The South African educational system and race relations were studied in the context of effects on cross-cultural relations in the classroom. An examination of South African faculty perspectives was compared and contrasted with U.S. faculty perspectives and was interpreted in relation to the cross-cultural relations that exist in the two countries. Faculty attitudes were compared through the use of a written survey. Based on the responses received, South African faculty (N=112) were found to be more consistent than U.S. faculty (N=97) and clearly indicated a preference for faculty dominance in the classroom (compared to U.S. preference for diversity and permissiveness). It was maintained that the reason for this was that South African faculty members, having less interaction with culturally different people, do not recognize that there are cultural perspectives other than those held by their own cultural group. It is noted that as long as this condition exists in the South African classroom, the communicative climate in the classroom will result in negative cross-cultural relations and the hampering of social change. The South African and the U.S. faculty survey instruments are attached. Contains 11 references. (GLR)
A COMPARISON OF FACULTY DOMINANCE IN U.S. AND SOUTH AFRICAN UNIVERSITY CLASSROOMS AS IT RELATES TO CROSS-CULTURAL RELATIONS

Jim Schnell, Ph.D.

Gahanna, Ohio 43230

The author is an assistant professor of interpersonal communication and cross-cultural communication is his primary research area. He has had the opportunity to teach students of various cultural backgrounds in a variety of cultural settings. These settings have included rural and urban universities, a foreign university (Beijing, China), different work settings, and the Ohio prison system.
A COMPARISON OF FACULTY DOMINANCE IN U.S. AND SOUTH AFRICAN UNIVERSITY CLASSROOMS AS IT RELATES TO CROSS-CULTURAL RELATIONS

This paper analyzes faculty dominance in U.S. and South African university classrooms. Comparison of faculty dominance between the two countries is interpreted in context of the cross-cultural relations that exist in the countries. Faculty attitudes are compared through the use of a written survey of faculty preferences regarding culture-bound areas. Findings indicate South African faculty members have a clear preference for dominance in the classroom. This dominance has a negative effect on cross-cultural relations in South African classrooms.

The release of anti-apartheid activist Nelson Mandela has marked another step toward racial equality in South Africa. Anti-apartheid reforms have been sought in practically all areas of South African life including economic, political, and educational reforms. This paper will focus on how faculty preference for dominance in South African university classrooms hinders cross-cultural relations. Examination of South African faculty perspectives is compared and contrasted against U.S. faculty perspectives. This analysis is intended to serve as an indicator of educational shortcomings, regarding cross-cultural communication in the classroom, and establish a need for modifications in this area. Before focusing on education in South Africa, a brief overview of the country will provide helpful context for the current situation.

South Africa is roughly three times the size of California. Seventy-five percent of its population (of 36 million) is black, 14% white, 8% coloureds (mixed
black/white/asian). and 3% asian & others. The chief commercial exports are gold, diamonds, uranium, platinum, chrome, and copper (Dostert, p. 93).

Race relations have long been controversial and, at present, much of the controversy stems from apartheid. Apartheid, a Boer word meaning separate, is a policy that provides for legalized compulsory separation of the races. This policy was instituted in 1948 when the National Party came to power. During the 1960's black rights were further reduced due to the threat posed by the African National Congress (that Nelson Mandela led). In 1973, ten Black homelands were established that allowed for internal self government. In 1986 the U.S. and other countries increased sanctions against South Africa to discourage apartheid, including bans on investments, loans, South African exports into the U.S., and divestment in companies that operate in South Africa (Dostert, pp. 93-98). At present, the African National Congress continues to lead the movement against apartheid with support from various foreign elements.

The author visited South Africa two weeks during July, 1989. His reason for the visit was to present a workshop on cross-cultural communication in the classroom at the annual national meeting of the South African Applied Linguistics Association. The meeting was held at the University of Natal in Durban. The University of Natal is one of five universities that has openly rejected apartheid.

His visit allowed for observation of day-to-day life in
South Africa. In comparison to U.S. standards, he observed limited meaningful black-white interaction. Interaction between blacks and whites evidenced indifference but very little overt anger. There seemed to be a peaceful coexistence for the most part; almost as if racially different persons were to be seen but not interacted with unless given a reason to do so. One gets the feeling each race knows "its place" and acts accordingly.

Local newspapers are full of articles and letters that give an impression of the chasm that exists between black and white life in South Africa. In a typical letter to the editor a writer shares an opinion on segregation of public areas in Durban.

We well remember those days when one could find a seat on a park bench where it was safe from a mugging or stabbing from layabouts; when one could stroll the Amphitheatre at night without fear of rape or worse; when libraries were quiet, pleasant places to visit without having to avoid the stretched out legs of some sleeping African; when queues in post offices were shorter; and when public toilets were fit and safe to use. (Buckman, 1989, p. 2)

This perspective is representative of the views expressed by many writers in South African newspapers. It is difficult to comprehend how devastating insensitivity between blacks and whites must be on cross-cultural communication in the classroom. Speculation on this subject is a primary concern
of this paper.

Study of cross-cultural communication has increased significantly since World War II. World trade and international exchange have helped perpetuate this increase. As the classroom becomes more culturally diverse it is important for faculty to consider the cultural variables that are introduced in such a situation. These variables, based on the different backgrounds represented, can serve as obstacles or as opportunities in the learning process. The author proposes sensitivity with cross-cultural differences leads to cross-cultural awareness, which in turn leads to improved cross-cultural understanding. He contends these cultural variables are obstacles to learning in South Africa.

Culture is the backdrop within which teaching and learning takes place. We all use our cultural background to "filter" what we are perceiving in the classroom. Thus, the faculty member can actually experience "culture shock" in his/her own classroom without leaving the country. Culture shock occurs when we experience confusion, anger, or despair as a result of unsuccessful attempts to make sense of cultural practices which are foreign to us. This usually occurs when we are outside of our own culture (in another country) but it can happen when dealing with culturally different individuals in our own culture.

A survey, entitled "Cultural Bound Areas for Personal Reflection," is included at the end of this paper as Attachments #1, #2, and #3. These cultural bound areas are
areas that can be interpreted and emphasized in significantly
different ways depending upon an individual's cultural
background. Thus, they can be obstacles to the learning
process. The survey is based on an outline of culture bound
areas which was created by the National Association of
Developmental Education. This is a self reporting
instrument. Faculty indicate their responses to each
statement in each area: strongly agree, agree, neutral,
disagree, and strongly disagree. Again, these are areas
which are frequently interpreted and emphasized differently
depending on the individual's cultural background. This
instrument focuses on teacher expectations, standards,
personal perspectives, approaches in common situations, and
how these areas can benefit or detract from the classroom
environment.

Awareness of these areas is also beneficial when working
with the variety of subcultures that comprise individual
cultures. Misunderstandings among subcultures are very
similar to misunderstandings among international cultures.
Both types of misunderstandings are based on differing frames
of reference. These differing frames of reference do not
necessarily indicate opposite interpretations of the culture
bound areas, rather they imply various interpretations on the
same continuum (but differing in varying degrees depending on
the cultural backgrounds compared).
Improvement of classroom interaction through emphasis on cross-cultural understanding requires an appreciation of cross-cultural communication. Cross-cultural communication "occurs when two or more individuals with different cultural backgrounds interact together . . . In most situations intercultural interactants do not share the same language. But languages can be learned and larger communication problems occur in the nonverbal realm" (Andersen, 1986). "Since we are not usually aware of our own nonverbal behavior it becomes extremely difficult to identify and master the nonverbal behavior of another culture. At times we feel uncomfortable in other cultures because we intuitively know something isn't right" (Andersen, 1987, pp. 2-3). "Because nonverbal behaviors are rarely conscious phenomena, it may be difficult for us to know exactly why we are feeling uncomfortable" (Gudykunst and Kim, 1984, p. 149).

The effect of the cultural backgrounds of interactants on human interaction is a crucial consideration. "Culture is the enduring influence of the social environment on our behavior including our interpersonal communication behaviors" (Andersen, 1987, p. 6). The culture of an individual dictates interpersonal behavior through "control mechanisms--plans, recipes, rules, instructions (what computer engineers call 'programs')--for the governing of behavior" (Geertz, 1973, p. 44). Thus, the processes for presentation of ideas (speaking) and the reception of ideas (listening) will understandably vary from culture to culture.
Different perceptions of the culture bound areas in the survey are not always a matter of differing values. Values can be similar but the expression of those values, based on cultural communicative norms, can vary significantly. Cross-cultural understanding can become especially difficult because different perceptions of culture bound areas can be a matter of differing values and differing communication processes. A high degree of tolerance is beneficial. How faculty teach their classes can be more important (with this issue) than what we are teaching. That is, actions speak louder than words. Thus, a multicultural classroom environment that is sensitive to various cultural and subcultural backgrounds is going to help provide considerable understanding for students of all backgrounds. Obviously the faculty member has a direct influence on this classroom environment.

The author has used the aforementioned survey at faculty workshops he's led, focusing on the multicultural classroom, in the U.S. and South Africa. Comparison and contrast of faculty responses to these survey areas can exemplify the void between U.S. and South African faculty perspectives. The survey was used in March, 1989 with 97 English/speech/linguistics faculty members at the annual Conference on Student Success Courses held in Orlando, Florida. The survey was also used in July, 1989 with 112 English/speech/linguistics faculty members at the annual meeting of the South African Applied Linguistics Association.
held in Durban. Neither group can offer a perfect standard to evaluate other nationalities by, but comparison and contrast does highlight differences allowing for examination of why groups vary regarding cross-cultural perspectives.

Responses to the survey by South African faculty members are included as Attachment #1. One hundred and twelve participants were surveyed. The numbers noted on the survey are percentage responses to each area. Review of the survey responses indicates strong consistencies and a desire for faculty dominance exemplified in most areas. For instance, 87% prefer formal communication rather than informal communication with students, 90% state they never lose control over the classroom, 72% prefer docile students, 89% feel respect for authority is important, 78% consider dress and cleanliness as important, and 84% state cheating should result in expulsion.

Responses to the survey by American faculty members are included as Attachment #2. Ninety seven participants were surveyed. The numbers noted on the survey are percentage responses to each area. Review of these survey responses, in contrast with the South African responses, indicates considerable diversity regarding faculty perspectives on the culture bound areas and less preference for faculty dominance. American society is a "melting pot" culture. Perhaps this cultural diversity is a base for the diverse interpretations noted in the survey. Again, it is important to remember there are not correct or incorrect responses to
survey areas. The survey merely gauges respondent perspectives as they relate to cultural norms.

Attachment #3 compares and contrasts responses by U.S. and South African respondents. As noted at the top of the survey, American majority responses are indicated with an "x" and South African majority responses are indicated with an "o". Review of these responses indicates similarities and differences between the two groups. Most notable are four areas that show radically different perspectives. These are I.A. (teacher-student communication should be formal), I.F. (cheating should result in expulsion), II.A. (importance of treating students the same), and III C. (respect for authority).

In each of the areas where responses differed, the South African group differed in favor of faculty dominance in the classroom. South African faculty indicated teacher-student communication should be formal, student cheating should result in expulsion, it is not necessary to treat students the same, and a preference for docile students. In contrast, the American group indicated teacher-student communication should be informal, student cheating should not result in expulsion, it is necessary to treat students the same, and a preference for aggressive students. Even in areas where both groups agreed, the South African group indicated stronger faculty dominance. In area I.E., 70% of the American respondents felt respect for authority was important compared to 69% of the South African respondents who felt respect for
authority was important.

Using faculty members as an indicator, and based on the information gathered with this survey, South African faculty members prefer more dominance in the classroom (when compared against the U.S. academic community). Faculty members who teach English, speech and linguistics in both cultures have been used as representative samples to generalize faculty perceptions regarding survey areas. The author contends the South African emphasis on faculty dominance can negatively affect cross-cultural relations in the classroom. A faculty member who exercises dominance in the classroom will be stressing control using his/her cultural perspective as a frame of reference (regardless of other cultural frames of reference of students).

Fourteen percent of the South African population is white, yet 98.2% of the faculty surveyed in this study are white. Therefore, the white South African cultural perspective will be the dominant cultural perspective in 98.2% of the university classrooms, assuming this sample is representative, while only 14% of the population shares this cultural perspective. Therefore, many university students are judged by faculty members who use a cultural perspective (in a dominant manner) different than their own.

Bhekumuzi Khumalo came to Denison University (Granville, Ohio) in 1986. He and others have come to the United States as part of a program Denison sponsors for non-white South
African students. Regarding Khumalo's and others transition into the U.S. educational system, Don Schilling, co-director of the Denison program, sees the U.S. educational experience as being different for Khumalo and others in comparison to what they experience in their native educational system. "They all come with stories of professors in South Africa... There are Afrikaner professors who greatly believe in apartheid. They tell them so right out. The atmosphere is adversarial between the instructor and students. It is a hostile rather than mutually supportive atmosphere" (Massie, 1990, p. 38).

Schilling is encouraged by the growth of Khumalo and others experience after arriving in the U.S. "We see them come to a sense of self-confidence and self-understanding as a result of being in a more open society where their own performance determines their success or failure" (Massie, 1990, p. 38).

The U.S. and South Africa have cultural diversity but the main difference is that South Africa has far less interaction among their culturally different populations. Integration is legislated in the U.S. while segregation (apartheid) is legislated in South Africa. The author believes separation among racial groups leads to ignorance about other racial groups, which leads to fear of other racial groups. A symptom of this problem in South Africa is the institution of apartheid.

Alex Boraine, executive director of the Institute for a
Democratic Alternative for South Africa, summarized a similar view in the South African press. "Many white South Africans have genuine deep-rooted fears . . . . the causes of such fears were largely attributable to widespread ignorance of black people . . . . Whites and blacks for the most part live in different worlds, and isolation breeds ignorance, which brings with it fear" (Boraine, 1989, p. 3).

The U.S. has progressed significantly towards improvement of cross-cultural relations in and out of the classroom. The author contends we are ahead of South Africa in this area because there is less separation of culturally different people in the U.S. Thus, it will benefit the U.S. to continue to promote interaction among culturally different people. "Projections indicate that ethnic and racial minorities will compose one-third of the U.S. population by the year 2000 and 45 percent by 2050" (Friedrich, 1989, p. 3). The U.S. will do well to emphasize interaction-knowledge-understanding (rather than separation-ignorance-fear).

Emphasis on sensitivity among cultures can be found in classroom considerations for the future. J. Jeffery Auer, a well recognized leader in the speech communication field, states "Displaying tolerance requires only patience while the other cultural minority does or says its thing. But accepting cultural pluralism requires a real effort to understand other cultural entities, to listen to what they say, and appreciate the context from which they speak" (Auer.
Regarding curriculum development, "specific cultures of minority students should be considered when planning curricula, teaching speech classes, and conducting teaching training programs" (Atwater, 1989).

In conclusion, South African survey responses are more consistent and clearly indicate a preference for faculty dominance (compared to U.S. diversity and permissiveness). A reason for these differences could be that enhanced cross-cultural interaction in the U.S. gives us constant reminders there are different cultural perspectives than those held by our own cultural group. South Africa does not have this reminder because they have less interaction among culturally different people.

As long as this condition exists in South Africa the communicative climate in the classroom will surely suffer as a result of negative cross-cultural relations. Awareness can be the first step toward social change. The author contends South African faculty can promote positive social change through emphasis on cross-cultural sensitivity in their classrooms.
