Projections show steady growth in the minority populations of the United States, but entry rates of minorities into postsecondary education are shrinking. Institutions of higher education are now being called upon to exercise leadership in addressing the problem of minority education before it reaches critical proportions. This report examines the recruitment of minority students into postsecondary education. The report discusses (1) what the institution's role is in pursuing diversity through recruitment; (2) how minority students are distinct from each other and from the majority; (3) how the recruitment of minority students is related to other institutional concerns; and (4) whose responsibility it is to recruit minority students, when it should be done, where it should be done, and how. Also provided are: a historical background of minority recruitment practice; a discussion of what information colleges should be aware of concerning the demographics and diversity of minority populations; a review of a recruitment plan; and summaries, conclusions, and recommendations for further research. Contain 193 references and an index. (GLR)

EXECUTIVE SUMMARY

Why Is the Recruitment of Minority Students An Important National Concern?

Present and future trends in population growth and participation in higher education reveal that people of color in the United States are a dramatically increasing but seriously undereducated segment of society. By 2000, minorities will account for roughly 30 percent of the population (U.S. Bureau of the Census 1990c). Even now, 27 percent of all public school students in the 24 largest city school systems are minorities (Hodgkinson 1986). Yet for nearly all minority groups, high school graduation rates are significantly lower than for the majority, and entry rates of college-age minorities into higher education are actually shrinking. For example, almost half of all 18- and 19-year-old Hispanics and one in three African Americans that age have not completed high school. The proportion of 18- and 19-year-olds from these groups enrolling in college, despite big increases in that population, are lower now than before. In fact, the gap between minority and majority students entering college was wider in 1988 than it was in 1976 (American Council on Education 1989).

With greater and greater numbers of minority youth coming of age, the problem is no longer one purely of social justice. Government and industry alike have noted the potential economic effect of these alarming trends in education (American Council on Education 1990). With the projected increases in the minority population, the situation threatens to affect the national economy. Given the present level of minority education, the potential shortage of qualified workers equipped to meet the needs of the market is a serious concern (Economist 1990b; Hodgkinson 1985). Institutions of higher education are being called upon to exercise leadership in helping to address these problems before they take on even more critical proportions. The recruitment of minority students must therefore not only focus on more aggressive strategies to recruit those students who are already well prepared but also encompass long term initiatives to improve existing educational conditions.

What Is the Institution's Role in Pursuing Diversity through Recruitment?

Higher education institutions are the traditional centers for scholarly debate, research, innovation, and change in social
matters. Increasing the presence of minorities and of minority perspectives in all aspects of the college and university is, in its broadest sense, a question of social change. Universities can provide vision, energy, leadership, and direction to other institutions, from school systems to government to business and industry, first to establish firmly the goal of excellence in minority education and then to pursue and achieve it (American Council on Education 1988). Through investigation into the subject of minority education and the effectiveness of responses at various levels, higher education institutions can bring the issue into focus. But beyond the social role, colleges and universities need to determine the ways in which diversity will be incorporated locally by identifying what the problems are with regard to their own institution. Are minority enrollments and graduation rates low and, if so, why? Do minority students feel welcome and are they part of the college community? Colleges need to evaluate their mission, institutional objectives and policies, and the allocation of resources with minority education in mind. An initiative to recruit minority students will affect, and be affected by, institutional concerns from curriculum to campus life. To be effective and make a real difference, therefore, the goal of increasing the presence of minorities on campus should be conceived as an institutional priority and an institution wide goal.

How Are Minority Students Distinct—from Each Other and from the Majority?

Because they share many common concerns, people of color are frequently referred to as a single group. In fact, however, this population of African Americans, Hispanics, Asian Americans, and American Indians consists of an enormous variety of people from different racial, ethnic, language, and cultural backgrounds. As a group, clear distinctions—social, economic, and educational—can be made between minorities and the majority. A much greater proportion of almost all minority communities have lower income, higher unemployment, and poorer education, both in terms of quantity and quality (Richardson 1988; U.S. Bureau of the Census 1990c). Additionally, the obstacles they encounter include some that are not part of the experience of most majority students, even those who are disadvantaged. Limited proficiency in English and racial and ethnic prejudice are two examples.
With regard to higher education, however, the nature of the problems in each minority community is somewhat different, and each situation calls for solutions that are informed and responsive to the needs of each community. Preparation for college, language proficiency, immigrant or nonimmigrant (or refugee) status, time in the United States, gender, cultural influences, and financial condition are only some of the factors that vary from group to group and could have more or less significance in a particular minority group’s educational profile. Further, important distinctions exist within minority groups. For example, low rates of graduation from high school are a serious problem in all Hispanic communities and significantly affect the number of Hispanic students who enter college. In the Puerto Rican community, however, school dropout begins in junior high school, reaching levels estimated to be as high as 80 percent in some school districts (Fernandez 1989). Consequently, it is considered the single most alarming educational concern in the Puerto Rican community. Recognizing and understanding the differences within and among the various minority populations are essential elements in a successful strategy for recruitment, and they are an important preface to the larger goal of achieving cultural diversity in higher education.

How Is the Recruitment of Minority Students Related to Other Institutional Concerns?

Because the ultimate goal in recruiting minority students must be graduation, recruitment is not an objective that can be pursued in isolation. The better integrated it is with the college’s educational programs and services, the more opportunity it will have for success. Admissions and financial aid policies, strategies for retention, and opportunities for transfer are some of the areas intricately tied to recruitment that therefore can share common objectives (Carnegie Foundation 1989; Lenning, Beal, and Sauer 1980). Organizing strategies for recruitment that combine the human and financial resources of all these areas can be cost effective. Above all, however, it will disseminate minority recruitment throughout the institution.

Effective recruitment of minority students should not only be coordinated with many different areas of the institution but also enlist the participation of people from different departments and at various levels of responsibility to work...
in concert as part of a comprehensive plan. Nontraditional models of recruitment teams can have significant success. Administrators, faculty, and staff from academic departments, including ethnic studies programs and centers, student services, and special program offices, such as economic opportunity programs, can be organized to participate in the institution's strategy for recruitment.

Who Should Recruit, When, Where, and How?
Even when a formal structure for recruiting minority students exists, the function is commonly located in one of several different areas within a college's organizational structure. The recruitment of minorities can be administered through the regular operations of the admissions office, by a specially appointed officer, or through a variety of other possibilities. Rather than the location of the office, however, it is the institution's commitment to improving the education of minorities that will ultimately endow recruitment with its potential to be effective (Christoffel 1986). In this sense, the leadership and involvement of top administrators are fundamental.

Ideally an institutionwide effort conceived as a process rather than a program, recruitment of minority students would optimally engage all constituencies of the college - faculty, administrators, staff, and students - in a well developed and deliberate plan designed to achieve specific, reasonable goals. The plan should be based on a comprehensive institutional audit reflecting the profile and present educational situation of minorities at the institution. It should be cooperatively designed, including the perspectives of those who will implement it, and should delineate the methods and resources designed to achieve its objectives within a stated time. Finally, it should be monitored, evaluated, and periodically modified to reflect changing conditions and to capitalize on aspects that emerge as being particularly successful.

Over the past few years, the ASHE-ERIC Higher Education Report series has published several reports dealing with the issues of diversity, including:

From these reports, several general conclusions are easily drawn:

- The concern over diversity is increasing.
- The issue of diversity not only concerns the strength of our society's social fabric, but also is becoming increasingly central to our economic well-being.
- Higher education institutions can and should play a major role in educating a diverse citizenry that will produce leaders capable of developing solutions for the issues of diversity in our society.

Much of the literature on minority students develops conclusions based on aggregate data. These publications clarify the general need by comparing the number of minorities graduating from college with the population as a whole, revealing that a major problem exists.

While that assessment is accurate, it is not very useful. A more fruitful examination would study the process from beginning to end and identify each important step along the way. A process similar to quality management, this method helps correct problems long before a failure occurs.

Following this logic one step farther, ensuring graduation of adequate numbers of minorities requires effective recruitment, appropriate academic advising, constant nurturing, and attention to both the academic and nonacademic student life throughout the process. In other words, for recruitment to be successful, an institutionwide value must be present, con
stantly reinforced by leadership at all levels, that develops an atmosphere conducive to the graduation of minorities.

In this report, Barbara K. Astone, director of retention programs, and Elsa Nuñez-Wormack, associate dean of faculty and associate professor of English, both of The College of Staten Island, City University of New York, review the available current research and literature on the recruitment of minorities. They examine demographics, the institutional structure, and topics on recruitment, offer general recommendations for institutions, make suggestions for further research, and discuss the basic elements and implementation of a recruitment plan.

The recruitment and retention of minorities is an issue that higher education will continue to face throughout the decade. This situation will not go away, for the percentage of college-bound minorities will continue to increase for the foreseeable future. As an institution-wide problem, it requires institution-wide attention, leadership, and solutions. Academic leaders must get all faculty involved in the process. Institutions must provide sufficient student support services. The entire college community must become intellectually as well as morally sensitive to the importance of ensuring the diversity of the institution.

INTRODUCTION

Minority students in increasingly smaller numbers arrive at colleges and universities from backgrounds as diverse as those represented by white students. They come from Republican, Democratic, Independent, apathetic, poor, rich, and middle-class homes. They are dropped off at airports, train [depots,] and bus stations, or emerge at college gates from station wagons, convertibles, and coupes driven by single parents, two parents, no parents, uncles and aunts, grandparents, themselves, and strangers. Some arrive in taxis. They come from homes where English is spoken impeccably, where it is spoken [with an accent], where it is broken, where it is not spoken at all.

Often they have been recruited as vigorously as first-round draft choices. . . ; sometimes they find themselves at the gates of the only college they ever wanted to attend [but] frequently they arrive at colleges whose names and locations were unfamiliar to them only weeks before freshman orientation. . . . In spite of their diversity, they are lumped into a group identity called "minority student" (Pemberton 1988, p. 9).

After more than 20 years, the percentage of minorities graduating from institutions of higher education, relative to their representation in society in general, has actually decreased. This result can be attributed to several factors. A major study published by the Commission on the Higher Education of Minorities reports that, compared to whites, significant numbers of minorities are lost at each juncture along the "educational pipeline" (Astin et al. 1982). First, minorities drop out of high school at a debilitating rate. Recent studies have found the Hispanic dropout rate to be well over 60 percent in some cities and, among Puerto Ricans, closer to 70 percent (Fernandez 1989). Second, significantly fewer students who graduate from high school enter institutions of higher education; those who do for the most part do not directly enter senior colleges. Third, most minority students in two-year colleges do not complete that degree, and among those who do, many fewer go on to receive a baccalaureate degree. Finally, minorities in four-year colleges who either transfer from two-year schools or enter directly leave before graduation at a rate that is two to three times greater than for whites (Astin et al. 1982). In the meantime, the urgency of
graduating minority students in significant numbers has taken on a completely new dimension.

The 1980s signaled increasingly important changes in demography. While the overall U.S. population growth rate is as low as it has ever been, about one-half that of the late 1950s, minorities account for a steadily increasing percentage of the population, reflecting the comparable youthfulness of these groups to nonminorities and growth rates two to 14 times greater (Estrada 1988). Immigration is a primary factor in minority growth rates, and presently 6 million of the 14 million immigrants in the United States are of school age (Hodgkinson 1985). Together with the higher number of births occurring in minority populations, it means that an ever-greater proportion of secondary and postsecondary students will be minorities.

As we enter the 1990s, the social, economic, and educational condition of most racial and ethnic minorities in the United States continues to lag behind that of the majority white population: Unemployment is higher, income is lower, and years of education are fewer. The poverty rate for racial and ethnic minorities in the United States is two to four times greater than that for Americans in general, according to 1980 and 1986 figures. In education, severe disparities persist for almost all minority groups, compared to nonminorities.

Today, the goals of access and academic success for minority students are no longer matters of concern only, or even principally, to the minority community. The demographic and economic realities becoming increasingly evident to government, industry, and the media are studied and reported so frequently now that issues involving minority education have moved into the national arena (American Council on Education 1988; Economist 1990a).

Projections of changing demographic profiles nationwide indicate that nearly 12 percent of the country's labor force between the ages of 25 and 54 will, by 2000, be African-American, 10 percent will be Hispanic, and another 4 percent will include Asians and American Indians. Combined, 26 percent of the nation's workers in their peak productive years will be people from ethnic and racial minorities (U.S. Dept. of Labor 1990b). The continuing neglect in minority education has a potential economic effect in light of differential fertility by class, ethnicity, and region. If this level of education and professional preparation continues, a shortage of qualified
workers who can satisfy the demands of the market will soon occur (Hodgkinson 1983).

In addition, enrollment at institutions of higher education has slowed in recent years, and in most states, the number of high school graduates is declining (Hodgkinson 1986; U.S. Dept. of Education 1989). These facts, coupled with the economic realities of our times, have created a financial squeeze that has brought largely untapped resources to the attention of college and university administrators. For all these reasons—social, moral, and economic—the issue of recruiting more minority students into higher education remains an urgent priority.

Of course, no single measure can solve the problem of minority undereducation, and higher education institutions cannot and should not have to do it alone. Much, however, is within their purview. Bringing more minority students to college campuses is clearly one important step, and therefore recruitment is an essential part of any successful institutional plan for increasing minorities' participation. It is only the beginning, however. Ensuring academic success and graduating are the necessary complements to achieving equity in education.

Colleges and universities have developed strategies for recruiting students to offset their low enrollment, but these programs often do not include responses to the specific requirements of the minority community (Christoffel 1986). Even institutions with the best intentions begin recruitment by arranging appointments at high schools with little or no preparation and then proceed to speak to large groups of students about the standard academic and social advantages of pursuing a degree at their institution. With this approach, however, a whole range of questions remains unanswered, and consequently results are achieved largely by chance. To be meaningful, recruitment of minority students should be part of a more holistic and systemic approach that also embraces the goals of access and retention.

Recruiting minority students is naturally complex because it is related so intricately to these other educational concerns. It is also complex, however, because of a more fundamental matter: the identity of the population in question. Although we use the term "minorities," no such single group of people fits the term, certainly not in the sense of common origin or cultural unity or shared language. Each group should be rec...
ognized and respected for the individuality of its history, culture, and language. The problems that confront different minority groups sometimes vary, and the practices employed to address them should naturally correspond when possible. The circumstances that limit the access and success of people of color in higher education are similar, however. In discussing these common issues, we have used the term "minorities," aware of the limitations it imposes. This report discusses four principal ethnic and racial minority groups: African-American, Hispanic, Asian-American, and American Indian.

While most of the factors that limit participation in higher education affect all groups, they do so to a greater or lesser extent, and the measures required to overcome the various obstacles may differ from one group to another. The case of dropping out of high school is an example. The smaller pool of high school graduates is a critical factor for both Hispanics and African-Americans, but for Hispanics, the problem begins in the transition from eighth grade to high school, a phenomenon that does not apply to the same extent with regard to other minority groups. This particular phenomenon is more evident for Puerto Ricans than it is for Cubans. When discussing the recruitment of minority students, therefore, it is important not only to analyze the different circumstances that exist for minorities in relation to the majority population, but also to consider carefully the differences that exist within the various minority groups (Monsivais and Bustillos 1990).

Examining the subgroups within each ethnic group also helps define the population of racial and ethnic "minorities." Because the proportion of students in higher education from the Asian/Pacific Islander population more than represents the proportion of that population in general society, most of the literature on "underrepresented minorities" no longer includes Asians. The literature indicates, however, that Pacific Islanders (Filipinos, for example) and Southeast Asians do not have the same socioeconomic or educational profile as other Asian groups and are indeed underrepresented on college campuses.

Throughout this report, the recruitment of minority students is discussed with reference to the most homogeneous groups of people feasible. Because studies are reported in the literature to a large extent based on aggregate data, however, the degree to which this application has been possible is limited. In discussions concerning recruitment in the larger
context, minorities have been referred to in general as a population distinct from nonminorities. In chapters that discuss educational factors or cultural characteristics that may differ for various groups, distinctions are made wherever possible.

In addition to reading the literature, the authors, in the interest of producing a complete and accurate report, have conducted personal interviews, visited community organizations, and explored minority networks at various educational institutions.
The practice of recruiting minority students in higher education is largely a response to the landmark Supreme Court decisions and the federal legislation and education policy of the civil rights era (Arvizu and Arciniega 1985; Galligani 1984). Since its inception, however, the purpose of minority recruitment and its terms, methods, and effects have evolved substantially.

Initial Efforts
In 1950, over 90 percent of African American students were educated in traditionally black colleges. By 1954, with the Supreme Court decision in Brown v. Board of Education, such racial segregation in public education was declared illegal (Fleming 1984). Subsequently, substantial numbers of African American students enrolled at previously all-white institutions (Turner 1980). In fact, by 1964, 114,000 African American students were attending predominantly white institutions, most of which were located out of the South (Gurin and Epps 1975). The sweeping legislation of 1964, 1965, and 1968 further articulated and accentuated the new goal of racial integration in higher education (Green 1982; N.Y. Times 1988c; Van Alstyne 1978).

The Civil Rights Act of 1964 "toughened means of federal enforcement against discriminatory use" of the increased federal funding to higher education institutions (Peer 1981, p. 3; see also Dunston et al. 1983). At the same time, the financial assistance provided by the Economic Opportunity Act of 1964 and the Higher Education Amendments of 1968 helped to turn access into a reality for many African American students. Few colleges were responding to their needs and expectations, however (Ascher 1983; Fleming 1984). While administrators recognized that some change would follow, that change was expected to occur with little or no conflict (Peterson et al. 1979). African American students were expected "to blend into the sociocultural life of the campus" and to compete academically, without any significant changes in the academic structure or in programs (Fleming 1984, p. 12). A survey sample of 1,168 institutions studied in the latter part of the 1960s reveals that 82 percent of colleges, in admitting African American students, had either adopted open admissions policies or used special admissions criteria, but that only 50 percent provided special academic support pro
grams and most of them made no effort to update their curricula (McDaniel and McKee 1971).

During this period, the main task of admissions offices was to sift through and evaluate college applications; students were still in large supply. According to some, the function of admissions was to make sure that the wrong people did not get into the school (Ingersoll 1988). The main purpose of the recruitment staff was college public relations. Recruiters provided information about admissions standards, described new programs and services, and attempted to attract qualified students to apply.

Not all the impetus for greater participation by minorities originated with the legislative body. The new political activism that characterized the late 1960s "generated a proliferation of black student organizations that expressed a need for black political and cultural identity. These organizations were instrumental in mobilizing the recruitment efforts that dramatically increased both the numbers and diversity of black students on all-white campuses in that decade" (Smith 1980, p. 29; see also Flemirg 1984, pp. 11-12).

While talented students who met the merit criteria of high school grades and aptitude test scores benefited from the efforts initiated by both legislators and activists, a much larger number of academically and economically disadvantaged students remained shut out of the system (Rossmann et al. 1975). Even after the 1954 Supreme Court ruling to desegregate, some states continued to operate dual systems of higher education, and, as a consequence, the NAACP filed a lawsuit, referred to as the Adams case, against the Department of Health, Education, and Welfare, charging that the department's Office of Civil Rights had failed to take action against the education systems in those states. U.S. District Judge John H. Pratt ordered the Office of Civil Rights in 1973 to develop plans with the states to desegregate their systems of higher education (Jaschik 1987; Melendez and Wilson 1985).

Peak Years

Erupting social conflict and student unrest added to the pressures for broader and more flexible admissions. At institutions like The City University of New York (CUNY) and Virginia State University, the policy of open admissions, referred to by Clark Kerr as "the most important single development in
higher education," was a result that revolutionized the mission of increasing minority participation (Rossmann et al. 1975).

In the case of CUNY, before 1970, both the two-year and four-year colleges had entrance requirements based on high school average or a combination of high school average and achievement test scores. Although the cutoff points varied somewhat from one college to another, in general students with averages of 80 or above were eligible to enroll in four-year programs. The two-year colleges required a high school average of 75 for entry to a transfer program, while students with high school averages below 75 but not lower than 70 were admitted only to two-year career programs. Students with averages below 70 or who had not taken an academic program in high school were not eligible to enroll in any college of CUNY. The special programs for disadvantaged students (through which most of the minorities at the university were enrolled) were an exception to this rule. With open admissions, the guidelines for entry to the four-year institutions were modified to include students who were in the top half of their graduating class or who had an average of 80 or above. All other students were then eligible to enroll at the two-year institutions (Rossmann et al. 1975).

The new policy opened the university's doors to a great number of people. While white students were the prime beneficiaries of the new policy, the proportion of African American and Puerto Rican students attending the university increased substantially (Lavin 1974).

With recruitment not necessary in open admissions institutions, the focus shifted to testing in the basic skills, placement, and counseling, and the new objectives of institutional reform became the implementation of compensatory programs for underprepared students, a new and controversial role for higher education.

In many instances, the special programs for economically and academically disadvantaged students were staffed by their own minority recruiters, and admissions offices often worked independently of the economic opportunity programs. Institutions of higher education were criticized for creating this dichotomy, as equal opportunity programs frequently became the sole source of recruiting minority students, resulting in the exclusion of minority students not economically or academically disadvantaged (Taddiken 1981).
In other states, the response was manifested in other ways. The expansion of community colleges was seen as a way of addressing the needs of nontraditional students without compromising the standards of four-year institutions (Richardson 1988). Critics have argued that this two-tier system allowed the four-year colleges to evade the responsibility of recruiting minorities, relegating it to the two-year colleges (Cohen 1981; Olivas and Alimba 1979; Richardson 1988). The objective of recruiting minorities from two-year to four-year colleges was, to a large extent, never realized (Donovan and Schaefer Peleg 1988).

As social pressures from other groups began to be felt, the concept of "minority" in the public consciousness expanded to include Hispanics, Native Americans, and Asians, and the word "minority" was replaced with the term "racial and ethnic minorities." Changing attitudes were reflected in the literature, as agencies and individuals began to report on the various minority groups as separate populations: African-Americans, Hispanics, American Indians/Alaska Natives, and Asians/Pacific Islanders. Colleges and universities included these racial and ethnic subgroups in special programs and as part of their focus on minority recruitment, frequently with a special emphasis on women.

In the independent sector and in the selective public institutions, the approach to minority recruitment focused on the adoption of alternative criteria for admissions. In these cases, the weighting of admissions criteria, such as class rank, high school grades, SAT scores, and letters of recommendation, was modified to reflect more equitable consideration of minority students. Other institutions permitted admission only through special status. In such cases, committees reviewed a student's application and, based on strong letters of recommendation and a clearly demonstrated special talent, the committee would recommend acceptance of the minority student in question. Still others offered probationary or conditional admission to students not meeting the regular requirements for admission in which students had to complete prerequisite requirements, such as prefreshman summer residency programs, a basic skills sequence, and counseling (Halcohn 1988; Trevino and Wise 1980). As with the public sector, active recruitment of minority students was still minimal; students sought admission to private colleges and universities, and enrollments were stable.
With the implementation of affirmative action through the admissions offices, many institutions sought to use a set-aside approach and to institute quotas. Reaction to the policy of using quotas for African-Americans and other minorities, however, resulted in the landmark Supreme Court rulings in *De Funis v. Odegaard* [416 U.S. 312 (1974)] and *Regents of the University of California v. Bakke* [438 U.S. 265 (1978)]. In *De Funis*, where Marco De Funis sought admission to law school, the Supreme Court ruled the case moot, but Justice Douglas, in the dissenting opinion, expressed concern about the cultural biases of a standardized test like the LSAT, biases that, he suggested, might severely limit the tests' utility in accurately predicting minority students' potential. He also expressed concern about the practice of reserving places in a law school class for select minorities (Astin, Fuller, and Green 1978; Cox 1979; Dunston et al. 1983; Hamilton 1979; Lincoln 1979; Preer 1981).

In *Bakke*, where Allan Bakke sought admission to the University of California at Berkeley Medical School, the Court was again divided. This time, Justices Brennan, White, Marshall, and Blackmun ruled that the use of race was admissible in university admissions, while Justices Stevens, Burger, Stewart, and Rehnquist decided that race was not an issue and ruled in favor of respondent Bakke. The compromise position of Justice Powell combined both views, concurring with the admission of Bakke to the medical school while supporting the use of race as a factor in university admissions (Preer 1981). This compromise position created ambivalence in higher education institutions in establishing alternative admissions criteria for minorities (Preer 1981) and resulted in a retreat from the momentum that was taking hold on college campuses in the recruitment of minority students (Atelsek and Gomberg 1978; Spratten 1979).

The students being admitted represented the two ends of the educational spectrum. At one end, the best and the brightest minority students who met all of the regular requirements for admission had achieved greater access and were being admitted where previously they would have been excluded. Others who were especially talented or who were able to secure special recommendations were also being accepted under alternative policies for admission. At the other end, economically and academically disadvantaged minority students were being accepted into special programs that had proliferated.
ered on college campuses, such as the state-sponsored educational opportunity programs. The students who still had limited access were the large number of students with average high school backgrounds. Depending on geographic region, the options for these students were two-year colleges or open-admissions institutions.

Declining Concern
As political pressure eased and new regulations governing the allocation of federal dollars were implemented, less attention was devoted to higher education for minorities. A study conducted at the University of Maryland during 1969 and 1976 documented an increase in median freshman African-American enrollments during the earlier years, immediately followed by a decline to initial 1969 levels in the North Central, Middle States, and Northwest regions, and decreases of 1 and 2 percentage points in the New England and Western regions after the peak year, 1973. Results also indicated a steady decline in the mean number of criteria for admission employed by institutions (Sedlacek and Webster 1978). The attitude that much had been accomplished in changing the complexion of our college campuses was perhaps what led to diminishing emphasis on the goal. Although overall college enrollments were stable in the 1970s, minority enrollments began to drop after 1974. By the end of the decade, focus on recruiting minorities had faded to near complacency.

Renewed Interest
As the college-going pool of students began to diminish in various regions of the country, concern focused not only on more aggressive public relations and recruiting but also on maintaining existing enrollments. Frequently, minority recruitment was accomplished only through special programs or through the efforts of a special recruiter for minorities. As long as cooperation and coordination existed among the various offices of an institution, recruitment could be effective. Many institutions, however, chose to bring together the previously disparate functions of recruitment, admissions, and retention, and presidents and chief executive officers began to realize the long range planning importance of enrollment management for their institutions (Ingersoll 1988).

In the early 1980s, demographers began to warn of the impact that the decline in birthrates in the white population
would have on college enrollments. At the same time, after the 1980 Census, demographers signaled the growing proportion of minorities in the general population and the shrinking proportion on college campuses. In response, recruitment took on a new face. A surplus of students no longer existed, and the vacuum was filled with the recruitment of nontraditional populations, such as part-time students and returning adults, and with the establishment of satellite campuses (Kelly 1989).

The renewed special emphasis on all of minority education—from recruitment to retention, graduation, and entry to graduate and professional schools—is now being fueled by a national concern for economic well-being. At individual institutions of higher education, the concern is also very real. As tuition costs soar, institutions are becoming more and more aggressive in their recruitment of minorities to fill otherwise empty seats.

Special Issues
Among the demographic literature, many researchers focus on the critical shortages apparent in science and technology (e.g., Dix 1987; Hodgkinson 1986; National Action Council 1988; Task Force 1988). Industry and government have expressed such serious concern over the projected shortages of college graduates prepared to enter scientific fields that it has been recognized as a national crisis (Economist 1990a; Naishitt and Aburdene 1989), drawing attention to the severe underpreparedness of school students in mathematics and science, especially among minorities and women (National Research Council 1989). In higher education, institutions have begun to respond with incentives like partial or complete scholarships and special programs designed to attract students to these curricula. Recruiters are especially interested in students who are already prepared and who plan to enter these fields. One population that has been targeted to fill the void is Asian Americans (Hodgkinson 1986). Indeed, a stereotype has emerged portraying Asian American students as gifted, especially in math and science, valuing education, and having strong support from their families (Hsia and Hirano Nakamishi 1988). Given the shortages in science and technology, and as a result of this positive image, some institutions have aggressively sought this population.
In recent years, two significant issues concerning the Asian community have surfaced. One is the distinction that has emerged between the application of the term "racial minority," which includes Asian-Americans, and "underrepresented minority," which does not. In higher education, the proportion of Asian-American students actually exceeds the proportion of Asian-Americans in the general society, and, as a result, some writers have questioned the need to include that group, even though it is a racial minority (Pemberton 1988; Ross 1986). It is clear, however, that certain subgroups of Asian-Americans, such as Southeast Asians and Filipinos, in fact are not represented in higher education equal to their numbers in the population as a whole and are frequently economically and academically disadvantaged (Hsia and Hirano-Nakanishi 1988).

The second issue, also stemming from a high degree of participation in higher education, is the question of restricted enrollments, or quotas (Reynolds 1988; Suzuki 1989). In the interest of achieving a more "substantively, culturally, racially, and ethnically diverse" student body (Hoachlander and Brown 1989, p. 11), colleges and universities have moved away from using strict meritocratic admissions criteria based on high school grades and test scores to including subjective and non-academic criteria. Authors argue that these policies are discriminatory in that they limit Asian-Americans' access to high-quality education and that they result from a manifestation of an anti-Asian bias (Reynolds 1988; Wang 1988). Asian-American high school students commonly maintain above-average grades and rank in class and score among the highest on standardized achievement tests (Hsia and Hirano-Nakanishi 1988). It is argued they should be admitted before others who have exhibited less academic achievement, without consideration of more subjective measures (Farrell 1989; Hsia and Hirano-Nakanishi 1988; Reynolds 1988; Wang 1988).
DEMOGRAPHICS AND DIVERSITY: What Colleges Should Know

Concern over the faltering pace of minorities' advancement in society in general and in education in particular has been expressed in recent years with conviction and eloquence. According to practically every measure of participation and well-being in our society, in education as well as in general prosperity, disparities persist between minority and non-minority people (Frank H. Rhodes, cited in American Council on Education 1988, p. vii). Individual institutions of higher education have a responsibility, to themselves as members of the academy and ultimately to the society it serves, to know and understand the realities that obstruct a growing segment of our population from full participation. The statistics in this section provide the foundation for examining the social, economic, and educational conditions concerning people of color in the United States as we enter the 1990s.

Population Trends, Socioeconomic Status, And Geographic Distribution

During the past 20 years, the proportion of minorities in the general population has increased so sharply as to "ensure future changes in the population balance between Anglo-Americans and minorities" (Oxford Analytica 1986, p. 35). This change is largely the result of two factors: immigration and higher birthrates. Immigration is higher than at any time since before 1920 (Robey 1985).

By 2000, racial and ethnic minorities will make up nearly 30 percent of the U.S. population.

American immigration continues to flow at a rate unknown elsewhere in the world. The U.S., with 5 percent of the world's population, takes about 50 percent of its international migrants, not counting refugees (Oxford Analytica 1986, p. 20).

Because most immigrants who have arrived in the United States since 1970 (77 percent by the end of the 1970s) have been people of color (Oxford Analytica 1986, p. 21), immigration is a significant factor in the discussion of minorities in higher education. Immigration is changing the racial fabric of the United States. In the 1950s, about 50 percent of U.S. immigrants came from Europe. During the 1970s, only 18 percent came from Europe, while more than 35 percent came from Asia and 30 percent from Latin American countries (Robey 1985). Immigration phenomena vary for the two groups relevant to this review, Asians/Pacific Islanders and Hispanics.
Birthrates within the African-American and Hispanic populations are higher than in the white community. A summary of the size of population groups by race and ethnicity in 1980 and projected into 1990 and 2000 appears in table 1, indicating the growth expected in the minority populations. By 2000, racial and ethnic minorities will make up nearly 30 percent of the U.S. population.

*= Not available.

The general decline in the number of school-age children that is expected to continue through the middle of this decade is not evenly reflected in all parts of the country. Because regional demographics vary, national figures can often mask major differences in states. From 1970 to 1980, public school enrollments decreased 13 percent nationwide. But in 12 Sunbelt states, enrollments increased, while many Frostbelt states decreased up to 25 percent (Hodgkinson 1983, 1986).

The high-growth states are also those with the lowest levels of high school retention: To a significant extent, students in these states are poor, handicapped, and of minority backgrounds, and speak limited English (Hodgkinson 1986). In other words, those states with the higher rates of high school retention will continue to experience diminishing numbers.
of students, while the states with the poorest records—those with high numbers of minorities, including students whose English is limited—will see bigger and bigger class sizes (see table 2).

*Source: American Council on Education 1989.*

Regardless of student population, however, differential fertility ensures that the proportion of minority students in U.S. elementary schools will continue to grow. By the mid-1980s, "each of our 24 largest city school systems [had] a 'minority majority,' [and about] 27 percent of all public school students in the U.S. [came from racial and ethnic] minorities" (Hodgkinson 1986, p. 9).

The socioeconomic status of minorities in the United States is substantially lower than that of whites, as measured by several different factors. Median family income (discussed in detail for each ethnic group later in the section) is significantly lower for African Americans and Hispanics, and the percentage of families living in poverty is several times higher. Families headed by a single female are three times more likely to live in poverty than are all families, and many more African American and Hispanic families are headed by women alone. The most powerful statistic of all, however—and the one that perhaps has the greatest import for educators—is that the single largest group of poor people in the United States is children. Nearly 20 percent of all American children live below the poverty level (see figure 1): 14 percent of white children, 36 percent of Hispanic children, and 43 percent of African American children (U.S. Bureau of the Census 1990c). Yet poverty rates...
decrease dramatically as years of school completed increase. The poverty rate in 1989 was nearly 20 percent for households who had not completed high school, less than 9 percent for high school graduates without college, and under 4 percent for those with one or more years of college (U.S. Bureau of the Census 1990c).

**FIGURE 1**

PERCENT OF CHILDREN IN POVERTY IN 1989, BY RACIAL AND ETHNIC GROUP

![Bar chart showing percent of children in poverty by racial and ethnic group: White, Hispanic, African-American.]

*Source: U.S. Bureau of the Census 1990c.*

Reporting on data from the early part of the 1980s, analysts have indicated two major trends affecting the geographic distribution of U.S. population in the 1990s: (1) the move away from the Northeast and North Central states to the South and the West; and (2) the move away from city centers to outer suburban and rural areas. In 1980, “for the first time in the history of the republic, the geographical center of the population crossed the Mississippi” (*Oxford Analytica* 1986, p. 42). This new migration notwithstanding, the East remains our most densely populated area: 80 percent of the U.S. population resides in the eastern half of the country (Hodgkinson 1986).
The African-American community

- African-Americans represent an increasing proportion of the population, but unemployment is higher for this group, especially among youth, than for any other group.
- Well over half of African-American children live with their mothers only, and 54 percent of families headed by African-American women with children under 18 years old live below the poverty level.
- Over half of all African-Americans lived in the South in 1980, and 81 percent lived in metropolitan areas.

Population trends. Although the fertility rate for African-Americans has fallen since the 1950s (Oxford Analytica 1986), it remains higher than that of the white community, and, as a group, African-Americans represent an increasing proportion of the population. In 1980, the total fertility rate (TFR) for African-Americans was 2.3, compared to 1.7 for whites. (A sustained TFR of about 2.1 is necessary to replace population. U.S. TFR has been below this level since 1971.) Though the number of African-Americans is increasing, circumstances deleterious to their greater social mobility continue to plague them.

Socioeconomic status. In 1989, median income was lower and unemployment was higher among African Americans than for whites, Asians, or Hispanics (see figure 2). Median family income for African Americans was $20,200, compared to $34,200 overall (U.S. Bureau of the Census 1990a), and unemployment was 11.4 percent, more than twice that of the total population (U.S. Dept. of Labor 1990a). Despite the gains made by some, African Americans as a group are more likely to be unemployed today than a generation ago (Robey 1985). The unemployment gap between African American youths and white youths was more than 20 percentage points in 1983, when nearly 50 percent of African Americans between 16 and 19 years of age were unemployed. Considering that this age group accounts for a larger portion of the total African American population than white youths do of the white population, the evident effect is that much more sobering (Robey 1985). Thirty percent of African American families lived in poverty in 1989 (U.S. Bureau of the Census 1990c).
In terms of its relation to socioeconomic status and ultimately to educational opportunity, one of the most compelling realities affecting African-Americans is the fact that so many families—more than three times as many African-American (44 percent) as white (13 percent)—are headed solely by women (U.S. Bureau of the Census 1990c). (The majority of African-American children—58 percent in 1984—live with their mother only [Robey 1985].) Because women continue to earn less than men do and single-parent families are more likely to live in poverty, the prevalence of this circumstance has devastating implications. In 1989, 54 percent of families headed by African American women with children under 18 years old had incomes below the poverty level (U.S. Bureau of the Census 1990c) (see also figure 3).

**Geographic distribution.** For African Americans, migration stems from the South, and their movement out of the South continued in increasing numbers until the 1970s. By the end of that decade, African Americans started to move back to the South again, perhaps because of changing attitudes there after the Civil Rights movement and perhaps because of the general population shift to the South and West (Robey 1985). Of the nearly 26.5 million African Americans counted in the 1980
Census, 53 percent lived in the South, 20 percent lived in the North Central states, 18.2 percent lived in the Northeast, and 8.7 percent lived in the West.

African Americans have traditionally lived either in the rural South or in large city centers. Along with the trend for the general population, the number of African Americans living in the inner cities declined somewhat (from 60 percent to 58 percent) between 1970 and 1980, and those living in city suburbs increased 13 percent. African Americans are not moving as far away as whites, who are going to the outer suburbs and small towns, but they are settling in the “low income inner suburbs” (Robey 1985, p. 149). Consequently, African Americans are becoming a larger portion not only of central city residents but also of metropolitan residents. Eighty one percent of African Americans make their home in the metropolis. In many major cities, such as Washington, D.C., Atlanta, Detroit, Baltimore, Memphis, and St. Louis, they are or soon will be a majority.

The Hispanic community

- In the past decade, the number of Hispanics has increased dramatically in the United States; by 2000, they are expected to constitute nearly 12 percent of the population.
The socioeconomic characteristics of Chicanos, Puerto Ricans, Cubans, and Central and South Americans vary substantially, and these differences are reflected in the degree of social integration and participation of each group in American society. Among Hispanics, Puerto Ricans have the lowest and Cuban-Americans the highest median incomes.

Because of migration patterns, more Puerto Rican families are headed by women in the United States than are other Hispanic families, and the median income for these families is considerably lower than for families headed by women generally.

Of Hispanic women heading households with children under 18 years old, 58 percent live below the poverty level.

Hispanics reside mainly in cities and cluster regionally according to nationality: Most Mexican-Americans live in California and Texas, the majority of Cubans live in Florida, and Puerto Ricans live mainly in New York.

Population trends. Although the 1990 Census provides a breakdown of Hispanic subgroups, previous data collections do not. Until this time, the prevailing form of reference has therefore been to the Hispanic population in the aggregate. Between 1980 and 1988, the Hispanic population increased 34 percent, compared to 7 percent for non-Hispanics. About half of this growth resulted from natural increase (Oxford Analytica 1986). According to U.S. data, a 38 percent difference in births per 1,000 women exists between Hispanic (94 per 1,000) and non-Hispanic (68 per 1,000) women (U.S. Bureau of the Census 1989). "The age of the average Hispanic female is almost a decade younger than her white counterpart. With no increase in the fertility rate, Hispanics will increase their numbers of young Hispanic females" (Hodgkinson 1986, p. 9).

The remaining increase in the Hispanic population is the result of immigration. It is projected that "immigration and high Hispanic fertility will change America's racial and cultural composition, putting white non-Hispanics in a minority in some states early in the next century" (Oxford Analytica 1986, pp. 11-12). Population projections indicate a yearly growth rate of 4.7 percent, declining to 3.5 percent, resulting primarily at first from immigration and then from natural increase. Based on these rates, it is projected that the Hispanic pop
ulation will exceed the African-American population in the early part of the next century (Oxford Analytica 1986, p. 37).

The major Hispanic subgroups include Chicanos (67 percent), Puerto Ricans (12.7 percent, not including the 1.5 million Puerto Ricans living in Puerto Rico), Central and South Americans (11.5 percent), and Cubans (5.3 percent). The remainder of the Hispanic population was counted in the 1980 Census as "other Hispanic." In terms of factors as significant as economic status, ability to speak English, family life, and demographic characteristics, the people of these four groups differ substantially. Although not much disaggregated data exist regarding Hispanics, some facts are available. The median age, for example, varies according to subgroup: For Mexican-Americans it is 21.9 years, compared to 30 years for Americans in general. More than one-third of both Mexican-Americans and Puerto Ricans are under age 15, compared to one-fourth of all Americans. This fact is significant because Mexican-Americans have a higher fertility rate than Hispanics in general. Cuban-Americans, on the other hand, have a median age of 38, and only 16 percent are under age 15, while 12 percent are 65 or older (U.S. Bureau of the Census 1980a).

**Socioeconomic status.** Because of different migration patterns, the family structure of Puerto Ricans varies from that of other Hispanics. More Puerto Rican women find work and reside in the United States than do men: 35 percent of all Puerto Rican families in the United States are maintained solely by women, compared to 15 percent of Cuban and 16 percent of Chicano families (Robey 1985). In 1989, 23 percent of all Hispanic families were headed solely by women. Of those with children under 18 years old, 58 percent lived below the poverty level.

The median family income for Hispanics in 1989 was much lower than for all U.S. families -- $23,400, compared to $34,200 (U.S. Bureau of the Census 1990a). Income varied significantly, however, depending on Hispanic subgroup. Figures for one year earlier, 1988, indicate that median income for Cubans was $26,900, for Central and South Americans $23,700, for Mexican Americans $21,000, and for Puerto Ricans $19,000 (U.S. Bureau of the Census 1990a). Unemployment rates corresponded, in that Puerto Ricans and Chicanos were unemployed at the highest rates (9.1 and 8.5, respectively, in 1989).
while the Cuban and Central and South American rates were closer to 6 percent. These figures compare to 5.3 percent for the total U.S. population (U.S. Dept. of Labor 1990a). The percentages of families living below the poverty level also varied, although all were higher than for the general population: 31 percent of Puerto Ricans, 24 percent of Mexican-Americans, and 16 percent of Cubans and Central and South Americans lived in poverty in 1989, compared to 12.8 percent of all Americans (U.S. Bureau of the Census 1990b).

**Geographic distribution.** Even more than African-Americans, Hispanics live in cities, but the number of cities in which they are concentrated is fewer because they also congregate according to ethnic origin. California, Texas, and New York alone are home to 60 percent of the nation's Hispanic population. Three out of four Mexican-Americans live in California or Texas, 50 percent of Puerto Ricans live in New York (43 percent in New York City), and two out of three Cubans live in Florida (over 50 percent in the Miami metropolitan area). On the other hand, in much of the country Hispanics are rare: In 34 states, Hispanics make up less than 2 percent of the population. In major cities like Miami, Los Angeles, San Antonio, and New York, Hispanics make up, if not a majority, then a significant portion of the population. Metropolitan areas like Chicago, Houston, and San Francisco-Oakland count 350,000 to 600,000 Hispanics. In seven other metropolitan areas, Hispanics number at least 250,000 (Robey 1985).

**The Asian and Pacific Islander communities**

- By 1900, the largest Asian and Pacific Island subgroups were expected to be, in order, Filipinos, Chinese, and Southeast Asians.
- Although Asian Americans are considered middle class in general, the socioeconomic status of the many Asian subpopulations actually varies enormously: Southeast Asians, the third largest group, averaged 50 percent living at poverty level in 1980, and 35 percent of all those in poverty were Vietnamese.
- The majority of Asian Americans reside in the West, but large portions of some subpopulations are concentrated in other regions of the country, such as the Northeast and the Southeast. Almost all Asian Americans live in metropolitan areas.
Population trends. From 1971 to 1980, Asian immigration totaled about 1.6 million, and from 1981 to 1988, 1.75 million (Hsia and Hirano-Nakanishi 1989). During the 1980s, Asians were the largest group of immigrants: A greater number of Asian immigrants came to the United States during the 1980s than were counted in the 1970 Census. These figures do not include over 500,000 refugees from Southeast Asia but do include Asian Indian immigrants, who previously had not been included in the Asian category. In the 1980 Census, 62 percent of U.S. Asians reported they were born elsewhere; their differing countries of origin are changing the face of the Asian-American community. Within the Asian population, the Chinese constituted 23.4 percent in 1980, followed by Filipinos (22.6 percent) and Japanese (20.7 percent). Koreans made up 10.3 percent of all Asians (U.S. Bureau of the Census 1980b). By 1990, however, Filipinos were projected to be the largest Asian-American group, followed by Chinese and Southeast Asians, who were expected to number more than 1 million (Hsia and Hirano-Nakanishi 1989). The Pacific Islander population is about 7 percent of the Asian and Pacific Islander group, and over two thirds come from Hawaii. The median age for both Asian Americans (28.8) and Pacific Islanders (23.1) is younger than for all Americans (30).

Socioeconomic status. The median family income of Asians and Pacific Islanders was $40,400, compared with the national median of $34,200 (U.S. Bureau of the Census 1990a). More detailed data are not available for 1989, but factors reported in 1982 based on the 1980 Census reveal that while income was higher among Asian Americans than for the general population ($22,700 compared to $19,900), the proportion of families with three or more workers was also higher, 17 percent compared to 13 percent (U.S. Bureau of the Census 1980b). In 1980, vast differences also existed in socioeconomic status in the Asian-Pacific Island community. More than one third of those in poverty (35 percent) were Vietnamese; in fact, Southeast Asians as a group averaged over 50 percent living at poverty level. For Samoans, the rate was also high, 29.5 percent. These figures compare to 7 percent for the Japanese and Filipinos (U.S. Bureau of the Census 1980b).

Geographic distribution. Similar to the other minorities described thus far, Asian Americans cluster in urban areas and
are about equally divided between central cities and their suburbs (U.S. Bureau of the Census 1980b). And, like Hispanics, Asians and Pacific Islanders congregate according to their ethnicity. Data from the 1980 Census indicate that over 80 percent of Japanese, 69 percent of Filipinos, and 53 percent of Chinese lived in the West and that proportionately more Asian Indians (34 percent) and Chinese (27 percent) lived in the Northeast than Asian-Americans in general (17 percent). Southeast Asians are found mostly in Texas, Louisiana, Northern Virginia, and California, where two-thirds live (Robey 1985).

For Asian-Americans as a group, 56 percent live in the West. California (35 percent), Hawaii (19 percent), and New York (9 percent) contain 60 percent of Asian-Americans. Illinois, New Jersey, Texas, and Washington have Asian-American populations of 100,000 or more.

The American Indian community
- The American Indian community is comparatively young and has more children than Americans in general.
- The large majority of American Indians do not live on reservations; in fact, most live in urban areas.
- While about half of all American Indians live in the West, every state contains American Indian communities. Many American Indians also live in the South and Midwest.
- Median income of American Indians is comparable to that of African-Americans and most Hispanics, which is about 40 percent less than the median income for whites.
- Compared to Americans in general, more than twice as many American Indians lived below the poverty level in 1980.

Population trends. The 1980 Census counted 1.4 million American Indians, about 0.5 percent of the overall population. The American Indian population is young, with 44 percent under 20 years of age, compared to 32 percent of Americans as a whole. Only 8 percent were 60 years or older, which is half the proportion for all Americans. The median age of American Indians was 22.9 years in 1980, considerably younger than the U.S. median age (30). At the same time, American Indians have higher fertility rates than the national norm. In 1980, about two-thirds of all American Indian families had children under 18, compared to one half of U.S. families in general (U.S. Bureau of the Census 1980c).
About 500 American Indian tribes and hands were identified in the 1980 Census; about 90 percent of them, however, had populations of less than 10,000. The tribes with the largest populations (from about 160,000 to 235,000) were the Cherokee and Navajo, which together accounted for 27 percent of the entire Indian population. Other larger tribes included the Sioux (5 percent), Chippewa (5 percent), and Choctaw (4 percent) (U.S. Bureau of the Census 1980c).

Socioeconomic status. Median family income in 1989 for American Indians was much lower than for the nation as a whole, $20,000 compared to the U.S. median of $34,200 (U.S. Bureau of the Census 1990a). Like the case of Asian-Americans, the most recent detailed information available regarding American Indians is based on the 1980 Census. About one-fourth of all Indian families were maintained by women alone, and their median income in 1980 was $7,200, about 72 percent of the median for all American families headed by women ($9,960). The proportion of American Indians living below the official poverty level in 1980 was more than twice as high as that of the general population, about 28 percent of all American Indians compared to 12 percent of Americans in general (U.S. Bureau of the Census 1980c).

Geographic distribution. One third of the American Indian population live on reservations (25 percent) and in the historic areas of Oklahoma (former reservations without established boundaries) (9 percent). While American Indians live in every state in the country, they are largely concentrated in the West, where almost 50 percent live in California, Oklahoma, Arizona, and New Mexico. The North Central region of the country is home to another nearly 20 percent. Of the 75 percent of Indians who live off the reservations, over 50 percent live in urban areas. Of the 10 states with the largest Indian population, only Michigan, North Carolina, and New York are east of the Mississippi River. About 27 percent of the American Indian population is in the South, 18 percent in the Midwest, and 6 percent in the Northeast (U.S. Bureau of the Census 1980c).

The Educational Profile of Ethnic and Racial Minorities
At virtually all transition points along the education continuum, disproportionately large numbers of minorities are lost...
lost—at completion of high school, entry to college, completion of college, entry to graduate or professional school, and completion of graduate or professional school (Astin et al. 1982). This reality, within the context of the changing demographics of the country, poses a singular challenge to education.

The size of the cohort of high school graduates will continue to decline until 1998 (Hodgkinson 1983) as a result of the decline in birthrates after 1964 in the white middle class. Higher birthrates among minorities, however, have meant that minority populations will continue to make up an increasing proportion of college-age, if not college-ready, students. Further, the shrinking size of the college-age population is not uniform across the country: As a result of immigration and migration, the birthrate is rising in the Sunbelt states while declining in the North, indicating that higher education enrollments will continue to expand in one part of the country as they constrict in the other.

Most of the disparities in education affect all the ethnic and racial minority groups in general. Because disparities could be more or less severe for each group at different levels of education, however, it is useful to consider the participation and completion statistics for each group, organized by level of education rather than by racial and ethnic group. The following sections therefore discuss the rate of participation and completion for African-Americans, Hispanics, Asian-Americans, and American Indians (where available) relative to the rate for nonminorities for each educational level from high school through graduation from four-year college. Where available, trends in the rate at which each group obtains baccalaureate and advanced degrees and educational statistics comparing the public and private sectors are discussed.

**High school completion**

Each minority group exhibits important variations in high school completion rates compared to the white population. Hundreds of tables have been compiled on topics ranging from demographics to economic and enrollment trends to institutional finance and student aid (see, e.g., American Council on Education 1989). U.S. Census data on high school completion rates from 1974 to 1986 tell a discouraging story. After 12 years, and with almost as many setbacks as gains, high school completion rates for Hispanics and African Americans
are still much lower than the rate for the majority, especially when they are measured for students 18 and 19 years old. In this category, the difference in high school completion between African-Americans and whites is more than 11 percentage points (76.6 percent for whites and 65 percent for African-Americans) and between Hispanics and whites is almost 22 points (only 54.7 percent of Hispanics). By age 24, when 85.4 percent of whites have completed high school, the gap narrows to about 4 points difference between whites and African Americans, but between Hispanics and whites it increases to almost 24 points, for only 61.6 percent of Hispanics in this age group have completed school (American Council on Education 1989).

In the two years after 1986, high school completion decreased for both groups (Carter and Wilson 1989). In 1988, African-Americans aged 18 to 24 completed high school at a rate of 75.1 percent (82.3 percent for whites), compared to 76.4 percent two years earlier. Despite the continuing disparity, however, until 1987 the high school completion rate for African Americans was improving slowly but steadily. For Hispanics, the number of high school dropouts is disconcerting. In 1988, only 55.2 percent of 18 to 24 year olds had finished high school, 4.7 percent fewer than in 1986 (see figure 4). Although rates have fluctuated, reaching a high of 62.8 in 1985, the most recent (1988) high school dropout rate for Hispanics is even lower than it was in 1976. The real school dropout rate for Hispanics is much higher than has been calculated, however, as a large number of Hispanic children never reach ninth grade and are therefore not counted in the high school attrition statistics (Fernandez 1989).

For American Indians, dropping out of high school is also a serious problem. The dropout rate for American Indians 35.5 percent is similar to that for African Americans. While American Indians represent 3.1 percent of all dropouts, they account for only 0.9 percent of all elementary and secondary students. Most American Indian students (82 percent) attend state run public schools, while 11 percent are in schools funded by the Bureau of Indian Affairs and 7 percent attend private (many of them missionary) schools near reservations (O’Brien 1990).

Contrary to the situation for American Indians, Hispanics, and African Americans, when viewed as a single group, Asian Americans stay in school: In the 1980 High School and
Beyond (HS&B) survey, the Asian-American group had the lowest high school dropout rate, the highest grade point averages (GPAs), the largest percentage of high school graduates who went directly to college, and the highest persistence rate at two-year colleges of any group, including whites (Hsia and Hirano-Nakanishi 1989). These achievements have been attributed to, among other things, a shared value among Asian-Americans in general of education, which is associated with status and respect and has long been considered a vehicle for social mobility (Hsia and Hirano-Nakanishi 1989). The sample used in the HS&B survey, however, did not allow for analysis by subgroups. Any differences among the various populations, therefore, would not be evident. While Pacific Islanders are frequently grouped together with Asians, some researchers maintain that their (Pacific Islander) situation in higher education is closer to that of other minorities (Bagasao 1989).

Other literature refers to state reports that Asian immigrants and refugees, especially those in the lower socioeconomic
strata, are burdened by culture shock, limited English, and, in some cases, "a high incidence of violence and prejudice directed against [them]" (Tokuyama 1989, p. 69). Southeast Asians are reported to be falling into the at-risk category, with many not completing high school (Tokuyama 1989).

**Undergraduate participation**

In absolute numbers, data from the National Center for Education Statistics indicate increases in 1988 college enrollment over 1976 for every ethnic and racial category. Nationally, college enrollment increased 13 percent for whites, 9 percent for African-Americans, 77 percent for Hispanics, 151 percent for Asian-Americans, and 22 percent for American Indians. More minorities are going to college, especially Asian-Americans and Hispanics. But given the variation in factors like population growth, the size of different age groups, and high school completion rates from one group to another, interpreting the significance of these numbers is complex.

For example, over the same 12-year period, the number of 18- to 24-year-old whites decreased 8 percent while high school completion rates remained the same. Yet, despite the smaller population, college participation increased 5 percent age points (see figure 5). Among African-Americans, however, the population in this age group increased 7.6 percent, high school graduation almost 8 percent. But out of this bigger population, a greater percentage of whom were high school graduates, a smaller proportion (5 percentage points fewer) enrolled in college. Among Hispanics, the same phenomenon is even more pronounced. The 18- to 24-year-old population increased fully 70 percent while high school completion stayed the same. Yet the percentage enrolling in college of this much bigger population, consisting of the same proportion of high school graduates, also decreased 5 percentage points (Carter and Wilson 1989). While the overall increases

---

1. Not all of the 20 or more ethnicities that comprise the Asian and Pacific Island community have had the same experiences in the United States, nor do they share the same degree of educational attainment. For example, the percent of 25 year olds with a high school or college education was higher for five of the six Asian groups counted in the 1980 Census than for the average U.S. population, with the exception of the Vietnamese. Consequently, although aggregate figures provide an important overview of trends for Asians and Pacific Islanders as a whole, the gross numbers can obscure a less optimistic reality for certain subgroups, especially Filipinos, Southeast Asians, and other refugee groups.
in the number of minorities enrolled in college reflect important advances, they must be considered in light of the changes in demographics. These data concerning the same 12-year period seem to indicate that the number of 18- to 24-year-old African-Americans and Hispanics enrolling in college has increased. The number who do not enroll has increased even more, however.

FIGURE 5
COLLEGE ENROLLMENT FOR 18-TO 24-YEAR-OLDS,
1976 VERSUS 1988

The college-going rate of young minority men in particular has dropped significantly in recent years. College enrollments among 18- to 24-year-old white men have increased 4 percentage points since 1976, to a little over 39 percent, but among African American men in the same age group, they decreased more than 10 percentage points, to 25 percent. Among Hispanic men, almost 31 percent of 18- to 24-year-olds were enrolled in college in 1988, down more than 8 percentage points from 12 years earlier (Carter and Wilson 1989).

The difference in college participation between men and women varies for different populations. Historically, more Hispanic women graduate from high school than men. A
smaller percentage, however, enroll in college. The gap
between men and women within the 18- to 24-year-old group
in the 12 years from 1976 to 1988 has closed from a difference
of almost 7 percentage points to about 1 point, but not
because a greater proportion of women in this age group
enrolled in college; it is the result instead of the relative
decrease for men in the same age group (Carter and Wilson
1989). In absolute numbers of Hispanics enrolled in college,
however, including all age groups, the number of Hispanic
women grew 112 percent, compared to 48 percent for His-
panic men over the 12-year period (U.S. Dept. of Education

In the African-American community, the situation is a little
different, but the general outcome in terms of gains for young
women is the same. In the 18- to 24-year-old group, although
a larger percentage of African American women traditionally
graduate from high school, 12 years ago a larger percentage
of male high school graduates went to college than female
high school graduates. This situation is now reversed; More
African-American 18- to 24-year-old women enrolled in col-
ge in 1988 than men. The reversal, however, is the result
of the precipitous drop in male enrollments rather than of
any increase in the proportion of female enrollments. In fact,
a smaller proportion of women in this age group enrolled

**Two-year Institutions.** For all the minority groups and for
whites, the proportion of two year enrollments has increased
in the past 10 years (U.S. Dept. of Education 1989, updated
1990). In the 10 years between 1976 and 1986, participation
of African Americans in two year institutions decreased from
11 percent to 10 percent. For American Indians and Native
Alaskans, enrollments remained virtually unchanged, at 1 per-
cent. Hispanic participation increased somewhat, from 5.4
percent to 7.2 percent, and markedly for Asian Americans,
from 2 percent to 4 percent (U.S. Dept. of Education 1984,

In terms of proportional representation, it is clear that
minorities are heavily concentrated in two year schools. Of
all Hispanic and American Indian students in college, the
absolute majority are enrolled in community colleges. Amer-
ican Indians have the largest concentration of all minority
groups, 56.6 percent, and Hispanics are similarly represented.
at 54.8 percent (Taylor 1983). Compared to the enrollment at two-year schools for white students (36 percent), African-Americans (43.1 percent) and Asian-Americans (42 percent) are also disproportionately represented (U.S. Dept. of Education 1984).

Data from 1984 providing a breakdown of minority participation by full-time versus part-time attendance indicate that two-year institutions have a larger part-time population than full-time population: For Hispanics, Asian-Americans, and American Indians, about two students attend part time for every one who attends full time, which is also the case for whites. For African-Americans, the difference is somewhat smaller, 58 percent part time and 42 percent full time (U.S. Dept. of Education 1984).

**Four-year institutions.** In four-year colleges, where participation of African-Americans has always been disproportionately low relative to the size of that population overall, participation also decreased over the same 10-year period, from 8.5 percent to 7.9 percent. Hispanic participation increased from 2.4 percent to 3.6 percent but remains significantly underrepresentative, as does participation of American Indians and Native Alaskans in four-year institutions, which remained unchanged at 0.5 percent (U.S. Dept. of Education 1989, updated 1990).

Of students attending college, a larger proportion of Asian-Americans (58.5 percent) and African Americans (56.9 percent) attended four-year colleges in 1986. These percentages, however, are down 1.6 percent for both groups from 10 years earlier. A smaller proportion of Hispanic (45.2 percent) and American Indian and Native Alaskans (43.3 percent) attended four-year colleges. Among whites, attendance at four-year institutions was 63.9 percent of the college-going population (U.S. Dept. of Education 1989, updated 1990).

**College completion in four-year institutions.** The college completion rate at the bachelor's level varies enormously, depending on race and ethnicity. According to a 1986 study of 12,000 students, after six years of college, Hispanic students graduated at a rate of 20.4 percent and African Americans at 23.9 percent, compared to Asian-Americans at 41.5 percent and whites at 43.9 percent. That is, African Americans and Hispanics in four-year colleges and universities earned degrees...
after six years at about half the rate of white and Asian-
American students (Porter 1989).2

Baccalaureate and advanced degrees obtained

Minorities as a group obtained more degrees at all levels in 1987 than they did in 1976, but when the data are examined according to subgroup, certain distinctions emerge. Hispanics, Asian-Americans, and American Indians made gains at all levels, and women made considerably more gains than men. But African-Americans, most particularly the men, lost ground: Fewer African-American men obtained degrees at any level in 1987 than in 1976 (Carter and Wilson 1989). From 1976 to 1987, the number of African-Americans earning bachelor's degrees fell 4.3 percent overall but 12.2 percent for men; the number of master's degrees decreased by 31.8 percent but by 34 percent for men. The number of Ph.D.s also declined 22.1 percent from 1978 to 1988, with a 46.7 percent drop among the men. While African-American women did obtain more degrees at the bachelor's, doctorate, and first professional levels, the number of master's degrees dropped 30 percent among African American women between 1976 and 1987 (Carter and Wilson 1989).

While Hispanics are still seriously underrepresented among those receiving degrees— the percentage of Hispanic under graduates (5.3 percent) is almost twice the percentage of those obtaining degrees (2.7 percent)— the number of degrees conferred to Hispanics over the period from 1976 to 1987 increased significantly (50.3 percent at the bachelor's level and 32.9 percent at the master's level); 52.8 percent more women and 16.1 percent more men earned a degree. For all degrees in this group, the percentage increases occurred largely among women; however, so few women earned advanced degrees in 1976 that even large increases result in relatively low numbers. For example, from 1978 to 1988, 25.6 percent more Hispanics earned doctorate degrees, 75 percent more women and 1.3 percent more men. In actual numbers, however, 273 doctorates were awarded to women, 321 to men. First professional degrees increased by 90.1 percent for Hispanics, for a total of 2,051 degrees; 748 were

2 It is also interesting to note that only a small portion of all students (a little more than 15 percent) graduated after four years, although this figure was about 12 points higher for students in the private sector (Porter 1989).
awarded to women (a 356 percent increase over 11 years earlier), 1,303 to men (42.4 percent more than in 1976).

The sharpest increases were among Asian-Americans, and, in keeping with the trend, women made the greatest advances. Between 1976 and 1987, bachelor's degrees awarded to this group increased 191.4 percent (215.3 percent among women), master's degrees 118.8 percent (121.1 percent for women); doctorates increased 56.9 percent between 1978 and 1988 (93 percent among women), and first professional degrees increased 24.9 percent (306.2 percent for women).

For American Indians in the same 11-year period, the number of degrees granted to women also increased to a great extent. Bachelor's degrees decreased 5 percent among men but increased 36.1 percent among women, master's degrees increased 21.3 percent among men and 65.9 percent among women, doctorates increased 51 percent for men and 42 percent for women, and first professional degrees increased 12.9 percent for men but 365.4 percent for women. In this group, however, the number of advanced degrees awarded is extremely small. In 1988, 93 doctorates were awarded to American Indians.

Public sector versus private sector
Private institutions continue to have more success in retaining and graduating students than do public institutions, but a recent report from the National Institute of Independent Colleges and Universities (Porter 1989) indicates that for African-American and Hispanic students, the advantage of the independent sector is not really much greater. In that study, the completion rate after six years at private institutions for African Americans and Hispanics was approximately 30 percent, about half the rate for whites and Asian Americans and only a few percentage points better than the completion rate for African Americans and Hispanics at public institutions after the same period of time.

The proportion of white students in private institutions is greater than in public ones, although the figure has been slowly decreasing in recent years. In 1986, white students accounted for 81.3 percent of students at private institutions, compared to 78.8 percent at public colleges and universities, about 3 percentage points lower in each sector from 10 years earlier. The difference has been made up by increased enrollments, especially in public institutions, of Asian Americans.
Hispanics, and nonresident aliens. African-American participation actually decreased in both private and public colleges since 1976. Proportionately, African-Americans make up the same part of the student population, within 0.1 percent, in both the public and private sectors. Their representation in the public sector, however, decreased 0.9 percent from 1976 to 1988. Hispanic enrollment in private institutions increased from 2 to 3.2 percent between 1976 and 1988 and from 3.9 to 5.8 percent in public colleges. Asian-Americans made up 1.4 percent of private school students in 1976 and 3.2 percent in 1988 but increased from 1.9 to 4 percent of students in public institutions. American Indians and Native Alaskans accounted 0.4 percent of private and 0.8 percent of public students in each year, with no change in either sector in 12 years.

Summary
Disparities persist in high school completion rates between whites on the one hand and African Americans, Hispanics, and American Indians on the other. While the gap has been narrowing for African Americans, African American high school completion rates have decreased in the past two years. The high school completion rate for Hispanics fluctuates almost from year to year. In the 12 years from 1976 to 1988, Hispanics made only small gains and frequent losses. The 1988 rate was slightly lower than that for 1986, and in 1988, close to half of Hispanic 18 to 24 year olds did not have a high school diploma. The high school attrition rate is as high for American Indians as for African Americans. The overwhelming majority of American Indians attend state run public schools. As a group, Asian Americans complete high school at a higher rate than whites. Large subgroups of the Asian American community, however, especially Southeast Asians and Filipinos, do not fit the educational profile of other Asian subgroups.

While a growing proportion of white high school graduates goes on to college, the proportion of African American and Hispanic high school graduates who go to college is shrinking. In 1988, the gap was even wider than it was 12 years earlier. Hispanic college enrollment has increased 77 percent overall since 1976, 112 percent among women. Neither Hispanic nor African American 18 to 24 year old women are making real gains in college participation, however. Proportionally, fewer of these women attended college in 1988 than in 1976.
The college-going segment of 18- to 24-year-old African-American and Hispanic men has been declining seriously: Only 25 percent of African-American men and 31 percent of Hispanic men enrolled in college in 1988, compared to 39 percent of white men in that age group. This difference is 14 percentage points greater for African-Americans and 8 percentage points greater for Hispanics than in 1976. Compared to whites, a much greater number of all minority groups attend community colleges as opposed to four-year colleges.

According to a recent study, only about half the number of Hispanics and African-Americans earned bachelor's degrees after six years than did whites or Asian-Americans. Contrary to the gains made by Hispanics, Asians, and American Indians in obtaining degrees at all levels, fewer African-Americans obtained degrees in 1987 than they did in 1976. Hispanic, Asian-American, and American Indian women have made great gains since 1976 in obtaining all levels of degrees, from bachelor's through first professional. The actual numbers, however, remain very low. African-American women have made some gains in doctorates and first professional degrees since 1976 but only a very modest gain (1.7 percent) in bachelor's degrees; the number of master's degrees obtained by African-American women dropped considerably.

Private colleges and universities retain and graduate more students in general than public institutions. African-Americans and Hispanics in private colleges and universities benefit only slightly from the advantage of the private institutions in this regard. The completion rate at private institutions for these two groups is only a few percentage points higher than the completion rate for the same groups at public colleges and universities. The proportional representation of American Indians and Native Alaskans did not increase in public or private colleges in the 12 years from 1976 to 1988.
INSTITUTIONAL COMMITMENT

The Role of Leadership

Leadership from the top is the driving force behind institutional change. Inspiring leaders are "dynamic, flexible, and precise—able to work with people, anticipate and accommodate change, and make decisions" (Fast 1977, p. 38); they look to the future (Fantini 1981), but "what is expected of them . . . is that they provide institutions with leadership appropriate to the times" (Murphy 1984, p. 443). A more ethnically and racially diverse campus environment begins with the commitment to this goal by the institution's governing board and the college president. In higher education, as in government or industry, it is the institution's leadership that must provide the challenge as well as the energy and the direction to meet it. Dedicated individuals among the faculty, staff, and administration can have a profound effect on the lives of individual students, but their influence is limited to the sphere in which they work. Achieving cultural diversity through the presence on campus of people from different backgrounds demands an institutionwide commitment (Arvizu and Arciniega 1985; Kelly 1989; Navarro 1985). This fundamental commitment must be expressed in the institution's mission statement. The development of a mission statement, although often expressed in broad terms, should include the concepts of diversity and cultural pluralism in a way that does not relegate them to the periphery.

The goal of bringing people of color to the campus is communicated to the trustees, faculty, staff, and students through the president's actions and words. It is the college president's demonstrated personal belief in the goal of cultural pluralism that will set the tone and send the message that minorities are welcome (Cole 1990; Rivera 1986; Wilson 1986). Effective leadership requires passion (Bennis 1990): On no issue will passion be more necessary or effective than on the issue of achieving a culturally diverse environment on campus.

A holistic approach to creating this environment includes relating the functions of minority recruitment, admissions, and retention with a diverse curriculum and an open, tolerant campus ethos. The tendency to view recruitment as a separate, isolated function at the institution is limiting, because the institution's policies regarding admissions and retention directly affect the function of recruiting minority students (Lemming, Beal, and Sauer 1980).
Recruiting minority students to college campuses and providing the mechanisms to support their success involves no mystery. The basic ingredient is institutional commitment (Christoffel 1986; Guichard and Cepeda 1986). If colleges and universities wish to include people of color in the college community, they need to set that goal as a priority and allocate the resources required to accomplish it (Halcon 1988). Having said so, however, it remains clear that the matter is not so simple. In many cases, it calls for a reordering of priorities and a redistribution of existing resources. In any community, change—and especially social change—requires courage and vision. "Effective leaders exude confidence in their own abilities and engender confidence in others. . . . They lead with their eyes focused on the future, working long hours to improve higher education in general, and society in particular" (Fisher, Fitch, and Wheeler 1988, p. 19). Once the vision has been transformed into a community goal, the institution is in a better position to develop the programs, services, and people to achieve it.

While no single measure can solve the problem of minority undereducation, and higher education institutions cannot and should not have to do it alone, much remains within their purview. Given the enormous complexity of the problem, a college's responses need to be diverse. An institution's commitment is expressed in its support of minorities from recruitment through graduation.

Recruitment in the Institutional Structure
The collegewide perception of the importance of recruiting minority students depends on recruitment's place in the institution's organizational structure. Because organizational structures and perceptions of the location of power and authority within those structures vary, it is difficult to generalize about the optimum place for minority recruitment. One thing is true, however: the more authority vested in the administration that oversees minority recruitment, the more likely that the matter will be perceived as a priority. Further, the more direct the reporting line to a senior administrator, the greater the perception that leadership is committed to the issue.

Institutions of higher education have adopted a variety of approaches to recruiting minorities. The most common location for this function is in the admissions office, where two conflicting philosophies have developed. One is the belief
that the responsibility for recruiting minority students should be shared by all individuals in the admissions office, regardless of race or ethnicity. Supporters of this position argue that if nonminority individuals are included in the effort, the issue will move from being a minority-centered concern to one of interest to the whole college. The other point of view holds that only minority role models should recruit minority students, because it has been documented extensively that minority students in fact respond more readily to people with whom they can identify (Rodriguez 1982). Accommodations to these conflicting positions have been made in varying degrees.

On some college campuses, minority students are recruited through special minority recruitment offices, which sometimes are staffed by a single recruiter. The extent of the institution's commitment to increasing the number of minority students is expressed in the size and physical location of and budget allocated to that office. On campuses where no other minority centers exist, the minority recruitment office often becomes a magnet where minority students congregate and where minority concerns are addressed.

Special support programs established with state and federal funding for economically and educationally disadvantaged students have historically been involved in recruiting minority students. Because large numbers of minority students enter colleges through these programs, they frequently become the sole avenue through which minority students are recruited (Commission on California 1983). In these cases, although minority students might also enter through regular admissions, no other special recruitment efforts are employed, and, as a result, the large number of minority students accepted to these colleges are educationally disadvantaged.

In response to social and political pressures, many campuses established the equivalent of an office of minority affairs to address such matters as cultural awareness and student leadership and to serve as advocates for minority concerns. Increasing the presence of minorities on campus in some cases became a natural outgrowth of these offices, formally or informally.

Often no special minority recruitment exists on campuses: rather, minority students enroll through programs and offices that were not designed specifically for this purpose. In these cases, coordination and communication among the various
offices are critical to realizing the goal of increasing the number of minority students.

**The Recruitment Team**

Institutional commitment is also expressed in the moral support and financial resources given to those who will carry out the task of recruiting minority students to the college (Commission on California 1983). By setting the activity on center stage and arming those responsible with sufficient financial backing, the president can demonstrate the priority of the commitment invested in this goal. On the other hand, in institutions where the responsibility rests with a single individual and that person has no authority to create policy, institute initiatives, or commit resources, it will be clear that no real institutional commitment has been made.

Among the various people participating in recruitment of minorities, minority faculty have been central. Although most campuses have a limited number of minority faculty, historically, because of their personal commitment to people of color, many of these individuals have taken an interest and been active in recruiting minority students to their colleges. While such dedication is commendable, it has become a double-edged sword: More minority students attend college, but voluntary personal interest frequently is transformed into an additional function they are expected to perform. Because the activity receives little recognition or reward, the time and energy it requires can jeopardize reappointment, tenure, and promotion. From the point of view of the goal, the outcome is limited because of the amount of time and energy faculty can spend on the activity.

In addition to isolated individuals in departments throughout the college, dedicated faculty in academic departments and programs offering majors, minors, concentrations, and courses in areas like American Indian, Asian, African American, Chicano, and Puerto Rican studies are also directly involved in recruiting students for their programs. Through these departments, faculty members can provide a direct line of entry to the college for minority students.

Staff and faculty involved in special support programs that serve disadvantaged students are also important advocates for minority students' participation. In some cases, in addition to teaching in and administering the programs, these people work closely with admissions and recruitment offices by par
participating in activities such as visiting schools, addressing minority students who visit the campus, and creating and maintaining networks in the community. Naturally, the degree to which they are involved in recruitment depends on the communication and coordination between the offices.

Some admissions and recruitment offices contain specific individuals who are responsible for recruiting minority students and who concentrate their efforts on locating and cultivating potential recruits. This function can be full time or part time, and it might be performed by one or more individuals in the office. Admissions and recruitment personnel establish links with the minority communities (Illinois Community College Board 1986), organize creative campus activities of interest to minority students, provide free transportation for school students to visit the college, set up information booths at schools and in public places, and write brochures and other literature tailored to students of different ethnic backgrounds (Bender and Blanco 1987; Warfield 1985).

All of the people discussed in this section can be effective as individuals and as members of a team. Even at those institutions where no formal office or specific individual has been identified solely to recruit minority students to the college, effective structures can be established to accomplish the goal. From a single individual to a heavily staffed administrative office, the types of mechanisms employed to recruit minority students are less important than the need for everyone to work as a team (Bender and Blanco 1987). Bringing individuals together who are responsible for and concerned about minority education in commissions, committees, or task forces is often the answer. Such groups allow all the constituencies of the college to participate, creating a collegewide effort and fostering a unity of purpose.

Respecting Diversity

One of the points most frequently raised in the literature on minority students is the propensity of institutions to treat everyone who is not white as a single group. The tendency to classify all people of color in the same category is powerful, encouraged perhaps by the nature of the bureaucracy in higher education and even larger institutions. Data collection, analysis, and report writing, for example, are simpler when fewer categories exist. The term "minority" does not represent a homogeneous group, however. The number and variability
of the people included in the category make the definition, at best, imprecise.

As the campus presence of students from the larger minority groups increases, their desire to be recognized separately intensifies. In turn, the cultural identity of different nationalities within each group emerges to claim its place in the collectivity. The desire of Hispanics to be acknowledged separately from African-Americans or Asian-Americans is the same desire Chicanos feel in wanting to be acknowledged separately from Cubans, Dominicans, and Colombians.

In addition to differences stemming from cultural identity, other important factors affect the quality of a student's experience at the institution and directly affect persistence and graduation. One of these factors is social class (Astin et al. 1982). Regardless of the stereotypes that persist, all minority groups include people from all social classes. The same recruitment techniques and the same support services will not be effective in recruiting a middle-class Puerto Rican who was born and raised in Puerto Rico as in recruiting a Puerto Rican student who was born and raised in New York City.

Other important factors differentiate individual members within the group, such as cultural values affecting the role of women. The closely knit family structure in Hispanic and Asian cultures and the protective attitudes toward women make it necessary for colleges and universities to work not only with potential students, but also with their families if campus residency is a consideration.

Because of the differences between the Euro-American and Native American cultures, American Indian students may not be receptive to aggressive recruitment techniques; "hard-sell" recruitment may in fact be counterproductive. Therefore, the participation of Native American recruiters is indicated as being critical for this population.

African-American students who come from rural areas rather than urban centers are sometimes as different in their experiences as students of different nationalities. Their interaction with people and their form of communication, for example, could pose a social barrier in the opposing social context. An urban institution that recruits African Americans from rural

areas has an obligation to provide them with assistance in adjusting to an environment that might be far removed from their personal experience.

Immigration within the minority subgroups has been so great in recent years that it must be considered a distinguishing factor when recruiting Asian-Americans, African-Americans, and Hispanics. Newly arrived immigrants have different profiles from their American born counterparts and others within the group. The new Asian immigration includes a large number of Southeast Asians who have less education and financial means than American born Japanese or Chinese (Hsia and Hirano-Nakanishi 1989).

While in some cases the issues relating to recruitment are of concern to all minorities, in other cases, differing circumstances, needs, and obstacles identify issues specific to one or more groups that cannot be generalized to all. The reality, of course, is that both inter and intragroup differences are significant, and recruitment must therefore be sensitive to individual circumstances.

A notable example of institutional leadership in the arena of creating diversity on campus and responding to the demographic changes in the state is the University of California at Berkeley, where attaining a pluralistic student body was an expressed goal. Between 1980 and 1989, the composition of the undergraduate population shifted from 66 to 45 percent white. In the 1990 freshman class, 34 percent of students are white, 30 percent are Asian American, 22 percent are Chicano or Latino, and 7 percent are African American (Magner 1990).

Referring to the goal of diversity at the university, the president of the system, D.P. Gardner, expressed the university's purpose of "assuring that an entering freshman class is possessed of the kind of experience, potential, ethnic differences, social differences, rural and urban differences, and so forth to enrich the whole learning environment and experience that these young people have..." (1987).
RECRUITMENT: A Collegewide Perspective

Recruiting more minority students into college brings with it the need to institute measures that address all of the reasons that relatively few minorities are on college campuses in the first place. Not only educational factors, but also social, economic, and political factors contribute to the exclusion of minorities from higher education. Because the problem of minority undereducation is so pervasive, recruitment in higher education is inextricably bound to the subjects of college access, admissions, and retention. Inadequate academic preparation affects all of these areas because so many minority high school graduates leave school less prepared than non-minorities (Smith 1980). Even if more aggressive recruitment were to succeed in enrolling all the minority students who meet the standard admissions criteria of most four-year colleges, the problem of severe disparities in higher education between minorities and nonminorities would persist: The proportion of minority students who attain that level of preparation is simply too small (Richardson 1988). Preparing students at the precollege level is critical if they are to be successful in college, and colleges have found that their direct involvement in this area has proved to be effective as part of both short-term and long-term strategies for recruitment (Wilbur et al. 1988). Widely recognized, nationally replicated models of programs that strengthen the academic preparation of students and prepare them for college include the University of Southern California’s MESA program (Mathematics, Engineering, Science Achievement) and Middle College High School at LaGuardia Community College in New York, where a majority of graduating students go on to higher education, with many choosing to attend the sponsoring institution.

At the same time, for minority students as a group, the educational system breaks down regardless of academic ability or achievement. For example, high ability African American men drop out of college at a rate that is second only to the rate for the lowest ability group (Porter 1989). If institutions want to provide access, and if cultural diversity is a serious goal, then colleges must remove all of the barriers that continue to obstruct the educational achievement of minorities. For most institutions, it will require a comprehensive policy involving admissions, recruitment, and retention (Christofel 1986).
Preparing for Minority Recruitment

Much has been written about the "revolving door," in which minority students, once successfully recruited to college, find it impossible to succeed. Researchers emphasize the importance of relating policies and strategies for recruitment to initiatives for retention, as so many minority students are recruited into colleges and universities, only to leave within a matter of months. Factors affecting retention of minorities are reported abundantly in the literature, including academic preparation, financial need, and feelings of isolation and alienation as key examples. It is to the institution's advantage to use as much institutional data as possible to understand the reasons for students' premature departure before developing a comprehensive plan for recruitment; it makes no sense to recruit minority students if most of them will leave the college without degrees (Magner 1989). Determining whether problem areas exist in the institution with regard to minorities is the essential starting point.

A discussion of Tinto's model of student-institution fit (Pascarella 1986) emphasizes that the dynamics of students' persistence or withdrawal are unique to the particular institution. Both the variables that influence retention and the interventions designed to affect it "may not be generally applied from one institution to another" (p. 105). A coordinated program of research investigating minority students' enrollment and success and the ways in which recruitment is presently performed is the recommended first step in any recruitment plan (Pelletier and McNamara 1985; Wilson 1986).

Such an institutional audit (Green 1989) would include a student profile that not only separates the principal minority groups (African American, Hispanic, Asian American, American Indian), but also provides information on the various subgroups they comprise. The profile should include factors such as employment, part time or full time enrollment, socioeconomic background, background and proficiency in the English language, degree program, and academic preparation and performance. These data should be analyzed for the student body as a whole and for the entering freshman class in particular, as it will include all students before attrition. Similarly, a profile of the faculty, staff, and administrators by race and ethnicity is important to determine not only the number but also the rank and visibility of minority members.
While many aspects of minority recruitment will apply in all cases, any strategy undertaken should include a comprehensive understanding of the local situation, taking into account the institution’s mission, the financial and human resources at its disposal for accomplishing the task, and an understanding of the complexities of the problem as it exists locally.

**Recruitment and Admissions**

A system of higher education based solely on merit excludes most people of color and has been charged as "the single most serious obstacle to the educational progress of disadvantaged minorities" (Astin et al. 1982, p. 154). Under such a system, the extent of change in the individual as a result of education, or its value-added benefit, is subverted in favor of screening for the best performers at the time of entry. Further, the widespread use of standardized testing in traditional admissions practices is "detrimental to the progress of minorities" (Astin et al. 1982, p. 157). According to a simulation survey conducted at the Higher Education Research Institute:

> When [college] application rates are so high that only one out of ten applicants can be admitted . . . a school relying solely on test scores to determine selection would admit only 1 percent of the black applicants and 3 percent of the Chicano applicants, compared to 10 percent of the white applicants. In other words, a white student is three times more likely to be selected than a Chicano student . . . ten times more likely than a black student . . . Clearly, if these minority groups are ever to approximate educational parity, some other approach to admissions must be found (Astin, Fuller, and Green 1978, pp. 162-63).

Most admissions policies are grounded in the position that those students should be admitted who are most likely to succeed (Ascher 1983). Following from that position, the predictive measures of high school performance, reflected in high school grades and class rank and scores on standardized tests like the ACT and SAT, are widely used as indicators of future academic performance and persistence in college. These criteria are consequently the principal determinants in most institutions’ decisions to accept or reject students for admis
sion. Much of the discussion involving the use of alternative criteria for admissions disputes both the validity of these measures and their use to the exclusion of all other measures as predictors of success for minority students.

High school grades have been shown to predict college GPA for all groups, minorities and whites alike, but not to the same degree. High school grades as predictors of academic performance in college are less consistent for African-Americans, Chicanos, and Puerto Ricans than they are for American Indians and whites (Astin et al. 1982). Furthermore, standardized test scores do not contribute to the prediction of college grades for American Indians and Puerto Ricans, although they are shown to be predictive of college GPA for African-Americans and Chicanos (Astin et al. 1982). "The magnitude of the relationship [of test scores to college GPA, however,] is quite small in comparison to the relationship between high school grades and college grades" (p. 92). In defense of the validity of the SAT, "it consistently measures for all groups of students what it is designed to measure, without inherent disadvantage to any single minority group" (Hanford 1982, p. 3).

While the SAT is a reliable predictor of academic performance regardless of race or ethnicity, all of these variables—test scores, class rank, and high school grades—are related to socioeconomic status and parents' educational background (Ascher 1983). Consequently, minority students have less of a chance to do well. "The measurement of academic aptitude and achievement represents only one dimension of an individual's capacity for growth and education in the broadest understanding of that term" (Hanford 1982, p.14).

Using alternative criteria for admissions in the selection of minority students for entry to college provides an opportunity to weigh all admissions factors in relation to one another. Where deficits surface with the regard to the standard criteria, other measures that signal potential for success can in this way be equally considered (Fincher 1975; Martinez Perez 1978).

Recruitment and Financial Aid

Although the minority participation problem cannot be solved with financial aid alone, it cannot be solved without it either (Hardesty 1990, p. 4).
One of the most frequently repeated observations in the literature regarding the decrease in minority students' participation in higher education is the unavailability of financial aid (Fields 1988; Green 1982; Jackson 1988). Studies concerning the impact of financial assistance on enrollment rates are as yet inconclusive, but "evidence suggests that financial need plays a part in admissions decisions and enrollments" and "denying financial aid to needy applicants does prevent those students from enrolling in higher education institutions" (Nora and Horvath 1989, p. 301). For minority students, the effect of financial assistance not only on enrollment rates but also on persistence is relevant if we are to understand the relationship of financial aid to minority students' attending college (Nora and Horvath 1989). Very little data are available regarding the effect of financial assistance on minority students' persistence; however, some studies (Astin 1975; Astin and Gross 1979; Nora 1987) suggest higher positive effects on persistence rates for minority students who received grants and campus-based aid.

Allocations for financial assistance have been severely reduced in the past decade. In the 1960s and 1970s, increased access and participation were expressed concerns, and the federal government responded by directing federal outlays to individual students through financial assistance. In 1975, student aid totaled 72 percent of federal spending in higher education. The importance of the government's financial aid for minority participation in higher education can be seen in the fact that much of the enrollment of minority students in public colleges was the result of federal initiatives and incentives, particularly financial aid programs (Green 1982). Since then, most of the government's financial aid initiatives that were instituted have been consistently and drastically cut back.

The rapidly escalating cost to attend college is a major factor in a student's decision to go to college. But at the same time, costs are soaring, sources through which financial assistance is available are becoming more scarce, and those that are available have largely changed from non-repayable grants and scholarships to loans (Hardesty 1990). A study of enrollment patterns in five major metropolitan areas links declining minority access to increasing costs and limited financial aid (Orfield and Paul 1988; see also Allen 1988 and Orfield 1988). Further, financial assistance is more and more awarded based
on academic achievement, leaving academically less prepared students with few options. For minority families already in difficult financial conditions, assuming the responsibility of paying back large college loans is simply not viable (Or. field 1988).

Other rationales also support the case for avoiding reliance solely, or even mostly, on loans for financing a college education. The type of aid and the make-up of the financial aid package students receive might also be important factors in both access and persistence. A study of the effects of financial aid on access to higher education concludes that financial aid packages that include a combination of grants, loans, and work appear to be more effective in promoting access than giving minority students loans as the only form of aid (St. John and Noell 1989). Studies have also indicated that students who receive diversified financial aid packages, including federal and state grants (Porter 1989) and work-study programs (Olivas 1986), are more likely to persist in college. It is also interesting to note that some minority groups hold cultural biases against borrowing (Thomas Mortenson, cited in Hardesty 1990).

While the principal barrier concerning financial aid is the lack of available funds, for many minority students, the first—and for some, insurmountable—obstacle is the process of applying for financial aid. The problem begins with access to basic information about what is available and how to apply for it. Often at a disadvantage in obtaining accurate and timely information, minority students can easily miss filing deadlines and therefore potential opportunities (Fields 1988; Olivas 1986). Advisers can help in compiling financial aid forms correctly and providing accurate information concerning the student's actual financial needs.

A financial aid adviser to American Indians in the New York area reports that many American Indians tend to shortchange themselves when filling out financial aid applications. One way is by reporting high hourly salaries for their parents without reporting that work is seasonal or that high commuting costs must be paid. Another common error is reporting ownership of one's home when the house is on Indian lands. Because such houses cannot be used to secure bank loans (Indian lands are held in trust by the federal government), they should not be counted among the family's assets, which contribute to the amount of parental contribution (Wiley
Besides compiling accurate aid applications, another important consideration for American Indians concerns the schedules of federal, state, and tribal payments. Because the actual funds frequently arrive after tuition and other costs are due, students are unable to begin classes on schedule (Wiley 1989).

The rising costs of higher education have been cited as a major concern for most Americans. For people of color, three times as many of whom live below the poverty level, they are often the deciding factor in getting an education or not. Special programs focusing on financial aid can facilitate recruitment and are one way to bridge the gap. The Association for Loan Free Education assists low-income minority students with grants and counseling about financial aid in addition to its other academic and personal services (Hardesty 1990).

At the University of Rochester in New York, undergraduate minority students are recruited to the university with a view to graduate school through an innovative program called "Fifth Year Free."* The financial incentive of tuition-free graduate study can be an alluring prospect for entering freshmen.

Recruitment and Retention

A study of student retention notes that the relationship between recruitment, admissions, and retention is a pertinent but, until recently, neglected phenomenon (Lenning, Beal, and Sauer 1980). Students are more likely to stay in college if they make informed decisions based on a sense of their personal and academic needs, on the one hand, and a knowledge of the institution and its programs, on the other. Postsecondary institutions need to provide students with adequate institutional and program information so that they can make decisions that will best allow their educational needs to be met.

Studies have shown that geographical region, institutional size, the setting (rural, urban, or suburban), school selectivity, and costs are some of the factors that count toward students' satisfaction and ultimately affect their chances of success (Astin 1975). For minority students, who may have special financial and academic requirements and interests related to diversity, elements like the ethnic mix of the student body and faculty, the availability of ethnic studies programs, the location of the school in relation to home, the availability of

special support programs and services, and provisions for financial assistance are especially important.

The objective of recruitment has been to enroll students in colleges with little concern as to the match, or fit, between the student and the institutional environment (Lenning, Beal, and Sauer 1980). Without an understanding of students' needs and the provision of programs and services that are responsive to them, however, the likelihood of retention is less than it could be.

Characteristics of students and the college environment that influence minority students' chances of staying or leaving include:

- Academic preparation before college (high school grades are an important predictor of college retention, much more so than standardized test scores);
- Good study habits and a college preparatory high school curriculum;
- Socioeconomic factors, such as parents' income and education, and the need to maintain a full-time job while in school;
- High self-ratings in academic ability;
- Relative youthfulness at the time of entering college;
- Attendance at an integrated high school (for African Americans and Chicanos);
- Initial enrollment in a four-year college as opposed to a two-year college;
- A higher quality institution;
- Financial aid, especially grants and scholarships;
- Residence on campus;
- Choice of field of study (for both minority and white students, better grades are achieved in the arts and humanities, social sciences, and education than in the natural sciences, engineering, and premedical curricula) (Astin et al. 1982, p. 178).

A survey of colleges and universities reports that different types of institutions identified negative characteristics of the campus in different ways (Beal and Noel 1979). In two year public schools, conflict between classes and jobs was most important, but in four year institutions, the most important factor was inadequate academic advising. Other studies sup
port the contention that academic advising is an important factor in retaining students in college, in part because of the opportunity it provides for interaction with faculty and counselors (Astone, Nuñez-Wormack, and Smolikak 1989, Glennin and Basley 1985; Mancini-Billson and Brooks-Terry 1987). The campus characteristic considered most important by all four campus types, however, was "a caring attitude of faculty and staff" (Beal and Noel 1979). For students prone to dropping out, almost all institutions reported low academic achievement and limited educational aspirations as their two most important characteristics (pp. 2, 9).

Other research defines the university as an enclosed social system with two subsystems, the academic and the social, into which students integrate and suggests that alienation from these subsystems contributes to dropping out (Langer 1987; Mallinckrodt and Sedlecek 1987; Nora 1987; Tinto 1987). A growing body of literature concerns retention as it is affected by noncognitive variables (Gosman et al. 1983; Pascarella and Campbell 1983; Pratt and Fedler 1982). While the quality of academic preparation has been shown to have the most frequent and significant relation to persistence, it is not the only variable that has proved to be important (Astin et al. 1982).

For example, the incidence of academic dismissal represents only 20 percent of all dropouts nationally, and voluntary departure, despite a sufficient GPA, results from other factors, most importantly the "nature of individual social and academic experiences in college after entry" (Tinto 1989, p. 3).

The relative importance of academic, social, and economic factors in minorities' participation and success in college cannot yet be stated conclusively, but studies of attitude and perception also indicate that, in addition to academic preparation, several other factors bear on these students' chances for success. Feelings of social estrangement (Suen 1983) and socio-cultural alienation experienced in feelings of cultural domination and ethnic isolation (Loo and Robison 1986) are evident among minority students at predominantly white universities, and attrition may be just as much a function of them as of academic factors.

As a result, improving access and success in higher education requires a change not only in the students who are entering but also in the policies and practices of the institutions themselves (Astin et al. 1982).
Recruitment and Transfer

Much of the effort in recruiting minorities into postsecondary education has focused on increasing the number of students who make the transition from high school to college. A large pool of minority students already enrolled in community colleges, however, are an untapped resource for minority recruitment into four-year institutions (Sanders 1987). Disproportionately large numbers of minority students who go to college attend two-year schools (43 percent of all African-American undergraduates, 55 percent of Hispanics, and 57 percent of American Indians). Together, these students make up about 30 percent of community college enrollments (U.S. Dept. of Education 1989, updated 1990) and are the least likely to continue their education at four-year institutions (Crook and Lavin 1989; Orfleld 1988). In Florida and California, where 76 and 85 percent, respectively, of all minority students begin their educations in two-year colleges, this reality is sobering (Commission on California 1983, 1985; Commission on Florida 1984).

Compounding the problem is the fact that minority students are not randomly distributed among two-year colleges; because most live in predominantly minority communities and commute to local colleges in their neighborhood, they are concentrated in a relatively small number of schools, where they make up more than half the enrollment. In fact, it has been suggested that the problem of transfers exists mainly at those institutions where most minority students enroll, that transfer is a “qualitatively and quantitatively different experience” in the two-year colleges attended by most minority students (Richardson 1988, p. 2; see also Commission on California 1985). The California community colleges with the highest population of African-American and Hispanic students transferred few, if any, students to the University of California (Orfield 1988). Furthermore, a study of community colleges in eight cities found that, in most cases, “minority students were less well represented among transfer cohorts than among community college students, and within community colleges, minority students were not proportionately represented in high-demand, selective programs . . .” (Richardson 1988, p. 3, citing Richardson and Bender 1987). In fact, according to the American Association of Community and Junior Colleges, about 35 percent of all two-year college students are enrolled in academic transfer curricula, while
the remainder are in vocational education programs.

Determining the actual number of students who transfer from two-year to four-year institutions poses a question that, according to some, is presently impossible to answer (Cohen 1987). The issue involves two principal problems: (1) The data referring to transfer are relatively scarce, and (2) the parameters for measuring transfer have not yet been firmly established. No generally accepted description of just what constitutes a transfer exists, and different institutions consequently use different definitions, inevitably resulting in diverse findings that are not strictly comparable (Cohen 1987, 1990).

A precise definition has been proposed (Cohen 1990) that, if accepted, could prove to be an important step toward resolving the fundamental problem of inconsistent data. Making more data available, however, will depend on the willingness of higher education systems and individual institutions to recognize the importance of conducting such studies.

Given the complexity of the issues surrounding the matter of transfer, this subject is one of the most important in the literature regarding minority students (Bender and Blanco 1987; Cohen 1987, 1990; Cole 1986; Olivas 1986; Rendón and Nora 1988; Richardson 1988).

One of the missions of community and junior colleges is to prepare students for the first two years of a baccalaureate degree (Cohen 1990; Velez and Javalgi 1987). The reasons few minority students actually succeed in transferring to and graduating from four-year institutions are varied. First, many minority students are not placed in academic transfer programs when they enroll in two-year community colleges. Low income students especially, because of financial and family obligations, are faced with conditions that motivate them to choose vocational programs leading to more immediate job opportunities. A lack of adequate counseling and advisement precludes them from exploring other options and from possibly reordering their priorities (Olivas 1986). Being enrolled in an academic transfer track increases the likelihood of acquiring a bachelor's degree. Students at CUNY who were enrolled in a liberal arts curriculum, for example, were “substantially more likely” to obtain a baccalaureate degree than students enrolled in vocational programs (Crook and Lavin 1989). Second, minority students in two-year colleges are often academically unprepared for higher education as a result of inferior elementary and secondary school preparation.

**Being enrolled in an academic transfer track increases the likelihood of acquiring a bachelor's degree.**
which can result in low GPAs and prevent them, in many states, from entering four-year colleges. In other cases, although students might enroll in four-year programs, they encounter academic difficulty severe enough to cause them to drop out. Third, four-year colleges typically reserve few spaces for transfer students. Consequently, competition for these seats is strong, eliminating all but those with the highest GPAs (Nuñez-Wormack 1989). Fourth, even when admitted to a four-year college, many students discover that a significant number of credits earned at the two-year college are not accepted toward the four-year degree, translating into extra time, effort, and money beyond the expected two years to complete the baccalaureate degree and frequently resulting in attrition (Cole 1986).

Other researchers have investigated the problems surrounding transfer from different perspectives. Four principal obstacles to transferring for minority students include:

1. The poor communication of transfer requirements;
2. The lack of computerized data base systems coordinated with four-year institutions for the purposes of advising students on transferring;
3. Complex procedures for admissions and registration;
4. The lack of financial aid (Castillo 1984).

Hispanic and African-American students have reported unavailable financial aid as the most serious problem they face in transferring (Alvarez et al. 1984). At Mesa Community College in Arizona, over 94 percent of American Indian students expressed concern about financing their education (McIntosh et al. 1987).

A study using the data base from the National Longitudinal Survey investigated the effect on transfer of four predictors: personal background, academic processes, psychosocial process, and institutional integration (Velez and Javalgi 1987). Among the findings: Even for students with low socioeconomic status, the likelihood of transfer is high when the students also have high aspirations and good grades. Additionally, facilitating transfer to four-year colleges does not necessarily facilitate graduation.

Some state systems of higher education have instituted policies that address the problems of transferring. The Commission on Florida State Postsecondary Education, for example,
created a policy in 1984 facilitating admission to four-year public colleges for students holding degrees from community colleges. Similar policies exist in other states, including New Jersey, California, and Michigan. These policies address questions regarding admission to senior colleges or the number of credits accepted. In Florida, Barry University and the University of Miami have considered the issue of credits lost during transfer. While admissions standards remain at these private four-year colleges, special agreements have been made stipulating that, for students who are admitted, all credits accumulated at the two-year college will be accepted (Cole 1986).

One stumbling block in developing articulation agreements between two-year and four-year colleges is that of curriculum. In many cases, the curriculum for the same major is different at the community college from the curriculum required at the senior college, resulting in students having to take substantial additional credits to complete the baccalaureate degree. Even when courses coincide, four-year colleges frequently do not accept all of the two-year credits because of factors related to standards and quality, also resulting in having to repeat credits. In another case, the four-year college might accept most of the two-year credits but assign them to the categories of electives and general education only, requiring the student to repeat completed courses in the major at the baccalaureate institution. One of the important areas in recruiting minority students is the development of articulation agreements that will overcome barriers related to curriculum, which so often discourage students from pursuing a baccalaureate degree.

Interinstitutional collaboration to effect better opportunities for transfer is also one of the key recommendations of a special report describing the recent emergence of a new kind of community college, the tribally controlled colleges of American Indians (Carnegie Foundation 1989). Twenty-four community colleges founded and controlled by American Indians and operating mostly in the North Central and northwestern states from Michigan to Washington offer a conventional college curriculum. At the same time, these institutions view Indian culture as their "curricular center." Reaffirming tribal traditions, these colleges also offer courses in native language, story telling, history, and arts.
Beyond the classroom, traditional values also are embedded in the very spirit of these institutions. Cooperation is valued, for example. Respect for elders is encouraged. Differing ideas about how time should be managed and how people should interact with each other are understood and accepted. In mainstream institutions, Indians find their own values undermined; tribal colleges reinforce the values of the Indian culture (Carnegie Foundation 1989, p. 4).

In its recommendations, the report urges that connections be strengthened between tribal colleges and non-Indian higher education, especially through the transfer of credits to four-year institutions and the development of cooperative degree programs. Many successful collaborations between tribal colleges and four-year colleges and universities have been established, including Oglala Lakota College with the University of Colorado, Black Hills State College with the University of South Dakota, and Little Big Horn College with Montana State University. Recruiting transfer students from tribal colleges may be a successful strategy in itself. Evidence suggests that students who complete their degree in a tribal college and transfer to a non-Indian college are better prepared socially and academically. According to a study at the Center for Native American Studies at Montana State University, graduates from tribal colleges "are at least twice as likely to succeed in a non-Indian college as Indian students who did not first study at a tribally controlled institution" (Carnegie Foundation 1989, pp. 77-78).

Responding to some of the problems of transferring for minority students in general, other innovative recruitment programs have been developed, such as joint admissions and proactive transfer. In joint admissions programs, students are accepted to both the two-year and the four-year institutions simultaneously. Such is the case in a program between LaGuardia Community College of CUNY and Vassar (Rodriguez 1988). In proactive transfer programs, a recruiter/counselor from the four-year college, working with counselors from the two-year college, identifies potential transfer students in their first semester at the community college. These students receive academic support services, enrichment activities, and counseling, all sponsored by the four-year institution. Such a program exists between Glassboro State College in New Jersey and its feeder community colleges (Ryan 1986).
An interesting concept presented in the literature and responding to the finding that being enrolled in an academic transfer program increases the likelihood of transfer is that of a "transfer college" within a community college. Students participating in the transfer college would be exposed to close contact between students and faculty, peer support, networking opportunities, and the staff's high expectations, in addition to other benefits (Rendón and Nora 1988).

The difficulty surrounding the subject of minority students' transferring is couched in a complex set of circumstances involving all of higher education. Matters of curriculum, faculty resistance, state and local bureaucracies, and financial constraints pose real challenges to the higher education community. Some of these challenges are being addressed by state and national programs, such as the Exploratory Transfer Institute (ETI), a collaboration between the University of Arizona and Pima Community College. The mission of the institute is to encourage students of color who are not considering transfer to attend summer institutes at the university, exposing them to a world they might not otherwise have considered (Elvin and Wood 1989). Another initiative, a project of the United Negro College Fund, involves 16 universities and 10 community colleges in the South. According to the Fund, the institutions work together to increase the number of African American students, in particular men, who receive baccalaureate degrees.
INSTITUTIONAL CLIMATE AND CAMPUS PLURALISM

Pluralism is a euphemism camouflaging the deep-seated conflicts that rage throughout the corridors of our economy, beliefs, and values. And some of the conflicts that prevail in the political arena originate on campus. The campus, despite its frailties and inadequacies, continues to be the major seedbed for next-generation ideas. Higher education, in the splendid chaos of its courses and the wild array of its activities, reflects the larger society and presages its future (Enarson 1984, p. 24).

For many minority students, college life is their first independent experience in a predominantly white environment. The ethnic heterogeneity in society is not indicative of most minority students' individual lives, because many minority youth grow up in ethnic neighborhoods, attend mainly minority schools, and socialize with people of their own ethnic backgrounds. The circle of family, friends, and community before college is therefore one of social and cultural continuity. For these students, going to college can be a kind of culture shock. One brief glance around the room at orientation can quickly sum up a new reality. Without any structures for support and inclusion, their feelings of isolation can only intensify (Forni 1989; Smith 1980), as white students and professors predominate in classrooms, and the courtyards, cafeterias, and dormitories fill with others who are so much like each other and so little like themselves. The transition required, suddenly and not really by choice, is a difficult and lonely one to make.

From the minority student's perspective, the climate of the campus is made up of all the subtle and not so subtle ways in which attitudes are expressed: the response with which one is received in the cafeteria, at the bursar's office, and in the bookstore; the degree of attention extended in the tutoring center or in the classroom and library; whether or not nonwhite culture is visibly reflected among the people, in the curriculum, and in the social and cultural programs available. The quality of the campus climate and the degree to which it is welcoming, indifferent, or openly hostile toward a minority presence are not simple to measure.

Perceptions of whether or not a campus is hospitable to minorities differ to an important extent between minority and white students (Loo and Rilison 1986). Surveys at predominantly white campuses repeatedly indicate the disparity
between whites' and nonwhites' impressions of similar circumstances, which may lead to misconceptions of minority students' behaviors. Even though no incidents of overt racism are recorded on a campus, an inhospitable atmosphere could exist, affecting minority students' ability to cope and their determination to stay.

**Curriculum**

Colleges and universities are presently engaged in an intense debate over curricular reform that is of immediate interest to minority and Third World students. The subject is being discussed in all sectors—large prestigious research universities to local community colleges, conservative and liberal institutions, public and private institutions. Proponents of reform contend that the present curriculum excludes to a large extent the points of view of women and of minority cultures, while opponents argue that matters of race, ethnicity, and pluralism are inherent in classical inquiry, and reform is therefore unnecessary (Himmelfarb 1988).

Response to the issue of curricular change has taken a variety of forms and covers a wide spectrum. In some institutions, it has meant creating courses that focus on specific ethnic cultures (Zita 1988). This approach aims to educate students cross culturally, an objective that could be confounded when students elect only courses that focus on their own social or ethnic group (Olstad et al. 1983). Courses of this nature could be more or less effective, depending on whether or not they are included in the college's core curriculum as a requirement. Curricular change has also been instituted through the revision of the composition course, usually a college requirement, by using multicultural subject material about which students can read and write (Clark 1987).

At some institutions, such as the University of California at Berkeley, changing the curriculum has been viewed as one aspect of a broader initiative to infuse the principles of cultural pluralism throughout the culture of the university. In these instances, a major institutional effort has been made to "heighten faculty awareness of the historical, social political, and ethical bases of their disciplines with respect to race, class, and gender" and to infuse these perspectives in courses throughout the curriculum (Nicholson et al. 1989, p. 1). At Rider College in New Jersey, a project of this nature included four main components: (1) a public symposium
featuring recognized scholars that explored the various aspects of curricular integration, followed by workshops for participating faculty; (2) a collaboratively designed interdisciplinary course directly addressing the issues of race, class, and gender; (3) a faculty development program in which faculty from various fields each created annotated bibliographies and revised a course in their discipline to incorporate the issues in the stated areas; and (4) a focus group, in which eight African American female students and four faculty and staff explored the issues of race and gender on the campus (Nicholson et al. 1989).

Reform has also taken place in teacher education. The National Council for the Accreditation of Teacher Education has recognized the need to prepare future teachers to understand the cultural backgrounds of the increasing number of racial and ethnic minority children they will be teaching, requiring teacher education programs to include a multicultural component as part of the teacher education curriculum (Bermingham et al. 1986). Again, the breadth and depth of a particular institution’s response depends on the degree to which the underlying philosophy of multicultural education has been accepted (Grant 1983).

As colleges embrace the change and incorporate nonwestern perspectives in their curricula, a new dimension will be added to the criteria students consider when selecting an institution of higher learning. It seems evident that institutions that choose to include minority perspectives in the curriculum will be perceived as being more responsive, tolerant, and committed.

**Critical Mass**

*Responding to a question about why she chose to attend a particular college, a young student put it succinctly: “There are other minorities there, so I don’t have to feel like a Martian.”...No matter how outstanding the academic institution, ethnic minority students can feel alienated if their ethnic representation on campus is small (Too et al., Rolison 1986, pp. 69, 72).*

In this context, the existence of a critical mass means having enough students around who are like oneself so as not to feel isolated, uncomfortable, and alone (Formi 1989; Smith 1980). One element in the nebulous concept of campus climate, crit
critical mass is perhaps the most concrete, the simplest to understand. The term is usually applied with regard to the "comfort factor," the degree to which students feel as though they are part of the campus community as opposed to feeling like outsiders—alien, marginal, unimportant.

*Being "the other" means feeling different; is awareness of being distinct; is consciousness of being dissimilar. It means being outside the game, outside the circle, outside the set* (Madrid 1988, p. 56).

It is easy to feel like an outsider to the community when the community is made up mostly of "others."

Feelings of discomfort stem from a variety of sources. The academic difficulty that many minority students experience can compound the feeling of not fitting in, making it doubly difficult to adjust (Green 1989). Knowing that others are around with whom to identify can facilitate adjustment, and seeing that other minority students have succeeded can affirm the value in the effort. The academic benefits and the effect on persistence of being among others of the same background may be significant. While the practice is not necessarily typical of or endemic to ethnic minorities, the strategy of forming study groups was shown to be a common and effective tool among one group for improving their academic success rate in a very challenging course (Teisman 1985). The presence in sufficient numbers of students from the same racial and ethnic background is clearly a prerequisite to forming ethnic support groups, whether they are academic, social, or personal.

As concrete as the concept of critical mass may be, it raises important questions with regard to the various ethnic subgroups embodied in the category of "minorities." Who is included in a critical mass for American Indians? Are they the same students with whom Chicanos will feel an affinity? Does the presence of African American immigrants, from Nigeria or the Caribbean Islands, for example, increase the comfort factor for African-Americans at a predominantly white college? The group with which a person identifies is probably influenced by many factors besides ethnic origin. Only a few of them may be social class, duration of time in the United States, native language, and educational background. A Hawaiian student studying at Hunter College in New York, for example, in discussing her experience with other Asian students, noted:
In Hawaii, we never talked much to different Asian students. Most of my friends were “locals.” At Hunter, you can meet first-generation students from Hong Kong and mainland China. Most of these students are from working-class families. At first, I was surprised that, even though our backgrounds are different, we share a lot of common ground. I also understand better what these first-generation students have experienced (Bagasao 1989, p. 34).

Institutions with a genuine interest in understanding what constitutes an identity group for the various ethnic minorities on campus might consider investigating the question through surveys of the minority student population, counseling sessions, or informal small-group discussions.

**Role Models**

In general, minority students have not had much opportunity to see people from their own ethnic backgrounds in prestigious and authoritative positions in society. Students who are first in their families to go to college are not prepared for the demands and have nonspecific educational objectives as well as an “inadequate understanding of the relationship between higher education and career goals” (Richardson 1988, p. 6). The mere existence of minority faculty and staff who make decisions, provide direction, and influence policy within the college community can have a powerful effect on a young and impressionable mind. While most students are challenged and motivated enough when they arrive on campus, the daily routine, the unfamiliar responsibility of independence, and the constant demands of college can cause students to lose sight of the benefits a college education can bring. The presence of successful people of color can have a motivating, positive effect.

Minority students frequently seek out minority faculty role models for academic advice and counseling. Connecting with someone who can identify with their personal situation is felt to be important, and relationships are established either through the formal procedures or informal networks. At many colleges and universities, the benefit of creating links between students and faculty from the same ethnic background has been recognized as being instrumental in students’ development and persistence. Faculty mentors act as friends, advisers, and confidants, and students accept them as people who

The presence of successful people of color can have a motivating, positive effect.
can show them the ropes because they have had similar expe-
riences in similar circumstances.

Other important role models at the institution include
administrators and staff, whom students may not see as reg-
ularly but who often provide valuable assistance. For many
students, minority people in positions of leadership and influ-
ence are rare. More important, however, is the integration of
values from other cultures into the institutional structure that
minority administrators bring with them. A minority student
who, for example, needs special intervention because of cul-
tural obligations that conflict with a college responsibility may
find himself or herself better understood by an administrator
who understands and can communicate to others the values
of his or her culture.

Whether a student consciously selects a campus because
of the presence of people of color in the professional ranks
is uncertain. The benefit role models provide, however, while
perhaps not tangible, objective, or easily measured, is clear.

**Programs Enhancing Diversity**

*If we have learned anything from our relationship with the
Native American, it is that people cannot be torn from their
cultural roots without harm* (Nuss 1989-90, p. 3).

**Ethnic studies programs**

Clearly, the inclusion in the curriculum of ethnic studies pro-
grams is an indication to students that the institution supports
them and their experience. The existence of academic pro-
grams in ethnic studies demonstrates the institution's recog-
nition of their inherent value and affirms the experiences and
perspectives of minority cultures on the world scene. For most
minority students, the opportunity to learn about the history
and culture of their ethnic heritage has been limited, as the
curricula of most secondary schools is just beginning to reflect
the diversity of cultures in America. Such a program in itself
could be a strong attraction and an inducement to participate
more actively in other areas of minority campus life and in
campus life in general.

As noted earlier, minority students gravitate to programs
and places where they can enjoy shared experience. The
attraction of ethnic studies is therefore also a matter of people.
An African American studies program, for example, is sure
to provide an environment where shared African-American experience will predominate. The professors and the students are likely to be African-American, the program of study personal and "relevant." For students whose native language is other than English, the additional attraction of dialogue in their native language will, at least in part, be possible.

**Academic support programs**

The literature is clear about the importance of academic support programs in developing students' basic skills and the impact that such programs can have on retention. For many students who enter the university underprepared, these programs provide the supplemental instruction needed to achieve and the emotional and psychological support needed to survive. The staff of tutoring/learning centers often become the persons with whom they can connect. Such individuals assist minority students in adjusting to college, meeting their academic responsibilities, and negotiating the system.

Students look for programs where they will feel welcome, and they gravitate to people who will listen and who care. It is frequently in these programs where they find refuge (West, Simpson, and Jones 1975). And minority students are quick to share these positive experiences with others in the college and in the community at large.

**Social programs**

Offering opportunities for minority students to join clubs and organizations that can provide academic enrichment as well as social rewards is important. For most students, belonging to a group that fosters and promotes their cultural or ethnic identity can be extremely gratifying. Such opportunities to meet with others like themselves are limited on campuses where few minorities are enrolled, and social activities can provide a stimulating way to meet new friends and establish helping relationships. Many organizations for minority students become involved in civic or community projects, which establish a kind of bridge between the old neighborhood and the new campus environment and allow them to return to their communities as "educated" persons who still care. On residential campuses where minority students are not able to go home for holidays because of financial constraints, friends become their bridge to a new extended family.
Social functions and artistic performances, including ethnic celebrations, such as festivals, theater, and dance, also play an important part in attracting minority students to campus. Opportunities for self-expression and cultural development are integral to personal fulfillment.
THE RECRUITMENT PLAN

Colleges and universities have developed a variety of innovative strategies for recruiting minority students. The key to effective recruitment, however, is not only in the strategies themselves, but also in the way they are incorporated into a larger design. Recruitment should therefore begin with the design of a plan. The type of recruitment plan a college develops depends on many factors: the institution's mission, the targeted minority groups, the abilities of the students to be recruited, and the resources allocated to do the job are only a few. And these factors are not mutually exclusive: The mission of the institution, for example, might delineate the range of abilities of the minority students it will plan to recruit.

Given the wide array of characteristics of institutions across the nation, the scope and methods of each college's recruitment plan will vary.

Despite these variations, however, research has shown that a comprehensive plan will meet five basic conditions:

1. It will be culturally sensitive, demonstrating an awareness of the cultures of the various minority populations.
2. It will be based on a recent assessment of minority student enrollment.
3. It will be integrated with the institution's broader educational objectives.
4. Its objectives will be stated in terms that are sufficiently specific so as to permit a thorough and detailed evaluation.
5. It will be holistic, incorporating all the principal constituencies of the institution.

Developing the recruitment of minority students as a comprehensive institutional initiative requires a considerable investment of time. Setting up committees, collecting data, engaging participants in healthy debate, arriving at consensus are phases of development that could require years instead of months. In addition, the delicate work of encouraging key people to participate, sustaining a productive level of involvement, and drafting preliminary versions of the plan are essential to the process before a final plan is rendered and the institution is ready to move to implementation.
Basic Elements

Cultural awareness: The backbone of minority recruitment

African-American, Chicano, Puerto Rican, Navajo, Mohawk, Vietnamese, Colombian, Filipino—the languages and cultural values of all these students vary greatly from mainstream America, and these differences must be understood and reflected in the design and implementation of the recruitment plan. Educators may be aware that minority students' language and culture are different from each other and from the majority, yet this reality has rarely been considered important enough to influence recruitment. Understanding the cultural values of the minority students the college wants to recruit might require a special effort, but it really is essential groundwork if these students are ever to become an integral part of the university (Green 1989; Madrid 1988). Many more students could be reached if the approach taken to recruit them were understanding of or, at the very least, not in conflict with their cultural values. The messages the institution conveys can present the college as a place students and their families can feel comfortable about or as a place where the environment seems alienating and unacceptable of their differences. Several categories of cultural characteristics are important to know about when formulating strategies for recruitment.

Family. Traditional cultures depend heavily on the support system provided by the family. Families are frequently extended, and the value of respect for elders both inside and outside the family is strong (Dupuis and Walker 1988). These young people are not accustomed to spending long periods of time away from home, and they might be apprehensive about being on their own. Away from the support of their families, they can feel incomplete and lonely (Carnegie Foundation 1989). They might question their ability to make proper decisions on their own. Beginning with the selection of the school and continuing to the selection of a major, the family's influence can be decisive, and it will more likely than not be respected. Depending on the distance from or proximity to traditional values, virtually all of the ethnic and racial minority groups and subgroups have populations to whom this cultural description of family applies. If an institution wants to recruit American Indian students, for example, an awareness of the importance of the family network to those
students' well-being must be demonstrated in the recruitment workshops and seminars they will attend. Parents and other family members should be encouraged to participate, accommodated at the seminar, and addressed directly. If possible, they should be greeted in their tribal language. Recruiters should make personal appointments, perhaps at home, with those families who may have concerns not addressed at the seminar.

**Normative social structure.** In many minority cultures, the social organization is more formal and less flexible than in American society. Prescribed roles within the culture mean that individuals work together to achieve common goals. Unconventional behavior that does not conform to the norms of the group is frowned upon, and social pressure is exerted on those who exhibit behavior that serves individual rather than community goals. Individuals are expected to put aside interests that could conflict with the good of the group, and cooperation is valued highly. These social conventions could result in passive and unobtrusive behavior in group settings (National Coalition 1988). Because this social organization exists in Asian cultures, recruiting Cambodian or Laotian students, for example, should involve individual or one-to-one contact. Recruiters must be willing to supplement the larger group format with private consultations so that students will have an opportunity to express their own interests and apprehensions. Individual contacts could be conducted in a formal manner, consistent with the student's culture.

**Group Identity.** Relationships with others in the community are important in the cultures of minorities. Interpersonal relationships weigh heavily in the individual's cultural experience (Bowler, Rauch, and Schwarzer 1986). The opinions of others who are held in high regard, whether family or friends, matter a great deal, and the importance of belonging to a community and identifying with a set or subset of that community is strong, bringing with it a sense of group bonding. Consequently, loyalty to the group is valued highly, and actions that signal a separation from the group can result in feelings of alienation and misgiving. The group identity may be powerful enough to dissuade the individual from realizing personal objectives that could even be in his or her best interest out of fear of being rejected by the group. Such is the case among
many African-American youth who are potential college students. In recruiting these students, the college must therefore be prepared to go a step beyond the standard program and provide services like counseling to help them work through conflicts arising from this cultural dilemma.

**Cultural concepts of time.** American society is commonly described as oriented toward the future. Intricate planning, delayed rewards, present sacrifice for future gain are concepts typical of American mainstream culture. But these ideas about time do not necessarily exist in other cultures. On the contrary, many minority cultures are much more oriented toward the present (Dupuis and Walker 1988). Concern is focused on meeting immediate needs and solving immediate problems, on living fully in the present and extracting as much as possible from the moment at hand. Because the future cannot be governed, it is addressed when it becomes the present. These ideas about time are manifested in a variety of ways, such as by attending to domestic routines on a daily basis or by organizing and participating in spontaneous, rather than planned, activities. These concepts are directly opposed to many of the organizational and structural requirements at American colleges and universities. For many Hispanic students, whose culture embodies the present time, this discord can create what might be avoidable difficulties. With Hispanic students, recruiters should convey the long-range benefits of college mainly within a context that emphasizes short-term gains. Placing emphasis on what will happen after graduation, four or five years away, will not necessarily motivate Hispanic students to apply to college. Additionally, recruiters should understand that, in many cases, Hispanic students might be interested in college without having planned for it financially, calling for close financial aid and personal counseling during recruitment.

**Dependence versus independence.** All cultures do not share the mainstream ideal of a self-sufficient, assertive, goal-directed individual. In many minority cultures, an almost contradictory set of values prevails. In the Hispanic culture, for example, relying on others for assistance and support is normal social behavior (Oakland and Ramos Cancel 1985), in Asian cultures, being reflective or reserved is not considered a sign of weakness but of appropriate conduct, and among
American Indians, promoting cooperative decision making by groups rather than individuals is valued and fostered (Badwound and Tierney 1988; Dupuis and Walker 1988). Yet the presence of one or a combination of these characteristics, especially in minorities, can easily cause them to be categorized as lacking the capacity to be independent. Colleges and universities must recognize that minority students frequently possess other cultural qualities and characteristics that can support them in being successful, despite the fact they might not exhibit the independence valued in American mainstream culture. Their success will depend largely on the university's accommodation of alternative cultural styles.

**Facts and figures: A solid foundation**

Good planning is based on accurate information. It is important not only to know the facts about minority education in general, but also to understand the situation of minorities at the local institution (Green 1989; National Center 1989). The first element in building a successful recruitment plan therefore is solid institutional research. A careful analysis of data collected by race and ethnicity will accomplish several things. First, it will form the basis for developing various profiles of minority students, indicating who stays, who leaves, when, and under what conditions. These profiles will reveal specific conditions the college needs to know in order to have a complete picture of minority education at the institution. A side benefit of having this factual information is that it will dispel any prevailing myths about the academic profile of minority students. Second, by providing the statistical foundation, an institutional audit will influence the direction or focus of recruitment. For these data to be useful in terms of understanding the subtleties that could affect specific ethnic minorities, it is essential that the statistical analyses be performed relative to each minority subgroup rather than for the groups as a whole. The disaggregated data will flag information that otherwise would go unnoticed. Finally, performing an institutional audit at the outset of planning for recruitment will serve as a benchmark for evaluating the progress and effectiveness of the plan. Minimally, the data collected according to racial and ethnic subgroup should include the following information:

**Overall enrollments.** The most basic statistic to institutional research, this information is rarely collected separately for the...
various subgroups within the major minority categories. Disaggregated data will indicate the proportion of minority students at the institution within each subgroup and the trends in their patterns of enrollment. Reviewed periodically, these data will reveal low enrollments of a particular subgroup and the fluctuations that might occur within each group as a result of migration and demographic changes.

**Retention rates by semester.** It is fundamental to a good recruitment plan to know whether or not minority students exhibit a higher dropout rate than nonminorities and the degree to which it might affect each subgroup. Analyzing persistence by semester for each ethnic subgroup will reveal patterns specific to the institution. Correlated with other factors, this information will aid in developing timely interventions.

**Graduation rates.** The complete picture of minority education cannot be fully understood unless the rate of graduation is known, but it is also important to determine the length of time needed to complete a degree. Consequently, rates beyond the traditional two-year and four-year exit points should be tracked.

**Transfer rates.** The objective of determining transfer rates is to determine the effectiveness of articulation between two-year and four-year programs. Senior colleges should therefore look at the number of minority students who transfer into the college, the point in their academic careers at which they do so, and the two-year schools from which they come. Two-year colleges need to establish the number of students who transfer to four-year programs, regardless of whether they have completed the associate degree.

**Academic performance by semester.** Because GPA has been shown to affect retention and graduation rates, this information should be collected early and reviewed frequently. Understanding the academic profile of each minority subgroup will help determine whether or not recruitment strategies combined with interventions such as academic support programs are indicated. In addition, correlating academic performance and high school origin will indicate the relative academic preparation of students from various feeder schools.
Enrollments by curriculum. Research indicates that, depending on their ethnicity, minority students cluster around certain curricula and underenroll in others. For example, the literature clearly shows that curricula in science and technology attract very few African-Americans, Hispanics, and American Indians. In fact, enrollments among these students in the sciences, mathematics, and engineering are so low that some researchers consider this fact to signal a national crisis, given the changing demography of the country. For Asian-Americans the problem is the converse: High numbers of Asian students enroll in science and technology, while few enroll in the social sciences.

Identifying minority enrollment rates in each curriculum will determine the degree to which this phenomenon occurs locally. An institution can design interventions and direct recruitment efforts to help counterbalance these trends, although it should be recognized that this issue cannot be addressed through recruitment alone.

An integrated design: Linking objectives
Another principal characteristic of an effective recruitment plan is that it be constructed from an institutionwide perspective (Pulliams 1988). Because recruitment is a starting point and not an end objective in minority education, it should be integrated with other institutional goals (Christoffel 1986). Involvement in both the academic and the social aspects of college life are important determinants in the success of minority students in higher education (Langer 1987; Mallinckrodt and Sedleck 1987; Nora 1987; Tinto 1987). Architects of the recruitment plan must recognize that such factors as social integration, academic performance, retention, and campus pluralism are closely related to recruitment. Research conducted in these areas will provide the basis from which to establish these connections.

Factors that surface in the institutional audit, such as low graduation rates, could indicate problem areas for minority students that cannot be resolved through recruitment as an isolated function. This information is nonetheless valuable to recruitment, because it will place the institution in a better position to integrate recruitment with other institutional initiatives related to minority education. For example, if the low graduation rates of Vietnamese students were determined to be a result of limited proficiency in English, a strategy could
be designed that simultaneously addresses the academic preparation of potential Vietnamese students, such as a high school/college collaborative program focusing on instruction in language. Such an initiative would ensure that the students the institution is recruiting are academically prepared to succeed and ultimately to graduate.

Relative to social integration, an institution might determine through research that African-American students who are actively involved in clubs or other organizations fare better than those who are not. By using this information in recruitment, the institution can accomplish two goals: to devise a strategy for recruitment specifically related to these findings and to address the retention of newly enrolled African-American students through better social integration. This goal might be accomplished, for example, by reviewing the application and general intake forms of African-American students to identify their special interests, perhaps playing a musical instrument, working on the school paper, or participating in student government. A system could then be devised to match these students’ interests with existing clubs and organizations on campus and to arrange personal contact through these offices with these potential students. With a holistic, multifaceted approach, this strategy combines both the recruitment and retention of African-American students through social integration.

Ethnic studies centers, departments, or programs on campus have been recognized in the literature as important elements in the education of minorities. A college might determine from its own institutional research, for example, that American Indian students who regularly attend programs and participate in activities at the Native American center on campus are better able to negotiate the university system and to establish stronger social networks with other American Indians. To capitalize on one of the institution’s identified strengths, the Native American center should be fully integrated in the college’s recruitment plan, perhaps by engaging the faculty and staff of the center in recruitment. Ideal role models, these individuals can relate to the American Indian community the center’s programs and activities by addressing small groups at local schools, visiting potential students at home, and telephoning prospective students. By combining recruitment with the people and activities of an ethnic studies center, this strategy addresses social integration on campus.
and the "comfort factor," two variables in the persistence of minority students.

**Specificity: The key to a measurable plan**

When working toward an objective they believe in, most people want to know whether or not their efforts are carrying them toward their goal and, if not, why not. No one wants to invest time, money, and energy in something that yields no results. Strong evaluation is therefore an essential component of the recruitment plan (Middleton and Mason 1987). As an institutional investment, recruitment is accountable to the college community, and it will be necessary to report on its effectiveness. Faculty, staff, administrators, students—all those who participate in the process—have a stake in its success and are entitled to be kept informed about its performance, whether positive or, on occasion, negative. It is even more important if the project is controversial at the institution. In that case, the frequent reporting of objective facts and figures will help counteract misconceptions.

At the same time, those responsible for recruitment will want to determine whether the human and financial resources invested are being expended efficiently. In an era of shrinking budgets and difficult fiscal decisions, a project of this nature could be vulnerable. In addition to assessing programmatic initiatives, therefore, the financial aspect of the project should be part of the evaluation, because clear and convincing evidence that resources are used resourcefully and responsibly will strengthen the project.

Complete and accurate information concerning the outcomes of the plan for recruitment will require continuous monitoring. Especially fruitful methods should be identified so they can be further developed, while ineffective ones must be assessed and reconsidered. And it will be easier to accomplish if the goals and objectives of the plan are stated in specific, measurable terms. A plan for recruitment whose goals are too broad and undefined can result in limiting rather than promoting recruitment, because outcomes will be difficult or impossible to measure. Vague and open-ended objectives will not indicate whether results are all they could be.

A general and vaguely stated objective, such as "to increase the enrollment of Hispanic students," leaves too much room for unanswered questions. The desired outcome remains ambiguous, inviting subjective assessments of success. For
example, what would prevent a favorable evaluation of this objective even if only three new Hispanic students were enrolled? Or suppose all the new recruits were middle-class Hispanic students from a foreign country or male; would the objective have been met? No one of these outcomes per se is unacceptable; the point is to ensure that the result achieved is the one that was planned for. Stating objectives specifically will force the plan's architects to think each objective through and to articulate it in concrete terms. In this way, the desired outcome will be clear and measurable.

For example, a more detailed plan might explicitly state this objective as follows:

To increase Hispanic enrollment by 5 percent (approximately 50 students). Of this 5 percent:
- At least 40 percent will be female;
- At least six students will be Puerto Ricans from U.S. urban areas;
- At least six students will be Puerto Ricans residing in Puerto Rico;
- At least 15 students will be Chicanos from the Chicago area. The remaining number will be randomly recruited.

Depending on the institution's needs, it is important when defining objectives for recruitment to be specific not only about who will be recruited but also about how it should be approached. In another example, a generally stated objective like "to increase the number of American Indian transfer students" might be made more specifically:

To increase Naraajo transfer enrollments by 50 percent (approximately 30 students). Of this number:
- Five students will be from tribal colleges;
- Six students will be recruited through the Native American studies center;
- Six students will be recruited through a new joint admissions program with an area community college;
- Thirteen students will be recruited through the existing proactive transfer program with an area community college. At least 20 percent of all students will be recruited into science curricula.

Of course, objectives at this level will not be complete until an accompanying set of activities is developed. In the previous
objective to recruit Navajo students, each strategy defined should specify how it will be accomplished and by whom. The strategy using the Native American studies center, for example, might be written as follows:

- Six students will be recruited through the Native American studies center and:
- Counselors will make weekly home visits;
- Native American faculty will conduct small group sessions at targeted community colleges;
- The Dean of Science and Technology will host a group of Navajo community college students visiting the Native American studies center;
- Brochures and open invitations to visit the Native American studies center will be mailed;
- Native American upperclassmen will follow up with phone calls after the mailing.

Defining specific objectives of the recruitment plan will make it necessary for those involved to think through proposed ideas and to express them precisely. The more concrete and specific the terms of the plan, the better able the institution will be to evaluate it, attributing success to the elements that are effective and identifying strategies that do not produce results. Periodic evaluations will provide the data needed to communicate the plan's progress to the college community, an essential component of any institutionwide initiative.

**A holistic approach: The team**

A holistic approach to recruitment incorporates a variety of constituencies, bringing together representatives of each from the initial development of the recruitment plan to the implementation of specific strategies for recruitment (Pulliams 1988; Tysinger and Whiteside 1987). Three principal constituencies are administrators, faculty, and counselors and professional staff.

**Administrators.** Ideally, the initiative of collegewide recruitment should be organized at the presidential or near presidential level (Rivera 1986; Wilson 1986). Leadership at these levels will signal to the college community that creating diversity on campus is a priority and that the administration is committed to accomplishing the goal. Moreover, individuals
from the institution's various constituencies will generally be more likely to participate and cooperate if the initiative comes from the top. Even if organized at some other level, however, it remains important to have the president's or another top administrator's endorsement, because doing so naturally lends authority to the project.

Because a strong effort in recruiting minority students necessitates evaluating present policies and possibly creating new ones, the participation of top-level administrators is fundamental. Many of the main responsibilities of high-level administrators include developing, implementing, and monitoring policy. Depending on the issue, policy might be developed elsewhere in the institution but implemented and monitored by the administration, such as with the case of curriculum.

Considered an academic concern, policy related to the curriculum falls within the purview of the faculty, but it is the administration's responsibility to implement it. On other matters and depending on the institution, consultation with other constituencies could be necessary or well advised to formulate policy, but the final decisions rest with the administration. An example might be procedures for student appeals. Regardless of whether administrators are directly or indirectly responsible for the institution's policies regarding recruitment of minority students, they are central to the discussion. Once a plan for recruitment is operational, the administrators will monitor whether the outcomes of the plan satisfy institutional policies.

Because a collegewide, uninvested perspective is needed to pull a team together to work on recruitment, a primary responsibility of administrators is to recruit and appoint its members. Much of the success of the entire effort will depend on the individuals involved. Consequently, the people responsible for the effort should be respected and held in high regard by their peers; faculty must be tenured, full time faculty with senior rank. Providing broad representation from all sectors of the institution, including student affairs, academic affairs, and special programs, should also be considered. The team must include a full range of people, from those working in front line positions to those in the upper administrative ranks. Attention should also be paid to ensuring representation from various races and ethnicities. With their bird's eye view of the college and their ability to identify individuals
with influence from each area, administrators are in the best position to see that these criteria are met.

In an ideal world, instituting change on campus would be simple to accomplish and would require no additional resources. Realistically, however, any significant effort, such as improving the campus climate and increasing the number of minority students, will almost certainly require resources. Among other things, they may include additional secretarial support, release time for faculty, or more professional staff. Because allocating resources is an administrative responsibility, it requires the support of administrators in positions of authority and influence regarding the institution's budget. Indeed, without committing dollars to this initiative, it is unlikely to yield significant results.

It is the administration's responsibility to communicate with the college community about the purpose, goals, progress, and evaluation of minority recruitment, which will require developing a system of communication in concert with the other constituencies of the project and devising the methods and techniques to disseminate the information to the college as a whole. By reporting on the status of the project at meetings—cabinet, faculty senate, institutional planning, and student government—administrators can ensure that all segments of the college community remain informed and have the opportunity to exchange views.

**Faculty.** Faculty are essential constituents in recruitment for many reasons. First, in the design of the plan for recruitment, policy issues like standards might need to be decided, and faculty are critical in this discussion. And for recruitment to be recognized as an academic as well as an administrative matter, faculty must be involved, because they are the natural advocates for such a position and they are the natural conduits through which it can be enacted. While all faculty, of course, will not be directly involved in the design and implementation of the institution’s plan for recruitment, they could be kept informed through their representatives at governing bodies like the faculty senate. Indeed, by placing the subject of recruiting minority students on the agenda of the faculty senate, it will be recognized as a central rather than a marginal matter.

Second, because a greater minority presence on campus signifies change, the active and informed participation of such
a principal constituency as the faculty is essential for success, especially when the change concerns the student body, with which faculty are so intricately involved. Professors have the most direct and constant contact with students after they enroll. They know students' academic needs, they design curriculum, and they evaluate performance. It is therefore natural they should be in the forefront of the effort to bring new students to campus. As the complexion of the student body changes, faculty should be prepared through an awareness of how the changes were planned for, and they should understand the cultural diversity of each subgroup.

Third, in addition to the important contributions they can make in designing the institution's plan to recruit minority students, faculty are specially qualified to implement certain strategies for recruitment. Through their general knowledge of the institution, its requirements and standards, and the intricacies of the system, faculty are in an excellent position to convey important information to students and parents. More important than all of this, however, is the intellectual excitement many faculty possess for their field. Professors who have a love for their discipline and can transmit that enthusiasm to young and impressionable minds can be the most effective recruiters.

**Counselors and professional staff.** In a traditional model, it is admissions counselors and recruiters who are mainly responsible for identifying, locating, and recruiting students to the campus. While in many colleges this approach has met with some success in increasing the enrollment of minority students, it has a narrow range of participants and as a result might not realize the institution's full potential for recruiting minorities. Professionals in other areas of the institution who have experience working with minority students have much to offer the initiative. Such individuals often have a special commitment to minority students, a knowledge of minority communities, and an understanding of their various cultures. In this category, therefore, key personnel include admissions counselors, recruiters, and the professional staff of minority offices and special programs.

Decades of front line experience make this constituency's contribution significant not only in implementing recruitment but also during design, when the scope and method of the plan for recruitment are being developed. With their wealth
of knowledge and expertise concerning recruitment and minority communities, the perspective of experienced counselors and professional staff can inform the discussion and keep it within the practical realm. Armed with good intentions but a lack of experience specific to recruitment, administrators and faculty might propose unrealistic objectives or initiatives that are not feasible to implement. The participation of counselors and professional staff in the design of the plan for recruitment will balance the discussion.

Counselors and professional staff will execute much of the day-to-day implementation of strategies for recruitment. They will therefore be in the best position to monitor the pulse of the plan and determine its progress. This important work, which might be accomplished through the systematic collection of objective and subjective data, detailed record keeping, and regular reporting, is critical to evaluating progress and modifying future plans. Counselors and professional staff therefore play a vital role in developing systems and organizing the operations relative to evaluation.

This aspect of the role of counselors necessarily calls for yet another dimension of their participation—the timely and thorough reporting to other members of the team regarding the status of the plan. In any collaborative effort, the regular sharing of information among the parties greatly enhances its effectiveness and is fundamental to maintaining cohesion in the project. By communicating regularly, everyone involved will be able to identify problem areas and will be in a better position to offer modifications or solutions.

Models of organization. Members of the recruitment team or committee could be organized in several different ways. The committee could be an institutionwide body organized at the top, reporting directly to the president or another top administrator and transmitting the committee's decisions and recommendations downward through the various committee members themselves and their constituents. In a second model, the collegewide committee would be organized at the midmanagement level, most likely in the recruitment or admissions office, and would probably report to the director of that office. The committee's decisions and recommendations would be transmitted both horizontally and vertically through the recruitment team. Although organized at this level, this model can also be effective if it has strong and com
mitted leadership, most often emanating from the chair. Both models, however, need the endorsement of top administrators to gain the authority necessary to create institutional change.

**Implementation**

An effective, holistic plan for recruitment implies the participation of a broad spectrum of individuals at the college or university, an approach that applies not only in designing the plan but also in implementing it. Individuals representing different segments of the college community— including administrators, faculty, and professional staff—have diverse responsibilities and expertise that are essential if the plan is to be well executed and successful. By capitalizing on all the talents of individuals at its disposal, the institution can create an efficient and cost-effective program to recruit minorities.

A strategy will be more effective with a specific minority group or subgroup if the particular cultural characteristics of that group are considered. The following strategies include examples of the kinds of activities suitable to one or another of the three constituencies described in the previous subsection. To some extent, however, the assignment of a given strategy to a particular category is flexible. Several of these activities require the cooperation and participation of a cross section of individuals from different areas of the institution or even from outside. Many factors can affect the way in which the strategies might or might not apply to different colleges or universities. Institutional characteristics, such as sector, size, traditions, and protocol, will affect potential adaptations of any type of strategy and will determine the locus of responsibility for implementing it.

**Strategies for administrators**

**Alternative admissions.** Traditionally, colleges and universities use high school grades, achievement test scores, class rank, and recommendations as predictors of academic success for determining acceptance. With nontraditional measures, such as alternative admissions, the weighting of these criteria is different (Berger 1988a, Fincher 1975; Martinez Perez 1978). For example, because some minority groups have been shown to perform less successfully on standardized achievement tests (Ascher 1983, Astin et al. 1982; Navarro 1985; Payan et al. 1984), this criterion would not be considered as heavily, while others, such as letters of recommendation, would be...
given more weight (Wright 1978). For example, the University of Massachusetts Boston has found that SAT scores are not predictors of GPA and therefore admits students based on nontraditional measures.

When an evaluation based on normal criteria would have precluded admission, a portfolio, originally used more frequently in the creative and performing arts, would override all other criteria. Special writing ability, for example, would be recognized. Ramapo State College in New Jersey has provided this opportunity for minority students for more than 15 years.

Higher education institutions use contracts to motivate minority students to aspire to college by guaranteeing admission while they are still in high school, provided they meet the criteria specified in the contract. It does not mean that admission standards are lowered; rather, the student no longer has to compete for the seat. Cornell University in New York, for example, contracts with American Indian students in local high schools for admission to the university.

Transfer programs. Because so many minority students attend two year colleges, these schools have become a resource for recruiting minority students into four year institutions (Illinois Community College Board 1986; Samuels 1985). Although these programs are not new, they did not always address the difficulties inherent in earning a four year degree from two different institutions (Guichard and Cepeda 1986), and transfer students would sometimes find it necessary to study for a semester or more at the senior college before achieving third year status.

Through interinstitutional cooperation, the course offerings in two year and four year degree programs are articulated so that students who have earned an associate degree in a specific major can enter the senior college degree program at the third year level. To encourage and facilitate the recruitment of minority students into senior colleges, joint admissions programs ease the transition for students who successfully complete the associate degree by indicating acceptance to the four year college at the time the student enters the community college program. La Guardia Community College and Queens College, for example, both part of CUNY, have established an effective joint admissions program through which community college students transfer to baccalaureate programs.
The goal of a proactive transfer program is to identify minority students who are potential transfers to a four-year program at an early stage in their college careers. Acceptance into such a program guarantees acceptance into the four-year institution. In this model, the liaison from the community college recruits students into the transfer program. Meeting regularly with the liaison from the four-year institution, they design workshops, seminars, and activities that bring the students to the senior college campus. Students who complete the program and transfer have the advantage of having had sustained contact with the senior college liaison, who becomes their counselor or adviser during the first semester. Glassboro State College in New Jersey, for example, conducts Project PROMIST, a proactive transfer program that fosters close collaboration between Glassboro and its surrounding community colleges to increase the number of minority student transfers.

Scholarships/financial assistance. One of the most essential ingredients in a plan to recruit minority students is comprehensive financial aid (Hanford 1982; Samuels 1985). Because so many minority students have no other means of financing a college education, providing financial aid is critical. Most full scholarships and complete financial assistance programs are based on merit and limited to the best and the brightest. Just as using alternative admissions criteria is necessary to break the barrier of access for large numbers of minority students, alternative criteria for awarding scholarships, grants, and other financial aid are also important (Committee on Education 1985; South Carolina Commission 1987). For example, the University of Colorado provides reduced tuition for American Indians enrolling in the university's programs.

Colleges and private industries have devised creative ways to underwrite the costs of higher education. One company provides full financial backing for a minority student the college identifies as having potential in the specific discipline of interest to the sponsor.

Athletics-related recruiting. Athletics has long been an avenue by which a few talented minority students have had access to larger, more competitive universities. Through special scholarships, alternative admissions, and aggressive
recruiting, such students reach campuses armed with a variety of academic backgrounds. In the minority community, however, athletics-related recruiting has become an item of concern. The academic needs of students recruited for their athletic prowess are often only minimally satisfied or neglected (Lapchick 1989).

As a strategy for recruitment, athletics-related recruiting can be effective for the institution and a valuable opportunity for the student. A large percentage of minority students with above-average though not exceptional abilities in sports do not consider college because of academic or socioeconomic reasons. Conversely, institutions have not fully exploited the motivating power that sports can engender. With the proper guidance and support, this pool of minority youth can become another source of successful students.

**Four plus One.** The idea behind this strategy is to address the underrepresentation of minorities at both the undergraduate and graduate levels simultaneously. A university offering both degrees would recruit a student into the graduate program at the beginning of his or her college career rather than at the end. In Four plus One programs, students receive dual acceptances and are awarded the fifth year—the master's degree program—free. At first glance, this creative idea appears to focus on recruitment into graduate school. Guaranteed acceptance into and financial support for graduate school, however, are attractive ways to build undergraduate enrollments, particularly in undersubscribed curricula.

The potential for this program is great. For the cost of one year of graduate study, undergraduate enrollments are increased, graduate enrollments are increased, and the pool of potential Ph.D. candidates is expanded. The University of Rochester in New York offers a Fifth Year Free program to attract minority undergraduate students to the university.

**Strategies for faculty joint ventures.** Collaboration between colleges and other entities, such as schools, community-based organizations, and businesses, has become more popular in recent years. These joint ventures share resources, avoid duplication, stimulate innovation, and increase the effectiveness of the cooperating institutions with regard to the education of minorities. Collaboration is effective not only in terms of cost, however; it
can also improve the efficiency and effectiveness of each separate partner. New structures and streamlined procedures can result, without compromising each individual partner's distinct identity (Tyton 1981). The best reflect an awareness on the part of the higher education community of the interrelatedness of the objectives of recruitment, retention, and graduation.

Higher education institutions have exerted their greatest efforts toward the participation of minorities by developing and operating special school/college collaborative programs. Of course, the availability of outside funding from the state and federal governments, private foundations, and business and industry has played a large part in fostering their development, but institutions have created an enormous variety of approaches and activities to carry out their goals (Galligani 1984; Kimmel, Martino, and Tomkins 1988; Wilbur et al. 1988). These programs encompass all facets of educating minorities, from early intervention in elementary school to supporting gifted and talented high school students.

A frequently used model focuses on improving academic preparation by emphasizing the development of basic skills, cognitive and study skills, and knowledge in specific content areas (Jordan 1981; Mendoza 1988). Two important types of models are used. In one, the college has a presence in the school through faculty members and staff who visit the school to give seminars, teach, and participate in developing curricula. The other type brings students to the college campus for instruction or special activities (Halcon 1988). In cases where students live some distance from the college, the program is conducted as a summer residency program. The target population as well as the goals and objectives of programs in this model vary. Some provide remedial instruction, while others concentrate on academic enrichment. Given the scarcity of resources in many school districts, collaborative programs provide school students an opportunity to use laboratories and state of the art equipment that would otherwise be unavailable to them. The College of Staten Island and several other units of CUNY, for example, provide academic instruction and support for science, engineering, and computer science students in a partnership between schools and colleges called the Science and Technology Entry Program (STEP) funded by the New York Department of Education.
Besides academic-based activities, collaborative programs also foster personal development. Through workshops with teachers and other professionals like psychologists and counselors, students explore themselves as individuals and as members of society by clarifying values, developing the ability to lead, and engaging in interpersonal communication (National Puerto Rican Coalition 1989). For example, ASPIRA, a national, Puerto Rican, community-based organization, works with high schools and colleges to help develop the potential for leadership among high school students.

Because the regular school curriculum is limited in offering the history and culture of minority children, collaborative programs have been developed to fill this void. Co-sponsored activities, perhaps focusing on Puerto Rican Heritage Month and Black History Month and celebrating the cultural backgrounds and traditions of people of color, teach the students to value and take pride in their heritage. Faculty and administrators at Mount Saint Mary’s College in Los Angeles, for example, have developed strategies to use cultural differences as a positive part of the educational process to teach students more effectively.

In recognition that the education of minority children is affected by the social and economic circumstances of their lives, a holistic model addressing all aspects simultaneously has been developed that provides academic support and personal and cultural enrichment through the school, the college, and community-based organizations. These partnerships help meet family needs, such as housing, food, counseling, and health care. Professionals from each of the three components communicate with each other, working together as a team to resolve the problems. New York state has over 50 Liberty Partnership programs, which require the inclusion of a community-based organization in collaboration with schools and colleges to provide at-risk junior high and high school students with academic and family support services.

Private businesses and industries have become increasingly involved with colleges in the education of minorities, providing grants, in-kind services, and training and internship opportunities (National Action Council 1988). Activities focusing on career development, in which high school students explore and experience the world of work, take place either
at the college campus or on site. Studying in seminars and workshops with minority role models as guest speakers, students learn about the kinds of career opportunities available and the academic programs necessary to pursue them (Hall 1988).

Because businesses are interested in developing the academic skills of their workers (Berger 1988a), collaboratives have been developed in which employees, sponsored by their employers, enroll in college to begin or complete a degree, leading to an improved status or promotion. This type of collaborative program among colleges, business, and industry is a potential resource for institutions of higher education interested in recruiting adult minority students. AT&T, for example, brings high school students to company sites, where college faculty and company staff conduct workshops; it also provides summer internships.

**Addressing student groups.** Whether faculty go to the local schools to address students or meet with them on campus, the benefits of having direct faculty student contact are many. When faculty members can transmit the enthusiasm they feel for their discipline, it can be a powerful stimulus, especially for minority students, who in fact might never have met a college professor before. In many instances, students might have only a vague notion of what a given discipline encompasses or, in practical terms, what studying in that discipline entails. These forums provide an opportunity for minority students to explore various academic areas of study with an expert in the field. To make students feel comfortable enough to ask questions and participate openly, these groups should be small and informal.

**Classroom and laboratory audits.** No substitute exists for first hand experience. For students to begin to understand what college would be like, a personal visit to a college class or seminar can be one of the most effective methods. Most minority students are the first in their families to consider a college education. Consequently, they have not had the benefit of family discussions about college life or trips to college campuses. Permitting potential students to sit in on their classes and taking a few moments to discuss the student's impressions afterward create an opportunity that only the faculty can offer. In doing so, they provide a special occasion
for students to gain a personal perspective on the way college classes are conducted and on what might be expected of them in such a situation.

**Role models among minority faculty.** Too often minority faculty are asked to be personally involved in all minority-related issues at the college or university. Not only is this role taxing on the individual, but numerous extracurricular demands can also seriously detract from the time and effort they would normally need to devote to their own scholarly and professional efforts. Other strategies mentioned in this section apply to both majority and minority faculty, but in this case, the involvement of minority faculty is key.

Because most minority students have had limited exposure to minority adults in prestigious or otherwise successful positions of authority, personal interactions with minority faculty members can make a lasting impression. Many minority faculty have had to overcome obstacles similar to those faced by today’s students. In sharing their personal experiences and points of view about setting and reaching their own goals in life, these individuals can inspire minority students to focus on their own aspirations. Because of their unique vantage point, minority faculty can provide valuable guidance and advice that others cannot.

**Strategies for counselors**

**Public relations and information.** The classic strategy of recruitment by disseminating information about the institution has been adapted to reach more minority constituencies by creating information centers in urban areas and minority communities. They include providing advice and guidance regarding postsecondary alternatives by experienced counselors and advisers. Often the information is provided in languages other than English, and technical assistance in filling out college applications, financial aid forms, and other documents is provided.

Because the cost of operating these centers can be prohibitive for a single institution, consortia are developed, with the additional benefit of providing guidance and direction regarding choices of postsecondary educational opportunities.

To reach prospective students in communities where languages other than English predominate, media using native languages (newspaper ads, television and radio commercials)
are common and useful means of spreading information about college programs and services. Hostos Community College, part of CUNY in the Bronx, for example, advertises in the Spanish media, targeting information in particular to women returning to college.

Direct mail and follow-up phoning have been tailored to provide a more personal focus in the recruitment of minority students. In this strategy, the literature that describes the college reflects the ethnicity of students and highlights the special programs and activities available for that particular group. After the mailings are sent, special staff or student recruiters of the student's same ethnic background call them to answer questions and encourage them to visit the campus. The University of Texas at Austin, for example, in its SHARE program (Students Helping Admissions in the Recruitment Effort), employs student aides who phone minority students who have applied to the university as well as students whose names are located through the PSAT search as competitors in the National Merit and National Achievement Scholarship programs.

Campus visits. For colleges to be more competitive in an already competitive market, some selective institutions that recruit students nationally have expanded the concept of "college days" to a full weekend orientation, all expenses paid. For many of the students, experiencing the atmosphere of the college first hand would not have been possible otherwise.

This model can be adapted to target the large portion of minority students who are not part of the top 10 percent and who are unable for financial reasons to visit college campuses they are considering. These students frequently choose an institution based on limited knowledge gleaned from the literature or information they receive from friends. Naturally, a positive experience is likely to result in a successful recruitment for the college. For example, Brown University in Rhode Island, Dartmouth in New Hampshire, and Wesleyan in Connecticut pay air fare and other expenses for minority students' visits to campus.

Parental involvement. Some strategies developed for general recruitment and adapted for recruiting minority students have met with less success than expected. Parents' involve
ment has always been an important and useful recruitment tool, but if it is to function effectively in recruiting minorities, it will have to be tailored to suit their needs. The involvement of Hispanic parents should occur, for example, when their children are still in elementary school, because by high school in some cities, more than 50 percent of the Hispanic student population has already dropped out (Fernandez 1989). Another limitation of programs to involve parents is that too often the focus is on middle class minority parents, ignoring the large percentage of parents with limited education and financial means (Wilson 1986).

Cultural factors and family values play a significant part in the decisions minority students make regarding higher education. In cases where residency is involved, protective attitudes, especially toward women, can have a decisive influence on the student's ultimate choice. Personal and sustained contact, when necessary in the family's native language, is one way to foster understanding, build trust, and allay the family's fears (Ramon 1985; Woodland and Goldstein 1984).

Successful recruiters of minority students have indicated the importance of maintaining a presence in the community. They can do so by attending local churches and cultural and civic activities, and by working with community based organizations. Creative initiatives have combined recruitment with social functions that the college sponsors for the benefit of the community.

It is equally important for parents and family to experience campus life. Strategies organized around this purpose may focus on one time activities, such as festivals or celebrations honoring minority cultures, or a talk given by an individual recognized in the community. Other strategies of this type include the development of ongoing programs (Commission on California 1985) involving both the student and the family in extended activities, such as instruction in a second language and basic skills. Programs of this type have a dual benefit: Besides the obvious contribution to the parents' personal development, the experience of participating in college activities increases parents' understanding of college life and helps them to better support their children at home. Arizona State University, for example, targets young Hispanic female students and their mothers by providing them with educational experiences on the university campus.
**Liaisons as recruiters.** In minority groups like American Indians, students are more likely to respond to encouragement to go to college when that encouragement is provided by another American Indian (Kleinfeld, Cooper, and Kyle 1987). An interesting and innovative strategy for recruitment was developed in the Yukon-Koyukuk high school district in Alaska. The postsecondary counselor program, based at the high schools, recruits potential American Indian college students for a variety of colleges in the area. The key element in this attractive program is the high school counselor, who continues to counsel and advise the student and family, not only to the point of enrolling in college, but also through his or her entire undergraduate career. The long-term, personal relationship established with a counselor from the student's home town and high school offers significant support, affecting both college recruitment and persistence.

Colleges are now hiring "student ambassadors" to help in the recruitment of new minority students. This practice is based on the concept that prospective students will naturally be more inclined to listen with care to students who share the experiences they have had at a college.

Other individuals, such as high school teachers, are also employed in recruitment. Their direct and sustained contact with students whom the college is interested in enables teachers to assist students in determining what college to attend. Teacher liaisons can also play an important role in influencing students who might not be considering college as an option. Valencia Community College in Florida, for example, works with high school teachers in the surrounding community to help identify students and facilitate their enrollment in college.

**Recruiting through social activities.** A problem recruiters often face at many of their functions is a low turnout of minority students. One way to address this problem is by holding activities in the local minority communities, rather than at the college, and combining them with social activities. In this way, people who would not ordinarily attend a college recruitment session may do so because of the social attraction. For example, a recruitment session might be scheduled between 7:00 and 8:00 p.m. at a local church and then followed by a dance featuring a familiar music group. While many young people might be attracted by the anticipation of socializing...
at the dance, those who attend will have the benefit of exposure they probably would not have received otherwise. To ensure participation in the function, organizers could charge admission to the dance and then waive it for people who attend the recruitment session. Even for those who choose to pay the admission, it is good public relations for the college to host an activity in the minority community, and the investment could pay off at a later date.
Summary and Conclusions

Clearly, improving educational opportunities for ethnic and racial minorities must become more than an objective of the admissions office. It must become an institutional priority.

More and more elementary and high school students come from minority backgrounds, and, according to demographers, their numbers continue to increase dramatically. Yet the proportion of these students who graduate from college is distressingly small.

Such trends cast a shadow over the future of higher education — indeed, over the future of the country. Solutions must be found.

Recruiting more minority students to colleges and universities is certainly one solution. But because the issue involves complicated social, economic, and educational factors, recruitment of minority students is most effective when it also recognizes the other factors that affect the educational success and persistence of minority students.

Higher education institutions have adopted various prescriptive measures to recruit minority students and improve their chances for success, but these measures are infrequently interwoven in an overall, collegewide plan. Incorporating recruitment in other college initiatives, aside from being an efficient use of college resources, also maximizes the college's ability to attract, retain, and graduate more minority students.

Broadening recruitment in this way, however, is more likely to be achieved if the college community recognizes and understands the goals of increasing the presence of people of color and of fostering the values of pluralism and diversity in campus life, and adopts them as an institutional priority. Change of this nature and scope, however, requires commitment, cooperation, and leadership. The literature clearly indicates that institutions are transformed through presidential leadership and expressed institutional commitment.

Such leadership and commitment do not come easily. If the process of recruiting minority students is to have integrity and if institutions are serious about their commitment to minority youth, then recruitment will be a reflective and considered process. To be most effective, it should begin with introspection: What is it about the institution itself that has contributed to the present situation of minorities' low enrollment? Another equally important subject that is integral to
the issue of enrollment is the question of success. If minorities are being enrolled in significant numbers only to drop out after the first or second term, then all the recruitment programs in the world will not serve to achieve the real goals — academic success and graduation.

The problem of minorities’ low participation and graduation rates at college is explained to a great extent by a breakdown in the flow of minority students along the educational continuum. While different minority communities can be affected to varying degrees, on the whole, people of color experience much less success than white students. Although the problem of a “leaky educational pipeline” has been discussed in the literature for almost a decade, for Hispanics, African Americans, American Indians, and many Asian Americans, the problem in many ways is worse now than before. Colleges and universities need to take an active role in preparing minority youth for the challenges of higher education. Higher education institutions, by cooperating with elementary and secondary schools, parents, business, industry, and government, can provide essential direction and support. Presidential leadership is needed to provide the inspiration for change and make the recruitment of people of color a central priority at the college. Whether it be to expand the curriculum, offer a broader program of social and cultural activities on campus, or promote racial diversity by enrolling more minority students, the support and courage of all a university’s constituencies are necessary. To attain a significant increase in the number of minority students on campus, a strong institutional commitment must be made to forging the kinds of changes required. Without the vision and leadership of the president and other top administrators, the issue is likely to remain marginal.

Focusing on the characteristics of students that affect educational attainment, such as academic preparation and socioeconomic status, will not necessarily guarantee greater success for minority students. Also important are changes in the climate of higher education institutions. College campuses enriched by diversity and embracing a philosophy of cultural pluralism will do much to enhance the participation and success of students from ethnic and racial backgrounds. Colleges and universities that recognize and respond to the demand for greater cultural diversity in the academy will broaden the range of experience for all students.
To be most effective, the plan for recruitment should
emerge from an institutional plan. The objectives of the
college's plan, however, should be considered as only part of
the broader goal of educating and graduating more minority
students. Institutions should take a holistic approach to
recruitment, integrating recruitment with other educational
objectives, such as academic performance, social integration,
pluralism, and diversity. In developing and implementing the
plan for recruitment, the perspectives of various college con-
stituencies should be considered, as everyone at the college
faculty, administrators, counselors, and professional staff
has an interest and an investment in the ultimate success of
all students.

An awareness of cultural differences is an essential part of
designing a good plan for recruitment as well as of imple-
menting it. While some strategies for recruitment can be used
to recruit students from various ethnic and racial backgrounds,
the manner in which the strategies are put into practice and
the people involved should depend on who the targeted stu-
dents are. An awareness of differing cultural values and needs
is an essential first step to a truly culturally diverse college
campus.

Recommendations for Further Research
The literature concerning the recruitment of minority students
would benefit enormously from additional research and devel-
opment in several important areas. The following ones are
the most pressing.

1. Collection, analysis, and interpretation of higher education
data concerning minority subpopulations, reported in dis
aggregated form;
2. Evaluation of model programs to improve the institutional
eclimate and cultural pluralism on college campuses;
3. Evaluation of the various state policies addressing transfer
from two year to four year colleges;
4. Evaluation of college based programs designed to increase
the rate of minority students' transferring to four year
colleges;
5. Analysis of cultural differences among minority groups
and subgroups and their effect on minorities' access and
success,
6. Effects of financial aid on minorities' entering college
according to ethnic and racial subgroup.
7. Evaluation of collegewide recruitment programs, especially those relating to specific minority groups;
8. Evaluation of innovative strategies for recruitment that are culturally specific;
9. Investigation of factors affecting minority students' success that are other than academic;
10. Evaluation of precollege recruitment programs that emphasize preparation for mathematics and science.
REFERENCES

The Educational Resources Information Center (ERIC) Clearinghouse on Higher Education abstracts and indexes the current literature on higher education for inclusion in ERIC's data base and announcement in ERIC's monthly bibliographic journal, Resources in Education (RIE). Most of these publications are available through the ERIC Document Reproduction Service (EDRS). For publications cited in this bibliography that are available from EDRS, ordering number and price code are included. Readers who wish to order a publication should write to the ERIC Document Reproduction Service, 7420 Fullerton Rd., Suite 110, Springfield, VA 22155 2852. (Phone orders with VISA or MasterCard are taken at 800 345 ERIC or 703 440 1100.) When ordering, please specify the document (ED) number. Documents are available as noted in microfiche (MF) and paper copy (PC). If you have the price code ready when you call EDRS, an exact price can be quoted. The last page of the latest issue of Resources in Education also has the current cost, listed by code.

ASHE-ERIC HIGHER EDUCATION REPORTS

Since 1983, the Association for the Study of Higher Education (ASHE) and the Educational Resources Information Center (ERIC) Clearinghouse on Higher Education, a sponsored project of the School of Education and Human Development at The George Washington University, have cosponsored the ASHE-ERIC Higher Education Report series. The 1990 series is the nineteenth overall and the second to be published by the School of Education and Human Development at the George Washington University.

Each monograph is the definitive analysis of a tough higher education problem, based on thorough research of pertinent literature and institutional experiences. Topics are identified by a national survey. Noted practitioners and scholars are then commissioned to write the reports, with experts providing critical reviews of each manuscript before publication.

Eight monographs (10 before 1985) in the ASHE-ERIC Higher Education Report series are published each year and are available on individual and subscription basis. Subscription to eight issues is $80.00 annually; $60 to members of AAHE, AIR, or AERA; and $50 to ASHE members. All foreign subscribers must include an additional $10 per series year for postage.

To order single copies of existing reports, use the order form on the last page of this book. Regular prices and special rates available to members of AAHE, AIR, AERA and ASHE, are as follows:

<table>

PRAISE FOR PAST REPORTS

"I welcome the ASHE-ERIC monograph series. It is a service to those who need brief but dependable analyses of key issues in higher education."

(Rev.) Theodore M. Hesburgh, C.S.C.
President Emeritus, University of Notre Dame

"Running a successful institution requires mastering details quickly. The ASHE-ERIC Higher Education Reports are valuable because they give a national perspective that helps me meet my own responsibilities."

Milton Greenberg, Provost, American University

"The first books off my shelf when I'm looking for answers. Keep me aware of potential problems and offer solutions that really work."

Kathryn M. Moore, Professor
Michigan State University

"The monographs make excellent textbooks, and their bibliographies are essential for graduate students."

Eileen Kubns, Coordinator
Education Administration Program
Michigan State University

"Excellent publications, authoritative and well researched, on timely topics."

Ronald W. Collins, Provost and Vice President for Academic Affairs, Eastern Michigan University

"A godsend to an administrator of a brand new doctoral program with caps on resources for course development."

Antonia D’Onofrio, Director
Higher Education Program
Widener University

"Excellent scholarly, informative, enlightening, superb for administrative and faculty development."

Robert Gleason, Director of Library Services
Rockland Community College

"An invaluable resource that gets me on top of a topic in a very efficient manner."

Donald Reichard, Director of Institutional Research
University of North Carolina at Greensboro
BARBARA ASTONE is director of retention programs at The College of Staten Island, City University of New York, where she also teaches developmental reading and writing and English language. She received her graduate training at Fairleigh Dickinson University and has taught at Ramapo State College and Bergen Community College in New Jersey. From 1981 to 1986, she taught at the Università degli Studi di Roma and the Libera Università degli Studi Sociali in Rome, Italy. She has an extensive administrative background in special academic and support programs. Her current research interests include minorities' dropping out of high school and the effect of pre-freshman programs on academic performance and persistence.

ELSA NUÑEZ-WORMACK is associate dean of faculty and associate professor of English at The College of Staten Island, City University of New York. Previously, she was associate professor of English at Ramapo State College, where she received several research grants. Dr. Núñez-Wormack is chair of the Hispanic Association for Higher Education and chair of ASPIRA, Inc., of New Jersey. Her publications and scholarly achievements include numerous articles and essays on the education of minorities. Her current areas of research concern curricula in higher education, particularly those relating to diversity. Stemming from her research interests in recruitment and retention, she has been a consultant to state departments of education and colleges and universities in New Jersey and New York.
