This paper describes how the Chinese educational system promotes ethnic studies programming. The Chinese approach differs from approaches in the United States as the Chinese promote ethnic studies primarily through English teacher education programs. Since the opening of China, the teaching of English has been a priority in Chinese education. Students not only learn the English language, but also study the cultures and ethnic groups who are native speakers of English. Thus, the English language and English-speaking cultures are simultaneously emphasized in English teacher training. This approach provides a cross-cultural understanding of both language and culture. (Author/JD)
PROMOTING ETHNIC STUDIES IN CHINA
THROUGH EMPHASIS ON ENGLISH TEACHER TRAINING

James A. Schnell
Assistant Professor
University of Cincinnati
The purpose of this paper is to describe how the Chinese educational system promotes ethnic studies programming. The Chinese approach differs from approaches in the United States as ethnic studies in China is promoted primarily through English teacher education programs. Since the opening of China, the teaching of English has been a priority in Chinese education. Students are taught not only the English language, they are taught about the cultures and ethnic groups who are native speakers of English. Thus, the English language and English speaking cultures are simultaneously emphasized in English teacher training. This approach provides a cross-cultural understanding of both language and culture.

This paper is based on English teacher education at Northern Jiaotong University in Beijing, The People's Republic of China. The author was a visiting professor of English instruction at the same university during the spring term (March-June) of 1987. The author taught students who were being trained to be English teachers, observed the English teacher training process at various levels, and formally surveyed student perceptions of their English teacher training.

Teacher education in The People's Republic of China has parallels with teacher education in the United States but it also has marked differences. A primary difference deals with the greater emphasis the Chinese give to ethnic studies. The teacher education processes used are based on the unique development of their country.

In 1949, The People's Republic of China was established and for the next 30 years China was essentially a closed society to the outside world. There was limited interaction with other countries and, thus,
little emphasis on the training of foreign language teachers. The only exception to this would be the teaching of Russian as China did maintain ties with the Soviet Union during this period.

Between 1966-1976, The People's Republic of China experienced a "cultural revolution". During this time education was criticized and charged drastically. Universities were shut down for the most part. Many administrators and intellectual were taken from their positions and forced to work in the countryside in "re-education camps". All books were banned except for works by/about Chairman Mao (the Chinese leader at the time). Students were taught primarily about the basics of agriculture (i.e. planting and harvesting of crops). This period, which ended with the death of Chairman Mao, stunned the growth of education in China.

In 1979, an open door policy was implemented in an effort to help China compete with the outside world. Since that time, trade and joint business ventures with the west have been emphasized strongly, specifically with the United States. China is eager to open to the outside world, but only on its own terms. The following excerpt provides a description of these terms.

Closing one's country to external contact results only in stagnation and backwardness. We resolutely reject the capitalist ideological and social systems that defend oppression and exploitation, and we reject all the ugly and decadent aspects of capitalism. Nevertheless, we should do our utmost to learn from all countries . . . . Otherwise, we shall remain ignorant and be unable to modernize our own country.¹
As interaction with the United States increases so does the demand for English language training. "China still has a long way to go in making its population fully literate in Chinese, let alone in English. But in terms of both national goals and individual aspirations, English is near the top of the list." English is now taught widely at all levels of education within China. By the time students of English reach the high school level they have normally had at least three years of English language training and, during the high school period, are expected to achieve a conversational ability with the English language. "In the universities, students practice English with a passion that comes from knowing where the future lies." 

To support the aforementioned objective students are trained to gain an understanding of English speaking cultures and ethnic groups outside of China. They want students to not only learn the English language but to learn about the people who speak the English language. Thus, ethnic studies in China is promoted through emphasis on English teacher education programs.

This approach addresses a problem which has existed in the teaching of English. A common problem has been students can learn the English vocabulary but have difficulty in communicating and understanding conceptual meanings. "Lack of competent English teachers and underestimation of the lesson time that should be devoted to verbal comprehension and speaking in English were mainly responsible for students low performance in learning English." "The poor English ability of middle school students is a potential obstacle to the country's opening to the outside world." An official government
objective, such as the opening of China, is taken very seriously by the Chinese people. Thus, answers to such problems are actively sought.

In teaching English as a second language, the emphasis on the communication process cannot be understated. Dorothy Bainton, chairman of the pathology department at the University of California at San Francisco, conducts a two week workshop to prepare Chinese health care workers who will be studying in the U.S. Her program emphasizes "even though they may read English quite well, they may have difficulty understanding the spoken language and making themselves understood. And they face the broader problem of conflicting rules about communication and socialization".6

These barriers to effective interaction are grounded in cross-cultural communication differences. Cross-cultural communication "occurs when two or more individuals with different cultural backgrounds interact together . . . . In most situations intercultural interactants do not share the same language. But languages can be learned and larger communication problems occur in the nonverbal realm".7 "Since we are not usually aware of our own nonverbal behavior it becomes extremely difficult to identify and master the nonverbal behavior of another culture. At times we feel uncomfortable in other cultures because we intuitively know something isn't right".8 "Because nonverbal behaviors are rarely conscious phenomena, it may be difficult for us to know exactly why we are feeling uncomfortable".9 The cross-cultural obstacles to effective listening exist in a similar manner.

The effect of the cultural backgrounds of interactants on human
interaction is a crucial consideration. "Culture is the enduring influence of the social environment on our behavior including our interpersonal communication behaviors."10 The culture of an individual dictates interpersonal behavior through "control mechanisms—plans, recipes, rules, instructions (what computer engineers call 'programs')—for the governing of behavior".11 Thus, the processes for presentation of ideas (speaking) and the reception of ideas (listening) will understandably vary from culture to culture.

A written survey of seven questions was administered to an English class of twenty students. These students were freshmen in the teacher preparation program at Northern Jiaotong University. They were requested to respond to seven statements (SA — strongly agree, A — agree, N — neutral, D — disagree, or SD — strongly disagree). The purpose of the survey was to study their perceptions of the role of communication in the teaching process. Results of the survey are as follows.

1. I think I will be a good teacher of English.
   SA  A  N  D  SD
   85% 5% 10%

2. I will most likely work as a teacher until I retire.
   SA  A  N  D  SD
   20% 25% 20% 35%

3. Teaching English is more difficult than teaching other foreign languages.
   SA  A  N  D  SD
   5% 15% 30% 45% 5%

4. As an English teacher, my behavior will serve as an important role model for my students (regarding social responsibility).
   SA  A  N  D  SD
   35% 45% 15% 5%
5. Intellectual development is more important than moral education and physical education.

SA  A  N  D  SD
10%  55%  25%  5%  5%

6. Teaching english was my first choice over other types of jobs.

SA  A  N  D  SD
20%  20%  35%  25%

7. Sometimes I understand the words an english speaker is using, but I don't understand his/her main idea or message.

SA  A  N  D  SD
15%  50%  10%  25%

For the purpose of this report the author is most concerned with questions four, six, and seven.

Question four responses indicate most students feel their behavior will serve as an important role model for students (regarding social responsibility). Eighty percent agreed (or strongly agreed) with this statement compared to five percent who disagreed. This corresponds with a statement made by Li Peng, Minister of the State Education Commission, regarding teachers serving as role models. "Schools in China should be most concerned with turning out youngsters with high ideals . . . and a devotion to socialism . . . . faculty members should improve themselves by mastering Marxist theory, the Communist Party's principles and academic knowledge".12

Question six responses show less than half of the students selected teaching english as their first choice of occupations. Sixty percent said teaching english was not their first choice while 40% said teaching english was their first choice. The author cannot speculate why there is such a high percentage of reluctant teachers but he feels it is worth noting.

Question seven responses indicate 65% of the students agree or strongly agree they sometimes understand the words an english speaker
is using, but don't understand his/her main ideas or message.
Twenty-five percent disagreed with this statement.

The Chinese are seeking to improve student understanding of the English language by giving more emphasis on the cultures which speak English since cultures provide a context within which languages are spoken. English teachers are ideally given instruction in both the English language and the U.S. and British cultures. Thus, ethnic studies is promoted through English teacher education.

This approach correlates bilingualism with biculturalism. In *Communicating with China*, interpreter Jan Carol Berris states "Biculturalism—sensitivity to cultural and social differences—is often as important as bilingualism".13

When an individual becomes bicultural he/she goes through an acculturation process as the new culture is learned. "Acculturation occurs through the identification and the internalization of the significant symbols of the host society".14 Young Yun Kim, in "Communication and Acculturation," emphasizes personal and social communication within acculturation. "Personal (or intrapersonal) communication refers to the mental processes by which one organizes oneself in and with one's sociocultural milieu, developing ways of seeing, hearing, understanding and responding to the environment".15 "Through social communication, individuals regulate feelings, thoughts, and actions of one another".16 Social communication is the interpersonal application of each person's personal communication basis of understanding.

Kim sees ethnicity and acculturation as being interrelated. "When the changes (to a new culture) are not complete, it is only
natural that there remains a certain degree of ethnicity. Incomplete acculturation, depending on one's point of view, can be interpreted as evidence of (some) assimilation or (some) ethnicity."17

Ethnicity can be described through the definition of ethnic groups offered by Albert and Triandis. "To the extent that ethnic groups have characteristic ways of behaving, they exhibit somewhat different distributions of behavior configurations . . . . An ethnic group, then, may consist of individuals having characteristic behavior patterns and subjective cultures".18

The educational system in China seeks to promote ethnic studies through emphasis on English teacher education. That is, they can use a number of means to help English teachers teach, not only the English language, but some of the more dominant English speaking cultures. There are three approaches for achieving this objective: the experiential, behavioral, and informational approaches.

The experiential method involves the learner actually experiencing the culture by living there for a period of time. Since this is not usually feasible, especially with Chinese learners, there are other diluted approaches within the experiential method. This would include creating laboratory or "imitation" cultural settings or spending time visiting ethnic neighborhoods which practice perspectives of the studied culture.19

The behavioral method involves "reinforcing the individual for producing behavioral patterns which are commonly found in another culture".20 The goal being to teach individuals about another culture rather than to change behavior. Similarly, Kim suggests acculturation can be effectively achieved "through communication training programs."
Such training programs should facilitate the immigrants acquisition of the host communication competence.\textsuperscript{21}

The third, and most common, approach is the informational method which focuses on readings about other peoples' customs or history.\textsuperscript{22} This method seeks to provide a perspective or context within which the culture operates. Lerner suggests studying the history, political structure, art, literature and language of the new culture.\textsuperscript{23} This, again, encourages the learner to understand the framework of the culture rather than specific behaviors which are offensive or complimentary.

Similarly, Stewart warns against studying a list of "do's and don'ts" since behavior is ambiguous (depending on the situations and circumstances encountered). He stresses the learner consider his/her own behavior and how it is affected by his/her assumptions and values.\textsuperscript{24} Assumptions and values vary from culture to culture, thus it is a stumbling block to "assume similarity instead of difference" when interpreting situations in a new culture.\textsuperscript{25}

Triandis suggests the use of attribution training within the informational method. This technique aims to teach members of one culture to make attributions commonly made by members of another culture. Attributions are interpretations of behavior; that is, they are inferences about the causes of a given behavior.\textsuperscript{26} This is helpful since attributions are based on norms, roles, affects, and consequences of actions which are operating in a particular situation.\textsuperscript{27}

As the People's Republic of China opens to the outside world, the learning of English continues to be an important objective in
their educational system. Their experience has shown that it is not 
enough to merely teach the English language, rather, it is also 
important to teach about the cultures within which the English 
language is spoken as this provides a context for language usage. 
Teachers are being trained in large numbers to teach English to 
Chinese students. In meeting this goal China is seeking to promote 
ethnic studies through emphasis on their English teacher preparation 
programs.
