The BIA/Contract School Administrator: Implications for At-Risk Native American Students.

In 1988 there were 103 schools operated by the Bureau of Indian Affairs (BIA) and 65 schools operated by Indian tribes under contract with the BIA. Typically, these schools are in a rural, poor, and reservation setting, with students at high risk for dropping out. This paper examines the duties, roles, and leadership styles of administrators at BIA and contract secondary schools. A descriptive questionnaire and the Leadership Practices Inventory were completed by 24 administrators, of whom 9 were Native Americans. Subjects were 80% male, had an average age of 40-45, had been in administration for an average of 11.7 years, and had taught for an average of 7 years before becoming an administrator. Compared to non-Indians, Indian administrators had less teaching and administrative experience, were more likely to be female or to hold a doctorate, and were more likely to have weekly faculty meetings. Although 57% of subjects viewed instructional leadership as their first priority, the average administrator spent 73% of the time on general managerial duties and discipline. Non-Indian and Indian administrators did not differ in this respect. With regard to leadership styles, both Indians and non-Indians scored in the high category for "inspiring" and "modeling," and in the moderate category for "enabling" and "encouraging." For the "challenging" style, Indians scored in the high category and non-Indians scored in the low category, indicating that Indian administrators were more willing to take risks. (SV)
THE BIA/CONTRACT SCHOOL ADMINISTRATOR:
IMPLICATIONS FOR AT-RISK NATIVE AMERICAN STUDENTS

ABSTRACT

American Indian youth are the largest at-risk group in the United States. This especially holds true for those Native American students in BIA/Contract schools. This study addresses the type of leadership exhibited by secondary school administrators in these schools. Two instruments were utilized in the study. The first was a self-reported descriptive questionnaire. The second was a leadership style instrument. The impact of leaders in these schools directly relates to the at-risk issue among American Indian youth.

INTRODUCTION:

The effective education of Indian youth in this country must become a paramount issue if Indian people are to survive and maintain their identity. The education of these students becomes even more important when one considers the drop-out rate of one of the largest "at risk" groups in this country. A special report published by Education Week (1989) estimated that an attrition rate of 29% to 50% of Indian students is the operational norm in schools primarily populated by Native Americans.

The same report also identified several other factors that dramatically impact the education of Native Americans. Most important among these are:

1) The suicide rate among Indian teenagers was the highest of any ethnic group;
2) Native American students were more often labeled as learning disabled or handicapped than other ethnic groups;
3) Poverty (50%) and unemployment (58%) among Native Americans on reservations were among the highest in the country;
4) Indian students had a greater than average probability of being from a one parent family as well as a greater likelihood of having under-educated parents; and
5) Finally, Native American students manifested greater health problems than did any other ethnic group in the United States.

A recent BIA study (1988) also documented some of the extensive problems that exist in reservation schools. This study, titled Report on BIA Education (1988), found that
approximately 29% of American Indian and Alaskan Native sophomore students drop out of school. This figure was 11% higher than Hispanics and 12% higher than that among Black students (p. 136). This report also indicated that fully 48% of American Indian students cut classes. This figure, when compared to all other ethnic groups, represented the highest of any group (p. 136).

Given this data, it is imperative that schools do a better job of educating Native American youth. The building level administrator is one of the essential factors in the creation of a school that educates all of its youth (Leithwood and Montgomery, 1985; Lipham, 1978; Rutherford, 1985, and, Sweeney, 1982). Administrators must be leaders who understand how to establish educational goals; how to involve others; how to effectively communicate; how to be informed decision makers; and how to consistently manifest proactive leadership postures (Croghan and Lake, 1984; Leithwood and Montgomery, 1982). The BIA recognized the importance of the building level administrator when it stated, "The principal is the central figure in reversing the vicious cycle of low expectations, low achievement, still lower expectations and a continuing downward educational and psychological spiral" (Report on BIA Education, 1988, p. 185). It further reported that "some principals regard their role as an administrative caretaker rather than as the school leader in charge of instruction" (p. 185). Administrators today must be much more than caretakers and managers. The educational reform movement of the 1980's, typified by the quest for an effective school (Edmonds, 1979; Foster and Boloz, 1980), has validated the influence of educational leadership on student achievement.

The passage of PL 95-561 in 1978 placed greater responsibility on administrators in Bureau of Indian Affairs (BIA) schools as well as on tribally controlled contract schools for the establishment of an effective instructional environment (Boloz and Foster, 1980). According to the Education Directory of the Office of Indian Education Programs, (1988) there were "103 elementary and secondary schools...operated by the Bureau of Indian Affairs (BIA), and 65 elementary and secondary schools...operated by Indian tribes under contract with the BIA" (p.i.). The vast majority of these schools are found in the states of North Dakota, South Dakota, Arizona, New Mexico, Oklahoma, and Minnesota although these schools operate in as diverse location as Mississippi, Washington and Alaska. Typically these schools are rural, and are often found in a reservation setting, where social problems such as poverty, alcoholism and single-parent households abound. The isolation and ruralness of many of these schools affirms that the role of the school administrator is crucial to the success of the Indian student.

THE STUDY:

In light of the important role of school administrators, this study was conducted to gather data about the leadership in BIA schools and contract schools which serve as the primary
educational delivery systems to Native Americans residing on reservations. This study was undertaken because of:

1) a deep concern regarding the type of education Indian youth receive;
2) a desire to ascertain a general profile of the administrators in these schools,
3) an aspiration to determine whether or not differences exist between those schools where the administrator is Indian and those schools where the administrator is of another ethnic group; and,
4) a desire to understand the impact of the building level administrator on at-risk students.

A survey was conducted with selected BIA and contract secondary school administrators throughout the country. A total of 54 surveys consisting of two separate instruments were mailed to administrators as identified in the Education Directory of the Office of Indian Education Programs, (1988). One instrument was a descriptive questionnaire consisting of 38 questions related to demographics and various administrative duties and activities. The return rate for the first instrument was 44%. Although this rate was below what was originally deemed acceptable, it was decided to accept this when follow-up mailings and phone calls failed to generate additional responses.

The second segment of the survey was a leadership style questionnaire developed by Kouzes and Posner (1988) and used with their permission. This instrument, The Leadership Practices Inventory (LPI), consisted of thirty behavioral statements in which each administrator was asked to rate himself/herself as to the frequency that he/she practiced the stated behavior. For instance a statement such as "I involve others in planning the actions we take" would then be followed by five Likert type possibilities ranging from "rarely" to "very frequently". Each answer was tabulated and correlated to five leadership practices identified by Kouzes and Posner (1988). These practices were: 1) Challenging the Process; 2) Inspiring a Shared Vision; 3) Enabling Others to Act; 4) Modeling the Way; and 5) Encouraging the Heart. The higher the score in each of the five areas, the more likely one would exhibit the described leadership style. All questions were scored by a computer program developed by the authors of LPI.

The reliability of the LPI instrument was addressed by Kouzes and Posner (1988) thusly:

First, the LPI has shown sound psychometric properties; each scale is internally reliable. That is, the items are highly correlated within each scale. Factor analysis indicate that the scales are generally orthogonal: they do not all measure the same phenomenon. Test-retest reliability is high. Second, results from the LPI have high face and predictive validity. The results make sense to people, and they predict high performing leaders as well as moderate and low performing ones (p.4).
They also indicated that scores on the self-reported version of this instrument "tend to be somewhat higher than scores on the LPI-Other" (p.5). The LPI-Other was not utilized because it would have involved identifying a number of specific teachers for each administrator surveyed. The return rate for the LPI questionnaire was 41%.

The data generated from the first questionnaire was reviewed for overall results as well as for any significant demographic differences between Native American and non-Indian administrators. The results of the LPI instrument were examined comprehensively as well as for any ethnic incongruency.

Results:

The results of the self-reported questionnaire determined the following about the responding administrators:

1) Eighty percent were male and 20% female;
2) The typical administrator had been a classroom teacher for 7.38 years before becoming a principal;
3) The average length in administration was 11.71 years;
4) The average tenure as an administrator in BIA or contract schools was 5.68 years;
5) The average length of time served as an administrator in their current school was 5.4 years;
6) The average age of the respondents was 40-45 years old;
7) Of those responding, 38.5% were Native American while 61.5% represented other ethnic groups;
8) Sixty-three percent of the respondents were reared more than 100 miles from their current school;
9) The average principal indicated a diverse education with 63% holding either a specialist or doctorate degree; and,
10) Only 8% of the respondents would not elect to become an administrator again if given the choice.

Typical administrators indicated they arrived at school approximately 40 minutes early and stayed at least one hour past the close of the school day. None of the respondents indicated teaching duties but 8% served as an athletic coach. Fifty-four percent attended one to two extracurricular activities weekly while 33% were present at three to four activities each week.

The typical administrator claimed a high visibility in the cafeteria, the teachers' lounge, and the halls of the school. Sixty-seven percent stated they spent time in a teachers classroom once a week or less often. Seventeen percent indicated they did not visit classrooms, even monthly and only 13% were in classrooms on a daily basis. Weekly faculty meetings were reported as the normal means of communication with the faculty for 58% of the principals. The remainder of the respondents held either biweekly (23%) or monthly (15%) faculty meetings. The principals also revealed that 92% of them attempted to praise their teachers, and the primary delivery mode for this praise was verbal. Twenty-five percent
wrote personal notes although none indicated ever placing a
laudatory note in a teacher's personnel file.

In the area of staff development, 96% indicated regular
attendance at such activities, while 81% reported they
conducted staff development activities for their teachers.
Regular attendance at professional conferences was reported by
66% of the respondents; however, 4% indicated they had not
attended a session in the past year. All but 19% had attended
some type of national professional convention with 20% having
attended more than three during his/her career. Forty-four
percent indicated they had read between one and five of the
national reports on education while 36% had read between five
and ten.

When the respondents were asked to identify their primary
responsibilities, 57% viewed instructional leadership as their
first priority. Twenty-three percent of the respondents
reported that their primary role was manager, and the
remaining 20% were evenly split between discipline or other as
their primary responsibilities.

Further examination of the self-reported data does not
support the espoused instructional leadership assertion. When
asked to estimate the percentage of time spent on a daily
basis in four areas, the averaged responses were as follows:

- 51.68% on general managerial duties
- 21.3% on discipline.
- 16.4% on working directly with teachers,
- 8.12% on meeting with parents.

The data suggests that the principals responded to the
desire to be an instructional leader but acted primarily as
managers. Instructional leadership necessitates an
understanding of what is happening in teachers' classrooms yet
only 13% were in classes on a daily basis. As stated, 17% were
not even in classrooms on a monthly basis. An active role of
instructional leadership is simply not supported by the data.

Ethnic Differences:
The collective data was also reviewed for any leadership
differences between Native American and non-Indian
administrators. As previously stated, 38.5% were American
Indian while 61.5% of the administrators were of other ethnic
groups. Of those who indicated they were Native American, the
majority were three quarters to full blood quantum. Few
differences, other than ethnicity and degrees of experience,
were found between the two groups.

1) Native Americans had taught for an average of 5.6
years prior to becoming an administrator while
non-Indians had taught for an average of 9.1
years,
2) Native Americans had 8.2 years of administrative
experience compared to 14.1 for non-Indians,
3) American Indians averaged 4.9 years as an
administrator in BIA or contract schools and
3.5 years in their current schools. Non-Indians
averaged 6.2 years in the BIA or contract schools
with 6.7 years in their current settings.
4) Thirty percent of the Native American principals were female while only 13% of the non-Indians were of this gender, and,
5) Eighty percent of the Indians held weekly faculty meetings while only 46% of the non-Indians did so.

Perhaps the most significant aspect in the comparison was not the number of overt differences but rather the degree of homogeneity between both ethnic groups in the daily operation of their schools. An identical 55% of Native Americans and non-Indians identified instructional leadership as their primary job. Both groups indicated that the majority of their daily routine was consumed by general managerial duties. Discipline and contact with teachers were ranked as second and third respectively in terms of amount of time allocated to these activities. The reported time spent in individual classrooms also was very similar, except that 33% of the American Indians were in classes monthly or less often while only 6% of the non-Indians fell into this category. Each ethnic group reported practically the same level of involvement in activities such as local staff development, attendance at state and national meetings, and pursuit of degrees of higher education. More Indians (40%) reported holding the doctorate than did non-Indians (4%).

Both ethnic groups were remarkably similar. The primary exception was that non-Indians have more teaching and administrative experience. Both groups envisioned themselves as instructional leaders yet failed to spend an adequate amount of time in this area. Instead they reported that they were much more involved in time-consuming managerial duties. Finally, the degree of homogeneity between the two groups indicated that the school as an institution remained singularly similar, regardless of whom the building principal was.

Leadership:

Responses to the LPI instrument consisting of thirty self-rated responses provided further insight into the leadership of these principals. The primary questions to be answered were:

1) Given the five areas to be scored (Challenging, Inspiring, Enabling, Modeling, Encouraging), what areas would represent the strength of these selected administrators?
2) Was the leadership exhibited by Native Americans significantly different from that of their non-Indian counterparts?
3) Were either of the ethnic groups in the high category of the LPI Instrument?

Although the individual respondents showed some variation in leadership on the LPI, overall, there again was a degree of congruency. Both groups of administrators, Indian and non-Indian, scored in the high category for Inspiring and Modeling. Scores at the 70% level or better were considered to be high. Scores between 30-69% were medium and scores less
than 30% were low. The Indian administrators also scored above
70% in the area of Challenging. Both groups scored in the
moderate range in Enabling and Encouraging.

---------------------------------------------
CHART 1 ABOUT HERE
---------------------------------------------

The scores on the LPI indicated that Native American and
non-Indian principals were in the high category for Inspiring
ar. Modeling. Leaders who inspire are those who are able to
develop a vision of a desired future, are good communicators,
and develop a degree of commitment to the vision. As modelers,
they understand their values, are good planners, and set good
examples of organizational expectations (Kouzes and Posner,
1988). The Native American administrator perceived him/herself
as especially strong in the area of Challenging while the non-
Indian administrator perceived this category as his/her lowest
area. Challenging, according to Kouzes and Posner (1988),
represented the desire to "seek out new opportunities" as well
as a "willingness to change the status quo" (p.2). Challengers
are risk takers.

Both ethnic groups were in the moderate range in the areas
of Enabling and Encouraging. Enabling is symbolized as the
development of collaborative goals through the active
involvement of others in the planning process. Kouzes and
Posner (1988) also define Encouraging as the ability to
recognize individual contributions to the organization, to
establish goals, and as the leader’s ability to praise those
contributors for their efforts. The moderate score in these
areas corresponded to the results of the self-reported
questionnaire which established the failure of the principals
to utilize their time as instructional leaders, although this
had been identified as an important goal. The focus on
management of the school by both ethnic groups with minimal
staff collaboration cannot help but hinder the creation of an
effective learning environment. The administrators perceived
an ability to inspire and model, and for one group to
challenge, yet failed to enable their subordinates and
sufficiently recognize them when they achieve. In other words,
both the LPI and the demographic questionnaire indicated an
ability to "talk the talk" but a functional failure in
"walking the walk".

Conclusion and Implications:
The BIA and contract school administrators appear to be
individuals who are actively involved in a variety of daily
activities, extra curricular events, and the constant
maintenance of their schools. They are gratified as
administrators and enjoy the daily challenges of the job.
They actively seek to improve themselves and regularly
participate in a variety of local regeneration activities as
well as those offered at state and national levels.

They perceive themselves as instructional leaders but spend
their days focusing on managerial duties or discipline. Their
leadership indicates an understanding of what they wish to accomplish and a desire to set good examples by their visibility and involvement in various daily activities. Their daily focus on management and maintenance makes it difficult to be a leader who is a collaborator, a praiser, and a shared decision maker.

Any expected cultural leadership differences between Native Americans and non-Indians simply failed to be manifested. Organizational maintenance appears to be the focus for both ethnic groups, although the Indian administrator appeared to be more willing to be a risk taker than his/her non-Indian counterpart. There are a variety of explanations for this one major leadership difference. Culture may play a part, although, the answer may be that Indian administrators have not been bureaucratically socialized to the extent of non-Indian administrators.

It is clear that one should not attempt to label the BIA and contract school principals as effective or ineffective, good or bad. They idealistically prefer to be instructional leaders but organizational obligations take precedence and control the focus of their daily activities. However, if the American belief, so readily espoused, that all students should be educated to the best of their abilities, is ever to become the operational norm in these schools, then it is imperative that educational administrators, develop skills that will allow students to achieve an optimum learning environment. This means that the administrator must not only recognize what it is he/she wishes to accomplish but also develop skills which empower others and which celebrate others’ achievements. Only when principals become proactive leaders, and not managers, will the education of Indian children improve.

It is obvious that the maintenance of the status quo in BIA schools and within their leadership is unacceptable and unthinkable. Native American culture cannot continue to survive in any form unless students are able to master the social norms of America while valuing and preserving the practices of the traditional Indian way of life. The fact that 27% of the adult Indian population on reservations have less than an eighth grade education must be addressed so that the cycle of educational failure is effectively remediated (Report on BIA Education, 1988).

Finally, given the nature, location, and clientele of the BIA and contract schools, these administrators must be the best possible. It is crucial that leaders in these schools understand they hold the key to success for a student population that has been too often neglected and ignored. This necessitates skills and abilities beyond that of organizational manager. Whether or not administrators in these schools have those skills remains in doubt. It is an inescapable reality that both Indian and non-Indian administrators must be better prepared if Native American youth are to be successful participants in an increasingly complex world.
Training, selection, and staff development of administrators in BIA schools must address the following in order to effectively confront the problems found in schools. Recommendations are:

1) Develop an extensive pre-training format for those who wish to become principals in BIA schools. This training must provide for an exhaustive assessment of each potential administrator as well as actively seek Indian educators who wish to be principals.

2) Develop a systematic staff development process for all administrators that is both sequential and incremental in design.

3) Establish an on-going evaluative performance process for current and future administrators which specifically designs an improvement process that meets their individual needs.

4) Reduce the managerial paperwork burden that the BIA bureaucracy seems to place on each principal.

5) Develop a cultural understanding of specific tribal needs and expectations that exist at each BIA school before an administrator takes his/her position as principal. This should hopefully assist in reducing the high principal turnover found in many BIA schools.

6) Finally, actively train each administrator in the concept of developing an educational vision and how to set goals in order to achieve this vision.

Then, and only then, will the needs of American Indian students be addressed by well-informed and trained school administrators.
