*National Education Goals 1990

Conceptual foundations of a process for assessing higher-order thinking are reviewed, and a viable model for carrying out the process is presented. The first section of the paper formulates 21 criteria that should be met by any process adequate to the task. The second section outlines the basic concept of critical thinking on which the paper is based and explains how a rich and substantive concept of critical thinking, grounded in research, provides a plausible foundation for accomplishing the 21 objectives offered in response to the criteria. The third section explicates the following four domains essential to critical thinking: (1) elements of thought; (2) macro-abilities, or basic modes of reasoning; (3) traits of the mind (affective dimensions); and (4) universal intellectual standards. The fourth section contains recommendations for a process and a time-table for assessing higher order thinking skills at the postsecondary level. Six figures illustrate the discussion, and two appendices provide supplemental information. A 20-item list of recommended readings is provided. Also provided are critiques by L. Boehm, P. A. Facione, and R. K. Hambleton. (SLD)

PREFACE

The Problem of Lower Order Learning

Virtually all informed commentators agree that schooling today does not foster the "higher order thinking and reasoning", which represent the "basics" of the future. America 2000, President Bush's education initiative, seeks to bring schooling in line with changing global and economic conditions, to engender sweeping educational reform in what are now admittedly largely static institutions, systems highly resistant to substantial change. America 2000 raises the following vital question: "How can we reverse the pervasive emphasis in education on lower rather than on higher order learning, on recall rather than on reasoning, on students merely "reproducing" rather than "producing" knowledge?"

The state of research regarding this problem was summarized recently by Mary Kennedy in an article for the Kappan:

"...national assessments in virtually every subject indicate that, although our students can perform basic skills pretty well, they are not doing well on thinking and reasoning. American students can compute, but they cannot reason..... They can write complete and correct sentences, but they cannot prepare arguments. ..... Moreover, in international comparisons, American students are falling behind...particularly in those areas that require higher-order thinking. ...Our students are not doing well at thinking, reasoning, analyzing, predicting, estimating, or problem solving.

In this summary, Dr. Kennedy linked the problem to the established mode of instruction:

"...teachers are highly likely to teach in the way they themselves were taught. If your elementary teacher presented mathematics to you as a set of procedural rules with no substantive rationale, then you are likely to think that this is what mathematics is and that this is how mathematics should be studied. And you are likely to teach it in this way. If you studied writing as a set of grammatical rules rather than as a way to organize your thoughts and to communicate ideas to others, then this is what you will think writing is, and you will probably teach it so. ... By the time we complete our undergraduate education, we have observed teachers for up to 3,060 days.

Though not as commonly realized, this problem of the dominance of lower order learning is as serious in post-secondary as it is in primary and secondary education. In both undergraduate and graduate programs students are typically enrolled in content heavy courses taught by professors who feel a greater obligation to cover subject matter through lecture than to generate thought-provoking activities or assignments that may seriously reduce what they can cover or significantly add to their work load, or both.

Alan Schoenfeld has explored this problem with respect to both pre-secondary and post-secondary mathematics instruction. To illustrate the detailed nature of what Schoenfeld's research is disclosing, here is a summary from one of his studies:

"At the University of Rochester 85% of the freshman class takes calculus, and many go on... but most of these students will never apply calculus in any meaningful way (if at all) in their studies, or in their lives. They complete their studies with the impression that they knew some very sophisticated and high-powered mathematics. They can find the maxima of complicated functions, determine exponential decay, compute the volumes of surfaces of revolution, and so on. But the fact is that these students know barely anything at all. The only reason they can perform with any degree of competency on their final exams is that the problems on the exams are nearly carbon copies of problems they have seen before; the students are not being asked to think, but merely to apply well-rehearsed schemata for specific kinds of tasks. Tim Keller and I studied students' abilities to deal with pre-calculus versions of elementary word problems.... We were not surprised to discover that only 19 of 120 attempts at such problems...yielded correct answers, or that only 65 attempts produced answers of any kind.

Schoenfeld summarizes the results, in general, of research into mathematics instruction as follows:

"In sum: all too often we focus on a narrow collection of well-defined tasks and train students to execute those tasks in a routine, if not algorithmic fashion. Then we test the students on tasks that are very close to the ones they have been taught. If they succeed on those problems, we and they congratulate each other on the fact that they have learned some powerful mathematical techniques. In fact, they may be able to use such techniques mechanically while lacking some rudimentary thinking skills. To allow them, and ourselves, to believe that they 'understand' the mathematics is deceptive and fraudulent.

There is good reason, in our view, to link instructional reform with the need for a special emphasis on critical thinking, problem solving, and communication skills, for it is precisely these higher order thinking skills that are routinely sacrificed when coverage and lower
order recall dominate the classroom at either the pre- or post-secondary level, as they now do.

The State of Research Into Critical Thinking and Instructional Reform

One major value of the last ten years' of research into critical thinking is the focus on the need for reform of instruction at all levels: on the need for students to reason mathematically in mathematics courses, to reason historically in history courses, to reason scientifically in science courses, to reason sociologically in sociology courses. Indeed, critical thinking research has emphasized three basic needs for all learning: for all students to reason out all basic concepts and understandings, to reason to all basic conclusions and solutions, and to reason through and across the curriculum.

This emphasis has been embedded in the structure of the 11 major international conferences on research into critical thinking and educational reform (1980-1991) held at Sonoma State University, the last attracting 1400 registrants from 20 countries and involving over 350 sessions representative of a wide variety of academic disciplines. This same emphasis is reflected in the 25 or so other conferences focused on critical thinking in the last ten years (at Harvard, the University of Chicago, Montclair State, Oakton College, and elsewhere), and in most of the articles published concerning critical thinking.

What is more, the research into critical thinking has focused not only on the cultivation of reasoning in all disciplines but also on generalizable standards for the assessment of reasoning as well. The concepts and distinctions embedded in critical thinking research are, as a result, well-suited for the design of a process to assess higher order thinking. In this paper we shall set out both the conceptual foundations for such a process as well as a viable model for carrying out that process.

Before we spell out the detailed structure of this paper, however, it is important to note that the concept of critical thinking has not played a central role in the design of educational assessment instruments to date principally because the concept has been developed extensively only over the last ten years, and therefore has not had time to permeate already developed assessment tools. Now that we possess a rich, substantive concept, however, we have an unprecedented opportunity to assess central rather than peripheral aspects of critical thinking, and to do so in an authentic and representative way. If anything less than this concept and its central aspects is assessed, the ultimate goal of fostering higher order thinking as an academic, social, and vocational need will be ill served.

The Structure of the Paper

The substance of this paper is divided into four sections, each focused on a major question, as follows:

Section One

What should be the main objectives of a process to assess higher-order thinking at the post-secondary level?

Section Two

How does a rich, substantive concept of critical thinking meet these criteria?

(A) What is included in a rich, substantive concept of critical thinking?

(B) How, specifically, does this concept meet the criteria?

(C) What, specifically, are the dangers of a non-substantive concept of critical thinking?

Section Three

What are the four component domains of critical thinking and the implications of each of these domains for the assessment of higher-order thinking?

Section Four

What is the simplest solution to the design of a process to assess higher-order thinking at the post-secondary level, given the answers to questions one through three above?

The first section of the paper formulates 21 objectives that should be met by any process adequate to the task. The second outlines the basic concept of critical thinking which informs the paper and explains how a rich, substantive concept of critical thinking, grounded in the research on critical thinking, provides a plausible foundation for accomplishing these objectives. The third section of the paper explicates the four domains essential to critical thinking:

A) The Elements of Thought (eight essential dimensions of all reasoning crucial for understanding and assessing reasoning).

B) Macro-Abilities (basic modes of reasoning—including reading, writing, speaking, and listening—that represent modal "orchestrations" of the elements of thought).

C) Traits of Mind (the affective support without which critical thinking skills are merely episodically used, and often in a limiting rather than an expansive manner), and
D) Universal Intellectual Standards  
(presupposed by critical thinking)

As we give a brief explication of the elements of thought, the macro-abilities, and essential traits of mind, we briefly comment on the implications for assessment purposes of each conception.

In the fourth and final section of the paper, we lay out our recommendations for a process and a time-table for assessing higher order thinking skills at the post-secondary level.

SECTION ONE

OBJECTIVES

What should be the main objectives of a process to assess higher order thinking at the post-secondary level?

1) It should assess students' skills and abilities in analyzing, synthesizing, applying, and evaluating information.

2) It should concentrate on thinking skills that can be employed with maximum flexibility, in a wide variety of disciplines, situations, contexts.

3) It should account for both the important differences among disciplines and the skills, processes, and affective dispositions that are crucial to all the disciplines.

4) It should focus on fundamental, enduring forms of intellectual ability that are both fitted to the accelerating pace of change and deeply embedded in the history of the advancement of the disciplines.

5) It should readily lead to the improvement of instruction.

6) It should make clear the interconnectedness of our knowledge and abilities, and why expertise in one area cannot be divorced either from findings in other areas or from a sensitivity to the need for interdisciplinary integration.

7) It should assess those versatile and fundamental skills that are essential to being a responsible, decision-making member of the workplace.

8) It should be based on clear concepts and have well-thought-out, rationally articulated goals, criteria, and standards.

9) It should account for the integration of adult-level communication skills, problem-solving, and critical thinking, and it should assess all of them without compromising essential features of any of them.

10) It should respect cultural diversity by focusing on the common-core skills, abilities and traits useful in all cultures.

11) It should test for thinking that is empowering and that therefore, when incorporated into instruction, promotes (to quote the September, 1991 Kappan) "the active engagement of students in constructing their own knowledge and understanding."

12) It should concentrate on assessing the fundamental cognitive structures of communication at the college-level, for example:

   with reading or listening, the ability to
   • create an accurate interpretation,
   • assess the author's or speaker's purpose,
   • accurately identify the question-at-issue or problem being discussed,
   • accurately identify basic concepts at the heart of what is said or written,
   • see significant implications of the advocated position,
   • identify, understand, and evaluate the assumptions underlying someone's position,
   • recognize evidence, argument, inference (or their lack) in oral and written presentations,
   • reasonably assess the credibility of an author or speaker,
   • accurately grasp the point of view of the author or speaker,
   • empathetically reason within the point of view of the author or speaker.

   with writing and speaking, the ability to
   • identify and explicate one's own point of view and its implications,
   • be clear about and communicate clearly, in either spoken or written form, the problem one is addressing,
   • be clear about what one is assuming, presupposing, or taking for granted,
   • present one's position precisely, accurately, completely, and give relevant, logical, and fair arguments for it,
   • cite relevant evidence and experiences to support one's position,
• see, formulate and take account of alternative positions and opposing points of view, recognizing and evaluating evidence and key assumptions on both sides,
• illustrate one's central concepts with significant examples and show how they apply in real situations, etc.,
• empathetically entertain strong objections from points of view other than one's own.

13) It should assess the skills, abilities and attitudes that are central to making sound decisions and acting on them in the context of understanding our rights and responsibilities as citizens, as well-informed and thinking consumers, and as participants in a symbiotic world economy.

14) It should avoid any reductionism that allows a multi-faceted, theoretically complex, and authentically usable body of abilities and dispositions to be assessed by means of oversimplified pars that do not adequately reflect the whole.

15) It should enable educators to see what kinds of skills are basic at the college level.

16) It should be of a kind that will assess valuable skills applied to genuine problems as seen by a large body of the populace both inside and outside of the university community.

17) It should include items that assess both skills of thoughtfully choosing the most reasonable answer to a problem from among a pre-selected set and also the skills of formulating the problem itself and of making the initial selection of relevant alternatives.

18) It should contain items that, as much as possible, are examples of the real-life problems and issues that people will have to think out and act upon.

19) It should allow a financially affordable means of assessment.

20) It should enable colleges to assess the gains they are making in teaching higher-order thinking.

21) It should provide for a measure of achievement against national standards.

SECTION TWO
CRITICAL THINKING AND CRITERIA FOR ASSESSMENT

How does a rich, substantive concept of critical thinking meet these criteria?

A. What is included in a rich, substantive concept of critical thinking?

Most of the language we shall use is drawn from draft statements of the National Council For Excellence in Critical Thinking Instruction. The National Council has been established precisely to articulate standards in critical thinking by 50 key leaders in critical thinking research and 105 leading educators. It is in process of establishing 8 regional offices and setting up 75 research-based committees to articulate the state of research in the field. (See Appendix #1.)

NATIONAL COUNCIL DEFINITION
"Critical thinking is the intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing or evaluating information gathered from, or generated by, observation, experience, reflection, reasoning, or communication, as a guide to belief and action."

This is the working definition of the National Council for Excellence in Critical Thinking Instruction. Though the definition as well as the other draft statements of the Council are subject to modification and refinement, the basic idea is one that is common to practitioners and researchers in critical thinking.

GLOSS ON THE DEFINITION
"In its exemplary form, [critical thinking] is based on universal intellectual values that transcend subject-matter divisions: clarity, accuracy, precision, consistency, relevance, sound evidence, good reasons, depth, breadth, and fairness" (National Council Draft Statement).

(a) "It entails the examination of those structures or elements of thought implicit in all reasoning: purpose; problem, or question-at-issue; assumptions; concepts; empirical grounding; inferences; implications and consequences; objections from alternative viewpoints, and frame of reference" (National Council Draft Statement).
(b) It entails larger-scale abilities of integrating elementary skills in such a way as to be able to apply, synthesize, analyze, and evaluate complicated and multidimensional issues. These include such macro-abilities as clarifying issues, transferring insights into new contexts, analyzing arguments, questioning deeply, developing criteria for evaluation, and assessing solutions, refining generalizations, and evaluating the credibility of sources of information. Among the macro-abilities are included also the central forms of communication: critical reading, writing, speaking, and listening. Each of them is a large-scaled mode of thinking which is successful to the extent that it is informed, disciplined and guided by critical thought and reflection (paraphrased from National Council Draft Statement).

c) Critical thinking entails the possession and active use of a set of traits of mind and affective dimensions: independence of thought, fairmindedness, intellectual humility, intellectual courage, intellectual perseverance, intellectual integrity, curiosity, confidence in reason, the willingness to see objections, to enter sympathetically into another’s point of view, to recognize one’s own egocentricity or ethnocentricity. (paraphrased from National Council Draft Statement).

"Critical thinking—in being responsive to variable subject-matter, issues, and purposes—is incorporated in a family of interrelated modes of thinking, among them: scientific thinking, mathematical thinking, historical thinking, anthropological thinking, economic thinking, moral thinking, and philosophical thinking" (National Council Draft Statement).

B. How does a rich, substantive concept of critical thinking meet the 21 criteria?

In our view, a rich, substantive concept of critical thinking, and it alone, provides an intelligible and workable means of meeting all 21 criteria. In this section we will briefly consider each objective in turn, not as a definitive response to the criteria, but merely to suggest the fuller response in Section Three below.

CRITERION # 1
Can it be used to test information processing skills? Critical thinking includes at its core "a set of information and belief generating and processing skills and abilities."
Can it make clear the interconnectedness of our everyday world. Mathematical thinking. Self-confidence increases with the practice of critical thinking. They become more proficient in understanding which, to be grasped, must be reasoned through. They become more proficient in—because they must be practiced within—a variety of modes of thinking: for example, historical, scientific, and mathematical thinking. Self-confidence increases with the interconnectedness of our everyday world.

CRITERION # 6:
Can it make clear the interconnectedness of our knowledge and abilities, and why expertise in one area cannot be divorced either from findings in other areas or from a sensitivity to the need for interdisciplinary integration? In learning to think critically one learns to transfer what one has learned about the logic of questions in one field to logically similar questions in other fields. Typically this begins with a recognition of the need to ask questions based on logical parallels between all fields of study, for example, skilled practice in questioning concepts and theories, in questioning data, in questioning the nature or organization of data, in questioning inferences, in questioning assumptions, in questioning implications and consequences, and in questioning points of view and frames of reference, etc.

CRITERION # 7:
Can it be used to assess those versatile and fundamental skills that are essential to being a responsible, decision-making member of the workplace? Critical thinking skills and abilities are highly transferable to the workplace. Since in learning to think critically we learn to take increasing charge of our mind as an instrument of learning—for example, reading, writing, speaking, and listening with greater discipline and skill—we are well situated to engage in collective problem solving and goal attainment, wherever they occur. The kind of "work" increasingly required in industry and business is "intellectual," i.e., requiring that workers define goals and purposes clearly, seek out and organize relevant data, conceptualize those data, reason to legitimate conclusions, consider alternative perspectives, adjust thinking to context, question assumptions and modify thinking in the light of the continual influx of new information. Furthermore, the intellectual work required must increasingly be coordinated with, and must profit from the critique of fellow workers. There is no avoiding the need, therefore, to express ideas well, accurately represent and consider fairly the ideas of others, write clear and precise memos and documents, and coordinate and sequence all of these so that well-reasoned policies and decisions can be accurately understood and effectively implemented.

CRITERION # 8:
Can it generate clear concepts and well-thought-out, rationally articulated goals, criteria, and standards? Since critical thinking is based on the art of monitoring one's thinking with standards implicit in the universal structure of thought and since the use of these standards with respect to the structure of thought is implicit in intellectual history from Socrates through Einstein, there is no problem using critical thinking to generate clear concepts for testing, as well as rationally articulated goals, criteria, and standards.

CRITERION # 9:
Can it account for the integration of adult-level communication skills, problem-solving, and critical thinking, and legitimately assess all of them without compromising essential features of any of them? Shallow concepts of critical thinking often distinguish critical thinking from problem solving and decision making as well as from reading, writing, and speaking skills. Once one considers a rich, substantive concept of critical thinking, however, it is clear that each of the skills of critical thinking are presupposed by each of the other skills, just as each of them is deeply interrelated to critical thinking as a whole. Consider, does it make sense to analyze potential solutions to problems or the implications of choosing an alternative in making a decision without using critical thinking? Clearly not. In the first place, every problem can be expressed in the form of one or more questions one is attempting to settle. Every problem to be solved (or question to be settled) requires a critical analysis of the conditions under which it can be solved or settled. We, as problem-solvers, need to look critically at the purpose for which we are attempting to settle the question, we need to critically examine contextual factors, our assumptions, our concepts, what we are using as data, our organization of the data, the source of the data, our reasoning, the implications of our reasoning, our point of view, objections from other points of view. All of these are essential to higher order problem solving and decision making. Furthermore, all of these intellectual abilities are crucial to higher order reading, writing, speaking, and listening. Reading requires that we analyze the text and re-create its logic in our own minds. Writing requires that we construct a logic that can be readily translated into the logic of the thinking of our potential readers. Speaking requires that we articulate our thoughts in such a way that those who are listening can translate our thoughts into their experiences. And listening requires that we analyze the logic of the thinking of the speaker. Intellectually disciplined reading, writing, speaking, and listening require, in other words, that we work explicitly with the
logic we are constructing or re-constructing, using our grasp of the standards of critical thinking to communicate accurately and precisely, effectively solve problems, and rationally make decisions.

**CRITERION # 10**

Does it respect cultural diversity by focusing on the common-core skills, abilities and traits useful in all cultures? As the criterion presupposes, we can respect cultural diversity best by constructing tests in higher order thinking that focus on skills and abilities necessary in all modern cultures. In this way we can legitimately justify assessing it in all cultural groups. Basic critical thinking skills and abilities—because they are based on fundamental elements implicit in the structure of all reasoned thought per se, and because their mastery is essential to higher order thinking in all academic, professional, personal, and public life—are an appropriate foundation for assessment.

**CRITERION # 11**

Does it test for thinking that promotes (to quote the September, 1991, Koppan) “the active engagement of students in constructing their own knowledge and understanding?” Narrow concepts of critical thinking sometimes characterize it in negative terms, as a set of tools for deciding if we are making mistakes in thinking. A rich, substantive concept of critical thinking, however, highlights its central role in all rationally defensible thinking, whether that thinking is focused on assessing thought or products already produced or actively engaged in the construction of new knowledge or understandings. Well-reasoned thinking, whatever its end, is a form of creation and construction. It devises and articulates purposes and goals, translates those goals into problems or questions, seeks data that bear upon problems or questions, interprets those data on the basis of concepts and assumptions, and reasons to conclusions within some point of view. All of these are necessary acts of the reasoning mind and must be done “critically” to be done well. Hence all require critical thinking.

**CRITERION # 12**

Does it concentrate on assessing the fundamental cognitive structures of communication at the college-level? Each of the dimensions identified in the objective is either straightforwardly a critical thinking ability or dependent on a critical thinking ability. The writer’s or speaker’s purpose, implications, assumptions, point of view, etc., are all elements of thought, and the ability to identify and assess those as one reads or listens—the ability to construct in one’s mind an accurate and fertile interpretation—are simply modes of thinking by listening, thinking by reading.

A similar reliance on elements of thought is central to writing or speaking effectively at the post-secondary level. The knowledge of how to amass evidence, to make clear one’s own assumptions, to see the implications of a position: these are critical thinking macroabilities.

All forms of communication, moreover, rely on critical thinking standards. Essays and interpretations of essays, utterances and interpretations of utterances, need to be relevant, logical, consistently worked out; evidence needs to be recorded and reported accurately; points need to be made clearly and with as much precision as the subject permits; topics need to be covered in depth and presented fairly.

**CRITERION # 13**

Can it be used to assess the central features of making rational decisions as a citizen, a consumer, and a part of a world economy? Both public and private life increasingly require mastery of the basic skills and abilities of critical thinking. When this mastery is absent the public degenerates into a mass society susceptible to manipulation by public relations specialists who can engineer political victories by an adroit use of mudslinging, scare tactics, shallow nationalism, fear, envy, stereotype, greed, false idealism, and maudlin sentimentality. Modern citizenship requires basic critical thinking skills and abilities throughout. The modern citizen should be able to assess the arguments presented for his or her assent, must rationally adjudicate between conflicting points of view, must attempt to understand a culturally complex world, must assess the credibility of diverse sources of information, must translate between conflicting points of view and diverge. appeals, must rationally decide between priorities, must seek to understand complex issues that involve multiple domains (for example, the environmental, moral, economic, political, scientific, social, and historical domains). Without a solid grounding in the skills and abilities of critical thinking, citizens are intellectually disarmed, incapable of discharging their civic responsibilities or rationally exercising their rights.

**CRITERION # 14**

Can it avoid the reductionism of a complex whole to oversimplified parts? Testing for a rich, substantive concept of critical thinking is testing for skills of reasoning in terms of elements of thought, for macroabilities that are orchestrations of those elementary skills, for the affective dimensions that make critical thinking actualizable in practice, and for universal intellectual standards, in short for a rich and complex whole rather than for fragmented parts.

**CRITERION #15**

Can it articulate what is central to college-level basic skills? Basic skills at the college-level are constituted by the structures explicated in a rich, substantive concept of critical thinking. To teach reading
at the college-level is to teach the ability not merely to repeat content, but to reconceptualize that content, to see applications of the main ideas, to generalize from them, critique them, see them in context, to enter with empathy into another's point of view. To teach writing as a basic skill at the college-level is to teach not merely grammar and punctuation, but the ability to arrange one's ideas logically and consistently, to anticipate reasonable objections, to transfer ideas to the page in a way that makes them decipherable in all their complexity by a reader. To teach math as a basic skill at the college-level is not primarily to teach how to solve preselected, individual, isolated problems out of context, but to teach the ability to begin to make sense of the world mathematically, to think quantitatively, to be able to see mathematical patterns, to set up the construction of problems and then creatively go about solving them. Critical-thinking abilities like these do not exist somehow in addition to the basic skills of college work; they constitute the basic skills of college work.

CRITERION #16

Can critical thinking be assessed in a way that requires evaluation of authentic problems in realistic contexts, where the abilities assessed include those of formulating the problem and initial screening of plausible solutions? Yes. Testing of authentic skills, abilities and dispositions in authentic contexts can be accomplished by using a combination of (a) standard multiple-choice items, (b) machine-gradable multiple-rating items and (c) short essay items.

(a) The standard multiple-choice part of the assessment would be an expanded version of established critical thinking tests, such as the Watson-Glaser or Cornell tests. This would test the ability to select, from among a sample, the most reasonable alternative. It is suitable for assessing micro-dimensional critical thinking skills, like identifying the most plausible assumption, recognizing an author's purpose, selecting the most defensible inferences, and such like.

(b) The multiple-rating part of the assessment would test more open-ended and larger-domained abilities, like thinking within opposing points of view, the willingness to suspend judgment, the ability to synthesize disparate data into a logical scheme, taking established findings and generalizing them into new contexts, etc.

The multiple-rating portion of the assessment, for it to be reliable, must

i) embody a rich and substantive idea of critical thinking,
ii) be composed and monitored by critical thinking experts who have such a concept,
iii) be changed often (5% annually) to assess critical thinking with respect to authentic contemporary issues.

(c) The essay part of the assessment would be designed to address critical thinking abilities and traits that involve creating a logic to capture a situation rather than selecting from among possibilities suggested by the test. Examples include the ability to construct an interpretation, to make a logical outline of a text, to figure out ways to gather information, to take an unclear and complex real issue and reformulate it so as to make it more amenable to solution.

Validity on the essay part of the assessment requires that the test be

i) composed by experts in critical thinking,
ii) assembled from a large and rotating bank of short essay questions to allow for items that show no significant differences,
To evaluate students in both these dimensions requires: grounding in the research into critical thinking. To make critical thinking at the post-secondary level be assessed nationally in a way that is financially affordable? To make it affordable, the constructed response segment of the assessment should be administered not to the population of students as a whole, but rather to a representative sample of the student population of a college or university. The assessment should be (a) paid for by colleges and universities that contract to have their students tested, and (b) constructed, monitored, administered and graded by a private agency with critical thinking credentials, or at least under the direction of scholars with a solid grounding in the research into critical thinking.

CRITERION 419
Can critical thinking be assessed so as to gauge the improvement of their students over the course of their college education and to measure the achievement of their students against national standards? To evaluate students in both these dimensions requires:

1) an assessment administered as a pre-test before university-entrance, at the end of the second year, and just prior to graduation (to provide for value-added judgments).

2) a criterion-referenced assessment that is built on clear, consistently applied quality-norms that are derived from a rich and substantive concept of critical thinking (to provide for the measuring of national progress).

3) an unrealistic strategy for the assessment and cultivation of critical thinking may be incorporated into testing and teaching.

Many examples of the unwitting use of a non-substantive concept of critical thinking could be cited—such as “thinking skills” programs devoid of intellectual standards (which, for example, systematically confuse “inferences” with “valid inferences” and “analogies” with “sound analogies”), or testing personnel who lack adequate grounding in critical thinking theory (and so, for example, frequently confuse assumptions with inferences or inferences with implications). The most far-reaching danger occurs when influential educational systems or institutions, like state departments of education, inadvertently incorporate a non-substantive concept of critical thinking into statewide curriculum standards or into statewide testing programs. This can result in significant, unintended negative consequences, for example: thousands of teachers encouraged to follow a misconceived model for the assessment of reasoning, leading to misinstruction on a grand scale.

2) Illustration We shall look at one important case. Unfortunately, given the brevity of this paper, one case must stand for all. The case we have chosen concerns the Integrated Language Arts Assessment of the California Assessment Program, a massive statewide program that has impact not only on every student in the public schools of California, but also, because of the leadership role of California in assessment, on national teaching and testing practices as well. It appears that three fundamental mistakes occurred in the design of the direct writing assessment:

1) Though one of the goals of the program was to place an emphasis on quality of reasoning and critical thinking in writing, it appears that no one with a research background in critical thinking reviewed the articulation or implementation of the assessment prompts (We infer this from the fact that fundamental conceptual errors occur both in the prompts themselves and in the application of criteria to student constructed responses.)

2) It was assumed, inappropriately, that classroom teachers without extended training in critical thinking are able to effectively assess student essays that call for evaluative reasoning. (We infer this from statements descriptive of the assessment design like:...
“Teachers on the CAP writing Development Team develop all the testing and instructional materials for assessment. For every type of writing assessed, the team develops a special set of prompts...and a scoring guide that identifies the thinking and writing requirements for that type of writing...” and “Essays are scored in four to six days by several hundred teachers at four regional scoring centers. A special handbook for each grade level provides teachers with practical instructional materials for each type of writing, including sample prompts, illustrative essays, and related readings.”

3) The resulting assessment was not monitored by anyone with a research background in critical thinking. (We infer this from the fact that model “strong” answers purporting to illustrate critical reasoning are showcased that are in fact patently very weak answers, containing virtually no reasoning at all.)

Consider Figure 1 and Figure 2 used as illustrations of the nature and quality of the writing assessment program in an article authorized and developed by the staff of the California Assessment Program. It is entitled “California: The State of Assessment” and was written for an important national anthology, Developing Minds (more than 150,000 copies disseminated by ASCD). The show-piece article, in which these figures occur, argues that the examples illustrate a “state-of-the-art teacher-developed writing assessment” that is sophisticated in “its testing, scoring, and reporting systems” and designed to “include only those tasks that will stimulate high-quality instruction”.

There are a number of problems illustrated in these figures that a substantive understanding of critical thinking would have avoided:

1) A description of subjective reactions was systematically confused with sound evaluative reasoning. It is important to distinguish questions like “Is rock music good music?” or “Does rock music excel as a form of...”

Figure 1
Evaluative Essay Sample

Evaluation. Students were asked to write an evaluative essay, make judgments about the worth of a book, television program, or type of music and then support their judgments with reasons and evidence. Students must consider possible criteria on which to base an evaluation, analyze their subject in light of the criteria, and select evidence that clearly supports their judgments. Each student was assigned one of the following evaluative tasks:

- To write a letter to a favorite author telling why they especially liked one of the author’s books.
- To explain why they enjoyed one television program more than any others.
- To justify their preference for a particular type of music.

The tasks made clear that students must argue convincingly for their preferences and not just offer unsupported opinions.

This is a sample essay from a student who demonstrated exceptional achievement.

Rock Around the Clock

“Well, you’re getting to the age when you have to learn to be responsible!” my mother yelled out.

“Yes, but I can’t be available all the time to do my appointed chores! I’m only thirteen! I want to be with my friends, to have fun! I don’t think that it is fair for me to baby-sit while you go run your little errands!” I snapped back. I sprinted upstairs to my room before my mother could start another sentence. I turned on my radio and “Shoot” was playing. I noted how true the song was and I threw some punches at my pillow. The song ended and “Contro” by Janet Jackson came on. I stopped beating my pillow. I suddenly felt at peace with myself. The song had slowed me down. I pondered briefly over all the songs that had helped me to control my feelings. The list was endless. So is my devotion to rock music and pop rock. These songs help me to express my feelings, they make me wind down, and above all they make me feel good. Without this music, I might have turned ant to be a violent and grumpy person.

Some of my favorite songs are by Howard Jones, Pet Shop Boys, and Madonna. I especially like songs that have a message in them, such as “Stand by Me”, by Ben E. King. This song tells me to stand by the people I love and to not question them in times of need. Basically this song is telling me to believe in my friends, because they are my friends.

My favorite type of music is rock and pop rock. Without them, there is no way that I could survive mentally. They are with me in times of trouble, and best of all, they are only a step away.

California classroom teachers wrote comments like these after reading and scoring students’ evaluative essays:

- “Evidence of clear thinking was heavily rewarded in our scoring.”
- “I am struck by how much some students can accomplish in 45 minutes; how well they can sometimes marshal the ideas; and which how much flair and sparkle they can express themselves.”
- “More emphasis should be placed on critical thinking skills, supporting judgments, and tying thoughts and ideas together. Far too many papers digress, summarize, underdevelop, or state totally irrelevant facts.”
- “Students generally need to develop skills in giving evidence to support their judgments. I plan to spend more time on these thinking skills next year.”

music?" (which call for objective evaluation) from questions like "Do you enjoy rock music?" or "Does rock music stir powerful emotions in you?" (which call, not for reasoning, but for the description of subjective reactions). The test developers were apparently not clear about this distinction.

2) The Assessing Teachers did not notice that the student failed to respond to the directions. The student did not develop evaluative reasoning, did not support his judgment with reasons and evidence, did not consider possible criteria on which to base his judgment, did not analyze the subject in the light of the criteria, and did not select evidence that clearly supported his judgment. Instead the student described an emotional exchange, asserted—without evidence—some questionable claims, and expressed a variety of subjective preferences (a fuller critique of the student essay is available in an appendix at the end of this paper). The assessing teachers were apparently not clear enough about the nature of evaluative reasoning or the basic notions of
criteria, evidence, reasons, evidence, and well-supported judgment to notice the discrepancy.

3) The California State Department of Education Assessment Staff did not notice these errors once they were made. Instead of catching the errors once made, the California Department of Education chose to use the misgraded student essay as a showcase model to disseminate nationally as illustrating "exceptional achievement" in reasoned evaluation, and as a model of their assessment of reasoned writing. We conclude that the California Assessment Program is not making use of scholars with a background in critical thinking research, any of whom would surely have recognized the problem.

It is essential that fundamental misconceptions of the nature of critical thinking and reasoned discourse such as those documented above not be replicated in a national assessment program. Steps should be taken to ensure that a substantive concept of critical thinking and a well-supervised implementation of that concept form the basis of the finished assessment program.

SECTION THREE

The Four Domains of Critical Thinking

What are the four component domains of critical thinking and the implications of each of these domains for the assessment of higher-order thinking?

A. ELEMENTS OF THOUGHT.

As soon as we move from thought which is purely associational and undisciplined, to thinking which is conceptual and inferential, thinking which attempts in some intelligible way to figure something out, to use the power of reason, then it is possible, and helpful, to think about what can be called "the elements of thought." The elements of thought are the basic building blocks of thinking, essential dimensions of reasoning whenever and wherever it occurs. Working together, they shape reasoning and provide a general logic to reason. We can articulate these elements by paying close attention to what is implicit in the attempt on the part of the mind to figure anything out whatsoever. Once we make them clear, it will be obvious that each of them can serve as an important touchstone or point of assessment in critical analysis and in the assessment of thinking.

Micro-skills. For each of the elements of thought there is a cluster of attendant basic thinking skills. Because they involve fundamental structures of thought, these skills can be characterized as micro-skills, those skills out of which larger-dominated critical thinking abilities are built. Being able to think critically about a particular issue, then, will include the ability to identify, clarify and argue for and against alternative formulations of the elements of thought.

The basic conditions implicit whenever we gather, conceptualize, apply, analyze, synthesize, or evaluate information—the elements of thought—are as follows:

1) Purpose, Goal, or End in View. Whenever we reason, we reason to some end, to achieve some objective, to satisfy some desire or fulfill some need. One source of problems in reasoning is traceable to defects at the level of goal, purpose, or end. If the goal is unrealistic, for example, or contradictory to other goals we have, confused or muddled in some way, then the reasoning used to achieve it is problematic.

An assessment of critical thinking, then, would test skills of being able to state an author's purpose, to identify a plausible statement of an author's goals from a list provided, to rank formulations of an author's objectives according to which are more or less reasonable in light of a particular passage, to distinguish clearly between purposes, consequences, assumptions and other elements of thought.

2) Question at Issue, or Problem to be Solved. Whenever we attempt to reason something out, there is at least one question at issue, at least one problem to be solved. One area of concern for reasoners, therefore, will be the formulation of the question to be answered or problem to be solved, whether with respect to their own reasoning or to that of others.

Assessing skills of mastery of this element of thought would test students' ability to formulate a problem in a clear and relevant way, to choose from among alternative formulations, to discuss the merits of different versions of the question at issue, to recognize key common elements in statements of different problems, to structure the articulation of problems so as to make possible lines of solution more apparent.

3) Point of View, or Frame of Reference. Whenever we reason, we must reason within some point of view or frame of reference. Any "defect" in that point of view or frame of reference is a possible source of problems in the reasoning. A point of view may be too narrow, too parochial, may be based on false or misleading analogies or metaphors, may contain contradictions, and so forth.

Levels of skill here would be tested with reference to being able to enunciate an author's point of view in a passage, to adjudicate between different statements of that point of view, to recognize bias, narrowness, and
contradictions when they occur in the point of view, to recognize relations between the frame of reference being used and its implications, assumptions, and main concepts.

4) The Empirical Dimension of Reasoning. Whenever we reason, there is some "stuff," some phenomena about which we are reasoning. Any "defect," then, in the experiences, data, evidence, or raw material upon which a person's reasoning is based is a possible source of problems.

Students would be tested on their ability to distinguish evidence from conclusions based on that evidence, to give evidence themselves, to identify from a pre-selected list data that would support an author's positions, data that would oppose it, data that would be neutral, to notice the presence or lack of relevant evidence, to recognize, to be intellectually courageous in recognizing (and labeling as such) mere speculation that goes beyond the evidence.

5) The Conceptual Dimension of Reasoning. All reasoning uses some ideas or concepts and not others. These concepts can include the theories, principles, axioms and rules implicit in our reasoning. Any "defect" in the concepts or ideas of the reasoning is a possible source of problems.

The assessment of the relevant higher order thinking would test the ability to identify main concepts of a passage, to choose among different versions of those concepts (some perhaps equally good), to see relations among concepts, to reason about the similarity of points of view on the basis of similarity of fundamental concepts, to distinguish central from peripheral concepts, derived concepts from basic concepts, to see the implications of using one concept rather than another.

6) Assumptions. All reasoning must begin somewhere, must take some things for granted. Any "defect" in the assumptions or presuppositions with which the reasoning begins is a possible source of problems.

Assessing skills of reasoning about assumptions would test the ability to identify assumptions underlying given inferences, points of view, and goals, to evaluate the accuracy of different formulations of the assumptions, to distinguish between assumptions and inferences, to rank assumptions with respect to their plausibility, to be intellectually fairminded by choosing the most plausible version of assumptions underlying points of view with which they disagree.

7) Implications and Consequences. No matter where we stop our reasoning, it will always have further implications and consequences. As reasoning develops, statements will logically be entailed by it. Any "defect" in the implications or consequences of our reasoning is a possible source of problems.

Skills to be assessed would include the ability to identify important implications, to do so by selecting from a list of possible implications, to make fine discriminations among necessary, probable, and improbable consequences, to distinguish between implications and assumptions, to recognize the weakness of an author's position as shown by the implausibility of its implications, to exercise intellectual fairmindedness in discriminating between the likelihood of dire and mild consequences of an action to which one is opposed.

8) Inferences. Reasoning proceeds by steps in which we reason as follows: "Because this is so, that also is so (or probably so)," or "Since this, therefore that." Any "defect" in such inferences is a possible problem in our reasoning.

Assessment would test students' ability to recognize faulty and justified inferences in a passage, to rank inferences with respect to both their plausibility and their relevance, to make good inferences in their own reasoning, to discriminate among various formulations of an author's inferences with respect to which is most accurate, to take something they do not believe but to entertain it for the sake of argument and draw reasonable inferences from it.

Assessment of Elements of Thought. Any program for the assessment of critical thinking skills must itself be assessed in terms of its validity and reliability in testing for the ability to think about, and in terms of, the elements of thought. These abilities can be successfully assessed in three related ways: by a restricted use of standard multiple-choice items, by multiple-rating items, and by short essay items. Both multiple-choice and multiple-rating items are machine-gradable, while essay items are not.

Although our recommendations about the content of the assessment will be spelled out in detail in Section Four, some of these can be anticipated here with respect to the assessment of reasoning abilities centering around the elements of thought.

Multiple choice testing (as in the existing Watson-Glaser Critical Thinking Appraisal or the Cornell Critical Thinking Tests) is an important part of an assessment of critical thinking, but its legitimate use is restricted to testing only the most basic skills of identifying and recognizing elements of thought, and then only as they occur in relatively short and unambiguous excerpts.

Within this domain, multiple-choice questions will require students:

- to identify an author's purpose in a passage;
- to rate selected inferences as justified, probably true, insufficiently evidenced, probably false, unjustified;
- to select among formulations of the problem at issue in a passage those that are clearly
reasonable, probably reasonable, probably unreasonable, clearly unreasonable;

* to recognize unstated assumptions;
* to distinguish evidence from hypotheses and conclusions;
* to rate described evidence as reliable, probably reliable, probably not reliable, unreliable.

### B. MACRO-AbILITIES.

The elements of thought do not exist in isolation from one another, nor—more importantly for the concept of an assessment procedure—do they exist outside a particular context of application. In the practice of good critical thinking, skills more closely associated with elements of thought are orchestrated into larger-domained abilities, called macro-abilities, which are applied to thinking about complex and sometimes ambiguous issues, problems, decisions, theories, states of affairs, social institutions, and human artifacts.

These critical thinking macro-abilities include being skillful at:

1. refining generalizations and avoiding over-simplifications,
2. comparing analogous situations: transferring insights into new contexts,
3. developing one's perspective: creating or exploring the implications of beliefs, arguments, or theories,
4. clarifying issues, conclusions, or beliefs,
5. clarifying and analyzing the meanings of words and phrases, constructing and clarifying interpretations,
6. developing criteria for evaluation: clarifying values and standards,
7. evaluating the credibility of sources of information,
8. questioning deeply: raising and pursuing root or significant questions,
9. analyzing or evaluating arguments, interpretations, beliefs, or theories,
10. generating or assessing solutions,
11. analyzing or evaluating actions or policies,
12. reasoning dialogically: comparing perspectives, interpretations, or theories,
13. reasoning dialectically: evaluating perspectives, interpretations, or theories,
14. reading critically: constructing an accurate interpretation of, understanding the elements of thought in, and evaluating, the reasoning of a text,
15. listening critically: constructing an accurate interpretation of, understanding the elements of thought in, and evaluating, the reasoning of an oral communication,
16. writing critically: creating, developing, clarifying and conveying, in written form, the logic of one's thinking,
17. speaking critically: creating, developing, clarifying and conveying, in spoken form, the logic of one's thinking.

Macro-abilities like these play a central role in a rich and substantive concept of critical thinking. They are essential to approaching actual issues, problems and situations in a rational way. Understanding the rights and duties of citizenship, for example, requires that one at least have the ability to compare perspectives and interpretations, to read and listen critically, to analyze and evaluate policies. In fact, there is no macro-ability on the list that would not be relevant or even crucial to thinking deeply about the rights and duties of citizenship. Similarly, the capacity to make sound decisions, to participate knowledgeably in the workplace, to function as part of a global economy, to master the content in anything as complex as the academic disciplines, to apply those disciplines to real-life situations, to make insightful cross-disciplinary connections, to communicate effectively—each of these relies on a fundamental way on having a significant number of the macro-abilities listed. Take, for example, the capacity to make sound decisions: such decision-making is hardly possible without an attendant ability to (going down the list of macro-abilities in order) refine generalizations, compare analogous situations, develop one's perspective, clarify issues, and so forth.

The last four macro-abilities listed—the ability to read, write, listen, and speak, each in a critical, informed, constructive way, at a post-secondary level of sophistication—are best considered not as in the usual model, not as manifestations of thinking already accomplished, but as being themselves actual modes of constructive thinking. As such, they are structured amalgams of elementary skills together with any number of other macro-abilities.

**Assessment of macro-abilities** is essential to assessment of critical thinking. Since these are the abilities implicit in the realistic use of thinking, no assessment tool that fails to assess a significant number of these abilities could justifiably be called an assessment of higher-order thinking. The assessment, moreover, needs to address such abilities directly (rather than through secondary indicators), systematically (rather than haphazardly as a result of an attempt to assess other variables like academic achievement), and in settings as authentic as possible given the requirement of uniform, relevant grading.
Assessment of macro-abilities that meets these four criteria cannot be accomplished within the confines of a standard multiple-choice-type test. It can be accomplished, however, for all of the macro-abilities (except those having to do with oral communication), by means of a combination of machine-gradable multiple-rating items and essay items.

For any macro-ability, there will be dimensions of the ability that are generative and other dimensions of it that are selective. In trying to solve a real problem, for example, a good deal of one’s thinking is devoted to generating a formulation of the problem that will make it more susceptible to solution. Another, and quite different, aspect of problem solving, is the ability to select, from among a large variety of possibilities, that avenue of thought which will most likely result in a solution. Students who are trained using a rich, substantive concept of critical thinking tend to improve in both dimensions of this ability, and both are genuine dimensions of real problem-solving.

The selective dimensions of an ability can be assessed accurately, even in complex, ambiguous, and subtle cases, using multiple-rating items. The generative dimension, on the other hand, cannot. Since it requires students to come up with their own critical thinking approaches within that macro-ability, this dimension can be assessed adequately only by carefully constructed and carefully graded essay tests. Details of the assessment and samples of assessment items will be presented in Section Four.

C. AFFECTIVE DIMENSIONS.
Higher order thinking requires more than higher order thinking skills. Critical thinking, in any substantive sense, includes more than macro-abilities. The concept also includes, in a crucial way, certain attitudes, dispositions, passions, traits of mind. These affective dimensions are not merely important to critical thinking; they are essential to the effective use of higher order thinking in real settings.

These affective dimensions include:

1. thinking independently,
2. exercising fairmindedness,
3. developing insight into egocentricity and sociocentricity,
4. developing intellectual humility and suspending judgment,
5. developing intellectual courage,
6. developing intellectual good faith and integrity,
7. developing intellectual perseverance,
8. developing confidence in reason,
9. exploring thoughts underlying feelings and feelings underlying thoughts,
10. developing intellectual curiosity.

Without intellectual perseverance, one could not solve the complicated, multi-faceted problems one confronts in industry. Without intellectual courage, one could not maintain a defense of citizenship rights in the face of scare tactics. Without fairmindedness, one could not enter into another’s point of view and thus would lack that empathetic understanding necessary for a reasonable approach to living in a pluralistic society. Without developing insight into egocentricity and sociocentricity one could employ one’s reasoning skills in a merely self-serving and prejudiced way. Without confidence in reason one could not adequately address those complex and frequently ambiguous real-life problems that require reasonable decisions in the face of crucial uncertainties.

Assessment of affective dimensions of critical thinking is an important part of an assessment of higher-order thinking. An initial problem is that from the fact that all these dimensions are essential, it does not follow that all are directly testable, nor does it follow that any of them is easily testable. For some of these affective dimensions (intellectual perseverance, for example), any testing would have to take place over an appropriately long period of time and thus could not be legitimately assessed at all during a time-frame suitable for a national test.

Nevertheless, a number of affective dimensions can be assessed in a relatively straightforward way using essay items and, especially, machine-gradable multiple-rating items.

"Reasoning Within Conflicting Points of View," a central aspect of the disposition of fairmindedness, is already being assessed on the revised version of the Watson-Glaser Critical Thinking Appraisal. This section of the Appraisal asks students to select the strongest (i.e., the most defensible) argument in favor of each side of a pair of conflicting and sometimes emotionally charged points of view. Proficiency on these items indicates a fairminded willingness to distinguish the concept of reasonable defensibility from that of personal belief.

Multiple-rating items are currently being prepared that address aspects of intellectual courage, other aspects of fairmindedness, aspects of intellectual humility, and aspects of the development of insight into one’s own egocentricity and sociocentricity.

D. INTELLECTUAL STANDARDS.
In any domain where assessment is taking place, there are standards that are implicit in the assessment. Higher order thinking is thinking that meets universal intellectual standards. Thus, when assessing a student’s ability to compare and evaluate perspectives (a macro-
ability) and to do so with fairmindedness (a trait of mind), we would judge whether she had made such evaluations in a relevant and consistent way, with attention to accuracy, fairness, and completeness in describing each perspective, and with a sensitivity to the degree of precision appropriate to the topic. We would assess critical thinking about and in terms of the elements of thought in very much the same way: to judge a person’s skill at recognizing the frame of reference underlying an issue, we would want to judge whether she could see relevant alternatives, whether the frame of reference she identified fits the available evidence, whether her answer was deep or merely mechanical, clear or vague, biased or fair. Intellectual standards apply to thinking in every subject.

The process of learning to teach so as to foster critical thinking is the very process by means of which one establishes intellectual standards for assessing thinking, and, by extension, for assessing instruction itself.

Such standards are more useful if they are made explicit—to the students who are taking the test, to those doing the assessing, and to classroom teachers. Making standards explicit benefits student test-takers because they can then see that there are standards, that the standards are not arbitrary ones, and that understanding the standards gives them an insight into what good critical thinking is. It benefits those doing the assessing because, in addition to the reasons already mentioned, it fosters both a uniformity in grading and a strong correlation between the grade and the skills being graded. Judging a response by how clearly and completely it states a position, for example, is using a critical-thinking standard and dictates a certain level of assessment; judging a response by how concisely or how elegantly it states a position, on the other hand, is using a standard that is inappropriate to critical thinking assessment. Explicit standards—part of a rich and substantive concept of critical thinking—might have avoided at least some of the mistaken assessment on the California Assessment Program, cited earlier (see p. 9). Thus, making standards explicit promotes both the reliability and the validity of the assessment-vehicle. Finally, it benefits classroom teachers because such standards can readily be built into classroom instruction. The standards, after all, are those implicit in teaching for higher order thinking skills; they are therefore invaluable both for teachers to use explicitly with their classes and—an essential feature of critical-thinking internalized—for students to learn to use as part of assessing themselves.

SECTION FOUR
RECOMMENDATIONS OF THE CENTER FOR CRITICAL THINKING

What is the simplest solution to the design of a process to assess higher-order thinking at the post-secondary level?

In this section we will (A) briefly survey existing assessment tools; (B) make recommendations regarding the substance and format of a national assessment tool—including the critical thinking domains to be assessed, the varieties of assessment strategies to be used (together with sample test items), and the dual interdisciplinary and intradisciplinary scope of the assessment—(C) appraise the value of the proposed assessment strategy for the reform of instruction, and (D) make recommendations regarding the implementation of the assessment.

A. Existing Assessment Tools.

There are limitations in all twelve of the commercially available critical thinking tests as instruments for assessing higher order thinking:

- Cornell Class Reasoning Test, Form X (1964)
- Cornell Conditional Reasoning Test, Form X (1964)
- Cornell Critical Thinking Test, Level X (1985)
- Cornell Critical Thinking Test, Level Z (1985)
- The Ennis-Weir Critical Thinking Essay Test (1985)
- Judgement: Deductive Logic and Assumption Recognition (1971)
- Logical Reasoning (1955)
- New Jersey Test of Reasoning Skills (1983)
- Ross Test of Higher Cognitive Processes (1976)
- Test on Appraising Observations (1983)
- Test of Enquiry Skills (1979)

In addition there are limitations in all of the other available “higher studies” tests which might be taken as a possible model for the assessing of higher order thinking: the SAT, LSAT, the Test of Academic Aptitude (British), the Graduate Record Exam, the Commonwealth Secondary Scholarships Exam (Australia).

We do not have the space here to review each of these tests one-by-one. Instead we will summarize the general situation as we see it.

Though aspects and dimensions of critical thinking are tested, some more and some less, in all of the above tests, none has been designed with the 21 criteria above (p. 3) in mind. Most importantly, none was designed to serve as a national assessment tool which establishes national standards in higher order thinking and in motivating and guiding instruction so as to lead to the achievement of the goal: “The proportion of college graduates who demonstrate an advanced ability to think critically, communicate effectively, and solve problems will increase substantially.”

Behind none of these tests was there a comprehensive model for the elements of thought, the macro-abilities of critical thinking, or the affective dispositions (as we have here provided). The relative recentness of the bulk of scholarship in critical thinking makes it unlikely that long-established tests will fill the bill.

Of course any new test for assessing higher order thinking should be based on a thorough review of established test strategies to incorporate those with significant application.

Given the need for assessment on the basis of a rich and substantive concept of critical thinking, there are two areas where competing values and objectives come into play.

The first concerns the substance and format of the test itself: Which domains exactly are to be covered, and with what emphases? What kinds of question will be asked? Will it be interdisciplinary or intradisciplinary? What kind of assessment question best relate to testing for skills of citizenship and the challenges of the workplace?

The second area concerns the implementation of the test and how it is conceived: Should it be value-added or simply criterion-referenced? Who will do the assessing and who will be assessed? How much will the assessment cost and who will pay for it? How often will the test be given?

Some of these are difficult questions, with genuine values and goals on different sides, where reasonable cases can be made for more than one position. Others of these questions are clearer, especially once the objectives of the test as a whole are brought into focus.

B. Substance and Format.

The overall recommendations of the Center For Critical thinking are set forward below.

(1) DOMAINS TO BE ASSESSED.

The national assessment of higher order thinking at the post-secondary level must test for a rich and substantive concept of critical thinking, and this testing
must be geared to assessment within all four domains of critical thinking.

(a) Elements of thought.
Skills of identifying, explicating, and using the elements of thought need to be assessed. They are necessary for any of the macro-abilities to be employed with precision, depth or accuracy. They are required if essential affective traits are to be rooted in solid, locatable, intellectual skills and the concepts they presuppose.

Lack of a solid grounding in these skills, and the concepts behind these skills, results in thinking which, good intentions notwithstanding, is far removed from the close, careful reasoning demanded by the rigors of higher order thinking. Even among testing personnel, lack of the informed use of these concepts is part of what results in such poor assessment tools and grading as we found in the California Direct Writing Assessment.

Critical thinking in students requires them to be able to perform well on items testing a list of skills that center around the elements of thought:

- identify a plausible statement of a writer's purpose;
- rank formulations of an author's objectives;
- distinguish clearly between purposes, consequences, assumptions, and inferences;
- choose the most reasonable statement of the problem an author is addressing;
- discuss reasonably the merits of different versions of the question at issue;
- recognize key common elements in formulations of different problems;
- give a clear articulation of an author's point of view;
- decide the most reasonable statement of an author's point of view;
- recognize bias, narrowness, and contradictions in the point of view behind an excerpt;
- identify assumptions and implications of a writer's point of view;
- distinguish evidence from conclusions based on that evidence;
- give evidence to back up their position in an essay;
- recognize data that would support, data that would oppose, and data that would be neutral with respect to, an author's position;
- recognize conclusions that go beyond the evidence;
- note, in an evaluative essay, the absence of evidence in an excerpt;
- identify the main concepts in a passage;
- distinguish central from peripheral concepts;
- identify the assumption underlying a given inference;
- evaluate the aptness of different versions of an assumption;
- choose the most reasonable statement of a background theory involved in a passage;
- distinguish between inferences and assumptions;
- rank different formulations of assumptions with respect to which is the most reasonable;
- identify crucial implications of a passage;
- discriminate between consequences that are necessary, probable, and improbable;
- evaluate an author's inferences;
- make, in an evaluative essay, justified inferences;
- choose the most accurate version of an author's inferences;
- draw reasonable inferences from positions they disagree with.

(b) Macro-abilities
Macro-abilities, grounded in a thorough familiarity with the elements of thought, are the activities we actually use to perform our higher order thinking. Abilities like clarifying values and standards, comparing analogous situations, generating and assessing solutions, analyzing and evaluating actions or policies are the stuff of reasoning. They are the means whereby decisions are to be made, problems are to be solved, industry is to be strengthened, and understanding of rights and responsibilities deepened.

The macro-abilities of critical reading and critical writing are keystones of any process to assess higher order thinking in that each of them, when considered at the post-secondary level, is permeated by other critical thinking macro-abilities. It is not as if we read and clarify values, read and compare analogous situations, write and generate solutions. To read critically is to clarify values, compare analogous situations, and to exercise the other macro-abilities as well; to write is to generate solutions and much more besides.

Assessment of proficiency in the macro-abilities can be keyed to student performance on test items geared to as many of the macro-abilities listed on p. 14 as is feasible given the time constraints of the test.
(c) Affective traits
Without assessing affective traits, only a diminished idea of critical thinking will be addressed.
What allows us to confront our prejudices and analytically break them down is not just macro-abilities but a commitment to use the macro-abilities in this regard. What allows us to solve our problems in a sufficiently diligent way as to address complicated and intricate real-life problems, is again not just cognitive abilities. It is intellectual perseverance—a drive, a disposition, an affective trait. A similar point can be made for each of the intellectual traits which are the driving force behind sound and penetrating reasoning.

Assessment of the affective dimensions will concentrate on those aspects it is plausible to test for within the constraints imposed by a national assessment. These will include aspects of fair-mindedness, of the willingness to suspend judgment, of intellectual courage and intellectual integrity.

(d) Intellectual Standards.
Assessment has to involve explicit universal standards. If we are not testing students' abilities to be relevant, precise, logical, consistent, and the rest, then we are not assessing students' abilities to engage in higher order thinking.
And if testing personnel do not employ these same explicit standards, then they are grading for something other than higher order thinking.

Relative mastery of these intellectual standards requires students to be able to
- recognize clarity vs. unclarity;
- distinguish accurate from inaccurate accounts;
- decide when a statement is relevant or irrelevant to a given point;
- identify inconsistent positions as well as (relatively) consistent ones;
- discriminate deep, complete, and significant accounts from those that are superficial, fragmentary, and trivial;
- evaluate responses with respect to their fairness;
- prefer well-evidenced accounts to accounts that are unsupported by evidence;
- tell good reasons from bad.

(2) VARIETIES OF ASSESSMENT STRATEGIES.
The assessment should contain items of three varieties:
(a) machine-gradable multiple choice items; (b) machine-gradable multiple-rating items; (c) essay items.

(a) Multiple-choice items.
Legitimate use of multiple-choice items on the assessment is limited. This type of item is geared toward relatively straightforward skills of reasoning, particularly with respect to recognizing elements of thought, distinguishing one element of thought from another, and recognizing clear examples of faulty reasoning.
Two detailed samples of assessment items follow (the first, figure 3, is on Inferences, the second, figure 4, on Recognition of Assumptions):
Other abbreviated samples of appropriate multiple-choice items are as follows:

(i) In the following excerpt, mark E for each item that is a piece of empirical evidence; mark C for each item that is a conclusion based on evidence; mark N for each item that is neither....

(ii) In this test, each exercise consists of several statements (premises) followed by several suggested conclusions...If you think the conclusion necessarily follows from the statements given, make a heavy black mark under "CONCLUSION FOLLOWS"; if you think it is not a necessary conclusion, put a mark under "CONCLUSION DOES NOT FOLLOW."

(iii) The following is a list of possible findings in relation to the experiment quoted above. For each, say whether it would support the author's hypothesis, oppose the author's hypothesis, or be neutral with respect to the author's hypothesis...

(iv) Below is a series of questions. Each question is followed by several reasons. For the purpose of this test, you are to regard each reason as true. The problem then is to decide whether it is a strong reason or a weak reason...

(v) Which of the following conclusions is C completely supported by the stated evidence, P partially supported by the stated evidence, or U unsupported by the stated evidence?

(vi) Which of the following is an implication of the author's position in the passage cited?
Figure 3

Inference

Directions: An inference is a conclusion a person can draw from certain observed or supposed facts. For example, if the lights are on in a house and music can be heard coming from the house, a person might infer that someone is at home. But this inference may or may not be correct. Possibly the people in the house did not turn off the lights and the radio when they left the house.

In this test, each exercise begins with a statement of facts that you are to regard as true. After each statement of facts you will find several possible inferences—that is, conclusions that some persons might draw from the stated facts. Examine each inference separately and make a decision as to its degree of truth or falsity.

For each inference you will find spaces on the answer sheet labeled J, PJ, ID, PU, and U. For each inference make a mark on the answer sheet under the appropriate heading as follows:

J if you think the inference is definitely JUSTIFIED; that it properly follows beyond a reasonable doubt from the statement of facts given.

PJ if you think the inference is PROBABLY JUSTIFIED; that it is more likely to be true than false in the light of the facts given.

ID if you decide that there are INSUFFICIENT DATA; that you cannot tell from the facts given whether the inference is justified or not; if the facts provide no basis for judging one way or the other.

PU if you think the inference is PROBABLY UNJUSTIFIED; that it is more likely to be false than true in the light of the facts given.

U if you think the inference is definitely UNJUSTIFIED; that it does not follow, either because it misinterprets the facts given, or because it contradicts the facts or necessary inferences from those facts.

Example

The first newspaper in America, edited by Ben Harris, appeared in Boston on September 25, 1690, and was banned the same day by Governor Simon Bradstreet. The editor's subsequent long fight to continue to publish his paper and print what he wished marks an important episode in the continuing struggle to maintain a free press.

1) The editor of the first American newspaper died within a few days after his paper was banned on September 25, 1690.

2) Information about the first issue of Ben Harris's newspaper promptly came to Governor Bradstreet's attention.

3) The editor of this paper wrote articles criticizing Governor Bradstreet.

4) Ben Harris persisted in holding to some of his aims.

5) Governor Bradstreet objected to some of the items published in Ben Harris's paper.

In the above example:

Inference 1 is (U) unjustified because in the facts given it mentions "the editor's long fight to continue to publish his paper..."

Inference 2 is (J) justified because the facts state that the first newspaper appeared on September 25, 1690, and was banned the same day by the Governor.

Regarding inference 3, there is no information given about the precise nature of the articles appearing in the paper; thus (ID) insufficient data.

Regarding inference 4, the facts given mention "the editor's subsequent long fight to continue to publish his newspaper and print what he wished..."; thus (J) justified.

Inference 5 is deemed (PJ) probably justified because the Governor banned the paper the day it appeared. However this is PJ rather that J because there may have been reasons for the ban other than objections to some of the items that appeared in the paper.
Recognition of Assumptions

Directions

Careful reasoners often find it necessary to complete partially stated arguments in order to evaluate those arguments. For example, someone might say, "John is selfish: we are good friends, but he never lends me money." The conclusion that "John is selfish" is supported by two explicit claims:

1) John never lends me money.
2) John and I are good friends.

But an important part of the argument was left out:
3) People who never lend money to their good friends are selfish.

This third assertion is an unstated assumption of the argument.

In this test each exercise begins with a brief argument. Each argument is followed by three numbered statements. Examine each of the numbered statements individually and make a decision about its logical relationship to the argument. For each numbered statement there are spaces on your answer sheet labeled: EC, UA, and N. Select just one of the following alternatives for each numbered statement, and make a mark on your answer sheet under the appropriate heading:

EC if you think the idea expressed in the numbered statement is an explicit claim made in the argument (even if the wording is not the same).
UA if you think the idea expressed in the numbered statement is a probable unstated assumption of the argument.
N if you think the idea expressed in the numbered statement is neither an explicit claim nor an unstated assumption of the argument.

Example:

Argument: "We need to save time in getting there, so we'd better go by plane."

1) Going by plane will take less time than going by some other means of transportation.
(Saving time is given as a reason for going by plane; this only makes sense if the person giving the argument believes that going by plane would take less time than other available means of transportation. So the idea expressed here is an unstated assumption of the quoted argument.) (UA)

2) We should try to cut down how long we spend travelling to our destination.
(The idea expressed here is directly asserted, though in different words, in the argument, so it is not an unstated assumptions of the argument; rather, it is an explicit claim made in the argument.) (EC)

3) Travel by plane is more convenient than travel by train.
(No mention is made in the argument of either trains or convenience. The idea expressed here is neither an explicit claim nor an unstated assumption of the argument.) (N)

(b) Multiple-Rating Items.

Though the use of multiple-choice questions is justified in assessing microskills, the bulk of the machine gradable items will be multiple-rating rather than multiple choice.

Multiple-rating items require students to evaluate each item rather than to select a single correct answer. They thus gauge abilities at the highest level of Bloom's Taxonomy rather than those at the bottom. Multiple-rating items allow one to ask questions where any number of answers from a provided list may be correct, or incorrect. It further allows students to rank, from a number of possibilities provided, those that are more correct. For example, teachers of critical thinking commonly grade — A, B, C, D, or F — the overall reasoning ability displayed in a series of student writing samples. This is in effect a multiple-rating assessment: the teacher takes each writing sample and rates it, with no pre-determined guidelines about how many will be A's, B's, etc. It is perfectly possible, on any given sample, that all items will be rated high, medium, or low. Thus, students can be assessed on their ability to grade — again, A, B, C, D, F — passages with respect to any dimension of critical thinking displayed in the passage.

The same list of possible answers can pertain to any number of independent test items. Thus, a list of twenty possibilities can be provided, and students can be asked to choose the appropriate response from that
list to six different questions. There is no restriction on the number of times a given answer may be correct. Nor is there any guarantee that there will be a reasonable answer on the list to every question. This allows much more subtle testing and grading. Moreover, guessing, using the process of elimination, and scoring well because of test-taking skills are all but impossible.

By including clearly unreasonable choices among the multiple-rating possibilities, a grade can be much more sensitive to the degree of a macro-ability or the intensity of an affective dimension. Thus, if there are five possible answers to a given question, they need not be graded 5, 4, 3, 2, 1. Rather, they may be graded, say, 5, 4, 1, 1, -3.

We have provided two detailed samples of multiple-rating items, Figure 5 is on Reasoning Within Conflicting Points of View (and thus is an assessment of an aspect of the affective trait of fairmindedness) and Figure 6 is on Comparing Analogous Situations (and is thus an assessment of a macro-ability). Each sample is limited here by having only four possible answers, a limitation that would not obtain on an actual test.

The following is a list of abbreviated samples of multiple-rating items, having to do with elements of thought, with macro-abilities, with affective dimensions, and with intellectual standards.

**Multiple-Rating Items, Elements of Thought.**

(I) Here is a list of formulations of the writer's objectives in this excerpt. Rank them from 1 to 5 with respect to which is the most reasonable in the light of the quoted passage...

(ii) For each of the underlined passages in the excerpts below, mark P on the answer sheet if it is a statement of the writer's PURPOSE, C if it is a statement of the CONSEQUENCES, A if it is a statement of the writer's ASSUMPTIONS, and I if it is an INFERENCE the writer is making.

(iii) Which of the following would the author most likely give as the statement of the problem she is attempting to solve? (iv) Read the excerpt; from the following list, identify the most plausible statement of the writer's purpose...

(v) Of the following statements of the author's point of view in this passage, select the one from the following list that is both most reasonable and most relevant to the passage....

(vi) List A below is a list of various possible statements of the writer's point of view in the quoted passage; List B is a list that includes possible assumptions and implications of those points of view. Match the items on list A with the items on list B...

(vii) Which of the following are main concepts in the passage cited; which are peripheral concepts?

(viii) For each inference below, decide whether the accompanying statement is U an unstated assumption, A an assertion, or N neither...

(ix) Rank the following items on a scale of 1 to 5 according to how reasonable it is as a statement of the author's assumptions...

---

**Figure 5: Reasoning Within Conflicting Points of View**

*Directions:* In the following questions, rank the answers in order of reasonability. In each case you are being asked to rank answers as to which is the strongest argument in favor of a position. By the strongest we mean the one that is most defensible, not necessarily the one which claims the most. To rank a defense for a position high does not mean that you actually hold that position but only that if you had to defend it before an audience of unbiased and open-minded people, the options you rank higher would be easier to defend on rational grounds than the ones you rank lower.

51. Children under the age of twelve should have all of their important decisions made for them by their parents and other appropriate adults because:
1) allowing them to make all important decisions for themselves will encourage false pride and stubbornness.
2) allowing them to make all important decisions for themselves will undermine parental respect and authority
3) children are not mature enough to make all important decisions for themselves
4) children should not be expected to take life's problems so seriously until they grow up
5) children can be expected to make grave mistakes, some of which could harm them for life

52) Children under the age of twelve should make some important decisions for themselves because:
1) children are less prejudiced than adults and more open to the truth
2) children spend a lot of time watching T.V. so they know a lot about what is going on in the world
3) children are likely to make many reasonable decisions affecting themselves
4) children will become depressed if they are not allowed to make some important decisions
5) children will be more apt to become responsible adults if they are allowed to make some important decisions for themselves as they are growing up
Figure 6: Comparing Analogous Situations

"Having a population to study instead of an individual fossil is enormously important. No two people today are exactly alike; no two Australopithecines were either. It is for that reason that drawing conclusions from a single fossil is risky. Measurements taken of it, and theories spun off as a result of those measurements, may be misleading because the part being measured may not be typical. It is only when a large number of specimens is available that all their variations can be taken into account, and a norm derived from them. If a visitor from outer space were to describe and name *Homo sapiens sapiens* by examining one skeleton, that of a short, squat, heavy-boned New Guinea tribesman, he would certainly be excused if he set up another species on the basis of a second skeleton discovered later a few thousand miles away—that of a seven-foot, slender-boned Watutsi tribesman from central Africa" (Edey, *The Emergence of Man*, pp. 47-48).

The author of the above passage makes an analogy between an anthropologist studying fossils and a visitor from outer space studying one or two single skeletons. Rank each of the following comments 1 to 3, according to whether it would be crucial to judging the strength of the analogy for the point the author is making. Give a comment a 3 if it is CRUCIAL in judging the worth of the analogy; give it a 1 if it is IRRELEVANT to judging the worth of the analogy; give it a 2 if it lies in between.

(a) The analogy illustrates the point well because in both cases we are called upon to draw general conclusions based on a limited sample. The more items you have in your sample, the more justified your generalization will be.
(b) It is a bad analogy because the visitors from outer space would draw the same erroneous conclusion even if they had a whole population of New Guinea tribesmen to study.
(c) It is a good analogy but it shows that we need not simply more fossils of Australopithecus, but fossils of it from other geographical areas.
(d) It is a bad analogy because we have no idea what visitors from outer space would conclude from seeing a skeleton of a New Guinea tribesman. The visitors might refrain from making the generalization for the same reason that makes the author say it is "risky."

(x) Look at each of the statements below as a possible consequence of the writer's position in the excerpt cited. Rank each statement on a scale of 1 to 7, where 7 means that you consider the statement a necessary consequence of the passage, and 1 means that you consider the statement a highly unlikely consequence of the passage.

(xl) Each of the following is an inference one might draw from the passage. Rank each one on a scale from 1 to 5, according to whether it is completely justified (5) or completely unjustified (1)...

(xil) Which of the following is the most accurate formulation of the author's inference in the cited passage?

*Multiple-Rating Items, Macro-Abilities.*

(xiii) Which of the following would be relevant to deciding whether A is a credible source of information on the topic...?

(xiv) Here is a list of observations about the behavior of Xs, made by a responsible investigator. Which of the items from the following list would be a justified generalization about Xs?

(xx) A has the following beliefs about astrology. Which of the questions below would be root or significant questions that A would have to answer to claim her beliefs about astrology were rational?

(xvi) A refuses to refund a customer's money and, when asked, defends her action by stating that it is "dictated by store policy". Which of the following would be relevant to deciding whether her action was indeed "dictated by store policy"? Which of the questions would be relevant to deciding if the store policy was rational?

(xvii) Judge A makes the following ruling in a case... Which of the following is the clearest statement of the standards Judge A is using?

(xviii) A compares the relation between managers and employees to the relation between teachers and students. Which of the following would A have to answer in order to continue using the analogy rationally?

(xix) A gives the following argument for...Which of the listed comments would be the strongest objection to her argument?

(xx) Listen to the accompanying excerpt from an audiotape of a lecture by A? Which of the following questions would be of most help in clarifying A's views?

*Multiple-Rating Items, Affective Traits.*

(xxl) Here are position-statements from both sides, A and B, of a controversial and inflammatory debate. From list X below, choose those items which are the most reasonable inferences to draw from position A; then choose those items which are the most reasonable inferences to draw from Position B.

(xxli) Here are position-statements from both sides, A and B, of a controversial and inflammatory debate. From list X below, choose those items which state the most reasonable assumptions underlying position A; then choose those items which state the most reasonable assumptions underlying Position B.
(xxiii) For each of the items below, tell which is the most reasonable action to take under the circumstances described. If, in your view, there is not enough information to make a reasonable decision, you may choose the action of suspending judgment as the most reasonable response.

(xxiv) A disposition to take a measured response rather than an exaggerated, disproportionate response will be measured by requiring students to discriminate between the likelihood of dire versus mild consequences of positions they dislike.

Multiple-Rating Items, Intellectual Standards.

(xxv) The following are four definitions from Webster's New World Dictionary. Which of them gives the clearest definition of...

(xxvi) Rank the following definitions for their precision on a scale of 1 to 7. 1 means "not precise at all"; 7 means "too precise for the subject matter"; and 4 means "exactly as precise as it should be".

(xxvii) Here is a list of data and a series of accounts summarizing the data. Which of the accounts is the most accurate summary of the data?

(xxviii) For each statement below, tell whether it is relevant or irrelevant to the hypothesis in the passage cited.

(xxix) Which of the following is the fairest rewording of the author's position (where the author is stating a highly controversial position)?

(xxx) Rank the following statements according to which are the best-evidenced and which are the least-evidenced.

(XXX) Which of the following is a good reason for believing the statement in question? Which is a bad reason? Which is somewhere in the middle?

(c) Essay Items.

The full range of the use of critical thinking cannot be assessed without requiring writing on the part of the student. To confront real issues, balance competing interests, weigh objections and alternatives, and make a reasonable decision about a matter of some consequence—this is a major part of what it is to think critically.

The ability and the disposition to engage in full-fledged critical thinking is measured or by in part by a person's ability to choose from among a pre-selected list. A true measure of critical thinking, and thus of a program's capacity to improve critical thinking, can be obtained only by including in the assessment generative as well as selective dimensions. Neither multiple-rating nor, obviously, multiple-choice items are adequate for testing this dimension.

Essay items will require proficiency in handling the elements of thought in using appropriate macro-abilities, in applying intellectual standards, and, what is more, it will require integrating these and bringing them to bear on a substantive issue.

Three detailed samples of essay items follow on the next page. Each has the same set of general directions.

In addition to full-blown essay tests, a series of short-justification items are currently being prepared. These would not ask students to write an essay on a topic, but would rather have them choose an answer from a pre-selected multiple-rating list and then justify their answer in a sentence of their own writing.

This type of test, if it were sufficiently developed, would have several advantages: it could be administered, because of the brevity and straightforwardness of students' written answers, to the college population as a whole rather than merely to a representative sample (see (i), under Implementation, below); it would assess some, though not all, generative dimensions of critical thinking; it would allow flexibility in grading the machine-gradable keyed answers (thus, one could adjust the rating of an item up or down depending on the justification); it would be no more difficult to grade by trained personnel than the math work on currently administered standardized calculus tests.

(3) INTERDISCIPLINARY AND INTRADISCIPLINARY

Scope of the Assessment. An assessment of the results of critical thinking instruction at the college level ought to focus both on thinking within the framework of particular academic disciplines and also on thinking in the interdisciplinary contexts that are so important to functioning as an autonomous, well-informed, productive member of a democracy.

A basic principle of critical thinking instruction, as applied to teaching subject matter in an area, is that (to quote the National Council for Excellence in Critical Thinking Instruction) "to achieve knowledge in any domain, it is essential to think critically". A related principle is that in any domain where one is thinking well, one is thinking critically. Any example of good biological thinking, or good historical thinking, or good anthropological thinking, or thinking in any other field, will necessarily be an example of critical thinking: It will involve basic skills dealing with elements of thought; it will involve at least some, and probably many, of the macro-abilities; it will involve affective traits like independent thinking and intellectual perseverance. And as far as instruction is concerned, there is a real sense in which learning biology is learning to think within and about the logic of biology.

Including critical thinking items taken from individual disciplines would also properly test those thinking skills that are more subject-specific, and it would do so in the context of presupposing a good deal of special-
Critical Thinking, Problem Solving, & Communication Skills Essay Exam

DIRECTIONS:
This test is designed to assess your critical thinking, problem solving and communication skills. Your answer will be judged for its clarity, relevance, consistency, logic, depth, coherence, and fairness. More specifically, the reader will be asking the following questions:

1) Is the question at issue well stated? Is it clear and unbiased? Does the expression of the question do justice to the complexity of the matter at issue?

2) Does the writer cite relevant evidence, experiences, and/or relevant information essential to the issue?

3) Does the writer clarify key concepts when necessary?

4) Does the writer show a sensitivity to what he or she is assuming or taking for granted (insofar as those assumptions might reasonably be questioned)?

5) Does the writer develop a definite line of reasoning, explaining well how he or she is arriving at his or her conclusions?

6) Is the writer’s reasoning well-supported?

7) Does the writer show a sensitivity to alternative points of view or lines of reasoning? Does he or she consider and respond to objections framed from other points of view?

8) Does the writer show a sensitivity to the implications and/or consequences of the position he or she has taken?

ISSUE #1: ECOLOGY
The nation is facing a variety of ecological problems that have the following general form: an established practice, whether on the part of business and industry or on the part of the public, is contributing to serious health problems for a large number of people. At the same time, it would be costly to modify the practice so as to reduce the health problem. People often say that the answer is one of achieving a “balance” between the amount of money we spend to correct the problem and the number of lives we would save by that expenditure. Develop a point of view and some plausible criteria for telling how one would determine this “balance.” Make sure you address any dilemmas inherent in your strategy for solving such problems.

ISSUE #2: POLITICS
There is a growing number of Americans who do not vote in national and local elections. Many of them explain their non-participation by saying that their vote would not make a difference. Some go on to argue that this is true because “money plays such a large role in elections that the candidate with the highest paid, and the highest quality, media campaign wins.” Most people agree that money sometimes plays an inappropriate role in determining the outcome of elections. Develop a proposed solution to this problem that takes into account the view that people and organizations with money have a right to use that money to advance political causes they believe in. If you like, you may decide to develop a position to the effect that there is no solution to the problem and that we have no choice but to accept the status quo.

ISSUE #3: MORALITY
Sociologist Irving Goffman has pointed out that all social groups, including professions, develop a protective attitude toward members of their group, even when what some of the members do is seen as morally wrong. A sense of loyalty to the group often overrides what they would otherwise deem immoral. Consider the arguments for and against exploiting people with whom you are personally close or with whom you have close professional ties. Develop a position on this issue that could serve as a guide for anyone in such a position.
ized knowledge. A critical thinking test in nursing or in history of art or in geology might well (in their different ways) test for skills of critical observation, while a test in sociology might assess thinking skills involved in constructing an unbiased questionnaire: a critical thinking test in English literature might well presuppose a knowledge of who Milton was, while a thinking test in physics might justifiably ask about a problem for which a knowledge of the second law of thermodynamics was taken for granted.

Even if we already had a series of critical thinking items within the various disciplines, however, we would not be testing for many of the interdisciplinary abilities we most want critical thinking for. Many of these have already been mentioned: the ability to make sound decisions in the context of understanding our rights and responsibilities as citizens, in the context of the workplace, as well-informed and thinking consumers, as members of our families, as participants in what is becoming a symbiotic and fragile world economy — the ability to reason about the gaps between disciplines, the bridges between them, and the generalizability of disciplines to other areas.

To test critical thinking abilities — specifically macro-abilities — as they apply to these areas, what is needed are interdisciplinary questions. These are questions of broad interest, ones that shed light on the quality of and improvement in students' thinking about realistic and fundamental issues; they ought to be the kind of question which can be at least partially illuminated by well-integrated knowledge in any number of academic areas.

The national assessment we are proposing would offer a range of interdisciplinary, subject-specific items, from which students would choose those relevant to their subject-matter knowledge. The interdisciplinary items, on the other hand, would not provide choices because of the desirability of avoiding the loss of equivalency that is almost always involved. (That loss would have to be minimized in the case of subject-specific items by field testing and rewriting.)

The interdisciplinary part is constructable by experts well versed in a rich and substantive concept of critical thinking. Interdisciplinary critical thinking assessment items will be constructed by members of the discipline working in consultation with experts in critical thinking, perhaps the standing committees on the various disciplines of the National Council for Excellence in Critical Thinking Instruction. (See Appendix #1.)

C. The Value of the Proposed Assessment Strategy for the Reform of Instruction.

Since higher order thinking has always been considered an important object of post-secondary education, and since this assessment would furnish a measure of that concept, and since performance on this assessment would have a significant impact on the standing of the college not only in the eyes of the intellectual community but in the eyes of the public as well, administrators and teachers would have a strong motivation to become familiar with the concepts and program behind the assessment. Most importantly, professors and others in charge of instruction and the formulation of educational goals would find in it a clear model for the articulation and integration of higher order thinking across the curriculum. Note the following:

1) The concept of the elements of thought not only provides a realistic analysis of the common dimensions of reasoning in every domain, it also encourages the explicit use in instruction of those critical/analytic terms which are the common possession of the intellectual community (question-at-issue, problem, evidence, data, concept, inference, assumption, implication, conclusion, point of view, frame of reference, etc.) and makes explicit the intellectual standards implicit in every discipline as well as in the closely reasoned professional work in business and industry (clarity, precision, accuracy, logic, consistency, etc.)

2) By highlighting reading, writing, speaking, and listening as modes of critical reasoning, the necessity of having instruction go beyond mere didactic coverage of content would become more intelligible. As long as reading, writing, speaking, and listening skills appear the sole province of specialized subjects rather than modes of reasoning intrinsic to the construction and mastery of knowledge in any subject, there will continue to be a significant lack of fit between modes of instruction and modes of necessary learning.

3) By highlighting the other macro-abilities of critical thinking, each analyzed into the same elements of thought, there would be significant transfer of emphasis on important modes of higher order thinking within a larger number of college and university student assignments. At present many professors fail to notice the extent to which they either presuppose that students already grasp the nature of fundamental intellectual processes, or they make assignments which, though they appear to call for such processes, can be successfully completed by simply repeating to the professor what was said in lecture or written in the text.

4) By highlighting a common critical/analytic language across the disciplines, students are encouraged to seek to transfer learning and intellectual discipline emphasized in one domain of learning to other domains of learning and application. The fragmentation of the
disciplines, in the minds of the students if not in fact, is now a serious problem in higher education. This problem is mirrored, of course, in business, industry, and government in the tendency to engage in fragmented, over-specialized problem-solving which fails to address the macro, multi-dimensional, nature of many complex problems.

5) By highlighting the importance of intellectual discipline and grounding it in specific skills and abilities, professors and other educational leaders will be given a reasonable impetus to help students make connections of a broader, more interdisciplinary nature. This will also be strongly re-enforced by the inclusion of everyday, multi-logial, interdisciplinary essay questions.

D. Implementation of the Proposed Assessment.
Our recommendations about implementation can be summarized as follows:

(i) The essay assessment should be administered to a representative sample of the student population at each educational institution, the machine-gradable items to the total student population;

(ii) it should be administered three times during a student's college career—at entrance, at the start of the junior year, and just prior to graduation—and thus yield value-added information to institutions;

(iii) the test should be constructed to be roughly three-hours long;

(iv) test items should be constructed from item shells, rather than from a simple pool of actual items;

(v) it should be administered by a private agency with critical thinking credentials;

(vi) it should be paid for by colleges and universities that contract to have their students tested;

(vii) it should provide educational institutions with detailed information about central aspects of their students' higher order thinking;

(viii) it should be developed according to the costs and timetables listed below.

Details of our recommendations center around the answers to five practical questions about the administration of the test:

(i) Who will be assessed?
Our minimal recommendation is that all portions of the assessment be given to, at the very least, a representative sample of the student population at each educational institution. Since the problems implicit in testing a random sample can be easily worked out, this recommendation avoids the expense of administering an essay test to the college population as a whole.

The assessment strategies we have proposed include two broad areas of testing: a machine-gradable portion that includes multiple choice items and multi-rating items and an essay portion. Both portions will assess, in their different ways and with their different emphases, micro-skills, macro-abilities, affective traits and intellectual standards.

There are, therefore, really two options with respect to who is assessed using the strategies we propose. First, the machine-gradable portion of the assessment can be administered to the college population as a whole, while the essay portion can be administered to a representative sample of students at each institution. Second, both portions could be given only to a representative sample of the population at each institution.

Both options will hold down costs, though the latter will clearly be less expensive than the former. Which option is ultimately chosen will depend on the amount of detail desired, the precise role the assessment is to play, and the funds available.

(ii) How often will the assessment take place?
The maximum benefit to educational institutions will be provided to the extent that they are enabled to measure the progress of their students' higher order thinking during the course of their college career. This will enable institutions not only to gauge their contribution to their students' progress, but also to measure the success of attempts to re-design their instruction so as to increase critical thinking capabilities.

These objectives can be accomplished by having students assessed often enough to reflect such progress, optimally: at the time of their entrance, at the beginning of their junior year, and just before graduation.

(iii) How long will the test take?
The test should last about three hours in order to cover multiple-choice, multiple-rating, and essay items without becoming a speeded test to an inappropriate degree. To span all difficulty levels, it would be best to have a total of at least 30 items. While two of these could be short essay items requiring 20 minutes each to answer, the machine-gradable items would be faster to answer, and hence could be handled in 3-8 minutes.

(iv) How will a sufficiently large pool of items be constructed?
While it might be possible to release a pool of items which would provide the equivalent of 6 tests, hence $6 \times 30$, it would be better to increase flexibility by using item shells, which would be items that include identified variables,
each of which could be replaced from a list of acceptable values. This would greatly increase the number of items that could be generated, but without "surprises". A pool of shells would generate over a thousand items, possibly several thousand.

(v) Who will do the assessing?
In order to avoid problems in the reliability of the assessment (like those we have seen occur in the California Direct Writing Assessment), the assessment needs to be monitored, administered, and graded by a private agency whose personnel have critical thinking credentials or are at least under the direction of scholars with a solid grounding in research in critical thinking.

(vi) Who will bear the costs of the assessment?
The assessment should be paid for by the colleges and universities that contract to have their students tested. This not only puts least burden on the public but represents an established precedent in distributing costs of testing.

(vii) What will institutions be able to learn from the results of the assessment?
We anticipate that colleges and universities will receive an analytic report that will document all of the following:

- how their students stand in relation to students at other institutions;
- how their graduates stand in relation to their juniors and their entering freshmen;
- how their students stand with respect to established performance criteria.

This information would enable institutions to target instruction to remediate weaknesses and build on strengths, as well as to measure what students are gaining as a result of attending their classes.

(viii) What is a reasonable estimate of the cost of and timetable for developing the national assessment?
It would be possible to develop the most restricted version of a series of three parallel tests— for entrance, junior year, and preceding graduation—in nine months at an estimated cost of $240,000. This version would be restricted to using only fully articulated items, rather than the more flexible pool of item shells, and to using only interdisciplinary items. However, restriction to three fully articulated forms would be useful only if security for the test were possible. In current contexts, especially New York State, it is difficult to maintain test security against the legal demand for full disclosure to facilitate legal hearings on protested results.

The full assessment in its most desirable form, including both subject-specific items and the pool of item shells described in (iv), would involve seat time to develop, and would then be subjected to expert criticism, rewrite, and re-criticism, and to two rounds of field testing with intervening rewrite. It could be done in two academic years, at an estimated cost of $350,000.*

* The authors wish to acknowledge the invaluable advice provided us by Michael Scriven on evaluation theory in general, and, more particularly, on the logistics of test construction.

Appendix #2
Critique of Student Essay from CAP

The student essay entitled "Rock Around the Clock", if graded by those with a background in critical thinking and reasoning would, in the professional judgment of the authors of this paper, have been graded at the lower rather than the higher end of the continuum of eight levels: "minimal evidence of achievement" or, at best, "limited evidence of achievement" rather than the highest grade of "exceptional achievement". For though the essay may have "flair and sparkle" (as one teacher expressed it), it is a poor example of evaluative reasoning, since it systematically confuses the objective goal of reasoned evaluation with the very different goal of explaining subjective preference, an important distinction in critical thinking which the teacher-evaluators apparently missed entirely.

First of all, the instructions themselves are confused. They begin with a clear requirement of "objective" evaluation:

Students were asked to write an evaluative essay, make judgments about the worth of a book, television program, or type of music and then support their judgments with reasons and evidence. Students must consider possible criteria on which to base an evaluation, analyze their subject in the light of the criteria, and select evidence that clearly supports their judgments.

Unfortunately, this request for reasoned evaluation is blended in the second half of the instruction with what might possibly be taken, with a little stretching and selective reading, as a request for the expression of a subjective preference:

Each student was assigned one of the following evaluative tasks: to write a letter to a favorite author telling why they especially liked one of the author's books, to explain why they enjoyed one television program more than any others, or to justify their preference for a particular type of music. The tasks made clear that students must argue convincingly for their preferences and not just offer unsupported opinions.

Let's look closely at this confusion. In the first place, there is still an emphasis on objective evaluation ("The tasks made clear that students must argue convincingly for their preferences and not just offer unsupported opinions") at the same time that the task itself is defined both as an "evaluative task" and as a justification for a "preference".

Now most people prefer books, television programs, and types of music for fundamentally subjective, not objective, reasons. They like a particular book, television program or song for no reason other than that they do like it, that is, because they enjoy it or find pleasure in it or are interested or absorbed or excited or amused by it. Each of these affective self-descriptions is typically not the result of an objective evaluation. They have no relation to the objective quality of what is judged. They are about the personal responses of the experiencer, not about the objective qualities of that which is experienced.

Most people, to take the point a step further, do not have "evidence"—other than the stuff of their subjective reactions—to justify their preferences. They prefer because of the way they feel, not because of the way they reason. To choose because of these subjective states of feeling is precisely to lack criteria of evaluation or evidence that bears upon objective assessment. When challenged to support subjective preferences, people usually can do little more than repeat their subjective reactions ("I find it boring, amusing, exciting, dull, interesting, etc...") or rationalize them ("I find it exciting because it has a lot of action in it").

A reasoned evaluation of a book, a program, or a type of music requires more than this; it requires some knowledge of the qualities of what we are evaluating and of the criteria appropriate to the evaluation of those qualities. One needs to be well-informed about books, about programs, about music if one is to claim to be in a position to objectively evaluate them. If one is not well-informed one is unable to render a justified evaluative judgment, though one can always subjectively react and freely express one's subjective reactions as (mere) personal preferences. This is what the student (graded as having written an objective evaluation of "exceptional achievement") actually does. But his evaluators, not having this distinction clear in their own minds, completely miss the difference.

The model student essay can, for analytic purposes, be divided into three parts. We shall comment briefly on each in turn. The first segment of the essay is an account of a highly emotional exchange between the student and his mother:

"Well, you're getting to the age when you have to learn to be responsible!" my mother yelled out.
“Yes, but I can’t be available all the time to do my appointed chores! I’m only thirteen! I want to be with my friends, to have fun! I don’t think that it is fair for me to baby-sit while you run your little errands!” I snapped back. I sprinted upstairs to my room before my mother could start another sentence.

It is clear that in this segment there is no analysis, no setting out of alternative criteria, no clarification of the question at issue, no hint at reasoning or reasoned evaluation.

In the second part the student makes a sweeping claim about a purported causal relationship between listening to rock music and his asserted, but unsupported, ability to control his emotions. He does not consider “possible criteria on which to base an evaluation”. He does not present any evidence, though he does cite two examples, one where a song prompts him to punch his pillow and one where another song prompts him to stop. This gives little credence to the notion that rock music leads to his “controlling” his emotions. If anything, his examples seem to imply that, rather than learning control from, he is learning to be controlled by, the music he listens to. His major claim, that “Without this music, I might have turned out to be a violent and grumpy person.” is without reasoned or evidentiary support. He merely brashly asserts that it is true:

I turned on my radio and “Shout” was playing. I noted how true the song was and I threw some punches at my pillow. The song ended and “Control”, by Janet Jackson came on. I stopped beating my pillow. I suddenly felt at peace with myself. The song had slowed me down. I pondered briefly over all the songs that had helped me to control my feelings. The list was endless. So is my devotion to rock music and pop rock. These songs help me to express my feelings, they make me wind down, and above all they make me feel good. Without this music, I might have turned out to be a violent and grumpy person.

In the third, and final, section of the essay the student closes his remarks with a series of subjective, unsupported, even irrelevant statements:

Some of my favorite songs are by Howard Jones, Pet Shop Boys, and Madonna. I especially like songs that have a message in them, such as “Stand by Me, by Ben E. King. This song tells me to stand by the people I love and to not question them in time of need. Basically this song is telling me to believe in my friends, because they are my friends.

My favorite type of music is rock and pop rock. Without them, there is no way that I could survive mentally. They are with me in times of trouble, and best of all, they are only a step away.

If this is reasoning, it is very bad reasoning: “Believe in your friends because they are your friends”, “If you feel you cannot survive without rock music, then it follows that you can’t.” Of course, a more appropriate interpretation of what is going on is that the student is not reasoning at all but merely asserting his subjective opinions. Consider, the student doesn’t examine alternative criteria on which to base an evaluation of music. He doesn’t analyze rock music in the light of evaluative criteria. He doesn’t provide evidence that clearly supports his judgment. His writing is vague where it needs to be precise, logically rambling where it needs to be critically reasoned. We don’t really know what he means by songs “controlling” his feelings. We are not provided with any evidence on the basis of which we could assess whether there is any truth in his sweeping claims about himself, for example, that he could not survive mentally without rock music. Indeed, common sense experience strongly suggests, we believe, that the student is simply deluding himself on this point, or, alternatively, engaging in unbridled hyperbole.

We are prepared to be sympathetic to students who don’t understand the difference between reasoned discourse and subjective assertion, but we cannot be sympathetic to the national dissemination of fluent subjective reactions as a model of good reasoning and rational evaluation. The damage that follows from such an ill-conceived model is incalculable.

When a blatantly weak essay is disseminated as an example of “exceptional achievement” in the writing of a reasoned evaluative essay—with accompanying directions calling explicitly for consideration of alternative criteria, analysis in the light of (appropriate) criteria, presentation of evidence that clearly supports conclusions drawn—then it is clear that a non-substantive concept of critical thinking and reasoning is at work.

A Review of Richard Paul and Gerald Nosich's "A Proposal for the National Assessment of Higher Order Thinking at the Community College, College, University Levels"

Lorenz Boehm
Oakton Community College

I like this essay. I find much in it with which to agree; I'm impressed by its careful, thorough, and respectful exploration of what critical thinking is and how it might be assessed; and I appreciate what it contributes to any conversation about the shape of a national assessment test. Thus, my strongest reaction is applause.

However, while there is much to agree with and be pleased by, there are a few points that I have questions about, or that trouble me, and that I would like to lift out and set aside, if only to save them for discussion at another time.

One among these is the "assessment strategies" professors Paul and Nosich suggest. I have a lot of trouble with multiple-choice tests. They seem to me, in a way, intellectually dishonest. Give a student a piece of prose to read, and then ask her to write-out state the main idea of the piece. I like that. It tests her understanding. If, on the other hand, you give her a list of possible main ideas and ask her to choose the correct one, you may be assessing her understanding; more likely you are assessing her ability to identify the correct answer,
which she may not have known on her own, but which you have given her, and which she now arrives at by eliminating the incorrect ones -- all of which, to my mind, is a different kind of "understanding" altogether. In the latter, there is a built-in crutch (and that's the "dishonesty"); further, it doesn't assess the same mental ability, although it pretends to. It also opens the door to/for guessing, which is intellectual dishonesty of another sort.

Now, I see that the kinds of multiple-choice questions Paul and Nosich have in mind are more complex, but I believe the "dishonesty" I described is still there. As long as there is a choice of answers there is a crutch; the test is doing some of the work. As a result, I would eliminate multiple choice questions of this type. I would much rather have the student formulate her answer out of her interaction with the piece she is being questioned on. I think in the jargon this is called a "free response" test item. In any case, I believe makes for a better test.

I'm not sure if the same can be said about "multiple-rated" test items. I see that these allow for different kinds of questions. And I see, as the authors point out, that "guessing, using the process of elimination, and scoring well because of test-taking skills are all but impossible." Still, I prefer test items that ask students to generate text. In fact, the example in figure 4 (p. 21) would, it seems to me, be ideal if it asked students to do what Paul and Nosich do: choose the answer from
the alternatives (EC, UA, or N) and then explain in prose why that choice was made. Such a test not only shows that the student can reason out the "correct" answer; it also shows the reasoning process the student went through which, in my opinion, makes it a superior test.

I do understand that there are other considerations about multiple-choice tests. They are easier and faster to score, especially if the scoring is done by a machine. Fine. Then the issue is efficiency or speed, not the nature or the efficacy of the assessment. They are different principles and, at the risk of sounding naive, I'll say that the efficacy of the assessment should get the higher "score."

Needless to say, I am most supportive of the "essay items" professors Paul and Nosich discuss. While I'd like to talk with them a little about the shape of the prompts, here we have almost no disagreement, save for how big a role writing should play. As I maintained in my review of Ed White's essay, I believe it is the superior method of assessing critical thinking and should be the primary (if not the only) basis of its assessment. In the context of this review, I would simply add my belief that Paul and Nosich are exactly on target when, in the "Objectives" section of their essay (#11, p. 3), they argue for an assessment test that "is empowering" and that "promotes...the active engagement of students in constructing their own knowledge and understanding". I believe there simply is no better way of doing that than through self(student)-generated prose written in
response to a carefully crafted prompt.

A second point that professors Paul and Nosich make that I'd like to explore further has to do with the distinction they draw between "interdisciplinary and intradisciplinary." This is, after all, one of the central dichotomies of the critical thinking movement and bears some talking-about. I like the idea proposed here that

An assessment of the results of critical thinking instruction at the college level ought to focus both on thinking within the framework of particular academic disciplines and also on thinking in the interdisciplinary contexts that are so important to functioning as an autonomous, well-informed, productive member of a democracy. (p. 24)

Some faculty members at some colleges argue that critical thinking is best understood as a set of mental abilities (like the ability to construct, analyze, and evaluate arguments; or the ability to apply, analyze, evaluate and synthesize ideas), and that these are best taught in separate critical thinking courses. Others argue that it is best understood as doing the mental work of the disciplines, and is best taught in all courses across the curriculum by teachers who have "unpacked" the thinking required by their discipline, organized it gradiently, and have made it the backbone of their courses. However, most critical thinking teachers now agree that doing both is optimal. (This is decidedly the case at my own institution, where for six years faculty worked successfully to build the "intradisciplinary" model, and where recently they have begun to develop a course in the "interdisciplinary model, which is now seen by them and just
about everyone else as a compliment to what came before and continues.)

The move to include assessment items that address both models is, I believe, a very strong aspect of what Paul and Nosich recommend. Conceptually. However, if the idea fails to win support, then I would argue for a test that assesses critical thinking defined as understanding and applying at the appropriate gradient the modes of inquiry, the language, the thinking, done by practitioners of the disciplines.

A third point. I'm interested in the idea of assessing what Paul and Nosich call the "affective dimensions" of critical thinking; I also appreciate the difficulty in doing it that they foresee. As they say, "For some of these affective dimensions (intellectual perseverance, for example), any testing would have to take place over an appropriately long period of time and thus [they] could not be legitimately assessed at all during the timeframe suitable for a national test." Perhaps. Without, for now, addressing the value, or the lack of value, of assessing "thinking independently," or "intellectual perseverance" or "intellectual courage," or any of the others, it seems pretty clear to me that these can be assessed very effectively by portfolio, which allows for, even calls for, a variety of assessment materials, including, especially, drafts of essays on a range of topics, which reflect the student's thinking process as well as his disposition toward thinking.

One last area of concern. Among the "main objectives of a
process to assess higher order thinking skills," the authors identify this one:

It should respect cultural diversity by focusing on the common-core skills, abilities, and traits useful in all cultures. (#11, p. 3)

I think I understand the intention here, but I also think there is a dilemma. I don't believe test designers can (or should) determine which are to be the "common-core skills, abilities, and traits useful" in other cultures; it seems best to let other cultures do that piece of determining. What can be done is identify "the skills, abilities, and traits useful," even necessary, for succeeding in this "culture," whether broadly defined as this "society" or more narrowly defined as a particular workplace, or an academic discipline. I think Paul and Nosich are trying to put the best light on the unavoidably dark side of any national assessment of critical thinking. There have to be standards of some sort; they may not be everyone's standards, predictably they won't be; certainly they won't be every culture's standards. Some won't like that. It's unfortunate, but I don't think we should avoid seeing it for what it is.
A Critique of Richard W. Paul’s and Gerald M. Nosich’s
"A Proposal for the National Assessment of Higher-Order Thinking at the Community College, College, and University Levels"

Prepared by Peter A. Facione

A figure of international renown in the Critical Thinking Movement, Richard Paul, in collaboration with Gerald Nosich, offers a detailed, multi-faceted set of recommendations and pronouncements with regard to critical thinking and critical thinking assessment at the baccalaureate level. Their paper focuses on three chief questions: What are the criteria by which a national assessment program should be evaluated? What does critical thinking mean, and what are its component parts? And, what about assessment instrumentation? The first question is normative, the second conceptual, and the third empirical. This review addresses each question in turn.

Dr. Paul, the philosophical guru whose energizing vision produced the Center for Critical Thinking and Moral Critique and more than a decade of international CT conferences, begins by suggesting 21 criteria upon which a national critical thinking assessment program might be evaluated. Addressing this issue at this level of detail is, in itself, a positive contribution. In so doing, Dr. Paul forcefully reminds us that there are many things we must keep in mind if we are going to do this job well.

Are Dr. Paul’s 21 the right 21? How do his 21 relate to what the experts in educational assessment would advise? Is each of the 21 clear, operational, and free from questionable assumptions? Is each expressed at the correct level of abstraction? Is the set of 21 comprehensive and reasonable? Which take priority over others?

A brief look at only one of these 21 offers an example of the many concerns each provokes and amplifies the importance of working with the experts in educational testing and CT testing to develop the proper set of criteria. #1 says the CT assessment process "should assess students’ skills and abilities in analyzing, synthesizing, applying, and evaluating information." The positive value of this proposed criterion is to point us toward content validity, a vital component of any sound assessment design. Content validity put more abstractly (as it is in the research literature of educational testing) asks, "Is the theoretical construct, X, which this test instrument targets the proper one? Unfortunately Dr. Paul’s way of putting criterion #1 compresses the theoretical concern for content validity with a partial list of some CT skills. A well-formulated criterion would separate the theoretical consideration (content validity) from an incomplete analysis of that content. A revised #1
might read "...should target an appropriately rich conceptualization of CT."

One could challenge and revise each of Dr. Paul's proposed list of 21. But would working through Dr. Paul's proposed list in a detailed, critical way advance our common goals? No. To his credit, Dr. Paul has aimed us in a useful philosophical direction: We must establish the criteria—both in general and in detail by which we will evaluate any proposed national system of CT assessment.

To carry out this part of the task we should turn from philosophical speculations to the technical advice experienced scholars in the field of educational tests and measurement can bring to the table. We should contact the likes of Robert Ennis, Stephen Norris, Joanne Carter-Wells, and Barbara Lawrence, as well as other experts in the psychological science of educational assessment, and invite them to carry out the philosophical direction set by Dr. Paul. These experts should be invited to review the scientific literature on educational assessment and identify the criteria of a suitable national CT assessment program. Thus content validity, along with construct validity, concurrent validity, reliability, etc. could be identified as appropriate general criteria without begging any questions with regard to how those various criteria play out in the case of critical thinking.

Experts experienced in the technical aspects of CT test validation should be asked to advise on how each general criterion should apply to CT assessment. For example, in the case of CT assessment, construct validity (that the process that the test-takers must use to achieve the correct answer is, indeed, the process which the test purports to assess) is extremely complex. Stephen Norris and Robert Ennis are very helpful in this regard, for in their book *Evaluating Critical Thinking* they provide a useful and highly readable list of

---

1 For example: Aren't "maximum flexibility" in #2 and "important differences" and "crucial to all the disciplines" in #3 dysfunctionally vague? What does #4 really mean, conceptually or operationally? In #5, do "readily lead to improvement" (p.3) and "can be used to lead to improvement" (p.5) mean the same thing? Are the epistemological assumptions inherent in #6 really true? In #7, what are "versatile" skills and do they differ from "fundamental" skills? Also, Joann's "responsible, decision-making" in #7 open the door to a whole series of moral judgments which take us well beyond critical thinking per se? Isn't #8 a meta-criterion, when compared to the others? How are "adult level" in #9 and "college level" in #12 related? Is the strategy proposed in #10 the right way to achieve the goal cited in #10, and shouldn't a criterion propose the goal only? How are #11 and #15 related; is #11 context valid; are its pedagogical assumptions correct? Does the theoretical basis for #12 accord with contemporary research in the areas of reading and writing as meaning making processes? Isn't it the case that some of the "central" things cited #13 go beyond critical thinking? What does "authentically usable" in #14 mean and what is "reductionism"? Does "basic at the college level" in #15 mean remedial or something else? Does the "large body of the populace" in #16 rule out the right idea if perceived only by a small minority (of experts, say)? In what way does "valuable skills that apply to genuine problems" in #16 overlap with critical thinking? In the specific assessment strategy cited in #17 a right one, and is it the only right one? Isn't #17 more of an implementation suggestion than a criterion whereby to judge a national assessment program? What specific things are the intended contrasts with "real life problems" in #18? In #19, "affordable" to whom—the institutions, state or federal government, individual test-takers, potential employers? Why should it be a criterion of the national program that it have to be linked in the way #20 suggests to institutional evaluation? Is CT testing achievement testing (as in how much does one know), as #21 presumes, or is it better described as aptitude testing (as in what are the levels of one's skills)? Should #21's proposed national standards be norm-reference or criterion-reference, should region, age, SES, career/discipline field, or level of educational attainment be differentiating factors or should there be only one national standard?
criteria by which to evaluate the quality of a CT assessment program. Additional criteria, specific to CT assessment, should be added. Fiscal and political criteria specific to the project for which this work has been commissioned should be identified and, if they do not violate the technical criteria, also be added. Criteria should not be confused with strategies for implementation, nor should they preempt the findings of empirical investigations.

A second useful contribution of Dr. Paul's paper is the attention he gives to the concept of critical thinking. His main point is that, yes, we do have a rich, multi-textured conceptualization. There is no need to ponder anew what critical thinking might mean. There is a consensus among CT experts about core CT skills. There is accord about the dispositions, or habits of mind, associated with good critical thinking. We can advance to the next step, which is the practical issue of how to assess these skills and these dispositions as they are, or should be expected to be possessed, by baccalaureate prepared persons in our society.

Dr. Paul cites a draft statement prepared for his newly formed CT coalition, the National Council for Critical Thinking. The draft happens to reinforce and largely confirm that conceptualization of core critical thinking skills and dispositions which emerged from the work of the national Delphi research project, conducted during 1988 and 1989 under the auspices of the American Philosophical Association.

The Delphi research project adopted a qualitative social science method developed by the Rand Corporation, known as the Delphi Method. Carefully conducted rounds of questioning, argumentation, refinement, and reformulation led to a consensus among a panel of 46 national experts (including Dr. Paul) regarding the core elements in the concept of CT which should be expected at the college level. The Delphi Panel took up many issues during its two years of work; it considered a variety of views. One of the panel's most useful points of consensus -- reprinted at the end of this review -- is the detailed definition of each core CT skill and sub-skill, with examples of educational outcomes. In these outcomes many see examples of the kinds of tasks that might also be used in a comprehensive CT instruction.

---

4 CT tests should presume a level of cognitive development appropriate to the subjects to be tested (and should not assume that college students, for example, will necessarily approach problems the way expert logicians or scientists or programmers might.) CT tests should presume no technical CT vocabulary. Correct answers should not be dependent upon information recall. CT tests should require that subjects use CT, rather than remember things scholars might say about CT, to achieve correct responses. Although explanation is a core CT skill, correct answers to some items may be achieved through the proper application of other, more preliminary critical thinking skills, such as analysis or inference. Those being tested should not necessarily have to be able to explain the processes whereby they correctly applied more preliminary skills. However, other items in a complete CT assessment program should target the criterion, methodological, evidentiary, and conceptual considerations which are involved in an explanation suitable of well developed critical thinking. See, *Assessing Inference Skills,* (ERIC Doc. No: TM 012 917), "Strategies for Multiple Choice CT Assessment," in *CT at Colleges and Universities,* David Hitchcock (Ed.), Vale Press, Newport News, VA, 1991, and "Thirty Ways to Mess Up a CT Test," *Informal Logic*, Vol. 12, No. 2, pp. 106-112, Spring 1990.
The Delphi research consensus produced a list of six core critical thinking skills to be expected at the college level: analysis, interpretation, inference, evaluation, explanation, and self-regulation. At the same time, the expert panel identified a set of critical thinking dispositions that characterized how a good critical thinker approaches life and living in general and specific problems or questions that might arise. In so doing the Delphi panel drew some instructive distinctions. Among the most significant distinctions was that discernment between the procedural, laudatory, and normative uses of the term "CT". In other words, a key question the experts resolved was how many main parts does CT have? First, does the concept of CT include cognitive skills? Second, does it also include affective dispositions? Third, does it include a moral component? There was no doubt about the list of cognitive skills. What the six are and that they are part of what is meant by "CT" was solidly accepted. But some experts, particularly those from the Center for Critical Thinking at Montclair State, argued that dispositions were not part of the meaning of "CT". However, The Executive Summary of the Delphi research expresses the majority and minority views on this issue as follows:

The experts are in consensus regarding the list of affective dispositions which characterize good critical thinkers. However, whether or not these affective dispositions are part of the meaning of "CT" in the way that the cognitive skills are, was an issue which divided the experts from the first. It became evident that various experts mean different things when they used the term "CT" in reference to its possible dispositional components.

The deepest division is between the nearly two-thirds majority who hold that the term "CT" includes in its meaning a reference to certain affective dispositions and the roughly one-third minority who hold that "CT" refers only to cognitive skills and dispositions, but not to affective dispositions. The majority (61%) maintain that the affective dispositions constitute part of the meaning of "CT." They argue that these dispositions flow from, and are implied by, the very concept of CT... These experts argue that being adept at CT skills but habitually not using them appropriately disqualifies one from being called a critical thinker at all. Thus, in addition to using "CT" in its procedural sense, these panelists also use "CT" in its laudatory sense. They find it sensible to say, "This person is a critical thinker, but this other person is so mentally lazy, close-minded, unwilling to check the facts and unmoved by reasonable arguments that we simply cannot call him a critical thinker."

---

5 TABLE 4 in particular, of Critical Thinking: A Statement of Expert Consensus for Purposes of Educational Assessment and Instruction, (ERIC Doc. No: ED 313 423).

The laudatory use of "CT" can suggest approval of how well a person applies her CT skills or it can convey praise for the person because the person has the proper affective dispositions. While the two-thirds majority was eloquent regarding the importance of finding ways to instill affective dispositions in students, in the final analysis they were unable to persuade the other third of their expert colleagues to view these dispositions as essential to the concept of CT. The majority was, however, persuasive in bringing about virtual unanimity regarding using the affective dispositions to describe the paradigm critical thinker.

The minority (30%) insist on using "CT" in a strict procedural sense, that is as referring only to a certain judgmental process. They [the minority] distinguish sharply between what is true of critical thinking from what is true of good critical thinkers. Their primary concern is with the CT skills. They argue that good critical thinkers are people who have those skills and certain valuable habits as well. If they are good critical thinkers, then they use their CT skills appropriately because good critical thinkers also have some or all of the affective dispositions... But those dispositions are not what is meant by "CT."

They argue that one would not want to say a sophist is not a critical thinker simply because the sophist uses CT skills for deceptive or self-interested ends. The sophist, they would maintain, is a critical thinker -- but not a good one (in an ethical sense). The strict proceduralists do not find it sensible to deny that a person is a critical thinker simply because the person, while skilled in CT, fails to check the credibility of sources, gives up too soon when asked to work a challenging problem, lacks confidence in using reason to approach everyday problems, or ignores painful facts. These experts hold that such a person, because of his CT skills, should be called a critical thinker -- but not a good one, (in terms of his effective use of those skills).

As Dr. Paul, Robert Ennis, and many others have pointed out, a full assessment program addressing CT should take into consideration both the cognitive skills dimension and the affective dispositions associated with good critical thinking.

For a number of years the work coming out Dr. Paul's Center for Critical Thinking and Moral Critique had advocated that beyond the skills and dispositions, there might be a third dimension -- a moral dimension -- inherent to the very meaning of "CT". The Delphi panel roundly rejected this idea. Quoting from the executive summary:

As suggested above, there are two senses of the term "good" which might be operating when one uses the phrase "good critical thinker." One sense applies to the thinker's effectiveness and responds to the question, "How well is this person using CT?" The second sense applies to the thinker's morality and responds to the question, "Is this person's use of CT ethical?" The sense of "good" the experts intended became clear:
FINDING: It is an inappropriate use of the term to deny that someone is engaged in CT on the grounds that one disapproves ethically of what the person is doing. What "CT" means, why it is of value, and the ethics of its use are best regarded as three distinct concerns.

Dr. Paul has pointed us in two useful philosophical directions. First he has reminded us of the need to define with great precision those normative considerations by which we would plan to evaluate all possible elements of any national program of CT assessment. Second he affirms that we have a suitably rich and widely acceptable conceptualization of critical thinking. The third thing Dr. Paul does is equally valuable, he directs our attention to the specific question of how the CT assessment might be executed.

The paper Drs. Paul and Nosich present includes a lengthy section offering a number of comments, pronouncements, untested declarations, about which assessment modalities can or cannot be used successfully to assess which aspect of CT. Unfortunately, they do not support their opinions with experimental validations or scientific studies. At several points they suggest for national use a testing strategy -- multiple-rating-items -- which is so new that calling it experimental would be premature. At other times they canonize folk wisdom without reference to the scientific literature on these highly technical topics. Hence, to explore these their opinions on these matters in detail would be unhelpful.

The key piece of wisdom to gain here is the insight that different modes of assessment might suit different aspects of CT better than other modes. But, which modes fit which aspects of CT best is a scientific question to be resolved by experimental research. Whether a certain aspect of CT, say a disposition or sophisticated application of several CT skills, can be tested validly and reliably using this or that modality is an experimental question. There are no a priori answers to these questions, just as there is no a priori answer to the question "Can a high quality, cost-effective means be found to provide mobile telecommunication capabilities?" For philosophers of an earlier era confidently to declare that we could not do this because voices cannot flow through wires or jump over mountains was the same kind of mistake -- it was an attempt to preempt a technical, experimental question with an a priori philosophical opinion. To say, in the absence of experimental evidence, that we can't effectively test CT skills and CT dispositions with a multiple-choice instrument is equally problematic. Psychology has been developing scientifically valid and reliable means of assessing a wide range of human cognitive skills and affective dispositions for decades. The challenge should go to the scientific community. Given a suitably rich

---

7 A preliminary pair of concerns that the multiple-rating-item strategy must overcome are that either it such test items reduce to multiple-choice items (which is not a criticism, but an observation that applies to many of the examples in Dr. Paul's paper), or the use of multiple-rating-items that ask students to rank order various things is simply a way of making value judgments look more objective and quantifiable than they are. To give partial credit for the middle rankings becomes very problematic in this regard. Also the chances for gender, social-class, and ethnic bias go up dramatically when "right" answers depend not just on selecting the single best choice among four or five but selecting the proper ranking of possible choices among several permutations. Except on those items that are simply converted multiple-choice items, students who are better at reflecting back the value judgments of their teachers will do best on tests using multiple-rating items. But critical thinking is not the same as judging things the way one's teacher does.
conceptualization of CT, let's invite empirical research, based on sound psychological principles, which addresses the scientific question of how to best measure CT.¹

In summary, Dr. Paul is right to call for the articulation of a comprehensive set of criteria whereby we can evaluate the quality of any national program of CT assessment. Through the Delphi research project, CT experts have come to a consensus conceptualization of CT, richly textured and discipline-neutral, in terms of cognitive skills and affective dispositions (habits of mind), which can serve to guide the assessment process and ground our concerns about content validity. Third Dr. Paul raises important issues with regard to assessment strategies. Experts in educational testing and the validating of CT assessment tools, speaking from a base of empirical research and scientific experience, should be called in to address technical concerns regarding criteria and strategies.

---

From the Delphi Report

### TABLE 4 — CONSENSUS DESCRIPTIONS SIX CORE CT SKILLS AND SUB-SKILLS

**Core Skill #1: INTERPRETATION:** To comprehend and express the meaning or significance of a wide variety of experiences, situations, data, events, judgments, conventions, beliefs, rules, procedures or criteria.

#### 1.1 CATEGORIZATION:

- to apprehend or appropriately formulate categories, distinctions, or frameworks for understanding, describing or characterizing information.
- to describe experiences, situations, beliefs, events, etc. so that they take on comprehensible meanings in terms of appropriate categorizations, distinctions, or frameworks.

For example: to recognize a problem and define its character without prejudice to inquiry; to determine a useful way of sorting and sub-classifying information; to make an understandable report of what one experienced in a given situation; to classify data, findings or opinions using a given classification schema.

#### 1.2 DECODING SIGNIFICANCE:

- to detect, attend to, and describe the informational content, affective purpose, directive functions, intentions, motives, purposes, social significance, values, views, rules, procedures, criteria, or inferential relationships expressed in convention-based communication systems, such as in language, social behaviors, drawings, numbers, graphs, tables, charts, signs and symbols.

For example: to detect and describe a person’s purposes in asking a given question; to appreciate the significance of a particular facial expression or gesture used in a given social situation; to discern the use of irony or rhetorical questions in debate; to interpret the data displayed or presented using a particular form of instrumentation.

#### 1.3 CLARIFYING MEANING:

- to paraphrase or make explicit, through stipulation, description, analogy or figurative expression, the contextual, conventional or intended meanings of words, ideas, concepts, statements, behaviors, drawings, numbers, signs, charts, graphs, symbols, rules, events or ceremonies.
- to use stipulation, description, analogy or figurative expression to remove confusing, unintended vagueness or ambiguity, or to design a reasonable procedure for so doing.

For example: to restate what a person said using different words or expressions while preserving that person’s intended meanings; to find an example which helps explain something to someone; to develop a distinction which makes clear a conceptual difference or removes a troublesome ambiguity.

---

¹ Recently developed psychological theories, such as the Ajzen-Fishbain Theory of Reasoned Action, may afford new ways to access CT dispositions using objective testing instrumentation.
Core Skill #2. ANALYSIS: To identify the intended and actual inferential relationships among statements, questions, concepts, descriptions or other forms of representation intended to express beliefs, judgments, experiences, reasons, information, or opinions.

2.1 EXAMINING IDEAS:
- to determine the role various expressions play or are intended to play in the context of argument, reasoning or persuasion.
- to define terms.
- to compare or contrast ideas, concepts, or statements.
- to identify issues or problems and determine their component parts, and also to identify the conceptual relationships of those parts to each other and to the whole.

For example: to identify a phrase intended to trigger a sympathetic emotional response which might induce an audience to agree with an opinion; to examine closely related proposals regarding a given problem and to determine their points of similarity and divergence; given a complicated assignment, to determine how it might be broken up into smaller, more manageable tasks; to define an abstract concept.

2.2 DETECTING ARGUMENTS:
- given a set of statements, descriptions, questions or graphic representations, to determine whether or not the set expresses, or is intended to express, a reason or reasons in support of or contesting some claim, opinion or point of view.

For example, given a paragraph, determine whether a standard reading of that paragraph in the context of how and where it is published, would suggest that it presents a claim as well as a reason or reasons in support of that claim; given a passage from a newspaper editorial, determine if the author of that passage intended it as an expression of reasons for or against a given claim or opinion; given a commercial announcement, identify any claims being advanced along with the reasons presented in their support.

2.3 ANALYZING ARGUMENTS:
- given the expression of a reason or reasons intended to support or contest some claim, opinion or point of view, to identify and differentiate: (a) the intended main conclusion, (b) the premises and reasons advanced in support of the main conclusion, (c) further premises and reasons advanced as backup or support for those premises and reasons intended as supporting the main conclusion, (d) additional unexpressed elements of that reasoning, such as intermediary conclusions, unstated assumptions or presuppositions, (e) the overall structure of the argument intended chain of reasoning, and (f) any items contained in the body of expressions being examined which are not intended to be taken as part of the reasoning being expressed or its intended background.

For example: given a brief argument, paragraph-sized argument, or a position paper on a controversial social issue, to identify the author's chief claim, the reasons and premises the author advances on behalf of that claim, the background information used to support those reasons or premises, and crucial assumptions implicit in the author's reasoning; given several reasons or chains of reasons in support of a particular claim, to develop a graphic representation which usefully characterizes the inferential flow of that reasoning.

Core Skill #3. INTERPRETATION: To assess the credibility of statements or other representations which are accounts or descriptions of a person's perception, experience, situation, judgment, belief, or opinion; and to assess the logical strength of the actual or intended inferential relationships among statements, descriptions, questions or other forms of representation.

3.1 ASSESSING CLAIMS:
- to recognize the factors relevant to assessing the degree of credibility to ascribe to a source of information or opinion.
- to assess the contextual relevance of questions, information, principles, rules or procedural directions.
- to assess the acceptability, the level of confidence to place in the probability or truth of any given representation of an experience, situation, judgment, belief or opinion.

For example: to recognize the factors which make a person a credible witness regarding a given event or credible authority on a given topic; to determine if a given principle of conduct is applicable to deciding what to do in a given situation; to determine if a given claim is likely to be true or false based on what one knows or can reasonably find out.

3.2 ASSESSING ARGUMENTS:
- to judge whether the assumed acceptability of the premises of a given argument satisfy one's accepting as true (deductively certain), or very probably true (inductively justified), the expressed conclusion of that argument.
- to anticipate or to raise questions or objections, and to assess whether these point to significant weakness in the argument being evaluated.
- to determine whether an argument relies on false or Jotful assumptions or presuppositions and then to determine how crucially these affect its strength.
* to judge between reasonable and fallacious inferences;
* to judge the probative strength of an argument's premises and assumptions with a view toward determining the acceptability of the argument.
* to determine and judge the probative strength of an argument's intended or unintended consequences with a view toward judging the acceptability of the argument;
* to determine the extent to which possible additional information might strengthen or weaken an argument.

For example: given an argument to judge if its conclusion follows either with certainty or with a high level of confidence from its premises; to check for identifiable formal and informal fallacies; given an objection to an argument to evaluate the logical form of that objection; to evaluate the quality and applicability of analogical arguments; to judge the logical strength of arguments based on hypothetical situations or causal reasoning; to judge if a given argument is relevant or applicable or has implications for the situation at hand; to determine how possible new data might lead logically to the further confirmation or disconfirmation of a given opinion.

Core Skill #4. INFERENCE: To identify and secure elements needed to draw reasonable conclusions; to form conjectures and hypotheses; to consider relevant information and to deduce the consequences flowing from data, statements, principles, evidence, judgments, beliefs, opinions, concepts, descriptions, questions, or other forms of representation.

4.1 QUERYING EVIDENCE:
* in particular, to recognize premises which require support and to formulate a strategy for seeking and gathering information which might supply that support.
* in general, to judge that information relevant to deciding the acceptability, plausibility or relative merits of a given alternative, question, issue, theory, hypothesis, or statement is required, and to determine plausible investigatory strategies for acquiring that information.

For example: when attempting to develop a persuasive argument in support of one's opinion, to judge what background information it would be useful to have and to develop a plan which will yield a clear answer as to whether or not such information is available; after judging that certain missing information would be germane in determining if a given opinion is more or less reasonable than a competing opinion, to plan a search which will reveal if that information is available.

4.2 CONJECTURING ALTERNATIVES:
* to formulate multiple alternatives for resolving a problem, to postulate a series of suppositions regarding a question, to project alternative hypotheses regarding an event, to develop a variety of different plans to achieve some goal.
* to draw out presuppositions and project the range of possible consequences of decisions, positions, policies, theories, or beliefs.

For example: given a problem with technical, ethical or budgetary ramifications, to develop a set of options for addressing and resolving that problem; given a set of priorities with which one may or may not agree, to project the difficulties and the benefits which are likely to result if those priorities are adopted in decision making.

4.3 DRAWING CONCLUSIONS:
* to apply appropriate modes of inference in determining what position, opinion or point of view one should take on a given matter or issue.
* given a set of statements, descriptions, questions or other forms of representation, to deduce, with the proper level of logical strength, their inferential relationships and the consequences or the presuppositions which they support, warrant, imply or entail.
* to employ successfully various sub-species of reasoning, as for example to reason analogically, arithmetically, dialectically, scientifically, etc.
* to determine which of several possible conclusions is most strongly warranted or supported by the evidence at hand, or which should be rejected or regarded as less plausible by the information given.

For example: to carry out experiments and to apply appropriate statistical inference techniques in order to confirm or disconfirm an empirical hypothesis; given a controversial issue to examine informed opinions, consider various opposing views and the reasons advanced for them, gather relevant information, and formulate one's own considered opinion regarding that issue; to deduce a theorem from axioms using prescribed rules of inference.

Core Skill #5. EXPLANATION: To state the results of one's reasoning; to justify that reasoning in terms of the evidential, conceptual, methodological, criteriological and contextual considerations upon which one's results were based; and to present one's reasoning in the form of cogent arguments.
* to produce accurate statements, descriptions or representations of the results of one's reasoning activities so as to analyze, evaluate, infer from, or monitor those results.

For example: to state one's reasons for holding a given view; to write down for one's own future use one's current thinking about an important or complex matter; to state one's research findings; to convey one's analysis and judgment regarding a work of art; to state one's considered opinion on a matter of practical urgency.

5.2 JUSTIFYING PROCEDURES:

* to present the evidential, conceptual, methodological, criteriological and contextual considerations which one used in forming one's interpretations, analyses, evaluation or inferences, so that one might accurately record, evaluate, describe or justify those processes to one's self or to others, or so as to remedy perceived deficiencies in the general way one executes those processes.

For example: to keep a log of the steps followed in working through a long or difficult problem or scientific procedure; to explain one's choice of a particular statistical test for purposes of data analysis; to state the standards one used in evaluating a piece of literature; to explain how one understands a key concept when conceptual clarity is crucial for further progress on a given problem; to show that the prerequisites for the use of a given technical methodology have been satisfied; to report the strategy used in attempting to make a decision in a reasonable way; to design a graphic display which represents the quantitative or spatial information used as evidence.

5.3 PRESENTING ARGUMENTS:

* to give reasons for accepting some claim.

* to meet objections to the method, conceptualizations, evidence, criteria or contextual appropriateness of inferential, analytical or evaluative judgments.

For example: to write a paper in which one argues for a given position or policy; to anticipate and to respond to reasonable criticisms one might expect to be raised against one's political views; to identify and express evidence and counter-evidence intended as a dialectical contribution to one's own or another person's thinking on a matter of deep personal concern.

Core Skill #6. SELF-REGULATION: Self-consciously to monitor one's cognitive activities, the elements used in those activities, and the results educed, particularly by applying skills in analysis and evaluation to one's own inferential judgments with a view toward questioning, confirming, validating, or correcting either one's reasoning or one's results.

6.1 SELF-EXAMINATION:

* to reflect on one's own reasoning and verify both the results produced and the correct application and execution of the cognitive skills involved.

* to make an objective and thoughtful meta-cognitive self-assessment of one's opinions and reasons for holding them.

* to judge the extent to which one's thinking is influenced by deficiencies in one's knowledge, or by stereotypes, prejudices, emotions or any other factors which constrain one's objectivity or rationality.

* to reflect on one's motivations, values, attitudes and interests with a view toward determining that one has endeavored to be unbiased, fair-minded, thorough, objective, respectful of the truth, reasonable, and rational in coming to one's analyses, interpretations, evaluations, inferences, or expressions.

For example: to examine one's views on a controversial issue with sensitivity to the possible influences of one's personal bias or self-interest; to review one's methodology or calculations with a view to detecting mistaken applications or inadvertent errors; to reread sources to ensure that one has not overlooked important information; to identify and review the acceptability of the facts, opinions or assumptions one relied on in coming to a given point of view; to identify and review one's reasons and reasoning processes in coming to a given conclusion.

6.2 SELF-CORRECTION:

* where self-examination reveals errors or deficiencies, to design reasonable procedures to remedy or correct, if possible, those mistakes and their causes.

For example: given a methodological mistake or factual deficiency in one's work, to revise that work so as to correct the problem and then to determine if the revisions warrant changes in any position, findings, or opinions based thereon.
Review of Paul-Nosich Paper "A Proposal for the National Assessment of Higher-Order Thinking at the Community College, College, and University Levels"

by

Ronald K. Hambleton
University of Massachusetts at Amherst

The authors remind us that the level of success in developing higher-order thinking skills among higher education students seems to be as low as it appears to be among elementary and secondary students. One might expect (or predict) better results among higher education students because of the goals and curricula of higher education, but the authors claim that this is not so.

I'm not an expert in either the skills that define what is meant by higher-order thinking skills for community college, college, and university students or how these skills might be measured in a national assessment. But, what is clear from the Paul-Nosich paper is that these authors are experts, and that they and their colleagues, over an extended period of time, have compiled an impressive amount of relevant material for this workshop.

In Section 1 of the paper, the authors offer a set of 21 objectives for a process to assess higher-order thinking at the post-secondary school level. I don't feel qualified to critique this list myself. What I would like to see eventually is evidence that the various objectives of a testing system that the authors advance are widely accepted by the educational community and which objectives (perhaps all of them) are needed to meet the intentions of Objective 5 of Goal 5.

In Section 2, the authors explain how their conception of critical thinking meets their 21 objectives (criteria) for an assessment system. The arguments they offer for the consistency of their conception of critical thinking with the 21 objectives was carefully prepared. Certainly, I could
