ABSTRACT

A statistical and narrative summary of the results of the 1983-1984 Survey of Earned Doctorates is presented. Basic information, such as sex, field, institution, and year of Ph.D., is presented for all of the 31,253 doctorate recipients; complete questionnaire data are included for the 29,713 Ph.D. recipients who responded to the questionnaire, while abbreviated records were compiled for the rest. Research and applied-research doctorates in all fields are covered, excluding such degrees as the M.D., D.D.S., O.D., D.V.M., and J.D. Baccalaureate sources of the doctorate recipients are identified, including the types of institutions they attended and the productivity of their institutions (e.g., sources by field, gender, and race). Tables include the following information: number of 1984 doctorate recipients by sex and subfield; number of 1984 doctorate recipients by citizenship, racial/ethnic group, and subfield; statistical profile of 1984 doctorate recipients by field of doctorate; sources of support in graduate school of 1984 doctorate recipients by sex and summary field; state of doctoral institution of 1984 doctorate recipients by sex and summary field; and statistical profile of 1984 doctorate recipients by racial/ethnic group and U.S. citizenship status. A questionnaire and specialties list are appended. (SW)

HIGHLIGHTS

- The nearly level trend in the number of doctorates awarded by U.S. universities since the late 1970s continued in 1984, when the total number of research doctorates conferred was 31,253. This number, down from the 1973 peak of 33,755, has not fluctuated by more than 1 percent since 1978.
- Although the number of new Ph.D.s has been stable since the late 1970s, the relative proportion of doctorates earned by men and women has changed. Women have increased their share by one third since 1977, earning 10,660 doctorates in 1984, or 34 percent of the total number conferred. The number of male doctorates has declined by 14 percent since 1977, with men receiving 20,593 Ph.D.s, or 66 percent, in 1984.
- Growth in women's share of Ph.D.s has occurred foremost in the fields of education, health sciences, psychology, and language and literature, disciplines in which women were 50 percent or more of the degree earners in 1984.
- The proportion of doctorates earned by non-U.S. citizens has also been increasing. In 1984 foreign nationals earned 19 percent of the Ph.D.s, reflecting an annual rate of increase of 5 percent since 1980. The number of temporary visa-holders outnumbered the permanent residents 4-to-1. Non-U.S. citizens had their highest concentration in engineering, where temporary visa-holders earned 44 percent of the degrees and permanent visa-holders earned another 9 percent.
- While increments in the proportion of minority degree earners have been slight over the last decade, all minority groups have enhanced their percentage of degrees. Minorities in 1984 earned 11 percent of the Ph.D.s, up 2 points since 1975.
- The median time-lapse from B.A. to Ph.D. has increased since 1970, standing at 10.0 years in 1984. Degree recipients in the physical sciences had the shortest time to Ph.D., 7.2 years. The median period for those in education was the longest, 14.6 years.
- In 1984, 20 percent of doctorate recipients who had postdoctoral employment commitments intended to work in business and industry. Over half (52 percent) of the engineering Ph.D.s reported commitments to business, and 48 percent of the physical scientists made similar commitments.
- The baccalaureate sources of 1984 Ph.D.s were divided into five major types of institutions: Research I, Other Doctorate-Granting, Comprehensive, Liberal Arts, and Specialized. The first three each contributed roughly 28 percent of the graduates who subsequently earned the Ph.D. Liberal Arts colleges were the B.A. source of about 14 percent of doctorates, and Specialized institutions contributed another 2 percent.
- The B.A. sources of 1984 doctorate recipients varied by doctoral field. Ph.D. engineers, for example, overwhelmingly (79 percent) earned their baccalaureate degrees from Doctorate-Granting schools, whereas the majority of education doctorates were graduated from either Comprehensive or Liberal Arts colleges.
- Baccalaureate sources also differed between men and women. Men doctorates were slightly more likely than women to have earned their B.A.s at Doctorate-Granting universities. Women Ph.D.s were more likely to have completed their undergraduate work at Liberal Arts colleges.
- Minority groups also had different baccalaureate experiences. Nearly half of the Asian Ph.D.s came from Research I universities as undergraduates. Close to half of each of the other minority doctorates--American Indians, Blacks, and Hispanics--had attended Comprehensive institutions.

Project Director

Office of Scientific and Engineering Personnel
NATIONAL RESEARCH COUNCIL

NATIONAL ACADEMY PRESS
Washington, D.C. 1986

NOTICE: The project that is the subject of this report was approved by the Governing Board of the National Research Council, whose members are drawn from the councils of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine. The survey project is part of the program of the Office of Scientific and Engineering Personnel.

This report has been reviewed by a group other than the authors according to procedures approved by a Report Review Committee consisting of members of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine.

The National Research Council was established by the National Academy of Sciences in 1916 to associate the broad community of science and technology with the Academy's purposes of furthering knowledge and of advising the federal government. The Council operates in accordance with general policies determined by the Academy under the authority of its congressional charter of 1863, which establishes the Academy as a private, nonprofit, self-governing membership corporation. The Council has become the principal operating agency of both the National Academy of Sciences and the National Academy of Engineering in the conduct of their services to the government, the public, and the scientific and engineering communities. It is administered jointly by both Academies and the Institute of Medicine. The National Academy of Engineering and the Institute of Medicine were established in 1964 and 1970, respectively, under the charter of the National Academy of Sciences.

This report is based on research conducted by the National Research Council with the support of the National Science Foundation, the U.S. Department of Education, the National Institutes of Health, and the National Endowment for the Humanities under NSF Contract No. SRS-8415556. Opinions, findings, conclusions, or recommendations expressed in this publication are those of the National Research Council and do not necessarily reflect the views of the sponsoring agencies.

FOREWORD

This report presents a brief summary of the results of the 1983-84 Survey of Earned Doctorates, which has been conducted each year since 1958 by the Office of Scientific and Engineering Personnel (OSEP) of the National Research Council. Questionnaire forms, distributed with the cooperation of the graduate deans of U.S. universities, are filled in by the graduates as they complete all requirements for their doctoral degrees. The doctorates reported here were earned during the period July 1, 1983, through June 30, 1984, and include research and applied-research doctorates in all fields. Professional degrees such as the M.D., D.D.S., O.D., D.V.M., and J.D. are not covered by this survey. A full list of degrees included can be found on the inside back cover; for convenience throughout this report, Ph.D. is used to represent any of the doctorate degrees covered by the survey.

Responses were received from 29,713, or 95 percent, of the 31,253 persons who earned the doctorate in 1984. When individuals did not complete the questionnaire, abbreviated records were compiled using information from the universities' commencement bulletins. As a result, basic information--such as sex, field, institution, and year of Ph.D.--is available for all of the 31,253 doctorate recipients.

This Summary Report is the eighteenth in an annual series of reports that began in 1967. Trend data from earlier periods can be found in the book A Century of Doctorates: Data Analyses of Growth and Change (National Academy of Sciences, 1978). All survey responses become part of the Doctorate Records File (DRF), a virtually complete data bank on doctorate recipients from 1920 to 1984. More than four-fifths of the 787,448 records now in the DRF have come from results of the 1958 to 1984 surveys. For doctorates granted during the 1920 to 1957 period, information was compiled from commencement bulletins, registrars' records, and other published material.

The conduct of the Survey of Earned Doctorates, the maintenance of the resulting data file, and the publication of this report are funded jointly by the National Science Foundation, the U.S. Department of Education, the National Institutes of Health, and the National Endowment for the Humanities. OSEP thanks these agencies for their support. The interest, aid, and counsel of Mary Golladay (NSF), the project officer for the agencies, are appreciated. In addition Felix Lindsay of the National Science Foundation, George Bowden of the National Institutes of Health, Jeffrey Thomas of the National Endowment for the Humanities, and Charles Miller of the U.S. Department of Education have provided constructive advice on the design and analysis of the survey, a contribution that increases its relevance to national policy issues. We also express our thanks to the graduate deans in the doctorate-granting institutions for their continuing interest in and assistance to this project.

During the data collection period for this report, the Survey of Earned Doctorates was conducted under the direction of Peter Syverson. Susan Coyle, the current project director, was responsible for the development of the summary statistics. Special appreciation also goes to Doris Rogowski and Eileen Milner, who jointly supervised the coding and editing of the data; to George Boyce, manager of the data processing department, and to Joseph Finan and Elise Brand, who were responsible for the computer programming and processing; and to Patricia King for her many contributions to this report.

OSEP is concerned with those activities of the National Research Council that contribute to the more effective development and utilization of the nation's scholars and research personnel. Its programs seek to strengthen higher education and to develop better understanding of the educational process. It is hoped that reporting of the present data to educational, governmental, and professional agencies will facilitate planning in higher education. Suggestions for improvement of the content or format of the report and questions or comments are welcome.

TRENDS IN THE NUMBER OF DOCTORATES BY FIELD

INTRODUCTION

This report highlights selected observations from the 1984 Survey of Earned Doctorates and examines patterns of degree earning by comparing data with surveys of years past. The report opens with a brief overview of the changing patterns of men and women doctorate recipients by field, followed by trends in foreign citizens' participation in U.S. doctoral education, racial/ethnic status, time to Ph.D., and employment commitments to business and industry.

This year's special section focuses on the baccalaureate sources of the 1984 doctorate recipients. It identifies the types of institutions that produced the scholars who later went on to earn doctoral degrees and discusses ways that institutional "productivity" may be measured. One such measure is used to compare B.A. sources of men and women and of the various ethnic groups.

Earlier reports in the Summary Report series presented highlights on the employment plans and citizenship characteristics of doctorate recipients entering the U.S. labor force (1983) and long-term trends in the plans of new doctorate recipients for postdoctoral study or employment (1982).

Between July 1, 1983, and June 30, 1984, a total of 31,253 research doctorates were awarded by 328 U.S. universities, a total nearly identical to the 31,219 doctorates awarded in 1983. As displayed in Table A and Figure 1, strong growth in the number of Ph.D.s occurred between the 1960s and the early 1970s. Following the peak year of 1973, the annual number of degrees granted declined to 30,875 in 1978 and has remained comparatively stable around a mean of 31,200 since then.

Men and Women Doctorate Recipients

While the total number of new doctorates has been stable since the late 1970s, there have been marked changes in the relative proportions of doctorates earned by men and women (see Table B and Figure 2). During this period of overall stability, both the number and the proportion of women Ph.D.s have increased by 36 percent--from 7,858 in 1977 to 10,660 in 1984--so that women now constitute 34 percent of all new doctorates. The number of doctorates earned by men decreased by 14 percent--from 23,858 to 20,593--during the same period.

TABLE A Doctorates Awarded by United States Universities, 1960-1984

Year	Number	Year	Number	Year	Number
1960	9,733	1969	25,743	1978	30,875
1961	10,413	1970	29,498	1979	31,237
1962	11,500	1971	31,867	1980	31,017
1963	12,728	1972	33,042	1981	31,353
1964	14,325	1973	33,755	1982	31,096
1965	16,340	1974	33,047	1983	31,219
1966	17,949	1975	32,951	1984	31,253
1967	20,405	1976	32,946		
1968	22,936	1977	31,716		

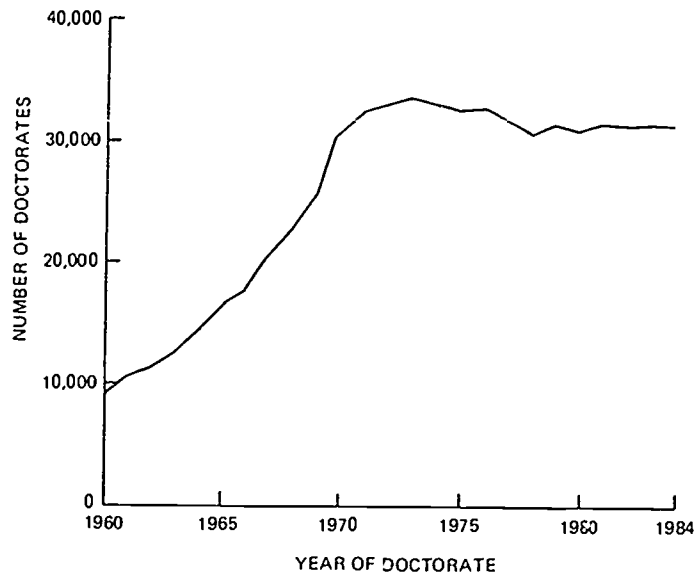

Figure 1 Doctorates awarded by United States universities, 1960-1984.

For men three broad fields--education, humanities, and the social sciences--have accounted for most of the decline in numbers over the last decade: decreases in these fields constituted over three-quarters of the total 1974-1984 change in total number (see Table B). The number of male doctorates increased from 1983 to 1984 in three of the remaining fields--engineering, professional fields,

and life sciences (see also Table 1, page 28, for a complete listing of disciplines subsumed under broad fields).

In contrast, two of the most rapidly declining fields for men--education and the social sciences--were responsible for much of the growth in the number of women Ph.D.s in the 10-year period beginning in 1974. Although the number of women

Figure 2 Number of doctorates awarded by U.S. universities by broad field and sex, 1974-1984.

earning doctorate degrees in the social sciences continues to grow, the number of new women doctorates in education declined from 1983 to 1984. However, the number of women in each of the other major fields increased in the last year: their greatest numerical increase was in the professional fields, and the greatest proportional increase was in engineering, which, although a very small field for women, has grown steadily since 1978.

The strong growth in the number of women Ph.D.s over the past 25 years, from 1,042 in 1960 to the current 10,660, is reflected in the four selected fields displayed in Figure 3: health sciences, psychology, languages and literature, and education. In each, the annual number of Ph.D.s received by women now exceeds the number earned by men. Much of the growth in women's share in these fields occurred during the post-1970 period. The most dramatic rise occurred in the health sciences, where the proportion of women Ph.D.s increased from 4 percent in 1960 to the current 58 percent, as the result of both numerical growth in the health

science fields such as nursing and in shifts in the gender make-up of audiology and speech pathology, public health, and epidemiology. A similar, though not as pronounced, situation has occurred in psychology, where the shift toward having a majority of women among new Ph.D.s has come from a combination of increasing numbers of women in clinical and counseling fields and of higher proportions of women in fields such as experimental, social, and industrial psychology.

Women have traditionally earned a substantial proportion of the humanities doctorates. The growth in women's representation in the languages and literature category--which includes both English and foreign languages--resulted from increased numbers of women achieving Ph.D.s during the 1960-1975 period, followed by a period in which the number of women doctorates levelled off while the number of men Ph.D.s markedly decreased. Nearly the same pattern occurred in the field of education, where women showed large numerical increases through 1983 while the number of men decreased steadily from 1973 to 1984.

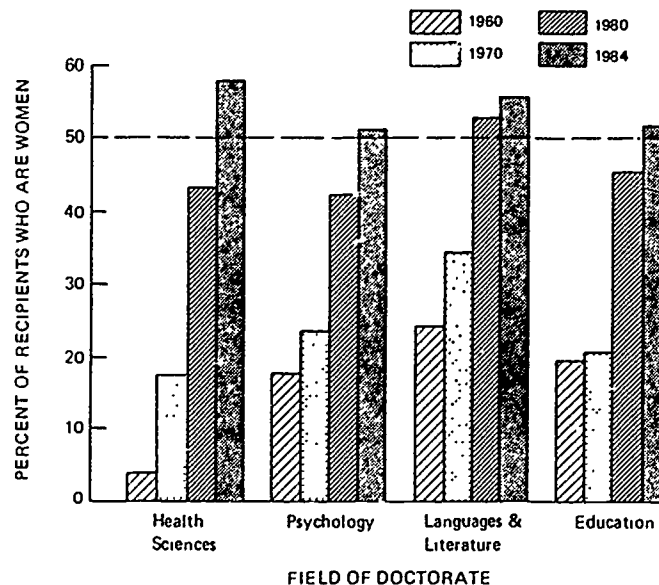

Figure 3 Percent of Ph.D.s who are women, in selected fields, 1960-1984.

Citizenship Status of New Doctorate Recipients

Along with the changing gender distribution among new doctorate recipients has been a continued evolution in the proportions of doctorates earned by non-U.S. citizens over the 1960-1984 period: historically, this proportion rose from 1960 to 1975, was stable from 1975 to 1980, and then increased at roughly a 5 percent annual rate in the 1980s. About one-fifth of all 1984 doctorates were earned by non-U.S. citizens (see Table C). Slightly more than 15 percent of the new Ph.D.s held temporary visas, a proportion that has grown steadily over the past decade. During the same period, the share of permanent visa-holders has remained in the 4-5 percent range.

TABLE C Citizenship Status of Doctorate Recipients, by Field, 1960-1984

Figure 4 Percent of 1984 doctorate recipients holding non-U.S. citizenship, by field.

Although the overall percentage of foreign doctorate recipients has grown slowly since 1960, the growth in some fields has been quite large (see Table C and Figure 4). Figure 4 reflects the proportional distribution of non-U.S. citizens among fields in 1984: engineering led with nearly twice the proportion of foreign doctorates as the physical sciences, the next largest field. The professional fields also drew more than the average proportion of non-U.S. citizens. Notably, while the proportions of permanent visa holders are relatively similar across fields, the fractions of temporary visa-holders account for the variations among fields, ranging from 7 percent in humanities to 44 percent in engineering.

By far, the largest proportion of non-U.S. citizens is in engineering, where foreign citizens accounted for more than one-half of the 1984 Ph.D.s. This percentage has doubled since 1970, and during the same period the percent of temporary visa-holders has more than tripled. In contrast, the fraction of engineering Ph.D.s who are permanent visa-holders has declined during the same 15-year period. The recent increase in foreign Ph.D.s in the physical sciences has primarily been in the fields of physics, mathematics, and computer sciences. The leading subfields for foreign citizens in the professional fields, life sciences, and social sciences were business (29 percent non-U.S. in 1984), agriculture (3, percent), and economics (40 percent), respectively.

Racial and Ethnic Status of Doctorate Recipients

Trend data for the past decade on the racial and ethnic status of doctorate recipients who are either U.S. citizens or non-U.S. citizens with permanent visas show that changes in the overall picture between 1975 and 1984 have been modest but positive, with all named minority groups having enhanced their percentage of degrees received (see Table D). In 1975 American Indians earned 0.1 percent of the Ph.D.s; in 1984 they attained 0.3 percent. Asians, who represented 3.7 percent of the recipients in 1975, were 4.1 percent in 1984. Blacks earned 3.9 percent of the Ph.D.s in 1975 and 4.3 percent in 1984. Hispanics have doubled their proportion since 1975, going from 1.2 percent of the degrees earned to 2.5 percent in 1984. The proportion of doctorates received by whites fell slightly from 91.0 per-

cent in 1975 to 88.8 percent in 1984.¹

American Indians comprise the smallest group of the reported ethnic cohorts: their largest concentration has been in education, the field in which 44 percent received their degrees in 1984. Education has also drawn the largest proportion of Black Ph.D.s--49 percent in 1984. Blacks' next largest concentration is in the social sciences, where 21 percent attained their doctorates in 1984. This pattern is also seen among Hispanics: the largest proportion, 26 percent, earned their degrees in education, and the next largest field was social sciences at 22 percent. Asians tend to choose the natural sciences and engineering more often: in 1984, 43 percent obtained their Ph.D.s in physical and life sciences, and 25 percent got engineering degrees.

*Percentage of those reporting racial/ethnic status.

¹ Of the 25,167 U.S. citizens and permanent visa-holders, 24,536--or 97 percent--reported their racial/ethnic status. The proportions reported here are based on this population.

Median Time-to-Ph.D.

The overall trend in time-to-P. D. (see Figure 5) shows a trough-shaped curve from 1960 to 1984. The 1960 median of 8.8 years is followed by a decline through the decade to a low value of 7.9 years in 1970; thereafter, the time-to-Ph.D. has risen steadily to its peak of 10.0 years in 1984. This aggregated median, however, obscures some distinct differences among its component parts, e.g., field and gender variations. Since the mid-1960s, the median time for all doctorate recipients in the physical sciences, engineering, life sciences, and social sciences has been lower than these aggregate figures. Meanwhile, the time from bachelor's degree to Ph.D. for individuals in the humanities, professional fields, and education has been longer than that average.

Consistently earning their degrees in the shortest amount of time have been the physical science doctorates. This group took a median 6.5 years in 1960 and then shortened their degree period to a low of 6.0 years in 1966 through 1968; by 1984 the median time-to-Ph.D. for physical scientists was 7.2 years. Consistently taking the longest amount of time have been the recipients of education degrees. In 1960, education doctorates earned their degrees in a median 12.8 years after their B.A.s. That amount of time rose to 14.3 years in 1966 but then declined, staying at about 12 and one-half years throughout the 1970s. In the 1980s, however, educators' median time-to-degree rose a second time and reached a high of 14.6 years in 1984.

In addition to dissimilarities in time-to-degree by recipients in the broad fields, the median time is different for men and women. On the average, women take longer to earn their degrees: in 1984 their median time-to-Ph.D. for all fields was 11.6 years, while men's median time was 9.3 years. When disaggregated by field, the gender differences in time-to-degree change in both direction and scope. In 1984, the overall direction of the gap in two of the seven broad fields was reversed, as women earned their degrees more quickly than men in physical sciences and engineering. In terms of the gap's

scope, the sexes were most alike in time spent earning degrees in the physical sciences, where women completed the Ph.D. in 7.0 years, slightly ahead of men's median 7.2 years. Men and women were most dissimilar in the professional fields, where men led women by completing the doctorate in 11.8 versus 13.3 years.

There are large differences between the broad fields reflected in Table E, which shows the median years-to-degree by field and sex, and a number of possible reasons therefor. For example, differential sources of support through the graduate experience may be a factor. Field comparisons show that doctorate recipients in the physical sciences reported the greatest proportion of institutional support through university fellowships, research assistantships, and teaching assistantships and were the Ph.D. recipients earning their degrees in the shortest amount of time. In contrast, education doctorate who reported the lowest proportion of support from these sources and the greatest from personal sources, had the slowest time-to-degree in 1984.

Figure 5 Median total years from receipt of baccalaureate to earning the doctorate, 1960-1984.

Commitments to Business and Industry

The proportion of doctorate recipients with commitments to U.S. business and industry has grown from 1970 to 1984 (see Table F), although the trend has been somewhat irregular. The lowest proportion of commitments (10 percent) occurred in 1972, followed by a rise and then a second, smaller dip four years later (to 12 percent). The high point (22 percent) was reached in 1982, and a small decline appeared in the two years thereafter (to 20 percent). The shape of this irregular trend varies from field to field (Figure 6), which may in part reflect the divergent conditions and demands for professionals among the seven broad disciplines.

The physical sciences field reflects the com-

bined field pattern, although its rises and declines are sharper. Its low proportion of intended business and industry entrants was 22 percent in 1972, and its high was 57 percent in 1982. In 1984, 48 percent of these recipients had commitments to business and industry; these strong proportions appear to result primarily from Ph.D.s in chemistry and computer sciences, who enter industry with some frequency.

A large proportion of engineering doctorates--50 percent or more in 13 of the 15 years from 1970 to 1984--have also made employment commitments to industry. Their lowest proportion was 47 percent in 1971, and the apex reached in 1982 (61 percent) slipped to 52 percent in 1984.

Life scientists have also been moving to business and industry. Like most of the others, their low point (10 percent) was in 1972. In 1982, and again in 1984, the proportion reached 26 percent. Agricultural and health science Ph.D.s are the most likely among life scientists to find employment in the business/industry sector.

Recipients of social science doctorates have been somewhat different, in that their proportionate upward trend toward commitments to industry and business has not experienced any interim declines since their 1971 low of 4 percent. Part of their growth may be explained by the component of clinical and counseling psychologists who are entering private practice.

In the other three broad disciplines of humanities, education, and professional fields, slight year-to-year fluctuations have occurred over the same period. The net flow has been in an upward direction, but in none of the fields has the proportion of commitments made to business employers exceeded 10 percent.

Figure 6 Business and industry commitments as a percentage of total employment commitments, 1970-1984.

BACCALAUREATE SOURCES OF 1984 DOCTORATE RECIPIENTS

The special topic of this report is the baccalaureate sources of doctorate recipients. B.A. institutions are categorized and analyzed by type, roughly along the lines of the Carnegie Classification system, and looked at individually as well. Two kinds of measures are used to analyze B.A. sources: the first measures "output"--that is, the absolute number of Ph.D.s who earned their baccalaureates at a given institution or type of institution, and the second measures "productivity," the ratio of Ph.D.s to the number of B.A. graduates from an institution or institutional type. The output measure is applied in a time series analysis whereby trends in B.A. origins over the 1920-1984 period are examined. Output is also compared to "productivity" of 1984 doctorate recipients. For this, a simple ratio is calculated in order to illustrate comparability between institutional types and individual institutions and to show differences in B.A. sources between men and women and between the whole cohort and minority groups.

The Typology

Currently in the United States, more than 2,000 colleges and universities grant baccalaureate degrees; the 1984 Ph.D. cohort earned their B.A.s from 1,380 U.S. institutions. To handle analytically the large number of institutions, a typology of B.A. institutions was constructed by recasting the Carnegie Classification of Institutions of Higher Education,² which categorized institutions on the bases, variously, of federal financial support for the sciences, the numbers and types of degrees awarded and programs offered, the size of enrollment, and the selectivity of admissions.

The present scheme reformulates that classification into five types of institutions, which are further identified as public or private. Type I consists of institutions that Carnegie rated as Research I--the first 50 research and doctorate-granting universities in terms of federal financial support for the sciences and numbers of Ph.D.s awarded annually. Type II merges institutions that Carnegie ranked 1.2 through 1.4--that is, all Other Doctorate-Granting universities. Comprehensive colleges and universities (Carnegie 2.1 and 2.2), which grant M.A.s as their highest degree, comprise Type III. Liberal Arts colleges, which primarily confer bachelor's degrees (the Carnegie 3.1 and 3.2 schools), are Type IV. Type V absorbs the myriad of specialized institutions that Carnegie ranked 5.1 through 5.9, such as teachers colleges, health professional schools, and schools of engineering and technology. While these generalized categorizations are useful, they are not always easily made, for their criteria allow some overlap. A chart followed by a full definition of each institutional category can be found in Appendix B.

² Carnegie Commission on Higher Education, A Classification of Institutions of Higher Education (rev. ed.), Berkeley: The Carnegie Foundation for the Advancement of Teaching, 1976.

Output by B.A. Source Types, 1920-1984

Using the measure of output, a historical look is taken at the B.A. sources in the United States of doctorates earned in the first year of each decade during the 1920 to 1984 period (see Figure 7 and Table G). Proportions are based on the total number of Ph.D.s who received their baccalaureate degrees from each institutional type.

Table G shows both the tremendous growth in the overall number of doctorate recipients and the change in distribution of those individuals among broad institutional categories over the past 65 years: the Research I institutions grew from being the B.A. source of 216 Ph.D.s to being the source of 6,715 of the B.A.s who earned doctorates, the Other Doctorate-Granting institutions went from 110 to 7,015, the Comprehensive group from 62 to 7,025, the Liberal Arts colleges from 113 to 3,390, and the Specialized institutions from 3 to 466.

However, over this growth period two interrelated trends markedly changed the distribution of individuals among institutional categories. In

Figure 7 Baccalaureate sources of 1920-1984 doctorate recipients.

1920, Research I institutions were the B.A. sources for 43 percent of the doctorates granted, but that percentage began to decrease slowly in the 1930s and more rapidly during the 1960s so that by 1984, only 27 percent of the new Ph.D.s reported B.A.s from Research I institutions. Similarly, the proportionate share for the Liberal Arts colleges declined from 22 percent in 1920 to 14 percent in 1984; this decline, however, was most rapid in the 1920-1950 period, and the share for this category has remained relatively stable since 1960. These percentage declines were not the result of numerical decreases but of the very rapid growth (beginning in 1940) of the public Comprehensive, or master's-degree, institutions that primarily grew out of the state colleges of the 1950s;³ from 1920 to 1984 their proportional share of baccalaureates earning Ph.D.s mushroomed from 3 to 18 percent. The share of B.A. sources also grew, although to a lesser degree, for the category of public Other Doctorate-Granting institutions, many of which again are the large state-supported institutions.

A consequence of the rapid growth of the Comprehensive institutions is the second trend, the shift from private institutions to public colleges as the primary B.A. sources (see Table G). Interesting is the almost mirror-image transition from a 60/40 private-public distribution in 1920 (62 percent private, 38 percent public) to a 40/60 private-public balance in 1984 (41 percent private, 59 percent public). The shift from predominately private B.A. sources to public ones occurred during the tremendous surge in graduate education in the years immediately following World War II.

To put the private-public shift in perspective, it would be helpful to know the number of all baccalaureate degrees conferred from each institutional type at appropriate antecedent dates for the Ph.D.s earned in 1920 and 1984. Unfortunately, information

³ The growth of the Comprehensive institutions as baccalaureate sources is well-exemplified by City College of the City University of New York. Among the 10 leading B.A. sources in terms of numbers of B.A.s earning Ph.D.s in 1940, City College was the top B.A. source in both 1950 and 1960, and the third largest source in 1970, accounting for 175, 190, and 339 of the new doctorates in those years respectively. While still an important B.A. source, City College was not one of the 30 leading producers reported in 1984.

on private and public institutional origins is not readily available for the earlier cohort. The U.S. Department of Education's earliest such data are for 1936-37, which can be used as a rough proximate B.A. period for the 1940 doctorates. Data are also available for 1974, the median B.A. year for the 1984 cohort of Ph.D.s.⁴ These data shed some light on the trend.

In 1936-37, B.A.s nationally were evenly distributed (50/50) between private and public institutions. However, the 1940 doctorates had a 54/46 split between private and public B.A. sources--that is, 54 percent earned their baccalaureates at pri-

private schools, while 46 percent came from public institutions (see Table G). By 1974, the proportion of baccalaureates awarded from private schools had declined to 31 percent, and 69 percent of B.A.s were from public institutions. Yet the 1984 doctorates, whose median B.A. year was 1974, had a 41/59 private to public B.A. source split. Thus, while there has been a historical change in distribution of doctoral antecedents from a majority with private origins to a majority with public institution sources, national data suggest that private institutions are still strong baccalaureate sources for graduates who subsequently earn Ph.D.s.

⁴ Biennial Survey of Education 1936-38, U.S. Office of Education, Bulletin No. 42; Earned Degrees Conferred 1972-73 and 1973-74 Summary Data, Tables 3A, 3B, and 3C, National Center for Education Statistics.

Distribution of B.A. Sources by Field

This section looks at the distribution of the five categories of B.A. source institutions across fields by output measure. The first row of Table H reflects this wide distribution while subsequent rows display marked differences among and within the fields in the proportional share of each institutional category. Research I, Other Doctorate-Granting, and Comprehensive institutions each contributed about 28 percent of the 1984 Ph.D. cohort, Liberal Arts colleges contributed 14 percent, and Specialized institutions added 2 percent.

The large field differences were strongly reflected within the physical sciences. Physics and astronomy had a distinctive distribution, with B.A.s

highly concentrated among the Research I universities. Quite different, however, was the B.A. source distribution for chemistry, where a much broader variety of institutions produced B.A.s who became doctoral chemists. In fact, chemistry had the highest fraction of Ph.D.s coming from Liberal Arts colleges and the lowest proportion from Research I institutions of all science fields.

Engineering had a pattern different from all other fields in that nearly one-half of doctoral engineers received their B.A.s from Research I institutions. Nearly a third came from Other Doctorate-Granting universities. Specialized institutions accounted for 5 percent of the engineering Ph.D.s, a contribution larger than that made by the

Type Vs to any other broad doctorate field and notable because only a minor number of those institutions have engineering programs. The performance of the Type V Specialized institutions in the field of engineering can be noted in field lists, which collapse gender and race categories and are reported in Appendix C.

Along with the social sciences, the life sciences fields reflected the overall wide range of B.A. sources, but their proportion from Research I institutions was somewhat higher than the average 27 percent of 1984. Two fields--the health and agricultural sciences--are notable for the concentrations of their Ph.D.s that came from Other Doctorate-Granting institutions. Moreover, doctorate recipients in agricultural sciences earned their B.A.s from Research I and Other Doctorate-Granting institutions with greater frequency than recipients in all other fields except engineering.

The Liberal Arts colleges were most highly represented among humanities doctorates, with about one-fifth of them having come from that B.A. type. Liberal Arts colleges were more frequently reported B.A. source than even the Research I universities for doctorates in English and American language and literature, despite the Research Is overshadowing Liberal Arts colleges overall by a margin of 2-1. Education doctorates were more than twice as likely to have come from Comprehensive institutions than from Research I schools (42 percent versus 16 percent, respectively the highest and lowest percentages of any field).

Distribution of B.A. Sources by Gender

The types of B.A. sources of 1984 doctorate recipients showed some differences in output proportions between the sexes, but the differences were not very large. Men were more likely than women to have been educated at Research I, Other Doctorate-Granting, or Specialized institutions, while women were more likely than men to have graduated from Comprehensive universities or Liberal Arts colleges (see Table I).

For example, 28 percent of the men and 25 percent of the women had their B.A. origins in Research I universities. Other Doctorate-Granting institutions graduated 29 percent (the highest proportion) of the men and 27 percent of the women recipients in 1984. The greatest difference was at the Liberal Arts colleges, where nearly 17 percent of the women doctorates received their B.A.s, compared with less than 12 percent of the men.

In terms of private and public institutions, there was fundamentally no gender distinction in the proportion of baccalaureate sources for doctorate recipients. In 1984, 58.9 percent of men Ph.D.s received their bachelor's degrees from public institutions, and 40.9 percent graduated from private schools. Public institutions conferred B.A.s to 58 percent of the women doctorates, and private colleges awarded degrees to the other 41.9 percent.

Distribution of B.A. Sources by Racial/Ethnic Status

When disaggregated by racial/ethnic group, the output distribution of B.A. sources changed radically, except among the white cohort (see Table J).

The Comprehensive, or master's degree level, institution stood out as the major source of B.A. degrees for American Indian, Black, and Hispanic doctorate recipients, having conferred 45.2, 49.2, and 48.2 percent of their degrees, respectively. All of these shares were much greater than the combined average of 28.5 percent from the Comprehensive type. The second greatest baccalaureate source was the Other Doctorate-Granting type of university, which granted B.A.s to 31.5 percent of American Indian Ph.D.s, 3 points higher than the combined average proportion. The Other Doctorate-Granting university was also the second largest source for Black and Hispanic doctorate recipients, although the respective 18.2 percent and 21.2 percent shares were below that of the combined average, suggesting its possibly lesser significance as a type of B.A. school for these two groups.

On average, Specialized institutions contributed 1.9 percent of the Ph.D.s; comparatively, they were a disproportionately large source of B.A.s for one group--American Indians, for which they comprised 4.1 percent of the B.A. sources. Given Liberal Arts colleges' combined average B.A. source share of 13.7 percent, they were a disproportionately large source for one group: for Black recipients they comprised 16.9 percent of the baccalaureate origins. For Hispanics the proportion of Other Doctorate-Granting institutions was nearly matched by that of the Research I universities (20.5 percent).

Doctorate recipients of Asian ethnicity differed in their B.A. sources both from the combined average proportions and from the other minority groups. The majority of Asian Ph.D.s received their baccalaureate degrees from Research I universities--48.4

percent, a share which put this group at greatest variance with the combined B.A. source proportion by being more than 21 points higher than the 27.2 percent average. With the exception of the Specialized institutions, all other types of B.A. origins were represented more sparsely among the Asian group than they were for the combined average.

"Productivity" of B.A. Sources of 1984 Ph.D.s

As mentioned earlier, there is more than one way to consider which schools are leaders in producing doctorate earners. For some investigators, the appropriate measure is an institution's "output," that is, the absolute number of Ph.D.s that its graduates ultimately earn.⁵ A disadvantage to such an approach is that large degree-granting institutions will dominate the field by sheer size of graduating classes with the potential to earn the doctorate. Public institutions will rank more highly in output because they graduate more persons than do their privately controlled counterparts (as noted earlier, 69 percent of the B.A.s in 1974 were conferred at public institutions).

⁵ See, for example, Lindsey Harmon and Herbert Soldz, Doctorate Production in United States Universities, 1920-62, National Academy of Sciences: Washington, D.C., 1963.

One way to normalize the Ph.D. output measure among schools is to introduce a ratio that divides the number of an institution's graduates who earn doctorates by the institution's total graduate number. The percentage that results, called Ph.D. "productivity," is particularly useful not only for controlling for the scale effects of institutional size, but also for comparing baccalaureate sources for gender or racial groups. To illustrate such applications--and not to suggest a standard--a "productivity" ratio implemented here puts the 1984 Ph.D.s into the numerator and the 1974 B.A.s into the denominator.⁶ A 10-year lag from 1974 was selected because in 1984 the median time from bachelor's to doctorate was 10.0 years, all fields combined. This lag does ignore the considerable variation in length of time-to-degree that is apparent when the data are disaggregated by field, sex, and ethnic group. In addition, the use of a particular set of years--1984 for Ph.D.s and 1974 for B.A.s--could produce results that reflect particular idiosyncratic conditions prevalent in those years. While such anomalies may be reflected in lists that rank individual institutions by their Ph.D. "productivity," they are not likely to arise in lists ranking the institutional types.

Both such kinds of "top producers" lists were generated for this report, a ranked type list and a ranked individual list. The institutional types ranged in their "productivity" from a high of about one Ph.D. out of every 10 graduates in 1974 (10 percent) to a low of about one doctorate out of every 70 grads (1.4 percent). The mean Ph.D. "productivity" of U.S. institutions of higher education in 1974 was 2.8 percent, a ratio of one out of 36 stu-

dents, with a standard deviation of 2.8 percent. The median was lower, at 2.1 percent, in a distribution skewed to the right. Individual institutions ranged widely in their Ph.D. "productivity," from 71 Ph.D.s out of 195 B.A.s (36.4 percent) to a low of one Ph.D. out of 1,228 graduates (0.08 percent).

To reduce the impact of snapshot irregularities on the ranked individual list, a size criterion was introduced: an institution had to have graduated 50 or more students in 1974, since numbers smaller than 50 would tend to produce unreliably high Ph.D. "productivity" ratios--that is, if a small institution granted 10 B.A.s in 1974, and one graduate earned a Ph.D. in 1984, that institution's Ph.D. "productivity" would be one out of 10, or 10 percent, well above the institutional "average" of 2.8 percent reported here. While all schools in a snapshot-type of analysis are subject to such over- (or under-) statement, institutions with denominators under 50 suffer stronger effects of anomalies here. The number of institutions deleted for small denominators was 59; on the ranked type list, this deletion process may have adversely affected the ordering of Type V institutions, which made up three-quarters of the excised group.

The selected lag time and snapshot years introduce a possible lack of reliability that other researchers may want to ameliorate; calculating the various lags appropriate to each field and group requires an investment of resources beyond the scope of this report. Similarly, collection of baccalaureate data to span a period of years rather than a single year requires extra resources that cannot be offered here, although other researchers in the field of baccalaureate origins have implemented

⁶ Data on bachelor's degrees conferred were obtained for 1,296, or 94 percent, of the 1,380 U.S. B.A. institutions reported by the 1984 doctorate recipients. Of the 1,296 institutions, 60 were dropped from further analysis: 59 because of their small size, and one because its nontraditional program did not lend itself to the typology used here. Undergraduate degree information was obtained from the National Center for Education Statistics (NCES), U.S. Department of Education.

ratios framed within longer time periods in which degrees have been awarded.⁷ For example, Hardy (1974) developed a formula for doctorates earned between 1920-1939 and 1950-1961, selecting 1917-1936 and 1947-1958 as the corresponding baccalaureate periods and including a weight for the proportion of female to male doctorates, which is not useable in the situation of single-sex institutions. Tidball and Kistiakowsky (1976) were the first to develop output and "productivity" ratios for women and for men separately: based on the actual numbers of B.A.s from 1910 to 1969 who subsequently received Ph.D.s in each of five major fields from 1920-1973, 137 institutions were selected on the bases of large numbers or large percentages of graduates who received the doctorate. While appropriate for comparing individual institutions, such selection is not appropriate to compare Ph.D. "productivity" by institutional type, as here. Brazziel (1983) calculated ratios for the baccalaureate institutions that conferred degrees in 1968-1970 to 25 or more Blacks who then earned doctorates in 1978-1980: he selected a 10-year lag to reflect the 1978-1980 average time-to-degree for Ph.D.s in humanities, social sciences, and education, fields in which Blacks were well-represented. Again, such narrowing is not appropriate here. Hall (1984a) assumed a 4-year lag when constructing indices for the 100 institutions most productive in terms of gross numbers of subsequent Ph.D.s: he divided both doctorate recipients by enrollment numbers and the number of Ph.D.s from 1920-1980 by the B.A. graduate numbers averaged over 13 time periods from 1923-1976. But the 4-year lag is inappropriately short, even when applied strictly to Ph.D.s in chemistry

(1984b), as he did later. Fuller calculated Ph.D. "productivity" on the basis of the average number of baccalaureates awarded 1946-1976 and the average number of Ph.D.s earned by graduates of all accredited institutions 1951-1980; she also included a calculation for Ph.D. "productivity" by doctorate field. Brazziel, Hall, and Fuller all constructed ratios that combined men and women students. Finally Tidball (1986) calculated, for women and men separately, and for eight institutional types, the proportion of B.A.s from 288 institutions graduating between 1970 and 1979 who subsequently received the doctorate in one of the natural sciences through 1983.

Output vs. "Productivity"

While the ratio of 1984 Ph.D.s to 1974 graduates is a simple one that may not prove strictly reliable, its purpose is to permit comparisons of schools of different sizes. Table K presents a ranking of the institutional types by both of the

measures discussed. The first list, under the heading of "Output," ranks institutional types on the basis of the numbers (n) of 1984 Ph.D.s who had their baccalaureate origins at each type. The second list, under the heading of "Productivity," ranks institutional types on the basis of the ratio of 1984 Ph.D.s to 1974 B.A. graduates (n/N). The ranked output list is topped by the public Type

II--Other Doctorate-Granting institutions, which were sixth on the list that measured "productivity" of Ph.D.s by their ratio to B.A.s. The "productivity" list was headed by the private Research I universities (Type I), which, conversely, were sixth on the output list.

Table L lists individual institutions by output and by "productivity." Ranked are the 30 B.A.

institutions that were the "top producers" of the 1934 cohort of doctorate recipients, both sexes and all ethnic groups combined. As in Table K, two columns show absolute numbers (n) and ratios (p.d.), while two other columns indicate the types of institution that these individual producers are. Appendix C presents similar tables of doctorates by each of the seven broad fields.

The Table L output list shows that 8 out of 30 top producers were private schools, whereas all 30 institutions on the "productivity" list were private. Under output ranking, 23 of the 30 top producers were Research I institutions, 6 were Other Doctorate-Granting, and 1 was a Comprehensive. On the other hand, the "productivity" list included representatives from all five of the institutional types: 8 Research Is, 3 Other Doctorate-Granting universities, 1 Comprehensive, 17 Liberal Arts colleges, and 1 Specialized institution. Even with the greater assortment of B.A. types under "productivity," the list is still skewed: when the expected and the observed numbers of institutional types among a group of 30 are compared, a chi-square test of significance ($\alpha=.01$) indicates that Type I schools--the Research I institutions--are significantly overrepresented in the table, and the Comprehensive colleges and universities--Type III--are significantly underrepresented.

The Research I schools have in place extensive graduate programs whose research scholarship and resources may overlap into baccalaureate education; these universities proportionately outrank the other types not only in the overall Ph.D. list but also in many of the field lists of Appendix C. These field lists, which again collapse the gender and race categories and report only the "top" 10 institutions for each major field, also show the strong performance of another type of school: the Specialized institutions, which are overrepresented in engineering and in the humanities (the latter primarily through the discipline of music).

To iterate, the measure of Ph.D. "productivity" used here--the ratio of 1984 Ph.D.s to 1974 graduates--is not meaningful in the sense of producing strictly replicable results. That is, year to year variations can occur that would affect the ratios reported here and perhaps change the list of "top producers." But, in addition to the institutional size comparison, two other comparisons are permissible by the exercise: construction of the "productivity" ratio allows one to point out gender differences in baccalaureate origins and to point out ethnic differences as well.

"Productivity" of B.A. Sources by Gender

From the data already described, Ph.D. "productivity" for each of the sexes can be calculated--that is, the denominator can encompass the total number of male or female graduates from a given institution, and the numerator can consist of the number who subsequently attained the Ph.D. Again to weed out small numbers in the denominator, institutions that granted fewer than 25 degrees to a gender group have been eliminated. The results provide a useful look at how U.S. universities compare in promoting achievement by either sex. Tables M and N show, respectively, the 30 institutions that were B.A. sources to the greatest number of men and women Ph.D.s in 1984 (the output list) and the 30 undergraduate institutions that in 1974 graduated the greatest proportion of men and women who earned doctorates in 1984 (the "productivity" list).

Twenty-seven institutions on the men's output list duplicate those on the overall output roster. In contrast, 21 schools from Table L's output list match the women's top producers (31 listed because of tie). Furthermore, 20 institutions on the men's "productivity" list, and 20 universities on the women's "productivity" list also appear on the overall roster of Ph.D. "productivity." The women's output list has more private institutions than the men's: of the 30 top producers, 9 of the women's and

7 of the men's were private schools. Both sexes' "productivity" lists are dominated by private institutions, the men's list having 28 and the women's having a full 30. On both of the "productivity" rosters, Type I institutions are overrepresented and Type IIIs are underrepresented. The women's output list has on it three women's colleges--Barnard, Wellesley, and Smith. Their "productivity" list also includes three women's colleges--Barnard,

Wellesley, and Bryn Mawr.

While 18 institutions appear on both the men's and the women's output lists, no more than 11 institutions appear on both sexes' "productivity" lists--and only about half of them had roughly similar "productivity" rates for women and men. This outcome underscores the problem of calculating "top producers" lists that assume that men and women have the same educational experience.

"Productivity" of B.A. Sources
by Racial/Ethnic Status

Unfortunately, Ph.D. "productivity" of minority groups cannot be calculated in the same way as "productivity" of gender groups because the racial/ethnic data are not available for the 1974 B.A.s. Instead, ratios have been devised that account for 1984 ethnic group member Ph.D.s, divided by the whole total of B.A. graduates. Such ratios were calculated for B.A. sources of Asians, Blacks, and Hispanics (see Table O), but not for American Indians because their number (73) was not large enough for meaningful comparative ratios. Because the numbers of these groups were not very large, only 10 "top producers" are shown here instead of the 30 that were listed in the overall rosters and in the lists for women and men.

Although ethnic Asian Ph.D.s were more like the majority of degree earners in their top baccalaureate producers than were the other two minority groups, their profile was distinctive. Notably, all of their top B.A. output sources were Research I universities. Top "productivity" B.A. schools for Asian doctorates were predominately Liberal Arts colleges. Seven institutions on their output list appear on the top 30 overall Ph.D. output list, and five schools on their "productivity" list appear on the overall Ph.D. "productivity" list.

The B.A. experience for Black Ph.D.s seems even more unlike the average. Top output institutions for Blacks were likely to be Comprehensive, or Type III, schools (7 out of 10). Top "productivity" schools were likely to be Liberal Arts, or Type IV, colleges (7 out of 10). None of the institutions on either list appear on the overall Ph.D. "top producers" lists (Table L); instead, all 10 of the leading Black B.A. sources ranked by output, and all 10 ranked by "productivity," were traditionally Black institutions.⁸ In the mid-1970s, two-thirds

of the Blacks who earned bachelor's degrees in the United States graduated from "majority" institutions. Yet, traditionally Black colleges are the ones visible for having educated the Black men and women who went on to become doctorate scholars. In part this may be because denominators of traditionally Black schools are composed mostly of Black students, whereas denominators of majority schools contain large numbers of non-Black students that dilute their ratios for Black Ph.D.s.

Finally, top B.A. producers are ranked for Hispanic doctorate recipients. Three of the schools in the Hispanic output list--all Type I institutions--also appear on the overall top 30 output list. Half of the schools on the output list are Comprehensives (Type IIIs). One of the leading Hispanic B.A. sources by "productivity", a Liberal Arts college, appears on the overall "productivity" list. Three Liberal Arts colleges appear on the "productivity" list, and six others are Type IIIs. By either measure, the geographic distribution is striking: Southern, Western, and Puerto Rican B.A. institutions were the greatest producers of the Hispanic cohort of 1984 Ph.D.s on the output list: the first and second top producers are located in Puerto Rico while the others are located in Texas (2), California (?), Florida (2), Colorado (1), and New Mexico (1). As measured by "productivity," three Puerto Rican institutions ranked among the top 10 list, and the remainder were from Western States, with the exception of Edgewood College (Wisconsin).

When top producers are compared between minority groups and the overall Ph.D. population in the U.S., several distinctions can be made. For output of the Asian group, the Type I institutions (Research I) figure exclusively in the top 10. The Comprehensive, master's-degree level, type of institution, becomes quite significant as a B.A. source among Black and Hispanic doctorate recipients, especially

⁸ Traditionally Black institutions have been identified by the National Center for Education Statistics in conjunction with a panel of experts on Black colleges and universities in Traditionally Black Institutions of Higher Education, Washington, D.C.: U.S. Government Printing Office, 1978.

when the measure is of output. Traditionally Black institutions eclipse all others in the ranked lists of baccalaureate sources of Black Ph.D.s. Hispanics seem anchored in certain regional areas. More research is needed to refine the "productivity" ratio by using racial/ethnic-specific data in the denominators.

Baccalaureate Sources: A Summary

The wide diversity of U.S. baccalaureate sources of doctorate recipients is striking: the 1984 Ph.D. cohort reported earning their B.A.s at 1,380 different American colleges and universities. A two-pronged approach was taken to the topic of baccalaureate sources: description of output and calculation of "productivity" ratios. Both institutional types and individual institutions were of interest.

Using the measure of "output," the B.A. origins of doctorate recipients since 1920 were documented. Comprehensive, or master's-degree granting, institutions grew rapidly as B.A. sources, particularly in the years following World War II. Continuing with the output approach, doctoral fields were characterized by the types of institutions that were predominant B.A. sources. For example, over three-quarters of the doctorate recipients in engineering earned their B.A.s from doctorate-granting institutions, while Ph.D.s in chemistry, social sciences, and the humanities came from a wider range of institutions, including Comprehensive and Liberal Arts colleges. Output was also differentiated by gender, revealing that women and men differed in their distribution of B.A. sources. This distinction was especially true

in the case of the Liberal Arts institution, which was proportionately a larger source of baccalaureate education for women doctorate recipients than it was for men in 1984. Moreover, the minority groups differed in their types of baccalaureate sources: for American Indian, Black, and Hispanic Ph.D.s, the Type III institution was dominant; but for Asian doctorate recipients, the most important type was the Research I universities.

The second prong to approaching baccalaureate origins--that of calculating Ph.D. "productivity"--illuminated the wide range of institutional "productivity" and pointed out those institutions from which very high proportions of B.A. graduates go on to earn the doctorate. Overwhelmingly, these institutions were private. While as a group the Research I institutions proportionately had the highest "productivity" rates, Liberal Arts colleges were also quite visible as leading baccalaureate sources of doctorate recipients. As with the output measure, when a gender perspective was applied, "productivity" looked different for men and women: only 11 of 30 "top producers" on the combined list (37 percent) were found to be on the separate lists for both of the sexes, and both the men's and the women's lists for 1984 were dominated by private institutions. When lists were drawn up for three of the minority racial/ethnic groups, "productivity" rates changed again, although the preeminence of the private institutions continued. One of the most striking results was that for Black Ph.D.s, all 10 leading B.A. sources--by either measure--were traditionally Black institutions.

APPENDIX A: The Five Basic Tables

Explanation

Table titles and headings are generally self-explanatory, but a few terms need special definition or explanation. The survey questionnaire is reproduced on pages 47-49.

- Table 1 Number of Doctorate Recipients by Sex and Subfield, 1984
- Table 1A Number of Doctorate Recipients by Citizenship, Racial/Ethnic Group, and Subfield, 1984
- Table 2 Statistical Profile of Doctorate Recipients by Field of Doctorate, 1984
- Table 3 Sources of Support in Graduate School of Doctorate Recipients by Sex and Summary Field, 1984
- Table 4 State of Doctoral Institution of Doctorate Recipients by Sex and Summary Field, 1984
- Table 5 Statistical Profile of Doctorate Recipients by Racial/Ethnic Group and U.S. Citizenship Status, 1984

Tables 1 and 1A

Tables 1 and 1A display 1984 data by subfield of doctorate, corresponding to the fields specified in the Specialties List on page 49. The "general" field categories--e.g., "chemistry, general"--contain individuals who either received the doctorate in the general subject area or did not indicate a particular specialty field. The "other" field categories--e.g., "chemistry, other"--include individuals whose specified doctoral discipline was not included among the specialty fields.

Table 2

There are three two-page tables: one contains data about all doctorate recipients in 1984 and the other two present data by sex. Refer to the inside of the back cover of this report for the codes included in each broad field and to the Specialties List on page 49 for the codes and names of each subfield. Definitions are as follows:

Median Age at Doctorate: One-half received the doctorate at or before this age.

Percentage with Master's: The percentage of doctorate recipients in a field who received a master's degree in any field before earning the doctorate.

Median Time Lapse: "Total Time" refers to total calendar time elapsed between the year of baccalaureate and the year of doctorate; "Registered Time" refers to the total time registered in a university between baccalaureate and doctorate.

Each year's doctorate recipients provide information on postgraduation employment or study plans in response to items 19 and 20 on the survey form. Since the questionnaire is filled out at about the time the doctorate is received, these planned activities can be subject to change. However, comparisons with data from the longitudinal Survey of Doctorate Recipients have shown these data to be a reasonable predictor of actual employment status in the year following the doctorate.⁹ Post graduation plans of the doctorate recipients are grouped as follows: "Postdoctoral Study Plans" (fellowship,

⁹ See discussion on page 22 of the 1982 Summary Report and also A Century of Doctorates: Data Analyses of Growth and Change (Washington, D.C.: National Academy of Sciences, 1978, pp. 92-93).

research associateship, traineeship, other), "Planned Employment" (educational institution, industry, etc.), or "Postdoctoral Status Unknown." The sum of these lines totals 100 percent for each column, with allowance for rounding: for example, 46.9 percent of all chemists had postdoctoral study plans, 47.1 percent planned employment, and 5.9 percent did not report their postgraduation plans; these total 99.9 percent. The study and employment rows are further subdivided, showing that 19.4 percent of all the chemists planned to pursue postdoctoral fellowships; 25.9 percent research associateships; 0.6 percent traineeships; and 0.9 percent some other form of postdoctoral study. The employment row is similarly subdivided; the percentages, listed by type of employer (educational institution, industry, etc.), total 47.1 percent planning employment.

The four lines of data beginning with "Definite Postdoctoral Study" distinguish between individuals who have definite postgraduation plans (item 18: "Am returning to, or continuing in, predoctoral appointment" or "Have signed contract or made definite commitment") and those who are still seeking employment or postdoctoral study (item 18: "Am negotiating with one or more specific organizations," "Am seeking appointment but have no definite prospects," or "Other"). These four lines, when added to the prior line, "Postdoctoral Status Unknown," total 100 percent with allowance for rounding. The two lines "Definite Postdoctoral Study" and "Seeking Postdoctoral Study" add to give the percentage having "Postdoctoral Study Plans," and the two lines, "Definite Employment" and "Seeking Employment," add to give the percentage having "Planned Employment After Doctorate."

Percentages showing the distribution of doctorate recipients by work activity and by region of employment are based on those who have a definite employment commitment. They exclude those still seeking employment and those planning postdoctoral study as described above.

Table 3

Displayed in Table 3 are data reported from item 16 on all sources of financial support during the course of individuals' graduate education. The response choices for source of support were revised in 1984 to provide more detailed information on items such as student loans and fellowship support. The data in the table should be interpreted as follows: 163 male doctorate recipients in the physical sciences reported financial support from National Science Foundation fellowships during graduate school. This number is 4.5 percent of the male physical sciences doctorates who answered the question, and it is 38.6 percent of the males in all fields who reported NSF fellowship support. Since students indicate multiple sources of support, the vertical percentages sum to more than 100 percent.

Table 4

Table 4 shows the number of persons receiving a doctorate from universities in each of the 50 states, the District of Columbia, and Puerto Rico.

Table 5

Table 5 contains data by racial/ethnic group (first included in the 1973 Summary Report) and by U.S. citizenship status for selected variables from Tables 2 and 3.

In 1977 the item on racial/ethnic group in the survey questionnaire was revised to coincide with the question format recommended by the Federal Interagency Committee on Education and adopted by the Office of Management and Budget (OMB) for use in federally sponsored surveys; an explanation of the effects of these changes is detailed on page 13 of the 1977 Summary Report. Changes in the OMB guidelines prompted the moving of persons having origins in the Indian subcontinent from the white category to Asian in 1978. In 1980 two survey revisions were made: (1) the category Hispanic was subdivided into Puerto Rican, Mexican American, and Other Hispanic

to provide more detail for users of the racial/ethnic data and (2) respondents were asked to check only one ethnic category. Prior to 1980 doctorate recipients could check more than one category to indicate their racial/ethnic background. However, when the data were compiled, all persons who checked Asian, American Indian, or Hispanic and also checked "white" were included in the minority-group category; and those whose responses were "Black" as well as any other category were designated as "Black." Evidence of this change was most pronounced in the American Indian group, where the majority of the

respondents formerly checked "white" in addition to American Indian.

Beginning with the 1982 survey, this item was revised to separate questions on racial and ethnic groups. Respondents are first asked to check one of the four racial group categories (American Indian, Asian, Black, or white) and then to indicate Hispanic heritage. For purposes of analysis all respondents who indicated Hispanic heritage, regardless of racial identification, are included in one of the three Hispanic groups. The remaining survey respondents are then counted in the respective racial groups.

APPENDIX B: Institutional Categories Derived from 1976
Carnegie Classification System*

Carnegie Class	Derived Type	Number** in Type	Bases for Being in Category
1.1	I	50	Support: Universities that led in terms of federal financial support for science in two out of three academic years 1972-73, 1973-74, 1974-75 Program: 50 or more Ph.D.s awarded in 1973-74
1.2-1.4	II	128	Program: 20 or more Ph.D.s awarded in 1973-74 in any field, or 10 or more Ph.D.s in at least three fields
2.1-2.2	III	548	Program: Liberal arts program plus at least one other professional or occupational program; highest degree is Master's or there is an extremely limited doctorate program Size: 1,000 or more at public ones; 1,500 or more at private institutions
3.1-3.2	IV	430	Program: Predominantly bachelor's degree level with a strong liberal arts tradition
5.1-5.9	V	80	Program: Exclusively or almost exclusively technical or professional programs in areas such as theology, medicine, engineering, business, art, music, law, and teaching

* Carnegie Commission on Higher Education, *A Classification of Institutions of Higher Education*, (rev. ed.). Berkeley: The Carnegie Foundation for the Advancement of Teaching, 1976.

**The number in this column refers to the number of institutions used in the analysis of B.A. sources and excludes colleges or universities whose graduates were too few to develop reliable "productivity" ratios.

Research I (Type I): The 50 leading universities in terms of federal financial support of academic science in at least two of the three academic years 1972-73, 1973-74, and 1974-75, provided they awarded at least 50 Ph.D.s in 1973-74. Examples include University of California at Berkeley, University of Texas at Austin, Duke University, and University of Chicago.

Other Doctorate-Granting (Type II): A sum of the Carnegie categories of Research II, Doctorate-Granting I, and Doctorate-Granting II institutions with established doctoral programs that awarded at least 20 Ph.D.s in 1973-74. In 1984, 132 Other

Doctorate-Granting universities were reported as B.A. sources. Examples include Iowa State University, University of South Florida, Howard University (DC), and Rensselaer Polytechnic Institute (NY).

Comprehensive University and Colleges (Type III): Institutions that offered a liberal arts program as well as other programs such as engineering, business administration, and nursing. Many offered master's degrees, but all either lacked or had an extremely limited doctoral program. Former teachers colleges that broadened their curricula in the 1960s are included in this category. Five hundred sixty-five comprehensive institutions were B.A. sources for the 1984 Ph.D.s. Examples include Glassboro State College (NJ), Old Dominion University (VA), Creighton University (NE), and Aquinas College (MI).

Liberal Arts Colleges (Type IV): Predominantly bachelor's-degree granting institutions with a strong liberal arts tradition. Thus, institutions such as Oberlin College are included even though they have master's degree programs. Examples of the 456 colleges in this category reported as B.A. sources in 1984 include Reed (OR), Bryn Mawr (PA), College of Charleston (SC), and Fisk University (TN).

Specialized Institutions (Type V): Those with primarily focused technical or professional programs in a range of areas such as theology, medicine, engineering, business, art, music, law, and teaching. There were 143 specialized institutions reported as B.A. sources in 1984 including Princeton Theological Seminary (NJ), University of Oklahoma Health Science Center, Rose-Hulman Institute of Technology (IN), Peabody Institute (MD), and Teacher's College of Columbia University (NY).

APPENDIX C: Field Lists of Leading B.A. Producers of 1984 Ph.D.s*

Institution**	n/N	Type***
<u>Physical Sciences</u>		
1. Harvey Mudd College/CA	20/71	IV, Private
2. California Institute of Technology	41/195	I, Private
3. Massachusetts Institute of Technology	76/1065	I, Private
4. Swarthmore College/PA	16/280	IV, Private
5. Reed College/OR	10/205	IV, Private
6. Carleton College/MN	13/333	IV, Private
7. University of Chicago/IL	15/446	I, Private
8. Washington College/MD	5/149	IV, Private
9. University of California-San Diego	32/991	I, Private
10. Colorado School of Mines	8/255	V, Public
<u>Engineering</u>		
1. California Institute of Technology	23/195	I, Private
2. Massachusetts Institute of Technology	63/1065	I, Private
3. Stevens Institute/NJ	8/256	V, Private
4. Harvey Mudd College/CA	2/71	IV, Private
5. Rensselaer Polytechnic Institute/NY	21/805	II, Private
6. Cornell University/NY	31/1616	I, Private
7. Carnegie-Mellon University/PA	12/648	II, Private
8. Worcester Polytechnic Institute/MA	7/392	V, Private
9. Clarkson College of Technology/NY**	10/572	V, Private
10. Rice University/TX	11/650	II, Private
<u>Life Sciences</u>		
1. Reed College/OR	12/205	IV, Private
2. University of Chicago/IL	22/446	I, Private
3. Cornell University/NY	73/1616	I, Private
4. Kalamazoo College/MI	8/218	IV, Private
5. California Institute of Technology	7/195	I, Private
6. Thomas Jefferson University/PA	2/58	V, Private
7. Brandeis University/MA	18/531	II, Private
8. Harvard University/MA	37/1122	I, Private
9. Massachusetts Institute of Technology	34/1065	I, Private
10. St. Johns College/MD	2/63	IV, Private
<u>Social Sciences</u>		
1. St. Mary's Seminary & University/MD	4/51	IV, Private
2. University of Chicago/IL	29/446	I, Private
3. Swarthmore College/PA	16/280	IV, Private
4. Brandeis University/MA	27/531	II, Private
5. Barnard College-Columbia Univ/NY	25/497	IV, Private
6. Reed College/OR	10/205	IV, Private
7. New College/FL**	7/147	IV, Private
8. Sarah Lawrence College/NY	10/219	IV, Private
9. Oberlin College/OH	28/623	IV, Private
10. Bryn Mawr College/PA	9/211	IV, Private

Institution**	n/N	Type***
<u>Humanities</u>		
1. New England Conservatory of Music/MA	5/52	V, Private
2. Westminster Choir College/NJ	6/85	V, Private
3. Haverford College/PA	8/162	IV, Private
4. Bennington College/VT	6/125	IV, Private
5. Wellesley College/MA	22/467	IV, Private
6. Boston Conservatory of Music/MA	3/66	V, Private
7. Juillard School/NY	5/118	V, Private
8. Barnard College-Columbia Univ./NY	21/497	IV, Private
9. Amherst College/MA	13/309	IV, Private
10. Reed College/OR	8/205	IV, Private
<u>Education</u>		
1. Covenant College/TN	3/66	IV, Private
2. William Jewell College/MO	10/223	III, Private
3. Phillips University/CK	7/172	IV, Private
4. Wiley College/TX	3/79	IV, Private
5. Our Lady of Angels College/PA**	2/54	IV, Private
5. Yankton College/SD	3/81	IV, Private
7. Kalamazoo College/MI	8/218	IV, Private
8. Trinity College/DC	5/139	IV, Private
9. Wilson College/PA	3/84	IV, Private
10. Alverno College/WI	5/144	IV, Private
<u>Professional and Other</u>		
1. William Jewell College/MO	5/223	III, Private
2. St. Mary's Seminary & University/MD	1/51	IV, Private
3. Concordia Theological Seminary/IN	3/156	IV, Private
4. Oklahoma Baptist University	5/277	III, Private
5. Louisiana College	3/169	IV, Private
6. Clark College/GA	3/172	III, Private
7. Palm Beach Atlantic College/FL	1/58	IV, Private
8. Howard Payne College/TX**	4/239	IV, Private
9. Wheeling College/WV	2/121	IV, Private
10. Wayland Baptist College/TX**	2/122	IV, Private

**"Productivity" of 1984 Ph.D.s in each field from schools that graduated 50 or more students in any category in 1974.

**Named institutions refer to main campuses, unless otherwise noted. Some institution names have changed since 1974: Clarkson College of Technology is Clarkson University; New College has affiliated with the University of South Florida and is a public Other Doctorate-Granting institution; Our Lady of Angels College is Neumann College; Howard Payne College is Howard Payne University; Wayland Baptist College is Wayland Baptist University.

 II=Type II
 III=Type III
 IV=Type IV
 V=Type V

SURVEY OF EARNED DOCTORATES, 1983-84

Form Approved
OMB No. 3145-0019
Approval Expires 1/85

This form is to be returned to the GRADUATE DEAN, for forwarding to The Office of Scientific and Engineering Personnel
National Research Council
2101 Constitution Avenue, Washington, D. C. 20418

Please print or type.

1. Name in full: (9-30)
 (Last Name) (First Name) (Middle Name)
 Cross Reference: Maiden name or former name legally changed
2. Permanent address through which you could always be reached: (Care of, if applicable)
 (Number) (Street) (City)
 (State) (Zip Code) (Or Country if not U.S.)
3. U.S. Social Security Number: _____ (33-41)
4. Date of birth: Place of birth:
 (10-14) (Month) (Day) (Year) (15-16) (State) (Or Country if not U.S.)
5. Sex: 1 Male 2 Female (17)
6. Marital status: 1 Married 2 Not married (including widowed, divorced) (18)
7. Citizenship: 0 U.S. native 2 Non-U.S., Immigrant (Permanent Resident) (19)
 1 U.S. naturalized 3 Non-U.S., Non-Immigrant (Temporary Resident) (20-21)
 If Non-U.S., indicate country of present citizenship
8. What is your racial background? (Check only one) 0 American Indian or Alaskan Native 2 Black (22)
 1 Asian or Pacific Islander 3 White
- 9a. Is your ethnic heritage Hispanic? Yes No (23)
- 9b. If yes, is it: 0 Mexican American 1 Puerto Rican 2 Other Hispanic (24)
10. Number of dependents: Do not include yourself. (Dependent = someone receiving at least one half of his or her support from you) (25)

11. Location of high school last attended: (26-27)
 (State) (or country if not U.S.)
 Year of graduation from high school: (28-29)
12. List in the table below all collegiate and graduate institutions you have attended including 2-year colleges. List chronologically, and include your doctoral institution as the last entry.

Institution Name	Location	Years Attended		Major Field		Degree (if any)		
		From	To	Use Specialties List		Title of Degree	Granted	
				Name	Number		Mo	Yr

13. Enter below the title of your doctoral dissertation and the most appropriate classification number and field. If a project report or a musical or literary composition (not a dissertation) is a degree requirement, please check box. (12)
 Title
 Classify using Specialties List
 Number Name of field
14. Name the department (or interdisciplinary committee, center, institute, etc.) and school or college of the university which supervised your doctoral program:
 (Department/Institute/Committee/Program) (School)
15. Name of your adviser for dissertation, project report or music/literary composition:
 (Last Name) (First Name) (Middle Initial)

16 Please enter a "1" beside your primary source of support during graduate study. Enter a "2" beside your secondary source of support during graduate study. Check (✓) all other sources from which support was received

Own/Family Resources

- a. Own Earnings
b. Spouse's Earnings
c. Family Contributions

University-Related

- d. Teaching Assistantship
e. Research Assistantship
f. University Fellowship
g. College Work-Study
h. Other

(Specify)

Federal Support

- i. NIH Traineeship
j. ADAMHA Traineeship
k. ADAMHA Fellowship
l. Other HHS
m. NSF Fellowship
n. Title VI Foreign Language and Area Studies Fellowship
o. Title IX Graduate & Professional Opportunities Pgm Fellowship
p. Other Dept of ED

- q. Veterans Administration (G.I. Bill, etc)
r. Other Federal

Nationally Competitive Fellowships (Non-Federal)

- s. Ford Foundation
t. Rockefeller Foundation
u. Other Fellowship

Student Loans

- v. Guaranteed Student Loan
w. National Direct Student Loan
x. Other Loan

Other Sources

- y. Business Employer Funds
z. Other

17a. Please check the category which most fully describes your status during the year immediately preceding the doctorate.

- c. Full-time employed (Go to Item "17b")
1. Held fellowship
2. Held assistantship
3. Part-time employed
4. Not employed
5. Other (specify)

17b. If full-time employed, what type of position did you hold?

- 6. College or university, faculty
7. College or university, non-faculty
8. Elem or sec. school, teaching
9. Elem or sec. school, non-teaching
(11) Industry or business
(12) Other (specify)

(50)

POSTGRADUATION PLANS

18. What is the status of your current postgraduate plans?

- 0. Am returning to, or continuing in, predoctoral employment
1. Have signed contract or made definite commitment
2. Am negotiating with one or more specific organizations
3. Am seeking position but have no specific prospects
4. Other (specify)

19. What best describes your immediate postgraduate plans?

- 0. Postdoctoral fellowship
1. Postdoctoral research associateship
2. Traineeship
3. Other study (specify)
4. Employment (other than 0, 1, 2, 3)
5. Military service
6. Other (specify)

20. If you plan to have a postdoctoral fellowship, associateship, traineeship, or otherwise undertake further study

A. What was the most important reason for taking a postdoctoral appointment? (Check only one.)

- 0. To obtain additional research experience in my doctoral field
1. To work with a particular scientist or research group
2. To switch into a different field of research
3. Could not obtain the desired type of employment position
4. Other reason (specify)

B. What will be the field of your postdoctoral study?

Please enter number from Specialties List

C. What will be the primary source of research support?

- 0. U.S. Government
1. College or university
2. Private foundation
3. Nonprofit, other than private foundation
4. Other (specify)
6. Unknown

Go to Item "22"

21. If you plan to be employed, enter military service, or other—

A. What will be the type of employer?

- a. 4-year college or university other than medical school
b. Foreign university
c. Medical school
d. Jr. or community college
e. Elem. or sec. school
f. Foreign government
g. U.S. Federal government
h. U.S. state government
i. U.S. local government
j. Nonprofit organization
k. Industry or business
l. Self-employed
m. Other (specify)

B. Indicate what your primary work activity will be with "1" in appropriate box; secondary work activity (if any) with "2" in appropriate box.

- 0. Research and development
1. Teaching
2. Administration
3. Professional services to individuals
5. Other (specify)

C. In what field will you be working?

Please enter number from Specialties List

D. Did you seriously consider undertaking postdoctoral study?

Yes ___ No ___

If yes, why did you decide against the postdoctoral?

- 0. No postdoctoral appointment available
1. Felt that I would derive little or no benefit from a postdoctoral appointment
2. Postdoctoral available but stipend inadequate
3. Had more attractive employment opportunity
4. Other (specify)

Go to Item "22"

22. What is the name and address of the organization with which you will be associated?

(Name of Organization)

(Street)

(City, State)

(Or Country if not U.S.)

(66-71)

BACKGROUND INFORMATION

23. Please indicate, by circling the highest grade attained, the education of

Table with columns for your father's and mother's education levels (none, elementary school, high school, college, graduate) and corresponding postdoctoral status.

- 369 Polymer
- 372 Systems
- 398 Engineering, General
- 399 Engineering, Other*
- COMPUTER AND INFORMATION SCIENCES**
- 400 Computer Sciences*
- 410 Information Sci. & Systems*
- MATHEMATICS**
- 420 Applied Mathematics
- 425 Algebra
- 430 Analysis & Functional Anal.
- 435 Geometry
- 440 Logic (See also 785)
- 445 Number Theory
- 450 Probability & Math. Statistics (See also 690)
- 455 Topology
- 460 Computing Theory & Practice
- 465 Operations Research (See also 363, 930)
- 498 Mathematics, General
- 499 Mathematics, Other*
- PHYSICAL SCIENCES**
- Astronomy**
- 500 Astronomy
- 505 Astrophysics
- Atmospheric & Meteorological Sciences**
- 510 Atmospheric Physics & Chem.
- 512 Atmospheric Dynamics
- 514 Meteorology
- 518 Atmos. & Meteorol. Sci., Gen
- 519 Atmos. & Meteorol. Sci., Other*
- Chemistry**
- 520 Analytical
- 522 Inorganic
- 524 Nuclear
- 526 Organic
- 528 Pharmaceutical
- 530 Physical
- 532 Polymer
- 534 Theoretical
- 538 Chemistry, General
- 539 Chemistry, Other*
- Geological Sciences**
- 540 Geology
- 542 Geochemistry
- 544 Geophysics & Seismology
- 546 Paleontology
- 548 Mineralogy, Petrology
- 550 Stratigraphy, Sedimentation
- 552 Geomorphology & Glacial Geology
- 554 Applied Geology
- 558 Geological Sciences, General
- 559 Geological Sciences, Other*
- Physics**
- 560 Acoustics
- 561 Atomic & Molecular
- 562 Electron
- 564 Elementary Particle
- 566 Fluids
- 568 Nuclear
- 569 Optics
- 570 Plasma
- 572 Polymer
- 574 Solid State
- 578 Physics, General
- 579 Physics, Other*
- Other Physical Sciences**
- 580 Environmental Sciences
- 585 Hydrology & Water Resources
- 590 Oceanography
- 595 Marine Sciences
- 599 Physical Sciences, Other*
- PSYCHOLOGY**
- 600 Clinical
- 603 Cognitive
- 606 Comparative
- 609 Counseling
- 612 Developmental
- 615 Experimental
- 618 Educational
- 621 Industrial & Organizational (See also 935)
- 624 Personality
- 627 Physiological
- 630 Psychometrics
- 633 Quantitative
- 636 School (See also 825)
- 639 Social
- 648 Psychology, General
- 649 Psychology, Other*
- SOCIAL SCIENCES**
- 650 Anthropology
- 652 Area Studies
- 658 Criminology
- 662 Demography
- 666 Economics
- 668 Econometrics
- 670 Geography
- 674 International Relations
- 678 Political Sci. & Government
- 682 Public Policy Studies
- 686 Sociology

- 799 Humanities, Other*
- EDUCATION**
- 800 Curriculum & Instruction
- 805 Educ. Admin. & Superv.
- 810 Educational Media
- 815 Educ. Stat. & Research
- 820 Educ. Testing, Eval. & Meas.
- 825 School Psych. (See also 636)
- 830 Social Foundations
- 835 Special Education
- 840 Student Counseling & Personnel Services
- 845 Higher Education
- Teacher Education**
- 850 Pre-elementary
- 852 Elementary
- 854 Junior High
- 856 Secondary
- 858 Adult & Continuing
- Teaching Fields**
- 860 Agricultural Educ.
- 861 Art Educ.
- 862 Business Educ.
- 864 English Educ.
- 866 Foreign Languages Educ.
- 868 Health Educ.
- 870 Home Economics Educ.
- 872 Industrial Arts Educ.
- 874 Mathematics Educ.
- 876 Music Educ.
- 878 Nursing Educ.
- 880 Physical Educ.
- 882 Reading Educ.
- 884 Science Educ.
- 885 Social Science Educ.
- 886 Speech Educ.
- 888 Trade & Industrial Educ.
- 889 Teacher & Educ. Specific Subject Areas, Other*
- 898 Education, General
- 899 Education, Other*
- PROFESSIONAL FIELDS**
- Business & Management**
- 900 Accounting
- 905 Banking & Finance
- 910 Business Admin. & Management
- 915 Business Economics
- 920 Marketing Mngmnt. & Research
- 925 Business Statistics
- 930 Operations Research (See also 363, 465)
- 935 Organiz. Beh. (See also 621)
- 938 Business & Mngmnt., General
- 939 Business & Mngmnt., Other*
- Communications**
- 940 Communications Research
- 945 Journalism
- 950 Radio & Television
- 958 Communications, General
- 959 Communications, Other*
- Other Professional Fields**
- 960 Architec. & Environ. Design
- 964 Home Economics
- 968 Law
- 972 Library & Archival Science
- 976 Public Administration
- 980 Social Work
- 984 Theology (See also 790)
- 988 Professional Fields, General
- 989 Professional Fields, Other*
- 999 OTHER FIELDS*

CODE NUMBERS FOR FIELDS DISPLAYED IN TABLE 2

Physics & Astronomy (500-505, 560-579)
 Chemistry (520-539)
 Earth, Atmospheric and Marine Sciences (510-519, 540-559, 580-599)

Physical Sciences Subtotal (500-599)
 Mathematics (420-499)
 Computer Sciences (400-410)
 Engineering (300-399)

EMP Total (300-599)

Biochemistry (100)
 Other Biosciences (105-199)

Biosciences Subtotal (100-199)
 Health Sciences (200-299)
 Agricultural Sciences (000-099)

Life Sciences Total (000-299)

Psychology (600-649)
 Economics and Econometrics (666, 668)
 Anthropology and Sociology (650, 686)
 Political Science and International Relations (674, 678)
 Other Social Sciences (652-662, 670, 682, 690-699)

Social Sciences Total (600-699)

Total Sciences (000-699)

History (700-719)
 English and American Language and Literature (726, 732, 733)
 Foreign Languages and Literature (740-769)
 Other Humanities (720-723, 729, 736-739, 770-799)

Humanities Total (700-799)

Business and Management (900-939)

Other Professional Fields (940-989)

Education (800-899)

Total Non-Sciences (700-989)

Other or Unspecified (999)

TITLES OF DEGREES INCLUDED IN THE SURVEY OF EARNED DOCTORATES

DAS	Doctor of Applied Science	DM	Doctor of Music
DArch	Doctor of Architecture	DMA	Doctor of Musical Arts
DA	Doctor of Arts	DME	Doctor of Music Education
DBA	Doctor of Business Administration	DML	Doctor of Modern Languages
JCD	Doctor of Canon Law	DNSc	Doctor of Nursing Science
DCJ	Doctor of Criminal Justice	PhD	Doctor of Philosophy
DCrim	Doctor of Criminology	DPE	Doctor of Physical Education
EdD	Doctor of Education	DPS	Doctor of Professional Studies
DEng	Doctor of Engineering	DPA	Doctor of Public Administration
DESc	Doctor of Engineering Science	DPH	Doctor of Public Health
ScDE	Doctor of Engineering Science	DRec or DR	Doctor of Recreation
DEnv	Doctor of Environment	DRE	Doctor of Religious Education
DED	Doctor of Environmental Design	DSM	Doctor of Sacred Music
DFA	Doctor of Fine Arts	STD	Doctor of Sacred Theology
DF	Doctor of Forestry	DSc	Doctor of Science
DGS	Doctor of Geological Science	DSch	Doctor of Science and Hygiene
DHS	Doctor of Health and Safety	LScD	Doctor of Science and Law
DHL	Doctor of Hebrew Literature	DScD	Doctor of Science in Dentistry
DHS	Doctor of Hebrew Studies	DScVM	Doctor of Science in Veterinary Medicine
DIT	Doctor of Industrial Technology	DSSc	Doctor of Social Science
SJD	Doctor of Juridical Science	DSW	Doctor of Social Work
JSD	Doctor of Juristic Science	ThD	Doctor of Theology
DLS	Doctor of Library Science		
DMSc	Doctor of Medical Science		
DMin or DM	Doctor of Ministry
