exchange
Office of Training and Program Support
806 Connecticut Avenue, N.W.
Washington, D.C. 20526

Add your experience to the ICE Resource Center. Send materials that you've prepared so that we can share them with others working in the development field. Your technical insights serve as the basis for the generation of ICE manuals, reprints and resource packets, and also ensure that ICE is providing the most updated, innovative problem-solving techniques and information available to you and your fellow development workers.
IN-COUNTRY TEFL/CROSSOVER TROPICAL AGRICULTURAL TRAINING MANUAL
(TRAINER’S EDITION)
U.S. PEACE CORPS/THAILAND

Prepared by
Carl R. Franck—Consultant to Training Office and Agricultural Technical Trainer (Crops)
Buddy Larson—Technical Coordinator
Pattana Aviphant—Agricultural Technical Trainer (Crops)
Randy Reitz—Agricultural Technical Trainer (Livestock)

under the supervision of
Dennis K. Hamilton, Training Officer
and
Marcia Hamilton, Editor

for the
Peace Corps/Thailand Training Office

******************************************************************************
This manual was produced on two Kaypro computers. It was input into a Kaypro II and completed by Peace Corps volunteer Michael Ordonez on a Kaypro 2X—one of the six Kaypro 2’s donated to Peace Corps Thailand by the Kaypro Corporation for volunteer use. Suffice to say that, with the number of editors and contributors, had this manual been produced on a typewriter, we would still be working on the first draft. Thank you Kaypro.

Introduction
A. STATEMENT OF PURPOSE

This In-Country Agricultural Training Manual has been developed for two purposes. First it creates an "institutional memory"—a record of what we did with the 1984 TEFL/Crossover Agricultural Training program. It will thus make it possible for us to replicate the content and much of the process of the training program in the future. Secondly, it was developed as a resource to share with other Peace Corps countries where in-country basic tropical agriculture training is conducted.

In order to facilitate the training process we have actually developed two manuals here—one within the other. This copy is the Trainer's Manual. It includes the introductory information, the completed training sessions and the appendixes. A manual for trainees has also been produced which includes everything in this Manual with the exception of the specific training session designs (which trainers can use as guidelines for developing future sessions), the calendar and schedule (which will be modified each time training is done) and the appendixes which contain background information for trainers.

During the actual training program, each technical trainer will receive a copy of the Trainer's Manual. Each trainee and language trainer will receive a copy of the Trainees' Manual. Therefore, all participants in training will know the objectives of each session and can read hand-outs in advance. Since language training staff members will have a copy of the Trainees' Manual they will have the technical vocabulary list for each session in advance to allow them adequate time for preparation of language sessions related to the agricultural sessions. Further, since the handouts for each session are included in the Manual, language trainers will be better prepared to participate in the agricultural sessions.

HOW THE MANUAL IS ORGANIZED AND WHAT IT INCLUDES:

A GENERAL NOTE ON THE ORGANIZATION

You will note on the Table of Contents that some pages are "T" pages and some are not. T pages are designated "Trainer" pages and are not included in the Trainee Manual. All regularly numbered pages (white pages) are "Trainee" pages and are included in the Trainer's Manual.

PART I: Aside from the traditional inclusions in a manual of this kind (this Statement of Purpose, the Acknowledgements, the Foreword, the Preface, lists of Abbreviations and Figures), Part I of this manual also includes a lengthy Introduction. The Introduction goes beyond the description in the Preface (that sets the context for the development of this training program) and describes some aspects of the design that focus on hands-on
experience, small-scale projects, community-focus, a strong general foundation, independent learning, trainee responsibility, Field Day, integration of training components and "sanuk." It also includes information on the 22 skill-group categories covered in the training. Each skill-group category is described and the sessions devoted to it are listed. The lengthy list of specific Performance Objectives by Skill Group is also included as well as a section on Evaluations and Progress Reviews (which includes sections on our philosophy of evaluation, how performance objectives are linked to sessions, quizzes, fulfillment of objectives, progress reviews and the composition of the trainee file.) The section in the Introduction devoted to "Staff Composition" describes the staff that was involved in this training—but we have included an alternate staffing pattern for a larger group as Appendix C. The Training Program Environment describes the infrastructure necessary (in our experience) for this kind of training program to be successful. There is also a description of "The Training Farm" based on the farm at Lampang, including some improvements, plot descriptions and an illustration of a prototypical farm.

**Part II:** of the Manual includes The Overall Training Schedule which lists (session by session, week by week) the title, the time and the place of each training session. It also includes some notes about contingencies, livestock care, revisions in the schedule and what they entail. The Training Program Calendar is a different kind of schedule. It is a critical part of pre-training preparation and training. It is a list, week by week, of the tasks that must be accomplished that week—from ordering supplies, to planting plots, to planning sessions.

**Part III:** of the Manual is divided into weeks. Each week includes the schedule and the session designs for that week—session-by-session. Each session includes a page that lists session title, code number, introduction, objectives and technical vocabulary. Only the Agricultural Sessions and the General Program Sessions are included here. The Language and Cross-Cultural Training Sessions (that already exist in a separate L/CC Training Manual) are integrated into the training by staff during pre-training preparation. (It is important to note that they are, however, scheduled in the overall training schedule in Part II.)

**Part IV:** of the manual includes the Program Specific training sessions for the TEFL/Crossover program as Appendix A, an alternate schedule, job descriptions, an alternate staffing pattern, Evaluation forms and tests, a Glossary of technical vocabulary in Thai and English and a section on Language sessions, Cross-Cultural Sessions, Role in Development Sessions, Home-stay and a list of resources.
# TABLE OF CONTENTS (TRAINER'S MANUAL)

## PART I: PROGRAM DESCRIPTION
- A. Statement of Purpose [T-1]
- B. Acknowledgements [T-5]
- C. Foreword [T-7]
- D. Preface [T-9]
- E. Abbreviations [T-11]
- F. List of Figures [T-11]
- G. Introduction
  - 1. General Perspective [1]
  - 2. Evaluations and Progress Reviews [4]
  - 3. Staff Composition [T-12]
  - 4. The Training Program Environment
    - The Training Farm [T-15]
    - Plot Descriptions [T-17]
  - 5. Skill Group Categories
    - Skill Group Descriptions and Sessions [T-21]

## PART II: SCHEDULES
- A. The Overall Training Schedule [T-31]
  - Notes on the Schedule [T-33]
- B. The Training Program Calendar [T-42]

## PART III: SESSIONS
- Week 1: Schedule, Designs and Hand-outs [17]
- Week 2: Schedule, Designs and Hand-outs [99]
- Week 3: Schedule, Designs and Hand-outs [155]
- Week 4: Schedule, Designs and Hand-outs [191]
- Week 5: Schedule, Designs and Hand-outs [243]
- Week 6: Schedule [291]
- Week 7: Schedule, Designs and Hand-outs [291]
- Week 8: Schedule, Designs and Hand-outs [363]

## PART IV: APPENDIXES
- A. Program Specific Sessions [T-60]
- B. Other Components
  - Session Additions [427]
  - Role in Development [429]
- C. Staffing
  - Job descriptions [T-176]
  - Duties of the Livestock Trainer [T-177]
  - Alternate Staffing Pattern [T-182]
- D. Alternate Schedule [T-183]
- E. Evaluation
  - Evaluation forms [T-191]
  - Tests [T-192]
- F. Glossary of Technical Terms in Thai and English [433]
- G. Resource List [439]
- H. Miscellaneous Appendixes [T-206]
This "In-Country TEFL/Crossover Tropical Agricultural Training Manual" is more than a compilation of training information and session designs. It must be seen in the context of an overall training program philosophy. A change in the approach to training TEFL/Crossover and Malaria Control volunteers was needed. Through the efforts of Ajaan Nikorn Saengchantr, the APCD Education, and Patty Gerken, APCD Health, and with the support of Robert Charles, the Peace Corps/Thailand Country Director, a request to do agricultural and malaria training entirely in country was approved by the Department of Technical and Economic Cooperation of the Royal Thai Government. Without the participation and support of Khun Poonsri and Khun Pissamai of DTEC this program would not have been initiated. While this Manual does not cover Malaria Control Training, the two programs were conducted simultaneously.

Once the decision to go ahead was made, Ajaan Surat Khoonphol, the APCD for Agriculture, provided invaluable assistance. Through his knowledge of agriculture and of personnel and facilities throughout Thailand, arrangements were made to use the Lampang Agricultural Research and Training Center (LARTC) as the training site. His expertise in tropical agriculture also helped shape the early character of the training program. LARTC was an exceptionally good site. The LARTC Director, Major Pian Chansuebsri was enthusiastic and consistently supportive throughout the entire program. He and all of the staff of the Center who participated in the training deserve a great deal of credit. The technical expertise they contributed as well as their support during day-to-day program operations helped make the program the success it was. The farm families in the surrounding villages were also excellent resources.

The staff of a training program is usually the key to a successful training experience. The Project Director, who was responsible for overall management was Ajaan Utthai Kaekhao. He, the entire staff of Thai language and cross-cultural trainers, and the administrative support staff worked very hard to ensure effective component integration, language instruction, logistical support and coordination. Buddy Larson, who worked as the technical coordinator, was with the program longer than anyone else. Buddy began early on by visiting all of the TEFL/Crossover volunteers to obtain their input into the training design and, during both the agricultural and TEFL training, contributed his knowledge and experience as a TEFL/Crossover volunteer to provide a well-rounded program and a manual that was both representative of the training and flexible enough for future adaptation. The Agronomy consultant, Carl Franck, who had responsibility for the agricultural training and for developing this manual, contributed immensely to the program's success. His knowledge of tropical agriculture and the ease with which he came to work with both trainers and other staff members contributed...
significantly to the maintenance of a positive, productive atmosphere throughout the program. Pattana Aviphant served as an agriculture technical trainer with emphasis on field crops, but also contributed a great deal in terms of her personal knowledge of Thai farming and practical farming techniques. Randy Reitz, a former PCV, served as the livestock trainer and was responsible for poultry and hog sessions. He also served very effectively as a liaison between the Center and the training program.

Many of the ideas and much of the information used in this training program came from these sources. Another most important source was the group of former and current TEFL/Crossover volunteers who made known their thoughts and feelings about Crossover problems and training deficiencies. At Close of Service Conferences and through termination reports, they provided feedback to Ajaan Nikorn and the Training Office. Also, the Crossover Committee discussed Crossover problems and possible solutions and provided suggestions for training. A special meeting was held in which the Peace Corps training staff met with this Committee.

The Agricultural Development Workers Training Manual prepared by A.L. Nellums and Associates, Inc. was also a valuable source of information and ideas. Some of what follows in this manual is adapted from that manual. In addition, there are many excellent sessions in the ADWT Manual which were not relevant to our purpose. The ADWT Manual also has useful information concerning preparation and planning for training which is not included here but which could be used most effectively.

Production of this Manual was supervised by Marcia Hamilton who provided invaluable assistance in editing, structuring and organizing the contents. She also trained Rewadee Vidheecharoen who entered all of the material into a Kaypro computer which facilitated editing, storage and retrieval. Michael Ordonez, a third year non-formal education volunteer must also be acknowledged for his effort in proofreading the entire manuscript, checking the manuscript against the original, editing and revising it where necessary, entering corrections into the Kaypro computer, and organizing the illustrations and diagrams.

My personal thanks go to all of these people for their time, commitment and contribution to this first-of-its-kind effort.

Dennis Hamilton
Training Officer
C. FOREWORD

For a number of reasons Peace Corps/Thailand has relied (until this year) on Stateside programs to provide agricultural training for TEFL/Crossover Volunteers. Those programs were as effective as could be expected, given that they were conducted in a physical and cultural setting and climate far from where PCVs were expected to apply their knowledge.

This year, due to a combination of factors including the availability of competent training staff and local facilitators, adequate resources, and administrative leadership and support, the decision was made to conduct this training entirely in Thailand.

The training was designed to emphasize hands-on experience with crops and livestock. Lectures on each subject were carefully planned and timed in order to receive full cooperation and attention from trainees. Lectures that introduce many of the sessions herein are important, but are timed not to be too long or to include irrelevant subject matter. Our experience demonstrates that trainees will complain about long days and tight schedules only if they believe they are wasting their time. Interesting and well-planned sessions were well accepted even with a very strenuous daily schedule. In this context, trainees were able to grow the most common home-consumption and cash crops. They also became familiar with the soil and weather conditions that they would face at their sites.

Due to limited time available for training, subject matter was carefully selected to satisfy the basic needs of trainees, regardless of their site locations, types of projects they might eventually select. Therefore, the session designs were selected to cover the broadest range of subjects related to small vegetable and field crops as well as the two classes of livestock most commonly found in the villages. Intercropping management techniques, which are very important, were also demonstrated in two plots. The success of this session sequence in the context of other training program requirements (such as site and staff selection) was demonstrated. Thus, it is foreseen that it would be extremely difficult to make any drastic changes in the schedule or sequence of sessions as presented in this manual.

Carl Franck
D. PREFACE

In the past, agricultural training for TEFL/Crossover trainees (responsible for teaching English as well as basic agriculture) was conducted in the United States at the Peace Corps Training site at Frogmore, South Carolina. While this training was, in a general sense, excellent, trainees arrived in Thailand with little knowledge of how to apply what they had learned to the Thai context. They often found that they had to relearn much of what they had learned in the United States because the plants, names, equipment and conditions were different. They had learned about rabbits, goats, sorghum, okra, radishes and a different culture. At the same time, fruits, fish and some Thai-specific vegetables were left out. Further, the African focus of the Frogmore training assumed a level of technological development below Thailand's. Arriving at their sites (although they knew something about tropical agriculture) they found that they knew little about Thai agriculture. They lacked confidence to do the agricultural half of their assignment. Indeed, they had no one to advise them as to how to adapt their experience to conditions here. This situation required a longer settling-in period and a longer time to gain the confidence needed to implement agriculture-related projects. In fact, some volunteers never learned about Thai agriculture and never got involved in that aspect of their assignment.

Another result of the Frogmore training was that Crossovers came to Thailand with an extension-worker emphasis. Because they work out of schools and have little (if any) chance to do extension work, two problems resulted. Crossovers wanted to do extension work and, thought in those terms. This led them to overlook opportunities to help with agricultural education. Further, they often felt that "real agriculture work" ("real development work") was extension work. For this reason, this training program emphasizes working with students and agriculture teachers at the school. Working with students at their homes is a secondary emphasis and doing extension work is viewed as a continuation of work at schools and student homes. The training presented here focuses on Crossovers as "agricultural educators." Further, Stateside training was inevitably dominated by Americans. This fostered a subtle preference for American teachers and technology which often converted into a lack of respect for Thai technicians—a most unfortunate result, considering the knowledge and experience available in Thai institutions. It was decided that more exposure to Thai resource persons and institutions during training would allow trainees to make better use of those resources when they became PCVs.

Language and communication are central to PCV effectiveness. Past training programs separated agricultural and language/cross-cultural training—both in time and place. Thus, the volunteers' ability to communicate their technical skills was diminished. This separation of agriculture from the rest of the training
process (with agriculture at the beginning) meant that agriculture was furthest from Crossovers' consciousness when they arrived at their sites. Crossovers must, however, get into agriculture quickly, if they are to get into it at all. Their collective experience was that, without agricultural skills and language ability that could be immediately used, they drifted more and more to the TEFL half of their job. And by the time they developed the necessary agricultural and language skills, they were too solidly entrenched in teaching English to fully participate in agriculture. Thus, in order to bridge the gap between Frogmore Training and the realities of agriculture in Thailand, an in-country orientation was conducted for TEFL/Crossover trainees for Group 78. This successful orientation paved the way for the first in-country training program—conducted for group 81. Moving the Crossover agricultural training to Thailand provided an opportunity to focus on the special needs of Crossover volunteers. Thus, a main goal of the "In-Country TEFL/Crossover Tropical Agricultural Training Program" became providing TEFL/Crossover volunteers with confidence to do agricultural education at their sites. With that goal in mind, the Training Program:

- Includes the experiences and ideas of Crossover volunteers in the planning and implementation of training (that they had developed over the four years the TEFL/Crossover program has existed in Thailand) such as:
  - focusing on Crossovers as "agricultural educators"
  - integrating agricultural and language skills
  - using Thai resource persons and institutions during training
  - using Crossover PCVs as trainers
  - including sessions that show how to apply agricultural skills in a rural school context.

- Includes relevant sections of The Agriculture Development Workers Training Manual written by A.L. Nellums, Inc., but modified extensively to reflect Thai agriculture and the realities of the Crossover program.

- Follows a Trainer's Manual designed to be used as is and which can also be updated. (It is bound in a three-ring binder, has "General Program" and "Crossover Program" sessions coded (in the Appendix) and unnumbered so that they can easily fit into the schedule of subsequent training programs, and includes pages for notes.)

- Uses a Trainees' manual which includes the first page of each Training Session as well as all hand-outs.

This In-Country Tropical Agricultural Training Manual was produced to facilitate future TEFL/Crossover agricultural training in Thailand. However, it can be easily adapted and used to train TEFL/Crossover trainees in tropical agriculture throughout the world.

G. INTRODUCTION

1. GENERAL PERSPECTIVE

The "In-Country TEFL/Crossover Tropical Agricultural Training Manual" has been designed for trainees coming to Thailand without stateside agricultural training. While it has been developed for the training of TEFL/Crossovers, the vast majority of sessions are appropriate for other Peace Corps programs in Thailand, as well as other Peace Corps countries. In order to meet the needs of this training program, the writers of this manual had to do a great deal of planning, preparation, research and design work. It is hoped that this manual will save future training staffs from duplicating much of that effort, so that they can concentrate on improving upon the past. The training sessions and recommendations presented here have proved to provide good learning experiences without taxing staff energies too greatly. Some of the concepts upon which this training is based are presented below.

Hands-on Experience: All trainees are college graduates and are fairly confident in their ability to learn, especially in an academic environment. However, the nature of the Crossover job requires skills, i.e. the ability "to do" things--agricultural things. This requires a great deal of hands-on training to allow trainees to learn and practice actions, concepts and experiences that most have never before encountered. This sort of learning can not be replaced by lectures and reading. Furthermore, hands-on training models a learning/teaching style most effective for working with Thai students. One relevant aspect of vocational education in Thai schools is the separation of classroom and practical learning--generally, with the latter being underemphasized. However, even with their lack of language ability at the outset, Crossover volunteers can use the methods we model here to focus on practical learning and, in doing so, can demonstrate the integration of knowledge with practice. This requires adequate practical skills on the part of Crossovers and their confidence in those skills.

Small Scale Projects: A variety of factors such as market access, financing, land, water and the school calendar, limit school agricultural programs to small-scale activities. This is in line with what students and poor farmers can do themselves. Therefore, training activities are designed on a small-scale. This Tropical Agriculture Training Program is like a school agricultural program in microcosm; it exists for education. Training activities need only be big enough to allow quality learning to take place. Trainees are exposed to large-scale activities, but their own are designed to be small.

Community Centered: An important goal of the L.S.S. (Lower Secondary Schools) project, in which Crossover volunteers work,
is that students are to receive a general and vocational education that is applicable in and appropriate to each school's surrounding community. Knowledge and skills that are applicable only in other provinces and cities are de-emphasized in favor of agricultural and economic activities that already exist locally or that are reasonably possible for local farmers and their children. Therefore, trainees should learn skills appropriate to rural areas and to the areas in which they will be working. As this training program is designed to cover general material and skills relevant to a number of different locales, it was considered important to include an independent study aspect so that trainees might do background research on their future locale while still being trained and supported by staff.

Strong General Foundation: Because of the training emphasis described here, there is not a great deal of time devoted to theoretical concerns. The scientific knowledge and its agricultural applications necessary for a full understanding of agriculture is impossible to impart in such a short period of time. Thus, a foundation is provided so that trainees have enough information to pursue reading and research during and after training. A strong understanding of basic agricultural concepts is necessary for continued learning. Trainees are introduced to important material and the most important concepts during training so that they can best make use of it later.

Independent Learning: It follows that Crossovers need to do a great deal of independent study to be useful in agriculture. Training encourages trainees to learn on their own and gives them some time and opportunity to do so. Such learning includes assigned and optional readings, informal learning during Home-stay, individual projects and pursuit of particular interests. Staff is available to help initiate and assist in such activities with the goal of increased trainee confidence and ability. Also, trainees draw on local resources (farmers, village and district officials and other resources) at their sites.

Trainee Responsibility: This Tropical Agricultural Training Program is an adult learning experience. Although trainees are like children in their language ability and cultural knowledge, trainers should never forget that trainees are adults. As adults, trainees need to be in control of their lives. This means that trainers are not school teachers. In turn, trainees are not students. Rather, training is a learning partnership, with trainees, not staff, responsible for the learning. Staff supports trainee responsibility with advice, knowledge, skills, experience, friendship and guidance. Suggestions on how to encourage trainee responsibility appear later in this Introduction.

Field Day: The major event that culminates training is Field Day—a trainee-planned and trainee-run day of demonstrations,
games, entertainment, food and fun. It is an opportunity for trainees to do something significant on their own, rather than follow the plans of trainers. While staff members lay down necessary guidelines, bring up important cultural and logistical points and act as resources, the trainees run the show, make the decisions and do the work. Trainees welcome the chance and they learn a great deal (in all components) during the process. In our experience, we saw a change in the level of trainee responsibility after Field Day. They took charge of more training activities, becoming more responsible, active and involved than they were previously. Many problems came with Field Day but trainees were able to solve them adequately. It is expected that future Field Days will by no means be perfect, but they will be fun, enlightening and will provide excellent learning and cross cultural experiences.

Integration of Components: The agricultural training detailed in this manual integrates a number of aspects of training. These "components" refer to agriculture, Field Day, Crossover-specific skills, language skills, cross-cultural skills, personal orientation and role in development. Further, in each session we have included technical vocabulary to be rendered into the local tongue. We have tried to stress how sessions should attempt linkages with other components—or, if possible, include other components directly. However, a manual cannot do it all. Integration is not a result of the materials, it must involve the personnel of a training program. A Language/Cross-Cultural trainer might (and should) co-facilitate a session involving a component other than language. Conversely, agricultural trainers should participate in the sessions and activities of other components. Successful integration is a product of creative teamwork, support and co-operation among all staff members. This kind of integration will help produce well-rounded PCVs who not only do well in each component, but who wrap them all up in a living package of technical skills, cultural awareness, communication ability and personal confidence.

Sanuk (Fun): Finally, we should never allow the importance and quantity of the training content to keep training from being fun. This is true in Thailand, where "sanuk" and "sabai" are so pervasive. If these concepts of fun are successfully incorporated into training, agriculture and the training experience will be much more meaningful for trainees than if they are not. When trainees arrive at their sites with an attitude of "agriculture is fun," then, they will be ready to work (and play) with Thais.
2. EVALUATIONS AND PROGRESS REVIEWS

Evaluation Philosophy:

The evaluation of trainee abilities and progress is very important to their successful training. Evaluation is necessary to ensure that all trainees are qualified for Peace Corps service and it must be done carefully. The tone and method of evaluations should be honest, straight-forward, and reasonable. A systematic, clear and open evaluation process keeps everyone informed of each trainee’s progress. If handled with sensitivity, each trainee will know the things s/he must do and can set about to do them. There should be no surprises. Indeed, the less subjective the process is, the less chance for misunderstanding and disagreement. The more trainees do self- and peer-evaluations, the more they will view trainers as learning-supporters, not as teacher-judges. This is important in adult learning. It lessens stress and contributes to good, open relations between trainees and trainers. There is time built in to training for trainees to accomplish the performance objective, and there are a number of evaluation opportunities along the way: further, evaluations need not be threatening and overly serious. Evaluations should fit into the training atmosphere of fun and achievement. In line with other efforts to make trainees responsible for training as possible, trainees should be involved in assessing themselves, other trainees and trainers. Further, whenever staff does evaluations, unnecessary secrecy and heavy-handedness should be avoided.

The method of evaluation of individual objectives and the overall evaluation process should be determined before trainees arrive. This will allow staff to fully explain the process during the session: "Introduction to Agriculture, GP and PS Sessions". Such pre-planning should not prevent trainees from making suggestions about adjusting objectives, the evaluation of objectives and the way progress reviews are done. In fact, staff should encourage such suggestions.

The Performance Objectives:

The performance objectives are the foundation of the evaluation process. They must be carefully reviewed, considered and revised, if necessary. While individual objectives may be easy or difficult to accomplish, they should average out to be somewhere in the middle. The performance objectives recommended herein were written to be specific, clear and directly relevant to the program trainees will go into. If future programs determine that additional performance objectives are necessary, the agriculture staff, with assistance from other staff members, the program manager and current PCVs in the program, should carefully revise them.
Every performance objective has at least one session objective which corresponds to it. If your staff revises the training design and a new performance objective is added, a new session should be added or a session modified in order to cover that performance objective. If there is no corresponding session objective, that performance objective should be dropped. In this way, when the staff reviews the schedule, if it will be clear when each performance objective should be fulfilled by the trainees and when the Progress Reviews (scheduled times for trainers and trainees to evaluate and discuss progress according to the performance objectives) are scheduled, specific objectives that should have been completed by that time can be listed.

**Quizzes:**

The next step is to determine how each objective is to be evaluated. A quiz will come a day or two before each progress review, but quizzes are only appropriate for evaluating certain objectives. Some objectives simply require attendance at a session or activity. Others are daily or regular chores which must be done for a large part of the training, (weeding (9-3) is one of these), and which show results in the health of crops and animals. Evaluation forms can be used by trainers and trainees to monitor such objectives. Sometimes, asking a few questions will suffice. In fact, some assignments are obviously done or not.

**Fulfillment of Objectives and Progress Reviews:**

After setting target dates for the completion of each performance objective and determining how each one will be evaluated, the staff member (responsible for that trainee) and the trainee independently check off each objective when it is fulfilled. Later, at the next Progress Review, the trainer and trainee compare their lists for differences of opinion. This will help staff understand how trainees view their own progress, in addition to highlighting what has been—and remains to be—accomplished.

**The Trainee File:**

The agricultural staff keeps a file on each trainee. Such files must be confidential, available only to trainers and the trainees whose files they are. Trainees can, if they wish, show their files to others. The files include a performance objectives checklist for staff to record the accomplishments of each trainee as well as notes, observations and concerns. Reports or other materials produced by trainees can also be included in the files.
3. STAFF COMPOSITION

It should be remembered that this agricultural training took place in the context of an overall pre-service training program which was simultaneously training malaria control and TEFL/Crossover volunteers. The agricultural training staff worked closely with the language and cross-cultural trainers and the project administration staff. Furthermore, toward the end of Phase I, with its heavy emphasis on agricultural training, coordination with the TEFL training staff effected a smooth transition to this equally important phase of the TEFL/Crossover PST program.

In the PST program from which this manual evolved the staff was as follows:

Overall Project Staff: Project Director
- Deputy Director/Cross-Cultural Coordinator
- Language Coordinator
- TEFL/Crossover Technical Coordinator/Trainer
- Malaria Control Training Coordinator

6 Language and Cross-Cultural Trainers

Core Staff Assistant

Administration Staff: Administrative Assistant
- Site Secretary
- Training Assistant/Driver

The Agricultural Training Staff consisted of:

One tropical agriculture/agronomy consultant—U.S. PSC with Thailand experience.
One livestock trainer—COSed PCV.
One agricultural training assistant—Thai with University Agriculture Degree.

(Job descriptions for these persons appear in Appendix C along with recommendations for consideration when staffing future programs.)

PCV Involvement: In addition, a number of current volunteers with areas of expertise related to agriculture or livestock participated in the training program and presented several training sessions. There was also a TEFL training staff composed of PCVs and Thai secondary school teachers.

Future Training Staff Composition: Based on our experience with this program, we will, in the future, have a Technical Coordinator who manages the overall technical training process, an Agricultural Training Co-ordinator and a TEFL Training Coordinator.
4. THE TRAINING PROGRAM ENVIRONMENT

Infrastructure and Resources Necessary to Implement a Successful Agricultural Technical Training Program:

The following items are considered necessary for a successful Agricultural Technical Training Program.

- Site at an Agricultural Research and Training Center.
- Transportation on a daily basis to provide support and timely movement of trainees and necessary supplies. Adequate equipment includes a van (full time), a station wagon (full time) and a pick-up truck (half time). More if 20 trainees.

Specific items that minimize personal discomfort of trainees and staff are:

- Enough water for trainees to have showers in the dorm.
- Living accommodations where the trainers can separate themselves from the trainees or other staff for session preparation or privacy.
- Good quality and affordable food must be available. A group "mess" gives the staff an opportunity to get acquainted with the trainees on a personal basis.
- Working, eating, living, and socializing together should be avoided as it gets overbearing.

Specific infrastructure necessary to adapt the site for training includes:

- An area of at least two (3 or more, if 20 trainees) rai, completely fenced for protection from cattle, buffalo and other types of loss or damage.
- Soil of medium quality with good surface drainage that will limit the amount of time lost due to heavy rains.
- Adequate water supply or storage that will allow the plots to be cared for during the possibility of hot and dry weather (which could easily happen).
- Shelter that can accommodate the trainees and staff comfortably as a resting place, shelter from the sun or rain, and on many occasions become a classroom for sessions that should be conducted near the plots (pesticide use, watering and numerous sessions concerning livestock).
o Storage shed, suitable for keeping the necessary items used in plot preparation and maintenance as well as livestock feeds and supplies. This storage shed must be kept dry and be able to be secured by locking.

o Pen with water suitable for two young pigs. This pen should also be covered for protection from the sun and rain but with adequate ventilation. This structure is best made from local materials.

o Structure suitable for raising 50-100 baby chicks to broiler size in approximately 45 days. This should have an adequate water supply with good ventilation and be capable of keeping dry. Electricity is required in this structure.

o Structure suitable to accommodate approximately 20 laying hens. This could be of two types—the preferred type has individual cages, the other type would be a loose house with nests for egg collection. The first is the most practical for training record-keeping.

o Adequate classroom space where lectures and demonstrations can be held regardless of weather conditions and to accommodate the splitting of trainees into small groups for special studies.

o Technical facilities and a trained host-country instructor responsible for each section would be a tremendous asset to the training program. Having a laboratory at the site and classroom facilities should be a high priority in site selection. These facilities, if not located at the training site, should be located nearby and utilized during the training program.

o Training Center Director and staff that will cooperate with training program staff to gain the full benefits of the facility.
The Training Farm:

Without a Training Farm and the plots there could be no agricultural training program. The importance of the farm is that it gives the trainees hands-on experience with crops and animals. This, in essence, makes an in-country training program possible and successful. The farm gives trainees the chance to know physical labor, to see seeds that they plant develop and produce. This, in turn, gives them the confidence to repeat this process once they arrive at their site. (See next pages)
Figure 1 The Training Farm

T-16

Front Gate

Existing water supply

T-16
Figure 1: The Training Farm (Continued)

A. Student House
B. Sala shelter
C. Storage
D. PCV Chicken Coop
E. LARTC Chicken Coop
F. PCV Pig Pen

**Individual Plots**

1. Cucirbot ½ pt 2 x 5 m
2. Direct seeded vegetable plot 1 x 5 m
3. Transplant Plot 1 x 5 m
4. Sweet corn Plot 2 x 5 m

**Community Plots**

5. Cassave—intercropped with peanuts
6. Sweet Potatoes
7. Mung beans
8. Soybeans
9. Field corn intercropped with cotton
10. Transplant beds

11. Additional area suitable for individual plots depending on the number of trainees.

**NOTE:** The dotted line shows the proposed water system with the circles being storage facilities.
LAND: The Training Farm should consist of two rai with a fence completely surrounding it for security and to prevent damage to the plots from buffalo or cattle. The soil should be light textured with a pH of approximately 5 to 6 and have excellent surface drainage as well as reasonable water holding capacity which is capable of being improved by the use of manure.

WATER: If the water supply is insufficient or sporadic, concrete rings can be installed and connected by PVC pipe. It is important to improve the water supply system prior to training program start-up.

PLOTS: The plots should be laid out in such a way (see map of farm) that each trainee has a given number of square meters for which s/he is completely responsible. The rationale for this is twofold:

1. Each trainee appreciates being able to do things on his/her own and to be responsible for the end results.

2. Individual plots are a sure way to monitor the progress or problems of each trainee and thus, the trainer is able to use the plot in evaluating trainee performance.

Each trainee should be responsible for 45 square meters of crops with 30 square meters being his/her sole responsibility and 15 square meters to be shared in a community plot.

Miscellaneous Farm Items:

Rain Gauge - A rain gauge should be installed at the farm as early as possible, sometime in the preparation phase. Daily readings are taken and recorded on a nearby graph, so that rainfall can be compared with the amount of water trainees must use to water their crops.

Thermometers - One or more thermometers should be installed in any of the following places: in rest shelter, in chicken coop or pig pen, near vegetable plots. They can be checked informally or systematically (and recorded) to point out relationships between temperature and animal and plant growth. They'll also help trainees to monitor their own adjustment to the climate.

Insect Traps - Trainees will make insect traps in the "Insect Control" session. They should be installed and checked regularly to monitor insect populations.
**Plot Descriptions**

The following provides an overview of what should be planted (by plot) for a tropical in-country agricultural training program.

**PLOT #1--2 x 5 meters--Cucurbits (See Hand-out #2-a)**
- cucumbers
- Thai melon
- pumpkin
- watermelon

**PLOT #2--1 x 5 meters--Direct seeded vegetables (see Hand-out #10-a)**
- long beans
- morning glory
- Japanese radish
- parsley
- kale
- carrots
- flowers
- onions/garlic

**PLOT #3--1 x 5 meters--Transplants**
- tomatoes
- peppers
- eggplant
- kale
- flowers
- onions
- garlic

**PLOT #4--2 x 5 meters--Maize**
- sweetcorn
  - 3 rows 68 cm x 25 cm

**COMMUNITY PLOTS**

**PLOT #5--5 x 5 meters--Pulses**
- Mung bean
- Soybean

**PLOT #6--5 x 5 meters--Cassava**
- Cassava
  - Interplanted with peanuts

**PLOT #7--5 x 5 meters--Sweet potatoes**
- Sweet potatoes
  - One row of sugar cane
TRAINER PLOTS FOR DEMONSTRATION

PLOT #1--2 x 5 meters--Maize
   Sweetcorn
   Interplanted with cotton or pulses.

PLOT #2--4 x 5 meters--Pulses
   2 x 5 meters mung bean
   2 x 5 meters soybean

PLOT #3--5 x 8 meters--Maize
   Sweetcorn
   Demonstration of different fertilizer applications using manure
   and different fertilizers/application rates.

PLOT #4--1 x 5 meters--Cucurbits
   cucumbers
   Thai melon
   watermelon
   pumpkin

PLOT #5--1 x 5 meters--Direct seeded vegetables
   string beans
   morning glory
   Japanese radish
   parsley
   kale
   carrots
   flowers
   onions/garlic

PLOT #6--1 x 5 meters--Transplants
   peppers
   eggplant
   kale
   flowers

T-20
5. SKILL GROUP CATEGORIES

The many skills that TEFL/Crossovers need have been broken up into 22 categories. Performance objectives and sessions have been developed for each. These categories are:

1. Training Information and Administration
2. Agricultural Environment Basics
3. Crop Production Management Principles
4. Units of Measure
5. Soil Management and Fertilizer Use
6. Water Management
7. Insect Control
8. Disease Control
9. Weed Control
10. Pesticide Safety and Use
11. Basic Botany
12. Vegetable Production
13. Field Crop Production
14. Fruit Production
15. Mushrooms
16. Poultry Production
17. Swine Production
18. Fish Production
19. Demonstrations
20. Field Day
21. General Program Sessions (GP)
22. Program-Specific (TEFL/Crossover) Sessions (PS)

It should be noted that some skill groups have only one specific training session because sessions of one skill group overlap with those of other groups; indeed some sessions fall equally into two groups. Also, the performance objectives for each skill group are not met only through training sessions. Readings, informal learning and skills developed during chores supplement the sessions.

SKILL-GROUP CATEGORY DESCRIPTIONS AND SESSIONS:

Skill Groups are numbered 1 – 22 and Sessions are numbered according to number, week and day (number – week – day).
1. TRAINING INFORMATION AND ADMINISTRATION:

Trainees must be well informed of the goals and content of the training and should be involved in the evaluation of training. Written and practical exams are important for gauging trainee progress. These sessions can be co-facilitated by the Technical Coordinator, Project Director and/or Agricultural Coordinator. As discussed in "Evaluations and Progress Reviews" (Introduction Part 2), the training evaluations, if done well, add a great deal to the training program. Sessions in this group are:

1 - 0 - 0  Group Resource Assessment
4 - 1 - 1  Meet Center Director and Staff
13 - 1 - 3  Introduction to Agriculture, GP and PS Sessions
37 - 2 - 10  Quiz I
39 - 2 - 11  Training Evaluation I
59 - 4 - 20  Quiz II
81 - 5 - 28  Quiz III
83 - 5 - 29  Phase I Evaluation

2. AGRICULTURAL ENVIRONMENT BASICS:

Agriculture is Thailand's most important industry, which highlights its close relationship with all aspects of Thai life. Thai life, in turn, affects agriculture. Social, economic, and political factors along with physical factors (such as climate, topography and water resources) make up the agricultural environment. Agriculture and environment are thus inseparable and mutual. When agriculture is left uncontrolled, it has a devastating effect on the environment and subsequently on the people. An understanding of this inter-relationship is crucial for PCVs to work in directions that benefit people. The session for this skill group is:

27 - 2 - 7  Agricultural Environment

3. CROP PRODUCTION MANAGEMENT PRINCIPLES

Farmers the world over are expert in "traditional" management techniques. However, "improved" techniques are now widespread, although poorly understood and used. PCVs play an important role in spreading the knowledge and concepts needed to properly use "improved" technologies. Management principles, fertilizer use, soil improvement, new seed varieties, pest management, inter-cropping, integrated farming and marketing are some of the areas that need to be considered. The sessions in this group are:

3 - 1 - 1  Plot Layout and Introduction to Metric I
24 - 1 - 6  Record Keeping (Crops)

T-22
33 - 2 - 9 Maintenance and Weeding (also 47-3-15, 48-3-16,
68-4-23, 72-5-25, 84-5-29, 86-7-37, and 98-8-43)
36 - 2 - 10 Introduction to Tropical Crop Management
53 - 3 - 18 Field Trip: Integrated Farm
55 - 4 - 19 Record Keeping Review/Marketing
61 - 4 - 21 Introduction to Marketing (Animals)

4. UNITS OF MEASURE

Weights and measures are a part of all agricultural
activities and trainees must be familiar with the units they will
encounter and the calculations involved. This is complicated by
the metric system (with which few trainees are familiar) and the
indigenous measuring system. Trainees become acquainted with
both systems, learn to convert to them and make basic
calculations using them. The sessions in this group are:

3 - 1 - 1 Plot Layout and Introduction to Metric I
30 - 2 - 8 Units of Measure and Introduction to Metric II
49 - 3 - 16 Using Chemicals and Chemical Fertilizers—
   Introduction to Metric III
67 - 4 - 23 Fertilizer Math and Introduction to Metric IV

5. SOIL MANAGEMENT AND FERTILIZER USE

Soil management and fertilizer use go together, but without
knowledge of both they have no connection. The aims of these
sessions are to familiarize trainees with how important soil is
in crop production. They learn how to classify soil, what is
good and what is unsuitable for crop production and how to
determine whether a soil needs special care. Fertilizer use
demonstrates not only the blends that are available, but what
types and blends should be used for what crops to receive the
maximum return. These sessions also include proper placement and
timing of fertilizer—aspects which are equally important to
types and blends when one considers soil type and water
availability. The sessions in this group are:

21 - 1 - 6 Composting Techniques
22 - 1 - 6 Using Organic Fertilizers
43 - 3 - 13 Plant Nutrition Basics and Determining
   Fertilizer Needs
48 - 3 - 16 Basic Soils
49 - 3 - 16 Using Chemicals and Chemical Fertilizers—
   Introduction to Metric III
69 - 4 - 24 Soil Conservation
6. **WATER MANAGEMENT**

The monsoon weather cycle alternates periods of abundant rain with dryness. Sometimes the extremes of flooding and drought are reached. Dealing with these variations is important for all crops. Trainees must be introduced to the water cycle below, on, and above ground. The session in this group is:

32 - 2 - 9   Plant Water Requirements

7. **INSECT CONTROL**

The tropical climate supports abundant insect populations which can devastate crops, particularly vegetables. Unfortunately, quick solutions such as scheduled insecticide sprayings have dangerous consequences. Integrated pest management is presented as a balanced package of controls which attempts to minimize dangerous side-effects. The sessions in this group are:

51 - 3 - 17   Insect Identification
54 - 4 - 19   Insect Control

8. **DISEASE CONTROL**

Plant diseases in the tropics are important in that diseases (like insects) are not controlled by freezing weather and monocropping as in temperate countries. When crops are grown the year round, increases in disease and insects are likely. In order to effectively control plant disease, one must be able to identify disease as well as (1) know how and when to control them and (2) know ways of preventing disease through the use of resistant varieties and improved cultural practices. The session in this group is:

57 - 4 - 20   Plant Disease and Control

9. **WEED CONTROL**

This concept is built into all the maintenance sessions and demonstrates the reasons why weeds must be controlled and the effects on crop yields if not controlled. Weed identification (as to type) and how weeds propagate are emphasized. The use of chemicals for weed control is of little importance due to their expense, but is nevertheless briefly discussed. The session in this group is:

33 - 2 -.9   Maintenance and Weeding

T-24
10. PESTICIDE SAFETY AND USE

Pesticides can be beneficial when used properly, but are destructive otherwise. The proper use of pesticides is based on safety. Proper use is stressed so that trainees can pass it on to farmers and students. The sessions in this group are:

63 - 4 - 22  Mixing and Applying Pesticides
85 - 7 - 37  Pesticide Use Review

11. BASIC BOTANY

Training covers a great variety of plants: vegetables, grains, legumes, fruits and weeds. The basic botanical classifications and concepts help trainees understand the specific species encountered during training. The sessions in this group are:

9 - 1 - 2  Direct Seeding Principles
20 - 1 - 5  Seed Germination Testing
42 - 2 - 12  Seed Germination Results
46 - 3 - 15  Plant Propagation

12. VEGETABLE PRODUCTION

Major emphasis is placed on vegetable production for several reasons. First, vegetables are a major portion of the diet and are widely grown both in home gardens and as commercial crops. Small vegetable plots are also easy for the trainees to develop at their sites as well as for home projects for interested students. Due to their importance, vegetable production techniques are studied and actual plot demonstrations with hands-on experience comprise a major portion of this training program.

2 - 1 - 1  Planting Cucurbits
10 - 1 - 3  Planting Direct Seeded Vegetables
26 - 2 - 7  Nursery and Transplants
28 - 2 - 8  Planting Transplant Plots
41 - 2 - 12  Vegetable Characteristics
47 - 3 - 15  Staking and Trellising - Maintenance
56 - 4 - 19  Planting Situations
62 - 4 - 21  Plot Evaluations
110 - 12 - 67  Garden Planning
13. FIELD CROP PRODUCTION

Field crop production is less focused upon than vegetable production, but the basics are covered concerning some of the major crops. The trainees, in most cases, will have little, if any, exposure to field crops other than rice, but some experience in planting techniques was seen to be beneficial for possible future work. For example, sweet corn is discussed in detail as a vegetable and is closely related to field corn production. The sessions in this group are:

6 - 1 - 2 Planting Maize
14 - 1 - 4 Planting Pulses
25 - 2 - 7 Planting Cassava and Sweet Potatoes
35 - 2 - 10 Traditional Rice Production Techniques

14. FRUIT PRODUCTION

Due to the tremendous amount of and variety of fruit here and the importance of fruit in the daily diet, fruit tree propagation and identification is thoroughly covered in this training program. The opportunities for trainees to use propagation techniques such as grafting and air layering at their site are unlimited. Improved varieties on existing trees would result through grafting or by increasing production using the air layering methods. This skill is also easily passed on to students who, in turn, could use them in home projects. Fruit tree production is also a project that can be initiated at trainees' sites as most schools have suitable land areas available. The sessions in this group are:

60 - 4 - 21 Fruit Tree Propagation
73 - 5 - 26 Introduction to Fruits
77 - 5 - 27 Planting Fruit Trees
88 - 7 - 38 Fruit Tree Propagation Follow-up

15. MUSHROOMS

Mushrooms fit well into the diet here and are also an inexpensive source of protein. They can be grown using waste materials (such as rice straw) with a minimum of investment. Mushroom growing makes an excellent site project and is useful for home projects as well. The results of this type of project can be achieved in 10 to 15 days. Therefore, trainees are eager to follow through with these sessions, which are:

52 - 3 - 17 Mushroom Production
80 - 5 - 28 Mushroom Follow-up
16. POULTRY PRODUCTION--LAYERS AND BROILERS

The fact that chicken is one of the main sources of protein in the diet here (as well as one of the most inexpensive) made poultry production a very important part of the training program. All types of poultry production are covered—including the production of native breeds which are important in most villages. Broiler projects are relatively easy to implement as they require low cash inputs and are short-term projects where results can quickly be realized. These projects are also suitable for home projects and can be successful on a very small scale with minimum investment risk. The sessions in this group are:

<table>

<td>Broiler Chicken Processing and Post-Mortem</td>
</tr>
</tbody>
</table>

17. SWINE PRODUCTION

Most families in the villages raise pigs on a small scale, for home use or sale, as pork is also one of the staple forms of protein here. Improvement in swine production at the village level can be relatively easy to achieve using new technology in breeding and feeding. The training program thus stresses swine production and provides trainees with basic hands-on experience necessary for the confidence they need at their sites to implement swine improvement projects. The sessions are:

<table>

</tbody>
</table>
18. FISH PRODUCTION

Fish are traditionally an important part of the diet. Recently, commercially raised fish have become an important commodity. Relatively simple and inexpensive, fish production is an excellent source of protein and cash for farmers and schools. Peace Corps’ contribution to Thai fisheries is impressive and trainees should be prepared to continue the work. The sessions in this group are:

38 - 2 - 11  Field Trip: Fish Farming
45 - 3 - 14  Introduction to Fish Farming

19. DEMONSTRATIONS

Having acquired agricultural skills and knowledge, trainees must be able to share what they have learned with others. Demonstrations are one communication method available to trainees, especially trainees with limited language skills. Trainees prepare and present demonstrations in conjunction with Field Day. Sessions in this group are:

78 - 5 - 27  Independent Study
89 - 7 - 38  Introduction to Demonstrations
90 - 7 - 39  Demonstration Preparation
96 - 7 - 42  Demonstration Presentation (English)

20. FIELD DAY

As explained in the Introduction, Field Day is an opportunity for trainees to use the many skills (language, cultural, agricultural, demonstrational) they have acquired in the course of training. In addition, they have the opportunity to plan, prepare and carry out a major activity. This activity is the responsibility of the trainees and they facilitate the majority of the sessions in this group, which are:

71 - 5 - 25  Introduction to Field Day
76 - 5 - 26  Field Day Organizational Meeting
99 - 8 - 43  Field Day Preparation I
101 - 8 - 44  Field Day Preparation II
104 - 8 - 45  Field Day Preparation III
105 - 8 - 46  Field Day Preparation IV
107 - 8 - 48  Field Day
108 - 8 - 48  Field Day Evaluation
21. GENERAL PROGRAM SESSIONS

Each trainee must be able to apply his/her new skills to the Peace Corps context, the Thai bureaucracy and the Ministries s/he will work under. These sessions provide information for the trainees and opportunities for them to discuss their roles in these contexts. Many of these sessions can be facilitated by trainees. Sessions in this group are:

17 - 1 - 4  Program Manager I
65 - 4 - 22 Program Manager II
87 - 7 - 37 PCV Visits Follow-up
92 - 7 - 40 Co-workers and Helping
94 - 7 - 41 Communication Skills
100 - 8 - 44 Projects
102 - 8 - 44 Program Manager III

(Additional sessions of this kind can be found in the ADWT Manual)

22. PROGRAM SPECIFIC SESSIONS

These sessions are directly relevant only to the program for which they were designed. In this case Program Specific Sessions refer to TEFL/Crossover sessions. The contents of each session may provide ideas for similar sessions that could be presented to other types of trainees, but cannot be used as they now exist. For this reason, this group of sessions will be found in the Appendix and has not been integrated into the main body of Sessions in Part II.

For TEFL/Crossovers these sessions are crucial because they provide information specifically about C.S.S. project schools and the Crossover role. Trainees can facilitate many of these sessions, especially those in which they discuss how they will fulfill the Crossover role at their sites. Previous to the PCV visits, trainers and PCV visitors must provide most of the information. Following the visits, the trainees are expected to contribute most of the points discussed. Sessions in this group are:

34 - 2 - 9  L.S.S. Project and Crossovers' Role
50 - 3 - 16 L.S.S. School Field Trip
70 - 5 - 25 School Hierarchies and Relationships
74 - 5 - 26 School Analysis
95 - 7 - 41 Ajaan Yais I
103 - 8 - 45 Ajaan Yais II
109 - 9 - 50 Thai Students’ Needs and Motivations
111 - 12 - 71 Getting Feet in Doors
5. PERFORMANCE OBJECTIVES BY SKILL GROUP

The training program includes regular evaluations of trainee progress. At each one of these progress reviews, some of the following objectives will be fulfilled by each trainee, while other objectives will be only partially fulfilled. As training progresses, the number of fulfilled objectives will increase. At the final progress review, fulfillment of the objectives must be met by each trainee. Failure to meet critical objectives—particularly in the program-specific and cross-cultural areas could disqualify the trainee from Peace Corps service.

It is important to note that fulfillment of each and every objective means adequate skills and knowledge as stipulated in each objective. Fulfillment does not mean expertise, it simply means fair and adequate attainment. This is why trainees are expected to fulfill almost all of the objectives.

GROUP 1: TRAINING INFORMATION AND ADMINISTRATION

- Understands the objectives of agricultural training.
- Takes part in training evaluations.
- Evaluates personal, group and staff performance.
- Completes all quizzes.

GROUP 2: AGRICULTURAL ENVIRONMENT BASICS

- Understands agriculture's place and importance in the Thai economy.
- Knows the basic successes and problems of Thai agriculture.
- Names five physical features of the agricultural environment and explains how they interrelate with agriculture and farmers.
- Names 5 non-physical features of the agriculture environment and explains how they interrelate with agriculture and farmers.
- Identifies host-country crop production techniques and habits that differ from the methods taught in this training.
- Uses local tools.
GROUP 3: CROP PRODUCTION MANAGEMENT PRINCIPLES

- Keeps records of all crops planted.
- Lays out one vegetable plot (individually) and one field crop plot (in a group), both of proper size and shape.
- Identifies the major differences between subsistence and market farming, along with the similarities.
- Understands how the farmers’ outlook (subsistence, market, or combination of both) affects the practices they use and the decisions they make.
- Does a simple market analysis.
- Buys and sells some agricultural products.
- Identifies how marketing determines a crop's success or failure.
- Explains the principle of integrated farming and gives three examples of integration.
- Finds the sources of important inputs and equipment.

GROUP 4: UNITS OF MEASURE

- Makes conversions between English and metric measurement systems.
- Calculates fertilizer rates in metric systems.
- Calculates pesticide rates in metric systems.
- Calculates plant populations and spacings in both systems.
- Makes conversions to and from the Thai system.
- Calculates feed ratios in the metric system.

GROUP 5: SOIL MANAGEMENT AND FERTILIZER USE

- Lists the classifications of soil types.
- Identifies soil types of field samples.
Explains the following soil properties and how they are important in crop production: structure, tilth, depth, levels, drainage, water holding capacity, texture.

Makes a compost pile and explains the process.

Identifies organic sources (available in-country) of the major nutrients.

Applies and understands the principles of applying organic fertilizers.

Applies and understands the principles of applying inorganic fertilizers.

Measures slope using a simple method.

Identifies important soil conservation problems in-country and appropriate conservation techniques.

Knows all of the macro- and micro-nutrients.

Knows the role each macro-nutrient plays in plant growth and health and identifies deficiency symptoms.

Determines fertilizer needs from deficiency symptoms.

GROUP 6: WATER MANAGEMENT

Hand waters vegetable plots.

Furrow-irrigates field crops.

Identifies the water needs of all crops grown.

Uses simple techniques to determine soil water content.

Understands the concepts of field capacity, holding capacity, saturation.

Understands how to furrow, drip, clay-pot and flood irrigate.

GROUP 7: INSECT CONTROL

Distinguishes between sucking and chewing insects.

Distinguishes among the life-cycles of moths, beetles and aphids.
Identifies, in the field, five common vegetable pests and three important field crop pests.

Understands the concept of economic threshold and knows how to monitor insect populations.

Understands integrated pest management.

Explains six methods of insect control that are appropriate for small-scale applications.

Builds one type of insect trap.

GROUP 8: DISEASE CONTROL

Knows the difference between diseases, natural senescence, and nutrient deficiencies.

Understands major disease types: fungal, viral, bacterial, inorganic.

Identifies important disease vectors.

Identifies, in the field, common vegetable diseases.

Explains five methods of disease control that are appropriate for small-scale applications.

GROUP 9: WEED CONTROL

Understands the effects weeds have on yields.

Identifies common weed types and their means of propagation.

Practices appropriate weed control in all plots.

GROUP 10: PESTICIDE SAFETY AND USE

Knows and understands pesticide classifications and labels, including key words in the local language.

Understands the ways different types of pesticides affect targeted pests and beneficial species.

Knows how to store and transport pesticides, deal with spills and dispose of used containers.

Treats simulated accidental poisonings.
GROUP 12: VEGETABLE PRODUCTION

- Determines application rates for small plots and calibrates applicators accordingly.
- Mixes and applies a pesticide.

GROUP 11: BASIC BOTANY

- Understands general botanical classifications.
- Identifies major plant parts.
- Understands how plants propagate and their corresponding life-cycles.
- Understands the differences between annuals and perennials.
- Identifies the parts of a seed and understands the germination process.
- Does a germination test.
- Understands how the placement of seed affects germination rate and seedling health.

GROUP 12: VEGETABLE PRODUCTION

- Identifies the major vegetable families and their most important characteristics.
- Understands the importance of proper seed-bed preparation.
- Plants and grows a variety of directly seeded vegetables: cucumbers, squash, long beans, morning glory, coriander, parsley, lettuce, radish.
- Seeds, raises and transplants seedlings of: tomatoes, peppers, eggplant, cabbage, kale, Chinese cabbage, greens.
- Plants and grows from bulbs: garlic, onions.
- Keeps detailed records for all vegetable plots.
- Deals with common problems as they arise.
- Stakes and trellises the appropriate crops.
- Harvests crops at the correct time.
Identifies which vegetable species are appropriate for a variety of planting situations.

Designs a garden plan.

GROUP 13: FIELD CROP PRODUCTION

- Plants (in groups): corn, soybeans, mung beans, peanuts, cassava, sugar cane, sweet potatoes.
- Knows the life cycles and planting seasons for the above crops.
- Transplants rice.
- Knows the stages of rice growth and the important management techniques of rice production.
- Applies the relevant fertilizer, water, soil and pest management techniques to the production of the above field crops.

GROUP 14: FRUIT PRODUCTION

- Identifies the fruit and leaves of major fruit crops: mango, papaya, coconut, lime, tamarind, custard apple.
- Air-layers one fruit tree.
- Grafts, using three different methods, other trees.
- Plants and maintains one seedling.
- Understands simple techniques to ensure good tree growth and fruit production.

GROUP 15: MUSHROOMS

- Understands the reproduction of mushrooms and their life-cycles.
- Knows the conditions necessary for good mushroom growth.
- Grows and harvests rice-straw mushrooms.

GROUP 16: POULTRY PRODUCTION

- Handles chickens properly.
Distinguishes the major breeds found in-country and identifies them as meat, egg or dual-purpose.

Names important internal and external body parts of poultry in English and Thai.

Knows the nutritional needs of chicks, broilers and growers.

Mixes appropriate feeds.

Feeds chickens.

Waters chickens.

Knows the water requirements of different kinds of chickens.

Knows the major chicken diseases and how to prevent them.

Vaccinates chickens.

Practices sanitation regarding water, feed, equipment, housing and personnel.

Understands the housing needs of chicks, broilers, layers and native breeds.

Constructs a brooder.

Constructs coops and cages.

Keeps records for all aspects of chicken production included in training.

Uses local materials in construction and for equipment.

Slaughters one chicken and cleans it.

Does a post-mortem to identify major internal organs.

Understands simple techniques for improving native chicken raising.

Understands marketing considerations that are relevant to chickens.

Knows the major differences between raising ducks and raising chickens.
GROUP 17: SWINE PRODUCTION

- Handles pigs of all sizes.
- Distinguishes the major breeds raised in-country.
- Knows the nutritional needs of pigs of all ages and locally available sources of vitamins and protein.
- Mixes appropriate feeds.
- Feeds and waters pigs.
- Understands the water requirements of pigs, for drinking, cooling and sanitation.
- Knows common signs of pig illness and where to turn to for diagnosis.
- Gives iron injections, clips needle-teeth and ear notches piglets.
- Castrates a piglet.
- Practices sanitation regarding water, feed, equipment, housing and personnel.
- Detects and controls internal and external parasites.
- Understands the housing needs of all ages of pigs.
- Constructs a pig pen with feeder and waterer.
- Understands the ear-notching system used in-country.
- Keeps records for all aspects of pig production included in training.
- Uses local materials for equipment and construction.
- Observes a pig post-mortem.
- Understands basic breeding concepts and principles.
- Knows simple techniques for improving village pig production.
- Understands marketing considerations that are relevant to pigs.
GROUP 18: FISH PRODUCTION

- Identifies major freshwater food fish, both those commercially raised, those found in streams and their predators.
- Understands pond digging and preparation.
- Knows easy-to-find, inexpensive feed.
- Releases fingerlings.
- Understands major factors in pond management.
- Harvests adult fish.
- Observes induced spawning.

GROUP 19: DEMONSTRATIONS

- Researches an independent study topic of personal interest and submits a 2-page outline.
- Presents a demonstration in English.
- Presents the same demonstration in Thai on Field Day.

GROUP 20: FIELD DAY

- Participates in the planning and organization of Field Day.
- Takes responsibility for one of the Field Day tasks.
- Participates in Field Day.
- Evaluates personal and group performance on Field Day.

GROUP 21: GENERAL PROGRAM SESSIONS (GP)

- Understands the goals and objectives of the Peace Corps Program assignment.
- Understands the goals and objectives of the agency assignment.
- Understands role and duties as expected by Host Country government, receiving agency, co-workers, Peace Corps and peers.
- Understands the workings of the Host Country's bureaucracy, particularly the workings of the receiving agency.
Knows how to locate local resources: inputs, equipment, successful farmers, government agencies, research and teaching institutions, private companies, professional associations and other volunteers (PC, CUSO, GVS, GVC, TVS, VSO, NZV, JOVC).

Is familiar with the work styles and attitudes of farmers and has strategies for working with them.

Shares useful knowledge from PCV visits.

Evaluates personal communication skills.

Considers strategies for working with others.

Assesses personal work style and habits.

Understands how "projects" are viewed by receiving agency and Peace Corps.

Knows what PC support is available for projects.

GROUP 22: PROGRAM SPECIFIC SESSIONS (PS)

Understands the technical and general objectives for TEFL/Crossover volunteers in Thailand. (See Appendix H for specific objectives.)

Visits a LSS Project school.

Understands the formal and informal hierarchies and relationships at small, rural schools.

Understands the duties and position of principals.

Has strategies for working with principals.

Understands duties/position of agricultural teachers.

Has strategies for working with agricultural teachers.

Understands Thai student needs, motivations and habits.

Understands what "Home Projects" are.

Knows of agricultural projects that are suitable at LSS Project schools.

Has a strategy for analyzing school resources, capabilities, needs and problems.

Has strategies for establishing the Crossover Role within LSS Project schools.
PART II

The Overall Training Schedule for In-Country TEFL/Crossover Tropical Agriculture Training

and

The Training Program Calendar
II. SCHEDULES

A. THE OVERALL TRAINING SCHEDULE FOR IN-COUNTRY TEFL/CROSSOVER TROPICAL AGRICULTURAL TRAINING

The Training Schedule below presents Sessions in the order they appear in this manual, by code (number, week, day), Session Title, Time and Location. The Training Schedule is repeated by week at the beginning of each week in Part III.

END OF TRAINING PROGRAM
NOTES ON THE SCHEDULE

The schedule we offer here is close to, but an improved version of the one we originally followed. We've incorporated our own thoughts and the suggestions of trainees and L/CC trainers in this schedule. We realize that the design of other training programs might require changes in this schedule. Therefore, we raise the following points in anticipation of some possible problems.

1. Give careful thought to changing the order and timing of sessions. Each day should have a balance between class and field, agriculture and other, plants and animals.

2. The amount of time needed for plot maintenance is highly variable. Factors affecting it include: rainfall, soil quality, trainee free-time, trainee health, heat, and whether trainees sleep at agricultural training site or elsewhere.

3. No time has been scheduled for animal care. This is not an oversight. While trainees stay at the agricultural training site, they can care for the animals in the morning and evening. This can continue, if the animals move to home-stay with the trainees. Otherwise, time must be set aside every day for animal care, to ensure that trainees are adequately exposed to livestock.

4. The last two weeks of this schedule are very flexible. They should be modified to meet the needs of each program.

5. In particular, more than enough time is given to Field Day preparation. Some of the time might be used for other needs.

PLAN AROUND THE POSSIBILITY OF RAIN!

As many of the agricultural sessions are outside and training takes place during the rainy season, there are numerous opportunities for "rain-outs." Although the sun may be shining, the ground may be too damp or puddled to work. This means that contingency plans must be made in advance, primarily that an indoor or "class" session is ready to go in case of rain. Sometimes an L/CC session can be the back-up session. Overall, scheduling must be flexible enough to adapt to weather (and other) induced changes.
B. THE TRAINING PROGRAM CALENDAR

The In-Country TEFL/Crossover Tropical Agricultural Training Program requires 14 weeks for proper implementation. These 14 weeks are divided into two periods. The first is staff preparation and the second is the actual agricultural training program. The general outline for the entire 14 weeks follows:

PRE-TRAINING STAFF PREPARATION

Before training actually begins, trainers spend six weeks preparing for training. During this time, facilitators and co-facilitators are assigned crop, livestock, GP and PS sessions. GP and PS sessions are scheduled and integrated into the program design, administrative procedures are established, lectures prepared, additional reading materials collected, etc. It is during this time that beds are prepared for crops needed for later sessions. During this six week period any changes in the training design that you make must be integrated and the schedule and calendar reorganized to reflect the new training program.

1 week - Technical and Agricultural Coordinators do preliminary preparation.

1 week - Agricultural staff’s general preparation.

1 week - Preparation with other staff.

3 weeks - Detailed preparation of all materials, procedures and sessions. (Trainees arrive in-country, but do not begin agricultural training immediately.)

AGRICULTURAL TRAINING PROGRAM

1.5 weeks - Intensive agriculture.

3.5 weeks - Agriculture with village home-stay.

1 week - Visit PCV in program.

2 week - Agriculture wrap-up, GP and PS sessions, and Field Day.
The following pages present a week-by-week guide for trainer activities. Note that this is not the same as the session schedule. Tasks that should be accomplished each week are outlined and include plot preparation, planting crops for demonstrations at a later date, ordering materials, animal maintenance, etc. The Pre-Training preparation schedule consists of the first six weeks prior to the arrival of trainees at the training site. The purpose of this schedule is to assist trainers in preparing materials and equipment in advance to avoid delays, poorly prepared and presented sessions, and logistical problems. Therefore, if the schedule is followed and items completed in the week suggested, sessions will be prepared properly. Training schedule preparation consists of weeks 1, 2, 3, 4, 5, 7 and 8. Week 6 is not included as trainees are off at PCV visits. While this preparation schedule will help prevent problems, it should not be followed blindly. Please review it carefully, in order to make the necessary additions, changes and deletions.

CALENDAR

PRE-TRAINING WEEK 1

1. Technical and Agricultural Coordinators meet with the other members of the training core staff, the training officer and program managers to plan the broad outline of the training program.

2. Technical and Agricultural Coordinators visit the training site to gather information and establish relations with the training site’s permanent staff, inform them of plans and provide them with a tentative schedule.

3. Technical and Agricultural Coordinators plan and schedule activities for the remainder of the pre-training staff preparation (using this calendar as a reference).

4. Prepare and distribute Trainers’ Manuals for the staff.

5. Assemble the agricultural staff reference library.

6. Prepare materials for the meetings that will take place the following week: paper, notebooks, pens, markers, tape, etc.

7. Order the texts that will be given to trainees.

8. Set up staff visits to current PCVs.
PRE-TRAINING WEEK 2

1. Entire agricultural staff is brought together. Meeting among the agricultural staff, the core staff and training officer takes place.

2. Staff members get to know about each other: background, skills, expectations, apprehensions and personal habits.

3. Staff discusses and clarifies roles, job descriptions, responsibilities, and mutual support.

4. Manuals, texts, references and other materials are distributed. Staff reads all areas that concern them.

5. Session responsibilities are assigned.

6. Meeting with Program Manager and PCV representatives from the programs to be trained takes place.

7. Staff visits PCV sites to learn about the programs that trainees will enter.

8. Each staff member reads the materials that concern her/him. This can be done during and after #7.

PRE-TRAINING WEEK 3

1. Staff meets at agricultural training site.

2. Staff shares observations from PCV visits.

3. Staff discusses the skill group categories, performance objectives, sessions, schedule, materials and farm design. Staff makes necessary modifications and reassignments as necessary.

4. L/CC staff arrives at agricultural training site. Gets acquainted, shares plans and discusses component integration.

5. Purchase and have available the following items:
   a. Seed of all varieties. Test the germination of all except the flowers.
   b. Commercial fertilizers, 50 kg each 15-15-15/21-0-0.
   c. Insecticide Furadan 36 (4 kg).
   d. Water sprinkling cans -- 10 each.
   e. Hoes with handles -- 20 each.
f. Rakes with handles -- 10 each.
g. Shovels with handles -- 10 each.
h. Buckets -- 5 each.
i. Baskets -- 10 each.
j. Measuring tape 50 m -- 1 each.
k. Manure (dry) 6 cubic meters (near plots).
l. Measuring sticks (bamboo), 1 meter, with 10 cm markings -- 15 each.
m. Bamboo poles for staking beans and tomatoes (2 meters long)

PRE-TRAINING WEEK 4

Staff members:

1. Plant Demonstration cucurbit plot (2 x 5 meters) according to hand-out #2-a.
2. Plant demonstration direct seeded vegetable plot (1 x 5 meters) according to hand-out 10-a).
3. Plant demonstration sweet corn plot (2 x 5 meters) according to hand-out #6-a.
4. Plant transplant beds for trainees plots with tomatoes, eggplant, peppers, flowers (assorted) and kale, using one square meter of each type with total of five square meters according to hand-out #28-a.
5. Plant demonstration pulse plot (2 x 5 meters) according to hand-out #14-a.
6. Gather detailed information on resources available at the agricultural training site and in the area.
7. Test the soil in and around where the trainee plots will be.
8. Visit nearby villages to look for possible field sessions and livestock locations.
9. Individual trainers research topics and practice skills in which they are weak.
PRE-TRAINING WEEK 5

1. Estimate materials required for sessions #7, #11, #15, #18 and order in advance. Construct frame if none exists at site. (Pen Construction).

2. Order baby chicks (50-100) for delivery for session #8-1-2.

4. Locate and arrange to purchase pigs for session #12-1-3.

5. Purchase livestock feed.

6. Prepare materials for session #21-1-6. (Composting).

7. Plant 3-4 sweet potato tubers for plants during session #25-2-7.

8. Discuss and establish norms for the qualification process, including evaluations, feedback, the performance objectives and progress reviews.

9. Technical or Agricultural Coordinator gives sessions on "Session Planning", "Quiz Writing" and other trainer skill areas that staff needs to work on.

10. Establish procedures for staff meetings.

11. Prepare sessions for first week of training.

PRE-TRAINING WEEK 6

1. Trainers practice sessions in front of each other.

2. Staff finalizes training schedule.

3. Staff prepares and assembles all texts, manuals and hand-outs.

4. Staff members lay out cucurbit plots according to hand-out #2-a. (2 x 5 meters) one for each trainee following farm design (Page T-16, 17). Mark corners with stakes and lime borders.

5. Staff members prepare planting depth demonstrations for session #9-1-2, 10 days prior to session.

6. Visit to poultry, swine and dairy farm for session #5-1-1 is arranged.

7. Appropriate staff members prepare materials for session #10-1-3.
8. Appropriate staff members prepare materials for session #14-1-4.

10. Arrange with co-facilitator for session #29-2-8 at training center.

11. Make prior arrangements for 20-25 trainees and staff to visit fish farming facilities for session #38-2-11 and session #45-3-14.

TRAINING WEEK 1

1. Prepare materials for record keeping part of session #19-1-5

2. Prepare materials for session #20-1-5.

3. Prepare materials for session #22-1-6.

4. Prepare materials for session #23-1-6.

5. Locate and make arrangements for cassava stem cuttings and sweet potato vine cuttings for session #25-2-7.

6. Organize with nearby nursery to co-facilitate with session #26-2-7 and prepare materials.

7. Prepare transplants and materials for session #28-2-8.

9. Organize for use of rice paddy area and prepare materials for session #35-2-10.

10. Arrange for assistance of co-facilitator for session #41-2-12

11. Organize lab facilities and co-facilitator for session #43-3-13.

12. Prepare take home quiz for hand-out following session #44-3-13.

13. Make arrangements with a co-facilitator and lab facilities for session #48-3-16.

14. Make arrangements with co-facilitator to assist with session # 52-3-17.

15. Contact integrated farm for session #53-3-18

T-47
TRAINING WEEK 2

2. Prepare materials for session #31-2-9.
5. Prepare materials for session #36-2-10.
6. Prepare demo model for session #52-3-17.
7. Prepare materials (vaccine) and equipment for session #40-2-12.
9. Prepare materials for session #45-3-14.
11. Prepare materials for session #47-3-15.
12. Purchase two 10 L pump type sprayers and 100 cc Malathion EC and small packet of seven wettable powder for session #63-4-22.
13. Arrange with co-facilitator and insect specimens for session #51-3-17.
14. Arrange with center nursery to use their facilities and a co-facilitator if possible. Also organize the needed plant material and grafting tools well in advance for session #60-4-21.
15. Organize with co-facilitator to assist with session #66-4-23 and prepare animals and materials that are necessary well in advance.

TRAINING WEEK 3

1. Prepare materials for session #49-3-16.
2. Follow-up on field trip preparations for session #53-3-18.
3. Prepare materials for session #54-4-19.
4. Prepare materials for session #57-4-20.
5. Prepare quiz for session #59-4-20.
6. Prepare materials for session #61-4-21.
7. Prepare materials for session #63-4-22.

TRAINING WEEK 4
2. Prepare materials for session #77-5-27.
3. Prepare subject recommendations and format for session #78-5-27.
5. Prepare materials and locate farmers with native chickens for visit during session #82-5-29.

TRAINING WEEK 5
1. Check progress of mushroom piles prior to session #80-5-28.
2. Prepare equipment and materials for session #85-7-37.
3. Purchase worm medicine and equipment for session #93-7-40.
4. Organize with the co-facilitator of session #60-4-21 to make follow-up visit to nursery and check grafts.
5. Organize with pig raising facility and co-facilitator to assist with sessions #91-7-39 and #97-7-42 and prepare materials.
TRAINING WEEK 5--HOME-STAY

During home-stay trainees should have the opportunity to take their home-stay families to visit their plots. This could be a scheduled group visit or on an individual free-time basis. This activity would benefit both trainee and family in building confidence and respect.

TRAINING WEEK 6--VOLUNTEER VISIT

Trainees are not at the Farm as they are traveling in-country to visit volunteers at their sites.

TRAINING WEEK 7 AND TRAINING WEEK 8

1. Survey plots and determine the type of maintenance that should be given top priority during session #98-8-43.

2. Prepare equipment and facilities at the farm for session #106-8-47.

3. Make final preparations for Field Lay.

SESSION TITLE: GROUP RESOURCES ASSESSMENT

SESSION #1  WEEK #1  DAY #0 (1-1-0)

PRESENTER:

CO-FACILITATOR:

TIME: 17:00-18:00 (Sunday) C

______________________________

INTRODUCTION: SESSION OBJECTIVES

Trainees and staff introduce themselves. Trainees brainstorm interview questions that will assess each others' skills, experience, knowledge and interests. An interview format is pre-written on a flipchart and displayed. Staff members pair off with trainees to interview each other. It is important for trainers and trainees to be aware of the group's resources. This will help trainees appreciate the trainers' experience and it will help trainers assess trainees' knowledge. Lastly, this activity will help staff and trainees to get to know each other.

Objectives:

- To share the skills, experience, knowledge, and interests of trainees and trainers.
- To practice gathering information.

HAND-OUTS: none

READING ASSIGNMENT: none

TECHNICAL VOCABULARY: none

</tr>
<tr>
<td>20 Min</td>
<td>Trainers introduce themselves with short descriptions of their development and agricultural experience. Trainees introduce themselves.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Write the words SKILLS, EXPERIENCES, KNOWLEDGE and INTERESTS on the board. Ask trainees to brainstorm open (not yes-no) questions that they could ask each other to assess the group's skills, experiences, knowledge and interests. Focus on these four areas. Write these questions on the left side of the board. Pare the list to 4-5 open-ended, conversation inducing questions. Don't erase the original questions. Combine and select the 4-5 questions and write them on the right side of the board.</td>
</tr>
</tbody>
</table>

**TRAINER NOTES AND RECOMMENDATIONS:**

This session should happen before any other technical sessions. We did it just before dinner on a Sunday, so that the interviews could take place after dinner.
SESSION PREPARATION:

- Blackboard and chart.
- Interview format pre-written on a flip chart as follows:

---------------------------------

FLIP CHART

A. Find someone in the group who you don't know well and set a time to meet.

B. Interview each other using the list of questions. Take about 30 minutes.

C. Write a "Resource List" on the person you interviewed, focusing on his/her skills, experience, knowledge and interests.

D. Ask your partner to review the list you wrote and make modifications.

E. Give the lists to the facilitator, who will post them.

F. Ask everyone to read the lists.

---------------------------------

TRAINER REFERENCE: Refer to "Group Resource Assessment", II-1 in A.D.W.T.M. Vol II, from which this session was condensed.
SESSION TITLE: Planting Cucurbits

SESSION #2 WEEK #1 DAY #1 (2-1-1)

PRESENTER:

CO-FACILITATOR:

TIME: 6:00-8:00 F

INTRODUCTION: SESSION OBJECTIVES

Cucurbits are extremely important in the diet of the host-country population and grow the year round in many areas. Therefore, techniques differ in methods of seed-bed preparation and planting, depending on weather conditions. From this session the trainees will:

- Develop the knowledge and skills necessary to prepare individual vegetable plots.
- Understand and identify the numerous types of cucurbit crops grown and consumed in the host-country.
- Have hands-on experience with land preparation, seed and fertilizer placement, manuring and watering.
- Gain experience in plot layout and design.
- Learn about the basics of using pre-emergence insecticides and their importance.

HAND-OUTS: #2-a Cucurbit Planting Instructions
#2-b Sample Planting Instructions

TECHNICAL VOCABULARY:

Cucumber
Thai melon
Pumpkin
Seed
Insecticide
Fertilizer
Hoe
Rake
Measure
Water can
Manure
Mulch
SESSION PREPARATION

- Lay out a 2 x 5 plot and seed it according to the planting instructions. The plot should be planted two weeks prior to trainees' arrival.
- Prepare hand-out.
- Acquire hoes, rakes and water cans.
- Acquire measuring stick (1m-Metric).
- Acquire seed and insecticide (Furadan).
- Acquire fertilizer and manure.

</tr>
<tr>
<td>20 Min</td>
<td>Preparing each hill according to the planting instructions and placing seed and insecticide.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Placing manure as mulch over each hill. (If enough is available, manure could be spread over the entire bed to prevent erosion.)</td>
</tr>
<tr>
<td>5 Min</td>
<td>Watering carefully by filling a basin between seeded area filling at least two times to ensure uniform germination.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Cleaning up and storing hand tools.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

This is the first agricultural technical training session; therefore, the trainees are fresh and eager to start work in the plots. This session should start at 6:00 a.m. when the weather is cool and conducive to physical work. The original plots were 1 x 5 m. They became overgrown. Therefore, it is recommended the plots be 2 x 5 m for future training programs (see attached map and that they contain only four hills. Two cucumbers, one Thai melon and one pumpkin. These seedlings emerge on the fourth day which is a tremendous encouragement for trainees and motivates them to work on other plots.
CUCURBIT PLANTING INSTRUCTIONS

1. Locate and identify your plot.
2. Clear plot of all weeds and grass.
3. Prepare plot according to hand-out.
4. Mark 4 holes evenly spaced within the 5 m.
5. Dig each hole 25 cm deep and incorporate equal amounts of manure when refilling hole.
6. Smooth and firm the top of each hole and using hoe dig shallow hole 12 cm x 24 cm x 10 cm deep.
7. Place 2 teaspoons of fertilizer (15-15-15) and incorporate lightly.
8. Scrape each side of hole about 6 cm wide and 3 cm deep.
9. Place 6 seeds on each side of hole as shown in diagram and apply furadan.
10. Cover with 1 cm of soil and firm.
11. Spread manure 1 or 2 cm thick over the water hole in a 50 cm dia circle. This is necessary as a mulch to retain moisture with this soil type.
12. Pour water, filling hole several times, until the seeded area is well soaked.

HAND-OUT #2-b

SAMPLE PLANTING INSTRUCTIONS

PLANTING INSTRUCTIONS:

We'll be spending a lot of time in the field the first two weeks or so preparing land and planting the following crops.

DIRECT SEED

- Cucumbers
- Bitter gourds
- Thai melons
- Pumpkin
- Beans
- Japanese radish
- Morning glory
- Lettuce (broadcast)
- Flowers
- Parsley
- Green onions
- Sweet corn

TRANSPLANT

- Tomatoes
- Peppers
- Cabbage
- Chinese cabbage
- Kale
- Flowers
- Corn
- Mung bean
- Soybean
- Cassava
- Sweet potatoe

FIELD CROPS

- Tomatoes
- Peppers
- Cabbages
- Chinese cabbages
- Kale
- Flowers
- Corn
- Mung bean
- Soybean
- Cassava
- Sweet potatoe

You'll each have your own individual plots containing the direct seed and transplant crops. In addition you will work together as a group with larger plots containing the field crops.

STOP AND THINK:

Planting is one of the most delicate and critical parts of crop production, especially with tiny seeds. Care and attention to detail really pay off. "Haste makes waste" and will give you a poor return on your time invested. Please follow the instructions carefully and do the job right the first time. Replanting is an unpleasant task.

STEP 1: MAKE A RAISED SEED BED

During the rainy season in Thailand vegetables are usually sown on raised seed beds 10-20 cm (4"-8") high. A raised seed bed makes for better drainage and prevents plants from growing in a saturated (wet feet) condition. Please take time to observe the beds that have been constructed to give you some idea of what yours should look like.

Once your beds have been constructed and shaped add manure at the rate of two shovels per sq m (see step #4) or more and incorporate into the top 10 cm (4") using your hoe. Smooth and level the top of the bed in preparation for seeding.

STEP #2: ROW LAY OUT

Lay out rows and plant seeds according to the hand-out. Specific to each plot.
SESSION TITLE: Plot Layout and Introduction to Metric #1

SESSION #3 WEEK #1 DAY #1 (3-1-1)

PRESENTER:

CO-FACILITATOR:

TIME: 9:00-11:00 F/C

INTRODUCTION: SESSION OBJECTIVES

This session on "Plot Layout" is designed to introduce trainees to methods and techniques for plot site selection and layout. They are also introduced to the metric system. From this session the trainees will learn the basics of the following:

- The metric system.
- How to select a garden plot site.
- How to lay out a selected site to gain the maximum from slope for drainage, light, water availability and soil conservation.
- How to lay out plots with square corners using the triangle method. This is best done in trainee pairs. For practice, trainees also lay out and mark one of the next plots they will plant.

HAND-OUTS: #3-a Measurement Instructions
#3-b Measurement Diagram

Lime
Drainage
Soil conservation...
SESSION PREPARATION AND MATERIALS

Assure availability of:
- Sample of model plot previously laid out.
- Material for 3-4-5 triangle. (Wood/bamboo).
- Measuring tape.
- One meter measuring stick for each trainee.
- 80 stakes, (40 cm long).
- String/plastic.
- Lime, (4 kg).

</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

This session is very useful in assisting the trainees to lay out the remaining plots in the training program. This is the first session of four in which trainees are introduced to the metric and host-country measurement systems; therefore, the US system should be avoided as much as possible. The entire plot layout process should be completed using the metric system.
MEASUREMENT INSTRUCTIONS:

1. Each group takes materials needed to measure plots.
   - 4 corner stakes
   - Hammer
   - String
   - 1 meter and 5 meter measurement sticks
   - Right angle frame (3:4:5 ratio).

2. As a group follow the diagram.
   - Put first stake at one corner, 1 meter from the corn plot stake.
   - Run the string down 5 meters parallel to the corn plot and put another stake at the end, 1 meter from the corn stake.
   - At either stake make the right angle with one method (i.e. using right angle frame) and follow the right angle.
   - Stake another 2 corners to make 5 x 5 sq m plot.
   - Run the string or tape between each stake.
   - Lime the borders.
INSTRUCTIONS FOR PLOT MEASUREMENT (12 of 1 x 5 sq m plots)

1. Start at first corner on the north. Put a stake in there. Leave a 1 meter path between your plot and the first demonstration plot.

2. Use measurement tape and measure 5 meters parallel with the demonstration plot and put another stake down. Tie colored string between the 2 stakes so you can see the line.

3. From first stake make a right angle (90 degree) with the string between the first 2 stakes. You can use one of these methods:

   3.1 3-4-5 method.
   - Take one string and divide it into 3 parts, having a 3:4:5 ratio of lengths. Tie the knots and stakes to each point. (K1, K2, K3, K4) as in the picture.
   
   ![Diagram of 3-4-5 method]

   - Put stake K2 on the same spot with the first corner stake and K3 parallel to the string.
   - Try to get K1 and K4 on the same spot and that will make a 90 degree angle.

   ![Diagram of 3-4-5 method with 90 degree angle]

   3.2 If you have a ready-make triangle, use that and follow the line.

4. Start from first stake (A). Take measurement tape and go down to the other end of the plot. At 23 meters put stake C. down.

5. Along the measurement tape put stakes in every 1 meter.

6. Do the same with the other end and that will make 12 plots of 1 x 5 sq m with 1 meter paths between each plot.

SESSION TITLE: Meet Center Director and Staff

SESSION #4 WEEK #1 DAY #1 (4-1-1)

PRESENTER:

CO-FACILITATOR:

TIME: 11:00-12:00 F/C

INTRODUCTION: SESSION OBJECTIVES

The Center’s Director and staff are introduced to trainees. The Director gives an overview of agricultural education in Thailand—the context in which Crossovers do their agricultural work. The importance of using a resource like the Center is also pointed out to trainees. When trainees are introduced to the Center’s Director, not only do they have an opportunity to hear from the Director about host-country agricultural education, but they have an opportunity to practice greeting people of superior rank and to observe how respect is paid to those with authority.

Objectives are:

- For trainees to recognize people they will be seeing during training.
- To introduce trainees to agricultural education in Thailand, through an explanation of the Training Center’s purpose.
- To satisfy, observe and participate in protocol.

HAND-OUTS: none

READING ASSIGNMENT: none

TECHNICAL VOCABULARY: none
SESSION PREPARATION:

- Gather biodata on the Center's Director.
- Arrange a time and place with the Director and staff.

---

TIME

<table>

</tr>
<tr>
<td><strong>3 Min</strong> Director and staff are thanked for their help. Trainees are informed that the staff here and at other agencies can help them a great deal.</td>
</tr>
</tbody>
</table>

---

TRAINER NOTES AND RECOMMENDATIONS:

If the Center Director does not speak English, he might rather answer questions from a previously prepared format—with one of the PC Training staff members acting as translator. The question and answer format might be prepared in advance.
SESSION TITLE: Livestock Orientation and Overview

SESSION #5  WEEK #1  DAY #1  (5-1-1)

PRESENTER: 

CO-FACILITATOR: 

TIME: 15:00-16:30 F/C

INTRODUCTION: SESSION OBJECTIVES

Livestock play an important part in everyday village life. One kind of animal or another is connected with each household. Therefore, the opportunity to improve animal type and/or production techniques, feeding, breeding and care is unlimited. Animal projects are also easy for trainees to develop on site, therefore, this session allows the trainees:

- To become familiar with the major components of animal production and practices under good management conditions.
- To have hands-on experience with every aspect of raising animals -- from buying to marketing.
- To understand the livestock training objectives and their relevance to the trainees expected rule in the host-country.
- To personally handle several types of livestock.

HAND-OUTS: #5-a Overview of Livestock Training  
#5-b Small Animal Production Assessment Tool  
#5-c Livestock Production Planning

READING ASSIGNMENT: Hand-outs above.

TECHNICAL VOCABULARY:

Chicken  Pig  Cow  Chicken cage  Pig pen  Cattle pen
Breed  Broiler  Egg  Beef cow  Dairy cow
SESSION PREPARATION AND MATERIALS

- Review references and hand-outs.
- Request permission to visit a poultry, swine and dairy facility near the training center.
- Arrange with the staff of the above mentioned facilities to assist with the tour and explanations.
- Organize transportation to and from the above facilities.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 5-1-1 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Min</td>
<td>Travel to poultry facility.</td>

</tbody>
</table>
| 15 Min | Explain session objectives and the five major components of raising livestock.  
1) Nutrition,  
2) Management,  
3) Diseases & Parasites,  
4) Genetics, and  
5) Housing.  
Encourage the trainees to observe manifestations of the above during the tour. |
| 15 Min | Brief tour of broiler chicken production unit with trainees able to handle day-old chicks. |
| 15 Min | Brief tour of egg-laying facility. |
| 20 Min | Brief tour of swine production unit with opportunity for trainees to handle piglets. |
| 30 Min | Tour milking barn and observe cows being hand milked. Trainees will be invited to try milking by hand. |
| 15 Min | Return to dorm and clean up. |

TRAINER NOTES AND RECOMMENDATIONS

This session is the starting point for Livestock Training. It should be well planned and presented to stimulate the trainees' interest in livestock production. The actual locations of the animal facilities visited will depend entirely on the training site location.

T-56
OVERVIEW OF LIVESTOCK TRAINING

Livestock training is designed to establish a basis for making the management decisions called for in the development of livestock operations. Because there are no absolutes in animal husbandry, our first goal is for you to learn that, in a complex system based on locally available resources, there are very few instant technological innovations that are truly effective. For this reason, the training is developed within a framework or continuum of development reaching from high technical production levels to the free range survival level. Within this developmental continuum, training focuses on the five principal categories of livestock development:

1) Nutrition,
2) Management,
3) Diseases & Parasites,
4) Genetics, and
5) Housing.

Most emphasis is placed on nutrition, the beginning and end of all livestock operations. (75% to 90% of the cost of raising animals can be feed). The health of the herd and the profit or loss for the farmer are all directly controlled by the nutrition and feeding of the animals. Nutrition is the most limiting factor in livestock development and therefore is the area that volunteers must develop before changing breeding stock or management levels.

The training manual/guidelines take the approach that in order to develop a profitable livestock operation all five of the categories must be balanced on the same level of the continuum. This balancing point on the developmental continuum is determined by a host of factors including markets, pricing of feeds and meat, local infrastructure, water quality, cultural tastes in meat, credit, agricultural extension, government policies, management levels, diseases, vaccines, medications, parasites, and locally grown animal feeds.

Therefore, when trainees learn the mechanics of a given technique (such as debeaking of chickens), they also must consider the context in which the practice will be employed. To determine the appropriateness of a given practice or technique, you should constantly ask:

- Is this practice consistent with local management levels and resources?
- What are the potential risks for the farmer?
- Will it increase profit?
- Are the risks for potential loss too great to justify the potential gain?
- Long term effects on the livestock operation?
The training program provides an integrated approach to technical information and ability as well as skills needed for animal projects at your sites. You will learn skills through an experiential training methodology implemented through intensive, "hands-on" learning. Sixty percent of the technical time is spent working with the animals and 40% in the classroom. The trainees are responsible for the daily feeding, watering, and caring for the animals.

The Role of the Volunteer in Small Animal Projects:

Successful animal projects (e.g. ones that make money for the farmer) are projects in which the five components of animal raising (breeds, nutrition, disease, management, and housing) either match or balance in the level of development and production.

The chart on the next page explains the concept of High Management vs Low Management on the development continuum.

Why Some Animal Projects Fail:

The degree of success of any animal project must have all the components match; that is, you cannot have one component in a low level of production while the rest of the components are high levels of production.

Example:

A project has a supply of exotic, a sophisticated disease control program, housing, and management. Unfortunately there is not a good source of nutritious feed in the area. This project will fail because the nutrition component does not match the other components. The animals will never reach their genetic potential because of a poor diet. And this poor diet will stress the animals to such a point that disease would eventually become a problem. Nutrition is usually the most limiting factor in animal projects. No matter what the genetic sophistication of the animal is, the animal must have the proper diet for its production purpose.

On the other side of the spectrum, if a project consists of using well balanced feed on native/country animals, it would probably fail also. Although a well balanced feed would be better than table scraps, the native animal does not have the genetic potential to produce meat, eggs, milk, etc. to make cost of the feed justifiable. In other words, the animal cannot utilize the feed efficiently.
<table>
<thead>
<tr>
<th>Animal Raising Component</th>
<th>High Level Production</th>
<th>Low Level Production</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Breeds</td>
<td>Animals genetically selected for efficient production of meat, eggs, milk: exotic,</td>
<td>Animals naturally selected for survivability e.g. &quot;survival of the fittest&quot;---selection for aggressiveness through exposure to predators: Native/Country Chickens.</td>
</tr>
<tr>
<td></td>
<td>hybrid breeds.</td>
<td></td>
</tr>
<tr>
<td>2. Nutrition</td>
<td>Animals fed a well balanced, scientifically determined feed in order to reach genetic potential.</td>
<td>Animals fed scraps and/or scavenge for food on their own; a well balanced diet not always assured, less meat and eggs, slow growth.</td>
</tr>
<tr>
<td>3. Disease</td>
<td>Prevention due to a high degree of sanitation, isolation, quarantine, use of vaccines and antibiotics for treatment.</td>
<td>Prevention due to animals that survive a disease outbreak. Over a period of time a natural resistance is developed. Survivors become hardier and more resistant to pathogens.</td>
</tr>
<tr>
<td>4. Management</td>
<td>Animals receive considerable amount of supervision/care, e.g., constant availability of water, feed. Record keeping.</td>
<td>Animals care for themselves with minimum care from owner. They develop survival characteristics.</td>
</tr>
<tr>
<td>5. Housing</td>
<td>Confinement, controlled environment, light, temperature, ventilation.</td>
<td>Free range or partial shelter usually exposed to the elements.</td>
</tr>
<tr>
<td>6. Degree of Investment</td>
<td>High with optimum returns if all components/production factor controlled.</td>
<td>Low investment, low return, animals are not bred &amp; raised for production purposes.</td>
</tr>
</tbody>
</table>
The examples mentioned are typical situations and reasons why development projects fail in developing countries. Planners either fail to look at the project in terms of the component package where all five components must be at the same levels or they feel that any one of the components (because it originates from a developed country) is better than none at all.

Advantages of Country/Native Breeds:

A good example of the latter situation is when exotic breeds of chickens are introduced into a village setting. Here the village breed has the advantage over the hybrid, especially if the village has no vaccines available or hatcheries to incubate eggs artificially. The exotic breeds have no natural resistance to disease in the area. Their aggressiveness has been bred out, so if they are free ranged, they are at the mercy of predators. And, if these hybrids have been selected for egg laying, broodiness has been bred out. Broodiness is the instinctive behavior chickens exhibit when they stop laying and sit and hatch their eggs.

The chances of these exotic breeds to survive are minimal. They will either be killed by disease or predators, or fail to reproduce offspring. It is important for the development worker to realize that improved scientific systems are not always appropriate for some situations.

The Development Worker Skills:

The extension/development worker must be able to determine, assess, and evaluate the systems of animal raising and production that he/she will find somewhere between the high level production system and the low level or survival level of production system. This ability or skill does not necessarily arise from having a technical background in animal raising. Information which can be readily available from a government office or library in the developed world may not be so accessible in a village in Africa. Skills in communications, information gathering and filtering, and community entry will be needed by the development worker in order for him/her to assess the local situation, evaluate resources and determine management systems in a particular area.

This can be a very slow and patience developing process. It can also be an enjoyable way of learning about a new place, its people and culture. Once these skills are utilized, only then can the development/extension worker determine if change that is desired by the farmer is appropriate and can be implemented successfully.
Credibility Techniques:

The Practical Poultry Raising Manual (ICE M-11) describes this (see page 16) as determining the gap and trying to fill it. The gap is what is between the production potential and the present situation. Once it has been determined that change is possible and appropriate, it is best to introduce it in small increments, especially those most easily understood by the farmer and those which show the quickest results and cost the least. These increments of change are sometimes called credibility techniques, because if done correctly, they help build confidence between the development worker and the farmer. With this confidence, larger increments of appropriate change can be introduced. The farmer can gradually have more control over his production components and move his management system on the development continuum towards an improved system, appropriate for his needs and desires.
HAND-OUT #5-b

SMALL ANIMAL PRODUCTION ASSESSMENT TOOL

1. Introduction

2. Assessment Questions

3. Some specific considerations for raising poultry and swine.

-------------------------

1. INTRODUCTION

Because of the potential for long-term effect on community nutrition and economy, small-scale animal production can be projects which are among the most satisfying of volunteer activities.

The small animal production resource packet should help you decide on the best animal project for your community. Your personal preferences should also be considered, of course. But the key to long-range success with your project is a combination of two basic points: 1) the project must meet local needs, and 2) it must achieve local support.

Choosing the project that will have the most positive impact will require careful observation, endless legwork, and nonstop questioning. This assessment tool raises basic issues and suggests some key questions to help you direct your investigation.

There are many variables to consider when deciding on an animal project, especially in a Third World context. Your position in your community and the opportunity to observe over time gives you an important advantage in judging the feasibility of the project. Your example and influence can have immediate and long-range impact. You may become involved in improving local stock, or you may try to introduce new animals or new uses for existing protein sources. Concentrate on making sure the project is intrinsically viable and valuable to the local target group. The adage, "Give me a fish and I eat for one day. Teach me to fish and I'll eat every day," is particularly appropriate to small animal projects. A logical and vital addendum is "Teach a mother and you teach a whole family." Do not ignore the long-range impact that your work may have on women. The linkage to health and nutrition programs, to cooperatives, and to other forms of economic development could be very effective.
Tips on Information Gathering:

Information gathering techniques are covered completely in *Community, Culture, and Care*, by Ann Templeton Brownlee (available through ICE) but in very general terms:

1. Gather your information first hand.
2. To develop a wide network of contacts and an overall picture, ask many sources.
3. Concentrate on cultural similarities, not differences.
4. Ask questions that get people thinking in a positive way.

**RATIONALE**

Note: When a project meets local needs and achieves local support, it will be considered successful and become self-perpetuating.

1. Why do you want to attempt a small animal project?
2. What community needs will be fulfilled?
3. What factors in the community point to the success or failure of a particular animal project?

**SITE**

Note: Being thoroughly familiar with a community and its problems will ensure a sensitive approach to meeting the needs of the local population.

1. What climatic/seasonal factors, such as ranges in temperature, rainfall, humidity, food or water shortages, etc., may have an impact on small animal projects?
2. What local or country-wide policies might have an impact on the project?
3. What predators or insects might have a negative impact on the project?
Note: Understanding the cultural and work patterns in the community will provide insight into how best to achieve an effective program.

1. Who is the target group? Is that group likely to support a small animal project? Why or why not?

2. Who is likely to support the project? For what reasons?

3. Who will benefit? In what ways? Will that insure long-term success?

4. Who are the traditional animal raisers? Why? What are the time constraints on this group?

5. Who are the influential economic leaders in the community?

6. How will the family or community structure be affected?

7. What local conditions, such as religious beliefs, migration patterns, etc., might help or hinder this project?

ECONOMICS

Note: An animal project that is income-generating is very likely to succeed.

1. What is the basic type of economy in the area (e.g., agricultural, pastoral, semi-industrial, etc.)?

2. What is the level of development of that economy? What are the strains on the local economy (e.g., crop failures, poor marketing system, etc.)?

3. What are the time and work requirements of the target group?

4. What is the average income level of the target group (or level of the source of money of the target group)?

5. What amount of capital outlay for projects could most members afford easily? What strains will small economic gains or losses have?
HAND-OUT #5-b (CONTINUED)

ANIMAL

Note: A thorough investigation of the level and scope of the production of existing animals will uncover many factors that may limit or enhance success.

1. What is the quality of the existing local stock? Is there potential for improving that stock through cross-breeding?

2. How and where are these animals raised? (e.g., run loose, in cages, pens)

3. Under what conditions are they raised? Is there adequate food, water, sanitation?

4. Why are those animals raised? (e.g., for food, sources of ready cash, for gifts, for special occasions, investment, etc.)

5. Why aren’t certain animals raised? Are there any special beliefs, rules, preferences, or prejudices concerning food from certain animals? Foods that various categories of people should or should not eat? Times when and ways in which certain foods should or should not be eaten? Special ways in which food should or should not be prepared? Foods believed to cause sickness or misfortune, separately or in certain combinations?

6. Do the local people eat the animals they produce?

7. Do they sell the animals? Where?

ANIMAL FOOD AND WATER SUPPLY

Note: The limiting factor in most animal projects is the non-availability of animal feed.

1. What food crops are easily available?

2. What could be fed to animals?

3. What do local people use to feed their animals?

4. Are bulk purchases of animal food possible?

5. Are special concentrates, vitamins, or mineral supplements easily available? Affordable?

6. Is clean, fresh water easily available?

7. Are salt blocks available?
MARKETS

Access to markets is an important consideration.

1. What outlets or markets are accessible?
2. What demand would there be for any animal or food product locally?
3. What potential markets exist for by-products?
4. What preferences in purchasing do marketers demonstrate (i.e., lean meat, fatty meat)?
5. What shipping and sanitation problems need to be addressed if distant markets are to be feasible?

LOCAL TECHNICAL SUPPORT

Technical advice from experienced local people will help prevent costly problems.

1. Who could be a resource person for technical advice (i.e., agricultural extension agent, veterinarian, experienced animal raiser, teacher, AID specialist)?
2. Who is attempting a similar project? Is it possible to collaborate?
3. Has a similar project been tried unsuccessfully? What were the reasons for the failure?
4. Who can give demonstration of practices and techniques that have been successful in that locale?
5. Who can supply healthy breeding stock?
6. What organizations in your country are involved in similar projects?
7. What government support is available for subsidies, if necessary?
HAND-OUT #5 (CONTINUED)

PERSONAL TRAITS AND BIASES

Note: Consider your personal motivation in starting a small animal project.

1. What kinds of personal experience with animals do you have to draw upon (e.g., pets, farm background, school projects, part-time work)?
   - Carrying water?
   - Locating food supplies?
   - Building shelters?
   - Fighting diseases?
   - Fighting predators?
   - Doing clean-up?
   - Slaughtering?

2. Are you a good manager? Will you be responsible for the feeding, breeding, and record-keeping of your animals?

3. Can you instill that responsibility in your target group?

4. When it comes time for slaughter, will you be able to do demonstrations? Will you be able to prepare the food and promote its value to others?

5. Are you willing to do a limited backyard project on your own to test out your choice of animal?

6. Are you willing to invest the time in answering all the assessment questions?
LONG-RANGE IMPACT

Consider the possible long-range benefits or liabilities in your planning.

**LIKELY BENEFITS**

- Increased source of protein.
- Cash source.
- Higher yield through improved management techniques.
- Source of by-products.
- Labor intensive.

**POSSIBLE LIABILITIES**

- Negative environmental impact
- Negative cultural impact.
- Financial risk.
- Time commitment (for you and the local animal raisers)

3. SOME SPECIAL CONSIDERATIONS FOR POULTRY AND SWINE

POULTRY

**POSITIVE CONSIDERATIONS**

- Diet supplement and/or cash source.
- Possible to raise meat birds or layers.
- Rich fertilizer by-product can be collected easily if housing exists.
- Possible to cultivate and use grain not consumed by humans for feed.
- Benefits (better nutrition, extra income) are easily seen.

**POSSIBLE PROBLEMS**

- Poor management techniques are common.
- Poor breeds hamper good production.
- Securing adequate feed and supplements may be difficult.
- Capital investment for housing, especially for small producers, is sometimes economically unfeasible.
- Chickens are very disease-prone.
- Chicken-raising is looked down on in some cultures/communities.
- Eggs are sometimes taboo.

SUGGESTIONS:

- Observe market supply and demand; identify peak periods. Ascertain what causes these fluctuations.
- Locate housing or materials for construction.
- Housing is a definite aid to disease control.
Decide on an emphasis of production. Meat birds (broilers) can be marketed in ten to twelve weeks. Layers can begin production after twenty weeks.

Be sure that any project is economically feasible from the producer's point of view.

**SWINE**

**POSITIVE CONSIDERATIONS**

Small-scale project can be low-risk and short-term but show impressive gains. Model projects can have a big impact on production techniques.

All parts of the pig can be eaten or used.

**POSSIBLE PROBLEMS**

Religious beliefs make hog production unacceptable to some areas.

Availability of proper feed is crucial for best production. Corn is best but the by-products of other grains are also possible.

Hogs are disease-prone; internal parasites are common; inoculations are necessary. An agricultural extension agent or veterinarian needs to be involved to prevent losses through disease.

Male pigs need to be castrated to produce meat of better flavor. This may be culturally unacceptable.

Meat can cause illness if not thoroughly cooked or cured.

Hogs need a salt supply and vitamin/mineral additives to basic rations.

**SUGGESTIONS:**

Keep project small. Financial risks are high due to the high costs of foundation stock.

Build a demonstration farrowing stall to show simple technique and positive impact on production.
Nutrition is the most important component of the five components that form livestock development. If a volunteer is working towards improving productivity in livestock production with small farmers then he or she must first work to improve the feeding of their animals. However, the volunteer often lacks the technical skills needed and an adequate knowledge of the community agricultural environment to know if an improvement in productivity is possible or desired by local farmers. We cannot over-emphasize the importance of working with local farmers in order to understand their husbandry practices, their reasons for their management decisions, and to gain knowledge of local conditions.

If productivity is to increase, there are a myriad of factors to consider, but nutrition and feeding are the first steps. The volunteer must conduct an exhaustive survey of all locally grown feeds. The volunteer should answer these questions: What are the animals fed currently? Is there an abundant supply all year round? Are there storage problems? What are the nutrient values of these feeds? Is it grown locally? What is the market value of the feed? Is there a surplus or shortage? Are there any other low cost, locally available feeds not currently being fed to animals? Why? When the volunteer has gathered complete information on every possible animal feed, then he or she should begin to balance feed rations. Try every possible combination in order to come up with as many profitable rations as possible. Since grain storage and transport may be a problem, one can not rely on a continuous supply of the same feed ingredients year round. Therefore different rations and feedstuffs will probably be used at different times of the year. If the volunteer finds a ration or rations that are inexpensive, available locally all year long, profitable for use by local farmers, appropriate for the local agricultural environment, not taking away needed grains from human consumption, matched to the four other components of livestock production on the developmental continuum, and accepted by the farmers as a good idea, then one can begin to work on improving local livestock production.

The next step is to become involved in a larger "community analysis" that includes infrastructure, available agricultural supplies, marketing, meat preservation, local climate, government policies & price controls, credit, pricing of meat and feeds, local taste in meat, and who will gain the most from the increased production. We will examine each of these points separately.
INFRASTRUCTURE:

Is there adequate shelter for the animals? How are the roads between you and your market? Passable year round? Is the transport you need available? How will transport cost affect profit? Is there adequate water for drinking by your larger herds? Are your animals on private land or public domain?

AVAILABLE SUPPLIES:

Are the vaccines and antibiotics you need available? Are they prohibitively expensive, scarce, or of low quality? Is there a good hatchery in the area? Are there low cost laboratory testing and medicines available?

MARKETING:

Will you sell to local butchers or slaughter and sell the meat directly? Will it be sold in the village or taken to the regional markets? When is the most lucrative time to sell? Is the market controlled by middle men or women? If so, how does that affect profit?

PRESERVATION:

Will the animal be sold live or as meat? If as meat, how will it be preserved? Salted? Smoked? Eaten fresh? Frozen? Refrigerated? Sun dried? Be sensitive to local custom on this because people's culinary habits are not going to be changed by you and you could lose money for the farmers you are working with.

LOCAL CLIMATE:

Expect the worst. What effect would a drought have on the production? Insect attacks? Excessive rainfall? Flooding? Crop failures?

GOVERNMENT POLICIES AND PRICE CONTROLS:

Are the costs of feeds or meat regulated? By whom? What are their policies? Will this affect your profit? Are there government policies for quarantine during disease epidemics? Is there a local agricultural extension agent? Can he be of service to you or the local farmers you are working with? Does the government offer low interest agricultural loans?
PRICING OF MEATS AND FEEDS:

Who sets the prices? Are you free to set your own? Can you make a profit based on current local prices of meat and feeds? (We will deal extensively with this question during our management planning classes).

LOCAL TASTE IN MEATS:

Is a dark, tougher meat preferred to a light, softer meat? Be sure to produce the type of meat with the flavor preferred locally and butchered in the local manner or people will not buy it.

WHO WILL GAIN?:

Finally, who in the community will gain the most from your work in increasing livestock production? What if you help the wealthy cattle rancher to increase his herd production and yet the price of beef makes it unaffordable to the poor? Yet, can you help the poor who lack the land, feed, and other resources needed to improve livestock production?

Once you feel you have the answers to all of these questions and a clear understanding of local conditions, your two years will probably be done. However, if you have any time left, make sure you balance the production level of your feed ration (high, moderate, survival) with the production level of your herd or flock in genetics, diseases and parasites, management, and housing. We will discuss the balancing of the five components on the same production level at length in our management planning classes.

THE PITS:

Listed below are seven common pitfalls that volunteers in livestock production often encounter. In an attempt to keep all of you out of the pits (some of which we found ourselves in), we are listing these. Our intent is to get your curiosity going and get you thinking, since we cannot provide answers that we do not have. We will take time in class to discuss these points.

1. They attempt to improve livestock production without improving the diet of the animal. Grave mistake.
2. They introduce improved (exotic) breeding stock that have been bred for high production into survival production environments.
3. They do demonstration work with livestock through different institutions (such as schools or 4H clubs) and base their project on shielded, false economies that a farmer cannot duplicate since he or she does not have the same resources. The alternative is to work in real development with farmers.

4. They place their projects into direct competition with humans by feeding grains to animals in villages where the people lack protein.

5. They start to work too soon - before they gain understanding of local culture, language, and the agricultural environment of their village. This can produce disaster.

6. They do not match all five components of livestock production (nutrition, management, diseases and parasites, housing, and genetics) at the same level of production.

7. They assume that an increase in production is always possible. Furthermore, they forget that the first objective of the small farmer is not to maximize production, but rather for the animal to survive.
SESSION TITLE: Planting Maize

SESSION #6 WEEK #1 DAY #2 (6-1-2)

PRESENTER:

CO-FACILITATOR:

TIME: 6:00-8:00 F

INTRODUCTION: SESSION OBJECTIVES

Many varieties of maize are grown in the host-country and contribute significantly to the economy and well-being of the population. Field corn is used for various kinds of animal feeds (which are manufactured locally throughout Thailand and make up a major export product) and is therefore an important crop. Sweet corn, on the other hand, is marketed fresh in season and is part of the diet. It also is processed as several products, including canned baby corn. For the purpose of training the trainees, sweet corn is the most important as they will have little to do with commercial crop production. Therefore, the trainees should know:

- How to prepare a proper seed bed for planting corn.
- How to select good quality seed and varieties, as well as how to test the germination.
- The difference between sweet corn and field corn including the slight differences in cultural practices.
- The proper seed spacing and depth, proper fertilizer use (and placement) and water requirements.
- Insect pests that attack corn and how to safely control them.
- The crops suitable for intercropping.
- Harvesting procedures.

HAND-OUT: #6-a Corn Planting Instructions

TECHNICAL VOCABULARY: Hoe Insecticide Water can
Fungicide Rake Sweet corn seed Fertilizer
Manure Furrow Field corn seed
SESSION PREPARATION AND MATERIALS

- Plant model demonstration plot 2 x 5 m 2-3 weeks prior to presenting session.
- Enough land for each trainee to have an individual 2 x 5 m corn plot.
- Hoes, rakes and water cans.
- Seed, (germination tested) fertilizer, insecticide, and manure for mulching.

TIME

<table>

<td>Demonstrate and have trainees: prepare individual 2 x 5 m plots following the planting instructions.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Apply fertilizer, seed and insecticide according to planting instructions.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Apply manure as mulch and water thoroughly for uniform germination and emergence.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Clean up and put hand tools in storage.</td>
</tr>
</tbody>
</table>

**TRAINER NOTES AND RECOMMENDATIONS**

The corn plot is important as an individual plot for several reasons. First it gives excellent hands-on experience with land preparation, seed, fertilizer and insecticide placement. The trainer can easily monitor the trainees' work once the crop emerges. The last and most important reason for planting corn is that trainees can see the results of their work very quickly.

Another suggestion is to use field corn and different rates of commercial fertilizer. The trainers can put in a 5 x 8 m plot 2-3 weeks prior to the corn session. This will show the trainees the real value of using fertilizer properly. The trainer's plots should all have the proper amounts of fertilizer for maximum yield.
CORN PLANTING INSTRUCTIONS

1. Make 2 x 5 m plot with 3 furrow rows the same as demonstration plot with 66 cm spacing between rows.

2. On each ridge, open up the top about 4-6 inches deep. Sprinkle 15-15-15 chemical fertilizer about 4 teaspoons per linear meter. Sprinkle furadan with a small pinch evenly through the whole row.

3. Use the hoe to mix it with the soil and cover the row within 2 cm of the top.

4. Put in 2 seeds every 25 cm (19 pairs/row).

5. Use rake to cover and firm the soil.

6. Spread manure evenly on each ridge using .5 cu ft/sq m for soil conditioning and mulching purposes.

7. Water the plot by running water into the furrows and let the water absorb into the soil.

---

Sweetcorn Plot (3 rows)
66 cm Row spacing
25 cm seed spacing
SESSION TITLE: Cage and Pen Construction

INTRODUCTION: SESSION OBJECTIVES

The use of local materials along with unique building designs makes it important that the trainees have exposure to local construction techniques. This session is designed to give trainees the confidence needed to duplicate these techniques at their sites; therefore they will:

- Be introduced to the most common building materials, methods and tools used in the host-country.
- Learn some of the basic vocabulary used in construction.
- Gain hands-on experience with the methods and styles of host-country construction.
- Gain the skills and confidence necessary to repeat this exercise at their sites when developing projects.

HAND-OUTS: #7-a Enclosing a Chicken Coop
#7-b Constructing Cages for Laying Hens
#7-c Pouring a Concrete Pig Pen Floor

READING ASSIGNMENTS: Hand-outs above.

TECHNICAL VOCABULARY:

- Chicken wire
- Nails
- Wood
- Bamboo
- Concrete
- Bucket
- Basket
- Gravel and cement
- Hammer
- Saw
- Knife
- Hatchet
- Measure
- Lay out
- Sand
SESSION PREPARATION AND MATERIALS

- Trainer references: Review hand-outs.
- Prepare construction plan based on the animal needs, availability of local materials and ease of construction.
- Contact local craftspeople to assist with construction to speed up and avoid delays.
- With construction plan, calculate the materials required and prepare for delivery in advance.
- Prepare hand tools necessary so everyone can have hands-on experience with the construction.

---

TIME SESSION 7-1-2 ACTIVITIES

8 Hrs This session is divided into four parts and given in 2 hour sessions on four different days. The schedule is as follows:

Week #1, Day #2  9:00-11:00 F
Week #1, Day #3  9:00-11:00 F
Week #1, Day #4  9:00-11:00 F
Week #1, Day #5  9:00-11:00 F

---

TRAINER NOTES AND RECOMMENDATIONS

The timing of activities will depend entirely on the size, type of construction and building materials used. Therefore, the time schedule for activities is determined by the construction plan and is scheduled accordingly.

At Lampang the wooden structure for a chicken coop was already in place and we just enclosed it. Hand-out #7-a reflects this situation. If the site in which this training is to take place does not have a chicken coop to be enclosed, construct one according to the dimensions on Hand-out #7-a during the six weeks of Pre-training preparation.

---

T-58

114
LIVESTOCK CONSTRUCTION
ENCLOSING A CHICKEN COOP

1. A wooden frame is already in place for the chicken coop. It consists of boards running between building posts at the ground, middle and top levels to mark out a 3 by 4 meter room area. The boards are spaced the width of the woven chicken wire we are using. You will also notice a doorway built into the frame. We will attach woven chicken wire to this frame for a cheap and simple method to keep our baby chicks in and to keep dogs, rats and other pests out, and still allow for plenty of cooling breezes.

2. Split sections of bamboo to prepare slats about 1 meter long by 2.5 cm wide.

3. Wrap the end of the roll of chicken wire around a slat and nail the slat to the back bottom corner of the frame.

4. Unroll the wire to the corner post. Pull tightly, align correctly and nail on another slat to hold in place.

5. Go back and nail slats on the upper and lower edges to hold securely.

6. Repeat for the next section.

7. Only cut the wire when you reach the door or the end wall. At each cut leave enough extra wire to wrap several times around a slat before nailing. When you cut the wire, cut it straight across, one wire at a time using the cutting pliers provided.

8. When pen is completely enclosed, use your hoe to level the floor and plug all gaps below the bottom board. Scatter fresh bedding.

Note: If frame cannot be easily constructed at least have a solid lower edge, pull tightly and use regular wire to "sew" the middle edges together.
CONSTRUCTING CAGES FOR LAYING HENS FROM BAMBOO

1. Study Practical Poultry Raising Manual and both the wire and bamboo models provided to understand the function of the cage.

2. For all bamboo sections attached to the frame use the following procedures:
   a. Measure the length of section needed.
   b. Mark and saw a section of bamboo to that length.
   c. Split the section of bamboo in half with a heavy knife.
   d. Further split each half into 1.2 to 2.5 cm widths.
   e. Bamboo is hard and sharp. Slide a knife along all sharp edges to dull them.
   f. Drive one nail through each section into each frame piece it contacts. If the section splits when driving the nail discard and replace it. Making a small notch before you pound the nail will help avoid splitting.
   g. Saw off excess length if necessary.

3. Using the model provided attach bamboo sections to the cage frame in the following order:
   a. Floor piece by piece on alternating sides. Each piece provides spacing for the opposite side.
   b. Back wall on one side of the frame or the other with spacing provided by the opposite floor piece.
   c. Side walls.
   d. Front wall.
   e. Top, only as chickens are placed in the cage.

4. Split section of bamboo to add at base of floor to stop eggs from rolling off.

5. Split large section of bamboo for feeder and waterer and wire onto front of cages.
POURING A CONCRETE PIG PEN FLOOR

1. Use your hoe to clear the weeds and level the soil in the area of the pig pen.

2. Build a rectangular frame of heavy boards to enclose the concrete while it hardens. The top edge should be level and of the same height as the finished concrete floor. Gaps between the bottom edge of the frame and the ground should be filled with dirt or gravel to keep the concrete from escaping.

3. Cover the enclosed area with sand. Lay pieces of bamboo to form a grid on the bottom. This will help reinforce the concrete.

4. Mix 2 buckets of sand, 4 buckets of gravel and 1 bucket of cement together. Gradually add water until a sloppy mix forms. Use less water at first because it is easier to add water than the other three ingredients.

5. Pour the concrete mix into the form. Continue to mix and pour until the form is full.

6. Work the concrete into all areas at the form evenly. Level as you go use a float to smooth the surface evenly and work the air bubbles out. Roughen up the surface with a coarse broom.

7. Cover the surface with water, plastic or other material to allow it to cure slowly and strengthen. The slower it dries the stronger it will be.

8. Completely clean all tools used before the cement on them hardens.
SESSION TITLE: Preparation for Chicks

SESSION #8 WEEK #1 DAY #2 (8-1-2)

PRESENTER:

CO-FACILITATOR:

TIME: 11:00-12:00 F

INTRODUCTION: SESSION OBJECTIVES

Chickens are an important part of farm life in Thailand. They are produced in large commercial facilities as well as at the village level. This session will show trainees:

- How to brood, feed and care for day-old chicks.
- How to use the special equipment and methods necessary for day-old chicks.
- How to develop and maintain poultry production records.

HAND-OUT: #8-a Broiler Chicken Pen Record

TECHNICAL VOCABULARY:

- Chick
- Clean
- Hot
- Cold
- Feeder
- Water container
SESSION PREPARATION AND MATERIALS

- Complete housing construction and assemble materials for brooder construction.
- Pre-order 50 to 100 day-old chicks, feeders, watering equipment and feed from agricultural supply store.
- Arrange transportation for collecting chicks and delivery to farm.
- Electric cord with 40 watt bulb and brooder materials.

<table>

</thead>
<tbody>
<tr>
<td>10 Min</td>
<td>Explain session objectives.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Trainees assemble brooder and adjust temperature, fill feeders and water.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Enter records of delivery date and average weight of chicks. Release chicks into pen by dipping beaks into water.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Schedule maintenance time for trainees to care for chicks.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Clean up and put equipment in storage.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS:

This session is planned early in the training program so that trainees can observe the 6-7 week growth cycle of the chicks. Broiler chicks are processed and cooked (at 6-7 weeks old) during Field Day which gives the trainees experience with marketing. Some should also be sold on a live weight basis if there are too many to process and sell on Field Day.

This session is linked to later sessions such as vaccination and processing.

SESSION TITLE: Direct Seeding Principles

SESSION #9  WEEK #1  DAY #2  (9-1-2)

PRESENTER:

CO-FACILITATOR:

TIME: 15:00-16:30

INTRODUCTION: SESSION OBJECTIVES

In this session all seeds are direct seeded. Some seeds will later be transplanted. The knowledge of how to plant different types and sizes of seed under different soil and weather conditions is extremely important in the tropics. This session is designed to show the trainees:

- The different types and sizes of the common seeds used in the host-country.
- The effects of over/under planting and the importance of proper plant populations.
- The proper depth at which seeds of different sizes and varieties should be planted and how depth affects emergence and production.
- The technique of calculating seeding rates in conjunction with seed germination testing.

HAND-OUT: #9-1 Direct Seeded Vegetable Instruction.

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Seed</th>
<th>Calculate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth</td>
<td>Germination</td>
</tr>
<tr>
<td>Spacing</td>
<td>Emergence</td>
</tr>

<td>Thinning</td>
<td>Soil crusting</td>
</tr>
<tr>
<td>Soil texture</td>
<td>Soil moisture</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Seed samples of the types to be planted in the individual plots.
- Demonstration of planting depth, using two clear plastic or glass jars filled with soil. 7 to 10 days prior to session trainers plant seeds of different sizes and varieties at different depths near the glass so trainees can observe what happens to seeds when planted to deep or to shallow depth.
- One clay pot with perfect seed bed and one clay pot with cloddy seed bed that will affect emergence (use corn seed).

</table>

TRAINER NOTES AND RECOMMENDATIONS

This session is scheduled early in training but after two planting sessions so that trainees have had some exposure to planting already. The demonstrations using soil-filled jars dramatically demonstrate seeding depth and should be prepared 7-10 days prior to presenting the session. Seed should be placed from 0 - 10 cm in order to be assured the ones too deep will not emerge and the trainees can vividly see the effects.
HAND-OUT #9-a
DIRECT SEEDED VEGETABLE INSTRUCTION

1. Prepare seed bed 1x5 m according to hand-out.
2. Level and mark rows according to hand-out.
3. Make small furrows 1-2 cm deep following seeding depth instructions in hand-out.
4. Place seed in furrow using the following spacing:
   a. Beans - 1 seed - 10 cm.
   b. Japanese radish - 1 seed - 2 cm.
   c. Morning glory - 2 seeds - 1 cm.
   d. Lettuce broadcast - 1 seed - 10 sq cm.
   e. Flowers - 1 seed - 2 cm.
   f. Parsley - 1 seed - 1 cm.
   g. Flowers - 1 seed - 2 cm.
5. Apply furadan approximately one pinch per foot (30 cm) of row.
6. Cover with soil one or two cm depending on seed size.
7. Spread manure between the rows at the rate of .5 cu ft per sq m and incorporate lightly.
8. Water lightly using sprinkler can daily until seed emergence which will be 4-7 days.

RECOMMENDED PLANTING DEPTH FOR SMALL, MEDIUM AND LARGE SEEDS.

SESSION TITLE: Planting Direct Seeded Vegetables

SESSION #10 WEEK #1 DAY #3 (10-1-3)

PRESENTER:

CO-FACILITATOR:

TIME: 6:00-8:00 F

INTRODUCTION: SESSION OBJECTIVES

All small vegetables are started from seed -- whether they be field plantings or nursery bed plantings that will later be used as transplants. Therefore, it is important that the trainees know and understand the importance of the many aspects of direct seeding that can improve the success of growing vegetables. The objectives of this session will give trainees knowledge of:

- How to construct a raised seed bed suitable for growing vegetables in the host-country.
- The different methods for growing each type of vegetable in different areas of the host-country.
- The proper use of insecticides and fungicides for controlling insects and diseases.
- How to use fertilizers and manure for maximum production.
- How and when to water each type.
- How plant populations are important and seeding depth can be a factor in the success of direct seeded vegetables.
- When each vegetable will be ready for harvest and how to harvest.

HAND-OUTS: #10-a Plot Layout
- #10-b See #9-b Direct Seeded Vegetable Instructions

TECHNICAL VOCABULARY:

- Seed
- Manure/compost
- Insecticide
- Hoe
- Broadcast
- Soil
- Rake
- Measure stick
- Water can
- Fungicide
- Vegetable names

65
SESSION PREPARATION AND MATERIALS

- Trainers should construct one raised bed 1 x 5 m as a model and seed it two weeks prior to trainees' arrival, following the plot layout and planting instructions.

- Hoes, rakes and watering cans.

- Measuring stick (1M, marked at each 10 cm) and small sticks to mark the rows once seeding is completed.

- Fertilizer and manure or compost for mulching -- extremely important for uniform emergence.

- Insecticide (Furadan) and measuring spoons.

- Good quality seed of the varieties recommended in plot lay out. This seed should be germination tested to ensure emergence and determine seeding rates.

T-61
TRAINER NOTES AND RECOMMENDATIONS

If trainees follow instructions it will become evident by the visual appearance of the plots upon seedling emergence. The following factors contribute to the success of this session:

- It is the trainees' third day and they are very energetic.
- The soil in the plot area should be in good condition (moist) and the weather should be cool.
- This session starts at 6:00 a.m. which is a very comfortable time to do physical work.

Note: Hot dry weather could make a dramatic difference in the outcome of this session and the success of this plot. Using manure as mulch to retain moisture is extremely important for seedling emergence and prevents the necessity for continuous watering in the later stages of growth when the trainees are pressed for time.

SESSION TITLE: Cage and Pen Construction

SESSION #11 WEEK #1 DAY #3 (11-1-3)

PRESENTER:

CO-FACILITATOR:

TIME: 7:00-11:00 F

This is the second two-hour session building cages and pens. (See Session # 7-1-2 for details and objectives.)
SESSION TITLE: Preparation for Pigs

SESSION # 12  WEEK #1  DAY # 3  (12-1-3)

PRESSENER:

CO-FACILITATOR:

TIME: 11:00-12:00 F

INTRODUCTION:

Pigs are raised in most villages in Thailand and are used as site and village projects. Therefore, it is important that trainees know the basics of pig raising and care. In this session they will:

- Be encouraged to accept the responsibility for selection, care and feeding of pigs.
- Learn how to keep production records and appreciate their importance.

READING ASSIGNMENT: Small Scale Pig Raising, Pages 45-62.

TRAINER NOTES AND RECOMMENDATIONS

Refer to Appendix C to see detailed list of the duties and responsibilities of the Technical Trainer for Livestock.
SESSION TITLE: Introduction to Agriculture, General Program and Program Specific Sessions

SESSION #13 WEEK #1 DAY #3 (13-1-3)

PRESENTER:

CO-FACILITATOR:

TIME: 15:00-16:30 C

INTRODUCTION: SESSION OBJECTIVES

The Crossover (or other) job description is clarified, the technical objectives are linked to it and training activities are related to the objectives. Then, administrative procedures such as evaluation, feedback and decision-making are explained. To make sense of and participate in the decisions of technical training, the trainees need to understand the objectives and how they will be fulfilled. They should also have the administrative procedures of training made clear.

Objectives are:

- To demonstrate how the technical objectives relate to the (Crossover) job and why each is important;

- To explain how the performance objectives will be fulfilled and how each trainee will be evaluated according to them;

- To explain various procedures of technical training, such as feedback, plots, animals, Field Day;

- To encourage trainees to get involved in training decisions.

HAND-OUT: #13-a TAC sheets.

READING ASSIGNMENT: none

TECHNICAL VOCABULARY: none
SESSION PREPARATION:

- 3-5 days before this session, pass out TAC sheets, (Crossover) job descriptions and any other information explaining the (Crossover) role, and ask that they be read carefully with an eye to how training should prepare them for their role;

- Remind trainees to bring their copies of the objectives;

- Flip charts for #4 and #6.

<table>
<thead>
<tr>
<th>TIME</th>

<td>- Demonstrations;</td>
</tr>
<tr>
<td></td>
<td>- Field Day participation.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Remind trainees about feedback and explain how it will be given regarding the technical component.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Point out the various ways trainees can give feedback about training and take part in decision-making.</td>
</tr>
</tbody>
</table>

FEEDBACK

Immediate - during or right after a session;

T-64
- Written - notes to trainers or a suggestion box;
- During progress reviews;
- Evaluation forms;
- Regular trainee meetings (with or without a trainer present) to discuss training;

DECISION-MAKING

- Through feedback;
- Trainee meetings;
- Staff will ask for input on some decisions;
- Trainee representative (rotating) to sit in on non-confidential staff meetings, who can assess and report trainees' opinions and feelings on various issues.

2 Min Close by explaining that the above topics have been introduced so that they can be discussed whenever necessary. It is hoped that everyone will feel free to do so. Staff has reasons behind all decisions, but may not always state them. It is as much the trainees' responsibility as staff's to make things clear and establish good communication.

TRAINER NOTES AND RECOMMENDATIONS

During this session the Core Staff members explain how the various components of the training program are integrated, and the agricultural, job-related, language and the cross-cultural objectives. This session prepares the foundation for open communication within the training community about processes, objectives, administration, schedule, etc. Trainee involvement is discussed and methods for encouraging it are suggested.

Also, if (TEFL) training comes early in training, this session should be modified to include TEFL objectives and trainers. It should be placed at the beginning of whatever technical training comes first.
Hand-out 13 a TAC Sheet

Peace Corps Assignment Area l99

You must have:

1. always been good in English, particularly writing and speaking; and

2. an interest in and strong willingness to teach English and assist in small scale agriculture projects.

3. a B.A./B.S. - Any discipline with an expressed interest in agriculture.

It would be helpful, but not necessary, to have a farm background or have been a future farmer of America.

Being a Peace Corps Volunteer in Thailand is more than just a job. It is a unique opportunity for you to experience another culture and learn while contributing to international understanding and peace. To make the most of this opportunity, you need more than technical skills. You must also have the flexibility to adjust, an openness to learning, and most important, patience and a sense of humor.

It is impossible to overemphasize the importance of being able to establish rapport with your Thai co-workers and supervisors. Thais will not listen to you unless they like you. They will not like you unless you can communicate your skill with a sense of fun and have the ability to operate within a bureaucracy you cannot change. Although technical knowledge is important to your success, your supervisor will attach more importance to your attitudes and personal relations. There will be frustrations. Things move slowly in Thailand and the American work ethic will be noticeably absent in many of your Thai colleagues. If you feel that you can adjust to a society that will evaluate your performance primarily on the basis of your ability to culturally conform, read on. If, on the other hand, your own priorities require professional accomplishment and the attainment of specific goals as defined by American standards, PC/Thailand is not for you. Do not accept this job unless you genuinely want to contribute your time, skills and knowledge in accordance with the Thai work ethic and cultural practices.

If you do decide to accept, it should be with an awareness and understanding that education in Thailand is afflicted with many problems, especially the disparity between rural and urban educational opportunities. Such disparity is reflected in the poor quality of education in the rural areas due to a lack of qualified teachers and relevant curricula as well as the inadequacy of school facilities. Thailand has been trying to rectify this educational situation by modifying high school education to accommodate the needs of larger proportions of the young population to be able to make the most use of their local resources, improve upon local occupations and contribute to the development of their local communities.

As a Community High School Teacher, you will be assigned to a small and rural junior high school which offers two programs of study: 1/ an academic program, and 2/ a vocational program which consists of courses on the existing occupations in the community, e.g. farming, animal husbandry, small machine repair, electricity, food and clothing... etc. Your job assignment will be 1/ to teach English-as-a-foreign-Language (TEFL) to 7th, 8th, and 9th Grade
THAILAND/Summer '84

TEFL Crossover/Community High School Teacher

students, about 12 hours per week; and 2/ to participate in the school's demonstration agriculture projects, i.e. vegetable plots, fruit trees, small animal husbandry, fish pond...etc. You will also assist in establishing and supervising students' home projects in the skill areas similar to the demonstration projects. You will be under the supervision of the school principal and will work closely with other staff members, especially the Heads of English and Ag. Departments. You will also be expected to participate fully in scheduled school activities. Besides your technical knowledge, among other factors, your ability to learn and speak Thai is even more essential to your success in this assignment. It will help facilitate communication between you and your students, co-workers, and a wide range of other people in academic and non-academic situations. You must be willing to extend yourself personally and professionally beyond the school assignment and enjoy being in a rural setting which has a very simple style of life. In short, being a volunteer is a 24 hours/day adventure in imaginative rice and personal development. Teaching TEFL and working on Ag. projects during the school year (May 16 - October 10, and November 11 - March 31), working on a 5-week summer project of a similar nature to your assignment job, and being involved in your community will be a full-time project for you.

Your community will be a village of about 5,000 people. Housing, which you will share with Thai teachers, maybe provided on campus. If campus housing is not available, you will rent a modest house in the village which you may share. Thai villagers are usually very friendly and hospitable, and teachers are always highly respected by them. They will invite you to stay in their homes, share their food with you, and make you feel like a member of the family. Flexibility in eating habits is important. Very strict vegetarians may find it difficult to maintain rigid diets and good social relations. However, maintaining a vegetarian diet in your own home will not be difficult. At times, it may seem as though they have an insatiable curiosity about everything you do or say, and you may feel some frustration at the lack of privacy Westerners value so highly. Your ability to cope with these conditions will earn you respect and admiration, and will also give you an understanding and appreciation of a segment of Thai society seldom seen by outsiders. Although motorcycles are popularly used as a means of transportation in Thailand, for safety reason, PC Thailand maintains a serious policy NOT TO ENCOURAGE you to own or use one. However, with careful evaluation on each circumstance, the PC Country Director may grant permission for you to use a motorcycle only if it deems necessary and that you agree to fully comply with all the provisions of the PC Thailand Motorcycle Policy.

Relations with the United States are close and, in spite of political changes and the unsettled border, life in Thailand goes on and volunteers are rarely affected by political events. 21 years of Peace Corps activities have left a legacy of receptive feelings. The high rate of extensions among PCVs attests to their general job satisfaction and cultural adjustment.

You will receive a pre-service training (PST) at several rural sites in Thailand. It will last for 14 weeks and will emphasize Thai language and culture since learning the language and understanding cultural practices are essential for successful job performance. Shortly after training begins you will move in and live with a Thai family in a village setting. This "home stay" will last for approximately 1 month and will help enhance your understanding of the language, culture and customs of rural Thailand. Another segment of the Training will be a technical orientation which will cover Tropical Agriculture and TEFL techniques. With the assistance of experienced PCVs during this period you will have an opportunity to learn more about the specifics of your job assignment so you can begin molding your skills and knowledge into the Thai context.

Upon completing PST, you will be sworn in as a volunteer and your service will be for approximately 2 years from that time.
SESSION TITLE: Planting Pulses

SESSION #14  WEEK #1  DAY #4  (14-1-4)

PRESENTER:

CO-FACILITATOR:

TIME: 6:00-8:00 F

INTRODUCTION: SESSION OBJECTIVES

Pulses of many varieties are grown in the host-country and are an important part of the agricultural economy. Their importance as an export crop is secondary only to their value in a wide variety of manufactured products, which, in most cases, are consumed locally. Therefore, it is important that the trainees learn and understand:

- The different varieties grown in the host-country and the specific use of each.
- The time of year most suitable for production and the areas of the host-country where each variety is produced.
- The cultural practices of the majority of the farmers and ways of improving production, including insect control.
- Proper land preparation, water requirements, seed spacing, fertilizer use and proper use of insecticides for maximum yields.
- How and when to harvest and the residual effects in the soil for the following crop.
- How pulses fit well into intercropping programs and which crops are the most suitable for intercropping.

HAND-OUT: #14-a Planting Instructions for Pulses

TECHNICAL VOCABULARY:

Hoe  Inoculant  Legume
Nodule  Manure  Water can
Rake  Fertilizer  Insecticide
Mung bean seed  Soybean seed
SESSION PREPARATION AND MATERIALS

- Model demonstration plot 2 x 5 m planted 2-3 weeks prior to session presentation.
- Two areas 5 x 5 m (one mung bean and one soybean) with reasonably good drainage. These plots should be worked as community plots with the trainees divided into two groups of equal number.
- Hoes, rakes, water cans.
- Fertilizer, seed, inoculant, insecticide--Furadan, and manure for mulching.

**TIME**

<table>
<thead>
<tr>
<th>SESSION 14-1-4 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Min Explain session objectives.</td>
</tr>
<tr>
<td>5 Min Briefly explain planting instructions and view demonstration plot that should be 2-3 weeks old. Demonstrate the use of the inoculant.</td>
</tr>
<tr>
<td>60 Min Divide trainees into two groups. Have them commence preparing the two 5 x 5 m plots for seeding.</td>
</tr>
<tr>
<td>20 Min Have trainees apply fertilizer and seed along with the insecticide.</td>
</tr>
<tr>
<td>20 Min Have trainees apply manure as mulch and water thoroughly for uniform germination.</td>
</tr>
<tr>
<td>5 Min Have trainees clean up and put hand tools in storage.</td>
</tr>
</tbody>
</table>

**TRAINER NOTES AND RECOMMENDATIONS**

It is recommended that trainees make a communal plot rather than individual plots. This will give trainees sufficient hands-on experience with every aspect of growing pulses. Emphasis for this session should be on seeding rate, depth, use of inoculant and fertilizers. Plot location and seed bed preparation are also important.
PLANTING INSTRUCTIONS FOR PULSES

1. Make bed 5 x 5 m with 7 furrows.

2. On each ridge open up the top about 3 inches deep, sprinkle 15-15-15 chemical fertilizer about 3 teaspoons/linear meter, with small pinch of Furadan evenly through the row, and mix with the soil.

3. Slightly cover the row within 2 cm of the top.

4. Put in 2 seeds every 10 cm spacing 2 cm deep. Use rake to cover the row, and firm the soil.

5. Spread manure .5 cu ft/sq m for soil conditioning and mulching purpose.

6. Water the plot after planting unless the soil has enough moisture.
This is the third session on Cage and Pen Construction. (See Session #7-1-2 for details and Objectives.)
SESSION TITLE: Newcastle's Vaccine

SESSION #16 WEEK #1 DAY #4 (16-1-4)

PRESENTER:

CO-FACILITATOR:

TIME 11:00-12:00 F

INTRODUCTION: SESSION OBJECTIVES

Disease control is extremely important in the production of poultry; therefore, trainees should be aware of the following prior to implementing projects at their sites. They:

- Will become aware of the serious diseases that can affect poultry in the host country.
- Will review their understanding of the concept of vaccination.
- Will become familiar with the use of vaccines and the equipment necessary for administering each type.
- Will have hands-on experience in handling and treating chicks.

HAND-OUT: #16-a Chicken Vaccination Program.

READING ASSIGNMENT: Practical Poultry Raising Pgs 115-119.

TECHNICAL VOCABULARY:

- Head
- Number
- Mouth
- Practice
- Ear
- Eye
- Mix
- Drop
- Catch
- Gently
SESSION PREPARATION AND MATERIALS

Trainer References: Practical Poultry Raising, pgs 115-119

- Purchase vaccine to coincide with the arrival of chicks.
- Organize equipment necessary for vaccination process.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 16-1-4 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>15 Min</td>
<td>Explain session objectives.</td>
</tr>
<tr>
<td></td>
<td>Give overview of diseases (Newcastle's, Bronchitis, Cholera).</td>

<tr>
<td>10 Min</td>
<td>Demonstrate technique for Newcastle's vaccinations.</td>
</tr>
<tr>
<td>30 Min</td>
<td>Have trainees continue until all of the chicks are vaccinated.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Have trainees clean up and put equipment in storage.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

This session must be scheduled a few (3) days after receiving day-old chicks. Be cautious when handling live virus vaccine. This session should be well accepted as all of the trainees will handle the day-old chicks.
HAND-OUT #16-a

CHICKEN VACCINATION PROGRAM

This is a general vaccination program that should be effective for all host countries. However, it must be adapted to local disease patterns, climate and weather. Vaccines for four poultry diseases are manufactured by the Veterinary Department of the Ministry of Agriculture and Cooperatives in Thailand. These vaccines are available in all provinces and most ampoes. Vaccines manufactured by foreign companies can sometimes be found, but are not common. The following schedule makes use of the government vaccines only.

<table>
<thead>
<tr>
<th>AGE OF CHICKEN</th>
<th>VACCINE</th>
<th>METHOD OF VACCINATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 days</td>
<td>Newcastle’s (Stan F) #1</td>
<td>Ocular</td>
</tr>
<tr>
<td>10 days</td>
<td>Fowl Pox</td>
<td>Wing-web</td>
</tr>
<tr>
<td>14 days</td>
<td>Newcastle’s (Stan F) #2</td>
<td>Ocular</td>
</tr>
</tbody>
</table>

That should be enough for broilers, because they go under the knife at 40-45 days.

IMPORTANT!! If Newcastle’s is epidemic near where you are vaccinating, you should do #1 when they’re 1 day old and might follow up with a #3 at 28 days. Also, INFECTIOUS BRONCHITIS can be a problem in the cold months, especially in the mountains. Therefore, you should vaccinate your entire flock in November and all new chicks a few days after Newcastle’s #1. If the weather is very cold, follow-up in January, and when chicks are 21 days old. Layers and native chickens last longer than broilers, so keep on vaccinating them, as follows.

| 60  | Newcastle’s (MP) | Wing-web |
| 90  | Cholera          | 2 cc. injection in breast |
| 150 | Newcastle’s (MP) | Fowl Pox |
| 180 | Cholera (depending on weather—see below) |

That should get your chickens through the first year. For YEAR 2, do NEWCASTLE’S (MP) every 6-12 months depending on how prevalent it is. Don’t forget BRONCHITIS in the cool season.

CHOLERA—This will make layers stop laying for a week. However, this disease can wipe out a flock in the hot season. Depending on the season you can give the first cholera vaccination anywhere from 2-5 months of age, but in late March or April to get them through the hot season. This vaccine is good for 6 months, but you may not need to follow-up until before the next hot season.
SESSION TITLE: Program Manager I

SESSION #17 WEEK #1 DAY #4 (17-1-4)

PRESENTER:

CO-FACILITATOR:

TIME: 15:30-16:30 C

INTRODUCTION: SESSION OBJECTIVES

The (Education)* Program Manager talks with trainees about Peace Corps in Thailand and the views of the Thai government. Trainees need to meet their future Program Managers.

Objectives are:

- For trainees and Program Managers to meet each other.
- To present a broad outline of successful PCV service in Thailand based on the history of that Program.

HAND-OUT:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

* This General Program Session is adaptable for any program. Program Specific terms are shown in parentheses.
SESSION PREPARATION:

- Schedule the session with the Program Manager and inform him/her of the topics to be discussed;
- Confirm, by letters, the date and topics;
- Compile a list of questions that are based on trainee concerns;
- Inform the Program Manager of topics related to this session that have already been covered in training.

TIME

SESSION 17-1-4 ACTIVITIES

5 Min

The Program Manager talks on the following subjects:

A. Some difficulties PCVs have— from Thai Government officials' points of view;

B. What is expected of PCVs by the Thai Government and Peace Corps;

C. The (Crossover) role, in general.

5 Min

Questions and answers.

After the session, an opportunity is provided for the Program Manager and trainees to talk informally.

TRAINER NOTES AND RECOMMENDATIONS

The Program Manager usually spoke just before lunch so that discussion could continue during lunch. Immediately following lunch is also a good time for this session.
SESSION TITLE: Cage and Pen Construction

SESSION #18  WEEK #1  DAY #5  (18-1-5)

PRESENTER:

CO-FACILITATOR:

TIME:  6:00-8:00 F

This is the fourth and last two-hour session of Cage and Pen construction.  (See Session 7-1-2 for details and objectives.)
SESSION TITLE: Laying Hens Arrive/Record Keeping

SESSION #19  WEEK #1  DAY #5  (19-1-5)

PRESENTER:

CO-FACILITATOR:

TIME 9:00-10:30 F/C

INTRODUCTION: SESSION OBJECTIVES

This session is designed to encourage trainees to keep accurate records and share the daily responsibility of taking care of animals. They:

- Will learn how to care for laying chickens.
- Will learn how to keep accurate records of production and inputs.
- Will learn how to handle feed, water and nutrition.

HAND-OUTS:  #19-a Egg Production Cage Record.
             #19-b Egg Production Weekly Record.

READING ASSIGNMENT: Practical Poultry Raising, Pgs 21-29 and 65-79.

TECHNICAL VOCABULARY:

Layer                      Comb
Cage
Water
Feed
Eggs
Cull
SESSION PREPARATION AND MATERIALS

- Trainer references: *Practical Poultry Raising*, pg 21-29 and 65-75.
- Locate 20-25 good quality laying hens and arrange to move to farm before session presentation.
- Prepare laying cages during cage and pen construction session.

TRAINER NOTES AND RECOMMENDATIONS

This session is scheduled early in agricultural technical training to give the trainees the time needed to benefit from this experience. Regular production of eggs is a daily positive reinforcement and stimulates trainee interest in the livestock component.

Note: Discourage the trainees from identifying with individual birds. Names and special care make records imprecise and culling difficult.

SESSION TITLE: Seed Germination Testing

SESSION #20  WEEK #1  DAY #5  (20-1-5)

PRESENTER:
CO-FACILITATOR:

TIME  10:30-12:00 C

INTRODUCTION:  SESSION OBJECTIVES

The importance of seed germination testing becomes evident when seeds that are planted properly do not germinate and emerge. Therefore, in order to avoid lost time caused by replanting, the quality of the seed should be known prior to seeding. When the quality of the seed is a known factor, mistakes of over-planting (which causes excessive thinning) or under-planting (which causes poor strands) can be avoided. The objectives of this session are to inform the trainees of:

- The basic components of most seeds.
- The difference between a monocot and a dicot and how they differ in emergence.
- What conditions are required for germination to take place.
- Several methods of practical seed germination testing.
- The importance of seed germination testing.

HAND-OUTS: #20-a  Seed Germination Test Instructions.
#20-b  Seed Germination Results Form.

TECHNICAL VOCABULARY:

<table>

</tr>
<tr>
<td></td>
<td>- Temperature, etc.</td>
</tr>
<tr>
<td></td>
<td>Discuss the benefits of using high quality seed.</td>
</tr>
<tr>
<td></td>
<td>Discuss the results of using low quality seed.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Explain the material required for seed germination testing and the methods most commonly used.</td>
</tr>
<tr>
<td>25 Min</td>
<td>Have trainees select the variety of seed they would like to test and work with--on their own.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Explain how and where to store the seed and at what intervals to check germination. Inform trainees how to finalize their tests and what day the results are due.</td>
</tr>
</tbody>
</table>

**TRAINER NOTES AND RECOMMENDATIONS**

It is not practical to do this session before trainees have planted seed; they will have planted curcubits and will have direct-seeded vegetables prior to this session, which will have given them some experience with seed. The follow-up session for seed germination testing is #42-2-12. Additional follow-up recommendations are that trainees should observe their plots and note (in the plot record) the germination results of the seed they have planted (i.e., how thick, how much thinning was required or if they have poor stands and had to replant).
SEED GERMINATION TEST INSTRUCTIONS

There are many ways to calculate germination rate, some requiring expensive equipment. Here’s a simple way.

1. Take a sampling of seeds from the can and clean out strange seeds (weeds and other vegetables), debris and incomplete seeds.

2. Count out 100 seeds.

3. Take two sheets of paper and on the top edge of one, write the kind of seed you’re working with and some identification of the container it’s coming from. Also, write today’s date.

4. Moisten the labeled sheet of paper and lay it on the table, writing down. Sprinkle the 100 seeds evenly upon it, but don’t leave any seeds close to the edges.

5. Lay the blank sheet of paper on the seeds with the writing up. Smooth it so that moisture soaks up into it, also.

6. Roll the paper around the stick so that the writing shows.

7. Put the roll in a plastic bag and put the bag in a dark, moist, warm place.

8. Daily unroll the paper and count the number of germinated seeds. Record your results below for 7 days. Also, note how the sprouts behave.

155
SESSION TITLE: Composting Techniques

SESSION #21 WEEK #1 DAY #6 (21-1-6)

PRESENTER: 

CO-FACILITATOR: 

TIME: 6:00-8:00 F/C

INTRODUCTION: SESSION OBJECTIVES

The lack of organic matter in soil is one of the most limiting factors to crop production in many host countries. In Thailand this problem is second only to available water for scheduled irrigation. Therefore, it is extremely important that trainees learn and understand not only the techniques for making compost but also the need and value of compost for host-country farmers. In this session trainees will develop:

- An understanding of the advantages of compost and manure over chemical fertilizers.
- Knowledge about what materials can be used in making compost by using different methods.
- An understanding of how compost is made, the length of time required and how to care for the compost pile to ensure quality.
- The knowledge of how compost can be used in conjunction with commercial fertilizer to cut costs of production and increase yields.

HAND-OUT:

READING ASSIGNMENT: Intensive Vegetable Gardening, pgs 44-53.

TECHNICAL VOCABULARY:

Compost  Manure  Fertilizer
Hoe  Rake  Basket
Water can  Turning  Decompose
Organic

85
SESSION PREPARATION AND MATERIALS

- Trainer references: *Intensive Vegetable Gardening*, pg 44.
- Locate or prepare (two weeks prior to session) examples of several different types of compost piles.
- Hoes, shovels, forks, rakes, baskets and water cans.
- If needed, arrange transportation for hauling materials such as manure.
- Prepare posters and diagrams to facilitate discussion of factors affecting rate of compost breakdown.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 21-1-6 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Explain session objectives.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Discuss composting -- how, why and factors affecting rate of breakdown.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Move to field. Observe different types of compost piles.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Demonstrate the technique of turning a compost pile. Explain the most appropriate time. Have trainees complete the turning.</td>
</tr>
<tr>
<td>50 Min</td>
<td>Have trainees select site for compost pile based on location of animal pens, composting material, water and garden plots. Have trainees prepare compost pile with materials available.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Review and observe the finished compost pile, making suggestions for maintaining and adding materials to the completed pile.</td>
</tr>
<tr>
<td>7 Min</td>
<td>Have trainees clean up and place hand tools in storage.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

This session is scheduled early in the training to allow the trainees the opportunity to observe the final product of composting. The collection and use of all types of organic matter is the cheapest source of plant food available to host-country farmers, but they must be taught how to use it for maximum returns. Weekly cleaning schedules for the animal pens provide both the time for regular maintenance and the material for the building of the compost pile.

T-71
INTRODUCTION: SESSION OBJECTIVES

Organic matter content of the soil is the main factor that determines the quality of any soil and its productivity. Soils of the tropics are known to be low in organic matter. It is also difficult to maintain suitable organic matter levels in them. Therefore, it is important that farmers take advantage and use organic fertilizers for improved crop production. This session will teach the trainees the basics of:

- The values format in organic fertilizers.
- Where to locate supplies.
- The proper use of organic fertilizers to gain maximum benefits.
- The differences between organic and chemical fertilizers and how they can be used together.

HAND-OUT: #22-a Organic Manure Values.

- Soils, Crops and Fertilizer Use, pgs 31-34.

TECHNICAL VOCABULARY:

Manure
Compost
Commercial fertilizer
Green manure crops
Legumes
SESSION PREPARATION AND MATERIALS

- Flip chart and felt pen.
- Posters detailing manure and compost values.

<table>

<td>15.6</td>
<td>24.3</td>
</tr>
</tbody>
</table>

The quantity of NPK produced by one buffalo per year is the same as in 300 kg of 15-15-15 fertilizer and the value is more than Baht 1,500 without calculating the benefits of the organic matter.

The value of NPK production in quantitative terms that is shown in table 4 does not consider manure's qualitative value for soil improvement, reducing salinity and acidity and increasing water holding capacity. Furthermore we do not quantify here with incremental yield due to application of large amounts of organic manure.

Any farmer with an average of 1 a.u. per 10 rai will be able to apply more than 3 cu. m of manure per rai to 3 rai every year and repeat the application every three years.
SESSION TITLE: Housing and Watering

SESSION #23  WEEK #1  DAY #6  (23-1-6)

PRESENTER:  
CO-FACILITATOR:  
TIME:  10:00-11:30 F/C  

INTRODUCTION: SESSION OBJECTIVES

Housing and watering are the major components of successful animal management. In this session the trainees will learn:

- About the five components of animal raising and the developmental continuum from survival to high production levels under host-country conditions.

- To compare their own physical needs to those of livestock in tropical conditions and appreciate the extra importance of housing and adequate water.

- To identify and begin to deal with any problems that have developed in the livestock component of training.

HAND-OUTS:  #23-a  Livestock Production Levels

READING ASSIGNMENTS:

1. Small-scale Pig Raising, pgs 63-78.
2. Practical Poultry Raising, pgs 81-94.

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Trainer references: Small-scale Pig Raising, Practical Poultry Raising.
- Construction sessions completed and cages and pens constructed.
- Livestock orientation or other visits to livestock production facility have been made.
- Records and chores are being completed and recorded on forms and chore sign-up sheets.
- Flip chart and felt pen.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 23-1-6 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Explain session objectives.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Get feedback on construction sessions.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Discuss housing requirements and considerations.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Discuss why livestock production usually declines in tropical climates.</td>
</tr>
<tr>
<td>30 Min</td>
<td>Reintroduce 5 components of livestock production. Use chickens as example of interrelationship of components at different production levels.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Review and fill in incomplete record forms. Update chore list and define weekend responsibilities.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS:

This session tends to be slow to get started and so must be well prepared and presented to keep the trainees' attention. However, it does produce excellent feedback from trainees on the construction sessions.
HAND-OUT #23-a

LIVESTOCK PRODUCTION LEVELS

Volunteers will encounter a wide range of production levels for livestock with different farmers. These varying production levels will range from survival to moderate to high in regards to nutrition, management, housing, diseases and parasites, and genetics. The purpose of this handout is to begin to identify, for each of the 4 species, specific examples of the kind of conditions that comprise survival, moderate, or high level production environments. The examples given are meant to be "typical" of varying production levels. Every farmer's livestock operation will be different and these are meant only to be used as a general guide for the volunteer. It can also help the volunteer in determining when one of the five different categories of production is not on the same level with the others.

RABBIT PRODUCTION

SURVIVAL LEVEL

Nutrition: Fed only table scraps and vegetable wastes. Given contaminated water on an erratic basis.

Management: No improved practices at all. Given only the minimal care needed to keep the rabbits alive.

Housing: Both bucks and does are placed on a dirt floor. There are no walls but there is a bamboo or palm thatch roof for shade.

Diseases/Parasites: Presence of two or more of the following: Coccidiosis, conjunctivitis, mange, ear mites, colds, or pneumonia.

Genetics: Creole varieties present - no improved (exotic) breeds.

MODERATE LEVEL

Nutrition: Given clean water daily. Given good quality grasses and legumes for forage daily.

Management: Breeding records kept and ear tattooing practiced.

Housing: Rabbits caged in bamboo or wooden hutches. Bucks and does separated. Cages cleaned occasionally. Rabbits shielded from drafts and the hot sun.

Diseases/Parasites: No pneumonia, mange, or coccidiosis present. Animals appear to be healthy and gaining weight. Coccidiostat used when needed.
**GENETICS:** Presence of exotic or improved breeds—probably crossed with local breeds.

**HIGH LEVEL**

**Nutrition:** Vitamin and mineral supplement given ad lib. An adequate supply of fresh legumes and grain given daily. Fresh, clean water given twice daily.

**Management:** Meat production and breeding records kept. Ear tattooing. Fryers marketed at 8 weeks/4 pounds. Rabbits sexed, palpated, mated, and handled properly.

**Housing:** The cages have wire floors (1/2 grid), leak proof roof, kindling boxes, hay mangers, and automatic waterers. The cages are cleaned weekly. The rabbits receive morning sun and no drafts.

**Diseases/Parasites:** Disease and parasite free. The regular use of a coccidiostat and dipterex or malathion for mange.

**Genetics:** All exotic breeds adapted to the local conditions and market preference in meat and size.

**POULTRY PRODUCTION**

**SURVIVAL LEVEL**

**Nutrition:** Scroungers, feed off of weed seeds, insects, manure, and table scraps. Probably drink contaminated water.

**Management:** No improved management practices used.

**Housing:** Free range—no housing provided. Perch in trees at night. Losses to predators.

**Diseases/Parasites:** Problems with both internal and external parasites. High mortality losses. Presence of both morbidity and mortality diseases such as Fowl Pox, Newcastle, Coryza, and Coccidiosis.

**Genetics:** All local varieties—no exotics.

**MODERATE LEVEL**

**Nutrition:** Fed "scratch" feeds (low quality and percentage protein grains), table scraps, and starchy tubers. Given water daily

**Management:** Wings clipped, coccidiostat used occasionally (during outbreak), home-made feeders and waterers used. Eggs collected daily.
| Housing:  | Penned on a dirt floor with thatch roof and fenced walls of thorn, thatch, or wood.                  |
| Diseases/ Parasites: | No current outbreaks of mortality diseases though birds may be carriers. Possible coccidiosis or overall stress lowering production. |
| Genetics: | Mixture of local breeds and exotics. Generally, "dual purpose" birds for both meat and eggs. |
| HIGH LEVEL |  |
| Nutrition: | Ad-lib fed a complete, balanced ration adapted to the type of production (egg laying or eating birds) and the cost of feeds locally. Includes a source of animal protein in the ration. Good supply of calcium. Fresh, clean water given daily. |
| Management: | Light source used for layers, brooders used for chicks. Kept separate from other birds. Breeding stock from good hatchery. Eggs collected daily. Birds debeaked and production records kept daily. |
| Housing: | Regular chicken coops using chicken wire and good roof. Perches and nesting boxes provided. No drafts, proper spacing requirements met. Automatic waterers and feeders used. |
| Diseases/ Parasites: | Disease vaccination schedule maintained for all major poultry diseases in the area. Birds are disease and parasite free. No known carriers in flock. |
| Genetics: | All exotic breeds. Probably leghorn used for egg production. Heavier meat breeds used for broilers. |
SWINE PRODUCTION

SURVIVAL LEVEL

Nutrition: Free range, scroungers. Diet consists of whatever is found in the streets - roots, feces, grass, and weeds. May be fed table scraps occasionally. Drinking water is probably contaminated by parasites.

Management: Probably no improved management techniques are used. In Latin America a forked yoke is commonly used to keep the pig out of barbed wire fences.

Housing: Free ranging during the day but may be placed in a compound at night.

Diseases/Parasites: Roundworm, tapeworm, fleas, and ticks are common. Probably are carriers of diseases such as brucellosis, hog cholera, African swine fever, and others. High mortality losses.

Genetics: No exotic breeds - all locally adapted breeds. Street pigs.

MODERATE LEVEL

Nutrition: Fed starchy tubers such as cassava, taro, yams, or potatoes, table scraps, and occasionally small amounts of corn or other low protein grains. Watered daily.

Management: Given deworming medicine occasionally, boars castrated, and sows still unassisted at farrowings. Ear may be notched or some marking present to indicate ownership.

Housing: Hog is penned and has a mud "wallow" to use for cooling down during the heat of the day. Possible shade from trees, and a dirt floor. Both sexes are still housed together.

Diseases/Parasites: No current outbreaks of the major mortality diseases. Some morbidity diseases, internal and external parasites still present, producing stress on the animal and lowering feed conversion and weight gain. May or may not be carriers of disease.

Genetics: Mixture of local varieties and improved breeding stock. No control over breeding.
HIGH LEVEL

**Nutrition:** Fed a high production feed ration that meets the NRC requirements for ME, CP, Lysine, Calcium, and Phosphorus. Clean, fresh water and feed available ad-lib.

**Management:** Production and breeding records kept. Farrowing crate used during farrowing, sow assisted during farrowing, piglet cords dipped with iodine, iron shots given, and needle teeth clipped. Boars are castrated and all pigs dewormed on a regular schedule.

**Housing:** They are penned on a cement floor. Farrowing crates, dirt runways, and pastures are used. Automatic waterers and feeders are used and they are kept dry by a good roof.

**Diseases/Parasites:** Disease and parasite free stock. A regular vaccination schedule is followed.

**Genetics:** All exotic breeding stock used to obtain a 3 way cross in meat hogs for hybrid vigor.

GOAT PRODUCTION

SURVIVAL LEVEL

**Nutrition:** Goats fed on overgrazed, unfertilized grass pasture of poor nutritional value. Given no protein, vitamin, or mineral supplements. Water may be in short supply and is probably contaminated with parasites.

**Management:** No improved management practices. Goats used for meat only - not milk.

**Housing:** Days spent foraging on pasture - may or may not be placed in the compound at night.

**Diseases/Parasites:** Brucellosis, mastitis, or mile fever may be present. Probable infestation of roundworms, coccidiosis, lice, and/or mange.

**Genetics:** All local breeds adapted to poor feeds - non milkers.
MODERATE LEVEL

Nutrition: Fed on pastures of improved varieties that are rotated regularly and not overgrazed. Occasionally grazed on legume crops. Adequate water supply but may be contaminated with parasites.

Management: Goats are milked daily. Does with severe mastitis or brucellosis are treated or culled. Treated for both internal and external parasites, but not regularly.

Housing: Animals are rotated on different pastures during the day and kept in the compound at night to prevent predator losses.

Diseases/Parasites: Herd may still be carriers of disease even though there are no current outbreaks. Parasites a problem still—but not severe due to an occasional treatment.

Genetics: Mixture of local breeds and exotic stock. Dual purpose animals for both meat & milk.

HIGH LEVEL

Nutrition: Goats are fed high quality legumes and grazed on improved and fertilized pastures. Grains and a vitamin and mineral supplement fed to the milking does. Ad-lib fresh and pure water.

Management: Dehorning, castration, and hoof trimming are practiced. Milking stalls used and does milked twice daily. A regular vaccination schedule is followed for all major diseases in the area. Production and breeding records are kept.

Housing: Bucks and kids are grazed during the day and penned at night. Does remain penned all the time and feed brought to them. Barn has a dirt floor and a roof for shade. The barn contains individual stalls with bedding and individual stanchions for milking.

Diseases/Parasites: Disease and parasite free herd. Treated when necessary for mastitis and roundworms. All new stock is kept separated from herd until it is sure that they are disease free.

Genetics: Improved, exotic stock such as Nubians or Toggenburgs.
SESSION TITLE: Record Keeping (Crops)

SESSION #24  WEEK #1  DAY #6  (24-1-6)

PRESENTER:

CO-FACILITATOR:

TIME: 11:30-12:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Record-keeping is as important as any function related to crop production. This exercise will not only show what one spends to produce a crop/crops but will in turn show the returns. These, when used together will show profit or loss. This session will show the trainees:

- The techniques of accurate record keeping.
- The importance of keeping records.
- Which items or functions are the most important.

HAND-OUT: #24-a  Sample Record Form.

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Trainer reference: **Intensive Vegetable Gardening**.
- Flip chart and felt pen.

---

**TIME** | **SESSION 24-1-6 ACTIVITIES**
---|---
5 Min | Explain session objectives.
10 Min | Discuss the techniques of record keeping using field notebooks and daily calendar.
15 Min | Discuss the importance of keeping records and the items of most importance.
- Planting dates.
- Rainfall.
- Irrigations.
- Fertilizer inputs.
- Fertilizer application dates.
- Insect control dates.
- Insecticide use record.
- Harvest amounts and dates.
- Sales, amount and type.
- Profit and/or loss.

---

**TRAINER NOTES AND RECOMMENDATIONS**

This session will give the trainees the basics of garden record keeping. They should be encouraged to keep records of their individual plots. These records should be checked by the trainers weekly during the maintenance sessions or a one-to-one basis.
NOTE THE FOLLOWING:

- Seed cost
- Fertilizer cost
- Planting dates.
- Rainfall.
- Irrigations.
- Fertilizer inputs.
- Fertilizer application dates.
- Insect control dates.
- Insecticide use record.
- Harvest amounts and dates.
- Sales, amount and type.
- Profit and/or loss.

SESSION TITLE: Planting Cassava and Sweet Potatoes

SESSION #25  WEEK #2  DAY #7 (25-2-7)

PRESENTER:

CO-FACILITATOR:

TIME: 6:00-8:00 F

INTRODUCTION: SESSION OBJECTIVES

Due to cassava's being an important crop to the host-country economy and the value of sweet potatoes for home consumption, it is important that the trainees learn the production basics for these crops. Therefore, during this session the trainees will develop the skills necessary:

- To prepare proper beds and ridges for planting.
- To be able to select and prepare cassava stem cuttings, sweet potato vine cuttings and sweet potato transplants.
- To understand the basic fertilizer and water requirements for normal production in the areas where these crops are produced.
- To determine the most suitable time for harvest and the most appropriate harvesting techniques of the host-country.

HAND-OUTS: #25-a Plating Instructions for Cassava.
 #25-b Planting Instructions for Sweet Potatoes.

TECHNICAL VOCABULARY:

<tr>
<td>Sweet potato vine cuttings/plants</td>
<td></td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Lay out plot 5 x 5 m for cassava.
- Lay out plot 5 x 5 m for sweet potatoes.
- Locate and have available cassava stems and sweet potato vine cuttings.
- Plant sweet potato tubers 2-3 weeks prior to session to have transplants ready for session.
- Acquire or gather hoes, rakes, water cans and sharp knives.
- Purchase commercial fertilizer blends if applicable in the host-country.
- Get manure or compost for mulching.
- Acquire peanut seed for intercropping peanuts with cassava.

---

TIME | SESSION 25-2-7 ACTIVITIES
-------------------------|-----------------------------------------------------
10 Min | Explain session objectives.
45 Min | Divide trainees into two groups. One group prepares 5 x 5 m cassava plot and the other group prepares a 5 x 5 m sweet potato plot according to hand-outs.
10 Min | Demonstrate the proper technique for selecting and cutting cassava stems and sweet potato vine cuttings and (where possible) how to dig and prepare sweet potato transplants.
20 Min | Demonstrate planting techniques and assist trainees in the actual planting of both crops.
15 Min | If intercropping cassava with peanuts, plant peanut seed, fertilize and apply manure according to planting instructions.
10 Min | Clean up and return hand tools to storage. Question and answer session.

---

T-75
TRAINER NOTES AND RECOMMENDATIONS

This session, if well prepared, is a tremendous hands-on learning experience for the trainees. The session covers several important plant propagation techniques which are important in the host-country as well as fertilizer and manure applications. Intercropping peanuts and cassava fits well into this session and should be included in all future sessions if at all possible.

This session was designed for communal plots with 2 hours allocated for completion of planting. The 2 hours should be sufficient to complete the plots. It is recommended that future presentations of this session do it exactly as designed above as it was met with enthusiasm by trainees and covers many necessary skills.
LAND PREPARATION AND PLANTING INSTRUCTIONS FOR CASSAVA

1. Clear the 5 m x 5 m plot of all weeds and grass.

2. Using the hoe, till the soil to a depth of 6 to 8" (15-20 cm), at the same time filling in low areas and leveling the entire plot.

3. Build ridges with deep furrows about 12-18" (30-45 cm) high. Place ridges 1 m apart, evenly spaced within the 5 x 5 m plot.

4. Manure may be applied by broadcasting during tillage or as a mulch for moisture retention. The amount recommended would depend entirely on the available supply with recommendations of not less than 1 cu ft per sq m.

5. The application of commercial fertilizers is not recommended, as under normal conditions it is not economical to apply due to the weak market for cassava.

Cuttings for planting cassava should be 8" (20 cm) long and taken from the center sections of the previous crop's stalks. Care should be taken that no diseased portions of the stalks are used.

7. Place the cuttings on the ridges at 50 cm intervals with 50% or 4" (10 cm) of the cutting covered with firm soil. Care should be taken that the bottom node is well covered with soil.

8. Inter-cropping with legumes is a common practice, with peanuts and mung beans the most widely used. Inter-cropping is only practical when sufficient moisture is available, and will assist in controlling grass and weeds.

9. Water by furrow until the area is thoroughly moist and maintain this moisture until the cuttings have rooted and top growth appears. Adequate moisture during the growing period of about 12 months will improve yield and quality.
HAND-OUT #25-b

LAND PREPARATION AND PLANTING
INSTRUCTIONS FOR SWEET POTATOES

1. Clear the 5 m x 5 m plot of all weeds, grass and other debris.

2. Using the hoe, till the soil to a depth of 6" to 8" (15-20 cm). At the same time fill in low areas and level the entire plot.

3. Build ridges and furrows 12" to 18" (30 to 45 cm) high, with 1 m between rows. This will give you 5 ridges evenly distributed in your 5 m plot.

4. Manure may be applied by broadcasting prior to tilling and/or as a mulch for moisture retention after the cuttings have been planted. The quantity used would depend on the supply, with 1 cu ft per sq m recommended as the minimum in order to receive noticeable results.

5. Fertilizer 15-15-15 at the rate of 50 kg/rai (32 gms/sq m) broadcast prior to tilling, or as a side dressing in the beds, with the latter being recommended.

6. Place the cuttings on the ridges at 50 cm intervals. Remove the leaves from the bottom half of the plant and insert into the soil at about a 45 degree angle.

7. Water by furrow until the area is thoroughly moist and maintain this moisture until the cuttings have recovered and rooted well. Adequate moisture throughout the growing period will greatly improve yield and quality.
SESSION TITLE: Nursery and Transplants

SESSION: #26  WEEK #2  DAY #7  ("6-2-7)

PRESENTER:

CO-FACILITATOR:

TIME:  9:00-11:00 F/C

---------------------------------------------------------------------

INTRODUCTION:  SESSION OBJECTIVES

All types of vegetables are grown from seed but many do poorly when direct-seeded to field plots. Therefore, there are many advantages for growing seedlings in the nursery until ready for transplanting. This session will give the trainees hands-on experience concerning:

- Which vegetables must be transplanted and which ones do better when transplanted.
- How to prepare the nursery seed bed.
- How to seed for growing successful transplants—i.e. broadcast or row-seeding.
- How to take care of seedlings after they emerge—watering and shading.
- When to transplant seedlings to individual plastic bags and when to move them to plots.
- How to plant without severe setbacks to plants.

HAND-C: #26-a  How to grow super transplants.

TECHNICAL VOCABULARY:

- Nursery
  - Nursery bed
- Seeding
- Mixture
- Seedling transplant
  - Broadcast
  - Row seeding
  - Seed
  - Basket
SESSION PREPARATION AND MATERIALS

- Prepare seeds for each type to be grown.
- Gather or acquire plastic baskets, plastic bags and fungicide.
- Prepare seedlings 2 weeks prior to session for placing in plastic bags during session.
- If co-facilitated with nursery near training site, set time schedule with instructor.

</table>

**TRAINER NOTES AND RECOMMENDATIONS**

This session is most successful when using the facilities of a nursery where plants of all types and in all stages of growth are readily available. The seed for this session should be germination-tested prior to the session.

Transplanting will be very useful at trainees' sites; therefore, this session should be well prepared and presented.
Growing healthy, vigorous transplants is the old science-and-an-art trip. Without good management, you'll end up with entrees for an ag gong show.

THREE WAYS TO START THEM: Nursery Seedbed, Seedbox, Individual Containers.

1. In-the-Ground Nursery Seedbed Method: The plants are grown out-doors on raised seedbeds made from ordinary soil or preferably a specially prepared soil mix (see next page). Seeds are planted in rows 2-3" apart and transplanted to the field 3-6 weeks later. In the rainy season, a removable thatch or permanent clear plastic roof should be built over the seedbed to prevent damage from heavy rain. Partial shade may be necessary if heat and sunlight are intense.

2. Seedbox Method: A good seedbox can be made from 1/2" wood and should be 3-4" deep and an easy to handle size (no bigger than 16 x 24" or so) with drainage holes in the bottom. A soil-compost, rice hull-soil, or other loose and well-drained mix is used. The seedbox is kept in full or partial sunlight either outdoors with a removable or clear plastic roof or else in a greenhouse; it should be raised up on blocks or stilts to cut animal and ant damage. Seedboxes offer more controlled, protected conditions than nursery seedbeds and are recommended when only a few hundred transplants are needed. About 400 transplants can be grown per sq meter of seedbox space. The plants can remain in the seedbox until full transplant size if properly spaced and progressively thinned to give at least a 2" x 2" final spacing. Some growers prefer starting out seeds in shallow flats a couple of inches deep and then transplanting to a deeper seedbox or nursery seedbed when the seedlings have formed their first pair of "seed" leaves. The only real advantage of this double transplant method is that most of the seedlings can be used instead of throwing the thinnings away. There's no evidence that transplanting stimulates a better root system.

3. Individual Container Method: Seedlings are raised in individual neat, plastic, or paper (homemade) pots. A special potting mix like vermiculite or peatlite can be used or you can easily make your own (see next page). Two or three seeds are planted per pot and thinned to one plant at the first true leaf stage. Big advantage of containers is that root injury is minimized during transplanting.

Whatever method you choose, remember that care and management are more important than the actual method.
SOIL MIXES FOR TRANSPLANTING:

Straight soil seldom makes a good planting medium compared to a mix. It's either too clayey (makes it tight and poorly drained) or too sandy (low water holding ability). When confined in a shallow pot or seedbox, most natural soil tends to become very poorly drained near the bottom no matter how many drainage holes you make—there's no soil below to provide a suction force to draw the water away, and gravity by itself isn't strong enough. That's the main reason you should use an extra coarse soil mix which will facilitate drainage yet still hold an adequate amount of moisture. Soil mixes also are usually lighter than regular soil, making it easier to move seedboxes around.

Here are a few recipes for soil mixes (variations are endless):

1. 1:1:1 sand-soil-compost. Modify the ratio to suit the soil you're using. Well rotted manure can be used.

2. A 2:1 or 1:1 rice hulls-soil mix.

3. A 1:3 sand-compost mix. Rotted coconut husk fibers run through a 1/4" mesh screen make great compost.

FERTILIZING:

Don't rely on compost alone to supply the needed nutrients; it's a low analysis, slow release source. Compost that's only partly rotted is not adequate.

Too much or unbalanced fertilizing produces overly succulent and leggy plants (makes them especially prone to damping-off disease.) Use an NPK fertilizer with a high P ratio (like 12-24-12 or 10-30-10). Aim for an application equal to 80-100 lbs (kgs) N, 150-250 lbs (kgs) P 0, and 100-200 lbs (kgs) K 0 per 2.5 acre (hectare). That's equal to 80 grams per sq meter of 12-24-12 or 10-30-10 or about 5 level tablespoons (about 1/2 tablespoon per sq foot).

How to Apply Fertilizer: Mix it in thoroughly with the seedbox soil mix or broadcast and work it into the top 4" of the nursery seedbed.

Nitrogen Deficiency: May show up after a few weeks due to the extra high leaching losses occurring in shallow containers. Leaves start turning a pale yellow. Water the seedlings with 1 tablespoon ammonium sulfate (or 1-1/2 teaspoons urea) dissolved in 1 gal. of water. Once should do it. Wash off leaves with plain water afterwards.
HAND-OUT #26-a (CONTINUED)

Timing Transplant Production

If tomatoes are to follow a crop of beets, the preparation and planting of the tomato nursery seedbed should be timed so that the transplant will be ready for field setting as soon as the beets are harvested.

Staggering Plantings of a Crop

A common problem for most garden projects is that each crop's production flow tends to be very uneven. This "feast or famine" syndrome can be largely overcome by risking a series of staggered plantings of the crop at weekly to monthly intervals rather than one planting alone. Another means is to plant early, medium, and late maturing varieties of a crop simultaneously to extend the harvest period.

Aside from evening out the flow of produce of home consumption, staggered plantings have several important advantages for market gardens:

a. Buyers are usually partial to producers who can provide a reliable supply of produce over a long period.

b. By spreading out the marketing period for a vegetable, growers can usually take advantage of favorable market price fluctuations, rather than gambling on a good price for a single marketing. Also, there is less likelihood of glutting the market and causing drastic price declines.

In selecting an appropriate time interval between staggered plantings, it's important to consider the harvest duration of each planting. Some suggestions:

a. A planting of sweet corn will remain at a harvestable stage for only 7-10 days; thus, succession plantings would be needed at 7-10 day intervals for an even flow of produce. Another approach would be to plant an early (about 65 days to maturity), medium (80 days), and late (90 days) variety at the same time which would provide a harvesting period of about a month.
b. The harvest duration of tomatoes varies greatly with the type. The short, bushy, determinate varieties have a harvest duration of only 2-3 weeks, while the tall growing, indeterminate varieties can continue producing for several months if the plants aren't killed off by fungal leaf spot diseases.

c. Some vegetables such as Swiss chard, spinach, leaf lettuce, mustard, and collards can be harvested either all at once (i.e. pulling out or cutting off the entire plant) or they can be picked a few leaves at a time over a number of weeks (new leaves continue to be produced from the base).
SESSION TITLE: Agricultural Environment

SESSION #27  WEEK #2  DAY #7 (27-2-7)

PRESENTER:  
CO-FACILITATOR:  
TIME: 15:00-16:30 C

INTRODUCTION: SESSION OBJECTIVES

The relationship between agriculture and its environment is complex. The human activity of agriculture cannot help but affect its environment, nor can agriculturists ignore the effects environmental factors have on agriculture. Only by understanding these effects, can farmers and PCVs maximize the benefits and minimize the side-effects of their work. (Here, environment is broadly taken to include social, economic and political factors, in addition to natural factors.) Trainees will learn in this session how:

- Agriculture affects the environment.
- They can control or reverse these effects.
- To understand the major influences on work and lifestyles of farmers and their families.
- It is possible to gather information on these influences.

HAND-OUT: #27-a The Agricultural Environment.

READING ASSIGNMENT:

- Traditional Field Crops, pgs 1-33.

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Season</th>
<th>Hot season</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rainy season</td>
<td>Cold season</td>
</tr>
<tr>
<td>Sunlight</td>
<td>Environment</td>
</tr>
<tr>
<td>Marketing</td>
<td>Credit</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Trainer References: *Traditional Field Crops*, 
  *Guidelines for Field Crops in Tropics and Sub-tropics.*

- Have data on rainfall—monthly averages.

- Have data on temperatures—monthly averages.

- Have data on seasonal changes over 12 months.

- Use bar graph showing linkage between the growth cycle of important crops and weather.
  
  (If available, this data could be specifically for the areas the trainees will be working in.)

- Have flipchart and felt pen.

---

**TIME**                  **SESSION 27-2-7 ACTIVITIES**

5 Min  
Explain session objectives.

5 Min  
Link content to home-stay and the community analysis. Emphasize that farmers do things for valid reasons and that to understand what farmers do, in order to participate in beneficial change, one must be aware of the social and physical factors that influence farmers’ behavior.

10 Min  
Trainees brainstorm factors that they think influence the lives, incomes and habits of farmers and rural families. Seek factors that are natural (weather, topography), economic, social, cultural and infrastructural (roads, radio) (see hand-out). List on flipchart.

30 Min  
Instigate discussion concerning the most important factors, allowing trainees to think and explore for themselves. Emphasize the following factors: ecology, water resources, marketing, credit, local farming practices (habits), and advisory sources.

20 Min  
Discuss the host-country seasons, emphasizing the regions where the trainees will serve. Focus on temperature, rainfall, photo period and wind patterns. Suggest where the information for a specific area could be found.
Discuss the link between the seasons and growth cycles for some important crops. Brainstorm where the above information can be found with help from trainees.

Have each trainee choose one factor that s/he will research within the training or home-stay area. This information can then be displayed.

TRAINER NOTES AND RECOMMENDATIONS

This session comes early in the training program; therefore, the trainees will not know a great deal nor will they have many facts at their disposal, but this project will get them thinking and exploring rather than focusing only on the information trainers can provide. To be interesting and informative this session requires a great deal of research which must be completed well in advance of the session itself.
THE AGRICULTURAL ENVIRONMENT

The local agricultural environment is made up of those factors which influence an area's agriculture. Some of the factors that are important in the host-country are listed below. We'll discuss the most important. Always keep in mind that these factors are closely interrelated.

NATURAL (PHYSICAL) ENVIRONMENT

Climate

Weather

Ecology (the interaction among crops, weeds, diseases, insects, animals and people)

Water Resources (natural)

Land

Soils

INFRASTRUCTURE & SOCIAL ENVIRON.

Transportation

Communications

Marketing

Storage and Drying

Land Improvements

Water Resources (man made)

Local Farming Practices

Available New Technology and Systems

Ag. Supplies, Equipment

Credit

Advisory Services

Ag. Labor Force

Land Distribution & Tenure

CLIMATE:

Some crops only do well in the cool uplands of the north, while others can survive the long hot, dry periods in the northeast. The consistent climate of some parts of the south allow some crops to thrive year round. When and what crops are grown have a large part in determining rural life styles.

SEASONS:

For most of the host-country, the distinct seasons dictate what crops can be planted and when. The major factors are rain, temperature and photo period.
RAINFALL

In Jryland (non-irrigated) areas, rainfall is the major environmental factor determining which crops can be grown, when they're planted and harvested, and what they yield. Rainfall varies greatly from place to place, often within surprisingly short distances, especially under mountains or hilly terrain.

Keep in mind that:

1. Annual rainfall averages have little meaning; seasonal distribution and reliability are far more important in terms of crop production.

2. Seasonal rainfall distribution gives a good indication of the amount of moisture available for crop production, but it doesn’t give the full story. The amount of rainfall that is actually stored in the soil for crop use depends on other factors, too, such as water run-off and evaporation, and the soil’s texture and depth.

3. Don’t be too concerned by what is "normal". You must be able to deal with what might happen, to be successful. Expect deviations and know how you’ll respond.

4. Cropping cycles are closely related to rainfall patterns: After the soil is baked in the hot season, a certain amount of rain must soften it up for plowing. Rice likes a lot of rain. Corn a lot, but not too much. Legumes do poorly if it rains much after they flower.

5. The farmer is a weather "expert": She/he knows the local conditions because his/her livelihood depends on it.

6. You must work the above cycles & rainfall data around your school’s calendar. When school closes, there won’t be anyone to watch crops. This may force you to plant at less than perfect times.

SUNL IT:

Generally the inverse of rainfall. Rain and the clouds it falls from prevent sunlight from reaching crops. Also, the short day lengths of winter lessen the sunlight available to chlorophyll. Yet, some crops (cabbage family) prefer less sunlight. In the north and northeast, day lengths are about 12 hours in December and 14 hours in June.
Although you'll see it here, field crops should not be planted on slopes greater than 6% unless terracing is used. Hilly land is best suited for livestock grazing (not heavy) and tree crops. Also, lowland that floods in the rainy season is generally unusable at that time of year.

SOILS:

Different soils favor different crops. Work with nature and adapt to each situation.

WATER RESOURCES:

Even when your land borders a river, you must do something to get the water to your plant roots. A hand dug well is fine for vegetables, but useless for flooding rice. The amount of water that your irrigation system can deliver limits the crops you can grow in the dry & hot seasons. It takes more water for rice and vegetables, than for peanuts and mangoes.

MARKETING:

This isn't important for subsistence crops, but means everything for cash crops (which includes the surplus from subsistence crops). Setting production records won't pay taxes if you can't get a decent price for your crop. Markets also affect how much you should invest in fertilizers and other inputs. Don't plant until you've found a market.

In the host-country, most things are sold through middlemen. Unless you're working on a small enough scale to sell to friends and acquaintances, get to know the middlemen. Know the going prices and how they vary according to season and supply. The price of garlic is around 50-70 baht/kg in September, but only 10-15 baht/kg in April. Obviously, if you can grow garlic when the price is good you can make a good profit. If you grow when it's easy to grow, you'll have a lot of company and the price will be low.

HABIT AND CUSTOM:

Much sophisticated agricultural knowledge resides in the universities and other government agencies. However, many farmers learn, not from the "educated", but from their parents, siblings, relatives and other villagers. In this way, they use a proven method - they can depend on their cultural practices to put food on the table. This isn't true of the "new" ideas coming from agricultural extension agents. However, farmers will copy a practice that another farmer uses successfully.
CREDIT:

Credit is increasingly important as more costly technology is spread throughout the host-country. However, many farmers aren't used to saving money and most borrow to buy fertilizers, tractors and chemicals. Many are poor risks and can't get credit from banks, which forces them to borrow from merchants and money lenders at high to serious interest rates. The problem snowballs from there.

LAND DISTRIBUTION AND TENURE:

There used to be enough land for everyone, but now the host-country is getting crowded. Many farmers have lost their land to merchants and must rent or work in the hills. Land is usually rented for a crop cycle, not long term, and there is no incentive for a farmer to improve land he doesn't own.
SESSION TITLE: Planting Transplant Plots

SESSION #28  WEEK #2  DAY #8  (28-2-8)

PRESENTER:

CO-FACILITATOR:

TIME: 6:00-8:00 F

INTRODUCTION: SESSION OBJECTIVES

Transplanting of many varieties of vegetables is very important for several reasons; therefore, this session should be well prepared in advance with several types of transplants started 2-3 weeks prior to session presentation. This session will give the trainees the knowledge and experience necessary to:

- Assist them in preparing a proper seed bed suitable for transplanting.
- Know which plants are most suitable for transplanting in the host country.
- Understand when transplants of all kinds are ready for transplanting, and how to prepare them for transplanting.
- Know how to care for the transplants to speed recovery and prevent losses.

HAND-OUT: #28-a Transplanting Bed

TECHNICAL VOCABULARY:

- Transplants
- Fertilizer
- Digging fork
- Manure
- Shovel
- Water cans
- Hoe
- Vegetable names
- Hoe
- Flower names
- Rake
- Basket

113 192
SESSION PREPARATION AND MATERIALS

- Selection and preparation of transplants, vegetables and flowers, suitable for host-country conditions.
- Individual plot 1 x 5 m for each trainee.
- Hand-out, plot layout and recommended plant spacing.
- Hoes, rakes, water cans.
- Insecticide (Furadan).
- Fertilizers and manure.

</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

The trainees should be given a hand-out prior to this session which shows the plot layout and recommended plant spacings. Then forego the plot layout and let the trainees design their own plots. This worked well and should be repeated to give the trainees experience in plot design. Mistakes should be brought to their attention, such as plant spacing and plant type grouping during plot evaluations. The end results of this session were extremely impressive by plot appearance. The recovery of the transplants were enhanced by daily rain and cool weather. Hot and dry weather could adversely affect the outcome of this session. Reading assignments are recommended prior to this session.

SESSION TITLE: Feeds and Nutrition
SESSION #29  WEEK #2  DAY #8  (29-2-8)
PRESENTER:
CO-FACILITATOR:
TIME:  9:00-11:00 C

INTRODUCTION:  SESSION OBJECTIVES

Proper animal nutrition is one of the main components in animal health and profitable livestock production. In this session trainees will use their understanding of human nutrition and the discussion of their reading assignment to:

- Develop an understanding of animal nutritional needs.
- Identify the different types of feedstuffs.
- Understand the concept of balancing a ration.

HAND-OUT:  #29-a  Introduction to Animal Nutrition.

READING ASSIGNMENT:  Introduction to Animal Nutrition (Hand-out).
SESSION PREPARATION AND MATERIALS

This session could be co-facilitated with the teacher from the Training Center's Animal Department. His/her co-facilitation should be scheduled 10 days prior to presenting the session.

TRAINER NOTES AND RECOMMENDATIONS

It is important that the trainees read the material in the handout 2-3 days prior to the session.

This session should be scheduled before the poultry and swine feed sessions.
INTRODUCTION TO ANIMAL NUTRITION

The basic concepts defined and discussed in this section of the livestock guidelines are also applicable to human nutrition. In the spirit of training integration it is a hope that these guidelines help the trainees develop a deeper understanding of their own nutritional needs by learning about those of animals. Furthermore, many of these concepts can be applied to those people they will be working with in-country. Many of the ideas and concepts covered in this section relate to the topics of health and nutrition in core classes and nutrition in the crops/vegetable training.

Nutrition is the process of changing food to living tissues and maintaining it. Nutrients are substances that:

1. Build and repair body tissue.
2. Provide energy.
3. Regulate body processes.

The amount of these needed in the body depends on:

1. The species of the animal i.e. simple stomach vs ruminants.
2. Purpose of the animal:
   a. Egg, meat, milk, or wool production
   b. Lactation/reproduction
   c. Growth
   d. Maintenance

Many microorganisms have simple nutrient requirements. They are:

a. Inorganic elements
b. Water
c. Source of nitrogen
d. Source of energy

All these can provide growth and production. Higher animals, including man, require more complex nutrient needs. Simple stomach or monogastric animals (man, chickens, and pigs) unlike ruminant animals (cows, sheep, and goats) require more complete proteins and vitamins in their diet because they cannot produce protein that includes all of the essential amino acids with just a supply of nitrogen.
Nutrients can be divided into six categories. These are water, carbohydrates, fats, proteins, vitamins, and minerals.

I. WATER

Water is the cheapest and most abundant nutrient. Consider the following:

1. 65 to 70% of the body weight at birth is water.
2. 40 to 50% of body weight of an animal at marketing is water.
3. 90 to 95% of the blood is water.

Sources of water to the animal include:

1. Drinking;
2. Food;
3. Metabolism (break down of nutrients).

If water is not available or withheld from an animal, the animal compensates in order to produce enough water to maintain its body's normal functioning. First, urine excretion and water in the feces are reduced. Second, the animal metabolizes the tissues present to provide metabolic water, causing weight loss. Third, the animal attempts to keep cool, seeking shade so as to reduce water loss from evaporation and sweating. Fourth, there is a reduction in feed consumption unless the feed is high in moisture. In low production or survival environments, the animals have probably developed these compensatory mechanisms as a means of survival. Since their owners do not usually provide water, the animals probably have developed a resistance to drought stresses and through time have become hardier animals.

Factors which affect the water requirement:

1. The type of diet, i.e., green forage vs dry forage.
2. The purpose of the animal, i.e., lactation vs meat.
3. The type of digestive tract, i.e., ruminant vs nonruminant.
4. The type of urinary system, i.e., mammals vs birds.

Function of water in the animal:

1. Transport of nutrients.
2. Chemical reactions.
3. Temperature regulation.
4. Maintains shape of the body cells.
5. Lubricates and cushions the body.

Approximate water consumption (mature animal):

1. Swine 1 1/2 to 3 gallons/head/day.
2. Sheep 1 to 3 gallons/head/day.
3. Poultry 2 parts water for each part of dry feed.
II. CARBOHYDRATES (CHO) ENERGY NUTRIENT

1. These are made up of carbon, hydrogen, and oxygen with chemical similarity of \( \text{H}_2\text{O} \).

2. These include sugars, starches, and cellulose.

3. Very little occurs as such in the animal's body.

4. CHO makes up 3/4 of plant dry weight.

5. It forms the largest part of an animal's food supply.

6. These are formed by photosynthesis in plants.

Classification (by number of sugar molecules)

1. Monosaccharides (simple sugars)
   a. Glucose
   b. Fructose
   c. Galactose

2. Disaccharides
   a. Sucrose
   b. Malatose
   c. Lactose

3. Polysaccharides
   a. Starch. Stored in small amounts in the body in the form of glycogen in the liver.
   b. Cellulose. All walls of plant cells are composed of cellulose.

Digestibility:

Crude fiber (cellulose, hemicellulose, & lignin) poorly digested CHO. Nitrogen Free Extract (soluble sugars and starches) readily digested. Function:

1. Energy;
2. Heat;
3. Building stones for other nutrients;
4. Stored in animal's body by converting into fats.

III. FATS - LIPIDS (EITHER EXTRACT)

1. Made up of CHO.

2. Produces approximately 2.25 times more energy than CHO or proteins, and more per unit of weight.

3. Composition: Fat = Glycerol and 3 fatty acids.

4. Fatty acids are either saturated or unsaturated.
5. Fatty acids considered essential for animals:
   a. Oleic
   b. Linoleic
   c. Linolenic
   d. Arachidonic

6. Fats are located in the animal body just below the skin surrounding the internal organs, in the milk, and marbling. In plants, fats are found in the seed germ or embryo.

7. Function:
   a. Energy
   b. Heat and insulation
   c. Protection
   d. Aid in absorption of fat soluble vitamins
   e. Marbling

Measuring the energy value:

Although all nutrients are equally important, feedstuffs are usually evaluated on the energy value because:

1. Energy is required in larger amounts than other nutrients.
2. It is the most limiting factor in livestock production and the major cost.
3. When all the other nutrients are present in adequate amounts, the amount of feed consumed is determined primarily by the energy level of the ration.

Energy is usually measured in kilocalories (Kcal). A Kcal is the amount of energy as heat required to raise the temperature of 1 kilogram of water one degree Centigrade. Another system of measuring energy is the Total Digestible Nutrient system (TDN).

This system is usually used in determining the energy requirements of ruminants and rabbits. TDN is the sum of the digestible protein, fiber, nitrogen free extract (CHO) and fat times 2.25. It is expressed either as a percentage of a ration or in pounds or kilograms.
The following scheme explains the utilization of energy by the animal:

- **Gross Energy**
- **Digestible Energy** (Similar to TDN)
- **Fecal Energy**
- **Urinary Energy**/
  **Combustible Gas**
- **Metabolizable Energy**
- **Heat Increment**
- **Net Energy**
- **Maintenance**
- **Production**

**Gross Energy** is the total potential energy of the feedstuff.

**Fecal Energy** is energy lost in the form of undigested food residue and energy-yielding metabolic products.

**Digestible Energy** is GE - FE, Energy received by digestion - similar to TDN.

**Gaseous Products of Digestion** - energy lost by combustible gases which escape the body.

**Urinary Energy** is energy lost in the urine during intermediary metabolism.

**Digestible energy** is the usable portion of the ingested energy DE - UE = ME. The ME value of feeds is usually used when determining the energy requirements for pigs and chickens. Usually it is a more accurate measure of energy available for the animal.

**Heat Increment** or HI is the increase in heat after the animal consumes feed.

**Net Energy** NE = ME - HI. The amount of energy used for maintenance and/or production.
IV. PROTEIN

1. Composed of carbon, hydrogen, oxygen, nitrogen, and sometimes phosphorus and sulfur.

2. Protein contains approximately 16% nitrogen so: \[ \% N \]

\[ \text{Crude Protein} = \% N \times 6.25 \]

3. Protein consists of many molecules of amino acids (AA) joined by peptide linkages, i.e., \[ AA \text{ } AA \text{ } AA \text{ } AA \]

\[ 1 \text{ } 2 \text{ } 3 \text{ } x \]

Type of Protein:

1. True protein: that which is composed of amino acids.

2. Nonprotein Nitrogen (NPN): compounds which are not true protein in nature but contain N and can be converted to protein by bacterial action.

3. Crude protein: that protein which is composed of true protein and any other nitrogenous product.

\[ \% N \times 6.25 = \text{Crude Protein} \]

4. Digestible protein: that portion of the crude protein which the animal can digest.

5. Essential amino acids: those amino acids which are essential to the animal and are needed in the diet because the animal's body cannot synthesize them fast enough to meet its requirement. Some of the most limiting amino acids (most difficult to supply in the diet) are: Lysine, Methionine, and Tryptophane.

Non-essential amino acids: Those amino acids which are not needed in the diet but are still essential for the animal.

Measure of Protein:

Protein quality refers to the amount and ratio of the essential amino acids.
Measure Used:

1. Biological value (BV): A measure of the relationship of protein retention to protein absorption; or the % of true absorbed protein that is utilized for maintenance and/or production. A protein with a BV of 70 or more (70% of the intake of N is retained) is considered capable of supporting growth if the caloric value of the diet is adequate. If less than 70%, the protein is less capable of supporting life.

Examples of Measurement

<table>
<thead>
<tr>
<th>Protein Type</th>
<th>Biological Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Whole egg protein</td>
<td>100%</td>
</tr>
<tr>
<td>b. Meat protein</td>
<td>72-79%</td>
</tr>
<tr>
<td>c. Cereal protein</td>
<td>50-65%</td>
</tr>
</tbody>
</table>

2. Net protein utilization (NPU) is a measure of protein quality expressing both the digestibility of the protein and the BV of the amino acid mixture absorbed from the intestine.  

\[
NPU = BV \times \text{digestibility.}
\]

Barrel Concept Explaining Limiting Amino Acids: See Figure # 4.

In order to understand the concept of limiting amino acids, the barrel concept is most helpful. Consider the barrel as the structure which holds amino acids together, like peptide bands, and each stave of the barrel is an amino acid (essential or non-essential). Consider the barrel's purpose, holding water, as a special protein which, let us say, makes muscle. The amino acid and the amount of water the barrel will hold (to continue the analogy, muscle that will be made) is limited to the amount of lysine available. In the drawing, methionine is the next most limiting AA. The lengths of the other staves (amino acids) above the length of the lysine stave will not be used for holding water or making muscle. The nitrogen portion of these amino acids will be passed in the urine and the C, H, and O will be utilized as energy. This is a very inefficient method of supplying energy needs because:

1. Protein, per unit of weight, is usually more expensive than carbohydrates.

2. The breaking down of protein to provide energy is stressful to the animal's system.

If a protein is not supplying all the essential amino acids in the right proportions at the critical time for growth and development, then the protein is not considered complete. Eggs and meats are usually considered complete proteins. No single plant protein is complete, but soybeans and peanuts come close.
LYSINE is the most limiting.

METHIONINE is the second most limiting.

Lysine determines how much water the barrel will hold, or muscle that will be manufactured.
Complementary Proteins:

When a complete protein is not available, different feed ingredients can be combined which can provide a more complete protein. Examples of supplementary action between different proteins would be beef blood meal, which is low in isoleucine and high in lysine and tryptophan, and corn gluten meal, which is high in isoleucine and low in lysine and tryptophan. When combined one part BBM to 4 parts of CGM, the mixture provides all three amino acids in considerable amounts to promote growth.

The second example would involve soybean and sesame meal. Soybeans are high in lysine but low in methionine. Sesame is low in lysine but high in methionine. These two, when combined, provide a more complete protein.

Examples of complementary foods can be seen in food mixtures throughout the world: rice and beans, rice and lentils, and tahini (chickpeas and sesame paste).

Purpose/Function of Protein:

1. Essential for growing cells.
   a. Maintenance
   b. Production, i.e., eggs, meat, milk, and wool
   c. Reproduction

2. Included in the structure of:
   a. Enzymes
   b. Hormones
   c. Catalyst
   d. Antibodies

3. May be used for energy.

V. MINERALS

1. Inorganic elements.

2. The total mineral content of plants or animals is called ash.

Classification:

1. Major minerals: calcium, phosphorus, sodium, and chlorine.

2. Trace minerals: iodine, potassium, magnesium, manganese, sulfur, iron, zinc, copper, cobalt, and molybdenum.
Flourine and selenium are considered beneficial in small amounts but toxic if in excess.

General Function:
1. Skeletal formation and maintenance.
2. Constituent of nucleoproteins which are vital to all cellular activity.
3. Oxygen transport.
4. Chemical reaction in the body.
5. Fluid balance (osmotic pressure and excretions).
7. Help in enzyme system.

VI. VITAMINS
1. Organic in nature;
2. Dietary requirements of one or more species;
3. Necessary in small amounts;
4. Effective for metabolic activity but are not found in the structure portion of the body.

Types:
1. Fat soluble (ADEK);
2. Water soluble (Thiamine, riboflavin, niacin, pantothenic acid, pyridoxine, biotin, choline, folic acid, & B12);
3. Isositol, paraamino-benzoic acid (PABA), and vitamin C.
SESSION TITLE: Units of Measure/Introduction to Metric II

SESSION #30  WEEK #2  DAY #8 (30-2-8)

PRESENTER:

CO-FACILITATOR:

TIME: 11:00-12:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Each host country uses a common system of measuring but more often than not also has a system of its own. Therefore, it is important that the trainees know the common system, which most likely will be metric. The trainees will have little knowledge of the metric system coming from the United States nor will they be familiar with the host-country system. This session, units of measure, will give the trainees knowledge of the following:

- Introduction to the metric system.
- Introduction to the host-country system and how the two systems work together.
- How to use these systems when laying out their plots and when planting. (All measurements will use the metric system.)

HAND-OUT: See: #3-d Host Country System
            #3-e Area Measurements
            #3-f Thai Units of Measure

READING ASSIGNMENT: Agriculture Math #4, Pgs 13-16.
SESSION PREPARATION AND MATERIALS

- Trainer references: Agriculture Math #4, Pgs 13-16.
- Samples of metric measuring devices.
- Samples of host-country measuring devices.
- Flip chart and felt pen.
- Sample problems of conversions for classroom work or take-home exercise.

TRAINER NOTES AND RECOMMENDATIONS

The trainees in general do not realize the importance of this session and therefore, can become inattentive. This session should be well planned and interesting due to its importance in the training program.

Trainers could break the group into smaller groups and have each group compete against the other doing the problems on the flip chart—to see which group, after the session is over, answered the most questions correctly.
SESSION TITLE: Poultry Feed and Nutrition

SESSION #31 WEEK #2 DAY #9 (31-2-9)

PRESENTER;

CO-FACTORiator:

TIME: 6:00-8:00 C

INTRODUCTION: SESSION OBJECTIVES

Feeds and nutrition are extremely important to profitable animal production and during this session the trainees:

- Will learn how to formulate their own feed rations for chickens.
- Will discuss the pros and cons of different feeding options available under host-country conditions.
- Will learn to mix feed ingredients in correct proportions following a standard recipe.

HAND-OUT: #31-a Feed Efficiency.

READING ASSIGNMENT: Practical Poultry Raising, Pgs 131-152.

TECHNICAL VOCABULARY:

- Corn
- Mineral
- Rice bran
- Oyster shells
- Broken rice
- Grit
- Concentrate
- Vitamins
- Supplemental feed

1 TDM pounds computed by multiplying pounds food (column of left) times percent TDM in normal rations. Normal rations present TDM taken from M.B. Emminger's books and reviews, except for following, dairy cows, layer, turkey, and turkey from Agricultural Statistics, p. 358, Table 518. Fish based on averages recommended by Michigan and Minnesota Stations and U.S. Fish and Wildlife.

2 Digestible Energy (DE) in this column given in kcal, which is 1 Calorie (written with a capital C). 1,000 calories (written with a small c). Kilocalories computed from TDM values in columns to estimate lb as follows 1 lb TDM = 3,000 kcal.

4 Food efficiency in used hands is based on pounds of food required to produce 1 lb of product. Given in both percent and ratio.

5 Kilocalories in ready-to-eat food = kilocalories in feed consumed, converted to percentage. Loss = kcal in feed - kcal in product.

7 Agricultural Statistics, 1976, p. 358, Table 518. Pounds food per unit of production is expressed in equivalent feeding value of corn.

8 Since pounds food (column No. 2) per unit of production (column No. 1) is expressed in equivalent feeding value of corn, the values for corn were used in arriving at these computations. No 2 corn values are TDM, 81%; protein, 9%. Hence, for the dairy cow 81% x 1.11 = 89 lb TDM; and 9.9% x 0.47 = 1 lb protein.

9 Data from report by Dr. Philip J. Schnelle, Michigan State University, Frederick, April 15, 1967. Industrial Fishery Technology, ed. by Irvin E. Stanley, Reinhold Pub Corp., 1963, Ch. 36, Table 36-1.

10 Std. Dev. Reports that, "Dressed fish averages about 73% both, 21% bones, and 6% skin." In limited experiments conducted by A. Emminger, it was found that there was a 3% cooking loss on list of sole. Hence, these values: 73% Both from dressed fish, minus 22% cooking losses give 57% yield of edible fish after cooking, as a percent of the raw dressed product.

11 Calories and protein computed based on egg; hence, the values here are 100% and 1 lb, respectively.

14 Ibid, Page 38, Table 10.

16 Allowing made for both cutting and cooking losses following dressing. Thus, values are on a cooked, ready-to-eat basis of less and marbled meat, exclusive of bone, gizzard, and off viscera provided by National Live Stock and Meat Board (personal communication of June 5, 1967, from Dr. Wm. C. Shearman, Director, Nutrition Research, in the senior author, and based on data from The Nutritive Value of Cooked Meat, by Ruth M. Leverson and George V. Oeffel, Mac Pub, 1969, Appendix C, March 1928).

17 Estimated by the authors.

19 Feed and Nutritional-Feeds, by H. E. Emminger and C. C. Kephart, Jr., published by The Emminger Publishing Company, F.D. No. 415, Clare, California, R.F.D. 1963, with the permission of the publisher.
SESSION PREPARATION AND MATERIALS

- Trainer references: Practical Poultry Raising.
- Prepare materials to demonstrate "Pearson's Square."
- Prepare chart with vocabulary.
- Assemble ingredients and tools to bulk-mix feed ration.

</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

Feed prepared in this session will be used for the remainder of the training program. The trainees, as a group, reacted well to the activity involving the mixing of feed rations from recipes.

Stimulation of interest and discussion in feed efficiency charts and the issue of livestock competing with humans for grain is necessary. The trainer might divide the group into two smaller groups and have each group develop a list of issues. Then the groups could debate against each other on one or two of the issues. At least one trainer with experience in this area should join each group.
SESSION TITLE: Plant Water Requirements

SESSON #32 WEEK #2 DAY #9 (32-2-9)

PRESENTER:

CO-FACILITATOR:

TIME: 9:00-10:00 F

INTRODUCTION: SESSION OBJECTIVES

Water for irrigating all types of crops in the host-country, comes from many sources. The most commonly depended on is natural rainfall which falls in undependable amounts at unpredictable times. Therefore, vegetables and field crops alike could need supplemental irrigation at times to ensure normal production. This session will give the trainees experience:

- In determining crop needs, shallow and deep root types.
- In developing water sources.
- In watering techniques, for different types of plants.
- In mulching to prevent erosion and improve water retention of most soils.

HAND-OUT: #32-a Watering Vegetables

READING ASSIGNMENT: Intensive Vegetable Gardening, Pgs 95-103.

TECHNICAL VOCABULARY:

TRAINER NOTES AND RECOMMENDATIONS

This session is difficult to present if rainfall is adequate and plot watering unnecessary. On the other hand, if plot demonstrations are prepared (such as mulching demonstrations and stressed plants) the trainees will easily see and understand. The afternoon of a hot day would be the optimum time to present this session when plant stress is at its maximum.
WATERING VEGETABLES
WHEN?  HOW OFTEN?  HOW MUCH?

There are no quick and easy methods for determining how much water plants need and how often it should be applied. The so-called "shiny" or "shiny layer" method popularized in some garden books just isn't reliable enough. (With this method, the soil supposedly has received enough water when a shiny layer of water remains on the soil surface for a certain number of seconds when watering is stopped). However, if you're willing to learn some fairly straightforward concepts and figures, you'll be able to greatly improve on "eyeball" methods. Here goes:

1. The frequency and amount of watering plants need depend on:
   - soil texture, root depth, crop stage, crop type, temperature, humidity, and wind. As temperature and/or wind increase and humidity decreases, water needs go up. We'll cover the other factors farther on.

2. Sandy soils need more frequent (about twice as often) but lighter waterings than clayey soils since they can store only about half as much water per unit of depth.

3. The shallower the root system of the soil, the more often watering is needed. Tiny seedlings with roots only a few centimeters deep may need water 1-2 times a day on a very sandy soil and once every 1-2 days on a clay or clay loam soil (depending on temperature, humidity, and wind). As roots grow deeper, watering intervals can by spread out. However, well-established lettuce, onions, cabbage, and other naturally shallow rooted crops will need more frequent (but lighter) waterings than tomatoes, eggplant, field corn, and other deeper rooted crops.

4. Crops themselves vary in the weekly and total amounts of water needed to grow them, but there's much more variation among field crops than among vegetables. Millet is the most drought resistant, followed by sorghum, and then peanuts and cowpeas.

5. Plant demand for water increases with growth and reaches a peak around flowering or fruiting time which continues until harvest is over for vegetables. Field crops which are harvested in a much more mature state (hard, dry seeds) taper off from this peak as maturity sets in.

Some useful figures: In warm weather, most very young plants will use about 19-25 mm (1.9-2.5 cm or 0.75-1.0") of water per week. This is equivalent to filling up a flat tub that is as big as the planted area to a depth of 19-25 mm. This includes soil evaporation and plant usage.
1" of water = 7 gallons (25 liters) per sq meter.

Peak usage rates for established crops run around 45-75 mm (4.5-7.0 cm or 1.75-2.75") a week, depending on temperature, wind, relative humidity, and crop type (not a real important factor with vegetables). This equals 12-19 gallons (45-70 liters) per sq meter (11 sq ft) per week.

6. Surprised at the high amount of water established plants need? That's the reason why most people overwater young plants (in terms of frequency and amount) and underwater older plants by putting on too little too often. Shallow watering produces a shallow root system, since roots won't penetrate into dry soil. It's a self-perpetuating cycle since the plants begin showing moisture stress signs far too soon after each watering, which sets them up for more of the same treatment.

On the other hand, putting too much water on can cause drainage problems and leaching losses of nutrients like nitrogen and also accentuate soil-borne fungal and bacterial diseases. Watering too often (regardless of quantity) promotes "damping off" in seedlings and fungal and bacterial leafspots in older plants plus soil-borne fungal, bacterial wilts. NOTE: 1 mm = 1 liter per sq m

Pre-irrigation: Farmers in low rainfall, irrigated areas should usually pre-irrigate the soil to full eventual rooting depth before planting to avoid getting behind later on in the season when demand really increases. It's a good idea, since the water will not be lost except for a small amount that evaporates from near the soil surface. The only water that drains downward is excess water that the soil's small pore spaces can't hold. Check the PC/ICE Soils, Crops and Fertilizer Manual (pp. 15-16) for a full explanation.

HOw CAN I TELL WHEN PLANTS NEED WATERING?

Wilting, leaf curling (or rolling), and, in some cases, color changes (maize turns bluish green, bean leaves turn dark green) are the initial signs of moisture stress (lack of water). Yellowing and eventual browning ("firing") of the leaves, starting at the tips, are very advanced symptoms that occur after days of continuous moisture stress. However, most of these symptoms can also be caused by anything else that interferes with water uptake or water transport such as nematodes, soil insects, fungal and bacterial wilts, stem borers, and even very high temperatures. N deficiency can cause yellowing too.

Although young plants can usually tolerate the initial symptom (wilting, curling, color change) without any significant yield
drop, older plants (especially those that are flowering and fruiting) should not be allowed to reach this stage or yields may be seriously affected. For example, if corn wilts for 2-4 days during pollination, yields are usually cut by 50%.

Now for some more guidelines:

Very young plants: When roots are very shallow, you can use a simple "scratch" test. Take your finger and scratch down a few centimeters. If the soil is dry more than 2-3 cm down, it may be time to water if seedlings are small and still shallow rooted. Look at the seedlings too for signs. Remember, young seedlings need frequent but light waterings; frequency will depend on weather and soil texture as well as root depth.

Older Plants:

Check over the water quantity guidelines on the previous page. As plants get older, you want to make less frequent but larger applications. The amount per application will range from about 25-65 mm (1-2.5" or about 25-65 liters per sq meter) and will depend on weather, soil texture, and root depth. The frequency will be inversely proportional to the amount applied and will vary from about one up to as much as 3 times a week. For example, in warm weather, cabbage might need two 30 mm waterings per week since it's shallow rooted, while deeper rooted tomatoes might require a 60 mm watering (60 liters/sq meter) once every 4-6 days. Remember that hardpans and excessive subsoil compaction can restrict root growth.

Other Guidelines for Older Plants:

Another guide is to apply water before one half of the root zone's available water has been used up. Sounds complicated, but hold on. Plants take up about 40% of their water needs from the top quarter of the root zone; once this top quarter gets down to 0% available water, it will soon be time to apply more. You can get a very good estimate of the percentage of available water remaining by using the "squeeze test" on p. 153 of the Soils, Crops, and Fertilizer Use Manual (don't confuse this with the "feel" test of textures.)

Measuring the Depth that Water has Penetrated:

Use a 10-15 mm (about 0.5") diameter iron rod about 1-1.5 mm long that is slightly tapered at one end. Wait about 1/2-1 day after watering and then push it into the ground. It should penetrate fairly easily until it strikes dried out soil (hardpans may affect the accuracy of this method).
What about Rainfall:

Buy a rain gauge or make one out of a tin can for checking rainfall, since its frequency and amount will affect the need for supplemental watering. Amounts much below 6 mm (1/4") aren't much use to plants, since much of this is lost by evaporation from the upper soil surface. Don't try to "eyeball" rainfall - it's very deceiving. Remember also that heavy downpours result in a lot of useless water runoff.

What about the best time of day to water?

This is important for minimizing "damping off" problems with seedlings and fungal and bacterial leaf spots with older plants. Water in the morning whenever possible to give the foliage and the soil surface opportunity to dry out as the day wears on. Watering late in the afternoon is not a good practice. You can water in the heat of the day without fear of "burning".

Application Tips:

Water gently to avoid splashing and erosion, especially when plants are young and the soil exposed. When possible, avoid watering the leaves themselves to help cut down on foliar diseases.
SESSION TITLE: Maintenance and Weeding

SESSION #33  WEEK #2  DAY #39  (33-2-9)

PRESENTER:

CO-FACILITATOR:

TIME: 10:00-12:00 F

INTRODUCTION: SESSION OBJECTIVES

Maintenance and weeding are both important in assuring high yields. The theory is that a clean, weed free plot looks and produces better. The schedule is set to have one maintenance session of 2 hours every week. 30 minutes of each session should be used to review or emphasize a completed session in which there was insufficient time to cover all of the important points. The trainees will:

- Benefit by better understanding the need for weeding.
- Understand the importance of thinning and plant spacing.
- Benefit by weed identification.
- Know when and why to clean plots and maintain bed shape.
- Benefit by basic introduction to fertilizer and water use.

HAND-OUT: #33-a Plot Maintenance

READING ASSIGNMENT: Intensive Vegetable Gardening, Pgs. 127-129.

TECHNICAL VOCABULARY:

- Weeds
- Thinning
- Herbicide
- Root
- Maintenance
- Water can
- Fertilizer
SESSION PREPARATION AND MATERIALS

- Hoe and rake.
- Fork spoon or stick for weeding.
- Manure.
- Fertilizer.
- Water can.

<td>Have trainees clean up and put hand tools in storage. Hold question and answer session.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

These 2 hour sessions, once per week, should be sufficient to maintain the plots as well as provide a 30 minute review of some crop related subject. The maintenance time should be monitored so the trainees do not waste time. This session also gives the trainees time off from the rigorous training schedule to relax; therefore, the mood of this session should be relaxed. Maintenance of the communal plots should be scheduled as needed with all of the trainees participating.

Trainees are also responsible for livestock up-keep, which can be done during maintenance sessions. As much as possible, trainees should use maintenance time on tasks they consider most important. Staff should refrain from telling them what to do.
When you work on a small-scale farm, most of the plot maintenance is likely to be hands-on, because it is not necessary to use chemical control on a small-scale, such as home gardens. You should cover all these subject while working in your plot.

1. Thinning is done to avoid competition between the plants themselves. Usually, if you have good seeds, planting one in each hole should be enough. If you plant more than 1 seed, after 7-10 day select the strongest one and pull the others out. Try to avoid root damage.

   Corn: 1 plant every 40 cm spacing
   Mung bean, soybean: 1 plant every 10 cm spacing
   Cucurbit: 4 plants every hill

2. Weed Control:

Weed is generally defined as any plant that is out of place. The chances of getting low quality and/or low quantity yields or crop damage can be affected by weeds. To control the weeds, and prevent competition with crop plants they should be removed or killed while they are still small, to avoid injury to the crop's root system. Controlling weeds by hand pulling and hoeing are commonly used in small gardens. After weeding you should water the crop so that the root damage and loss of water will not be so severe.

Using chemical weed controls are mainly for big areas of vegetables or for field crops. This method can avoid physical damage to the crop root system, but the cost is substantial and each herbicide must be used as prescribed by the manufacturer. Different species of weeds require the use of appropriate herbicides, and sometimes mixtures of two or three are needed to cope with all species. A few herbicides leave a residual toxicity in the soil that affects other succeeding crops. Chemical control measures for weed control usually produce the greatest benefits when applied while weeds are still small or before germination.
3. Watering:

In the raining season, this is not much of a problem; some field crops such as corn and beans can grow on only rain water. The way to check and see whether they need to be watered or not is to take some topsoil about 3 cm. deep. If you can press the soil in your hand and the soil sticks together, the moisture is enough. Vegetables need more moisture than field crops and a deeper level of moisture can help the vegetables to develop a better root system.

4. Fertilizer Needs:

If the deep water penetration in the soil is very poor, manure can help with soil structure, but not much for fertility. If plants look too weak we can help by putting some 15-15-15 chemical fertilizer on by:

Side dressing: Opening the soil at the side of the plants, sprinkling in fertilizer, covering and watering.

* Be careful if plants are too small. An over dosage can make them wilt.
SESSION TITLE: L.S.S. Project and Crossover Roles

SESSION #34  WEEK #2  DAY #9  (34-2-9)

PRESENTER:

CO-FACILITATOR:

TIME:  13:30-15:00 C

The Session Design for this PS Session is in Appendix A.
SESSION TITLE: Traditional Rice Production Techniques

SESSION #35  WEEK #2  DAY #10  (35-2-10)

PRESENTER:

CHAIR-FACILITATOR:

TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Rice, being the staple food for virtually millions of people in the host-country as well as a major export commodity makes it extremely important to the economy. If the trainees encounter rice production at their sites it will very likely be on a small scale and not involve commercial production. Therefore it is recommended that trainees learn the basics of rice production for credibility with their students and co-workers at their sites. This session will give them a brief overview of rice production that will enable them:

- To understand the most common methods of land preparation.
- To know how and why rice seedlings are grown.
- To understand the basic botany and growth cycle of the rice plant.
- To understand how chemicals are used to increase yields i.e. fertilizers, insecticides and fungicides.
- To know the basic water requirement of rice and how it can affect yields.
- To learn the techniques of transplanting and harvesting used in different areas of the host-country.

HAND-OUTS:  
#35-a Rice Production Costs  
#35-b Rice Growth  
#35-c Rice Plant Parts

TECHNICAL VOCABULARY:  
Rice seed  Flow  Seedling
Harrow  Fertilizer  Tractor
Insecticide  Harvest  Transplant
Stem  Broadcast  Tiller
Panicle
SESSION PREPARATION AND MATERIALS

- Trainer references: **Guide for Field Crops in the Tropics and Sub-Tropics**, Pg 42.
- Arrange with Center teacher for session assistance, using the rice paddy fields of the Center for demonstrations and practice.
- Prepare a short showing of slides that will cover the growth period of the rice plant from seeding through harvest.
- Prepare rice seedlings for actual transplanting by trainees.
- Advise the trainees to wear work clothing as rice transplanting will be done in the water.
- Soak and germinate some rice seed one week prior to session for observation.

</tbody>
</table>

T-86
This session is designed to be presented at the beginning of home-stay, in order that they might help their families with transplanting. This should give them insights into the difficulty of agriculture and admiration for the skills of the farmers.

This session should emphasize hands-on field work. The slide presentation with information on the growth cycle and cultural practices should be general and brief. Trainees with a deeper interest in rice could be assisted on a one-to-one basis. It is important not to emphasize the fact that trainees might never have to plant rice, but to emphasize the importance of rice production in the host-country and the ability to share in an important village activity might come in handy. This session must be well planned and presented in order to maintain the interest of the trainees.

สำนักงานฯ ของพิษณุโลกจัดทำขึ้นโดยศิลปินและศิลปินในวันที่
INTRODUCTION: SESSION OBJECTIVES

Tropical crop management, unlike that for temperate climates, requires much closer attention and awareness of detail—for many reasons. This session will cover the "what" and the "how" of tropical crop management and give trainees a much improved understanding in the following areas:

- Tropical crop management techniques.
- Integrated farming systems of the host-country.
- The benefits of intercropping and which crops are the most suitable for it.
- Cropping systems suitable for host-country conditions and the basic crops used. (Domestic and export.)
- How to implement an improved crop management system.
- The importance of record keeping, the key to profits.

HAND-OUT: #36-a Cost Effective Cropping Techniques

SESSION PREPARATION AND MATERIALS

- Hand-outs on the host-country economy, imports and exports.
- Cropping system schedules.
- Diagrams of selected integrated farming systems successful in the host-country.
- Samples of record keeping forms.
- Intercropping examples.

</tr>
</tbody>
</table>

**TRAINER NOTES AND RECOMMENDATIONS**

This session is important in the sense that it can assist farmers to help themselves using what they already have to work with. It must be well prepared with interesting and factual information that will maintain the trainees' interest. The following subjects could be included but should be researched well in advance.

- Costs and return ratios.
- Planting dates/harvest dates calendar.
- Fertilizer and chemical application dates and rates - records.
- A log that shows the results of rainfall monitoring.
- Crop planning schedule
- Timely harvest to avoid losses.
- Quick sale or safe storage.
- Marketing.
- A list of the major constraints to most farmers, water, credit and soil conditions.

SESSION TITLE: Quiz I

SESSION #37 WEEK #2 DAY #10 (37-2-10)

PRESENTER:

CO-FACILITATOR:

TIME: 15:30-16:30 C

-----------------------------

INTRODUCTION: SESSION OBJECTIVES

Trainees have had almost two weeks of agricultural training and should have by this time begun to understand the basic concepts which have been presented in this training program. At this point, it is important to assess how well trainees are assimilating the knowledge presented to them—in order to fine-tune future sessions. A written quiz is needed to assess conceptual learning and plot evaluations can be performed to assess hands-on skills. The Objectives are:

- To gauge trainee understanding of those agricultural concepts presented to date.
- To measure trainee assimilation of information.
- To test and practice adaptation to the metric system.

HAND-OUT: none

READING ASSIGNMENT: Review hand-outs and reading assignments.

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Test/quiz</th>
<th>Question</th>
</tr>
</thead>
<tbody>
<tr>
<td>To grade</td>
<td>Answer</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

As each session is presented in Weeks 1 and 2, the session presenter should write a few quiz questions that follow from each session. These questions should be short answer, true/false and numerical, and should directly correspond to performance objectives.

The Agricultural Coordinator collects the questions and categorizes them according to Skill Groups (1-22).

A few days before the quiz, the coordinators and lead trainers meet to select and edit the questions. After the final decision is made, the questions are then typed. On the quiz form, each question should be identified with the number of the performance objective to which it corresponds. (See Appendix E for examples of Quizzes.)

TIME

SESSION 37-2-10 ACTIVITIES

1 Min Distribute quizzes and remind trainees how the scores fit into the qualification process.

55 Min Trainees take quiz.

2 Min Collect quizzes and post answers which staff considers correct.

2 Min Announce or establish a time when plot evaluations will take place. Share criteria for plot evaluation with trainees. Reiterate when performance reviews will take place and ask trainees to come to the performance review to discuss any quiz question which they considered confusing, or too difficult.

TRAINER NOTES AND RECOMMENDATIONS

The quizzes should be graded as quickly as possible. Staff members should grade the tests together, so that each is aware of trainee performance and can respond to trainee inquiries consistently. The tests should be returned to trainees quickly—before the progress review. The quiz and plot evaluations should be timed so that a progress review comes soon after.

How tests are graded might be established in a group session. Some groups might prefer letter grades, others numbers. Including trainees on the decision about this sensitive issue before the fact helps establish their investment in the process and in the results of the process.

T-89

236
SESSION TITLE: Field Trip: Fish

SESSION #38 WEEK #2 DAY #11 (38-2-11)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-12:00 F

INTRODUCTION: SESSION OBJECTIVES

Field trips have at least two purposes. This one is no exception. Field trips are important in that they give the trainees a much needed break from the heavy schedule of the training program and at the same time they learn another agriculture related skill. This field trip to a fish raising facility will:

- Give the trainees exposure to commercial fresh water fish farming.
- Show how it can fit into an agricultural program when they reach their site.
- Learn the different species grown in the host-country and how to take care of each.

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Fish varieties</th>
<th>Pond</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>Plastic bags</td>
</tr>
<tr>
<td>Fingerling</td>
<td></td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Arrange a visit to a fish farm and the purchase of fingerlings.
- Arrange for release with cooperating farmer or group.
- Arrange transportation.

TIME

SESSION 38-2-11 ACTIVITIES

30 Min  Travel to provincial fish station and fish farm.

90 Min  Tour fish farm observing each step of fish life cycle. Discuss characteristics of good fish pond and link to management components of other livestock activities. Purchase fingerlings.

45 Min  Travel to fish release site.

45 Min  Inspect release site, discuss suitability and demonstrate proper release techniques.

45 Min  Return to training center.

TRAINER NOTES AND RECOMMENDATIONS

This can be an interesting field trip for the trainees but must be well planned in advance. It should be scheduled early in training to allow maximum growth of the fingerlings prior to the optional harvesting session at the end of Agricultural Technical Training.
SESSION TITLE: Training Evaluation I

SESSION #39  WEEK #2  DAY #11 (39-2-11)

PRESENTER:

CO-FACILITATOR:

TIME: 15:00-16:30 C

INTRODUCTION:  SESSION OBJECTIVES

Trainees and trainers discuss how each person feels physically, emotionally and mentally. Then, trainees and trainers separately list technical performance objectives that have been fulfilled. When the two lists are compared, trainees will better understand what is expected of them and trainers will gain insights about trainee expectations of themselves and training. Feedback from trainees is needed for staff to assess the progress of training. It is important to sound out everyone’s thoughts and feelings in a large group to establish feedback as a behaviour. Also, it will allow trainees to be more confident and willing to give opinions.

Objectives are:

- To assess trainees’ emotions about the first weeks of training;
- To clarify any questions that trainees have concerning training and review progress so far;
- To seek feedback, criticism and suggestions.

HAND-OUT: none

READING ASSIGNMENT: none

TECHNICAL VOCABULARY: none
SESSION PREPARATION AND MATERIALS

- Ask trainees to bring their notebooks, including objectives and schedules;
- Pass out evaluation form the day before and ask trainees to complete it before this session;
- Write the "numbers" of the performance objectives (without words) twice—once on two flip charts.

TIME SESSION 39-2-11 ACTIVITIES

45 Min Ask everyone (including trainers) to write three words on a sheet of paper. The first word describing how they feel physically, the second one how they feel mentally and the third one how they feel emotionally.

Go around the group and ask everyone to share his/her first word. Ask a few people why they answered as they did. Explore strong reactions. Get feelings out in the open. Keep the discussion on physical states.

Go around again with the second words and discuss as before. Do it again for the third words.

20 Min Ask everyone to take out the technical objectives. Ask the trainees and trainers to separate. Give each group a sheet of chart paper and a marker.

Have each group go through the objectives to list objectives that have been touched on, but not sufficiently and those adequately fulfilled. Mark a (check) after the former, a (t) after the latter and a (o) after those not yet covered.

Both lists are posted side-by-side. Note the agreements and mark them with a * star. Circle the disagreements and ask each group to explain itself. If possible, try to achieve consensus, but move through the list quickly, as agreement is not the goal here.

5 Min Ask the trainees to revise their evaluation forms if they have new or changed thoughts and to do so in a different color than when they originally filled it out. They should note which color was original and which was second. Ask that the forms be turned in the next day.
It is considered important that group members need to know where others stand. Secret opinions are informative, but consensus is needed to make changes. The participation of trainers helps to make evaluation the responsibility of everyone. The airing of views in the group will help taciturn trainees fill out the form more confidently. Below are some Guidelines for the Evaluation Form. You should adapt it to your own needs.

GUIDELINES FOR EVALUATION FORM

- Ask what 2 or 3 sessions or activities trainees appreciated the most, and their reasons.
- Ask what 2 or 3 sessions were least appreciated and the reasons.
- Ask what they think is lacking.
- What changes would they suggest?
- How relevant is training to their future assignment?
- How relevant is training to their needs—personal and professional?
- How do they feel about training's "atmosphere"?

NOTE: Save the charts from this session and jot down the responses from the first part of the session to use in a later evaluation session.
SESSION TITLE: Fowl Pox Vaccinations

SESSION #40  WEEK #2  DAY #12 (40-2-12)

PRESENTER:
CO-FACILITATOR:
TIME: 8:00-9:30 F

---------------------------------------------

INTRODUCTION: SESSION OBJECTIVES

We have already discussed the importance of vaccination as a disease prevention management practice. In this session we will:

  o Vaccinate broiler chicks for fowl pox by the wing stab method.

  o Identify the typical local vaccination schedule and discuss how it varies for different types of chickens and in different seasons.

HAND-OUT: See Hand-out #16-a Chicken Vaccination Program

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Assemble vaccine, wing stab vaccinating implements.
- Prepare hand-out.

TRAINER NOTES AND RECOMMENDATIONS

This session should be scheduled corresponding to the time recommended in the hand-out. After receiving vaccination schedule trainees will be responsible for any later vaccinations including, if feasible, purchasing vaccine.
SESSION TITLE: Vegetable Characteristics

SESSION #41  WEEK #2  DAY #12  (41-2-12)

PRESENTER:

Ct-FACILITATOR:

TIME:  9:30-11:00 C

INTRODUCTION: SESSION OBJECTIVES

Since the major portion of the trainees' work will involve growing small vegetables, it is essential they know the families of each type; therefore, they will be able to identify and distinguish the characteristics of the important vegetable families. In this session the trainees:

- Will be able to identify each vegetable family important to the host-country.
- Will know the growing habits of important vegetables.
- Will learn about direct seed and transplant varieties.
- Will understand how each vegetable is grown and used in the host-country.
- Will identify root crops from leafy types.

HAND-OUT:  #41-a Vegetable Families

SESSION PREPARATION AND MATERIALS

- Pictures of vegetable families, with flip chart and felt pen.
- Actual plant material, if available.
- Research information on small vegetable families.

TIME

SESSION 41-2-12 ACTIVITIES

10 Min
- Explain session objectives.

50 Min
- List and describe the important vegetables of the host-country and the members of the families. Point out the significant characteristics of each family such as seed appearance, seasonal considerations, propagation techniques, common problems and uses. Not all of the above need be covered, only the characteristics that distinguish each family from others. The following families should be covered.

Monocots

- Gramiae
- Araceae
- Liliaceae
- * Amaryllidaceae
- Zingiberaceae

Dicots

- Chenopodiaceae
- * Cruciferae
- * Leguminosae
- Umbelliferae
- Convolvulaceae
- * Solanaceae
- * Cucurbitaceae
- Compo-itaes
- Labiatae

* Emphasize these families.

TRAINER NOTES AND RECOMMENDATIONS

This session is designed as a lecture and the trainees should take notes. The seasons and weather of the host-country must have been presented in an earlier session (Agricultural Environment) and is assumed here to have been understood.

* Note - Technical vocabulary is included in the attached hand-out.

T-94
HAND-OUT #41-a

VEGETABLE FAMILIES

MONOCOTYLEDONEAE (Monocots)
GRAMINEAE (Grasses)
SWEET CORN
Lemon grass
ARACEAE (Arum family)
Tarо
ARACEAE (Arum family)
Chinese chive
Garlic
Leek
Shallot
Multiply c ion
Onion
ZINGIBERACEAE (Ginger family)
Ginger
DICOTYLEDONEAE (Dicots)
CHENOPODIACEAE (Goosefoot family)
Spinach
CRUCIFERAE (Mustard family)
Cauliflower
Cabbage
Kale
Chinese mustard
Chinese cabbage
Leaf mustard
Japanese radish
LEGUMINOSAE (Legumes)
Common bean
Winged bean
Yard long bean
Sugar pea
MALVACEAE (Mallow family)
Okra
Roselle
UMBELLIFERAE (Parsley family)
Coriander
Parsley
CONVOLVULACEAE (Morning glory family)
Morning glory
Sweet potato

SOLANACEAE (Nightshade family)
Sweet pepper
Chili
Eggplant
Tomato
Potato

CUCURBITACEAE (Gourd family)
Bottle gourd
Cucumber
Muskmelon
Watermelon
Ivy gourd
Smooth loofah
Angled loofah
Wax gourd
Pumpkin
Bitter gourd
Thai melon

COMPOSITAE (Composite family)
Chrysanthemum
Lettuce

LIBIATAE
Sacred basil
Hoary basil
Peppermint
Sweet basil

FIELD CROPS
Rice
Corn
Sugar cane
Cassava
Soybean
Mung bean
Peanut
Marigold
INTRODUCTION: SESSION OBJECTIVES

This session is a follow up to record and discuss the results of Session #20, week #1, day #5. If there are trainees that had no results they should be encouraged to perform a second test on their own time.

SESSION TITLE: Plant Nutrition Basics/Determining Fertilizer Needs

SESSION #43  WEEK #3  DAY #13  (43-3-13)

PRESENTER:

CO-FACILITATOR:

TIME:  8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Soils in most host countries are extremely poor and the addition of plant nutrients is not a common practice. Therefore it is important for the trainees to know:

- What basic nutrients are required by most plants for normal production.
- How to determine what specific plants need.
- Which elements are available and in what form.
- Ways most suitable for adding these elements and when to add them.
- The appropriate source of supply.
- The relationship among soil, water and plant nutrients.
- Soil pH and its effect on normal plant growth.

HAND-OUT:  #43-a  Source of Plant Nutrients.

TECHNICAL VOCABULARY:

- Corn
- Legumes
- Fertilizer
- Lime
- Sulfur
- Compost
- Organic
- pH Values
- Deficient
- Toxic
- Macro nutrients
- Micro nutrients
- Manure
SESSION PREPARATION AND MATERIALS

- Trainer references: *Soils, Crops and Fertilizer Use: Interactive Vegetable Gardening*, Chapter #5.
- Soil laboratory with facilities for tissue and soil testing.
- Fertilizer test plots (preferably corn) for field observations.
- Portable pH meters or testing kits.
- Arrangements made with Center teacher to co-facilitate session and use center facilities.

---------------------------------------------------------------
TIME          SESSION: 43-3-15 ACTIVITIES          
---------------------------------------------------------------
10 Min  Explain session objectives.
30 Min  Lecture in lab by co-facilitator using plant parts as examples of normal and deficient tissue.
50 Min  Hold in-field demonstration on how to use the pH testing equipment, with the trainees doing individual tests in different areas of field.
20 Min  Instruct trainees to look through crop in nearby field, select leaves showing deficiencies and collect them. Then have trainees identify each with the assistance of the trainer.
10 Min  Have trainees clean up and put equipment in storage. Hold question and answer session. Have trainees thank the Center teacher.

TRAINER NOTES AND RECOMMENDATIONS

This session concentrates on hands-on field experience with the classroom lecture held first to outline what trainees will see in the field.

Specimens found in the field could be compared to specimens brought by the teacher. Charts of various specimens representing various deficiencies could be started at this session and added to throughout the rest of training.

The follow-up session for this should be in the trainees' plots. Each trainee should test the pH as well as the available nutrients in his/her plot and determine what the plot needs for normal plant growth. The results of each person's plot pH tests could be counted as one quiz.

T-95
Plants require food like people and animals. Plants take food from the soil like people eat from the bowl with the soil being the most effective store-house of plant nutrients. Some soils are depleted and would be classed as empty store house i.e. sandy soils. Generally soils suited for agriculture are low in plant nutrients, therefore, nutrients in the form of manure or commercial fertilizers must be added.

1. THREE GROUPS OF ESSENTIAL PLANT NUTRIENTS

We can break down plant residue by chemical analysis into at least 17 elements, which are essential elements for normal plant growth and yield. If one of these elements is unavailable in the soil the plants will show signs of deficiency. This will reduce the quantity and quality resulting in lower yield and profit.

In the following table you can see the importance of the top 14 plant nutrients and the amounts required for maximum yield. These could be classified into three groups such as the primary, secondary and trace elements.

3. SOURCES OF PLANT NUTRIENTS

As mentioned above, most soils used to produce agricultural crops need many of the essential elements added for normal crop production. The materials that we add to the soil are fertilizers and may be classed into two groups.

a. Organic manures and compost, which are basically decomposed organic materials, that act as a soil conditioner as well as supplying appropriate amounts of nutrients depending on their source.

b. Chemical fertilizers are compounds synthesized by a chemical process.

4. SOURCES OF PLANT NUTRIENTS

Organic materials are considered the outstanding source of plant nutrients and the most important for soil improvement and conservation. The physical and chemical properties of soil care are best supplied by living residue. Listed below are three ways you may collect and store organic materials for mixing with agricultural soils.

a. Farmyard manure, of which most are ready to mix with the soil prior to sowing seeds. You may spread manure over the soil then plow under or harrow until thoroughly mixed with the topsoil. If you have large quantities of manure collected and piled it should be protected from the weather by covering, until applied to the fields.

b. Compost, which you will learn to make, is an excellent source of plant food. Almost any type of crop residue can be added to the compost pile and if kept moist and turned can be applied to the soil within 5 months. Making compost is not difficult and is an excellent soil conditioner but care should be taken to preserve and protect the organism activities. Crop residue or any plant material will decompose by organisms that are kept alive with proper moisture, aeration, temperature and sufficient microbe food. Proper care reduces the time required for preparing quality compost.

c. The third method of adding organic material to the soil is green manure. The term green manure means that a growing crop is plowed into the soil and decomposes later. The most widely used crops for this purpose are legumes of which there are many varieties to choose from. The flowering stage of these legumes is the proper time for incorporating into the soil for maximum yield, in Kg/Rai.
d. Chemical Fertilizers: Chemical fertilizers are compounds of which we know the composition of each element and we may calculate the amount of plant nutrient needed for each application. Most chemical fertilizers are soluble in water and therefore the nutrients stay in the soil suspension and move easily through the root zone for uptake by the plants. Proper application rates and placement are extremely important to prevent injury to the plants.

The three most common forms of commercial fertilizers are (N) nitrogen, (P) phosphorus and (K) potassium.

5. FERTILIZER BLENDS

Fertilizer blends are the result of combining two or more single fertilizers and mixing well with the exact quantities of each type known in one bag. You may make any blend by calculating the amounts of nutrients required for a specific crop and weighing and mixing together. Care must be taken that all fertilizers that are mixed will be compatible and no reaction will take place where they become unavailable.

The most economical method to acquire the proper mixed fertilizers is to purchase from the market. You may select any blend that is the most suitable to meet your soil and crop requirements. Remember to have your soil tested prior to applying fertilizer. If it is difficult, or impossible, to have your soil tested you must observe the plant growth during the past crops to determine future plant fertilizer needs. You should also observe the soil profile and where necessary consult with a soil specialist. You should at least know the pH of your soil as it will help you in making decisions about what to apply.

The following mixed fertilizers are available in most area markets. The amounts used per unit area may vary greatly depending on soil type.

6. SOIL pH, ITS EFFECT ON PLANT GROWTH

If the soil solution produces hydrogen ions in larger quantities than hydroxy ions the soil reaction will be acid. The other type of soil may contain large quantities of Ca, Na, K or Mg, which prefer to form with hydroxy ions and the soil will indicate alkalinity.

The measurement of the concentration of hydrogen ions in a solution is the method of determining the pH value. With the pH value of 7 being neutral any value over 7 becomes alkaline and below 7 becomes acid.

The importance of the soil pH to normal plant growth is as follows. First one must consider which crops are capable of tolerating strong acid or strong alkaline soils. Second, which nutrients are dissolved and available to the plants at a specific pH range. Third, the dangers of toxicity from micro nutrients which are over dissolved in the soil solution while the micro nutrients are fixed. For example phosphorus is precipitated at pH below 4.5 and above 8.0.

7. CORRECT SOIL pH VALUES

The most desirable pH value for all crops is between 6 and 7. At the value of 6 or 7 every essential element is dissolved in the exact proportion for maximum plant growth. Lime, (calcitic or dolomitic limestone) are used to increase the pH value of acid soils and sulfur is used to decrease the pH value of alkaline soils. Soil tests should be made to verify the exact needs prior to applying any of the above mentioned materials.
SESSION TITLE: Pig Feed and Feeding
SESSION #44 WEEK #3 DAY #13 (44-3-13)
PRESENTER:
CO-FACILITATOR:
TIME: 10:00-12:00 F/C

INTRODUCTION: SESSION OBJECTIVES

After relating the general animal nutrition discussion to specific swine needs, this session indicates how to determine whether the pigs are growing satisfactorily with the existing feed mix. The trainees will:

- Learn how to estimate the weight of pigs by the tape measure method.
- Also discuss pig nutritional needs and feeding options available in the host-country.
- Learn how to balance and mix a pig ration.

HAND-OUT:

READING ASSIGNMENT: Small-scale Pig Raising, Pgs 102-103 and 160-161.
SESSION PREPARATION AND MATERIALS

- Trainer reference: *Small-Scale Pig Raising.*
- Locate materials for weighing.
- Flip chart and felt pen.
- Locate tools and ingredients for mixing feeds.

---

TIME  SESSION 44-3-13 ACTIVITIES

10 Min    Explain session objectives.
30 Min    Divide into small groups and find average weight of both pigs using the tape measure method. Enter on record after comparing the results of each group.
20 Min    Discuss growth rates and diets.
20 Min    Discuss feeding options available in the host-country.
10 Min    Hold discussion on how to balance the protein using the Pearson Square Method.
25 Min    Have trainees mix pig ration with supplied materials.
5 Min     Have trainees clean up and put equipment in storage.

---

TRAINER NOTES AND RECOMMENDATIONS

This session should be scheduled early in training but after there are signs of measurable growth in the animals.

A suggested way to time this session is when the initial feed supply is nearly used up.

FOR FUN: After the pigs weight is estimated, trainees might try to estimate each other's weight using the same method.
SESSION TITLE: Introduction to Fish Farming

SESSION #45 WEEK #3 DAY #14 (45-3-14)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Crossover and Fisheries volunteers play an important role in the development of small-scale fish farming in the host-country. The need for integrated farming which includes fish, animals and crops is extremely important in assisting farmers to develop a range of activities that generate income.

The objectives of this session are:

- To understand the basic components of small-scale fish farming. Facilities, maintenance, care, nutrition and disease control.
- To understand the basic species of fish grown in the host country.
- To understand the environment necessary for the production of each species and ways that fish can be integrated with livestock.
- To be introduced to the facilities necessary for small-scale fish farming (pond, water, marketing).
- To introduce trainees to Crossover & Fisheries volunteers to be used as future resources.

HAND-OUT:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Prepare visual-aids showing different species.
- Locate at least two Crossover or Fisheries volunteers nearby to facilitate presentation.
- Have consulting volunteers prepare hand-outs and reading materials for trainees.
- Locate small-scale fish farming facility nearby.

SESSION TITLE: Plant Propagation
SESSION #46 WEEK #3 DAY #15 (46-3-15)
PRESENTER:
CO-FACILITATOR:
TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Many types of plant propagation techniques are used in tropical agricultural production and the methods most commonly used in the host country will be detailed in this session. The trainees will learn:

- How to propagate plants of various types including tubers, cuttings, and rhizomes.
- The theory and technique of each type.
- How to identify the methods used for most plants, i.e. flowers, vegetables, herbs.
- Through hands-on experience with all of the above.

HAND-OUT:

TECHNICAL VOCABULARY:

- Propagation
- Cutting
- Tuber
- Rhizome
- Kitchen garden
- Plant
- Nursery
- Hoe
- Water can
- Rake
SESSION PREPARATION AND MATERIALS

- Three weeks prior to session, set demonstration plot of plants that propagate by:
  - Rhizome: Ginger
  - Sucker: Lemon grass, Banana
  - Cutting: Basil, Mint
  - Tubers: Sweet Potato
- Prepare materials for each type, prior to session, with sufficient quantities for each trainee.
- Manure, fertilizer, hoes, rakes, and water cans.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 46-3-15 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Min</td>

</tr>
<tr>
<td>30 Min</td>
<td>Have trainees plant available plants and mulch with manure--watering thoroughly.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Have trainees clean up and put hand tools in storage.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

Some of these plants will require shade or nursery if the weather is hot. Other plants may require pinching of leaves to reduce transpiration and wilt. Most of the materials for this session are available in the local market.
SESSION TITLE: Staking and Trellising/Maintenance

SESSION #47  WEEK #3  DAY #15  (47-3-15)

PRESENTER:

CO-FACILITATOR:

TIME: 10:00-12:00 F

INTRODUCTION: SESSION OBJECTIVES

In the tropics many crops will not grow or produce properly if not kept up off of the ground. This is especially true, during the wet season when the soil surface remains wet or moist fostering fruit and vegetable spoilage during growth. Therefore, this session will demonstrate to the trainees:

- Why staking and trellising are important in the host-country.
- Which crops require staking or trellising.
- The most appropriate methods and materials used in the host-country.
- The proper timing for staking or trellising different crops.

HAND-OUT:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Staking</th>
<th>Trellising</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tying</td>
<td>String</td>
</tr>
<tr>
<td>Plastic</td>
<td>Stakes</td>
</tr>
<tr>
<td>Bamboo</td>
<td>Crop names</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Trainer references: Not available - check local techniques
- Stakes, bamboo and plastic or twine for tying.
- Stakes and trellises completed on trainers’ model plot for trainees to observe.

TIME SESSION 47-3-15 ACTIVITIES

5 Min  Explain session objectives.

10 Min Observe model plot and explain the importance of the technique used in building, i.e. strength for weight, and stability for wind.

10 Min Demonstrate (by observing the model plot) the importance of keeping the vegetables or fruit up off of the wet soil.

5 Min Demonstrate the single, tripod and trellising methods.

90 Min Have trainees commence to stake or trellis appropriate crops in their individual plots with the trainers observing and assisting on a one-to-one basis.

TRAINER NOTES AND RECOMMENDATIONS

This session is designed to coincide with the plantings so that the crops that require staking or trellising are ready. In this way trainees get hands-on experience in their individual plots. This session also is used for plot maintenance once the staking and trellising is completed.
SESSION TITLE: Basic Soils
SESSION #48  WEEK #3  DAY #1  (48-3-16)
PRESENTER:
CO-FACILITATOR:
TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Soils are the medium for plant growth and have a wide variety of qualities and characteristics. Therefore it's extremely important that the trainees learn and understand the following aspects of basic soils:

- The importance of the basic soil and plant relationship.
- How soil is formed and how it is classified by texture.
- How to test soil pH values and their effect on plant growth.
- The variability of soil types throughout the host-country.
- The importance of soil conservation techniques and soil improvement methods.
- The techniques of adding chemicals, i.e. fertilizer, lime and sulfur, and what the results will be in different areas of the host country.

HAND-OUT: #48-a Soil Texture Classifications.
- Oils, Crops and Fertilizer Use, Pgs 20-30.

TECHNICAL VOCABULARY: Soil particles Sand
Clay Silt
Soil Fertilizers
Soil profile Manure
Texture Compost
Soil pH Organic matter

167.
SESSION PREPARATION AND MATERIALS

- Trainer reference: *Soils, Crop, and Fertilizer Use*.
- Soil particle samples i.e. sand, silt, and clay.
- Soil testing equipment (pH) and distilled water.
- Field locations to examine an actual soil profile.
- Soil auger for demonstrating core sampling.
- Fertilizer test plots (preferably corn) to visually show the benefits of adding nutrients and the effect of different combinations.

---

TIME SESSION 48-7-16 ACTIVITIES

- **5 Min** Explain session objectives.
- **30 Min** Hold in-laboratory session to acquaint the trainees with specific soil textures and particles.
- **20 Min** Have in-field demonstration of crop responses to different types of soil with different pH values.
- **20 Min** Have trainees observe actual soil profile and hold discussion.
- **20 Min** Have trainees take core sample and learn the technique of testing the pH of different horizons.
- **15 Min** Have trainees look through corn plot and select leaves showing deficiencies and identify each. Assist as necessary.
- **10 Min** Have trainees clean up and put equipment away. Hold question and answer session.

---

TRAINER NOTES AND RECOMMENDATIONS

"Basic soils" was originally scheduled as a 3-hour session which turned out to be overbearing. Therefore, it has been reduced to 2 hours and includes mostly hands-on field experience. The session on basic plant nutrition, which overlaps basic soils should also be 2 hours. There should be a later 1-hour session for review (week #4, day #19) that will follow up both sessions and could include the trainees using soil sample kits in their own plots with the results used in a fertilizer math session or quiz.

The "Basic Soils" session should focus on soils of the host-country and, more specifically, on the areas the trainees might be located in.
INTRODUCTION

Soils of all types and characteristics are the basis for all living plants and trees. The quality of these soils is the primary factor that determines the yield or growth of these plants and trees. The following session, basic soils, will give you an insight on how to care for, maintain and improve a wide variety of soils for higher production.

1. SOIL COMPOSITION

It is possible to separate the composition of any soil. When separating, topsoil for example, you will find 4 major components as described below.

a. Solids, which you can see with the naked eye, such as particles of sand and gravel, but many of the particles are very small, such as ions, and must be magnified to see clearly.

b. Organic matter, in the topsoil of most agricultural land would be 2 percent or less by volume. In the subsoil it could be called carbon instead of organic matter.

c. Water, which in most cases surrounds the soil particles, except in very dry soil.

d. Air, since the soil contains a certain amount of particles or aggregates, there are numerous pore spaces among them that will be filled with water or air. These pore spaces vary greatly with the soil type and texture.

We will study soil solids in depth but due to the limitation of time we will only mention the other components and describe their functions. The solid phase of a soil is a mineral grain smaller than 2 millimeters in diameter. The size from 2 to less than 0.002 millimeters are called soil particles. These particles function as an absorber of other elements such as organic matter, water and important plant nutrients. The elements or ions which we are not able to see with the naked eye can be determined by analysis with great accuracy. The fertilizers we apply to the land consist of elements that when dissolved in soil suspension ionize into ions that plants can take up as plant food.

What other roles can ions play in soil suspension besides that of plant nutrition? One may be toxic to plants if large amounts are dissolved into soil solution under certain conditions. Nutrient elements may also exist in forms of precipitated compounds which are not available to the plants.
2. INSPECTING A SOIL PROFILE

Let us dig a pit to a pre-determined depth, then examine the profile and what do we see? We find a distinct difference between the top layer, defined as topsoil, and the lower layer defined as subsoil. Most topsoil is darker in color than the subsoil because of the higher content of organic matter. This topsoil is more porous with good aeration and abundant plant food. This top layer is named the A. Horizon.

Now look over the lower profile, subsoil, and you will see that it is lighter in color and contains less plant roots and organic matter, and is therefore, less fertile. If you look deeper you may find color spots called mottling in this horizon. We differentiate soil horizons by color, texture, structure, porosity, amount of roots, chemical reaction and others. Let us now learn about soil textures.

3. SOIL PARTICLES AND TEXTURES

Soil textures are classified into three types according to the combination of particles with the particles the smallest unit of a soil. A mixture of soil particles determines the type of soil texture, with particle classification based on size.

<table>

<td>&lt; 0.002</td>
<td>Plate like</td>
</tr>
</tbody>
</table>

Each soil texture consists of the above mentioned soil separates but are different according to the percentages of each component. These textures may be classified into 12 groups as indicated by the following table.
Different layers may vary greatly in their textures and one local texture may differ from others. We are able to examine the textures by the two following methods. First, by taking a handful of moist soil, not too wet, and squeezing it between the fingers. As a rule of thumb you can tell what the soil texture is by this method. The second is by the sedimentation method which requires a given amount of soil and water mixed thoroughly and allowed to settle. This technique is considered an intensive investigation.

4 WHAT THE TEXTURE TELLS YOU

a. Sandy or light soil has less plant nutrients, excessive drainage, leaches fertilizers and nutrients quite readily, has low water holding capacity and does not support trees for normal growth. The only plus for sandy soil is that it is easy to till in most cases.

b. Loamy soil on the other hand is good for agriculture and if managed properly will give a high value return from most crops.

c. Clay soils have high cation absorption capacity, high water holding capacity and are high in plant nutrients. It is easier to maintain the organic matter level. Usually we find clay soils in the lowlands because in most cases it is carried by water from the higher elevations and deposited in the lower plains.

#### 6. SOIL STRUCTURE

What does a clod of soil look like? They can be round, blocky, platy or prism shaped. We are talking about the shape of a soil clod (ped) and its sizes. Clods are formed by the arrangement of soil particles and the amount of moisture in the soil which when dry forms hard clods which are soil structures. The primary function of the soil structures are for holding plant roots, air, water and plant nutrients.

Plate like structures are clods when formed look like plates. The horizon width of plate clods is greater than the vertical one. The soil containing plate structures indicate poor aeration and water drainage. Some soils have blocky structures or blocky types which mean each side is equal.

#### 7. SPHEROIDICAL STRUCTURES

These are the structures which form in soil containing high organic matter and would be considered loamy soils. This type of soil structure would only occur in the topsoil which is the horizon.
0. SOIL OF THAILAND

a. Soils of the Central Plains

Most of the soils in the central plan of Thailand are clayey in texture and classified as alluvial, rich in plant nutrients. Most of these soils are used for rice paddy with some being very acid with the pH value below 4.5. Therefore, the farmers must use lime (calcitic or marl) to correct the acidity problem which can also be improved through the use of organic matter along with the application of lime. It is also possible to have soils, used for field crops, that are heavy in texture but in the high pH range. (alkaline)

b. Soils of the East

The majority of the soils in the east are sandy in texture, with a few areas in the lowland high in clay texture. Some areas also have high concentrations of lateritic soils but not serious enough to affect the growth of trees. Most of these soils are used for field crops and small areas for rice production.

c. Soils of the South

The peninsular area has a wide variation in soil textures with sandy soils along the coast but higher elevations are clayey and gravelly. Good quality soils, high in organic matter are found in large areas in Narathiwat province. The low productive soils are mostly in the old mine lands.

d. Soils of the North

Soils of the northern part in the most part are of medium texture with few problems in terms of their productivity but highly susceptible to erosion.

e. Soils of the Central Highlands

Soils of the central highlands are generally speaking of fine texture and on a complex topography. Many areas are full of cobbles and large rock outcrops. However, the soils are quite productive with a high hazard of erosion.
f. Soils of the Northeast

Coarse to medium textured soils of a sandy nature are found throughout the northeast. Due to the large areas of highly weathered soils which are extremely leachable, these soils are very low in productivity. Most of these soils are medium to highly acid with considerable amounts that are very highly saline. The salinity causes tremendous problems with all types of crop production and yields are reduced. The major technique for correcting soil salinity problems is by using plenty of water to dissolve the salts. Once the salts have been dissolved, adequate drainage is necessary to remove the salts from the soil, followed by broadcasting sulfur powder. The last alternative is to grow crops and varieties that have a high tolerance to saline conditions.
SESSION TITLE: Using Chemicals and Chemical Fertilizers
Introduction to Metric III

SESSION #49  WEEK #3  DAY #16  (49-3-16)

PRESENTER:

CO-FACILITATOR:

TIME: 10:00-12:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Farmers the world over are becoming more aware of the fact that proper maintenance of their soil's fertility and structure will help reduce pest damage. In doing this the farmers grow stronger, healthier and higher producing plants with an ultimate decrease in production costs, which increases profits. This session will introduce the trainees to ways and methods:

- That will show the benefits of using chemicals along with chemical fertilizers for maximum results.
- Of proper fertilizer use (timing and placement) for higher yields and returns.
- Used in the labeling and identification of elements (i.e. N-P-K).
- Used in applying such as rates Lbs/ac or Kg/ha.
- That local farmers use fertilizer to benefit the crop or waste money.

HAND-OUTS: #49-a The Average Composition of Fertilizer Materials.
#49-b Applying Chemical Fertilizers.

TECHNICAL VOCABULARY:

Chemicals  Chemical fertilizer
SESSION PREPARATION AND MATERIALS

- Trainer references: Soils, Crops and Fertilizer Use and Intensive Vegetable Gardening.
- Field plots at all stages of growth for demonstrations of fertilizer timing and placement.
- Measuring and applying equipment.
- Water cans.

TIME SESSION: 4/7-3-16 ACTIVITIES

10 Min  Explain session objectives.
15 Min  Discuss the benefits of using chemical fertilizers properly.
10 Min  Discuss how healthy plants resist insects and diseases more readily.
15 Min  Discuss how to identify fertilizer elements N-P-K (7-15-15) and the percentages.
15 Min  Discuss application rates and terms used (Kg/ha - Lbs/ac). These concepts will also be covered in Fertilizer Math, Session #67-4-23.
15 Min  Discuss ways the local farmers could improve their methods of applying chemical fertilizers, i.e. correct blends/correct amounts and what their major constraints are. (Credit, availability, etc.)
40 Min  Hold field demonstration on placement and timing for maximum benefits.
5 Min   Conclude and have trainees clean up.

TRAINER NOTES AND RECOMMENDATIONS

The pre-planning for this session, at least 3 weeks in advance, will make this session much more interesting. Clay pot examples are also helpful and vividly show the results of chemical fertilizer use. It is best to present this session in the plot area with actual examples.

APPLYING CHEMICAL FERTILIZERS

Recommendations for fertilizer blends in Thailand would be consistent throughout the country. 15-15-15 at the rate of 50 Kg/rai (275 Lbs/ac) will act as a starter fertilizer and in most cases supply all the P and K necessary for maximum yield. The only addition to some crops such as corn, rice and some leaf vegetables would be 50 Kg/rai (275 Kg/ac) of ammonium sulfate.

The following calibrations are based on the grams per linear meter at different row spacings.

15 cm (small vegetables)  5 gms  one level teaspoon
30 cm (med vegetables)  9 gms  two level teaspoons
50 cm (field crops)  16 gms  three level teaspoons
60 cm (green beans)  19 gms  four level teaspoons
Broadcast = 31 gms/sq m  six level teaspoons
SESSION TITLE: L.S.S. School Field Trip
SESSION #50  WEEK #3  DAY #16 (50-3-16)
PRESENTER:
CO-FACILITATOR:
TIME: 13:00-17:00 F

The Session Design for this Program Specific Session is in Appendix A.
SESSION TITLE: Insect Identification

SESSION #51 WEEK #3 DAY #17 (51-3-17)

PRESENTER: 
CO-FACILITATOR: 
TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

The use of pesticide in the host-country is poorly controlled and therefore is used indiscriminately without regard to plant, animal or human safety. Alternate methods are overlooked and could be used in place of pesticide in many cases, if the farmers could identify their problems and plan for proper insect control. The trainees can contribute to providing this information at their sites. It is thus important that they can:

1. Identify the most common types of insects in the host-country and the damage caused by each type.
2. Understand the life cycle of these pests to assist in an insect monitoring program.
3. Have hands-on experience in the field to observe the actual insects and the damage done by each.
4. Know the basics of how the different types (chewing and sucking) are controlled.

HAND-OUTS: #51-a Insect Identification
#51-b Insect Life Cycles

TECHNICAL VOCABULARY:

Names of insects found or studied.

Chew \hspace{1cm} Such \hspace{1cm} Life-cycle \hspace{1cm} Damage \hspace{1cm} To fly \hspace{1cm} To jump
Beneficial insects
SESSION PREPARATION AND MATERIALS

- Locate dead and live specimens, pictures and damaged plants.
- Locate suitable field areas for latter part of session; locate damage and insects within those areas, and identify both beneficial and pest species.

-------------------------------
TIME
SESSION 5/1-3-17 ACTIVITIES
-------------------------------

5 Min
Preview session aims. Explain that insects can devastate crops, particularly vegetables. Show a vivid example or two. Thus, insect control is important and will be covered shortly. Insects are part of the local ecology and all of our cropping practices will affect insect populations; therefore, we must understand insect lives in order to both avoid practices that increase insect pest populations and control such pests.

15 Min
Explain the difference in damage from sucking and chewing insects. Provide specimens of the damage.

Have insect specimens of both types of mouth parts to give trainees practice telling the two apart. If a large number of specimens are available, each trainee can take a quiz of 10 specimens.

These specimens should be limited to common pests.

25 Min
Lay out the following display. Have trainees circulate through it and observe it closely.

Table 1 - Sucking Insects

Live and dead specimens, pictures, and damaged plants, labeled in Thai and English, for the following pests (all stages of life cycle):

- Aphids
- Green leaf hopper
- Thrips
- Mites
Table 2 - Chewing Insects

Same display as 1, for:

- Diamond back moth
- Cabbage looper
- Cucumber beetle
- Tomato fruit borer
- Corn ear worm
- Corn stem borer
- Flea beetles

The insects displayed will depend on available resources and some ought to be found in the field trip part of this session. Don't load this display down with great deal of data. Save the data for hand-outs.

15 Min
Give lecturette, with pictures or hand-outs, on the life cycles of:

- Moths/worms
- Beetles
- Aphids

Emphasize the stages where pests cause damage and the stages where they are vulnerable to control measures.

10 Min
Break and walk to infested crop area.

45 Min
In a plot with noticeable insect damage, preferably trainee plots, do the following in groups of 3-4. Each group should be led by a trainer:

A. Trainer points to a group of damaged plants and trainees find the damage and identify whether the damage was caused by sucking or chewing.

B. Trainees look for insects that may have caused the damage. Discuss whether or not captured insects are capable or likely to have done the damage. If no insects are found discuss why.

C. Count insect populations on various plants and relate to damage level and health of the plants.

D. Bag a few specimens to show other trainees.

E. Discuss any beneficial insects that are discovered.
F. Repeat A through E for at least three common pests. Vegetables, field crops and orchards are possible sources of insects.

5 Min

Pass out resource material on body parts and morphology, common pests and identifying characteristics, and whatever else can be found and compiled.

Pass out "Pesticide Safety Facets. These should be read before "Pesticide Safety" session. Pass out hand-outs on Insect Control to be read before Insect Control Session.

TRAINER NOTES AND RECOMMENDATIONS

Slides cannot replace specimens and hands-on searching for insects. If adequate preparation is not possible, drop this session and assign a reading instead. Do not lecture what can be easily covered in a reading or hand-out.

Schedule this session early in the morning or late in the afternoon, when insects are most numerous.

SESSION TITLE: Mushroom Production

SESSION #52  WEEK #3  DAY #17  (52-3-17)

PRESENTER:

CO-FACILITATOR:

TIME: 10:00-12:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Mushrooms are grown throughout the host-country using many different techniques. They are a cheap source of protein and can be produced on a small scale in home gardens. The objectives of this session are to demonstrate the many techniques for growing mushrooms with hands-on experience that will give the trainees confidence to develop mushroom projects at their sites. They will understand the following at the end of training:

- Nutritional values of mushrooms.
- Materials required for production of each type.
- The basic cost of production.
- Marketing, supply and demand. When and how to harvest.

HAND-OUT: #52-a How to grow rice straw mushrooms.

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

- Rice straw
- Mycelium
- Soak
- Sprinkle
- Mold
- Spawn
- Mushroom
- Edge
- Kapok
SESSION PREPARATION AND MATERIALS

- Trainer should contact Center Instructor to co-facilitate this session.
- Trainer should set demonstration model 10-11 days prior to session. This will give the trainees some idea of how their mushrooms will look when finished and there will be mushrooms to harvest on the day of the session.
- Rice straw soaked in water overnight.
- Wood mold for shaping and packing each set.
- Kapok seed to mix with mushroom spawn.
- Water can.
- Dry rice straw and plastic to cover finished sets.

TIME

SESSION 52-3-17 ACTIVITIES

5 Min Explain session objectives.

20 Min Instruct trainees to uncover demonstration model and look for mushrooms ready to harvest. At the same time explain how and when to harvest.

15 Min Explain and introduce the trainees to the mushroom spawn and how to use it.

10 Min Use two trainees and demonstrate how to build one pile using rice straw and how to mix the mycilium with the kapok seed for best results. Explain the best seasons for mushroom production and why. Include information on moisture requirements.

50 Min Have trainees separate into pairs and practice building mushroom piles. Two piles each is recommended.

10 Min Have the group cover all of the piles with plastic and seal them. Then have the group cover the plastic with dry straw to keep out light.

10 Min Hold question and answer session and discuss experiences of trainees. Have group clean up and put excess materials away.
TRAINER NOTES AND RECOMMENDATIONS

This session is done best in cooperation with the Training Center instructor using the facilities and fresh mycilium from the center. The follow-up session to inspect and harvest the results should be about 10 days following the session presentation, (week #5, day #28).

If the weather is extremely wet and cool the trainees can build a fire next to the beds to increase the temperature and expedite the growing process. This is an important session and should be well prepared in advance.
HOW TO GROW RICE STRAW MUSHROOMS (VOLRARIELLA VOLRACEA)

A. MATERIALS

1. Rice straw, preferably the part left in the field after harvest. Pull it out with the roots included. The threshed ears are minor quality and give poorer results. Other substrates can be used: sorghum and wheat straw, maize residues bagasse, banana leaf, tobacco stems, water hyacinth, sawdust, cotton and kapok wastes.

2. Manure: dry cattle manure, possibly mixed up with dry chicken or pig manure at rates of 2:1 to 3:1.

4. Water: don’t use saline, alkaline or acid water.

5. Container to soak the straw: water pond, oil barrel, according to possibilities.

6. Plastic sheet 1 roll 100-115 baht about 60 m. If you buy per meter: 3 baht/m.

7. Wooden mold: L 80-150 cm
   W 30-40 cm the bottom part should be wider than the top.
   H 30 cm

8. Watering can.

B. METHOD

1. Inoculation
   - Soak the straw (10 min – 1 night).
   - Loosen the soil and water.
   - Place the wooden mold on the plot (if necessary use a rope for lining up the beds).
   - Put in the first layer of straw, not more than 4 cm. Try to put the roots at the outside. Tread with bare feet until dense, especially at the 4 sides, and water.
   - Mix the dry manure with water and put it on the straw along the 4 sides, 1 to 2 cm thick, about 5 cm wide.
- Take the mushroom spores, previously divided into 3 equal parts (1 part for each of the 3 layers) and press it gently into the manure, as close to the wooden mould as possible. Water.

- Put in the straw for the second layer, about 6-8 cm, and repeat same procedure.

- Identical for the 3rd layer. Add a thick layer (= 10 cm) of straw on top. Tread and water.

- Remove the wooden mold by pushing on the straw and pulling up the mold on both sides.

- Repeat this procedure for as many beds as you want (10 is a practical number). Leave about 1 hoe width between the beds.

- Straw manure on the soil between and around the bed.

- Cover with two plastic sheets, with or without wooden support. Fix it with earth, stones, wood, whatever.

- Cover with dry straw.

- Protect from chicken (if necessary) by putting bamboo branches or roof patches on top of it.

2. Follow up

The first 4 to 5 days, the spore is running (35-40 degree C). Be sure the temperature is high enough.

The fruiting period starts at the pinhead stage (opt 30-35 degree C). Follow up temperature and humidity. If necessary, water around (not on!) the bed, and open the plastic 5 to 10 minutes per day, in the morning or the evening, or open the plastic two fingers, day and night.

3. Harvest

Pick the mushrooms (after 9 to 10 days, depending on the season) by turning them around. Be sure not to leave the foot in the bed. It will cause rotting.

Pick before the head emerges completely. Market price for full grown heads drops about 50%.

You should be able to harvest at least 1 kg per bed.
4. Ratooning

After 2 to 4 days, all the mushrooms will be picked. Pour plain water, or water enriched with manure or urea on top of the beds, cover up again with plastic and straw, and after 3 to 6 days a ratooning harvest will be possible (fewer and smaller mushrooms).

The remaining straw is excellent for composting.

5. Seasonal variations

Temperature and humidity vary strongly according to the season. The inoculation and following procedure will vary correspondingly.

</table>

Very seldom mushrooms are grown in the rainy season because:

- No straw is left since all the paddy fields are under cultivation.
- The farmers spend all their time growing rice.

Since the supply is not meeting the demand, price are booming (up to 50 baht/kg, whereas an average hot season price is 20 baht/kg).

Convincing farmers to stock their straw for mushroom production in the rice growing season would provide them with an excellent extra income.

Be sure however that spore is locally available then.
SESSION TITLE: Field Trip: Integrated Farm

SESSION #53  WEEK #3  DAY #18  (53-3-18)

PRESENTER:

CO-FACILITATOR:

TIME:  8:00-12:00

INTRODUCTION: SESSION OBJECTIVES

The purpose of this field trip—to visit an integrated farm and a commercial flower and ornamental plant farm—is twofold. First, it gives trainees a break from the rigorous training schedule while still serving as an agriculture-related training session. Trainees also benefit from seeing new parts of the host-country. A trip of this nature broadens their perspectives concerning agriculture in the host-country and allows them:

- To better understand the benefits of integrated farming.
- To improve their knowledge of different techniques used for producing vegetables.
- To understand the improved ways of producing ornamental plants.
- To see new technology for flower production and propagation.
- To see high technology in irrigation systems i.e. mist box for nursery propagation.

HAND-OUT:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

- Integrated farm
- Manure
- Chickens
- Flowers
- Fish
- Cut flowers
- Vegetables
- Potted plants
- Vegetables
- Ornamental plants
- Mist box
SESSION PREPARATION AND MATERIALS

- Organize (with the owners of the selected farms) a suitable time to visit, inform them of the number of visitors who will be coming and how long they will be there.
- Arrange transportation to the site and return.
- Make hand-out that identifies the time and place of each stop and what time you will return to the hotel.

TRAINER NOTES AND RECOMMENDATIONS

This type of field trip is very useful and informative if planned well and should be kept on an informal relaxed basis. Lecturing should be minimal with walking around and observing as the main objective. Questions could be answered as they arise while walking around. The timing of this field trip is quite appropriate for a break in the training schedule and home-stay.

SESSION TITLE: Insect Control

SESSION #54 WEEK #4 DAY 19 (54-4-19)

PRESENTER: 
CO-FACILITATOR: 
TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Insects, in the tropics, can/do have a tremendous effect on the production of most crops. The use of chemicals for insect control is important but, unfortunately in the host-country, their application is generally haphazard. Therefore this session will assist the trainees:

- In understanding integrated pest management and its major concepts.
- In understanding control measures appropriate to host-country conditions at volunteer sites.
- In learning how to build and use several types of insect traps for monitoring populations.

HAND-OUTS: #54-a The Principles of Insect Control
#54-b Introduction to Insects and Insect Control
#54-c Organic Pest Controls

READING ASSIGNMENT: Traditional Field Crops
SESSION PREPARATION AND MATERIALS

- Prepare Guidelines for monitoring insect populations.

- Prepare detailed figures on specific crops and pests of these crops, illustrating how to determine the economics of control.

- Have materials required to build one each: light trap, bait trap and several sticky traps. Plans are not included but should be simple using local materials.

TIME  
SESSION 54-4-19 ACTIVITIES

<table>
<thead>
<tr>
<th>TIME</th>
<th>ACTIVITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Preview session aims.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Ask a trainee to summarize the concept of Integrated Pest Control as follows:</td>
</tr>
<tr>
<td></td>
<td>- Work with nature as much as possible;</td>
</tr>
<tr>
<td></td>
<td>- Use a variety of methods to avoid putting all your eggs in one basket;</td>
</tr>
<tr>
<td></td>
<td>- Environmentally safer than relying on pesticides;</td>
</tr>
<tr>
<td></td>
<td>- Less disruptive, easier to maintain equilibrium;</td>
</tr>
<tr>
<td></td>
<td>Less reliance on outside inputs;</td>
</tr>
<tr>
<td></td>
<td>Deal with problems when necessary, but don’t over-kill and cause more problems.</td>
</tr>
<tr>
<td></td>
<td>Disadvantages:</td>
</tr>
<tr>
<td></td>
<td>- More complicated concepts;</td>
</tr>
<tr>
<td></td>
<td>- Regular monitoring;</td>
</tr>
<tr>
<td></td>
<td>- Sometimes labor intensive.</td>
</tr>
</tbody>
</table>

Note: Some of these disadvantages can be considered advantages, depending on one’s point of view (farmer, merchant, technician).
15 Min Explain how to monitor insect populations in small vegetable plots, orchards and fields. Include pests and beneficial insects. Recall the insects found & counted in the Insect Identification Session.

10 Min Explain the concept of economic threshold and its importance. Illustrate with specific examples for crops with which trainees are familiar.

15 Min Ask trainees to explain how the following cultural controls work:

- Crop rotation;
- Intercropping;
- Burying crop residues;
- Timing the crop calendar;
- Controlling weeds and natural vegetation;
- Sanitation.

50 Min Have trainees break into 3 groups to build the following:

1. A light trap.
2. A bait trap.
3. As many sticky traps as can be made in an hour.

These traps should be placed in vegetable plots to test their usefulness and to help monitor insect populations. The trainer should prepare the materials so that the traps can be finished in the allotted time.

------------------------------------------

TRAINER NOTES AND RECOMMENDATIONS

It is assumed that the trainees get their best technical information from reading. The traps will get them actively involved in monitoring. Pesticide safety and use comes in session 63-4-22.

You might ask each group to predict what kinds of insects will be caught in its trap. Trainees check their predictions against reality at a later date. Have each group list its predictions on a piece of flipchart paper as follows:

INSECT TRAP PREDICTIONS

1. Light Trap:
2. Bait Trap:
3. Sticky Trap:

T-109
THE PRINCIPLES OF INSECT CONTROL

1. Correctly identify the pest:
   a. Does the insect match the damage?
   b. Is there more than one pest causing the damage.
   c. Was the insect caught "red handed"?

2. Assess the economic importance of the pest:
   a. What losses in yield, quality and marketability result from the damage?
   b. Will the pest infest other crops, present or future?
   c. Will the pest spread disease?

3. Survey the insect pest (quantitative and qualitative):
   a. How many pests are in our field or plot?
   b. What type of pest is present? (species)
   c. What's the damage level?

   How to survey:

   [Diagram showing survey methods]
   Survey on the diagonal to cover more ground and all the areas of plot.

4. Choose the appropriate method(s) of control while you are in the field, and decide how you'll put them into action.

5. Study the ecology of your plot area to see how it affects the insect population. Beware of anything that would upset the ecological balance. However, planting your crop may have upset things already. Study the ecology both before and after introducing a control measure.
6. Study the biological details of the insect pest. Bring specimens home and watch them closely.
   a. Morphology;
   b. Life history and life cycle;
   c. Alternative hosts (weeds, other crops);
   d. Nature of the outbreak and what triggered it;
   e. Parasites and predators.

7. Know the growth and development of economic plants (your crop), so that you can see how pests are interfering with your goals of good crop growth and good yields.

METHODS OF INSECT CONTROL

I. NATURAL CONTROL

A. Abiotic factors (physical factors)
   1) Weather factors
      a) drought/flooding
      b) temperature
      c) rainfall
      d) weather patterns
   2) Geographic barriers
      a) lakes
      b) mountains
      c) deserts
      d) oceans

B. Biotic factors
   1) predators
   2) parasites
   3) disease
II. APPLIED CONTROL

A. Biological Control: The mass rearing of predators, parasites and pathogens which are then released in the affected crop area.

1) Bacillus thuringiensis (trade name: Argona) is a spore forming bacteria.

2) Trichogramma sp. can be mass reared on the egg of the rice moth (Coreyra cephalonica).

3) Praying mantis nymphs: find a cocoon and keep at home until the nymphs hatch out.

B. Mechanical Control: Equipment is used to control the pest.

1) Hand picking: an often overlooked way to control pests;

2) Nets;

3) Cover the crop (usually fruit) with wax paper, bags, or cloth;

4) Traps: stickly, water, bait;

5) Flooding;

C) Physical Control: Electrical equipment or some form of energy is used in these methods.

1) Light traps;

2) Sound—some frequencies repel mosquitos;

3) Heat;

4) Boiling water.

D) Cultural Controls: Develop the crop environment so that it isn’t conductive to insect growth.

1) Crop rotation

2) Intercropping

3) Burying crop residues

4) Timing the crop calendar

5) Sanitation

E) Resistant Varieties: This has been accomplished, to some degree for rice, but not for other crops, especially vegetables. In short, this method of control is not available for you in Thailand.
F) Genetic Control: Growing a weak or sterile variety of a pest to mate with natural pests. This can be done by selection or by induced mutations from chemicals and radioactive agents. This is probably beyond your means, also.

G) Chemical Control: The farmers first choice, but it should be your last. Consider other methods first.

1) Inorganic insecticides;
2) Synthetic insecticides (petroleum derived),
3) Botanical insecticides (plant derived).
4) Hormones: usually hormone analogs that are synthesized in the laboratory.

H) Organic Control: These don't harm the environment and are sometimes quite effective. Best of all, they don't leave nasty things in our food. However, don't depend on them.

I) Grow Another Crop: Consider the value, both economic and nutritional, of the crop and compare it with the costs in time, labor, safety and money of controlling the pest that is destroying that specific crop. Don't fight nature. Work within nature's limits.
I. SOME IMPORTANT FACTS ON INSECTS

How Insects Damage Plants

Insects can often be identified by the type of damage they cause:

1. Chewing and boring insects

   a. Caterpillars are larvae of moths. They damage plants by feeding on leaves and making holes in them or by boring into stalks, pods, and maize ears. The cutworm caterpillar is unusual in that it lives in the soil and emerges at night to cut off plant stems near ground level.

   b. Beetles feed on plant leaves and chew holes in them; some beetles of the weevil family bore into pods and seeds and deposit eggs inside. Certain beetles can also transmit bacterial and viral diseases.

   c. Most beetle larvae like white grubs, wireworms, and rootworms live in the soil and damage roots and the underground portion of the stem by chewing or boring. A few beetle larvae such as those of the Mexican bean beetle and Colorado potato beetle live above ground and feed on leaves.

2. Sucking insects

   Aphids, leafhoppers, stinkbugs, harlequin bugs, whiteflies, and mites have piercing and sucking mouthparts and feed on plant sap from leaves, pods, and stems. They transmit a number of plant diseases, especially viruses. Sucking insects do not make holes in the leaves but usually cause leaf yellowing, curling, or crinkling.
Insect Life Cycles

A general understanding of insect life cycles will also help you identify insect problems in the field. Beetles and moths go through a complete metamorphosis (changes in form) of 4 stages, while aphids, leafchoppers, whiteflies and other sucking insects go through only 3 stages.

(Moth)

> EGG

(Does no damage)

(Larva)

CATERPILLAR

(Usually feeds on leaves)

(Pupa)

(Dormant stage; turns into a month)

(Adult stage)

Beetle

> EGG

(Feeds on leaves, pods)

(Larva)

(Grubs, wireworms, rootworms, etc. feed on plants roots)

(Pupa)

(Dormant stage; turns into a beetle)

(Adult stage)

Aphids, leafhoppers, stinkbugs, whiteflies,

OTHER SUCKING INSECTS

> EGG

(Nymph)

(Look like a miniature adult; sucks sap also; turns into the adult stage)

II. HOW TO IDENTIFY INSECTS AND THEIR DAMAGE

1. Be Observant: Troubleshooting takes practice, but a sharp eye is essential. When walking through a field, closely examine the plants for insects or their damage symptoms. Check both sides of the leaves since many insects prefer the undersides of leaves. A magnifying glass can be very helpful.

2. Identifying Insect Damage: Very often you'll be able to identify insects by the damage they cause.

a. Holes in leaves: Caterpillars, beetles, crickets, snails, and slugs; snails and slugs aren't insects but do attack plant foliage (look for slime trails on leaves). Caterpillars leave green or brown sawdust-like excrement.
b. Wilting: Soil insects like white grubs and wireworms if root feeding or tunneling of the underground portion of the stem has been serious; stem borers. Remember that wilting can be caused by other factors too: dry soil, very high temperatures, root rots, bacterial and fungal wilts, and nematodes.

1) Dig up the affected plants and check the root system and underground portion of the stem for insect and disease damage; look for soil insects.

2) Slit the stem lengthwise with a pocket knife and check for borers or rotted tissue.

c. Leaf Curling, Crinkling, or Yellowing: Sucking insects, especially aphids, leafhoppers, and mites. Viruses and some nutrient deficiencies also produce these symptoms. Nematodes and poor drainage cause yellowing too.

III. Identifying Insects:

Spend time with locally experienced extension workers in the field and have them point out the prevalent crop insect pests (and beneficial predator insects) in your work area. Seek out host-country or regional insect guides such as extension bulletins.

III. THE USE OF SCIENTIFIC NAMES FOR INSECTS

Each insect is known by many different local names throughout the world, which can make proper identification confusing. Fortunately, all insects (as well as plants, animals, and diseases) are assigned standardized scientific names derived from Latin.

Example: The corn earworm has been given the scientific names of Heliothis zea. The first word of the two part name refers to the insect’s genus and the second part to its species.

Host-country agronomists and extension workers may often refer to insects using their genus such as "heliothis". Farmers will usually use local names for insects. Since this genus-species is being continually revised, an insect may have more than one commonly used scientific name; for example, the fall armyworm has had its scientific name changed from Laphygma frugiperda to Spodoptera frugiperda. When referring to several insects of different species that are all within the same genus, publications will often place the abbreviation "spp." after the genus.
Thus, Heliothis spp. refers to several types of heliothis caterpillars.

IV. METHODS OF INSECT CONTROL AND THEIR EFFECTIVENESS

Let’s compare the effectiveness of non-chemical, chemical, and integrated insect control methods:

NON-CHEMICAL METHODS

Natural Balance

Many natural controls act to keep insects in balance:

1. Weather factors like temperature and rainfall can restrict the distribution of an insect species; for example, mites and leafhoppers are usually more prevalent under dry conditions.

2. Geographic barriers like large bodies of water, mountains, and deserts can also limit insect distribution.

3. Frogs, toads, lizards, moles, and birds are some of the many animals that feed largely on insects.

4. Beneficial predator insects like lady bugs feed on aphids, while others like the braconid wasp and tachinid fly lay eggs on or in certain pests which are killed by the developing larvae. Some predator insects like praying mantis also eat beneficial insects as well, however.

5. Insects are also attacked by viruses, fungi, and bacteria which help keep populations down.

As agricultural activities have increased, many of these natural balances have been upset and can no longer be relied upon to keep harmful insects under control. Monoculture and the existence of vast areas under cropping have led to marked increases in a number of insect pests. Many of the traditional crop varieties, despite their lower productivity, have better insect resistance than some of the improved varieties. Indiscriminate use of pesticides has also resulted in an actual buildup of harmful insects in some cases.
BIOLICAL CONTROL

Biological control is the purposeful introduction of predators, parasites, or diseases to combat a harmful insect species. About 120 different insects have been partially or completely controlled by this method in various parts of the world. Microbial insecticides such as Bacillus thuringiensis (effective against a few types of caterpillars) are now commonly used by farmers and gardeners in many areas. Unfortunately, biological control measures are presently effective against a very small portion of harmful insect species.

CULTURAL CONTROLS

Cultural controls such as crop rotation, intercropping, burying crop residues, timing the crop calendar to avoid certain insects, and controlling weeds and natural vegetation that harbor insects are all effective control methods for some insects. In most cases, however, cultural controls need to be supplemented by other methods.

VARIETAL RESISTANCE

Crop varieties vary considerably in their resistance to certain insects. For example, maize varieties whose ears have long, tight husks show good resistance to earworms and weevils; CIAT found that some bean varieties were relatively unaffected by leafhopper damage during the wet season, while others suffered yield losses up to 40%. Screening for insect resistance is an important part of crop breeding programs.

"ORGANIC" CONTROLS

"Organic" control refers to non-chemical methods in general, including the application of homemade "natural" sprays made from garlic, pepper, onions, soap, salt, etc., and the use of materials like beer to kill slugs and wood ashes to deter cutworms and other insects. Some of these "alternative" insecticides are slightly to fairly effective on small areas like home gardens and where insect populations are relatively low. They are seldom feasible or effective on larger plots, especially under tropical conditions that favor insect buildup.
CHEMICAL CONTROL

Chemical control refers to the use of commercial insecticides in the form of sprays, dusts, granules, baits, fumigants, and seed treatments. While some of these insecticides like Bacillus thuringiensis, rotenone, and pyrethrin are naturally derived, most are synthetic organic compounds that have been developed through research.

ADVANTAGES OF INSECTICIDES

1. Rapid action.
2. They are the only practical means of control once an insect reaches the economic threshold of damage on a commercial size plot.
3. Insecticides are available in a wide range of properties, species effectiveness, and application methods.
4. They are relatively inexpensive, and their proper usage can often return $4-$5 for every $1 spent.

DISADVANTAGES OF INSECTICIDES

1. Insect resistance to pesticides is a growing problem. In 1961, about 60-70 species had developed resistance to certain products, and the number had increased to around 200 by the mid-1970's.
2. Outbreaks of secondary pests: Few insecticides kill all types of insects, and some actually promote the increase of certain pests. For example, continual use of Sevin (carbaryl) in the same field may increase problems with some types of aphids which it doesn't control well.
3. Damage to non-target species such as beneficial predators, bees, and wildlife.
4. Residue hazards: Some chlorinated hydrocarbon compounds like DDT, Aldrin, Endrin, Dieldrin, and Heptachlor are highly persistent in the environment and may accumulate in the fatty tissues of wildlife, livestock, and humans. It's important to realize that many other insecticides are broken down into harmless compounds fairly rapidly.
5. Immediate toxicity: Some insecticides are extremely toxic in small amounts to humans and animals. Again, it's important to realize that insecticides vary greatly in their toxicity.
CURRENT STATUS OF INSECTICIDE USE

At the present time and for the immediate future, insecticide usage will often be an essential part of any package of improved practices for the reference crops. For this reason, we urge all agricultural field workers to learn the basic principles of safe and effective insecticide application. Even though you may be personally opposed to these chemicals, you should realize that farmers throughout the LDC's are using them, often in an unsafe and indiscriminate manner. Most of these countries have few, if any, pesticide regulations or restrictions on environmentally harmful products like Aldrin or highly toxic ones like Parathion. By instructing farmers in safety precautions and in the appropriate choice and use of insecticides, the incidence of human poisoning and possible environmental damage can be greatly reduced.

INTEGRATED PEST CONTROL

The disadvantages of total reliance on insecticides have given rise to integrated pest control or pest management which involves the judicious use of these chemicals based on the following guidelines and principles:

1. The development and use of cultural and other non-chemical control methods to avoid or reduce insect problems.

2. (Economic threshold) Determining crop tolerance to pest damage based on the principle that complete freedom from pests is seldom necessary for high yields. Nearly all plants can tolerate a surprising amount of leaf loss before yields are seriously affected.

3. The appropriate timing and frequency of treatments to replace routine, preventative spraying. Treatments are not initiated before the particular insect has reached the economic damage threshold which will vary considerably with the species. Insect scouting and population counts are an essential part of this system.

The advent of integrated pest control dates back to the early 1970's, and much of the efforts have been directed at cotton where insecticides frequently account for up to 80% of total production costs. Some remarkable successes have been achieved with other crops as well. In terms of the reference crops, integrated pest control is still in the very early stage, especially in the LDC's.
SOME "ORGANIC" (NON-CHEMICAL) PEST CONTROLS

CUTWORMS:

Place a collar made of cardboard or a paper cup around the stem so that it extends from about 2 cm below the soil surface to about 5 cm above ground. Don't place the collar deeper or you may restrict the root system of the transplant. Wrapping the stem with several layers of newspaper or a couple layers of tin foil works great too. So do small juice cans or beer cans cut down to the right size.

SLUGS & SNAILS:

Stale beer (or water and yeast) placed in shallow pans in the garden is very effective at attracting and drowning the critters. However, if the container is placed on top of the mulch, slugs are unlikely to reach it. Other remedies are:

1. Place a wide board on the ground in the late afternoon. By next morning, lots of slugs and snails can be found under it; crush them.

2. Sprinkling coarse sand, wood ashes, lime, or diatomaceous earth around the plants' base will repel them. (Caution: too much lime may raise the pH too much).

3. If using mulch, keep it several inches away from the plant rows: slugs like to hide and feed under it.

4. Keep the field clean of weeds and debris.

ANTS:

Pouring boiling water over nests is very effective for fire ants. Steamed bone meal supposedly repels ants (don't try making your own bone meal out of old cattle bones; they can harbor dangerous anthrax disease).

NEMATODES:

1. Crop rotation: Sometimes difficult or impractical since most types of nematodes have many crop hosts.
2. Resistant crop varieties: Varieties of a crop will vary in their resistance, and some (i.e. Roma FSN and Better Boy VFN tomatoes, Nemagold sweet potatoes, and others) are good enough to rate the name "nematode resistant variety". Check out what's available in your host-country.

3. Plowing up roots of nematode infested crops right after harvest will expose them to sunlight and drying, which will kill many of the nematodes; however, many are likely to be left in the soil itself.

4. Flooding: One month of flooding followed by a month of drying and a further month of flooding will greatly reduce nematode problems but is seldom practical.

5. Antagonistic plants: Many organic garden books suggest interplanting marigolds among susceptible crops to control nematodes. Unfortunately, research has shown that marigold species vary in their types of nematodes (root knot, root lesion). Furthermore, nematodes aren't killed by marigolds but only repelled or starved out. This means that interplanting marigolds among susceptible crops isn't effective, since the nematodes still have a food source. You would need to plant marigolds solidly and exclusively for a few months.

Two legume green manure or cover crops, Crotalaria spectabilis (showy crotalaria or rattlebox) and Indigofera hirsuta (hairy indigo) can reduce populations of most types of nematodes. Showy crotalaria is poisonous to livestock.

6. Good soil fertility and high organic matter levels help somewhat.

7. Sugar: 8 kg cf sugar/sq. meter worked into the top 15 cm of soil is said to control root knot nematodes; this may be worth a try if you're in a low cost sugar area.

COCKROACHES:

1 lb. boric acid crystals mixed with 1 can of condensed milk (the thick, sugary stuff). Make pea size pellets out of this, place on pieces of tin foil and use one per room. Will keep a year under refrigeration. Results vary from mediocre to fairly good.
BIRDS:

Soaking large seeds like maize in turpentine before planting may be a fair repellant to seed eating birds. An effective method for vegetable gardens and larger plots is continuous string flagging which uses cloth or plastic streamers 5-6 cm wide and 50-60 cm long. The streamers are attached at 1.5 meter intervals to string twine which is strung along heavy stakes at least 1.2 m tall which are spaced about 15 m apart.

ANOTHER CUTWORM REMEDY:

Tie wild or cultivated onion stems around the stems of susceptible plants at the soil surface.

CORN EARWORM:

Inject 1/4 of a medicine dropper’s worth of mineral oil into the tip of each corn ear; begin as soon as silks appear and repeat every 3 days until silks begin to brown.

HAND PICKING:

Very feasible for small areas and larger insects like beetles and caterpillars.

INTERPLANTING GARLIC AND ONIONS AMONG OTHER CROPS TO REPEL INSECTS:

Gives poor to sometimes fair control of some insects, but don’t rely on it under high insect pressure.

BENEFICIAL PREDATOR INSECTS:

Ladybugs, lacewing bugs, tachnid flies, braconid wasps, praying mantids are among the more common. Where they occur naturally, they can make a big contribution. Trying to introduce them is seldom effective, since they tend to disperse.

BIOLOGICAL INSECTICIDES:

1. *Bacillus thuringiensis* (Dipel, Thuricide, Biotrol): Made from a natural bacteria that kills many types of caterpillars such as cabbageworms, earworms, armyworms, and hornworms. Non-toxic to humans and animals. Slow acting—insects don’t die immediately but stop feeding within a few hours; apply while they’re still young for best results.

2. *Bacillus popilliae*: Causes milky spore disease in Japanese beetle grubs and some other beetle grubs when applied to the soil.
HOMEMADE ORGANIC SPRAYS

All of them except nicotine spray (which isn't really "organic") will only repel some types of insects to varying degrees and may require daily application.

Bug Juice Spray:

You need a strong stomach for this one, and it's of fickle effectiveness. Collect up to half a cup of a bad guy insect like cabbage loopers, stinkbugs, etc. Add 2 cups of water, place in a blender, and whiz it up. Organic gardening says this solution can be diluted up to 1:25,000 but that sounds like a misprint! Try it 1:5 or 1:10 for starters. Use it within an hour or two or freeze it to prevent possible contamination by Salmonella bacteria (food poisoning). Clean your blender well. In some cases, bug juice actually attracts insects; cutworm juice is known to attract cutworms. Some success has been reported with aphids, cabbage loopers, and stinkbugs plus a few more. Don't use flies, ticks, fleas, or mosquitos since they may harbor diseases or parasites.

Plant Juice Spray:

Find a non-poisonous weed or plant leaf unbothered by insects; choose smooth leaf plants, not hairy ones, and then dilute no more than 5 fold with water. Wormwood is said to kill slugs, crickets, and aphids.

Hot Pepper Spray:

Grind hot pepper pods and mix with an equal amount of water. Add a little soap powder. Try it at a 1:20-1:30 dilution with water. Be sure to strain it well before putting it in the sprayer tank.

Garlic-Pepper-Soap Spray:

4 crushed garlic cloves, 4 tablespoons hot pepper, one cake of strong soap, one cup of hot water. Strain and dissolve in 2-4 gallons warm water. Use as a general purpose spray. Results are variable.

Citrus and Banana Peel Spray:

Let banana and citrus peels soak in a pail for several days. Spray the mixture on plants and place the spent peels at their base.

Milk Spray:

Using milk full strength is deadly to many bugs but what a waste of protein! By the way, it's been shown that dipping one's hands periodically in milk or a powdered milk solution when
Transplanting tomatoes can significantly cut down the spread of mosaic virus by contact from plant to plant.

Salt Spray:
A tablespoon in 2 gallons of water supposedly gives fair to good control of cabbage worms; 2 tablespoons/gallon supposedly controls spider mites but test a plant or two for leaf burn first with the spray.

Molasses Spray:
Diluted 1:50 with water and used as a general purpose spray. Sounds doubtful.

Vegetable Oil:
Apply with a sprayer; may kill insects by plugging up their pores.

Soap Spray:
For soft bodied insects like aphids, thrips, whiteflies, mites, but not leafhoppers. Vegetable or plant derived soaps are better for this than petroleum derived ones.

Nicotine Extract:
For sucking insects like aphids, leafhoppers, whiteflies, thrips, and spider mites along with many other non-suckers. Most effective during warm weather. Soak 1-2 cheap shredded cigars overnight in 1 gallon water. Strain and add one teaspoon of household detergent.

CAUTION: Nicotine is poisonous to humans and animals; it can be absorbed through the skin in harmful amounts. It can also spread tobacco mosaic virus to tomatoes, peppers, eggplant, and potatoes.

Miscellaneous
Flour:
Sprinkle on cabbage plants in early morning when dew is heavy. Supposedly controls cabbageworms and their moths by sticking to them and then hardening as it dries out.

Wood Ashes:
May repel some types of insects if sprinkled on plants; if spread in a ring around plants and moistened, they may repel cutworms.
SESSION PREPARATION AND MATERIALS

- Trainer Records.
- Flip chart or blackboard.

TIME

</table>

TRAINER NOTES AND RECOMMENDATIONS

It is important to continue to emphasize the importance of accurate record keeping and to review records sporadically to see how they are being kept.

It might be possible by this point, depending on where trainees are in language training, to keep the records in the host-country language. Consult with language instructors about how to integrate this effort with the language program.
SESSION TITLE: Record Keeping Review/Marketing

SESSION #55  WEEK #4  DAY #19  (55-4-19)

PRESENTER:

CO-FACILITATOR:

TIME: 10:00-11:00 C

INTRODUCTION: SESSION OBJECTIVES

This session will help trainees view the current status of the "training farm" by reviewing the records that are being kept. They will look at, analyze and discuss records relating to:

- Maintenance
- Laying Hens
- Crops
- Hens/Chicks
- Seed Germination
- Other records

The purpose of this session is:

- To determine whether adequate records are being kept.
- To see whether what is on paper represents the real situation on the farm.
- To redesign forms or add new record keeping forms if necessary.
- To consider record keeping in relation to marketing.

HAND-OUT:

READING ASSIGNMENTS:

TECHNICAL VOCABULARY:
SESSION TITLE: Planting Situations

SESSION #56  WEEK #4  DAY #19 (56-4-19)

PRESENTER:

CO FACILITATOR:

TIME: 11:00-12:00 F/C

INTRODUCTION: SESSION OBJECTIVES

This session will basically inform the trainees of the many types of planting situations they will find at their sites and how to make decisions concerning plot locations. The trainees will also learn:

- The factors that should be considered when deciding what vegetables to plant and where each type would be the most productive.
- What major elements are involved and how to plan around them.
- How to plan garden plots once they arrive at their sites.

HAND-OUT:  #56-a Planting Situations
            #56-b Garden Planning Exercise (Thailand).
            #56-c Choosing a Vegetable Garden Location
            #56-d Using the Right Type of Seedbed

                        Small Vegetable Gardens, Pgs 4-27, 4-36.

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Trainer references: *Intensive Vegetable Gardening, Small Vegetable Gardens.*
- Flip chart or black board.
- A variety of planting situations. (See hand-out).
- Any real examples, such as might be found in their plots.

---

TIME | SESSION 56-4-19 ACTIVITIES
--- | ---
5 Min | Explain session objectives. Link to agricultural environment and vegetable characteristics.
15 Min | Recall environmental factors that affect which crops are grown and when. This is a review of the agricultural environment session. Focus the discussion on vegetables and cover the following points.

- Soil and fertility
- Topography and slope
- Seasons and weather
- Time and labor
- Planning
- Markets
- Credit or money

25 Min | Give hand-out to trainees and divide into small groups. (3-4 trainees each.) Each group will decide which vegetables to plant for each of the "Planting Situations." Each group will share its decision with the entire group.

15 Min | Hold discussion on which factors were the most important in each group's decision.

---

TRAINER NOTES AND RECOMMENDATIONS

The quality of the planting situations is the key to this session. Explicit situations will tax trainees level of knowledge. The degree of detail will depend on where this session comes in the training schedule.

T-111
HAND-OUT #56-a

PLANTING SITUATIONS

1. You're at a school in Petchaboon Province near the Basak River. The soil is very fertile and has a moderate amount of organic matter. Your plot is on a slight slope and has good drainage. It's May (the hot season) and the temperature gets up to 39 degree C in the day and drops to 29 degree C at night. It hasn't rained for a month and you can't count on much for 2 months, but there's a spigot 50 meters from your plot. Your plot is 1 "ngan" (1/4 rai or 400 sq m). What would you plant and why?

2. You're at a school in Khon Kaen. Your soil is very sandy with no fertility. In fact, there's no topsoil, because your school is on a hill and the minute amount of topsoil was long ago washed and blown away. Water drains away very quickly on your plot, which is on level ground. It's December and temperatures range from 10 degree C to 28 degree C. There's no rain, but your plot is next to a pond. You've a rai of land to plant on and access to some pig manure. What would you plant and why?

3. Your school is at the base of a mountain in Nan Province. The land slopes 5% and erosion is a problem, especially now in August (the rainy season). The soil has low fertility, but still has some topsoil as the land was only recently cleared. Temperatures go as low as 20 degree C at night and up to 33 degree C on a cloudy day. You've a strip of land along the school fence that is 12 m x 100 m. What would you plant and why?

4. Your school is along the Mekhong River in Nakorn Phano Province. The soil is sandy and poor. A sheet of rock lies 1 to 2 meters below the surface and is exposed in some places. Your agricultural plot is used as a rice field in the rainy season, but it's January and nothing is there except stubble and weeds. Temperatures range from 5 degree C at night to 23 degree C in the day. You've got 1 rai of land and a well that won't go dry. What will you plant and why?
You are a teacher at Meuang Ban School and have been asked to assist in planning the utilization of 1.25 rai (2.5 rai = 1 acre) for planting vegetables and some field crops throughout the year. You have 30 students (age 10-12 years) at your disposal to do the actual work, along with their other studies, during the school day. Most of the crops will be used to supplement the nutritional needs of the students—though it is hoped there will be some extra to sell at the market.

The school well is deep enough to provide water for up to 1.25 rai of vegetables in the dry season. Hot season vegetables can be planted beginning in January. If not following rice, legumes can be planted earlier than normal at the end of August.

SOIL: Clayey; pH of 6.0; low in N, P; 0-3% slope
FERTILIZERS: See Hand-out #49-b. Budget up to 600 Kg for the year.
ORGANICS: Each student will be able to bring 20 Kg of cow manure from home in October and there is 300 Kg of duck manure (available free or donated) from a local farm in February.
INSECT PROBLEMS: Aphids
Bean leaf beetles
Flea beetles
Corn ear worm
DISEASE PROBLEMS: Damping off
Early blight
Powdery mildew

GUIDELINES: Your garden plan should include the following:

1. Planting and harvest dates for the various crops; assume that it's now mid-August and you're all set to start.
2. Area allotted per crop. Amount of seed, transplants needed, seedbed needed.
3. Seedbed style.
4. Raw spacing and in-row spacing for the various crops.
5. Kind and amount of fertilizers that will be needed and how they will be applied and at what rates.
7. General watering schedule.
8. Methods of weed control.
CHOOSING A VEGETABLE GARDEN LOCATION

Here are some important factors to consider:

1. Soil factors: Good drainage is a must and can be enhanced by using some form of raised seedbed. Very clayey or sandy soils can be improved by large additions of organic matter (compost, manure or both; rice hulls help loosen up clay). Try to avoid very rocky or shallow (less than 18") soil. If the slope is much more than 3-4% (3-4 ft drop per 100 ft), some erosion control measures will be needed like contour planting or mulching.

2. Shade: Less of a problem in the tropics due to the higher sun angle, but beware of nearby tall trees. Most vegetables prefer at least 7-8 hours of sun a day. However, partial shading may be beneficial when trying to grow heat sensitive vegetables like lettuce in hot weather. Watch out also for competition from tree roots.

3. Availability of water: Even very rainy climates have dry spells, but provision for irrigation water is vital in areas with a distinct dry season.

4. Protection from animals: Many garden projects have been temporarily devastated by animals, especially cattle, pigs, and goats. Some type of protective fencing is necessary.

5. Wind protection: Exposed plants can be seriously damaged by whipping or stem breakage due to heavy winds. In hot, semi-arid areas such as along the Senegal River in Mauritania, hot, drying winds can literally dry up plants. Some windbreak protection is usually needed for most gardens (i.e. buildings, a hill, planted windbreaks, trees).

6. Protection from pilferage: The best security is locating the site near a house.
The right type of seedbed varies more with climate and soil than with the crop. The common ones are:

RAISED BEDS OR RIDGES: Under conditions of high rainfall and/or poor drainage, crops are usually planted on raised up beds or ridges to keep them from getting "wet feet"; they're also essential when furrow irrigation is used. (In some areas, at the start of the wet season when rains are lighter, field crops like maize, sorghum, and beans are planted on flat beds and then gradually hilled up as the season progresses; this only works with plants that have enough stem height and leaf clearance to tolerate this partial burial). Raised beds are especially well suited for intensive vegetable growing for reasons beyond drainage:

1. They keep the soil looser since there's no need to walk on them. The bed's width should allow all the plants to be reached by hand from the alleyways (about 1-1.5 meters is best).

2. There's less bending over involved.

3. You end up with a double thick layer of topsoil.

4. They reduce the incidence of soil-borne diseases caused by poor drainage.

5. The raised bed makes it possible to use very narrow rows or even equidistant plant spacing, since you don't need to walk among the plants.

Raised beds can also be used under low rainfall or for sandy soils, but their height should be reduced (may be 8-10 cm high vs 15-20 cm high). Mulching would help cut down the extra moisture losses raised beds are subject to under dry conditions. Making a "lip" around the edge of the bed will also help.

---

FLAT SEEDBEDS: Used where moisture is adequate for crop growth and there are no drainage problems.

SUNKEN SEEDBEDS: Under low rainfall or very sandy soil conditions, vegetables may be planted in slightly sunken beds or in slightly sunken furrows to improve moisture availability. In arid conditions, shallow rooted crops like onions that have frequent watering needs can be grown in sunken beds a few centimeters below normal soil level.

214
SESSION TITLE: Plant Disease and Control

SESSION #57  WEEK #4  DAY #20 (57-4-20)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-9:30 F/C

INTRODUCTION: SESSION OBJECTIVES

Plant diseases are more abundant in tropical regions than in temperate regions. Therefore, it is important that the trainees have experience with the common plant diseases of the host-country. During this session the trainees will be able:

- To identify a healthy plant from one that is diseased.
- To determine the cause of the disease by observing the symptoms.
- To identify the disease as bacteria, fungus or virus.
- To understand the methods of control for each type of crop with each type of disease.

HAND-OUT:

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Disease</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>Bacteria</td>
</tr>
<tr>
<td>Control</td>
<td>Fungus</td>
</tr>
<tr>
<td>Identify</td>
<td>Virus</td>
</tr>
<tr>
<td>Symptoms</td>
<td>Wilt</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Samples of plant symptoms from each type of disease i.e. root, stem, leaves, shoot and fruit.
- Samples in field of diseased plants.
- Sharp knife, beaker and water for testing bacterial diseases.
- Flip chart and felt pen.
- Picture posters of plant diseases if available.
- Coordination with Center Instructor—two weeks prior to session.

TIME SESSION 57-4-20 ACTIVITIES

10 Min Explain session objectives.
30 Min Observe plant samples and discuss, as well as identify, the disease and control measures.
40 Min In the field, have trainees collect diseased plants with each trainee collecting and identifying each sample, from the trainees' plots.
10 Min Return to class and summarize, clean-up.

TRAINER NOTES AND RECOMMENDATIONS

This session should be about half in the lab and half in the field. The assistance of the Center facilities and the instructor would be highly recommended. The Center Instructor should be contacted two weeks prior to session presentation.
SESSION PREPARATION:

- Same as for Quiz I (see Session 37-2-10).
- Compile a list of agricultural problems that are common in villages, schools and the training. Select those for which the trainees can give reasonable answers of one or two paragraphs in length.

TIME

SESSION 59-4-20 ACTIVITIES

2 Min Distribute Quiz II and explain that trainees have two days to finish it.

55 Min Trainees begin Quiz II.

TRAINER NOTES AND RECOMMENDATIONS

Skill areas in which trainees did well on Quiz I, need not be covered in Quiz II. Emphasize their weak points and new information. It is probable that the metric system and conversions will still be a problem. Before giving Quiz II as a take-home, make sure that trainees will be able to do the quiz at home (i.e. home-stay).
SESSION TITLE: Maintenance

SESSION #58 WEEK #4 DAY #20 (58-4-20)

PRESENTER:

EDI-FACILITATOR:

TIME: 9:30-11:00 F

INTRODUCTION: SESSION OBJECTIVES

Refer to Session #33-2-9 for details on maintenance.

This session can also be used by trainees for individual plot evaluations. The trainer could give out Hand-out #62-a so that trainees could evaluate their plots before the Trainer Plot Evaluations the next day for comparisons during Progress Review. (See Session 62-4-21 for details.)
SESSION TITLE: Quiz II
SESSION #59 WEEK #4 DAY #20 (59-4-20)
PRESENTER:
CO-FACILITATOR:
TIME: 11:00-12:00 C

INTRODUCTION: SESSION OBJECTIVES

Another eleven days have passed and it is time for a more detailed assessment of learning. In addition to what was covered by Quiz I, trainee problem solving abilities are assessed (see Session #37-2-10). Because this quiz may take longer to complete than the first one, this quiz can be taken home and completed in two nights.

Objectives are:

- Same as Quiz I, plus;
- To measure trainee capacity to solve common agricultural problems, especially those that have occurred during this training.

HAND-OUT: Quiz II.

READING ASSIGNMENT: Review hand-outs and readings.

TECHNICAL VOCABULARY:

- Problem
- To analyze
- To solve
SESSION TITLE: Fruit Tree Propagation

SESSION #60  WEEK #4  DAY #21  (60-4-21)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-11:00 F/C

INTRODUCTION: SESSION OBJECTIVES

With fruit of all types abundant in the host country and of major importance in the diet of most people, it seems appropriate that the trainees learn the arts connected with developing new fruit sources as well as how to improve existing plantings. Therefore the objectives of this session will teach the trainees the following techniques and skills:

- To identify the different fruit tree species and understand the appropriate technique for propagation for each type.
- To develop the skills necessary for the three most common types of fruit tree propagation, i.e. cleft grafting, approach grafting and air layering.
- To thoroughly understand the concepts for sexual and asexual propagation.
- To know how and why to select proper propagation material and root stocks.
- To properly use equipment and materials for successful propagation.

HAND-OUT: #60-a Fruit Tree Propagation

READING ASSIGNMENTS:

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Propagation</th>
<th>Select</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grafting</td>
<td>Grafting knife</td>
</tr>
<tr>
<td>Air layering</td>
<td>Plastic tape</td>
</tr>
<tr>
<td>Stock</td>
<td>Plastic bag</td>
</tr>
<tr>
<td>Scion</td>
<td>Hang</td>
</tr>
<tr>
<td>Coconut husk</td>
<td>Clay soil</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- If possible arrange with a nursery to provide root stocks, scions, trees for side graft and air layering.
- Grafting knife, razors, plastic grafting tape, plastic bags, coconut husk soaked in water for one week and clean clay soil for air layering.

TIME SESSION 60-4-21 ACTIVITIES

<table>
<thead>
<tr>
<th>Time</th>
<th>Activity</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Explain objectives.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Explain the different methods of fruit tree propagation and demonstrate the proper use of equipment. Have co-facilitator assist you.</td>

<tr>
<td>20 Min</td>
<td>Have each trainee take orange root stock and scion and practice 2 methods of grafting.</td>
</tr>
<tr>
<td>30 Min</td>
<td>Demonstrate approach grafting and have trainees take necessary materials and go into the field, select a suitable tree and practice with one or two grafts.</td>
</tr>
<tr>
<td>30 Min</td>
<td>Demonstrate air layering and have trainees take necessary materials and go into the field, select a suitable tree and practice with one or two grafts.</td>
</tr>
<tr>
<td>30 Min</td>
<td>Demonstrate air layering and have trainees tape necessary materials and go into the field, select a suitable tree and practice air layering on one or two branches.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Have trainees clean up. Hold question and answer session.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

The time allocated for this session was 3 hours and appeared to be sufficient. This session is mostly hands-on experience; therefore 3 hours was well accepted for one subject. The follow-up for this session occurs in week #7, day #38. At that time trainees have the opportunity to return and check the progress of their grafts. Fruit tree grafting is an important subject; therefore this session should be well prepared in advance with the assistance of the training center's facilities and staff, if possible.
FRUIT TREE PROPAGATION

There are two ways to propagate fruit trees.

1. Seed or sexual propagation.
2. Vegetative or asexual propagation: cutting, air layering budding, grafting.

Before we select any method for propagation we should discuss the advantages or disadvantages of each method.

<table>
<thead>
<tr>
<th>ADVANTAGES OF SEED PROPAGATION</th>
<th>DISADVANTAGES OF SEED PROPAGATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Easy to do and can get a lot of plants at one time.</td>
<td>1. Easy to have mutant and usually get recessive characteristic.</td>
</tr>
<tr>
<td>2. Small in size and easy when transporting.</td>
<td>2. Take longer to be able to provide fruit.</td>
</tr>
<tr>
<td>3. Won’t get virus disease from mother plant.</td>
<td>3. Tall plants, harder to maintain and harvest.</td>
</tr>
<tr>

</tbody>
</table>
SESSION TITLE: Introduction to Marketing (Animals)

SESSION #61  WEEK #4  DAY #21  (61-4-21)

PRESENTER:

CO-FACILITATOR:

TIME: 11:00-12:00 C

INTRODUCTION: SESSION OBJECTIVES

Marketing of crops and animals is of equal importance to their production. Without marketing, production becomes a high risk business with returns on investments unplanned and unguaranteed. Therefore it is important that trainees learn the basic principals of marketing and:

- Understand how the marketing system of the host-country is structured.
- What pre-planning is necessary for successful transactions.
- What the market demands in terms of quality and how it affects price.
- How to prepare and present products for sale for highest returns.

HAND-OUT:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Market</th>
<th>Merchant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quality</td>
<td>Process</td>
</tr>
<tr>
<td>Price</td>
<td></td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Trainer reference: Market Statistics from USDA and/or Thai Government.
- Local Market Reports.
- Visit to local markets.

---

TIME | SESSION 61-4-21 ACTIVITIES

5 Min | Explain session objectives.
15 Min | Discuss marketing system of the host-country i.e. merchants, daily markets and how local customs affect marketing.
10 Min | Discuss ways to plan for marketing well in advance of actual sale.
15 Min | Discuss quality control in the host-country markets and its effect on selling price.
15 Min | Discuss ways of marketing in order to receive the highest possible return, i.e. poultry—live or processed.

---

TRAINER NOTES AND RECOMMENDATIONS

This session could coincide with a trip to the local market and the session's points discussed while touring the market. Lunch could follow at the market to observe the trading activities.
SESSION TITLE: Plot Evaluations

SESSION #62 WEEK #4 DAY #21 (62-4-21)

PRESENTER:

CO-FACILITATOR:

TIME: 13:30-14:30 F

INTRODUCTION: SESSION OBJECTIVES

This session only involves the agricultural technical trainers (crops) and is specifically designed as one method of evaluating trainee performance to date.

The hand-out #62-a could be given to the trainees prior to session #58, week #4, day #20 and during this session they would evaluate their own plots. Their evaluation would be compared with the trainer's evaluation and discussed during session #72 week #5, day #25, with each trainee at his/her plot—on a one-to-one basis.

These evaluation results would be presented and compared at the regularly scheduled staff progress review.

SESSION TITLE: Mixing and Applying Pesticides

SESSION #63  WEEK #4  DAY #22  (63-4-22)

PRESENTER:  
CO-FACILITATOR:  
TIME: 8:00-10:00 F/C  

INTRODUCTION: SESSON OBJECTIVES

Insect control is of major importance to successful crop production. Therefore it is important that trainees know how to mix and apply chemicals properly and safely as well as how to operate and maintain the spraying equipment. This session will give the trainees experience in:

- Acquiring the skills necessary and the proper techniques of mixing pesticides safely.
- Developing the skills for calibrating pesticide spray equipment.
- Learning proper methods of mixing wettable powders and emulsifiable concentrate liquids.
- Learning how to calculate the amount of commercial product (formulation) needed to provide the amount of actual insecticide. (Chemical)
- Learning the basic skills of insect monitoring or when it is the optimum time to spray.
- Learning how to operate and maintain spraying equipment.

HAND-OUT: #63-a Knotts Handbook for Vegetable Growers, Pgs 200-205 (Calibration Charts)

TECHNICAL VOCABULARY:

- Gloves
- Bucket
- Insecticide
- Calibrating
- Formulation
- Monitoring
- Protective clothing
- Pump type sprayer
- Measuring cup and spoon
- Wettable powders
- Emulsifiable concentrate liquids
SESSION PREPARATION AND MATERIALS

- Rubber gloves.
- A clean bucket of water with soap.
- Protective clothes and proper shoes.
- Two 10 l. pump sprayers.
- Insecticides: Seven wettable powder.
- Malthion E.C.
- Mixing bucket.
- Measuring cups and spoons.

TIME

SESSION 63-4-22 ACTIVITIES

10 Min  Explain session objectives.

10 Min  Discuss techniques for mixing different types of formulations i.e. wettable powders and emulsifiable liquids. Explain why chemical applications fail, i.e. delayed applications, insufficient mix or wrong type of pesticide.

10 Min  Demonstrate the techniques for calibrating and uniform applications, emphasizing early morning spraying.

10 Min  Explain how to calculate the amount of material needed from the product's "percent of active ingredient."

10 Min  Explain the importance of insect monitoring to avoid scheduled spraying.

10 Min  Demonstrate the proper use and maintenance of the spraying equipment.

60 Min  Have trainees monitor their individual plots and determine the areas that need spraying. If spraying is not necessary they can practice mixing and calibration with lime and pure water.

TRAINER NOTES AND RECOMMENDATIONS

This session should coincide with the vegetable plots actually at the stage where insecticide applications are necessary. Emphasize the importance of insect monitoring and avoid scheduled sprays.
SPRAY EQUIVALENTS AND CONVERSIONS

Pesticide containers give directions usually in terms of pounds or gallons of material in 100 gal of water. The following tables make easy the conversion for smaller quantities of spray solution.

**SOLID EQUIVALENT TABLE**

SPRAY ADJUVANTS OR ADDITIVES

Adjuvants are chemicals that, when added to a liquid spray, make it mix, wet, spread, stick or penetrate better. Water is almost a universal diluent for pesticide sprays. Water is not compatible with oily pesticides, and an emulsifier may be needed to obtain good mixing. Furthermore, water from sprays often remains as large droplets on leaf surfaces. A wetting agent lowers the interfacial tension between the spray droplet and the leaf surface and thus moistens the leaf. Spreaders are closely related to wetters and help to build a deposit on the leaf and improve weatherability. Stickers cause pesticides to adhere to the sprayed surface. They are oily and serve to increase the amounts of suspended solids held on the leaves of fruits by holding the particles in a rain-like film.

Recently a new group of materials called extenders has been developed. Extenders form a sticky, elastic film that holds the pesticide on the leaves and thus reduces the rate of loss due to sunlight and rainfall.

Spray adjuvants for use with herbicides often serve a function distinctly different from that of adjuvants used with insecticides and fungicides. For example, adjuvants such as oils used with atrazine greatly improve penetration of the chemical into leaves, rather than just giving more uniform coverage. Do not use an adjuvant with herbicides unless specifically recommended.

Adapted from R.F. Sandsted et al., Cornell Recommendations for Commercial Vegetable Production, New York State College of Agriculture, Cornell University (1979).
GUIDELINES FOR EFFECTIVE PEST CONTROL

Often failure to control an insect, mite, or disease is blamed on the pesticide even though the cause may lie elsewhere. Among the more common reasons for failure are the following:

1. Delaying applications until pests become too large or too numerous.

2. Making applications with insufficient gallonage or clogged and/or poorly arranged nozzles.

3. Selecting the wrong pesticide.

Follow these suggestions to ensure more effective pest control:

1. Inspect field regularly: Keep abreast of pest buildup. Frequent examinations (at least twice a week) help to determine the proper timing of the next application.

2. Control insects and mites according to schedule: Many pest problems can be predicted to occur at approximately the same time year after year. Examples are corn earworm, cabbage looper, and Colorado potato beetle. One application before buildup often eliminates the need for several applications later in the season. Often less toxic and safer-to-handle chemicals are effective when pests are small in size and population. After pest buildup, more toxic chemicals frequently are needed to control infestations. If possible, spray when the weather is ideal. Spray only when wind velocity is less than 10 mph. Dust only when it is calm. Do not spray when plants are wilted during the heat of the day. Sprinkler irrigation washes insecticide deposits from foliage. Wait at least 48 hours after insecticide application before irrigating. More frequent applications may be needed during and after periods of heavy rainfall.
3. Strive for adequate coverage of plants: The principal reason aphids, mites, cabbage loopers, and diseases are serious pests is that they occur beneath leaves where they are protected from spray deposits or dust particles. Improved control can be achieved by adding and arranging nozzles so that the application is directed toward the plants from the sides as well as the tops. In some cases, nozzles should be directed for application beneath the leaves. Sprays from high-volume, high-pressure rigs (airblast) should be applied at rates of 40-100 gal/acre at approximately 400 psi. Sprays from low-volume, low-pressure rigs (boom type) should be applied at rates of 50-100 gal/acre at approximately 100-300 psi.

4. Select the proper pesticide: Know the pest(s) to be controlled and use recommended pesticides and rates of application.

Adapted from Commercial vegetable production recommendations, Maryland Agricultural Extension Service EB-236 (1979).
VEGETABLE SEED TREATMENTS

Various vegetable seed treatments prevent early infection by seedborne diseases, protect the seed from infection by soil microorganisms, and guard against a poor crop stand or crop failure caused by attacks on seeds by soil insects.

Two general categories of vegetable seed treatments are used. Eradication treatments kill disease-causing agents on or within the seed, whereas protective treatments are applied to the surface of the seed to protect against seed decay, damping-off, and soil insects. Hot-water treatment is the principal means of eradication, and chemical treatments usually serve as protectants. Follow time-temperature directions precisely for hot-water treatment and label directions for chemical treatment. When insecticides are used, seeds should also be treated with a fungicide.

HOT-WATER TREATMENT

To treat seeds with hot water, fill cheesecloth bags half full, wet seed and bag with warm water, and treat at exact time and temperature while stirring to maintain a uniform temperature. Use an accurate thermometer.

CHEMICAL SEED TREATMENTS

The most frequently used fungicides are thiram and captan applied as a dust or slurry. Large-seeded vegetables may be protected from attack by soil insects by combining diazinon, lindane, or lorsban with fungicides. Use only on crops if approved for such use, and follow label directions.
SESSION TITLE: Chicken Records Analysis

SESSION: #64 WEEK #4 DAY #22 (64-4-22)

PRESENTER:

CO-FACILITATOR:

TIME: 10:00-11:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Record keeping is important not only for animals but anywhere there is input and output. Accurate records confirm three basic points. How much did you spend? How much did you take in? How much was left over (profit)? This session will assist the trainees:

- In acquiring an understanding of the importance of accurate record keeping for all livestock raising activities.

- To use records from the training farm to calculate flock performance compared to accepted norms and strategies to improve returns.

- To discuss ways of motivating students to maintain adequate records at their sites.

HAND-OUT: #64-a Field Notebook Outline - Poultry.

READING ASSIGNMENT: Practical Poultry Raising, Pgs 153-168.
SESSION PREPARATION AND MATERIALS

- Trainer reference: *Practical Poultry Raising*.
- Raise and keep adequate records of training animals for several weeks.
- Analyse records before session to understand trends reflected by them.

----------------------------------------
TIME

SESSION 64-4-22 ACTIVITIES

5 Min
Explain session objectives.

90 Min
Use records from training farm to guide trainees through calculations for:

- Laying percentage
- Feed consumption/bird for two rations
- Feed cost/dozen eggs for two rations
- Total cost/egg
- Broiler feed consumption
- Broiler growth rate
- Broiler feed conversion

Have trainees discuss performance compared to accepted norms as well as reasons and strategies to improve management for each problem.

25 Min
Have trainees discuss importance of records and ways to motivate students to keep records.

----------------------------------------
TRAINER NOTES AND RECOMMENDATIONS

This session should be scheduled late enough in the training to have adequate records--preferably after at least one ration change, but with still enough time remaining in training to implement any management change suggested by the results.
FIELD NOTEBOOK OUTLINE - POULTRY

I. RAISING CHICKS

1. Preparation for receiving chicks.
2. Breed.
3. Date bought # Date sold #
4. Space requirements (floor space, feeders, waterers).
5. Housing (roof, floors, litter, feeders, waterers, lime at entry).
6. Brooding system.
7. Vaccination program including: vaccine, date, product, method.
8. Control of internal and external parasites (date, product, method).
9. Feeding program (including different rations and their protein level).
10. Locally available foodstuff (include maximum percent permissible in diet).
11. Diseases (if they appear) include: symptoms, causes, and means of control.
12. Other (check lists, record sheets, etc.)

II. BROILERS

1. Weight at 7th and 8th week.
2. Selling price (amount per kilo).
3. Weekly and total feed consumption and cost.
4. Feed conversion rate.
III. LAYERS

1. Start of laying date.
2. Nest space requirements.
3. Debeaking (date, method).
4. Culling (date, number culled).
5. Calcium and/or phosphorus source.
6. Pounds of feed per dozen eggs.
7. Laying rate (include date and expected production).
8. Artificial lighting (system, number hours per day).
9. Molting (system, date started, date of return to maximum production).
10. Vaccination program and parasite control.
SESSION TITLE: Program Manager II

SESSION #65 WEEK #4 DAY #22 (65-4-22)

PRESENTERS:

CO-FACILITATOR:

TIME: 11:00-12:00 C

INTRODUCTION: SESSION OBJECTIVES

During this session the Program Specific (Education) Program Manager talks with trainees about the host-country (Thai) bureaucracy.

Objectives are:

- To provide an overview of the structure and working of the Thai bureaucracy;
- To mention some problems PCVs have with the bureaucracy and to suggest how to deal with these problems.

HANDOUTS:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
**SESSION PREPARATION AND MATERIALS**

- Schedule the session with the Program Manager(s) and inform him/her of the topics to be discussed.
- Confirm, by letter, the date and topics.
- Compile a list of questions that are based on trainee concerns.
- Inform the Program Manager of topics related to this session that have already been covered in training.

SESSION TITLE: Swine Management Skills

SESSION #66  WEEK #4  DAY #23 (66-4-23)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

This session is important in that it covers the entire range of swine production skills which are relevant to even small-scale producers. The trainees will:

- Gain the confidence they need to handle swine.
- Acquire the skills necessary to establish credibility, in swine production, at their sites.

HAND-OUT: #66-a Management Techniques for the Care of Piglets.

READING ASSIGNMENTS: Small-Scale Pig Raising, Pgs 150-169.

TECHNICAL VOCABULARY:

</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

Session scheduling should be flexible enough to accommodate farrowing date of swine. Depending on practices pending during volunteer visits, session could be expanded to include assisting a farrowing sow, scours treating, vitamin or vaccine shots, ear notching and tail docking.

The training staff may decide to forgo requiring each trainee to practice castration due to lack of animals or the beliefs or feelings of the trainees. However they should all watch and observe the techniques involved.
Needle Teeth

Piglets are born with 8 tiny "needle" teeth that are so named because of their sharp tips. If left unclipped they are used by piglets to compete with one another. The results of such competition are scratched up sow's teats, which can lead to infections and/or mastitis, and the piglets will chew on the sides of each others faces while competing for milk. To prevent this scratching and chewing, it is best to clip the ends of these teeth. Wire cutting pliers or toe nail clippers can be used to remove the top one third of each tooth. Care must be taken to make a clean cut and not break the tooth off, because a broken tooth can cause gum infections and abscesses. Hold the piglet's mouth open with your finger far back between the jaws and snip the needle teeth with the clippers in the other hand.

Tail Docking

Tail docking is a practice that should be used in high level management conditions where pigs are being raised in a clean environment and subject to crowded conditions. Chewing results because of the stress of overcrowding. Piglets chew the tails of other pigs near them. Since there is very little feeling in the last third of the tail, crippling infections can occur from the open wounds that result from chewing. When the pig is about one week of age (provided that it appears healthy and unstressed) a sharp knife can be used to remove the tip of the tail. It is important to apply a disinfectant, such as iodine, to the wound after clipping. In a free-ranging environment where pigs have plenty of room, this is not a necessary or recommended practice, since it does open a wound to infection.

Iron Shots

Piglets are born quite anemic due to a very low reserve of iron. Iron is needed to produce the oxygen carrying hemoglobin in the blood. The sow does not provide iron in her milk, so piglets must get it from another source. Free-ranging pigs will eat soil while rooting in order to get the needed iron. Pigs raised in confinement on cement or wood floors need another source. One way to provide iron to piglets quickly and easily is to give a 1 to 2 cc injection of a liquid iron solution. Piglets that do not receive this injection within the first two weeks of life never produce to their genetic potential and should not be considered as high production pigs. This intramuscular injection should be given in the ham some time within the first three days after farrowing. Avoid veins and arteries when giving this shot. Clean the flesh where the shot is to be given with an alcohol saturated cotton ball. Aspirate (draw back the plunger of the
Syringe) after the needle is poked into the ham to see if blood enters the syringe. If blood enters the syringe, you have the needle inside an artery or vein and you need to move it. If no blood enters the syringe, then depress the plunger and complete the injection. Be sure to wipe the needle down with alcohol before doing the next injection. Syringes and needles should be boiled after finishing with one litter before injecting another.

Castration: Castration is the practice of removing the testicles from the male pigs and may be practiced for any of the reasons below:

1. Prevents uncontrolled breeding in the herd.
2. Gives the farmer control over which boars he/she wishes to use as breeding stock.
3. Some feel that castration can improve the f/g ratio of young boars.
4. Castrated boars are of a more even temperament than uncastrated boars.
5. The meat of a castrated boar has a less gamy or strong flavor than that of an uncastrated boar.
6. In many cultures, people prefer eating a boar if it has been castrated.

Ideally, castration should be done with young piglets when they are two weeks of age. Castrating them at this age is best because smaller wounds are made, healing is rapid, and it is less stressful for the piglet than if done later.

Procedure: Castrating a piglet will require two people. The holder places the piglet on its back in his or her lap with the rump facing up. The piglet’s hind legs should be held forward. This presses the testicles tightly against the scrotum while at the same time restraining the piglet. If the scrotum area is dirty, wash it with soap and water and then with a disinfectant. The person doing the cutting presses the testicle against the skin on the side of the scrotum between the thumb and the forefinger, and slices down with a sterile razor blade. Make only one cut and do not saw. Pressure behind the blade should cause the cut to pass through the skin and into the testicle. If the blade cuts the testicle, it is okay, because it will be gone soon. The cut should be a half inch to an inch long and low on the scrotum to assure proper drainage from the wound. Remember that “low” will appear high on the upturned piglet. As soon as the incision is made, press the testicle through the opening and pull it gently away from the piglet’s body. It will be attached by what appears to be one piece of stringy tissue. Actually, there are two vessels closely attached to one another; the sperm duct, which is white and the blood vessels which are red. First, cut through the white sperm cord. Then pull the blood vessel out until you feel a little tension and snip it off as close to the body as possible. When you have completed the removal of the second testicle, apply disinfectant and release the piglet.
SESSION TITLE: Fertilizer Math and Introduction to Metric IV

SESSION #67  WEEK #4  DAY #23  (67-4-23)

PRESENTER:

CO-FACILITATOR:

TIME: 10:00-11:00 C

INTRODUCTION: SESSION OBJECTIVES:

Applying fertilizer for increased yields is extremely important, but applying the right amounts of the right elements is more important. This will, in effect, have the most dramatic effect on profit and loss. This session is designed to develop the math skills for:

1. Calculating the most economical source of N given the choice of several blends and straight N fertilizers.

2. Determining the amount of fertilizer for any given area, per plant, per meter of row length in Kg/ha or lbs/acre.

3. Using metric calculations in the host country.

HAND-OUTS: #67-a Take Home Math Quiz

READING ASSIGNMENT: Soils, Crops and Fertilizer Use, pages 50-52.
Intensive Vegetable Gardening, pages 39-41.

TECHNICAL VOCABULARY:
**PREPARATION AND MATERIALS:**

- Trainer reference: *Soils, Crops and Fertilizer Use*
  - *Intensive Vegetable Gardening*
- Pre-planned fertilizer problems for classroom discussion.
- Pre-planned fertilizer math problems for the take home quiz.

<table>

</tr>
</tbody>
</table>

**TRAINER NOTES AND RECOMMENDATIONS**

This is the first and last session on metric. Therefore, the quiz should be more difficult, but realistic and relevant to what they will be confronted with at their sites. Hard and frustrating tests accomplish nothing, but learning type quizzes are well accepted.
Introduction: The following quiz is not to test your skills in fertilizer math and the metric system but to assist you in developing your skills in these areas. The objectives are for you to compute the correct solutions as well as to know how you got them.

1. If you are to apply chemical fertilizers at the following rates (15-15-15 at 44 kg/rai and 21-0-0 at 80 kg/rai, how much would you apply to 500 square meters?

2. What would the total N-P-K be in kg/rai?

3. What would the application rates of 44 kg/rai and 80 kg/rai be if calculated in lbs/ac?

4. Assume that the following types of seeds have a germination percentage of: corn 70%, beans 80%, cabbage 90%, cucumbers 60% and pumpkin 95%. Using the following information, how much of each type would you plant to receive optimum plant population?

<table>

5. Convert the above to KG/rai and the answers to Kg/rai.

6. Imagine at your school you have an area of .55 rai which has never been used for agricultural purposes before. You and your co-worker have decided to plant mango trees in this area. The recommended spacings for mangos are 2x4 square meters.

a. How many mango seedlings will you require?

b. Of the three major nutrients N-P-K, which one will be the most important in the early stages of the mango seedling growth? Why?

c. After the trees are two years old and start to set fruit, the fertilizer recommendations for your area are 12-24-12, 300 Kg/rai.

d. How many kg/tree would you apply?

e. How and when would you apply this fertilizer?
7. a. Your vegetable garden is divided into three groups:
   Group A: kale, cabbage, chinese cabbage, morning glory
   Group B: cauliflower, broccoli and curcubits
   Group C: Japanese radish, carrots and beet roots

   b. None of these groups received fertilizer pre-plant.

   c. At what stage will you apply fertilizer?

   d. What type of fertilizer N-P-K will you apply to each group? why?

SESSION TITLE: Maintenance

SESSION #68 WEEK #4 DAY #23 (68-4-23)

PRESENTER:

CO-FACILITATOR:

TIME: 11:00-12:00 F

INTRODUCTION: SESSION OBJECTIVES

Refer to Session 33-2-9 for details.
SESSION TITLE: Soil Conservation

SESSION #69 WEEK #4 DAY #24 (69-4-24)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

One serious problem area of the-host country that receives little attention is soil conservation. Many of the trainees' sites have lost or have very poor topsoil. This is true for many reasons including site location and construction. Therefore it is imperative that trainees:

- Recognize good soil conditions and know the appropriate measures to maintain and conserve them.
- Understand the common soil conservation problems of the host-country and how to improve or prevent serious erosion problems.
- Understand the relationship between slope and surface drainage which when not controlled equal soil erosion.

HAND-OUT:

READING ASSIGNMENT: Soils, Crops and Fertilizer Use, Pgs 1-19.

TECHNICAL VOCABULARY:

- Soil
- Fertility
- Topsoil
- Organic matter
- Structure
- Erosion
- Slope
- Contour plowing
- Contour planting
- Cover cropping
- Inter-cropping
- Crop rotation
- Dikes
SESSION PREPARATION AND MATERIALS

- Trainer references: *Soils, Crops and Fertilizer Use*, Fgs 1-19.
- Flip charts and felt pen.
- Tape measure, string, small nails, stakes, carpenter level, flat boards and protractors.

### TIME SESSION 69-4-24 ACTIVITIES

<table>
<thead>
<tr>
<th>Time</th>
<th>Activity</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Min</td>
<td>Explain session objectives.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Discuss what good soil is and list qualities on flip chart. Do the same for bad soil, new soil and the aspects of soil that need protection—i.e. fertility, organic matter, topsoil and structure.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Discuss the concept of slope, how it is calculated, what it means and its importance in soil conservation.</td>
</tr>
<tr>
<td>30 Min</td>
<td>Discuss soil conservation techniques that are recommended in the host-country and the conditions for which they are recommended. Illustrate with charts/pictures or slides, i.e. contour plowing and planting, cover crops, inter-cropping, wind breaks and crop rotation.</td>
</tr>
<tr>
<td>45 Min</td>
<td>Have trainees measure slope in the garden plots using the two methods described in the <em>Soils</em> book.</td>
</tr>
<tr>
<td></td>
<td>Discuss soil conservation techniques.</td>
</tr>
</tbody>
</table>

**Note:** See Fgs 21-23, *Soils, Crops and Fertilizer Use*, for slope-finding methods.

**TRAINER NOTES AND RECOMMENDATIONS**

The first part of this session both reviews some of the things trainees have learned about soils and gets them thinking about conservation. The latter part of the session should be an overview, emphasizing when conservation is called for and only generally considering the various methods, since trainees will not be able to employ many of the recommended techniques until their second year as volunteers.

SESSION TITLE: School Hierarchies and Relationships
SESSION #70  WEEK #5  DAY #25  (70-5-25)
PRESENTER:
CO-FACILITATOR:
TIME:  8:00-9:00 C

The Session Design for this Program Specific Session is in Appendix A.
SESSION TITLE: Introduction to Field Day

SESSION #71 WEEK #5 DAY #25 (71-5-25)

PRESENTER:

CO-FACILITATOR:

TIME: 9:00-10:00 C

INTRODUCTION: SESSION OBJECTIVES

Before trainees can take charge of Field Day, the goals and guidelines for it must be explained. This should be done before "Introduction to Demonstrations," so that trainees understand how the demonstrations fit into Field Day and before the break so that trainees have enough time for planning.

The objectives of this session are:

- To explain the idea of Field Day, what has been done in the past and what might be done this time.
- To make clear to trainees the conditions and guidelines that must be followed for Field Day.
- To have trainees begin to think about their Field Day.

HAND-OUTS:
- #71-a Field Day
- #71-b Sample Schedule
- #71-c Field Day Guidelines

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

- To organize
- Field Day
- To advertise
- Committee
SESSION PREPARATION AND MATERIALS

- Staff (including Core Staff) decides on the guidelines to be given to trainees and the role staff will play during Field Day preparation and Field Day itself. It must be made clear to everyone that the trainees are in charge. Staff members should limit their suggestions as much as possible.

<table>

</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

This session is primarily to explain Field Day. All future sessions related to Field Day will be led by trainees.

The Field Day Advisor is the staff person responsible for Field Day. This trainer is either the Technical Coordinator or a trainer who has participated in a previous Field Day, ideally both.
FIELD DAY

Field Day is a series of method demonstrations, result demonstrations and scale-model demonstrations which can be focused on a central theme. These and other activities are strung out over the course of a day which, at your site, can be used to promote new practices and bring recognition to successful students and farmers in your area. The point of such a day is to call attention to new and exciting developments in agriculture. The prevailing mood is festive and the atmosphere is like that of a country fair.

Activities can include inviting special guests, cooking a big meal, sports, preparing presentations, music and dancing. It is not expected that farmers leave a field day having learned a great deal of specific information, but leave with new interests and new concepts of what is possible to accomplish.

The first consideration is to decide whether or not to have a theme—if so, what. The next concern is to come up with a list and sequence of demonstrations, booths, activities and other events and features. This is followed by planning the routing of guests through the course of the day, meals and refreshments, entertainment, and clean-up. A decision has to be made, for instance, to route guests through demos in a single, large group, in several smaller groups, or individually. This will depend on how large a turnout is expected and how many people are involved in organizing the day. For all of the different tasks, responsibilities need to be clearly designated.

Contingency plans should be made for late arrivals, rain, and slow-moving groups. It is useful to choose someone to monitor the progress of the day overall. This person can be responsible for setting any contingency plans in motion should they prove necessary.

The work involved in putting on a field day can be divided into stages. There are initial meetings at which decisions are made concerning field day topics, guests and the division of responsibilities among planners. These are followed by a period of early preparation during which presentations are rehearsed, invitations are sent out and meetings are held about routing of guests. Then come last minute preparations such as cooking, assembling materials for demonstrations and marking paths where guests will walk. On field day itself someone greets the guests, demonstrations are given, a big meal is eaten, someone thanks the guests for coming and then a clean-up crew goes to work. At your site, follow-up contacts should be initiated and continued over the course of the next few weeks or months.
Individual presentations should not exceed half an hour. Sufficient time is necessary at both the beginning and end of the day for guests to travel to and from their homes. Water, shade, and chairs should be available.

List of responsibilities to be considered:

1. Invitations.
2. Clear area around demonstration sites.
3. Set up/move chairs.
4. Master/Mistress of ceremonies.
5. Guides.
6. Presenters.
7. Refreshments and water.
8. Timer.
11. Clean-up.

Reasons for Field Day:

1. To provide trainees with the opportunity to demonstrate the skills and knowledge they have acquired during training.

2. To identify field days as a useful promotional technique in attracting farmers to an agricultural program.

After trainees have presented activities they have designed and prepared, they meet with the trainers to evaluate the day. Trainees may start with a critique of their individual presentations. The trainee-planners may give a self-critique also, including how well they planned for the field day, conducted the planning meetings, etc. The trainers give constructive feedback to trainees on the field day.

Note: Trainees may be allowed to choose a theme. If trainers choose a theme, the opportunity exists to meet specific technical training objectives.

HAND-OUT #71-c

FIELD DAY GUIDELINES
(a sample)

**DATE:**
Saturday, September 30, 1984

**TIME:**
(up to trainees)

**LOCATION:**
Any place accessible to villagers.

**AUDIENCE:**
Farmers and their families.

**BUDGET:**
Money raised by livestock, food and other sales, plus a specified (in advance) amount from training budget.

**RECEIPTS:**
Needed for all purchases.

**LIVESTOCK:**
All of the pigs raised during training will be auctioned or raffled on Field Day. Broiler chickens will be slaughtered, cooked and sold at a reasonable price. Extra birds can be sold live. All profits from livestock will go to defray Field Day expenses.

**VEHICLES:**
The van and pick-up will be made available, if requested through the Technical Coordinator.

**DEMONSTRATIONS:**
All trainees do one, in Thai, except, the master of ceremonies.

**STAFF SUPPORT:**
Will answer questions. Will not offer unsolicited advice and suggestions, except for the designated advisor.

**MATERIALS AND EQUIPMENT:**
Peace Corps equipment is available. Other items can be borrowed, rented or bought within budgetary limits.
SESSION TITLE: Maintenance
SESSION #72 WEEK #5 DAY #25 (72-5-25)
PRESENTER:
CO-FACILITATOR:
TIME: 10:00-12:00 F

INTRODUCTION: SESSION OBJECTIVES
Refer to Session 33-2-9 for details.
SESSION TITLE: Introduction to Fruits

SESSION #73  WEEK #5  DAY #26  (73-5-26)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-9:00 C

INTRODUCTION: SESSION OBJECTIVES

With fruits of many varieties abundant and popular in the host-country, it seems appropriate that the trainees become familiar with:

- The many kinds and varieties grown in the host-country.
- The season in which they are available.
- The areas they grow in volume.
- The name of each.
- How they are propagated.

HAND-OUT:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

Tropical fruit
Propagate
Fruit

Temperate fruit
Grow
Available fruit names
SESSION PREPARATION AND MATERIALS

- Trainer references. Local fruit.
- Color posters showing clear pictures of each fruit with name.
- Categorize in groups according to where grown.
- Pictures or samples of leaves from as many as possible to identify the trees.
- Prepare to co-facilitate with one or two language teachers as this session lends itself well to language integration.

TIME SESSION 73-5-26 ACTIVITIES

10 Min Place pictures up in front of class and have each trainee select two types of fruit.

40 Min - Each trainee will then identify and name each fruit s/he selected.
- Discuss where fruits grow and the seasons of production.
- Discuss the technique for propagation of each type.

10 Min Hold discussion and share ideas concerning any similarity or differences between temperate and tropical fruits.

TRAINER NOTES AND RECOMMENDATIONS

If fruit trees are available in the training area it would be helpful and useful for the trainees to see how they actually grow. This session could also be in conjunction with fruit tree propagation. It would also be beneficial for the session to have samples of real fruit for tasting.
SESSION TITLE: School Analysis
SESSION #74  WEEK #5  DAY #26  (74-5-26)

PRESENTER:

CO-FACILITATOR:

TIME:  9:00–10:00 C

The Session Design for this Program Specific Session is in Appendix A.
SESSION TITLE: PCV Visit Preparation
SESSION #75  WEEK #5  DAY #26  (75-5-26)
PRESENTER:
CO-FACILITATOR:
TIME: 10:00-11:00 C

INTRODUCTION: SESSION OBJECTIVES

Each trainee chooses the PCVs s/he will visit. Expectations for the visits are explained. Administrative and travel information is provided. For the visits to be successful and efficacious trainees must be provided with structure for activities as well as travel information. The objectives of this session are:

- To inform trainees about the objectives of the visits and what they're expected to do on the visits;
- To decide where the trainees will go;
- To inform trainees about logistical and administrative aspects of the visits.

HAND-OUT: #75-a PVC Visits

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Hand-out on activities for visits;
- Sign-chart;
- Map of (Thailand);
- Training office or staff gets OK from (Crossover) volunteers to be visited.

TIME SESSION 75-5-26 ACTIVITIES

5 Min Give a general overview about why trainees are visiting volunteers:
   - To learn about actual sites and (Crossover) work;
   - To get to know current (Crossover) volunteers;
   - To gather information;
   - To travel and relax.

15 Min Pass out hand-out of things to do during visits. Explain and clarify.

15 Min List the PCVs to be visited and show their sites on a map. Trainees choose who they will visit. Details about how to get to the schools will be given individually after the session. Explain that they must write and send a telegram warning the person they'll visit.
HAND-OUT #75-a

PCV VISITS
THAI TEFL (CROSSOVERS)

Please try to use your volunteer visit time to find out as much as you can about the actual conditions at the volunteer's site. Observe and/or ask questions about:

1. The volunteer's role at the (school) in both the (English) and (Agriculture) Departments:
   a. Number of hours of teaching by the volunteer in both departments.
   b. Size and quality of (English and agriculture) staff.
   c. Special projects or time commitments of the volunteer.
   d. Volunteer's positive and negative feelings about his/her place in (both departments.)

2. The volunteer's relationship with co-workers.

3. The volunteer's relationship with (student-)

4. The volunteer's relationship with individuals in the community.

5. The dress-and behavior of (teachers) at the (school.)

6. The living-arrangement (food, shopping, laundry, entertainment) of the volunteer.

7. (School) facilities (especially English & Agriculture) including buildings and grounds.

8. The nature and size of surrounding villages.

9. How the PCV got started at his/her site.

This information will be helpful in understanding the similarities and differences between one site and the next, as well as one volunteer and the next, when we all return together and have a chance to discuss our experiences.
To help gather the above information, do the following:

1. Meet the (Principal.)
2. Meet the (agriculture teachers,) especially the department head.
3. Meet the (English teachers,) especially the department head.
4. Observe, and when possible help (teach) the PCV's (English classes.)
5. Participate in any (agriculture) work that the volunteer is doing.
6. Visit the market and buy something (fruit).
7. Visit a nearby village, ideally the home of a (student).
8. Observe, if possible, the teaching of a Thai (English teacher.)
9. Learn how the PCV signs in and requests supplies; get copies of the relevant forms.
10. Visit English and/or FFT clubs, if possible.
11. For men, drink with some male (teachers.)
12. Find out what the PCV considers his/her 3 most important contributions to the (school.)
13. Find out what the PCV considers his/her 3 most significant difficulties and understand why.

Many of these activities will take a short time, so you should be able to do almost all of them. Please take notes and, most of all, have fun with everyone.
SESSION TITLE: Field Day Organizing Meeting

SESSION #76  WEEK #5  DAY #26  (76-5-26)

PRESENTER:  
CO-FACILITATOR:  
TIME: 11:00-12:00 F/C

INTRODUCTIONS

SESSION OBJECTIVES

What happens in this session is up to the trainees; however we recommend that they consider the following objectives. Recommended objectives are:

- To choose a Field Day Coordinator.
- To define the tasks that need to be done in preparation for, during and after Field Day.
- To assign tasks and responsibilities to individuals and groups.
- To consider choosing a theme.
- To make tentative decisions on location, time and schedule.

HAND-OUT: #76-a Sample Task List

READING ASSIGNMENT:  

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>To meet</th>
<th>Meeting</th>
</tr>
</thead>
<tbody>
<tr>
<td>To decide</td>
<td>Coordinator</td>
</tr>
<tr>
<td></td>
<td>Tasks</td>
</tr>
<tr>
<td></td>
<td>Theme</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Field Day Advisor seeks input from a few trainees on what should happen in this session.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 76-5-26 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Ask if there are any new questions about Field Day and clarify them.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Explain that it is time for staff to step into the background and turn Field Day over to the trainees. (Trainees should take charge of the rest of this meeting and future Field Day sessions.) Suggest that a Field Day Coordinator be chosen to take over this task and other tasks as well. Trainees choose a Coordinator, if they wish to have one.</td>
</tr>
<tr>
<td>45 Min</td>
<td>Led by the Coordinator, trainees use the remaining time as they wish. They may follow the suggested session objectives, or not, as they see fit.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

Depending on the size of the training group, trainees may want to choose two or three people to be a coordinating committee; however, both the size and role of such a committee is decided by the trainees. Once a coordinator or committee is chosen, staff should remain present, but not conspicuously. Except in cases of utmost necessity, staff members should refrain from talking until their advice and knowledge is sought. Staff members become resources, responding to trainee needs.

If there is a Field Day Advisor, either the Technical Coordinator or a trainer who has participated in a Field Day, that person should work with the Field Day Coordinator or committee. This would include being regularly informed of decisions, session agendas and other plans. If other staff people have concerns, they can route them through the Field Day Advisor to the Field Day Coordinator.

SESSION TITLE: Planting Fruit Trees

SESSION #77  WEEK #5  DAY #27  (77-5-27)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-10:00 F

INTRODUCTION: SESSION OBJECTIVES

Fruit trees, like most types of trees, must be planted with care in order to produce normal growth. In tropical conditions the techniques used require more care due to the weather conditions. In the tropics you encounter very wet or dry conditions, either of which can adversely affect normal growth and production. This session will demonstrate how by properly planting one can overcome the adverse conditions and:

- The trainees will learn about different types of fruit trees and the technique for growing each.
- The soil, water and fertilizer requirement of each.
- The proper plant spacing for each variety.
- How to plant trees that are from grafts, air layering or from shoots such as bananas, as well as coconuts.

HAND-OUT: #77-a Instructions For Planting Fruit Trees

READING ASSIGNMENTS:

TECHNICAL VOCABULARY:

Fruit tree  Hoe
Fruit  Shovel
Grafted seedling  Water can
Air layer seedling
Manure
Mulching
SESSION PREPARATION AND MATERIALS

- Locate area to plant trees with one tree allotted for two trainees.
- Prepare hole.
- Locate seedlings or stocks of different trees to be planted.
- Have manure or compost for incorporating and mulching.
- Have shovels, hoes, baskets and water cans.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 77-5-27 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Explain session objectives.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Explain linkage and review fruit tree propagation.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Discuss hand-out and planting instructions.</td>
</tr>
<tr>
<td>50 Min</td>
<td>Have trainees pair off and plant one tree they have selected, following planting instructions.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Have trainees clean up and place hand tools in storage. Hold question and answer session.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

Knowing how to plant fruit trees will be useful when the trainees reach their sites; therefore, the session should be well planned and presented. If possible the trainees should follow up to see the results of this session.
INSTRUCTIONS FOR PLANTING FRUIT TREES

Fruit trees are divided by size of tree such as small, medium, and large. Most of the trees which are propagated by asexual propagation are usually medium size and not as big as growing from seed. Plant spacing for each type will be different according to the variety, location and purpose of planting.

PLANTING INSTRUCTION FOR MANGO GRAFTED SEEDLINGS

1. Dig the hole .50 x .50 x .50 m and leave the soil near the hole.

2. Mix soil: manure using the ratio 2:1

3. Fill the hole with mixture about half of the hole and water to firm the soil.

4. Fill up again to 15 cm from the top and plant the seedling with the joint of the graft above the soil level, cover up and firm the soil with hoe and water.

5. Mulching with dry grass or material available to keep moisture. If the weather is really hot it is recommended that you provide the shade for the new tree so it will not wilt.

6. Keep filling up around the tree for 1 or 2 weeks or until the ground is level.
SESSION TITLE: Independent Study  
SESSION #78 WEEK #5 DAY #27 (78-5-27)  
PRESENTER:  
CO-FACILITATOR:  
TIME: 10:00-12:00 C  

INTRODUCTION: SESSION OBJECTIVES

By this time in training, trainees have probably developed personal interests in various agricultural areas. Some of these areas are not covered during training and few are covered in great detail. Still, trainees like to pursue their interests more deeply. Further, trainees will be preparing demonstrations for which they may need to do research. Finally, as PCVs, they will have to find most of their information on their own and should practice doing so. The objectives of this session are:

- To pursue personal interests in greater detail than training provides.
- To do background research for demonstrations.

HAND-OUT:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

<table>
<thead>

<tbody>
<tr>
<td>Interests</td>
<td>Topics</td>
</tr>
<tr>
<td>Research</td>
<td></td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Arrange to use training site library for this session and to check out books.
- Have trainees think, in advance, of topics in which they are particularly interested.
- Flip chart and markers.

TIME

SESSION 78-5-27 ACTIVITIES

5 Min  
Discuss the objectives of the session.

5 Min  
Explain that each trainee will research a topic of special interest to him/her. Each is to write a one or two page outline (not report) on what s/he learned, which will be given to other trainees, so that trainees can act as resources for each other. Set a deadline for outlines.

10 Min  
Brainstorm study topics that are neither too broad, nor too specific. Generate more topics than trainees, then have each trainee select the topics s/he will pursue.

90 Min  
Trainees locate resources (books in library, facilities and staff at training site, local farmers, government agencies) that they will use. They begin to research. Staff should assist by pointing out resources.

TRAINER NOTES AND RECOMMENDATIONS

Depending on the scope of the research, a second session may be needed to follow-up. The selection of topics is important and the presenter should help trainees choose subjects that are reasonable. Even so, some trainees will change topics after having difficulty finding resources or having realized what a large subject area they have chosen.
INTRODUCTION: SESSION OBJECTIVES

Diseases of poultry can seriously affect the profit margin of poultry production. This session will help the trainees:

- To understand some factors that encourage and help control diseases of poultry.
- Identify some economically important diseases, their symptoms and control.
- Develop the ability to use the poultry disease prevention/treatment resources provided to them.
- Explore their role in disease control at their sites.

HAND-OUTS: 
- #79-a Introduction to Disease
- #79-b Basic Poultry Disease Diagnostic Guide

READING ASSIGNMENTS: Practical Poultry Raising, Pgs 115-130.

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

Demonstrate post-mortem procedures on any chickens that have died (without apparent cause) during training.

---

TIME

SESSION 79-5-28 ACTIVITIES

---

10 Min  
Explain session objectives.

30 Min  
Discuss reading assignment.

5 Min  
Trainees brainstorm to identify any chicken disease they know.

20 Min  
Discuss basic poultry disease diagnostic chart.

20 Min  
Distribute Salsbury manual, read sections on Newcastle, fowl pox, cholera and infectious bronchitis. Discuss.

30 Min  
Discuss post-mortem examination procedures.

5 Min  
Clean up.

---

TRAINER NOTES AND RECOMMENDATIONS

Should disease appear earlier in the training this session could be re-scheduled to deal with the problem at that time.

If post-mortem examinations are conducted at the Center and arrangements can be made for trainees to observe such a session, it would be desirable for them to do so. However, it would be best if they had had this session before observing the post-mortem examination.
INTRODUCTION TO DISEASE

The purpose of this unit is: (1) to give trainees a better understanding of the causes, transmission, prevention, and treatment of animal diseases, (2) to allow them a clearer understanding of their own health, and how to maintain it, and (3) to become sensitive to health needs when they enter their community overseas.

By the integration of the two components, livestock and core, on this topic, it is felt that trainees will be able to reinforce their learning in a positive way.

DISEASE: A DEFINITION

Disease is a departure from a state of good health by an alteration of the internal organs or external conditions of the body. It is a disruption of the normal functioning and performance. Causes of diseases:

1. Infectious agents, or pathogens such as bacteria and virus.
2. Parasites, external (e.g., ticks) or internal (worms).
3. Heredity, caused by defective genes, e.g., in humans, sickle-cell anemia, swine melanoma.
4. Congenital defects caused by developmental accident during the embryonic stage or from toxic or infectious agent during prenatal development, e.g., pullorum disease in chickens; brucellosis in pigs, goats.
5. Nutritional deficiencies, e.g., kwashiorkor (protein deficiency in children), polyneuritis (vitamin B deficiency in chicks).
6. Traumatism, e.g., wounds, burns.
8. Man, animals and man overcrowding, poor housing and sanitation facilities.

TRANSMISSION AND SPREAD

Two methods of transmission are horizontal and vertical.

Horizontal

1. Direct or immediate contact with a diseased animal
a. Sexual (brucellosis)
b. Bodily contact (ringworm)

2. Contact with non-living objects, infected pens, litter, feeders, waterers.

3. Contact with disease carriers (animals infected but which do not have or exhibit disease).

4. Infection in the soil, food, and/or water.

5. Air borne infections, transmitted in the air by inhalation of disease agent.
   a. Intensive transmission which has a spread of 1 km, expelled by coughing and breathing in by others.
   b. Moderate transmission which has a maximum spread of 15 meters. Chronic respiratory problems can be transmitted this way.
   c. Low transmission in the air—needs tight contact (crowding) between animals to transmit pathogenic agents.

6. Infections from blood sucking arthropods such as flies, fleas, mosquitoes, lice, or ticks. Malaria (man) and anthrax (cattle) are diseases transmitted in this way.

7. Infections from organisms normally found on or in the animal’s body. Streptococci are found in healthy animals but become dangerous if the animal is stressed and its defenses weakened.

8. Spoiled feed, molds, and fungi in the feed which produce toxins (mycotoxicosis and aspergilosis).

9. Fecal contamination, coccidiosis in chickens and hepatitis and cholera in both chickens and man.

A term usually used to explain the method of transmission of a disease is vectors. These can be either mechanical such as contaminated clothes, wild birds, insects; or included in the life cycle of a parasite, that is a biological vector, where a parasite has the pathogen within its system, rather than carrying it on its legs, wings, etc. and transmits the disease by biting the animal.
1. Embryonic: The disease is spread congenitally, that is, the ovary or uterus which is infected transmits disease to the egg or fetus.

3. In the case of chickens, eggs can be infected by fecal contamination from a disease in the intestinal tract.

DISEASE RESISTANCE

The animal's defense against disease carrying organisms.

1. Skin and mucous membranes: Tissue acts like a mechanical barrier to bacteria, yeast, and molds.

2. Mucous membranes produce fluid which washes away the pathogens. This primary defense is more effective against larger pathogens than viruses. If the skin is damaged by cuts, abrasions, or burns, infections may result. This means that the organism is in the body but it does not necessarily mean that the disease is present.

Whether a disease will occur depends on the secondary defenses of the body.

SECONDARY DEFENSES (ex. a cut in the skin)

1. Bleeding washes the wound and removes bacteria.

2. Phagocytes are specialized white blood cells that eat and destroy bacteria.

3. If the number of bacteria is small then healing occurs. If not, then inflammation, heat, swelling, and pus occur.

4. Pus (an accumulation of dead bacteria and tissue cells). This accumulates in a closed wound and forms an abscess.

5. Abscesses become walled off with connective tissue to prevent extension of the infection.
6. Leucocytes (white blood cells) go to the wound site to prevent infection from spreading beyond the point of introduction. With any active bacterial infection there is almost always an increase of white blood cell count. The opposite is commonly seen with viral diseases.

In normal circumstances, most infections are stopped and disease is prevented but if the body cannot produce leucocytes because of malnutrition, a long term disease, or stress, then a condition called bacteremia or septicemia develops, in which case an antibiotic would be necessary.

Besides pus, eye secretion, droplets of moisture from respiratory infections, feces and urine can move the pathogens from the site of the infection. If the infection persists and gradually wears down the animal's resistance, the infection is termed chronic. If the animal's resistance is quickly lowered leading to the rapid growth of infectious organisms, it is called acute. In the case of acute infection death usually occurs. Proper disposal of the carcass by incineration or deep burial, and decontamination of the host quarter will destroy the majority of the pathogens. If this is not done properly, disease can be spread to healthy animals.

It is possible for an animal to live with the pathogen because either the animal cannot eliminate the pathogen or the pathogen cannot lower the resistance of the animal. With humans this is how people can live a long time with parasites and other types of infectious agents. If one or the other loses the upper hand the disease will spread or the animal will be cured.

Sometimes a disease is said to be arrested. This does not mean the animal is cured because it can be subjected to periodic flare-ups of the disease. In both man and animal some deadly organisms continue to live in the excretory organs after the disease has run its course. These infectious organisms are eliminated by what is called a carrier.

**Convalescent Carrier:**

An animal after surviving a disease is unable to rid its body of the organisms.

**Immune Carrier:**

An animal that is immune to a disease but possesses and eliminates the disease carrying organisms from its body.
Contact Carrier:

These are animals that are host to and eliminate highly deadly organisms which they have picked up from contact with another animal. The carrier is one of the great problems affecting the control of infectious diseases.

It may be easier to recognize and possibly treat a diseased animal but virtually impossible to detect a carrier.

MICROORGANISMS WHICH DO NOT CAUSE DISEASE (SAPROPHYTES)

1. Microorganisms in the rumen of ruminants help to break down cellulose to usable energy.

2. Utilization by ruminants of non-protein nitrogen, facilitated by microorganisms in the rumen.

3. Microorganisms useful in making cheese, yogurt, beer, wine, silage, and compost.

4. Microorganisms that are helpful in maintaining fertility of the soil.

5. Microbes that remove biodegradable waste.

MICROORGANISMS WHICH CAN CAUSE DISEASE (PATHOGENS)

1. Parasitic: they survive at the expense of the host.

2. Affinity for certain tissues (i.e., rabies attack the nervous system).

3. Differ in mode of action.
   a. Some invade and destroy body cells.
   b. Some produce toxins which are poisonous.
   c. Mycotoxins form molds in feed.

4. Some have affinity for some animal species but host specificity is not absolute. Certain diseases can be between different species of animals.
SPECIFIC

1. Bacteria
   a. One cell organisms which are members of the plant family.
   b. Some are harmless unless they show up where they do not belong (i.e., E. coli from the gut, if transferred to the urinary tract and bladder, can cause an inflammation of the bladder.)
   c. Classified according to shape and arrangement of cells.
   d. Classified by staining. Gram positive, or gram negative which indicates their susceptibility to drugs or antibiotics. (i.e., penicillin is effective only against gram +, or broad spectrum which is effective against both, usually, such as combiotic: a mixture of penicillin and streptomycin.)

VIRUSES

1. The smallest living organism known. Measured in millimicrons.
2. Parasitic: They must live in body cells where they grow and multiply, they contain no energy of their own.
3. They slip through tissue with little disruption and tissue reaction (unlike bacteria).
4. Pus or phagocytes are not a defense against them.
5. They usually are tissue specific. i.e., nerve cells, skin cells, etc.
6. They can make harmless bacteria the secondary invaders.
7. They cannot be destroyed by antibiotics, control is difficult. Viruses can be prevented by vaccines but these are used very little because vaccines destroy body cells as well as the parasitic virus.
8. The first evidence of viral infection may be a fever which is protective because it disrupts the virus' environment. However, prolonged fever may have a detrimental effect such as dehydration.
PROTOZOA

1. Similar to bacteria, unicellular, microscopic, and capable of carrying on all life processes within a cell.

2. 15,000 to 20,000 known species.

3. i.e., malaria in humans and cocci in chickens.

RICKETTSIA

1. Smaller than bacteria but larger than viruses.

2. They can cause intracellular infection.

3. Like viruses, they can live and multiply inside the tissue cell of the host.

4. Unlike viruses, they are sensitive to antibiotics and have a carbohydrate shell.

5. i.e., Q fever and Rocky Mountain spotted fever are both caused by them (zoonoses).

MYCOPLASMA

1. A virus-like organism.

2. They can be grown in a medium free of mammalian tissue cells.

3. They are sensitive to certain antibiotics.

4. i.e., CRD in chickens.

FUNGUS

1. Molds (multicellular), yeast (unicellular).

2. They can invade animal tissue to produce disease and produce potent toxins.

3. They can grow outside the animal in feed, producing toxins which are harmful to animal after being consumed. i.e., mycotoxicosis and aspergilosis.

PARASITISM (GENERAL)

1. They vary from a single cell coccidia to worms and insects.

2. They can be either totally dependent on the host animal for survival or independent part of the time.
3. The relationship of many parasites is commensalistic. That is, the parasite lives off the host without really harming it, because if it did the parasite will be homeless.

4. Some immune response is developed.

5. Knowledge of the life cycle can provide the opportunity for control without depending on drugs.

6. Parasite control through medication alone is a continuing expense without any lasting benefit.

EXTERNAL PARASITES

1. They damage or irritate the skin by nourishing on blood, skin, hair, feathers, or other body tissues.

2. They transmit disease by carrying certain organisms in their body which they transmit to the host while feeding or sucking blood. i.e., Rocky Mountain spotted fever from ticks to humans.

3. Parasites can mechanically transmit disease organisms on their feet, mouth, wings, etc.

TYPES OF PARASITES

1. Ticks
   a. They carry the most diseases of any type of parasite and cause considerable damage to tissues around the feeding site.
   b. This area susceptible to bacterial infections, anemia, loss of weight, and even death.
   c. Life cycle: egg, larva, nymph, and adult stages.
   d. Hard ticks (infest domestic/wild animals and humans). They require one, two, or three hosts for each stage to develop.
   e. Soft ticks infest birds, poultry, rodents, bats, some domestic animals, and man. They are multi-host ticks which feed intermittently while hosts sleep and then return to crack or crevasses to lay eggs.
2. Mites
   a. They cause mange, scabies, and ear cankers.
   b. Life cycle: egg, larva, nymph, and adults (2-3 weeks).
   c. Types: Sarcoptic mange mite and Domodectic mange mite (cause hair to fall out) and ear mange (frequently found in dogs, cats, and rabbits.)

3. Lice
   a. Two types: Biting (birds & mammals) and sucking (Mammals).
   b. These are capable of transmitting disease, loss of hair or feathers, blood loss, and making animal susceptible to other infections.
   c. Life cycle: eggs (nits), nymph, immature louse to adult. Eggs are usually glued to the hair shafts.

CONTROL AND TREATMENT

Insecticides in the form of dusts, dips, or spray.

1. You should be careful in using these because they are poisonous to man, animal, and environment when improperly applied.

2. You must know which insecticide to use for which animal, the recommended dosage, and the method of application. Also be familiar with where to apply it and how to prepare it.

3. In general, treat including bedding, feeding equipment (but not the feed or water), nest, etc.

4. If insecticides are not available, a mixture of edible oil and kerosene (2 parts to 1) can treat for parasites.

INTERNAL PARASITES

1. The degree of injury or damages depends on number, life cycle (where migration takes place in the host), and the degree of immunity developed by the host.

   a. They can cause wounds which allow bacteria to enter or cough, bronchitis (i.e., lung worms).
b. They can prevent proper food passage (i.e., roundworms) or absorb food intended for the host (i.e., tapeworms).

c. They can cause anemia or blood clotting (i.e., hookworms or strongylyes)

d. They destroy tissue (i.e., bladder worms).

e. They cause irritation and itching (i.e., pinworms).

f. They transmit disease and secrete toxins which destroy enzymes and red blood cells.

Resistance to parasites is dependent on an adequate diet because protein is needed for the production of antibodies and to feed the parasites while some temporary immunity is developed.

TYPES OF INTERNAL PARASITES

1. Direct life cycle - one definite host, i.e. roundworms where adult worm lays fertile eggs in the host.

2. Indirect life cycle - the parasite will spend intermediate life on one or more intermediate hosts, i.e., swine acquires lungworms by eating earthworms that have consumed lungworm eggs.

PREVENTION

1. Break the life cycle.
   a. Rotate pastures where eggs may incubate.
   b. Remove intermediate host, i.e., provide a sanitary environment (fly control).
   c. Use good quality feeds.

TREATMENT

1. Drugs, deworming medicine which can be animal specific and parasite specific, i.e. piperazine for chickens to treat roundworm but ceca worms are treated with phenothazine.

2. Read and follow directions carefully because overdoses can be dangerous.
3. Most worm medicines are effective only against the adult stage, therefore animals should be treated a second time (2 weeks later) to remove immature larvae.

Non-living agents which cause disease:

a. Nutritional deficiencies are covered to some extent in the Introduction to Nutrition, especially the vitamin and mineral charts. For protein and energy deficiencies refer to pages 107-130 in Where There Is No Doctor, by David Warner.

b. Toxins: poisonous substances. Upon entering the body they destroy tissues.

Types of toxins according to their sources:

a. Bacterial toxins; these cause diphtheria, tetanus, and botulism.

b. Zootoxins; these are produced by certain snakes, bees, and spiders.

c. Phytoxins; such as those produced by the castor bean plant, poisonous fungi of certain toad stools, and braken fern.

d. Poisons in metallic substances such as lead and arsenic.

IMMUNITY

1. It is the degree of resistance to any specific organism and it can be complete or partial.

2. Defense against viral infections relies heavily on immunity. Immunity is also involved in fighting larger pathogens such as bacteria but to a lesser degree.

3. Immunity is highly selective. That is, protection against one organism does not protect against another with very few exceptions.
IMMUNITY SYSTEM - How it happens

The body produces a protein called antibody which is modified and found in the globulin fraction of the blood (humoral antibody). This antibody is formed in response to stimulation by a foreign protein (antigen). The antigen - antibody reaction is the fundamental way in which pathogenic organisms are destroyed. This destruction is done physically or chemically by the antibody combining with the antigen. When the animal has antibodies in its tissues and fluids and sufficient blood to stop the growth and invasion of a pathogen it is said to have immunity.

WHERE IT HAPPENS?

The primary sites of humoral antibody development are the liver and bone marrow. In young animals the thymus gland also is a producer. Lymphoid tissues such as tonsils and lymph nodes play less clear roles.

Interferon is a different type of antibody which blocks the entry of a virus into target cells. The production of this antibody is more rapid and works locally at the site of the infection.

WHAT DETERMINES THE DEGREE OF IMMUNITY?

The production of antibodies depends on:

1. The number of organisms (antigens) at the time of invasion.
2. The strength of the invader (i.e., virulent vs. low virulent strains of viruses).
3. The condition of the animal at the time of the invasion (sick animal vs. healthy animal).

HOW LONG DOES IT TAKE?

In general it takes about two weeks for a protective level of antibodies to be produced either in response to infection or vaccination. For this reason, vaccinating after a disease appears in a herd or flock is usually of little value and possibly may be harmful if the vaccine is live. There are a few exceptions to this rule, depending on how fast a particular disease spreads in a flock.
TYPES OF IMMUNITY

Passive immunity - occurs without the active participation of the antibody production system of the immunized animal.

Two types of passive immunity:

Artificial:

Blood serum from an immune animal contains antibodies which, when injected into another animal, makes the latter immune.

1. Mechanical transfer of immunity done by man, therefore, artificial.
2. Recipient plays no part, therefore, passive.
3. Antibody, not antigen, is transferred, recipient's immune system is not stimulated. Immunity will last only as long as the transferred antibody lasts (which could be from two weeks to 6 months).

Natural immunity is transferred from mother to offspring. This is done via the colostrum. Colostrum or first milk contains twice the total solids of normal milk and an excess of globulin which contains the same antibodies as found in the mother's blood. This is very important because the newborns have not yet developed their immune systems to produce their own antibodies. The newborn is able to absorb the antibodies intact--but this ability diminishes after 24 hours, and digestive processes destroy the antibodies. It is important that newborn animals receive colostrum as soon as possible after birth even if by hand feeding.

Active Immunity:

Active immunity occurs when the animal itself produces antibodies in response to antigens. The duration of active immunity may range from several months to a life-time, depending on the stimulative effect of the antigen involved.

Two type of active immunity:

1. Natural: When the animal is exposed to the disease and fully recovers.
2. Deliberate exposure: Antigens given through vaccination.
ACTIVE AND PASSIVE IMMUNITIES CAN COMPLEMENT EACH OTHER

The mother passes immunity via colostrum to her newborn; thus immunity is being developed because of natural exposure and infection. But if the pathogen is still in the environment, the offspring will be exposed. The offspring will not get the disease, however, because of the passive immunity. But as this immunity wears down, active immunity will develop through exposure. This will provide the long term protection after the passive immunity is gone.

WHEN IS THE BEST TIME TO VACCINATE?

Because passive immunity might interfere with antibody development from vaccines, it is generally best to immunize permanently by vaccine after most of the maternal antibodies are gone. This is usually at about six months. If vaccines are given before this they are:

1. Usually a milder strain because an animal's immune system is not fully developed but the animal needs immediate protection.
2. Part of a booster series of a gradual immune process.
3. Given because the animal needs the vaccine because of a potential outbreak in the immediate area, possibly with an antiserum.

TYPE OF IMMUNIZATION VACCINES

1. Antiserum:
   
   Produced from whole blood from animals either exposed naturally or artificially to the disease. The antiserum contains a high percentage of globulin (the protein containing the antibody).

   Advantage: It produces immediate immunity when injected, so protection is provided very quickly (valuable when there is an epidemic in your area).

   Disadvantages:
   
   1. Duration of immunity is short.
   2. It does not stimulate immunity but merely passively transfers antibodies to the animal.
3. It is quite perishable, expensive, species specific, and needs refrigeration.

2. Bacteria
   a. Suspension of killed pathogen bacteria, usually produced in an artificial medium.
   b. Method of getting a specific bacterial protein (antigen) into the animal without causing disease.
   c. Effectiveness depends on:
      1) Antigenicity of the organism.
      2) The number of killed organisms in the bacteria.
      3) Quality of the manufacturing process.
   d. Immunity rarely lasts over a year, and two or more doses may have to be given to yield satisfactory protection.

3. Vaccines:
   a. This term is used for all immunizing agents but technically a vaccine is a product containing a living antigen.
   b. Most common vaccines are used against virus diseases in animal and man.
   c. Because viruses only survive in living tissue, production of vaccine is different from production of bacteria.

   TYPE OF VACCINE

   1. Modified Live Virus (MLV)
      a. Generally produce long lasting immunity.
      b. Because they are live they can cause illness.
      c. They are dangerous if given to weaker, stressed, diseased, or malnourished animals or those whose immune mechanisms are not developed.
   d. Use only when your animals are healthy.
e. Use during the stage in life where economic loss will be minimized if the animals get sick (i.e., give vaccine when animals are not in production).

2. Attenuated Vaccines are produced through a procedure in which the virus loses its virulence and capability of producing disease.
   a. Immunity is not as long lasting because the balance between antigenicity and attenuation shifts to the latter.
   b. There is less risk involved because the vaccine can not produce disease. It is not as hazardous to use.

3. Dead or killed virus vaccine
   a. Vaccine that cannot produce the disease but produces immunity.
   b. Degree of immunity less than attenuated or live virus vaccine.
   c. These usually have to be repeated every year to maintain a protective number of antibodies.

Vaccination is not a procedure which is 100% effective in preventing diseases. Vaccines fail when:

1. They are improperly manufactured.
2. They are not properly refrigerated.
3. They are exposed to sunlight.
4. They are used after the expiration date.
5. They are improperly administered.

These problems are magnified in developing countries. Other problems one might encounter are:

1. The dosages are geared for large flocks because the country imports vaccines from developed countries where large flocks are common.
2. Dumping of expired vaccines by manufacturers on Third World countries.
METHODS OF ADMINISTERING VACCINES:

1. Intramuscular (IM) injection.
2. Subcutaneous (SubQ) - under the skin between skin and muscle.
3. Ocular: through the tear duct to the respiratory tract (eye dropper).
4. Nasal (eye dropper)
5. Oral
6. In the drinking water.
7. By spraying/dusting (chicken houses) enclosed areas.
8. Wingweb (chickens) injecting by stab in the wingweb.
10. Painting the anus.
11. Intradermal: fine needle in skin (i.e., TB test).
12. Intraperitoneal: under the skin onto the fold of the abdomen (swine).

GENERAL SIGNS IN RECOGNIZING DISEASE

1. Sick animals usually isolate themselves from rest of flock or herd.
2. They look dull and are inactive.
3. They eat and drink less (this may be the first sign).
4. They grow slowly.
5. They produce less (eggs, weight gain, milk, & number of offspring).
6. Fertility may decline.
SPECIFIC SIGNS OF DISEASE

1. Diarrhea
2. Paralysis
3. Coughing
4. Sneezing
5. Wheezing
6. Inflammatory exudate on skin
7. Blood in stools

If possible, it is good to send live sick animals to a veterinarian with the history of the animal. Decomposed animals are usually of little diagnostic value.

ZOONOSES

Zoonoses are those diseases whose causative agents are transmitted naturally between man and animal.

1. Over 100 zoonoses are recognized through the world.
2. These diseases are usually chronic in animals.
3. The symptoms are similar in man and animal.
4. Very little man to man or man to animal transmission of diseases occurs.
5. Man is often the dead end of the infection.

Some example of zoonoses are:

1. Rabies (virus).
2. Q fever & Rocky Mountain spotted fever (rickettsial disease).
3. Brucellosis (undulant fever in man) - bacteria
5. Trichinosis (worm origin).
This Poultry Diagnostic Guide is a compilation in chart form of basic information relative to diagnosis of disease problems in poultry occurring in the different age groups.

BROODING PERIOD (Day-old to 4 weeks old)

<table>
<thead>
<tr>
<th>CLINICAL SIGNS</th>
<th>POSSIBLE CAUSES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Huddling near heat source</td>
<td>Low brooding temperature. Disease condition salmonellosis, coceidiosis, NCD, CRD, etc.</td>

SESSION TITLE: Mushroom Follow-up

SESSION #80  WEEK #5  DAY #28  (80-5-28)

PRESENTER:

CO-FACILITATOR:

TIME:  10:00-10:30 F

INTRODUCTION:  SESSION OBJECTIVES

This session will allow the trainees time to return to the mushroom piles they made in session #52 week #3 day #17 to observe and harvest the results.
SESSION TITLE: Quiz III

SESSION #81 WEEK #5 DAY #28 (61-5-28)

PRESENTER:

CO-FACILITATOR:

TIME: 10:30-12:00 C

INTRODUCTION: SESSION OBJECTIVES

Agricultural training is nearly over and the trainees have been instructed in agricultural concepts, procedures, skills and have had a great deal of hands-on experience. To determine what trainees have retained a written quiz is used to assess some of their knowledge. The objectives of this session are:

- To gauge trainee understanding of those agricultural concepts presented to date.
- To measure trainee assimilation of information
- To test and practice adaptation to the metric system

HAND-OUT:

READING ASSIGNMENT: Review hand-outs, readings and previous quizzes.

TECHNICAL VOCABULARY:

- Ideas
- Knowledge
- Skills
- Practical

To identify
SESSION PREPARATION AND MATERIALS

- Same as Quiz II (see Sessions 37-2-10 and 59-4-20).
- Plan and prepare 15 minute field-practical problems (See example attached)
- Between written problems and practical problems, decide which is more important at this point of training and plan this quiz accordingly.

<tr>
<td>50 Min</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

If practical problems are emphasized in this quiz, the time may need to be expanded to 1-1/2 hours. Even if the main part of the quiz is in the field (on or near the farm), some written problems can be completed at the farm shelter.
FIELD-PRACTICAL PROBLEMS

1. Vegetable Seedling ID:

Three weeks before the quiz, prepare a seed bed and broadcast a mixture of all the seeds that have been planted during the training. Include seeds of common plants that were not planted in training and weeds will steal themselves. Don’t call trainee attention to this plot. As seedlings come up identify, but don’t label them. The day of the quiz, number from one to twenty a specimen of each of the species in the plot, including weeds.

Trainees are to identify whether each plant is a crop or a weed. For those that are crops, trainees should also name the family and, where possible, the species. Getting the families correct is more important. This sort of Plant ID is directly covered in a training session, but is a good way to see how well trainees have observed their own plots. Go over their answers with each individual trainee, so that this quiz problem is also a learning experience.

2. Insect ID:

If enough specimens are lurking in the trainees’ plots, have the trainees find and identify some species. Then, they should recommend whether or not to use a control measure for each species and name the control measure in each case.

3. Soil Test and Fertilizer Application:

A 1 sq m area of soil is staked out. From this area, each trainee takes a soil sample and tests it for N, P, K, and pH. Based on the results, the trainees should make fertilizer recommendations (organic and inorganic). Fertilizer references should be available and it should be understood that fertilizer recommendations should not be made from one soil sample. If any trainee cannot complete the problem, time should be taken to help them complete it.

4. Feed Mixing:

A variety of feed sources (corn, rice bran, fish meal, leucaena leaves, soybeans, etc.) are made available. Each is labeled, including protein and nutrient content.

Trainees must mix 10 kg of feed suitable for one of the following: 10 day chicks, finishing broilers, layers, 30 kg pigs, 80 kg pigs.
5. **Slope:**

Trainees measure the slope in one area of the farm and recommend any soil conservation techniques that might be needed.

6. **Tool Maintenance:**

Trainees sharpen hoes, spades or knives.
SESSION TITLE: Native Chicken Production

SESSION #82  WEEK #5  DAY #29  (82-5-29)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-10:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Improved chicken varieties are beyond the means of most small farmers, while native chickens are found in most villages. By working to improve the quality of native chickens, rural incomes and nutrition will also improve. At the end of this session the trainees will better understand:

- The difference between native and improved breeds of chickens.
- How improved management and care can increase the size and quality of native flocks.
- The village method of chicken raising. (Trainees observe the coops and flocks of nearby villages.)

HAND-OUT: #82-a Native Chickens

TECHNICAL VOCABULARY:

</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

The trainees should do most of the talking. They have learned enough about chickens by now so they should apply what they remember. The presenter of this session should only supplement a few ideas and occasionally clarify a question.
These often scrawny birds running around every village in Thailand are a major source of protein for the poor. Villagers who cannot afford to buy meat, fish and eggs at the market, can have an adequate supply of protein if they raise a decent number of native chickens. In addition, those villagers with decent-sized flocks can sell their extra birds for pocket money. And in emergencies, 30 birds can bring over 1,000 baht. Unfortunately, many villagers don’t have enough birds to eat chicken regularly.

**COMPARED TO IMPROVED BREEDS**

**Growth rate** -- Improved meat varieties have been carefully bred to convert high protein feed into meat very efficiently. Native birds are much less efficient converters and take much longer to grow. Also, the improved varieties have been selected for size.

**Egg production** -- Improved egg varieties have been selected for high egg production, as many as 220 eggs per year. Native hens, on the other hand lay something like 50-75 eggs per year. Clearly, native hens are not our best source of eggs. Instead, their eggs should be hatched out into chicks.

**Cost** -- The great benefits of improved varieties are matched by high costs. Costs for chicks, feed, medicine and equipment are generally too high for villagers to get involved. In addition, economics of scale make it impossible for small farmers to compete with the large operations (10,000 birds or more) found in and near cities. In short, poor people can’t afford to raise the improved varieties. But they can afford native chickens. Most farmers already raise native chickens for close to nothing. As will be seen, if they slightly increase their investment (a few baht per bird), their return will be greatly increased.

**Feed** -- This is the major cost for improved varieties, largely because of the high protein content. Native chickens don’t need as much protein and they can run around to find most of their food. Thus, feed is not a high cost item with native chickens.

**Management** -- Very careful management techniques have been developed for the improved breeds. They take a lot of time, training and knowledge. Most farmers do very little to manage their flocks, but would benefit from doing so. Still, native chickens require far less management than improved varieties and what they require is easily within the range of small farmers.

**Disease resistance** -- The improved breeds were developed in Europe and North America. They have little adaptation to Thailand. Although the diseases are pretty much the same here as in the West, environmental factors, particularly heat and moisture, are a complicating stress on the improved birds. Native chickens are better able to withstand such stress.
Disease losses -- Seemingly contradictory is the fact that disease losses are much higher for native chickens than for the improved varieties. The reason for this is that improved varieties better feed, cleaner water, closer attention, better sanitation and, most important, regular vaccinations and medical treatment. If all these things were done with native chickens, their losses would be less than with the exotic birds.

Pecking & fighting -- Imported chickens are far more docile than the natives and are generally raised in conditions that can control this problem. Native birds are raised with various ages and sizes running around together. Many chicks are pecked to death and larger birds grow more slowly while recovering from wounds.

BUDDY'S GREAT NATIVE CHICKEN PROJECT

Most Thai find the meat of improved varieties bland and soft. Thus, native chickens get a better price (by weight) than the imported birds. Since no one is raising native chickens on a large scale, the market for them is far from saturated. I believe that it is possible for villagers to expand their flocks to a size of 100 birds or more, which would allow them to eat a bird every day and have surplus to sell. Because native chickens are preferred to the mass produced improved breeds, this is the only way that small farmers can compete with the big producers.

For example: A farmer with 10 hens and 2 roosters should have 500 to 700 chicks hatched out every year, if the chicks are taken away from the hens a few days after hatching. It's possible to keep losses under 10% (instead of over 50%). Thus, 500 hatched chicks should produce around 400 birds for the family to eat and 50 for sale (over 2,000 baht). With good hens and management 750 chicks are attainable, producing 400 birds to eat and 300 to sell (over 12,000 baht--many farmers receive less than 1,000 baht/rai for their rice crop before subtracting expenses!!!). I think that these results can be achieved with an investment of less than 5 baht/bird. And farmers can make more money off their rice by feeding it to their chickens.

HOW TO DO IT

What I have to offer is a package deal. In this package are nine improved techniques. In some cases you can’t do one without first doing another. Do a couple of them and you’ll get better results. Do them all and you’ll get great results. Here they are in the order that I’ve introduced them to my students and that they’ve been introduced to me by my students.

Improve housing -- Or in many cases, provide housing. Doors, walls and a roof that will keep the chickens in at night and dogs, thieves and children out. Floors that stay dry. Protection from wind and rain. Simple coops can be built under
houses and rice storage sheds. Get the chickens into the coops every night and release them in the morning. Most losses to dogs and thieves occur at night. If all the birds get cooped up it’s much easier to vaccinate and do other medical things.

Waterers -- One in the coop and others around the house for a clean water supply. Dry up the dirty puddles that chickens usually drink from. Use the waterer in the coop for medicine, antibiotics and wormers. Store bought, plastic waterers are worth the cost.

Feed -- Some people say that Thai chickens get all the vitamins and protein they need from scratch, and they are short on carbohydrates. Use broken rice to get the birds into the coop at night and out of it in the day time. Plant leucena fences for the birds to nibble on. Kitchen scraps are good.

Feeder -- If you’re going to feed them in the coop you should use a feeder for the sake of cleanliness. A simple bamboo feeder is fine.

Vaccines -- This is the biggie!!! Diseases needlessly decimate native flocks. Vaccines are easy to find and administer. If you’ve done the above steps, vaccinating is a breeze. When starting out, individual farmers won’t have enough chickens (at least 70) to vaccinate economically, so vaccinate in groups of 5-10 farmers. The more farmers who participate, the lower the chances of disease outbreaks. The big die-offs occur in April and October (when the monsoons change), so make sure you’ve vaccinated beforehand. If you do, the results will be spectacular!

Medicine -- The real scrawny birds lacking most of their feathers are probably that way because they’ve got worms. Worm ‘em! That’s what your coop and waterer are for. In times of disease you may want to feed antibiotics and other medicines.

Brooding -- Hens are stupid and don’t know how to count. They do a terrible job of keeping track of their chicks, so if you leave the job to them a ten chick clutch will soon be down to five or less. Second, hens don’t like the chicks of rival hens and will peck them to death (it only takes one good peck) if given the chance. Third, it’s the mothers that teach the youngsters to fight. These are three good reasons to take the chicks away from their mothers as soon as possible. Make a brooder and brood the chicks for 3-4 weeks, much longer than that and they’ll suffer from an inadequate diet. You can mix chicks from any number of clutches with no problems, as long as the age gap is no more than a few weeks. I’ve been told that a 2 month old cockerel, when put in with all the chicks, will become the leader. When the chicks are released after brooding in peace and safety, they can take care of themselves and won’t fight among themselves. They’ll behave as a flock and follow their leader, which makes them easy to control, coop up and manage.
let the hens nest in trees and other places where you can’t keep track of what they’re doing. Often, two hens will lay in the same nest box, which leads to fighting, which breaks eggs (don’t forget that one egg should end up as a 40-50 baht bird)! Count and record the number of eggs in each nest and do so every morning. If the number of eggs increases by two in one day, guess what? The hens will stop laying when their nest has ten to fifteen eggs, which happens twice as fast when two hens share the same box. If this happens, take half the eggs and put them in another box. Do what you can to get one hen to move to that box. Keep track of how many eggs a hen lays before she starts to sit on them and how many she hatches out. Make soup out of the hens who stop laying after only seven eggs or hatch out less than 85%.

Breed improvement -- Besides getting rid of lousy hens, you can get an improved breed rooster. Research is being done on this and the data isn’t available yet, but the theory is that some desirable traits will be passed to the rooster’s offspring, while disease resistance and good taste will be retained. Rhode Island Reds and Barred Rocks are recommended because of good growth and egg production. A note of caution--be careful how you introduce these roosters or they’ll be destroyed by local bullies.

The above techniques have been used successfully by 15 year old students. In fact, I learned more from my students than they learned from me. What I did was get them thinking and trying new ideas. I’m sure that other things can be done and recommend that you try. If, in the course of this, you teach some people how to keep records and experiment, you’ll have succeeded. You’ll eat a lot of chicken dinners, too.

Buddy Larson
Ag Training-Thai 81

(See Practical Poultry Raising, PC Manual M-11 for further ideas, particularly Chapter 4.)
SESSION #83  WEEK #5  DAY #29  (83-5-29)

PRESENTER:

CO-FACILITATOR:

TIME:  10:00-11:00 C

INTRODUCTION:  SESSION OBJECTIVES

Even though staff and trainees have individually evaluated training throughout, it is also necessary to do so in a large group and somewhat formally. Although not a great deal of time remains in agricultural training, there is still a chance to adjust the final two weeks. This evaluation will also assist staff members write their reports. The objectives of this session are:

- To evaluate the success of training, specify strong points and weak points and suggest modifications and improvements.
- To make suggestions for the remaining weeks of agricultural training.
- To allow staff and trainees to share opinions and feelings concerning training, so that everyone knows where everyone else stands.

HAND-OUTS:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

<table>

</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Prepare three flip charts, the first with the physical feelings, the second with the emotional feelings and the third with the mental feelings that were expressed in "Training Evaluation I." Put them up before the session starts.
- Find the flip charts from "Training Evaluation I" that measured progress on the performance objectives.
- Prepare a written evaluation form that covers both what is in this session and other important points.
- Flip charts.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 83-5-29 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Min</td>
<td>Introduce the session by pointing out the three flip charts on physical, emotional and mental feelings. Ask trainees to read the charts and try to remember their own responses. They should reflect upon whether their feelings have changed or not. Anyone who wants to can add new and different responses.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Remind trainees of the schedule, as planned up through Field Day. Be careful to point out sessions that cannot be changed.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Seek recommendations on how the schedule can be modified. One way of doing so is to brainstorm a list of tasks (object $\triangleright$s, topics, skills, activities) that remain to be done and/or covered, or activities that trainees want included. Establish item priorities.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Have staff members and trainees pair off. Each pair takes one high priority item and considers how best to incorporate that item into training.</td>
</tr>
<tr>
<td>40 Min</td>
<td>Starting with the highest priority item, each pair makes a recommendation to the large group. After any necessary discussion, attempt to reach a consensus of agreement or disagreement. Move fairly quickly, so that most of the points can be discussed. For any remaining items, have those pairs write and submit their recommendations.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Hand-out the written evaluation form and ask that it be turned in the next morning.</td>
</tr>
</tbody>
</table>
TRAINER NOTES AND RECOMMENDATIONS

This is a good time to begin having trainees facilitate sessions. As with the first evaluation session, it is very important to air ideas and feelings in the large group and to reach a consensus on what is to be done. It is likely that a series of regular trainee meetings gathers input from trainees only. A session like this would be primarily to discuss and clarify such input between staff and trainees.

<td>Those who do not need to spray should observe others applying pesticides and should be free to ask questions both of trainers and trainees.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Put equipment away. Question and answer period.</td>
</tr>
</tbody>
</table>

**TRAINER NOTES AND RECOMMENDATIONS**

This session should be informal and relaxed, encouraging trainee independence. Trainers should input technical advice and monitor safety consciousness, but in a very easy manner. Trainers must be sure trainees have time to decide whether or not to spray and what to spray at least 1-2 days beforehand.

T-135
SESSION TITLE: PCV Visits Follow-up
SESSION #87 WEEK #7 DAY #37 (87-7-37)
PRESENTER:
CO-FACILITATOR:
TIME: 11:00-12:00 C

INTRODUCTION: SESSION OBJECTIVES

The trainees have just returned from the PCV Visits. Each one of them has seen a different situation and it is important for them to share their experiences for several reasons. They will have a better picture of the program they will be working in and will be able to better formulate reasonable strategies for site entry. This session is a transition from earlier General Program (GP) Sessions—in which information was presented to them—to the remaining GP Sessions in which they are expected to provide the bulk of the information. The objectives of this session are:

- To share general impressions of the PCV Visits.
- To compile lists of points to discuss in later GP and PS sessions, such as: PCV lifestyles, PCV work roles, interesting stories, successes, problems and PCV emotional states.

HAND-OUTS:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Informally discuss the visits with some trainees to get some idea of what occurred and some indication of trainee reactions.

- Label six flip charts with the following: "PCV Lifestyles", "PCV Work Roles", "Interesting Stories", "Successes", "Problems", and "PCV Emotional States".

- Cut up small slips of paper, one per trainee.

---

TIME SESSION 87-7-37 ACTIVITIES

---

5 Min Pass out small slips of paper to each trainee. Each trainee should answer "Yes" or "No" to this question: "Would you like to be assigned to the site you visited?" They can write short explanations if they wish.

20 Min Collect the slips and count the "Yes" and "No" responses. Read aloud any explanations that were given.

Summarize the results with a question such as:
"Most of you seem impressed by the sites, why is that?"
Encourage a general discussion.

20 Min Break the trainees into six groups and give each group one of the prepared flip charts. Depending on the category that they have, they list discussion topics which they feel are important and want to include in later sessions. After about ten minutes, have groups exchange charts. They read the topics already listed and add new ones.

10 Min The charts are posted and read aloud. Further additions are included. Inform trainees that these lists will be given to the presenters of relevant sessions.

---

TRAINER NOTES AND RECOMMENDATIONS

Make sure that the majority of the topics produced here are discussed in later sessions. Since trainees will present most of the sessions, the charts should help them prepare. (See "The Agricultural Development Workers Training Manual Vol. 2: Development Skills" for ideas.)
SESSION TITLE: Fruit Tree Propagation Follow-up

SESSION #88 WEEK #7 DAY #38 (88-7-38)

PRESENTER:
CO-FACILITATOR;

TIME: 8:00-9:00 F

INTRODUCTION: SESSION OBJECTIVES

This session is for the sole purpose of returning to the fruit tree nursery to follow up on the results of the previous Session #52, week #4, day #21, i.e. to check the grafts. If there were problems with the grafts, technical trainers will try to explain.
SESSION TITLE: Introduction to Demonstrations

INTRODUCTION: SESSION OBJECTIVES

Knowledge of agriculture alone is of little use to PCVs. They must be able, in spite of language and cultural obstacles, to communicate their knowledge with students, farmers and co-workers. Each trainee must develop and practice this ability. Demonstrations are a very useful communication tool that allows PCVs to overcome some of the obstacles. The objectives of this session are:

- To develop ideas about demonstrations and what makes one good or bad.
- To show 3 kinds of demonstrations: method demo, scale-model demo and result demo.
- To prepare trainees to do their own demos.

HANDOUTS: #89-a Points to be covered during the session. #89-b The Use of the Method Demonstration #89-c The Result Demo Plot

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

- To demonstrate
- To communicate
- To evaluate
- Method demo
- Scale-model demo
- Result demo

431
SESSION PREPARATION AND MATERIALS

- Make and display posters advertising the session in well-trafficked areas. Posters have title, time, date, place and catchy phraseology. Post a few days before the session.

- Make registration book and name tags.

- Set up the room as follows: chairs in a half-circle, back far enough so that mats may be put down for those who wish to sit on the floor. A sturdy chalkboard is center stage flanked by two flip-charts. Posters with catchy sayings are all around.

- Coffee, cool water and other refreshments.

- Flip charts, blackboard, chalk, eraser, markers.

- A small scale-model demo and a result demo.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 89-7-38 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>15 Min</td>
<td>Trainees register, put on name tags and enjoy refreshments. Presenter greets and chats amiably with guests. Slowly, everyone is urged to seats.</td>
</tr>
<tr>
<td>60 Min</td>
<td>Brainstorm: What is a method demo? The presenter will offer possible definitions, and solicit definitions from audience. Basic ideas will be written on chalkboard. Definition is then revealed: An organized system of teaching people how to do a practice or skill. What might be some examples of demos? -- college, silent way. What are some good or some bad points of these? -- answers are written on flip-charts previously labeled good and bad. When this section is finished, the good/bad charts are taped to the chalkboard. -- flip-charts have been prepared in advance with major headings -- these headings are each brainstormed, with comments written on the flip-charts. 1st heading -- preparation 2nd heading -- set-up 3rd heading -- the demonstration 4th heading -- considerations</td>
</tr>
</tbody>
</table>
The audience will be divided up into two groups, each group to attend a result demo and a scale model demo, each lasting 20 minutes, on a rotating basis.

I. Scale-model -- Taking soil samples -- Presenter will explain whys and wherefores of taking soil samples. Then ask audience to point out possible areas for taking samples from scale-model. (Any easy-to-prepare scale-model demo can be done here.)

II. Result demo -- Fertilizer application -- Presenter will explain how fertilizer was applied, giving times, dates, and rates. The audience will then be shown comparable plots, one healthy, the other moribund. (Any result demo may be used.)

When the groups return to the main hall, the presenter will lead a discussion on the good and bad points of each of the presentations. Flip-charts will be appropriately headed for each type of demo, and comments will be written down.

Evaluation -- What is the best indicator of whether your demonstration is successful or not?

If the farmer/teacher doesn't use your technique, what might the reasons be? -- Answers on flip-chart. Presenter gives first closing of demo, handouts, thanks and credit. Return to considerations chart.

Audience will be asked to give an evaluation of the preceding four hours and asked how it might be made Thailand specific. Handouts are given out.

---

TRAINER NOTES AND RECOMMENDATIONS

This session was adapted by Tom Ertner (Thai-78). When he presented the session, his preparation was evident. It was an outstanding session. When done well, this session inspires trainees and other trainers to prepare their demos and sessions equally as well.
I. PREPARATION

A. Choosing a topic
   1. Is the farmer ready to use the improved practice?
      a. Are materials available?
      b. Are there other things that are more important?
      c. Are there any factors which might prevent the practice? eg. cultural, religious.
   2. Does the farmer need the practice?
      a. Is it an improved practice?
      b. Can farmer readily put it into practice?
   3. Can the farmer afford it?
      a. What materials need be bought?
      b. Is there any way to reduce cost?
         1) Local materials?
         2) Sharing of costs between farmers?
         3) Grants or loans?
   4. Can the farmer learn it?
      a. Physically possible?
      b. Does the farmer have the background knowledge?
   5. Demonstrate one thing at a time?
      a. Will you need more than one demo session?
      b. Is the topic too broad, too complicated?
   6. Research?
      a. All available information?
      b. Anticipate questions.
   7. Title?
      a. Does it convey what will be done?
      b. Is it a catchy title?
   8. Timeliness?
      a. Is the demo to be just before that type of work is to be done?
      b. How soon before?

B. Set-up
   1. Arranging the time
      a. Convenient for the farmers?
      b. Holiday or regular work day?
      c. Morning, afternoon, or evening?
   2. Arranging place?
      a. On one of the local farms?
      b. Convenient location for all?
      c. Is transportation to be provided?
   3. Physical arrangements?
      a. Will everyone be able to see your actions?
      b. Will everyone be able to hear?
      c. Space provided for people to practice?
4. Materials?
   a. What will you need?
   b. Are the materials available?
   c. Have the materials long before hand?
   d. Will you provide practice materials for the farmers?

5. Practice?
   a. How smoothly will the demo go?
   b. Will you be lost for words?

6. Will the demo relate to the audience?
   a. Can you relate to the farmers' experiences?
   b. Is there anyone present you can ask for examples?

7. Did you write down each step?
   a. Do you have enough time for each step?
   b. Can you divide more difficult steps into easier ones?
   c. Will you be able to follow your plan?
   d. Can you change your plan easily in case of unforeseen circumstances?
      1) Rain
      2) Illness

8. Are your instructions written in a simple, understandable manner?
   a. Is the vocabulary that of the area?
   b. Do the instructions include all necessary steps?

9. Publicity?
   a. Did you use posters to advertise?
   b. Did you remind people?
   c. Was your last demo the talk of the town?
   d. Advertise your next meeting?

C. Considerations during the demo.
1. Did you present the demo with enthusiasm?
2. Did you act?
3. Did you talk to (not at) your audience?
4. Was the demo explained step-by-step?
5. Are you certain they understood?
6. Was there time for questions?
7. Did you repeat steps as necessary?
8. Did you assist the slower persons?
9. Were faster persons used to assist?
10. Were important steps summarized?
11. Were final questions encouraged?
12. Were hand-outs distributed at the end of the demo?
13. Was the audience told where to get additional help if necessary?
14. Was a list of attending farmers made?
15. Were there any conflicting meetings?
16. Were photographs taken?
17. Were records kept for future reference?
18. Were credit and recognition given to farmers for their help?
II. Demonstration

A. Choosing the type of demo.
   1. Scale-model.
   2. Result demo.
   3. Method demo.

B. Scale-model
   1. When used?
      a. Illiterate people.
      b. People unfamiliar with conventional Western concepts.
      c. To show results.
   2. Serve as communication aids in the following contexts:
      a. Mapping 3-D relief features.
      b. Showing relationship between system's parts.
      c. Replicating to scale a mechanical part that can be manipulated and used for practice.
      d. Planning.
      e. Promotion of innovations.
      f. Problem solving.
      g. Comparative analysis.
   3. Planning considerations
      a. Choice of scale.
         1) Large or small.
         2) How small?
      b. Choice of materials.
         1) Cost
         2) Availability
      c. Permanent or temporary construction.
      d. Rain protection, shade.
      e. Accessibility, suitable for audience size.
      f. Capable of being manipulated.
      g. Culturally acceptable.
         1) Certain colors.
         2) Replication of human forms.

C. Result demo
   1. When used?
      a. To show results of research or testing.
      b. For long-term concepts.
   2. Select practices according to
      a. Local testing
      b. Affordability
      c. Profitability
      d. Showing immediate results
      e. Suitability to prevailing cultural patterns
   3. Need not be run by extension agent
      a. More credibility with local farmer.
      b. Testimony of farmer.
   4. The farmer
      a. Should not be too wealthy or progressive.
      b. Should not give undue care to plots.
      c. Results shown should be normal conditions by normal farmers.
5. The plot
   a. Typical of surrounding lands.
   b. Crop must be managed at realistic levels.
   c. Who will provide necessary input?
      1) Ideally, the farmer.
      2) Some instances where the extension service might provide inputs as a courtesy to the farmer.
         a) Will a gift of inputs have a negative effect on the agent-farmer relationship?
         b) How will other farmers perceive the gift?
   d. Location
      1) Conspicuous or readily noticeable.
      2) Along road or footpath.
      3) Traditional and improved plots
         a) Meet local literacy rates.
         b) Local tradition.
   e. Size factors
      1) Labor constraints of farmer.
      2) Amount of land available.
      3) Size of group observing final result.
      4) Type of crop.
      5) Overall impression the demo is to create.
      6) Large enough so both traditional and improved plots can be seen at a glance.
      7) Some suggestions.
         a) 100-200 sq m for field crops.
         b) Less area for vegetables.

6. The process
   a. The farmer must be familiarized with what, why, when, and how of the project.
   b. Extension agent must see that all inputs are done on time.
   c. Accurate documents.
      1) Rain and temperature.
      2) Fertilizer
      3) Etc.

7. Again the farmer
   a. Must be thoroughly trained.
   b. May provide testimony.
   c. Opportunities early on to show progressive results.

8. The presentation
   a. Farmer may help agent in
      1) An explanation of new practice focusing on amount of labor, materials, and changes from traditional methods.
2) Conservative estimate of costs and returns.
3) Question and answer period.
4) An offer to follow-up visits to other farmers interested in adopting new methods.
   b. May take the form of a method demo.
   c. Encourage active participation.
   d. Prepare a written plan.
   e. Pose questions at regular intervals to see if audience is understanding.

D. Method demo
See points to consider at beginning of outline.

III. Follow-up
A. Evaluation
1. If it was a good demo, farmers should know how to do the practice presented.
2. Are they adopting the new practice?
3. If not adopting, reasons?
   a) Too difficult
   b) Too costly
   c) Untimely
   d) Poorly planned
   e) Not needed.
THE USE OF THE METHOD DEMONSTRATION AS A TEACHING DEVICE

Principles of learning as applied to the method demonstration:

A method demonstration is an organized system of teaching people how to do a practice or skill. It has been used in many countries since extension first came into existence. The basic principle of the use of this method of teaching people is that the people are taught a skill one step at a time. It has long been known that people learn more, retain more and learn faster if the information being taught is presented in definite, clear-cut steps, where each single step advances the learner one stage nearer to the completion of the skill.

The sense of hearing:

The method demonstration requires a teacher and a learner. This requires a teacher who understands how people learn. An understanding of how the senses are employed in learning a skill is basic for the ability to teach. The sense of hearing plays a very useful and important role in learning, but it can easily be pointed out that learning certain skills can take place without the use of this sense. A deaf person can be taught to do most tasks except those requiring the use of the ear to do the job. People have been taught rather complicated skills where the teacher and the learner had no common language ability. Thus, the sense of hearing is not absolutely essential for some forms of learning. About 10% of the skills we learn are attributable to the use of the ear.

Hearing has limits in learning:

Imagine how limited your learning would be if hearing was the only one of the five senses you possessed. It is almost impossible for a person to tell another how painful it was when he broke his arm. Could you tell another person the difference between paraffin and petrol? There are more effective methods of teaching than by just telling.

The sense of seeing and learning:

There is evidence to support the argument that the use of the eyes is not absolutely essential to learning, but admittedly, sightlessness is a far greater handicap here than deafness. About 35% of the skills we learn are accomplished through the use of the senses of hearing and seeing. These are not hard and fast figures since individuals vary in the use of these senses. It is definite that the combined use of the two senses serves the learner to greater advantage than the use of them separately.
We learn skills best by doing:

There is only one way of knowing that a skill has been learned, and that is when the teacher actually sees the learner doing the job that is being taught. The use of the hands (doing), along with the application of hearing and seeing, increases our effectiveness in learning a skill. 75% of all skills learned make use of the senses of hearing, seeing and doing. Some skills may require the sense of taste and smell.

We use our sense of taste to determine when milk is souring. We use our sense of smell to distinguish between paraffin and petrol. Obviously the limitations of the use of these senses arise from any danger coming from this activity. We do not identify poisonous insecticides by taste, nor do we detect poisonous gases by smell.

THE METHOD DEMONSTRATION

Your subject must be timely:

Before deciding what you will demonstrate, it is a sound practice to be certain the subject meets a few basic requirements. This can be determined by asking yourself first: Is the subject timely? It is not time to demonstrate coffee pruning before the tree is planted. It is not time to demonstrate maize harvesting when it has just been planted. It is not timely to teach farmers how to operate tractors when they do not own them, and may not for a long time.

The farmer must need the skill:

The next question to ask yourself about the subject is: Does the farmer need this skill? The fact that you feel the farmer needs to be taught a new method has little bearing on the farmer's opinions. You can say the farmer needs a skill when he has so decided for himself/herself. If you cannot convince the farmer s/he has a real need for the subject you plan to demonstrate, perhaps it is not time to attempt to demonstrate it.

If the farmer cannot afford it, don't teach it:

The third question is: Can the farmer afford it? Again, if the farmer does not believe s/he can afford it, s/he will not adopt your practice. It is only when s/he can be convinced that s/he cannot afford to farm without adopting your practice that s/he will ask your help to learn to use the information.

The materials must be available:

There yet remains another question: Are the materials available? It is of little use to select the subject of a new hybrid maize to be planted if the seed is not available.
How to use the method demonstration:

The questions asked about the subject to be demonstrated elementary, but many a demonstration has been doomed to failure before it was started, simply because one of these questions could not be answered "Yes." It is also helpful to think of a demonstration from the standpoint of three phases, or periods.

1. Before the meeting
2. At the meeting
3. After the meeting

Careful planning is required for each.

Before the meeting:

In setting up the time for a demonstration, we are not only to think of the hour, the day, the month and the season. There are other considerations about the time. It would not be a good time to give a demonstration when you would run into competition with another meeting, or perhaps a visit to your area by a V.I.P. Such competition would be difficult.

Select the site:

In regard to a place for a demonstration, the important thing is to be certain that you have a satisfactory site at which to hold it. The key point for each consideration in planning a demonstration is to plan ahead. You can be sure to have a site arranged if you take the matter up well ahead of time. Should you request a farmer to use his shamba to hold a maize planting demonstration, it would be disappointing to learn he had already planted his maize the day before.

Use a title which attracts an audience:

Selecting a title which has an appeal is not always an easy job, but it deserves thought. You select a book by its title, or a magazine by its articles. A farmer may be attracted to a demonstration by a title which appeals to him or her, or s/he may not attend because it failed to arouse an interest. If you study your audience you can better know what appeals to their interests.

Teach one thing at a time:

Your plans should be made to teach the farmer one thing at a time. You will only confuse the issue if you try to cover the entire area of coffee culture in one demonstration. S/he will remember most of the details about one phase of coffee culture, but s/he may forget several vital points made at a demonstration.
given on planting, pruning, mulching etc. Plan to teach one thing during one demonstration. It is best not to divide a farmer's interests between several phases of an enterprise, yet a demonstration must provide a challenge to the farmer if s/he is to consider it worthwhile to attend.

Watch your language:

The language to be used at your demonstration may well spell success or doom to your performance. Language is not referred to as meaning only the vernacular you will use, but even more important is the choice of words. Plan to use language at the level of your audience's ability. People are not impressed by big words. Why say "di-chloro-di-phenyl-trichlor-ethane" when you mean D.D.T.? The farmer may not even have heard of D.D.T. in which case it would be wise to refer to it as a "medicine" called D.D.T. Aristotle said: "Think like a wise man, but speak in the language of the people." It is the best assurance that you will be understood.

Relate to experience:

Whenever possible relate to experience of people. One example of this was heard at a demonstration. In placing fertilizer in a ring around the base of a coffee tree, the demonstrator was asked why he did not simply put the fertilizer in one pile. He was able to relate to experience as follows: he referred to the roots of the tree as the mouth of the tree and said: "when you want food you put food to your mouth. Fertilizer is tree food, Put the fertilizer to the mouth of the tree--the roots." The farmers understand this kind of talk because it relates to everyday experience. The farmer who has lost a large part of his crop to insect damage fully understands the economic importance of a recurrence. Make your comparisons relate to the past experiences of your audience.

Have everything ready:

Embarassing moments may come about at your demonstration because you failed to include an item. You may not be able to get a particular item if you wait till the last minute. It is possible that the last can of DDT was sold the day before. Plan well ahead to have materials on hand.

Be ready for questions:

Research will assist you to answer the difficult questions asked at your demonstration. Even then someone will ask a question you had not expected. Gather as much subject information as possible before you give your demonstration. When you are asked questions for which you have no answer, tell the person you do not have an answer and that you will find it and give it to him another time.
If you give misinformation, you will soon be found out. You cannot afford to lose prestige by giving incorrect information.

Practice:

You will avoid making embarrassing mistakes if you will practice your presentation ahead of time. Practice until you become an expert at the skill you are demonstrating. Practice makes perfect. Become a perfectionist.

Outline your plan:

The purpose of this whole exercise is to get the demonstrator to develop written plans. Written plans help a demonstrator stay on the subject. They help him to give the demonstration with greater certainty and proficiency. A good plan causes the demonstrator to complete his demonstration without omitting any steps or key points and to give the same information at each similar demonstration in his location. The strongest support for written plans is that when they are used as guides, each step is given in its logical order. A step is an action by the demonstrator that brings the job being demonstrated one phase nearer to completion. A key point is information which prevents a step from being improperly done, or that might otherwise ruin the job. An example of a step is: add two ounces of DDT liquid to four gallons of water. The key point for that step would be: Stir the "medicine" and water to assure a uniform mixture. Unstirred, the mixture would fail to do the job.

At the meeting:

We have been thinking of all the things to do before the meeting. Long time planning ahead is the only known method of preparing for the day of the meeting.

Plan ahead:

On the day of the meeting you should have everything you will need ready to go. All necessary materials should be checked before leaving your home or office so that nothing will be forgotten. You should plan to be at the demonstration site at least 20 minutes before your audience arrives. This will allow you time to arrange your materials in their logical order for the demonstration. Plan for audience comfort. Plan to arrange them so that they can see every action on your part. Demonstrations during the hot weather, when the sun is at its peak are uncalled for and show poor planning. Plan for a cooler part of the day. At the meeting you must show enthusiasm while presenting your demonstration. If you do not appear to be interested and convinced in what you are saying, it is quite likely that your audience will not show interest either. Act yourself. Appear relaxed during the demonstration, if you have confidence in your
ability this will come naturally. Talk to your audience at all times. There is a difference between talking "to" an audience and talking "at" them. An audience being talked to is aware of it. They can feel that they are part of the discussion. Avoid talking to one individual for any length of time. You can soon lose your main audience with such methods. Each member should be made to feel that you are talking to him/her.

Question techniques:

Your audience should be made aware of each step as you present it. They should not only clearly understand just what it is you are showing them, but should also clearly understand the importance of the step to the total demonstration. The questioning technique can often be used to determine if you are being clearly understood. If you will also allow and encourage the audience to ask questions you will find it a useful means of noting your effectiveness in being understood. Each time one of your audience asks a question, repeat the question before you give an answer. First, it assures that each of your audience had an opportunity to hear the question. Secondly, it gives you time to organize your thinking and give a sound answer. Most people will not ask to have you repeat the question even though they may have been interested. Some demonstrators use the technique of having a member of the audience demonstrate his ability to perform a step to give confidence to the group. If one of them can do it, there is less doubt about their own ability to perform what is being demonstrated.

Repeat steps whenever necessary:

In testing members of the audience you may find it is necessary to repeat a step. This is considered to be a good teaching technique. Let no one leave your demonstration unable to carry it out at home.

Watch for the faster and slower learners:

Some members of your audience may be faster in learning the skill than others. When the audience is doing the demonstration, faster learners may be used to teach or assist the slower learners. Use this technique whenever practical.

Give a summary:

A brief summary of what you have been demonstrating before you close helps to refresh the audience and sends them away with the sequence of the steps in their proper order. This period also serves to give last minute warnings of any dangers or hazards to avoid. After your summary, encourage any final questions so that none may go away not knowing. Advise them where and how to get further assistance if needed.
Don’t fail to advertise your next meeting;

Extension workers should take advantage of every group at a meeting or demonstration to announce the next meeting. Even though your next meeting may be on quite a different subject, there is the possibility that some of the audience may contact people who will be interested. If it is to be related to the present demonstration, do not fail to announce that the next meeting will be one further step toward the total job. Remember, your present audience gives good promise of being your audience in the future, if you are giving a good, well-planned demonstration today. As a parting shot, you may have materials to hand out for today’s demonstration, or a short comment about the coming meeting.

Follow up after the meeting;

Although your demonstration is over for the day, it is not finished. Extension work requires continued evaluation. Your follow-up serves several purposes, one of which is an evaluation of your effort. If you have put on a good demonstration the farmers should know how to do it. If you have convinced them of the need for practising the skill you taught them you can expect them to do it on their own farms. If they do nothing to use the practice, the matter needs to be investigated. All of these things are included in the follow-up.

It is not enough that you have taught the farmer how to do a practice, s/he must be motivated to carry it out on the farm. If s/he has not adopted it, it may have been:

- too difficult
- too costly
- untimely
- poorly planned
- not needed

Any one of the above situations is reason enough for failure to adopt. Check the farmers so you can check yourself. Determine your short-comings. Correct them and avoid future failures.

PLANNING A METHOD DEMONSTRATION

1. **Demonstration title:** Garlic Onions are Easy to Grow for Food and Profit.

2. **Why is this demonstration important to your audience?**
   a. Garlic onions are a new crop in this area.
   b. Garlic onions grow easily.
   c. Garlic onions provide a good food addition for the home.
   d. There is an available market for a good crop of garlic onions.
3. Materials needed for this demonstration:

   Equipment and supplies:
   (1) planting plot
   (2) hoe
   (3) hand rake
   (4) Pegs
   (5) One "oil tin" full of well rotted farmyard manure
   (6) Stick, one foot long
   (7) Stick, four inches long
   (8) String
   (9) Garlic onion bulbs

   Visual Aids and Hand-outs
   (1) Pamphlet on "Planting Garlic Onions" in host-country language, with many drawings, if possible.
   (2) Sample onion bulbs

4. Presenting the Demonstration

   STEP-BY-STEP ACTIVITIES

   I. Mark out the first row.
   Use a string and pegs to mark the row; make sure the string is tight.

   II. Measure second row one foot from first row.
   Use stick 1' long to measure spacing.

   III. Additional rows are laid out at same spacing.
   Keep rows straight using string and pegs.

   IV. Make the planted furrows 1" deep.
   Use hoe to dig furrows along the line of the string.

   V. Place farmyard manure in furrows to the level of the ground.
   Use well-rotted manure.

   VI. Mix the manure into the furrow soil.
   Prevents burning of the bulbs.

   VII. Mark the planting spaces along the furrow.
   Use 4" stick to lay out spaces.

   VIII. Plant the bulbs at the 4" spaces in the furrows with the point of the bulb up.
   Bulb point must be up. Firm soil around each bulb.
5. **Summary of points made during the demonstration:**

   (1) Garlic onions can be planted during the long and the short rains.

   (2) The planting space is 4" between plants in the row and the rows are one foot apart.

   (3) Furrows are dug and filled with well-rotted manure to the level of the ground.

   (4) The manure is mixed in the furrows with the soil.

   (5) A single bulb is placed at each 4" space in the furrow.

   (6) The point of the bulb is upward.

   (7) The soil is firmed around the bulb for fast germination.

6. **What are the people expected to do as a result of this demonstration?**

   The farmers are expected to plant garlic onions properly for an easy cash crop.

7. **Plans for follow-up and testing the effectiveness of the demonstration.**

   (1) Visit the farmers who will plant onions and assist them as necessary.

   (2) Visit again before harvest time to assist them with marketing their crop.

THE RESULT DEMO PLOT AS AN EXTENSION TOOL

I. WHAT IS A RESULT DEMO PLOT?

Designed to provide farmers living proof of the benefits of new practice or package of practices; it's actually two plots (improved and traditional) compared side by side.

II. RESULT DEMOS AND THE RESEARCH-EXTENSION CHAIN.

Developing and testing new practices vs. promoting them; where do result demos fit?

A quick look at the Research-Extension Chain:

Pure Research -- Biological Sciences
Basic Research -- Agricultural Sciences
Applied Research

DEVELOPING
ADAPTIVE RESEARCH: "Customizing recommendations to local agro-environments

Small plot tests at national and regional experiment stations using promising leads of applied research.

AND

On-farm experiments: The "best bet" practices derived from the small plot trails are tested at various levels (rates, etc.) and in varying combinations under on-farm conditions. Due to their complexity and need for precision, they should be supervised by researchers and assisted by extension workers.

TESTING

On-farm result tests: The most promising practice or "package" is tested for profitability by extension workers and farmers under actual farming conditions. This is the "acid test" of suitability.

EXTENSION

Result demonstrations (or Result-Method Demos)
Method Demos
Other extension tools
Farmer Feedback & Adjustment of Recommendation

Researcher Extension Workers Farmers
Promoting practices without adequate testing is a common syndrome among PCVs and extension workers. No wonder farmers often appear to be resistant to change.

III. HOW TO SET UP A RESULT DEMO PLOT

1. Select an appropriate practice or "package" to demonstrate.
   a. Given your lack of local experience and time to adequately test practices, rely on the local extension service to provide appropriate choices; always check to see if adequate local testing has been done; the amount needed will vary with the practice; i.e., selecting an adapted improved crop variety requires much more lengthy local testing than the use of mulch or insecticides.
   b. One practice vs. a package: Although a package may be more complex and cost more, it may be the only way to achieve good enough results to interest farmers. A well designed package actually reduces farmer risk.
   c. The practice(s) chosen should be affordable, adapted, and profitable for the majority of farmers in your area. Extension services that really have their act together may divide the region's target farmers into several recommendation domains, each with an adjusted package to reflect variations in soil, topography, economic circumstances, etc.
   d. Gestation period: At least in areas where extension efforts are relatively new, practices that produce results in weeks or months are more likely to be readily accepted than those requiring longer periods.

2. Select a cooperating farmer (or organization)
   a. Don't run the demo on your own land. Farmers are most impressed by the results obtained by other farmers, not by a PCV or ag agent.
   b. Choose key farmers who are influential but not necessarily the best or most progressive, since they may be regarded as eccentric or as favored pets of the extension service.
   c. Group demos on rented land are OK, but the group should be a preexisting one (like a co-op) rather than one specially organized for the demo.
   d. Since the farmer or farmer's group should do most of the actual work (this makes the demo credible), be sure that this is understood. This brings up the question of whether the inputs should be donated or charged for.
3. Choose a suitable location and layout.

a. **Site Criteria**: A conspicuous location with good exposure like near a road or trail. The land and soil should not be atypically favorable or unfavorable but representative of target farmers' situations.

b. **Size**: Large enough to be realistic but not so big that it's difficult to visually compare the traditional and improved practice plots side by side. A couple hundred square meters per plot would be adequate for a maize demo, with less area sufficing for more intensive crops like vegetables. It's also easier to find cooperative farmers if they know that the plots will be small, thus minimizing any perceived risk.

c. **Plot layout**: Decide the best way to show off the demo to an audience, plus consider audience size. A side by side layout is better than a front and back layout.

![Diagram of a side by side layout]

<table>
<thead>
<tr>
<th>![Plot Layout Diagram]</th>
</tr>
</thead>
</table>

It's usually best if the rows run front to back rather than parallel to the viewing area. This makes it easier for farmers to enter the plots.

4. Provide adequate supervision of the demo.

a. Both the extension worker and the farmer need to be thoroughly familiarized with the what, why, when, and how of the various operations involved.

b. Make sure the needed inputs are on hand.

c. Make sure that the inputs and other practices are correctly applied on schedule.

d. Avoid the tendency to favor the improved practices plot by giving it an unrealistic amount of TLC.

e. Keep accurate records, including rainfall which will help analyze the success (or failure) of the demo.
IV. PROMOTION AND FOLLOW UP

1. At what stages will the demo produce visible results worthy of farmer attention? i.e. only at harvest or at earlier stages too (like color and plant size difference).

2. Arranging farmers visits.

   a. Unsupervised, unscheduled "stop by anytime" visits: Need explanatory signs in writing and with pictorial explanations for those who can't read. This type of visit should only be a supplement to supervised visits.

   b. Supervised, scheduled visits conducted periodically at key stages. Since new practices usually require a combination of explanation and instruction, a combined result-method demo may be appropriate. However, don't co farmers being convinced enough to try the new practices even by the times successful demo reaches harvest stage. Also, farmers may not be able to apply the practices till the next cropping season.

   It's often appropriate to schedule separate method demos at a later date (i.e. even well after the result demo). Such method demos should be timed to coincide with the crop's actual production cycle and may involve several staggered method demos so that farmers can learn the new methods within a month or less of having to apply them.

   c. Any result demo scheduled visit session should provide farmers with realistic cost-return date for the practices. Researchers and extension workers tend to exaggerate the claims and benefits of a new practice. Be conservative yet realistic. Remember that a typical result demo is small scale and therefore more pampered than when farmers implement the methods on larger fields.

V. WHAT ABOUT THE "SPONTANEOUS" DEMO?

A spontaneous Demo is a very effective type of demo using a farmer's field that already demonstrates the benefits of what you're trying to promote. One advantage of the spontaneous demo is that it escapes the possible stigma of appearing contrived like a purposely organized result demo.

SESSION TITLE: Demonstration Preparation

SESSION #90  WEEK #7  DAY #39  (90-7-39)

PRESENTER:

CO-FACILITATOR:

TIME:  8:00-10:00 C

INTRODUCTION: SESSION PREPARATION

Each trainee will give a demonstration on Field Day. The trainees need time to prepare their demonstrations and clarify what is expected of them. The objectives of this session are:

- To have each trainee select his/her demonstration topic and the type of demo that s/he will do.
- To have each trainee complete a rough outline of his/her demonstration.

HAND-OUTS:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>

316  454
SESSION PREPARATION AND MATERIALS

- Prepare a short list of demo topics that trainees might use and write them on a flip chart.

- On a flip chart, write a sample outline, following those given in Session 89-7-38, "Introduction to Demonstrations."

- On a flip chart, write the guidelines for trainee demonstrations.

- Find a trainee to be co-facilitator.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Ask a few questions about the demos given in earlier sessions. Also, ask about topics that interest trainees.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Post flip chart with guidelines and discuss. These guidelines should deal with place (Field Day location), audience, time, team presentations, budget (for each demo), and materials. As much as possible, let trainees set the guidelines and lead the discussion.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Post list of possible topics. Point out that the demonstrations can cover any topics of use and interest to the expected audience, which might include health, culture, and economics, in addition to agriculture. Ask a trainee to facilitate additions to the list, which may include research topics from &quot;Independent Study&quot; (Session #78-5-27).</td>
</tr>
<tr>
<td>15 Min</td>
<td>A trainee leads the selection of topics that each will do. Those interested in doing team demos can discuss the possibility with friends.</td>
</tr>
<tr>
<td>55 Min</td>
<td>Post sample outline. Instruct trainees to spend the remaining time to sketch outlines for their sessions. Ask to see each outline in order to know trainee plans and to avoid anyone choosing a demonstration topic that is too big to cover.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

The trainer specifies what is expected from the demos and any limitations which must be imposed. Other than that, trainees are free to do as they see fit. Guidelines should be carefully thought-out and complete. None should be added after this session.
SESSION TITLE: Swine Selection

SESSION #91  WEEK #7  DAY #39  (91-7-39)

PRESENTER:  

CO FACILITATOR:  

TIME:  10:00-11:00 F/C

INTRODUCTION:  SESSION OBJECTIVES

Because of genetic variability, physical characteristics of swine have an effect not only on the reproductive performance, but also on the growth production of individual animals. At the end of this session trainees will:

- Be familiar with methods of selection based on conformation and production characteristics.
- Be able to identify characteristics of good feeders and breeding stock.
- Be able to identify the common breeds of swine used locally.

HAND-OUTS:  #91-a Record Keeping and Field Notebook Guide for Swine.

#91-b Swine Anatomy.

READING ASSIGNMENT:  Small-scale Pig Raising, Pgs 30-44.
SESSION PREPARATION AND MATERIALS

- Arrange to visit swine farm and select mature pigs showing range of physical conformation.
- Arrange for transportation.
- Prepare hand-outs.

<table>

TRAINER NOTES AND RECOMMENDATIONS

This session can be included here, or also be scheduled either before choosing the pigs in the "Intro to Pigs" session or preceding the "Swine Reproduction" session.
The sample records that have been included are designed to provide ideas about record keeping and important points and dates that you would want to keep track of. No matter how large or small your swine herd, record keeping is important as a management tool and can affect the profit of your operation. The design or format of these records is not important; you may find that given the size of your herd, you can keep detailed records that are adequate for you on a large calendar. Some of the points included on these sample records are obviously not needed in all cases (such as the sow's pedigree). They are intended to provide one sample of how a record keeping system can be organized and to provide ideas on important points. Listed below are some of the points I consider to be important and that should be included in your records and field notebooks. Remember that these are not feed consumption records (which should be kept separately) but are breeding and production records.

1. Breeding date of sow
2. Breed of the sow and the mating boar
3. Identification of the breeding boar
4. Farrowing date of the sow
5. Number of piglets born (and how many of each sex)
6. Their birth weights
7. Number of piglets weaned and their weaning weights
8. Weaning date
9. Health and temperament observations of the sow
10. Number of piglets born dead
11. Number of functioning teats of the sow
12. Which of the litter were kept for future breeding stock and which were sold off or eaten
13. Assign a number to each individual litter
14. Is it the first, second, third, etc. litter of the sow?
15. Complete health records: Date and dosages of any vaccinations or medications
16. Date and cause of any death
17. Any findings from post-mortem examinations
18. Any notes or findings on individual or overall herd health
19. Castration, iron shots, and clipping of needle teeth dates
20. Who was the pig sold to and for how much?

SESSION TITLE: Co-workers and Helping

SESSION #92 WEEK #7 DAY #40 (92-7-40)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-10:30 C

INTRODUCTION: SESSION OBJECTIVES

Peace Corps puts a lot of emphasis on transferring skills and working with others, which is seldom as easy as it might appear to be. The work styles of different PCVs and those of host-country counterparts can differ greatly, as can concepts of what constitutes "helping." PCVs can save a lot of time by assessing how they and others stand on these two issues. A better understanding of these two concepts increases the likelihood of their happening.

NOTE: It is important to note that, although this session was developed for Crossover volunteers it can be used in a general sense. For that reason, words that are Program Specific are enclosed in parentheses.

The objectives of this session are:

- To explore different styles of working with others and assess the consequences of those styles.
- To consider how one's personal, preferred style of working with others may affect one's work and how to adapt that style when necessary.

HANDOUTS: #92-a Working Style Inventory - Trainees should complete it prior to the session.

#92-b Your Co-worker---The (Agriculture Teacher)

#92-c Transferring Responsibility

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

Co-worker To help
SESSION PREPARATION AND MATERIALS

- Remind trainees to fill out the "Work Style Inventory" before the session.
- Put "Continuum of Volunteer Helping/Work Styles" on a flip chart. Save for "Projects" session.
- Flip chart on group discussion tasks.
- Chart on conditions, advantages and disadvantages.

TIME

SESSION 92-7-40 ACTIVITIES

5 Min

Introduce the session by linking this session to the prior sessions that relate to the theme of development. Remind volunteers that in the first session, a general idea was developed that the goal of Peace Corps work is to help others towards self-sufficiency.

State that in this session we want to explore some of the specific ways that volunteers work with people in different situations which may help or hinder that goal. In so doing, we want:

- To explore different styles of working with others and assess the consequences of those styles.
- To consider how one's personal, preferred style of working with others may affect one's work and how to adapt that style when necessary.

25 Min

Move on to the following lecturette.

LECTURETTE: The inventory you have just taken presented a series of situations where you were asked to choose which way to work with the people in that situation. In fact, there is no hard and fast rule for which is the best way to work and no situation is exactly like another (for example, even through one long range goal is self-sufficiency, a situation may dictate that we choose actions that would fall in the direct service column in order to attain short term goals). As much as possible, we need to be clear about what the situation is we are confronting and try to make a conscious choice about how to act so that we are clear about the consequences of our choices and how they affect the people with whom we work.

T-141
The inventory, in general, corresponds to the "Continuum of Volunteer Helping/Work Styles" (unveil the diagram drawn out on a flip chart). Your score corresponds to one of the major work styles (the numbers in columns 1, 2, 3, and 4 follow: a = Direct Service, b = Demonstration, c = Organizing with Others, and d = Indirect Service). If you score higher in one column than in another, it indicates that you prefer to work in that mode in the situations described. Each style is described as follows:

Column A: Direct Service
----------------------------------------
This is a direct approach in which the volunteer mostly does the work, gets a project organized, provides a needed service where none exists, and generally takes the initiative for making things happen. In most instances, this means that the volunteer takes responsibility for the action or project, and that a counterpart may or may not be involved—and even if involved, will look to the volunteer for action and leadership.

Column B: Demonstration
-----------------------------
In this approach or situation, the volunteer spends most of the time demonstrating to others how to do something, but also spends a lot of time doing it himself/herself. Most often the responsibility is shared with one or two counterparts. The work is a combination of direct service and training/demonstrations, often with the volunteer sharing some responsibilities with a promising local leader or an assigned counterpart.

Column C: Organizing with Others
------------------------------------------
In this system, the volunteer encourages and stimulates promising counterparts and others in the community, generally—although not always—working with people rather than directly on projects. (NOTE: Throughout this session, we use community in its most generic sense—it could be a school community, an agricultural office, or a town or section of a city.) The focus is on building leadership and helping a group or organization develop which will continue the work. The primary work is behind the scenes using influence, assisting
as a resource in developing alternative solutions which the people choose or generate themselves, serving in a training capacity, occasionally serving as a model in doing work, and so on.

Column D: Indirect Service

In this approach, the volunteer responds to a range of situations and problems raised in volunteer work by helping others solve their own problems; the volunteer does not direct any of the work but concentrates on helping the people define and refine their perceived need. Help is given only on request, rarely initiated by the volunteer. The volunteer may even come and go, leaving the project to do something else and thus reinforcing the autonomy of the group. The way the volunteer works is primarily clarifying, asking questions, listening a lot, and facilitating.

These four styles can be seen as related to stages in the development of self-sufficiency. For example in a beginning stage, a group may never have worked together, may not have any technical resources, and may not believe that it is possible to make improvements. In such a situation a volunteer may decide that the best way to get things moving is to: a) establish credibility, b) show people that (for example) a fat pig can be produced, and c) salvage a bad situation. In so doing, he may decide to simply do the work himself and show the skeptical that something could be done. In this instance, the volunteer may be using a combination of "direct service" and "demonstration".

At a later stage of development as a group or project moves towards self-sufficiency, a volunteer may decide that the best way to help a group move along is to work with only the leader in a community to help with ways to effectively plan or communicate together. In this instance, the volunteer will do nothing without a counterpart from the community. The primary task in this case would be leadership training and "organizing with others".

In these situations, one must consider the circumstances and the consequences and address a critical question. Is one looking for a short term or a long term result?
In reality, different styles or combinations of styles may be called for at different times, depending on the circumstances, the urgency of the task, what people are expecting of the volunteer, whether the project is at a beginning stage or a later stage, whether one is addressing a long term or short term situation, etc. Sometimes, a volunteer may need to use all four work styles on different days of the week for the same project. Whatever the style, there are consequences for the way a volunteer works. Let's consider some of those consequences by doing the following task.

Divide the group into quarters by mixing people with different score preference areas. A way to do this is to ask all people who scored highest in Column A to raise their hands. They count off by four's, then go to Column B, etc. mixing people from the four preference areas.

Written up on a flip chart:

- Go back through the inventory you have just taken, choose those questions where members of your group have scored differently.

- Discuss two or three of these situations and for each one share the reasons that you scored it the way you did, including the conditions that were present that caused you to score it that way. For example, what people were there, what skills you have, etc. Try to discover what assumptions you are making.

- For each situation, discuss and list what the consequences of your choices may be in terms of the principle of working towards eventual autonomy for the community.

- Be prepared to select one of your cases to present to four other people. You will be asked to give the pros and cons of each choice to another group.

Ask if there are any questions.

Quarter groups work on the tasks.
Bring the group together  
(a) Ask generally -- What are some of the things that came out of your discussion in small groups? What things did you agree on? Disagree?  
(b) Ask the group to help you fill in the following chart based upon the things they have discovered in their conversations. (Ask for people to give you ideas randomly, clarify these responses and then list under the appropriate headings).

CHART

<table>
<thead>
<tr>

</tr>
<tr>
<td>Organizing with Others</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Indirect Service</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Now that you have had a chance to see how you would approach these kinds of questions both by yourselves and in groups, what are some of the things you can say about working with others in the community that you think are true in general? (List responses on flip chart.)

- In the specific situation of your work? 
- In the community experiences you have had so far in training what style would you use?
We’ve discussed this a little above, but how do you think you will be able to find out what style is the best one to use in your volunteer work when you first start on the job? (List ideas).

- What style is easiest for you? Why?
- What style is most difficult? Why?
- What changes do you want to work on over the next month or two that will help broaden your style range?

5 Min

Refer back to the goals of the session and check with the group to see to what degree the goals have been met. Tie this session into other sessions in which trainees work with farmers.

TRAINER NOTES AND RECOMMENDATIONS

This session was presented by a trainee, who condensed but closely followed the session design for "Working with Others: Helping" (II-4 in Vol. 2 of The Agriculture Development Workers Training Manual).

For the group discussions, the procedure assumes a roughly even balance between the 4 columns or typologies—which of course rarely happens! If one group (column B for example) is predominant, you may put two "B's" in each group, and no "D's". The task can still be accomplished as stated—the "B's" may find they differed on particular items, and they could discuss why, or they may have agreed on an item for completely different reasons, which would also be interesting to share and discuss.

Another suggestion is to take those who have a high score in one column, and a next highest score in another column that is almost as high as the first, and assign him/her to a group that needs a B or C or whatever. By their scores, some people could go in two or even three columns—wait until you get a sense of how the scores break out, and then assign these people to "needy" areas (i.e., only two real "A's" in the group, so assign one whose second highest score is "A").
FIGURE 16 CONTINUUM OF VOLUNTEER HELPING/WORK STYLES

- Self-sufficiency
- Extent to which the volunteer is responsible for the work
- Extent to which the community is responsible for the work
- Dependence

- Indirect Service
- Organizing with others
- Demonstration
- Direct Service

Points:
- (A)
- (B)
- (C)
- (D)
Sixteen situations typical of those faced by Peace Corps Volunteers in the past are described below. Four different ways of handling each situation are described next. Select the way of handling each situation which you prefer and assign the number "4" to that choice. Select your next preferred choice and assign a "3" to it. Assign a "2" to the next preferred choice and then a "1" for the least preferred choice. Assign your numerical choices directly on the scoring sheet attached to this self-assessment form.

This form is designed to help you assess your own preferred style of handling situations which you are likely to face during service as a volunteer. Later, you will analyze the results yourself and will be given opportunities to try out different ways to handle similar situations.

ASSIGN A "4", "3", "2", or a "1" IN THE ORDER OF YOUR PERSONAL PREFERENCE FOR HANDLING EACH SITUATION DESCRIBED. PLACE YOUR RESPONSES DIRECTLY ON THE SCORING SHEET ATTACHED TO THIS SELF-ASSESSMENT FORM.

SITUATION #1

You are entering your assigned village to take over an appropriate technology project. The volunteer you are replacing has already left. The project is three years old. You have had brief discussions with village leadership and get the sense that the project is being received with mixed results. You have been asked to address a meeting of village leaders to introduce yourself. How would you prefer to handle the situation? (Respond on Scoring Sheet!)

Choices:

1. Present your approach to the project and ask for questions and advice.

2. Seek the leadership's view of the project and identify problems.

3. Ask the leaders to describe their goals for the project, as well as other pressing needs the village is facing.
4. Ask the leadership if you can sit in on this meeting and become better acquainted with village needs before addressing a meeting.

SITUATION #2
-----------------
You have been assigned to help the largest village cooperative keep their financial records straight and to provide general management assistance to coop leaders. The cooperative is operating at a deficit, and membership is declining. You need to decide how to prioritize your time from the following choices.

Choices
---------
5. Develop a balance sheet and income statement to analyze causes of the deficit.
6. Work with coop manager and bookkeeper to identify causes of deficit and declining membership.
7. Encourage coop leadership to call a membership meeting to discuss the causes of deficit and declining membership.
8. Observe everyday functioning of the coop and informally talk with people who belong and do not belong to the enterprise.

SITUATION #3
-----------------
You have been assigned as a teacher in the local trade school in manual arts. A disagreement has arisen among the faculty about whether to emphasize employable skills-training or preparation for advanced training. You are about to attend a faculty meeting to discuss these issues. You are the only expatriate member of the faculty. What is your strategy?

Choices
---------
9. Publicly state your point of view indicating a willingness to listen.
10. Meet with influential faculty and seek to influence them to your point of view.
11. Seek the advice of fellow faculty and follow it.
12. Take a position in public and attend the meeting to listen and learn.
SITUATION #4

You are assigned to a small vegetable cooperative project which has been underway for several years. There is very high interest in the project among the village at large. However, the local leadership has just decided all coop labor must be assigned to re-building the bridge recently flooded out during the rainy season. This is planting time for the vegetable coop. What would you do?

Choices

13. Persuade the leaders to change their priorities, at least to enable the once-a-year planting in the vegetable fields.

14. Help the leadership identify some alternatives to choosing between the vegetable crop and the bridge.

15. Help the local vegetable coop manager develop strategies to try to get the local leaders to reconsider.

16. Join in and facilitate bridge repair in an effort to complete it in time to also plant vegetable plots.

SITUATION #5

You are in the last six months of your tour. It is unclear whether you will be replaced by another volunteer. The local project committee is urging you to be sure to finish a gravity irrigation project before you leave. You are not sure you can complete in is the time allotted. How will you handle this pressure?

Choices

17. Try as hard as you can to complete the project.

18. Lead a planning meeting with the local project committee and staff and try to develop alternative strategies.

19. Concentrate on developing skills in local project staff to enable them to complete the project after your departure.

20. Pass the dilemma on to the local project staff leaders and encourage them to solve the problem and tell you what to do.
SITUATION #6

A new counterpart has been assigned to your food production project. He/she does not have the connections with local district officials which the previous counterpart had and seems unable to use connections to get needed inputs. If you do not get the needed inputs soon, serious food shortages could result at harvest time. What will you do?

Choices

21. Use your previous associations through the past counterpart to ensure the required inputs are received in time.

22. Develop strategy with new counterpart to provide introductions and contacts to enable him/her to get inputs in time.

23. Ask new counterpart to develop plan to get inputs, and critique plan.

24. Encourage new counterpart to go out and try to figure out how to get needed inputs.

SITUATION #7

You have taken over an agricultural production project of the "green revolution" type with a "most promising farmer" orientation. There are two very progressive farmers using the new technologies and greatly increasing their cultivated land. Most farmers in the area have not adopted the new practices. The village leadership is predicting scarcity to starvation next year if food production is not greatly increased. Where will you focus your time?

Choices

25. On increasing food production by whatever means, including using the progressive farmers as "model" farmers for others.

26. Balancing between encouraging the progressive and working directly with more traditional farmers.

27. Organizing traditional farmers and training them in new agricultural practices.

28. Identifying why traditional farmers are not adopting new agricultural practices.
SITUATION #8

The village to which you have been assigned has a native bee-keeping project going and are highly motivated about it. Your assignment is a general agricultural assignment, but you happen to know quite a bit about bee-keeping and can see some ways to help improve their already successful project. They have shown no interest in using you in that way. How will you respond?

Choices

29. Speak to village and project leaders laying out some of your ideas for improving the project and suggesting change in your assignment.

30. Make a suggestion from time to time, informally, demonstrating your competence in this area.

31. Share your dilemma with your counterpart and seek his/her advice and follow it.

32. Move ahead with your assignment as planned, being alert to any future opportunities to be helpful in an informal way with the bee-keeping.

SITUATION #9

You are beginning the second year of your two-year teaching contract. You have been able to introduce some innovative methods, and students and fellow faculty have responded well and begun to adapt them. Some students in particular have "blossomed" under your direction. What are your priorities for the next eight months?

Choices

33. Focus on blossoming students and bring more into the fold.

34. Organize special teacher-training seminars to broaden and deepen innovations in curriculum and teacher practices.

35. Seek opportunities to co-teach with counterparts to solidify innovations already adopted.

36. Begin planned withdrawal to lessen dependency on you for sustaining innovations adopted.
SITUATION #10

You are a health and nutrition specialist assigned to a community clinic with a very vague and general assignment. The needs surrounding you are overwhelming, but you don't know where to begin. The clinic director seems glad to have you, but has provided no specific direction. How will you begin?

Choices

37. Assess your strongest field and make a concrete proposition to the director to clarify your role.

38. Ask for a meeting with the director to mutually explore his/her priorities and ascertain where you can be most helpful.

39. Ask your counterpart(s) if you can observe them for a month in hope of identifying areas where your skills can complement theirs.

40. Conduct a community needs assessment and develop your role in response to community needs.

SITUATION #11

You are a technician assigned to a well-drilling project in a community where potable water is in short supply. You know how to dig a well and have demonstrated how to do so. However, in this culture, manual labor by men is frowned upon. They are happy to have you dig wells while they watch. What will you do?

Choice

41. Continue digging to model that manual labor is o.k. and, by example, influence local men to join you.

42. Meet with influential leaders and point out the necessity for potable water and its relationship with health problems in the community.

43. Meet with counterpart(s) and try to get them to help you solve the problem.

44. Stop digging wells and focus your attention on overall community needs and how you might help meet some of those needs.
SITUATION #12

You have been working as an athletic coach in the community, and, under your direction, the community has produced outstanding teams. It is a matter of considerable pride to community leaders, and they have asked you to continue to win. You have noticed little parental involvement, however, and in order to win you have focused attention on a small number of talented youth. How will you change the situation?

Choices

45. Try to maintain your winning teams, while organizing new teams with more focus on parental involvement among new team members.

46. Call a meeting of existing and new parents and make a condition of your continued coaching, greater parental involvement all around.

47. Seek parental assistance in coaching, organize new teams, and focus your time on training new coaches.

48. Spread your "winners" among newly organized teams, minimize importance of "winning", and concentrate on parental involvement to identify new needs.

SITUATION #13

Your counterpart is becoming increasingly dominating during project committee meetings. As his/her confidence and skill has grown, you have gladly given more responsibility to the counterpart. But, it seems to you other committee members are becoming more withdrawn from the project. You want to build a strong project team, rather than just one strong counterpart. What should you do?

Choices

49. Raise the issue directly with the counterpart and offer to lead the next committee meeting to demonstrate participative leadership skills.

50. Provide help in planning the next meeting and make some specific suggestions to the counterpart about how to modify leadership behavior.

51. Watch for opportunities to provide feedback, ask the counterpart questions about how she/he thinks meetings are going, and reinforce participative behavior.

52. Leave the situation alone and count on the committee to call the counterpart on dominating behavior, then reinforce and offer to help.
SITUATION #14

You have just been assigned to a project which is a mess. Your counterpart appears to have opened a small shop for a second income and is not showing up for project work. Community leaders are unhappy because the project was begun with a lot of enthusiasm. They have asked you to take over and straighten it out. How will you proceed?

Choices

53. Take over and straighten out the project first, then deal with the counterpart problem later.

54. Confront the counterpart with his/her behavior and provide ongoing consultation until both problems are more manageable.

55. Present counterpart with pressing project problems and ask him/her to suggest solutions and plans to implement solutions.

56. Call meeting with leaders and counterpart and facilitate a problem-solving session as first step toward project reorganization.

SITUATION #15

You are working in a community with another volunteer. You have just become aware that the other volunteer has deeply offended the leaders because of dress code behavior. The level of distress in the community is rising and inhibiting the success of both of your assignments. How will you handle this?

Choices

57. Speak to the other volunteer immediately and strongly suggest she/he change inappropriate behavior.

58. Consult with the other volunteer and try to understand reasons for the behavior in a mutual problem-solving manner.

59. Bring influential community leader(s) and the other volunteer together to mutually explore problem and solutions.

60. Encourage local leaders to go to volunteer on their own and offer to be available if they need help.
Situation #16

Your counterpart is moderately skilled and experienced and moderately interested in your project. She/he does not see the project as advancing her/his own career. The village, however, is vitally interested in the project. How would you handle this situation?

Choices

61. Try to get counterpart reassigned, and temporarily take over direction of the project until a new person is assigned.

62. Spend time with counterpart trying to identify ways in which his/her role in the project can both meet project goals and career aspirations.

63. Work with counterpart on career goals and help her/him develop strategy for pursuing them, including leaving project if appropriate.

64. Facilitate a meeting between community leaders and counterpart to see if they can come up with a mutually satisfactory solution to the problem.
INSTRUCTIONS:

Enter your responses for each of the sixteen situations above. Assign a "4" to your first choice, a "3" to your second choice, a "2" to your next choice, and a "1" to your last choice in each situation.

When you have responded fully to each set of choices, total the numbers vertically in each column.

YOUR CO-WORKER --- THE AGRICULTURE TEACHER

This is primarily about the one, two or three agriculture teachers at your school. However it will also give you some ideas about English and other teachers at your school.

HIS (HER) JOB

His primary duty is to teach agriculture classes, which are of two sorts, the basic agriculture course which all students take one term/year, for two hours/week and the elective course which some students will take every term, for two hours/week in M.1 and M.2 and four hours/week in M.3.

He will have some duties at school, possibly looking after the school grounds or supervising the janitors. He may or may not be expected to set up and maintain agricultural demonstration projects. Some agriculture teachers do extension work, but not much, unless they are well known by the villagers and the villagers come to them. Many of them will raise chickens or pigs to make some money on the side.

He is also the advisor of F.F.T. and will have specific duties toward it. It is possible that he will be one of the Ajaan Yai's main men and that may give him numerous duties that will prevent him from carrying out his agriculture duties. Such things are relative—relative to the Ajaan Yai. Most people appreciate it when we make their job easier and few people like it when we think of extra work for them to do. If you come up with ideas that will make more work for him, you better have something in it for him.

HIS (HER) MOTIVATION

Like many people, he needs a job to support himself and his family. You may wonder why he chose this particular job; he may wonder also. Possibly, the agriculture college was the only thing he could get into after M.3 or maybe he really likes agriculture or maybe he heard the agriculture college was fun. It is unlikely that he is running on altruistic goals, though he will have a few ideals lurking around somewhere.

Now that he is a teacher, he has a job for life, independent of performance. Raises, however; called two-steps, are handed out by the Ajaan Yai every year and competition for them can be nasty. Depending on the Ajaan Yai's criteria, the agriculture teacher may be affected. If he got a two-step last year, this will not be a factor for a while, since few teachers get many of these raises.
This leaves intangibles as the motivators that you can affect. Pride in the work he does, social standing, fun, desire to help, the need to be respected, a chance to get out of the house, freedom, creativity, emulation of a good role model, friendship, money, and something to do, may be things that motivate him (or her).

YOUR RELATIONSHIP

You may be older or younger than him, you may know more or less about agriculture than he does, you may be smarter, better organized, highly motivated, or not, but these things won't make a big difference at first. You are new and he has probably been around for a year or more, and he's been in Thailand much longer than you. That means you've got a lot to learn from him--first--even if there are many things you can teach him. You can teach him once he accepts you as his teacher. Start with asking a lot of questions, particularly the kind that he can answer; some questions that neither of you can answer now, but can search for an answer together, and later, questions that you can answer, in order to establish yourself as someone who knows something.

Be friends. That may mean drinking together, though not getting sick together. It may mean admiring his children and having dinner with him. It definitely means not judging him quickly and trying to understand why he does some of the things he does (especially the things that you don't like). Work and play aren't separated by much, don't try too hard to separate them.

He may want you to teach him English, but you may want to practice your Thai. Maybe there's a way you can do both and learn about agriculture at the same time. He may be insecure about his agricultural knowledge, maybe you are, too. Learn together. Visit fish stations and farmers together. Have fun.

(CO-WORKER-2)

SOME THINGS I'VE DONE--GOOD AND BAD

--- I disagreed with him in front of students and other adults. That made him look bad, even though I thought he was dangerously misleading people. BAD. I should've found a way to change the subject to avoid the conflict.

--- I walked by him while he was drinking with some friends. I was tired and busy, which I told him when he pressed me to sit down. BAD. I could have sat down for 10-15 minutes, had a small drink, chewed some fat, then politely took my leave. Instead, I acted like he wasn't my friend.

--- He likes to grow ornamental plants. I know nothing about them and don't care if I do. Still, I ask a few polite
questions, so that he can ask me questions about the things that I know about.  GOOD.

--- At first, I was embarrassed by my lack of knowledge and plainly told many people so. Later, after I acquired some agricultural knowledge, it was difficult to convince people that I wasn't the same old dummy. BAD. I could've been less humble, without acting like I knew everything. Show what you know, not what you don't know.

--- I expected to be listened to from the start. DUMB. That doesn't happen anywhere; one must always establish one's credibility first. Being a foreigner from some big University is nice, but not everything.

--- I took pictures of his kids and gave him copies. GOOD.

--- I remembered to buy sweets or toys for his kids when I went to Bangkok. GOOD.

--- He doesn't have a good reputation at my school. I helped him raise chickens, but took none of the credit, though there were problems and I did a lot of the work. We both know I made him look good and that I'm valuable for him.

--- He said he was my friend. Then he did something that I didn't consider to be something a friend should do. I got mad. BAD. We aren't close friends, we're Thai friends. Still, we could've talked about it, if I'd given it a chance.

--- He hit his wife. I threatened to hit him. DANGEROUS. Not my business.

--- I lent him money. BAD. It took four months of hard work to get it back.

--- His parents came to visit. I "wai"ed them and was very nice to them, although they asked me all the usual questions and I was bored. They didn't need me around all night, so I left after a little while. GOOD.

--- You of course will be working with different people than I have. The behavior mentioned above is basically being friendly and sensitive, rather than rude and stupid. I'm amazed at the stupid things I've done, but I've been forgiven.
TRANSFERRING RESPONSIBILITY

When an extension agent sets out to improve agriculture in a community he/she is interested in ideas actively accepted and hence he/she accepts all the responsibility for their acceptance. Once the farmers or community recognize it as in their personal interest, then it is time to transfer the responsibility to the farmers themselves for introducing the new ideas and making them work.

MAKING A FARMER'S WORK HIS/HER OWN

Since the extension agent must teach each aspect of improved agricultural practices, he/she must demonstrate each activity or have someone do it with or for the farmer the first time. It is important to transfer the responsibility for accepting and using new practices by "handing over" a farmer's work to him as soon as possible and as many times as necessary. Adherence to the principle of self-help responsibility transferring goes far.

CREATING A LIMITED AND CLEAR ROLE

A terribly counter-productive fallacy under which farmers, villagers, and some development workers labor is that extension is the act of doing something for a client and not with him/her. From the very beginning the role must be reiterated many times. It is essential that in everything the extension agent does to "facilitate" work going on in a village, a native counterpart must participate and the how and why of what is done must be explained to the farmers. The extension agents' role should run a standard course: it should expand as farmers' interest in specific extension services grow initially, then it should slowly contract as farmers' responsibility and self-motivation grow, until the role virtually dries up as farmers approach self-sufficiency and self-reliance with regard to those specific services. Being an extension agent involves attaining complete empathy with farmers, but it does not include doing all of a farmer's work. The extension worker teaches and transfers responsibility to farmers who are initially and repeatedly made aware of what they must do and what responsibilities they have in the new work they espouse.

WHY DO IT?

One way of helping a community to solve its own problem is to create indigenous problem solvers. These people not only operate as a resource to be called upon by villagers, but also serve as role models. In addition they insure that organizations created to solve group problems are maintained.
IDENTIFYING AND TRAINING LEADERS

Part of the analysis which an extension organizer makes of the community involves the identification of local leaders. Leaders are of two types, formal and informal. Formal leaders like presidents, alphas, chiefs, generals are complemented by people like the wealthy, those who speak well, those who do something well (master farmers), who are informal leaders of people.

Obviously a technically skilled farmer who just wants to be left alone will not be a good leader, nor will a bright 13 year old, nor an important man who has no interest in the work.

Leaders are people who have followers. During contacts with the village people the extension organizer identifies the people who have followers. As part of the process of "testing" people, defining an issue, and determining who are interested in those issues, the extension agent "tests" leaders to ascertain their skills and their personal interests. In the case of leaders who express interest, the extension agent asks them to help as leaders of people working on pertinent issues. The organizer-agent can develop the skills of these leaders by giving them more and more responsibility for the work people have undertaken. It is advisable to maintain a group of leaders initially, loosely organized so the best and most interested leaders can eventually find their way to the top. By an increasingly demanding and insistent transfer of responsibility for the work from the organizer to these local leaders, the agent helps develop the local leadership and--coincidentally--the organization of the people who work. Training leaders is the key to the extension agent eventually "working him/herself out of a job". It is an on-going, very, very long process, however, that must begin immediately after the agent arrives in a village.
SESSION TITLE: Pig Diseases

SESSION: #93 WEEK #7 DAY #40  (93-7-40)

PRESENTER:

CO-FACILITATOR:

TIME: 10:30-11:30 F

INTRODUCTION: SESSION OBJECTIVES

Disease control is a major factor in swine management and it is important for the trainees to know the basics. With this session the trainees:

- Will learn and understand the methods of controlling and treating important swine diseases.
- Will treat pigs for internal parasites.

HAND-OUT:

READING ASSIGNMENTS: Small-scale Pig Raising, Pgs 169-193.
SESSION PREPARATION AND MATERIALS

- Purchase worming medicine.
- Scales for weighing feed.

<table>

</table>

TRAINER NOTES AND RECOMMENDATIONS

Discussion of disease types should focus on those prevalent in the various areas of the host-country to which trainees will be assigned.
SESSION TITLE: Communication Skills

SESSION #94 WEEK #7 DAY #41 (94-7-41)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-10:00 C

INTRODUCTION: SESSION OBJECTIVES

People in different cultures use different methods to communicate. PCVs frequently find themselves in discussions about a multitude of topics, in which they and their host-country friends usually behave somewhat differently. It is very important for PCVs to recognize how they behave in discussions, in order to assess the effect they have on such discussions. This session prepares trainees for such self-assessment. The objectives of this session are:

- To identify communication, group maintenance and task oriented skills exhibited and observed by trainees.
- To reflect upon and generalize skills that will be useful at PC assignments.

HAND-OUTS:
- #94-a--On U.S. Volunteers
- #94-b--Group Maintenance Oriented Behavior Worksheet
- #94-c--Task Oriented Behavior Worksheet
- #94-d--Observer's Worksheet
- #94-e--Task Oriented Behavior/Group Maintenance Oriented Behavior
- #94-f--Communication Skills Self Rating Form

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

To communicate
To discuss
To argue
To listen
To observe
SESSION PREPARATION AND MATERIALS

Assign Hand-out #94-b (Group maintenance oriented behavior) worksheet to two trainees and Hand-out #94-c (Task oriented behavior worksheet) to two other trainees. Assign Hand-out #94-d (Observer's worksheet) to two other trainees. Finally, give Hand-out #94-e (Task oriented behavior/group maintenance oriented behavior) to each of them. Ask the trainees to observe the group discussion at the beginning of the session, and to note when they see any of the behaviors on their worksheet for later sharing with the group. Clarify any questions the trainees have about the behaviors, or what is expected of them.

Ask all other trainees to bring their hand-outs for this session to the session.

---

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 94-7-41 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Min</td>
<td>Ask trainees to reread the Hand-Out #94-a—On U.S. Volunteers.</td>
</tr>
<tr>
<td>15-30 Min</td>
<td>Ask trainees what they think of the article, what their reactions and feelings are, then withdraw from the ensuing discussion. Some groups will react strongly to the article and may want to discuss it for a long time while other groups may not take it seriously.</td>
</tr>
<tr>
<td>5 Min</td>
<td>After the discussion has gone on a while, intervene and explain that the purpose of Hand-out #94-a was to serve as a discussion starter. State the goals of this session. Ask that further consideration of the hand-out be postponed until after the session. Ask trainees to complete Hand-Out #94-f (Communication skills: self rating form) which is in their manual.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Ask everyone to look at Hand-out #94-b, c, d and e. State that some trainees had been asked before the session to use these for observation purposes. They filled them out based on their observations of the group. Ask these six trainees to share their observations about the behaviors (of the group) with the group.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Pose the question, &quot;If you all had the discussion to do over again, how would you improve the communication?</td>
</tr>
</tbody>
</table>

T-148
Ask if the ideas in Hand-out #94-e are clear to everyone. Ask if these skills would be useful when working with host-country people at your PCV assignment.

In closing, ask that trainees apply the behaviors and skills brought up in the session in future training sessions and discussions.

Give positive reinforcement to those trainees who exhibited positive group maintenance behavior, task oriented behavior, and listening behavior. And thank the six trainees who observed the group.

---

**TRAINER NOTES AND RECOMMENDATIONS**

This session was, and should be, presented by a trainee, who closely followed the session design "Communication Skills" (Session VII-1 in Vol. 2 of The Agriculture Development Workers Training Manual).

The session calls for a lot of work before the session starts, contacting six trainees and getting handouts to them.

Confer with other trainees for possible discussion starters (to take the place of Hand-out #94-a-On U.S. Volunteers). Another hand-out could be substituted, or another issue that has come up in training could be discussed. For example, discussion topics could be:

- Use of chemical insecticide to control insect pests is better than non-chemical control methods.
- The future castration of the little piglets by trainees is a needed training activity.
- Slaughtering chickens for livestock sessions and doing post-mortems by trainees, is a worthwhile learning experience.
For the past six years, I have become known for my increasing opposition to the presence of any and all North American "do gooders" in Latin America. I am sure you know of my present efforts to obtain the voluntary withdrawal of all North American volunteer armies from Latin America: missionaries, Peace Corps members and groups like yours, a "division" organized for the benevolent invasion (of Mexico).

I do not come here to argue. I am here to tell you, if possible to convince you, and, hopefully, to stop you, from pretentiously imposing yourselves on Mexicans.

I do have deep faith in the enormous good will of the U.S. Volunteer. However, his good faith can usually be explained only by an abysmal lack of intuitive delicacy. By definition, you cannot help being ultimately vacationing salesmen for the middle-class' "American Way of Life", since that is really the only life you know.

A group like this could not have developed unless a mood in the United States has supported it—the belief that any true American must share God's blessings with his poorer fellow men. The idea that every American has something to give, and at all times may, can, and should give it, explains why it occurred to students that they could help Mexicans peasants "developing" by spending a few months in their villages.

Of course, this surprising conviction was supported by members of a missionary order, who would have no reason to exist unless they had the same conviction—except a much stronger one. It is now high time to cure yourselves of this. You, like the values you carry, are the products of an American society of achievers and consumers, with its two-party system, its universal schooling, and its Family-Car affluence. You are ultimately consciously or unconsciously "salesmen" for a delusive ballet in the ideals of democracy, equal opportunity, and free enterprise among people who haven't the possibility of profiting from these.

Next to money and guns, the third largest North American export is the U.S. idealist, who turns up in every theater of the world as the teacher, the volunteer, the missionary, the community organizer, the economic developer, and the vacationing do-gooder. Ideally, these people define their roles as service. Actually, they frequently wind up alleviating the damage done by money and weapons, or "seducing" the under-developed to the benefits of the world of affluence and achievement. Perhaps this is the moment to instead bring home to the people of the U.S. the knowledge that the way of life they have chosen is not alive enough to be shared.
By now it should be evident to all America that the U.S. is engaged in a tremendous struggle to survive. The U.S. cannot survive if the rest of the world is not convinced that here we have Heaven-on-Earth. The survival of the U.S. depends on the acceptance by all so-called "free" men that the U.S. middle-class has "made it". The U.S. way of life has become a religion which must be accepted by all those who do not want to die by the sword—or napalm. All over the globe the U.S. is fighting to protect and develop at least a minority who consumes what the U.S. majority can afford. Such is the purpose of the Alliance for Progress of the middle-class which the U.S. signed with Latin America some years ago. But increasingly this commercial alliance must be protected by weapons which allow the minority who can "make it" to protect their acquisitions and achievements.

But weapons are not enough to permit minority rule. The marginal masses become rambunctious unless they are given a "Creed" or belief which explains the status quo. This task is given to the U.S. volunteer whether he be a member of the Peace Corps or in a so-called "Pacification Program". The U.S. is currently engaged in a three front struggle to affirm its ideals of acquisition and achievement oriented "Democracy". I say "three fronts", because three great areas of the world are challenging the validity of a political and social system which makes the rich richer, and the poor increasingly marginal to that system.

In Asia, the U.S. is threatened by an established power--China. The U.S. opposes China with three weapons: The tiny Asian elites who could not have it any better than in an alliance with the United States, a huge war machine to stop the Chinese from "taking over" as it is usually put in this country, and, forcible re-education of the so-called "pacified" peoples. Another front is in the U.S. itself: The efforts to check the unwillingness of the black community to wait for graceful integration into the system.

And finally, in Latin America the Alliance For Progress has been quite successful in increasing the number of people who could not be better off--meaning the tiny, middle-class elites--and has created ideal conditions for military dictatorships. The dictators were formerly at the service of the plantation owners, but now they protect the new industrial complexes. And you came to help the underdog accept his destiny within this process.

All you will do in a Mexican village is create disorder. At best, you can try to convince Mexican girls that they should marry a young man who is self-made, rich, a consumer, and as disrespectful of tradition as one of you. At worst, in your "community development" spirit you might create just enough problems to get someone shot after your vacation ends and you rush back to your middle-class neighborhoods where your friends make jokes about "spics" and "wetbacks".
Suppose you went to a U.S. ghetto this summer and tried to help the poor there "help themselves". Very soon you would be either spit upon or laughed at. People offended by your pretentiousness would hit or spit. People who understand that your own bad consciences push you to this gesture would laugh condescendingly. Soon you would be made aware of your irrelevance among the poor, of your status as middle-class college students on a summer assignment. You would be roundly rejected, no matter....

If you have any sense of responsibility at all, start with your riots here at home. Work for the coming elections. McCarthy might lose, but certainly by campaigning for him you will know what you are doing, why you are doing it, and how to communicate with those to whom you speak. And you will know when you fail. If you insist on working with the poor if this is your vocation, then at least work among the poor who can tell you to go to hell. It is incredibly unfair for you to impose yourselves on a village where you are so linguistically deaf and dumb that you don't even understand what you are doing, or what people think of you. And it is profoundly damaging to yourselves when you define something that you want to do as "good", a "sacrifice", and "help"

I am here to suggest that you voluntarily renounce exercising the power being an American gives you. I am here to entreat you to freely, consciously, and humbly give up the legal right you have to impose your benevolence on Mexico. I am here to challenge you to recognize your inability, your helplessness, and your incapacity to do the "good" which you intended to do.

I am here to entreat you to use your money, your status, and your education to travel in Latin America. Come to look, come to climb our mountains, to enjoy our flowers. Come to study. But do not come to help.

Speech given by Ivan Illich at Cuernavca, Mexico, April 20, 1968
GROUP MAINTENANCE ORIENTED BEHAVIOR WORKSHEET

FUNCTIONAL BEHAVIOR TO ASSIST GROUPS IN MAINTAINING GROUP COHESIVENESS:

DIRECTIONS: Observe members and record the number of times each behavior is used by each member.

HAND-OUT #94-c

TASK ORIENTED BEHAVIOR WORKSHEET

FUNCTIONAL BEHAVIOR TO ASSIST GROUPS IN TASK PERFORMANCE:

DIRECTIONS: Observe and record the number of times each behavior is used by each member.

GROUPS MEMBERS

1 2 3 4 5 6 7 8

1. INITIATING - proposing tasks or goals; defining a group problem, suggesting ideas.

2. SEEKING INFORMATION - requesting facts, asking for expressions of opinion; seeking suggestions and ideas.

3. GIVING INFORMATION - offering facts, information, opinions, and ideas.

4. CLARIFYING AND ELABORATING - interpreting ideas or suggestions, defining terms indicating alternatives.

5. SUMMARIZING - pulling together related ideas; offering a decision or conclusion for a group to accept or reject.

6. CONSENSUS TESTING - sending up a trial balloon to test for a possible decision or conclusion.

From J.D. Ingall's A Trainer's Guide to Andragogy, p. 138
1. Be sure you are able to see all participants' gestures, expressions, etc.

2. What roles are people performing—clarifying, initiating, supporting, harmonizing, or conflicting?

3. How are styles of communication—tone, phrasing, gestures, etc., contributing to or hindering clarity and effectiveness?

4. How are participants in the group reacting to each other?

5. Do participants' non-verbal gestures conform to their verbal statements?

6. To whom are people talking? To one other person? To persons who just previously talked? To the whole group? To no one?

7. What attitudes and emotions do you feel are being transmitted to the group? (Check out your own personal reactions to comments made by others).

From: Ingall’s A Trainer’s Guide to Anadragogy, p. 175
HAND-OUT #94-e

TASK ORIENTED BEHAVIOR

1. INITIATING—proposing tasks or goals defining a group problem, suggesting ideas.

2. SEEKING INFORMATION—requesting facts, asking for expressions of opinion; seeking suggestions and ideas.

3. GIVING INFORMATION—offering facts, information, opinions, and ideas.

4. CLARIFYING AND ELABORATING—interpreting ideas or suggestions, defining terms, indicating alternatives.

5. SUMMARIZING—pulling together related ideas; offering a decision or conclusion for the group to accept or reject.

6. CONSENSUS TESTING—sending up a trial balloon to test for a possible decision or conclusion.

GROUP MAINTENANCE ORIENTED BEHAVIOR

1. HARMONIZING—attempts to reconcile disagreements; reducing tensions.

2. GATE KEEPING—helping to keep communication channels open; facilitating the participation of others.

3. SEEKING INFORMATION—encouraging by being friendly, warm and responsive to others; non-verbal or verbal approval or acceptance by expressions.

4. COMPROMISING—admitting error; modifying in the interest of group cohesion and growth.

5. STANDARD SETTING AND TEST—testing whether group is satisfied with its procedures; pointing out explicit or implicit norms which have been set.

6. SENSING AND EXPRESSING FEELINGS—sensing feeling, mood, relationships within the group; sharing own feeling with other members; soliciting feelings of others.

7. PERCEPTION CHECK—describing what you perceive the other is feeling in order to check whether you do understand what s/he feels.
HAND-OUT #94-f

COMMUNICATION SKILLS: SELF RATING FORM

Please indicate where you rate your own abilities as of now by circling one of the numbers on the rating scales below. (Note: See #1 for rating scale identification.)

The Session Design for this Program Specific Session is in Appendix A.
SESSION TITLE: Demonstration Presentation (English)
SESSION #96 WEEK #7 DAY #42 (96-7-42)
PRESENTER:
CO-FACILITATOR:
TIME: 8:00-10:00 C

INTRODUCTION: SESSION OBJECTIVES

The fact that demonstrations will be presented in Thai on Field Day may intimidate some trainees. This session gives trainees a chance to practice their demonstrations in English in front of other trainees and receive suggestions. The objectives of this session are:

- To practice trainee demonstrations in English.
- To give and get feedback on demonstrations.

HAND-OUTS: #96-a Trainee Demonstration Evaluation Form

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>English</th>
<th>Thai (Example)</th>
</tr>
</thead>
<tbody>
<tr>
<td>To practice</td>
<td>วิธีการฝึกปฏิบัติ</td>
</tr>
<tr>
<td>To give feedback</td>
<td>ให้ข้อเสนอแนะ</td>
</tr>
<tr>
<td>To suggest</td>
<td>ให้คำแนะนำ</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Trainee Demonstrations prepared.
- Ask trainees to bring all four evaluation forms with them to the session.
- Find separate locations for as many groups of four as are needed.
- Break trainees into groups of 4, with no more than one team-demonstration in each group. Group people according to need for similar facilities and locations for their demonstrations. Assign one or two trainers to go with each group.

TIME

<table>
<thead>
<tr>
<th>SESSION 96-7-42 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>15 Min</td>
</tr>
<tr>
<td>Discuss what to look for in each other’s demonstrations. Ask trainees to take out their evaluation forms, Hand-out #96-a.</td>
</tr>
<tr>
<td>90 Min</td>
</tr>
<tr>
<td>Have the groups go to their separate locations. Ask members of the group to give individual demonstrations, fill out evaluation forms and give brief feedback. State that the evaluation forms are to be filled out, but not given to the demonstration presenters until after the session. Have all trainers act as timekeepers.</td>
</tr>
<tr>
<td>15 Min</td>
</tr>
<tr>
<td>Call everyone together and have trainees give feedback. List impressions of the various demonstrations. Focus on ideas that worked well. Have trainees give their evaluations to the appropriate presenters from their group.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

In addition to helping trainees get over their apprehensions about doing demonstrations in Thai, they must plan and prepare their demonstrations a week before Field Day, instead of at the last minute. The fact that demonstrations are completed by this session, allows trainees to prepare for Field Day itself the following week. They only have to practice the language part of the demonstration.

SESSION TITLE: Swine Reproduction

SESSION #97 WEEK #7 DAY #42 (97-7-42)

PRESENTER:

TIME: 10:00-12:00 F/C

INTRODUCTION: SESSION OBJECTIVES

Whether they will be directly involved in a swine breeding project or not, trainees who will be working with swine need to be familiar with the main stages of reproduction--both because of the effect of reproduction on the production and marketing of pigs and for their own credibility as agriculture teachers. This session is intended as an introduction to and overview of all stages in the reproduction of swine and the equipment and management practices associated with swine reproduction.

HAND-OUTS: #97-a Swine Production Record Forms
#97-b Swine Pork Cuts

READING ASSIGNMENT: Small-scale Pig Raising, Pgs 131-149
SESSION PREPARATION AND MATERIALS

Trainer reference: *Small-scale Pig Raising*, Pgs 131-149

- Make arrangements to visit a swine farm where breeding process is about to take place.
- Have trainees read the reading assignment beforehand.

<table>

<td>If records are kept, ask to see copies of them.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Clean up and return to training center.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

It is best to have this session late in the day in order to observe the breeding process.

On the trip back discuss record keeping methods at the swine farm and compare to those given as hand-outs. If possible, at the farm, trainees might want to try to fill out one or two of the forms for a particular sow.

END OF TRAINING PROGRAM
SESSION TITLE: Maintenance

SESSION #98  WEEK #8  DAY #43  (98-8-43)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-10:00 F

INTRODUCTION: SESSION OBJECTIVES

This should be the last opportunity for trainees to work in the plots; therefore, harvesting and final weeding should be completed. This will leave the plots in good condition as the trainees should have the option of returning to their plots during their free time.
SESSION TITLE: Field Day Preparation I

SESSION #99  WEEK #8  DAY #43  (99-8-43)

PRESENTER: Field Day Coordinator

CO-FACILITATOR: Trainees

TIME: 10:00-12:00 C/F

*** NOTE: There are five Field Day Preparation Sessions included in the schedule. The number of sessions is variable, but a total of 7-8 hours should be provided. All of the Field Day Preparation Sessions follow this design.

INTRODUCTION: SESSION OBJECTIVES

Time is made available, in different locations as needed, for the trainees to plan, organize and prepare for Field Day. This time is at their discretion, with staff available for support.

The objective of this session is:

- To carry out and complete necessary preparations for Field Day.

HAND-OUTS: up to trainees

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Up to the trainee Field Day Coordinator.
- The Field Day Advisor should meet with the Field Day Coordinator regularly, in order to help solve any organizational problems.

---

TIME SESSION 99-8-43 ACTIVITIES

Variable Up to trainees.

---

TRAINER NOTES AND RECOMMENDATIONS

These sessions may likely be at a variety of locations: Field Day site, Agricultural Training site, villages, restaurants, or hotels.

The Field Day Advisor should attend all of these sessions. As many other technical and language trainers should attend as are necessary.
SESSION TITLE: Projects

SESSION #100 WEEK 8 DAY 44 (100-8-44)

PRESENTER: Trainer who is/was a PCV

CO-FACILITATOR:

TIME: 8:00-9:30 C

INTRODUCTION: SESSION OBJECTIVES

The Thai bureaucracy views "projects" very favorably and applies this label to many tasks. This can mean that the work a PCV does can be judged by the number and size of his/her projects and PCVs often feel the pressure to complete projects. However, it is important to apply the lessons of the session "Co-workers and Helping" to the way projects are to be done. It is also important to stress that there is support available from the Peace Corps Office and Peace Corps staff. The availability of this support needs to be emphasized to trainees before trainees arrive at their sites. The objectives of this session are:

1. To identify what "project" means in the context of the Thai bureaucracy and at the sites where trainees will be assigned.
2. To consider how to work with the Thai conceptions of projects in ways that take into account ideas developed in "Introduction to Development" and "Co-workers and Helping".
3. To learn what resources Peace Corps has to support projects and other PCV undertakings.

HAND-OUTS:

#100-a What Funding Sources are Looking For
#100-b Project Proposal Form and Nutrition

READING ASSIGNMENT: Fear and Loathing on the Agricultural Guide; Peace Corps Thailand Guides; Agricultural and Nutrition Resources in Thailand, pgs.51-7; Small Project Proposals and Funding Sources.

TECHNICAL VOCABULARY
SESSION PREPARATION AND MATERIALS

- On a flip chart, list a variety of projects undertaken by the offices where (Crossover and Nutrition) PCVs work.
- Retrieve "Continuum of Volunteer Helping/Work Styles" from Session #92-7-40.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 100-8-44 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Have presenter briefly describe the first project she/he was involved in or another project that was unique. This anecdote should have humorous aspects.</td>
</tr>
<tr>
<td>30 Min</td>
<td>Post list (by PCV site) of projects undertaken. Using examples from this list, have presenter give a lecturette on what &quot;project&quot; means in the Thai context, how they are carried out and who does them. Ask trainees to provide insights from PCV Visits.</td>
</tr>
<tr>
<td>40 Min</td>
<td>Post &quot;Continuum of Volunteer Helping/Work Styles&quot; and discuss where the projects mentioned above would fit on the continuum. Follow with these questions: Are they in line with Peace Corps goals? Would trainees like to be involved in such projects? Are there any projects trainees consider good? bad? Would trainees want to modify any of these projects? While trainees are discussing the above, interject what you think supervisors and co-workers might feel, think and say.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Ask if there are any questions or needs for clarification of the hand-outs for this session.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

The presenter of this session needs to be familiar with the projects done at a variety of PCV (relevant programs) sites, both with and without PCV participation. The middle portion of the session can be led by a trainee. If this is done, that trainee and the presenter should adapt this design, following what that trainee feels is needed.
WHAT FUNDING SOURCES ARE LOOKING FOR

There is a range of priorities among the various funding sources known to Volunteers. For more specific information than is provided here, read *Fight and Loathing on the Agricultural Trail*, pgs. 51-55 and the relevant sections of the 1982 Agricultural Conference Handbook. The following are generalities, which you should check into more closely by visiting the agency, consulting with other volunteers or checking with the Office.

"Basic human needs" is a fairly strong requirement for most agencies. In general, a project satisfies "Basic Human Needs," when you are making an attempt to improve one or more of the following problems:

- Poor nutrition;
- Lack of clean drinking water;
- Poor sanitation;
- Lack of fuel;
- Inability to make a decent living;
- Inadequate housing;
- Poor health.

When you write a project proposal, you must convince the funding source that your project will improve a situation that it wants improved. Often, further requirements, such as self-help or matching funds, will be attached. A good proposal does not necessarily reflect a good project.

WHAT OTHER CROSSOVERS HAVE DONE

Nursery project: When connected with a Fruit Orchard intended to produce fruit or seedlings, this answers "basic human needs" because it is food related. When accompanied and intended for only flowers it ignores "basic human needs" unless there is a market for the flowers.

Broiler Chicken Project: Broilers are food, though not easily marketable. However, this is a good, acceptable project that can help you get into other things.

Biogas. Provides a good fuel and saves the forests--sometimes.

Fishpond. Lots of protein.

Water Tanks: Store rain water for the hot season, so there is something safe to drink.

Irrigation Improvement: To get water to the vegetables you are growing at school.
Pig Raising. Food. Educational and hopefully an example for villagers, though they might not come to check it out.

Mushrooms: Food and profits.

Home Projects: Any of the above scaled-down so a student can do it at home. Help students out, but don't do it yourself.

Ducks: Eggs and/or meat. Fertilizer in your fish pond.

**SOME QUESTIONS TO ASK YOURSELF**

1. Who will this project help. Students? Teachers? Farmers? Police?

2. Who wants this project? Just me? My Ajaan Yai? Ag teachers? Parents?

3. Why should I be involved?

4. Is this educational? Who gets educated besides me?

5. How will this help people?

6. Isn't it better to wait?

7. Shouldn't they do it themselves?

8. Will this project be any fun?

SESSION TITLE: Field Day Preparation II
SESSION #101 WEEK #8 DAY #44 (101-8-44)
PRESENTER:
CO-FACILITATOR:
TIME: 9:30-10:30 F/C

See Session 99-8-43.
SESSION TITLE: Program Manager III
SESSION #102 WEEK #8 DAY #44 (102-8-44)
PRESENTER:
CO-FACILITATOR:
TIME: 10:30-12:00 C

INTRODUCTION: SESSION OBJECTIVES

(Education) Program Manager talks with trainees about the (Crossover) program.

Objectives are:
  o To inform trainees about the (Crossover) program.

HAND-OUTS:
READING ASSIGNMENT:
TECHNICAL VOCABULARY:
SESSION PREPARATION: Same as PM-I.

- Schedule the session with the Program Manager and inform him/her of the topics to be discussed;
- Confirm, by letters, the date and topics;
- Compile a list of questions that are based on trainee concerns;
- Inform the Program Manager of topics related to this session that have already been covered in training.

SESSION TITLE: Broiler Chicken Processing and Post-Mortem

SESSION #106  WEEK #8  DAY #47  (106-8-47)

PRESENTER:

CO-FACILITATOR:

TIME: 13:30-16:30 F

INTRODUCTION: SESSION OBJECTIVES

It is important that the trainees know how chickens are killed and processed for market as well as the post-mortem aspect of growing poultry. This session will give the trainees experience:

- In the proper methods of killing chickens for market.
- In how to clean and prepare after killing.
- In examining the internal organs for parasites or disease.

HAND-OUT:

SESSION PREPARATION AND MATERIALS

- Broiler chickens 1-2 kg each (one per each trainee).
- Equipment for killing and dressing birds.
- Organize cold storage for dressed birds.
- Prepare hot water prior to session.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 106-8-47 ACTIVITIES</th>

<td>Demonstrate post-mortem procedures.</td>
</tr>
<tr>
<td>40 Min</td>
<td>Trainees perform post-mortem examination.</td>
</tr>
<tr>
<td>10 Min</td>
<td>Have trainees clean up and discuss activities.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

Trainees who have never participated in processing and marketing chickens often react with strong emotions; therefore, advance preparation and peer support are extremely important for this session. Trainees should not be forced to kill chickens, but it should be emphasized that knowing how to do so is to their benefit. This session should also be planned so there are not long delays once the chickens are selected until they are killed. The post-mortem demonstration should occur after all chickens are processed.
SESSION TITLE: Field Day

SESSION #107 WEEK #8 DAY #48 (107-8-48)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-17:00 F

INTRODUCTION: SESSION OBJECTIVES

Field Day, as described and planned in previous sessions, happens.

The objectives of this session are:

- To learn.
- To have fun.
- To eat our chickens.
- To sell our pigs.
- To give demonstrations.

HAND-OUTS:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

380
SESSION PREPARATION AND MATERIALS:

- Previous Field Day preparation sessions.

SESSION 107-9-48 ACTIVITIES

Field Day Schedule

---

TRAINER NOTES AND RECOMMENDATIONS

Do what trainees ask you and the other staff to do, have a good time and be proud of the trainees.
SESSION TITLE: Field Day Evaluation

SESSION #108  WEEK #8  DAY #48 (108-8-48)

PRESENTER:

CO-FACILITATOR:

TIME: 19:00-21:00 C

INTRODUCTION: SESSION OBJECTIVES

Evaluation is a critical part of any training activity (most Peace Corps activities and projects include an evaluation aspect). Evaluation helps participants make the most of their experience and produces advice for others. Evaluation also provides an opportunity for participants to compare their assessments of events with others and learn from the experience in order to do it better next time. (It is hoped that many of the trainees will have events like Field Day at their sites.)

The objectives of this session are:

- To judge which aspects of Field Day went well, which didn’t, and why.
- To consider how trainees might do something like Field Day at their sites.
- To make suggestions for future Field Days for Agricultural Training.

HAND-OUTS:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- The Field Day Coordinator or Committee, with the Field Day Advisor compiles a list of items to evaluate and puts the list on a flip chart.
- Flip charts to record the evaluations.

<table>
<thead>
<tr>
<th>TIME</th>

</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Have everyone congratulate each other on a job well done.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Post flip chart with evaluation items. Solicit additions to list.</td>
</tr>
<tr>
<td>40 Min</td>
<td>Discuss the items on the list—in either the large group or in small groups that report to the large group. The trainees responsible for each item (task) might evaluate themselves. Emphasize &quot;the why&quot;. Record on flip charts.</td>
</tr>
<tr>
<td>20 Min</td>
<td>Have trainees break into groups according to their job or program and discuss how to use Field Day ideas at their sites. Record ideas, so that everyone can later be given a typed copy.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Compile a list of suggestions for future Agricultural Training Field Days. Have trainees include suggestions regarding staff support, how trainers might differently present Field Day, etc.</td>
</tr>
</tbody>
</table>

TRAINER NOTES AND RECOMMENDATIONS

This session should come within a few days of Field Day. If Field Day (and clean-up) ends soon enough and trainees aren’t too tired, the evaluation can be over after that night’s dinner. Otherwise, it should be the following Monday or Tuesday.
(These sessions occur during the TEFL and Final Wrap-up Phases of Training)
SESSION TITLE: Thai Students Needs and Motivations
SESSION #109  WEEK #9  DAY #50  (109-9-50)
PRESENTER:
CO-FACILITATOR:
TIME: 10:30-12:00 C

The Session Design for this PS Session is in Appendix A.
SESSION TITLE: Garden Planning

SESSION #110 WEEK #12 DAY #67 (110-12-67)

PRESENTER:

CO-FACILITATOR:

TIME: 13:30-16:30 C

INTRODUCTION: SESSION OBJECTIVES

It is the end of training and this session is intended to wrap-up the agricultural component. Many sessions, particularly "Planting Situations," lead up to this exercise. This is a chance for trainees to work with each other (as they would with co-workers) to plan a garden project, using the skills and knowledge they have accumulated before and during training. The situations to be given to each group are based on realities encountered by PCVs in the same program. The objectives of this session are:

- To work in small teams to plan a Garden Project suitable for the programs in which the trainees will serve.
- To use (creatively) knowledge acquired before and during training.

HAND-OUTS: #110-a Crossover Garden Planning Situation
#110-b Nutrition Garden Planning Situation

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Adapt, expand and modify the situations provided, as well as prepare new ones for whatever programs trainees will go into. All trainee teams within the same program may do the same situation, or enough situations may be prepared to give each team a different one. These situations are much more detailed than those used in the "Planting Situations" (Session 56-4-19).

- Obtain more accurate data on climatic conditions for assignment provinces and ampoes.

<table>
<thead>
<tr>
<th>TIME</th>
<th>SESSION 110-12-67 ACTIVITIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Min</td>
<td>Give session objectives and underscore the relevance of this exercise.</td>
</tr>
<tr>
<td>5 Min</td>
<td>Within their programs, have trainees break into teams of 2 or 3.</td>
</tr>
<tr>
<td>15 Min</td>
<td>Distribute garden planning situations to trainees, so that all trainees have a copy of each situation. Have one trainer act as advisor to each program group or team (if each team has different situations). Discuss briefly to insure that everyone understands the exercise and their situations.</td>
</tr>
<tr>
<td>1-2 Hrs</td>
<td>Have trainees work in their teams to develop plans appropriate to their programs and situations. Trainers, particularly the advisors mentioned above, remain available for consultation if necessary.</td>
</tr>
<tr>
<td>1 Hr</td>
<td>Have each group present its plan to the full group for feedback.</td>
</tr>
</tbody>
</table>
TRAINING NOTES AND RECOMMENDATIONS

Good situations are the key to this exercise. The situations attached here should be scrutinized carefully for appropriateness before using them.

The purpose of this session may affect the time allotted to it. It can be used for evaluation—a quiz, and if it is to be used for this purpose, trainees must be given sufficient time to feel they can think and respond to the best of their abilities. If the exercise is primarily a learning experience, less time will be needed.

If the session is to be a group exercise, the first part of the session can be done just before lunch or dinner, then time given for trainees to do the exercise. The group reports would come first thing the next morning.

During the course of training, trainees should have been given sufficient host-country data and references to complete the exercise.
CROSSOVER GARDEN PLANNING SITUATION

Your school has already established Home Projects with the F.F.T. students. Five students have been working together growing long beans for the local market. They have asked for your help in growing other vegetables that could earn them more money than long beans. Here is data specific to the situation, otherwise assume that the situation follows regional and national norms.

MARKET POSSIBILITIES

1. The provincial market is 30 km away. A local merchant raises layers and sends eggs to the provincial market every morning.

2. The local market, consisting of a dozen women who sell vegetables and other products.

3. The women who sell lunch to students and teachers.

Note: The students take some of their beans home to eat and will do so with all crops. However, this doesn’t earn them the money that they desire.

LOCAL CLIMATIC CONDITIONS

You are in Nakorn Phanom Province.

Rainfall: Begins in April and is intermittent and light until late May or early June, when it becomes suddenly heavy. This lasts until late September. The rains dwindle through October. November through March is dry.

Temperature: Rainy Season - daily highs in 90's and lows in 70's.

Cool Season - highs in 80's and lows in 40's.

Hot Season - highs in 100's and lows in 70's.

Soils: Sandy soils, low in all nutrients and organic matter, slightly acidic.

Other: Very strong winds, especially in cool season. Tobacco mosaic virus is common.
RESOURCES

1 rai of level land bordering a stream that never dries up.

One boy’s family raises pigs (30-50 head) which are near the plot.

AVAILABLE INPUTS

In provincial town: All fertilizers mixes. All seed types. Wide variety of chemicals.

In local area: 16-20-0, 21-0-0 and 45-0-0 fertilizers. Only out-of-date seed. Only most popular chemicals (also most dangerous). Most tools and some machinery.

YOUR MISSION (Which you must accept)

Plan the best use of the boys’ 1 rai of land, 10 boy-hours/day of labor and 500 baht of capital. Do the following:

1. Choose a marketing strategy you will use.

2. Choose 5-6 vegetable varieties suitable to the situation. Justify your choices.

3. List all the inputs you will use, the general quantity and rough price of each.

4. Choose one vegetable and describe how you will plant it to insure a uniform flow of produce. Give a sample planting/harvest schedule.

5. Draw a map of the plot, giving it any shape you choose. Show the size and configuration of beds and facilities. Show the relative quantity of each vegetable that will be grown.

In addition, answer the following questions:

6. Where will you (the boys) get equipment and inputs?

7. If additional money is needed, where will it be found?

8. How will you help the boys to plan their garden?

9. How will each of the crops be harvested - entire plot at once, plants as they mature, leaves and fruits as they mature?

10. How will produce be sent to market?
HAND-OUT #110-b

NUTRITION GARDEN PLANNING SITUATION

Your Ampoe's Agriculture and Public Health workers have been working together with Housewives' Groups. One village has a strong group which has already completed a few small projects. Your colleagues have convinced these women that they can successfully grow vegetables year-round, not only in the cool season. Because of your interest and training in vegetables, you've been asked to work with the core group of ten women who are most interested in the project.

MARKET POSSIBILITIES

1. The Provincial market is 95 km away, half of the distance is dirt road.
2. The Ampoe market is 12 km away, all of it dirt road.
3. One shop in the village sells fresh vegetables, brought in from the Ampoe.
4. Home consumption.

LOCAL CLIMATIC CONDITIONS

You are in the southern part of Srisaket Province.

Rainfall: Is erratic and undependable, varying greatly from year-to-year, flood-to-drought. Usually begins with light "mango rains" in April and picks up sometime in June or July. Heavy rains come at any time or not at all. There's usually little rain in October and none from November until April.

Temperature: Rainy Season - daily highs in upper 90's and lows in 80's

Cool Season - highs in 80's and lows in 50's

Hot Season - highs in 100's and lows in 80's

Soils: Very sandy, low nutrient content, no organic matter and acidic.

Other: Nematodes are a problem.
## Resources

**Land:** All have access to rice and cassava fields, that are at varying distances from the village. All have 50-200 sq m of space at their houses.

**Capital:** 1,200 baht left from previous project. Most are willing to invest some money, if there are good reasons.

**Water:** Most streams and ponds dry-up in the hot season, but not all. Some homes and fields have year-round access to water.

**Manure:** All of them raise 1-5 buffaloes. Some raise pigs and/or cattle.

## Available Inputs

### In Provincial Town:
- All fertilizer mixes
- Most seed types
- Wide variety of chemicals
- Wide variety of equipment and machinery.

### In Ampoe Market:
- 16-20-0, 21-0-0 and 45-0-0
- Inorganic fertilizers
- Old and poor-quality seed
- Only the most popular chemicals
- Simple tools

### In Village:
- No fertilizer
- Some poor seed
- No chemicals

## Your Mission (Which you must accept)

Plan how to organize the women to begin growing vegetables this cold season in a way that will lead to hot season gardening, i.e. concentrate on the cool season, but have an outline for the hot season. Do the following and justify:

1. Choose a marketing strategy, if any.
2. Decide whether to do one communal plot, a few communal plots, or individual plots.
3. Choose the vegetables to be concentrated on in both seasons.
4. List all of the inputs that will be needed, the general quantity and rough price estimate.
5. Choose one of the vegetables and describe how it will be planted, where, by whom, when, and how often. Give a sample planting/harvest schedule.

In addition, answer the following questions:

6. How will the vegetables be distributed; by whom?
7. How will animals be integrated into the project?
8. What role will husbands and children play?
9. How will you help the women to plan their project?
10. What nutritional benefits will come out of the project and who will be benefited?

SESSION TITLE: The L.S.S. Project and Crossover Role

SESSION #34  WEEK #2  DAY #9  (34-2-9)

PRESENTER:

CO-FACILITATOR:

TIME: 13:00-15:00 C

INTRODUCTION: SESSION OBJECTIVES

Trainees arrive in Thailand with almost no knowledge of their role as Crossovers in the L.S.S. (Lower Secondary Schools) Project. The Crossover Program is unique and the L.S.S. Project is the context in which the program exists and, in fact, is justified. Thus, for trainees to see the importance of agricultural training and its relationship to the TEFL training (and how they will use agriculture in their role as volunteers) it is important that the Crossover role and the L.S.S. project be explained early in training. The objectives of this session are:

- To understand the general objectives, policy and implementation of the L.S.S. Project and its predecessors.
- To understand what Peace Corps and the Department of General Education expect of Crossovers, especially in agriculture.

HAND-OUTS: #34-a Crossover Role and Job Description

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

<table>

</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

While in Bangkok, the Crossover who will present this session should:

- Get background information from the following sources:
  - The Peace Crops Education Program Manager,
  - The Director of the Special Projects Office and
  - Other officials involved in the L.S.S. Project.

- Clarify the history of the project, the results of Crossover involvement and current trends, possibilities, problems and plans.

- Look for the L.S.S. Project by Dr. Sawat Udompote translated with additions by Buddy Larson.

- Gather relevant reading materials for trainees on the history of Thai education and strategies for improving rural education.

- Prepare slide show and/or photo display.

- Blackboard and chalk (or charts).

TRAINER REFERENCE: If possible read something on the concept of Community Schools.

TIME

SESSION 34-2-9 ACTIVITIES

5 Min

Introduce the session and objectives.

40 Min

Do overview of the L.S.S. Project.

- Objectives (5th or 6th National Plan).
- Rationale (social and rural problem solving).
- Work plan (special projects office, budget).

Present this as a lecturette, followed by questions.

5 Min

Have trainees reread the Crossover Job Description.

40 Min

Solicit questions from trainees about the role, especially as it fits into the L.S.S. Project, and help to clarify things.

Bring up some of the following subjects and encourage discussion of:

T-161

556
- the usefulness of the job,
- problems experienced in the past and foreseen,
- how trainees see themselves fitting into the role and the possibilities of the role.

Some other subjects to discuss are:

- Being a regular teacher.
- Ajaan Yais are supervisors.
- Department Heads are co-workers.
- Agriculture Educator: not an extension agent, not an expert, rather a facilitator and catalyst of student and villager learning.
- TEFL - working with other teachers.
- Home Projects - getting to know your community.
- Improving the quality of rural education and the skills of teachers.

TRAINER NOTES AND RECOMMENDATIONS

A photo display can be put up before this session and/or a slide show (of Crossover work and lives) can be given one evening.

The content of this session should be linked to the Program Manager sessions that precede and follow it, both to avoid redundancy and to reinforce important points. Questions which the facilitator can't answer can be saved for the Program Manager.

The timing of this session depends on how the trainees react to their role. As there is usually some confusion and questions about the relevance of agricultural training, it has been planned early on.

Discussion of the issues noted under "Activities" above will probably continue throughout training. They (and others suggested) might be written on a flip chart and displayed in the training area to stimulate and continue discussion.
THE A9 PROGRAM AND YOU (US)—SOME THINGS TO DO

YOUR JOB is to improve the quality of education (both TEFL and Agricultural) that students receive at your school. You do this by directly working with students and by working with other teachers.

YOUR SOCIAL ROLE is to teach each child with whom you work to be useful and respected in his/her village, as a farmer or something else, rather than teach him/her skills that can only be used in a big city. Do not train students to leave home. Help them want to stay and be able to stay.

ODD JOBS: There are many useful roles you can play and skills you can bring that are not confined to TEFL and A9 roles. Some of these involve being a:

Facilitator/Resource Person:
- Get people working together in new ways
- Access to Ajaan Yai
- Access to outside resources
- Access to money

Idea Person/Creativity
- Cross cultural
- Here because you’re different
- Still fitting in

Social
- Community events (religious parties)
- School events
- Drinking
- Songs
- Tiows
- Add to teacher prestige

AGRICULTURE: There is much more to agriculture than projects. First, you are here to help with the teaching of agriculture, to improve how agriculture is taught at your school. You are not an Extension Agent, though you may do a little extension work. You are a teacher. You work out of a school. Fit your Agriculture vision to that situation. Here follow some ideas:

Some general things to work for:

Relevancy (skills these kids can USE in their lives in the near future)
- to kids who will be farmers
- to kids who will have other professions

Urban Migration and the Civil Servant Mentality
- Role models
expectations
self esteem
food in the belly

Theory and Practice--Bridge the Gap (School vs. Home).
Slave work
memorization
thinking skills
planning skills
responsibility

Idea s they can pass on to their parents

Modernization and World Economics
the world is changing
you've seen more of it
East and West

AGRICULTURAL POSSIBILITIES--IDEAS TO LOOK INTO

HOME PROJECTS: These get you out into the communities where you can learn, work with kids one-on-one or in small groups, become acquainted with farmers and bridge the gap between classroom and reality.

FFT: Future Farmers? Have they thought about the future? Can you help them get there?

DISPLAYS AND DEMONSTRATIONS: At school, in the community, at the market, at a Wat, in a newspaper shelter, wherever someone could use some information.

LOCAL EXPERT: There may be something that somebody knows about that you could learn and that would be of use.

RESOURCES: Get some of those resources to your school and community where they can do some good.

IDEAS: People may need some fresh jolts in their thinking. And, then again, maybe they don't.

COMMUNITY SERVICE: Not much extension, probably; often one day activities that are easy to set up and do. Students can get involved.

CLASSES: Help improve the in-class teaching of Agriculture by helping develop: lab demos to go with lessons; teaching aids; lesson planning (especially by month and term); teaching methodology (similar to TEFL); relevancy; integration with field work;

YOU DON'T NEED TO BE THE ONE PROVIDING THE TECHNICAL SKILLS!!!!!!ORGANIZE, MOTIVATE, LINK, FIND RESOURCES, GET THINKING GOING, ASK QUESTIONS!!!!!!
SESSION TITLE: L.S.S. School Field Trip
SESSION #50  WEEK #3  DAY #16  (50-3-16)

PRESENTER:

CO-FACILITATOR:

TIME: 13:00-17:00 F (possibly full day)

INTRODUCTION: SESSION OBJECTIVES

Peace Corps In-Country Training prepares trainees to live and work at their future sites. For Crossovers, these sites are L.S.S. Project schools. In order to picture their future situation more clearly, trainees visit an actual L.S.S. Project school. This session is scheduled near the beginning of training and, ideally, the school visited should have a Crossover assigned to it, but that is not necessary. The objectives of this session are:

- To introduce trainees to an L.S.S. Project school, its staff, students and facilities.
- To show trainees what a Crossover PCV has done in one or two years at the school.
- To allow trainees to see the school's agriculture and English programs, meet teachers and students, and see teacher housing.

HAND-OUT:

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Look for CSS and LSS Project descriptions and create a hand-out.
- Select a school that is both accessible and appropriate.
- Contact the PCV at the school and the school's Principal, to plan the visit.
- From the school, get a map of school facilities and important statistics and information about the school. Translate these into English.
- Arrange with school for lunch to be prepared at PC expense.

TRAINER NOTES AND RECOMMENDATIONS

The best school to visit is one that has had a Crossover for two years, so trainees can see what they might expect to accomplish. Ideally, that Crossover should lead this trip. The exact schedule of the trip (lunch, slide show and sports) depends on the school. Whatever activities are chosen should allow trainees to see the school's agriculture and English programs, meet teachers and students, and see teacher housing.
SESSION T'ITLE: School Hierarchies and Relationships

SESSION 370 WEEK #5 DAY #25 (70-5-25)

PRESENTER:

CO-FACILITATOR:

TIME: 8:00-9:00 C

INTRODUCTION: SESSION OBJECTIVES

An important part of the Crossover volunteer's job is to find a comfortable niche in the school's administrative hierarchy for him/herself. To work successfully, Crv. fvers need to understand that hierarchy. Equally or more important than this formal hierarchy, are the informal relationships among school personnel—from janitor to Principal. The place each PCV occupies within these relationships has great impact on both the success and happiness of each volunteer. Trainees need to understand these situations; to begin to do so early on helps them learn from the PCV visits. The objectives of this session are:

- To learn a model administrative hierarchy for L.S.S. Project schools, the duties of teachers within the hierarchy, some of the possible exceptions and places where Crossovers can fit into the hierarchy.
- To discuss some of the key factors that affect relationships among the personnel at L.S.S. Project schools.

HAND-OUT: #70-a School Administrative Structure  
#70-b Secondary Administrative Structure

READING ASSIGNMENT:

TECHNICAL VOCABULARY:

<table>
<thead>
<tr>
<th>Hierarchy</th>
<th>Relationships</th>

</tr>
</thead>
<tbody>
<tr>
<td>Structure</td>
<td>Administration</td>
<td>Formal</td>
</tr>
<tr>
<td>Duties</td>
<td>Positions</td>
<td>Social</td>
</tr>
</tbody>
</table>
SESSION PREPARATION AND MATERIALS

- Discuss the recommended administrative structure for L.S.S. Project schools with a few Principals, teachers and DOE officials.
- Learn the duties for each of the positions within the structure.
- Arrange for one or two Crossovers, in addition to the presenter, to be at this session as resources.
- Prepare flip chart headed "Informal Relationships" listing the key factors discussed in the second half of this session.
- Prepare anecdotes.

TIME

SESSION 70-5-25 ACTIVITIES

5 Min  Introduce the session with an anecdote about a problem the presenter has had that could have been prevented if the presenter understood his/her school's hierarchy better.

40 Min  Give lecturette on the model administrative structure. Cover the following:

1) Important positions and their duties;
2) Relationships between the positions;
3) The PCV's relationship to each position;
4) Possible exceptions to the model;
5) How PCVs can fit into the hierarchy.

Certain positions, especially that of the Principal, will be discussed later. The important thing here is to provide a broad overview. This will help trainees make use of the PCV Visits, which will provide actual details to go along with the model.

40 Min  For each of the factors listed below, one of the Crossovers present tells a short anecdote (3-5 min) illustrating how that factor is important. Factors to present are:

- Money and raises;
- Male/female roles;
- Romance, marriage, and families;
- Drinkers, card players, gossips;
- Pro and anti - Ajaan Yai;
- Live at/away from school;
- Departments and similar work;
- School power;

Time should be allowed for questions and clarification.

5 Min

Close the session by pointing out that the anecdotes given are only examples from the experiences of the Crossovers present. Trainees will see other examples on the FCV Visits. Later in training, these topics will be discussed further in various GPS and PSS.

TRAINER NOTES AND RECOMMENDATIONS

The presenter must have a good understanding of school hierarchies, which the other Crossover(s) can supplement. The anecdotes should illustrate both positive and negative instances of the factors and should not be too unique.

SESSION TITLE: School Analysis

SESSION #74  WEEK #5  DAY #26  (74-5-26)

PRESENTER:  

CO-FACILITATOR: (a trainee)  

TIME: 9:00-10:00 C

INTRODUCTION:  SESSION OBJECTIVES

Before a PCV begins to think about the work s/he will do, s/he must find out with what there is to work. An analysis of the school situation that s/he is in will provide a starting point for deciding on specific work goals and strategies. Such an analysis will show the PCV what is realistic, what has been done and for what the PCV can expect support. Most important, the PCV will learn about the people with whom to work. This session takes place before the PCV visits in order to allow trainees to do a mini-analysis of the schools they visit. The objectives of this session are:

- To learn what points should be considered in a school analysis.
- To discuss how to do a school analysis.

HAND-OUTS:  #74-a  School Facilities  
           #74-b  Local Resources Worksheet  
           #74-c  Ampoe, Jangwat and Regional Information Sources.

READING ASSIGNMENT:  

TECHNICAL VOCABULARY:  

To analyze  
Facilities  
Resources  
Skills
SESSION PREPARATION AND MATERIALS

- Update and expand the hand-outs.
- Flip charts.

TIME SESSION 74-5-26 ACTIVITIES

5 Min
Humorously explain the differences between what a school is supposed to have, what it actually has and what is available for use. Give your reasons for these differences.

15 Min
Go over the first two hand-outs: "School Facilities" and "Local Resources Worksheet". Through examples, make it clear to trainees what sort of things can be useful for them, i.e. what things to be looking for.

20 Min
Refer the trainees to the session "Community Analysis" that was done in conjunction with the community projects.

Break the trainees into 3 groups and ask each group to brainstorm a list of information sources on one of the following: the school, the local community and the Province. These sources can be people, places, things, etc. Trainees should not concentrate on people of whom they can ask questions, because language problems can distort the information. They should think of things to observe—such as products and produce sold in the local market, things trucked in from outside the community, and how busy the local agricultural officials are.

15 Min
Have each group share its list with the large group. Have these lists typed after the session and distributed to trainees.

TRAINER NOTES AND RECOMMENDATIONS

The presenter may want to have trainees gather information on different things that they will see during the PCV visits. If so, assign areas of responsibility during the "PCV visits Preparation" session.
All of our schools received 60.10 million baht worth of buildings and equipment. The equipment is more or less the same for every school. By the time you arrive, various things may have been permanently borrowed, lost or used in such a way as to make them useless. The following is a partial list of some important things to locate, repair or replace. Do not expect these things to be available for your and other folks' use.

**SCHOOL IN GENERAL**

- Pick-up truck (probably not included for C.S.S. II schools)
- Motorcycle
- Tractor
- Science Department Equipment
- Home Economics Equipment
- Industrial Arts Equipment

**AG SHOP**

- hoes, rakes, shovels, soil augers
- hammers, saws, planes
- grafting knives, pruning shears
- watering cans, buckets
- sprayers, masks
- soil test kits, fertilizer test kits
- syringes, wing sticks, castrating equipment
- grinder, pump
- incubator

**AG LAND**

- at school, next to school, rented
- fish ponds
- orchards, nursery
- rice paddy
- vegetable plots
- coops and pens
- compost

**WATER**

- water system
- wells
- canals
- ponds; streams

**MAY ITING OR USE**

- food sellers
- school co-op
- other teachers
- displays for visitors

SESSION TITLE: Ajaan Yais I

SESSION #95  WEEK #7  DAY #41  (95-7-41)

PRESENTER:

CO-FACILITATOR:

TIME: 10:00-12:00 C

INTRODUCTION: SESSION OBJECTIVES

Good relationships with Ajaan Yais are important for the success of Crossover PCVs. Trainees will have heard about the individual situations of particular Crossovers during the PCV Visits and these should be discussed. Trainees and trainers discuss the roles, limitations, needs and motivations of Ajaan Yais. Possible relationships between Crossovers and their Ajaan Yais are considered. The objectives of this session are:

- To appreciate the Principals situations and limitations;
- To understand the PCV/Principal relationship.

HAND-OUTS: #95a Ajaan Yai Situations

READING ASSIGNMENT:

TECHNICAL VOCABULARY:
SESSION PREPARATION AND MATERIALS

- Ajaan Yai Situations. This handout is in the TEFL Manual. (Retrieve and modify if necessary.)
- Flip charts.

TIME SESSION 95-7-41 ACTIVITIES

5 Min Preview session aims. Point out the importance of Ajaan Yais in each school and their importance to the success of the Crossover role. (The Ajaan Yai is everyone's boss—including the PCV's.)

30 Min Give Lecturette on the following points:

A. Legal requirements of positions;
B. AY's bosses and what they expect of a Principal:
   - Money and accounting;
   - Good appearances;
   - Impressiveness;
   - No problems.
C. Relationships with local government officials;
D. Beliefs and expectations of parents and other community members.

Note: During 81's training the Education PM sketched the Ajaan Yai's place in both the Ministry of Education and the Provincial government. B and C above fill out that sketch. See recommended outlines for PM visits.

30 Min Ask trainees to share their observations from PCV visits on the following:

A. Student ideas, opinions and beliefs about Ajaan Yai, as expressed by students not PCVs (possible no one discussed Ajaan Yais with students);
B. Teacher opinions, beliefs and ideas about Ajaan Yais;
C. Direct contact with Ajaan Yai;

T-16A

575
D. Crossover opinions, beliefs, etc. about Ajaan Yai, including how PCV works with Ajaan Yai, problems and good points.

10 Min Close. Remind trainees that Ajaan Yai's actions are thus sometimes motivated by a desire for:

- Professional accomplishment;
- Status;
- Power;
- Helping others and their country;
- Money;
- Promotions;
- Fame;
- Family and friends;
- Fun.

10 Min Explain "Ajaan Yai Situations."

Break trainees into pairs and pass out "Situations."

Have them do this role play in which a trainee is the Crossover PCV, a trainer is the Ajaan Yai and, in some cases, a second trainer is the agriculture teacher. After a 15 minute role play, have the participants discuss:

- what was said and decided,
- how things were decided and
- who decided.

Have trainees ask for explanations of how the Ajaan Yai was portrayed. Have trainers comment on what the trainees said.

After the discussion, have the trainees summarize it in writing and give the summary to the trainer, who will have the summary typed with the situation descriptions for use in "Ajaan Yai II" session.

The role plays will be scheduled by appointment with the "Ajaan Yai," outside of session time.

TRAINER NOTES AND RECOMMENDATIONS

This session, in a somewhat different form, was facilitated by a trainee, with guidance from the Technical Coordinator. This worked well and should be considered for future sessions. A trainee and a trainer (Crossover) can modify this session. The lecturette may be presented by the trainer, while the trainee facilitates the over-all session.
