The pronunciation and use of /s/ in the isleno dialect of Spanish, a dying language spoken in a small ethnic enclave in southeast Louisiana, is examined. Today, there are fewer than 20 fluent speakers of isleno Spanish, which has been described as a fossilized derivative of the speech of Canary Island peasants with additions from Spanish sailors. The aspiration or deletion of /s/ in various contexts is an overt linguistic indicator of isleno speech that members of the isleno social network recognize as a feature of their language. This paper demonstrates that /s/ plays a prominent role in style-shifting for all islenos; e.g., a semi-speaker deletes /s/ much more frequently in casual conversations with in-group members than in a dyadic interaction with an out-group interviewer. The frequency of /s/ deletion of the semi-speaker is much higher than that of the Spanish-English balanced bilingual, suggesting a process of speech accommodation. Additional differences between semi-speakers and fluent speakers are discussed. Contains 22 references. (LB)
A well-known sociolinguistic process in American Spanish dialects is syllable-, word- and utterance-final /s/ aspiration and deletion. The few remaining fluent speakers of the isleño dialect of Spanish, a dying language spoken in a small ethnic enclave in southeast Louisiana, vary their casual pronunciation of /s/ in a manner consistent with, but not identical to, other Caribbean Spanish dialects. Less fluent members of the isleño social network also vary their pronunciation of /s/ with more or less success to parallel that of fluent speakers in group conversations.

Let me give first a brief sociolinguistic background of the group. Map 1 of your handout locates the area in Louisiana where the isleños settled after they arrived from the Canary Islands to the newly-acquired Spanish territory in 1778. They established an isolated community where isleño Spanish was the primary language until the 20th century, when public education, military service, and occupational opportunities brought American English to the group. Today there are less than 100 speakers of isleño Spanish, probably fewer than 20 fluent speakers, with semi-speakers and passive bilinguals comprising the rest of the scattered population of 1,000.

Isleño Spanish is characterized by Lipski (1987) as "a partially fossilized derivative of the speech of Canary Island peasants, with small additions from the speech of Spanish sailors who wandered into the community in the late 19th and early 20th centuries." In addition to /s/ variation, other linguistic features of the dialect include reduction of /d/ and the liquid migration of /r l/. Specifically, the aspiration or deletion of /s/ in various contexts is an overt linguistic indicator of isleño speech which members of
the isleño social network recognize as a feature of their language /s/ plays a prominent role in style-shifting for all isleños: this will be demonstrated by the fact that a semi-speaker will delete /s/ much more frequently in casual conversations with in-group members than in a dyadic interaction with an out-group interviewer. The frequency of /s/ deletion of the semi-speaker is much higher than that of the Spanish-English balanced bilingual, suggesting a process of speech accommodation.

To compare with Caribbean Spanish, Longmire (1976) states that "when the consonant /s/ is followed by an unstressed vowel, it is more likely to be deleted than if it is followed by a stressed vowel." Cedergren (1973) and Poplack (1980) note that in Panamanian Spanish and Puerto Rican Spanish, the deletion rate for inflections is higher than for monomorphemic variables. Puerto Rican Spanish deletes /s/ most frequently in second person singular verb forms, correlated with a high usage of the subject pronoun tú (Hochberg 1986, Terrell 1978, Uber 1981). In addition, Ma and Herasimchuk (1971) and Cedergren (1973) have stated that the determiner position as the first element in a plural-marked noun phrase is a favorable morphemic environment for /s/ conservation; however, this is by no means categorical (Poplack 1980). Terrell (1975) suggests as a consequence that not morphemic status but redundancy in surface structure is correlated with /s/ deletion: because so many elements of a noun phrase may carry plural marking, its deletion is more likely than a single instance. The redundancy factor will be important later in analyzing the infrequent speech of semi-speakers.

The isleño dialect of Spanish contains aspiration or deletion of /s/ variably according to the factors previously identified by Cedergren (1973):
the nature of the following segment; the existence of a word boundary; the morphemic status of s; the type of s suffix; and the grammatical environment of the plural.

Lipski (1990) tabulates the behavior of /s/ in isleño Spanish in the phonological environments syllable-finally before a consonant; word-finally before a consonant, a stressed vowel, and an unstressed vowel; and utterance-finally, discovering that deletion is most common word-finally and aspiration most common in a consonant cluster. His study encompassed only fluent speakers gleaned from both inside and outside the ethnic enclave, whereas the majority of the population is passively bilingual or less fluent in the dialect. Non-fluent isleño Spanish speakers (called 'semi-speakers' in Dorian 1981) also vary their pronunciation of /s/, although their decreased competence limits the number of styles they are able to produce along the formality continuum.

If /s/ aspiration and deletion remains a marker of the isleño dialect, then we would expect all members of the isleño social network regardless of proficiency to use this marker more in in-group interactions (called casual style as a point of reference in the style continuum) than in conversations with out-group interviewers (called interview style). In order to examine this claim, I first investigated /s/ aspiration and deletion in various speech styles along the style continuum of fluent isleño speakers and then compared these findings to the corresponding behavior of /s/ in the speech of semi-speakers using the categories already defined by Lipski (1990) as important in the behavior of /s/. Campbell and Muntzel (1989) call stylistic shrinkage one of the noncontroversial points of dying languages. The younger speakers of the isleño dialect do not (or no longer) possess the
performance style of singing décimas (10-stanza ballads) or telling adivinas (riddles). These genres of narration require a high level of competence in order to reproduce the forms faithful to the oral history of the group, and only two informants regularly use performance style any more. One informant estimates that at one time there were as many as 200 isleño décimas that could be sung by various members of the enclave. Some of the more famous ballads are still sung, but only the oldest informant (age 95) recalls any adivinas from the isleño oral tradition.

An obvious social factor in the decline of performance style is the opening of the social network. As enclave members lived and worked outside, the opportunities to observe and create décimas about group members diminished, in addition to the overall problem of the lessening importance of Spanish. Hence, today’s semi-speakers possess only a “restricted code” (Hill 1978) which allows them to participate marginally in informal conversations but not to produce an “elaborated code” for décimas, adivinas, or narratives.

I interviewed 15 informants extensively; the data in this particular study are taken from about 50 hours of speech from five balanced bilinguals and two semi-speakers. The speakers were recorded in interviews with me and with each other in group discussions in which I only observed. These informants are moderately to highly active in the isleño social network, as noted on your handouts in Figure 1. I have to say outright that the social norms of the isleño community dictate that in group interactions younger and less fluent speakers attend to older and more fluent speakers rather than actively engaging in conversation. Because semi-speakers rarely talk at length in these group interactions, these data will not be statistically robust but will be used to point out certain tendencies.
Table 1 on your handout compares the /s/ variation in fluent vs. semi-speaker isleño Spanish syllable-finally, word-finally, and utterance-finally.

In interviews, the two groups differ in /s/ variation: semi-speakers retain [s] in all phonological environments, while fluent speakers prefer aspiration syllable-finally or deletion word- and utterance-finally. In group conversations in casual style, however, the behavior of /s/ in semi-speaker speech parallels that of fluent speakers, differing only in the higher degree of aspiration and deletion. Both fluent and semi-speakers aspirate /s/ predominantly in syllable-final contexts, and deleted /s/ in word- and utterance-final contexts. The graphs on pages 3, 4, and 5 show the comparative rates of /s/ variation for fluent and semi-speakers. While the rates of /s/ variation are not identical for fluent and semi-speakers, a pattern emerges from these graphs: in interviews with the out-group researcher, the semi-speakers retained /s/ more frequently than fluent speakers; but in group conversations the semi-speakers aspirated or deleted /s/ more frequently than the fluent speakers. This "cross-over" pattern is evident in every graph except one. What is the source of this pattern?

Rather than simply being 'wrong' or 'inconsistent', the variation by isleño semi-speakers can be regarded as a type of speech accommodation called 'upward convergence' (Giles and Powesland 1975) expressing social integration and identification.

Speech accommodation is a model of linguistic variation which focuses on an individual in order to "note changes in his speech in different settings and situations with different conversants" (Fischer 1958). Giles and Powesland (1975) call this type of research "the interpersonal aspects of speech diversity."
The central tenet of speech accommodation is that "during social interaction, participants are motivated to adjust (or to accommodate) their speech styles as a means of gaining one or more of the following goals: evoking listeners' social approval, attaining communicational efficiency between interactants, and maintaining speakers' positive social identifications" (Thakerar, Giles, and Cheshire 1982), broadly categorized by Coupland (1985) as identity marking and interactional management functions. Thus, the rise of /s/ deletion and aspiration in both fluent speakers and semi-speakers casual speech when within the ethnic enclave may be regarded as a means of expressing social integration and identification. This process is called convergence: "a linguistic strategy whereby individuals adapt to each other's speech by means of a wide range of linguistic features" (Thakerar, Giles, and Cheshire 1982). Fluent speakers are accorded prestige for preserving the culture's oral traditions (Hill 1978) and in group interactions control conversational flow and turn-taking. The social norms of the isleño community influence less fluent speakers to maintain a more passive interactional role than more fluent speakers, functioning as an audience and chorus to emphasize and echo conversational points. By listening to and repeating fluent isleño speech, semi-speakers are motivated towards integration and solidarity by varying their pronunciation of /s/ to resemble the perceived behavior of /s/ in the speech of fluent speakers who are identified as prestigious. This variation is not identical to fluent speakers because semi-speakers have limited opportunities in these group conversations in which to maintain or improve their proficiency in the ethnic mother tongue, rendering their competence in /s/ variation imperfect. In contrast, upward convergence does not occur in interviewers with the
researcher, who, as an outsider, has no prestige status and whose dialect does not match isleño Spanish.

It is likely that while semi-speakers may accommodate to the interviewer's speech pattern as part of "a general tendency for people to converge towards others in many social situations" (Thakerar, Giles, and Cheshire 1982), their accommodation is greater in the social network situation with which they identify most strongly. Trudgill (1981) determines that often an interviewer will accommodate more to the informant than vice versa. Says Thakerar, Giles, and Cheshire (1982), "convergence may be best considered as a reflection of an individual's desire for social approval." From these data we will conclude that in casual style semi-speakers accommodate to the group norm more dramatically than to the interviewer in interview style. The semi-speakers of this study are politically active isleños, along with the balanced bilinguals, and it is entirely likely that they would wish to ally themselves with these other group members in solidarity, and consequently manipulate the variables in their speech which they recognize to be markers of ethnolinguistic identity to be more like that of their social network cohorts. Figure 1 shows the social network integration of the fluent speaker informants of this study (underlined) and the semi-speakers (boxed). By increasing the percentage of aspiration and deletion of /s/ in their speech (the only phonological variable in which this is the case), semi-speakers seek to reinforce their solidarity with the group even though their self-reported fluency is limited. Edwards (1985) asserts that convergence "varies in magnitude according to the extent of the available linguistic repertoire..." In this case, semi-speakers are able to manipulate their pronunciation of /s/ to converge with the group norm.
Important lexical items like isla [ihla] and pez [peh] are examples of marked items which always carry aspiration or deletion.

The pattern of /s/ deletion in semi-speaker speech is not simply hypercorrection, because the term hypercorrection implies that the form produced is incorrect. No example has been found of /s/ variants being produced in the wrong environments or in the wrong situations. Therefore, we will not dwell on the notion that semi-speaker /s/ variation is a simple case of error.

Several recordings of semi-speakers talking among themselves reveal that English is the primary language, but when isleño Spanish is used, it is mostly for ethnically-oriented lexical items. Preliminary findings indicate less /s/ variation on the whole than with fluent speakers, reinforcing the notion of upward convergence.

The convergence of semi-speakers’ speech to that of fluent speakers’ speech indicates that /s/ aspiration and deletion is a linguistic factor which the isleños recognize as a marker of their dialect. "Since the desire for social approval is assumed to be at the heart of accommodation" (Giles and Powesland 1975), the semi-speakers more often aspirate and delete /s/ when within the social network than when outside.

The fact that variables of /s/ are chosen to represent this desire for ethnic identification stems from the assumption that "every individual possesses a speech repertoire from which he selects speech forms according to the nature of situational constraint" (Giles and Powesland 1975). Thus, both willingness and ability enter into accommodation. The salience of /s/ as a productive morpheme may draw attention to its variable use as a linguistic marker (Chambers and Trudgill 1980). Recall Terrell’s (1975) notion that redundancy in surface structure correlates with /s/ deletion;
semi-speakers are able to perceive /s/ variation because of its frequency and can produce some form of /s/ variation with simple linguistic structures. Whereas subtle pronunciation differences are not recognized by informants (Buck 1980), semi-speakers of isleño Spanish are able to perceive the variation of /s/ in the speech of fluent speakers and vary their pronunciation accordingly. Given their willingness to conform to group norms but their limited proficiency in Spanish, these semi-speakers vary /s/ as their only linguistic strategy of speech accommodation in order to gain approval and solidarity with their ethnic group.
