This report provides an initial analysis of the occupational and qualification structures in the field of environmental protection in the Italian metal and chemical industries. The first two chapters review the legislative background, situation in industry, and provision of environmental education and training. The third chapter presents results of a survey of 10 firms to identify occupations associated with environmental protection and to determine their characteristics. Summaries are provided of an analysis of responses from seven companies in the chemical industry and three in the metal and iron and steel industries. Each case study includes the following: a narrative summary; a chart indicating occupation, percent of working time devoted to environmental activities, and qualifications; and a table that summarizes the principal characteristics of the occupations and indicates the principal tasks, skills, and training requirements. The fourth chapter sets forth conclusions. It identifies "groups of activities" and lists the related tasks for each group. An analysis of occupations groups them into three types: managerial, technical, and operational. A table illustrates criteria for the description and classification of the occupations. Then, the occupations identified in the case studies are classified on the basis of these analyses. A list of the occupations indicates the degree to which each can be assigned to one of the three types. The survey instrument is appended. (YLB)
Occupational and qualification structures in the field of environmental protection in the metal and chemical industries in Italy

The Centre was established by Regulation (EEC) No 337/75 of the Council of the European Communities
Preface by CEDEFOP

One of CEDEFOP's main tasks is to cooperate with the Commission of the European Communities in carrying out national and comparative studies of existing and emerging occupational and qualification structures within certain groups of occupations in the most important of the Member States' industrial, trade and service sectors. The findings of these studies are being used to compile an inventory of occupational and qualification structures relevant to the labour market, which is intended both to increase the transparency of the qualifications that will be needed in a future European labour market and to form the basis for the design or updating of initial and continuing training curricula.

These studies also focus on the emergence of or changes in occupational and qualification structures as a result of measures taken in all leading sectors of the economy to protect the environment, especially as all the relevant forecasts indicate that the demand for specific qualifications in the field of environmental protection will increase significantly in the European Community in the next few years.

However, as it would be beyond the scope of the overall project for all the industries examined by CEDEFOP to be made the subject of separate studies aimed at identifying occupational and qualification structures relevant to the environment, we have begun by selecting two sectors in which the protection of the environment is becoming a special challenge: the metal and chemical industries. Our next step will be to extend this research to the public services.

Studies of the metal and chemical industries, which have now been completed, were commissioned in four Member States (Italy, the Netherlands, the Federal Republic of Germany and the United Kingdom). Despite the very short time allowed and financial restrictions imposed by CEDEFOP, which did not permit a representative approach, these studies reveal a wealth of different, yet comparable, findings on changes in occupational
and qualification structures and the emergence of new, environmental occupations.

This has required considerable personal commitment on the part of the authors, and we would like to take this opportunity to thank them for their efforts.

The findings of these studies will be summarized in a report containing comparative tables of the most relevant occupational and qualification structures in the four countries. It will be published in late 1991 (in English, German and French).

Finally, where they have access to appropriate research findings, the Member States which have not participated in this project are urged to draw up reports on occupational and qualification structures in the field of environmental protection in the same industries in their own countries, adopting the same approach as in this and the other studies.

2 Training for specific occupations

CHAPTER III - Occupations in the metal and chemical industries: ten case studies
1 Methodology
2 Case studies

CHAPTER IV - Conclusions
1 The groups of activities
2 Analysis of occupations
3 Classification of occupations identified in the survey
4 Career development

ANNEX - Survey questionnaire
The present study, prepared for CEDEFOP, provides an initial analysis of the occupational and qualification structures in the field of environmental protection in the Italian metal and chemical industries.

The first two chapters briefly review the legislative background, the situation in industry and the provision of environmental education and training.

The third chapter sets out the results of a survey covering ten firms, designed to identify occupations associated with environmental protection and determine their characteristics.

The fourth chapter sets out the conclusions of the study. On the basis of an analysis of the case studies, and bearing in mind the limits of the sample (described below), we have listed the occupations involved in environmental protection in the metal and chemical industries.

For each of these occupations the related tasks, skills and educational requirements are specified. We have also attempted to generalize the results obtained, by:

- identifying "groups of activities",
- listing the related tasks for each group,
- identifying types of occupations,
- giving examples of career development.

The survey questionnaire used for the case studies is reproduced in the annex.

Dr Mario Gatti, a member of the ISFOL (Institute for the Development of Vocational Training for Workers) research staff, took part in the preparation of this study; in particular, he was responsible for drafting the second chapter.

Sincere thanks are expressed to Dr Gatti and to Patrizia Martinelli, Virgilio Mannocci and Giuseppe Baffert, members of the SINDNOVA research staff.
CHAPTER I
ENVIRONMENTAL AND INDUSTRIAL LEGISLATION IN ITALY

1. The current legal situation regarding environmental and ecological questions

In Italy, environmental protection legislation has only been developed fairly recently.

On the initiative of the Government, since the beginning of the 1980s the legislature has adopted a series of basic provisions designed to protect the environment and the population by identifying sources of industrial pollution.

Many of these provisions were introduced in accordance with EEC directives.

Law No 349 of 1986 established the Ministry for the Environment, stipulating that its task is to coordinate all policies and initiatives aimed at the promotion of environmental and ecological protection and surveillance. The Ministry acts through the public health services of the Local Health Units (USL), which come under the local authorities, the fire service and the civil defence organization.

In each district the Mayor is the highest authority with regard to the issue of licences and permits in respect of industrial activities or energy production, which are accorded bearing in mind the need to protect the environment and the population.

The regional authorities are responsible for programming and planning within their respective territories.

A summary of Italian environmental protection legislation is given below.

1.1 Waste products

The basic instrument applying to industrial waste products is Decree 915|82, which was followed by a series of implementing or interpretative laws: e.g., Law No 441 of 29.10.87 (Provisions governing the disposal of waste products), Law No 475 of 9.11.88 (Provisions governing the disposal of industrial waste products), and Law No 45 of 10.2.89 (provisions governing emergencies arising in connection with the disposal of industrial waste products).

Responsibility for evaluating the environmental effects caused by waste disposal installations, which was entrusted to the regions before the issue of Decree 915, has been restored to the Ministry for the Environment under Law No 475.
More recent measures include the following:

- the establishment of "exchanges" for secondary materials and by-products, run by the Chambers of Commerce and promoted by the Ministries of Industry and the Environment;

- the establishment of a register of special wastes and toxic and dangerous substances, including certain types of urban refuse, to enable the preparation of data banks on waste production and disposal at regional level.

1.2 Environmental effects

The 1985 EEC Directive on the assessment of environmental effects was incorporated into national law under Law 349/1986 (establishing the Ministry of the Environment), Decree No 377 of 10.8.88 regulating decisions regarding environmental compatibility, and the Decree of 27.12.88 laying down technical standards for the study of environmental effects and the issue of opinions regarding environmental compatibility.

This legislation concerns the environmental effects - i.e., the effect on man, flora and fauna, the soil, water, air, etc. - of public and private projects and infrastructures. Of major significance, it is designed to supersede the earlier legislative philosophy based on the concept of compensation, and seeks to acquire knowledge and control from the planning phase of hazards inferable from environmental compatibility opinions and assessments.

1.3 Major hazards

EEC Directive 501/82 - better known as the "SEVESO" Directive, since it was introduced in the wake of the accident at the ICMESA plant in 1976 - was incorporated into Italian law by Decree 175/1988. This law establishes the principle that industries using dangerous substances or technologies may operate in Italy on condition that they adopt effective precautions and security measures to reduce to a minimum the possibility of dangerous accidents and ensure that such incidents are kept under strict control if they occur. Another aspect of this law is that the owner of the plant is held to be fully responsible and is considered to be conversant with the production processes and substances employed, being liable to penalties under criminal law in the event of total or partial failure to comply with the relevant legislative provisions; responsibility in this matter can under no circumstances be delegated.

The Ministry of the Environment, in agreement with the Ministries of Industry and Health, exercises broad administrative and supervisory powers with respect to the major hazards; in particular, the Ministry has set up a group of "super inspectors", with broad police powers.
1.4 Atmospheric pollution

Under Decree No 203 of 24.5.88 the provisions of four Community directives relating to the protection of the population against atmospheric pollution were incorporated into Italian law; they concern, respectively, permitted and recommended concentrations for sulphur dioxide and suspended particulates, the permitted concentration for lead, atmospheric pollution caused by industry, and standards for nitrogen dioxide.

This Decree fills the gaps in the legislation which were left uncovered by the so-called "anti-smog" law of 1966.

The Decree contains significant new provisions: it is valid throughout the national territory, unlike the earlier anti-smog law which applied only to certain areas; the entrepreneur is obliged to submit notification of any potential hazards together with an emission control plan, which must be respected; monitoring arrangements are provided for which enable direct participation by the public and the environmental protection associations.

Considerable difficulty has been met with up to the present, however, in applying these provisions, mainly owing to delays on the part of the Government and local authorities.

1.5 Water pollution

Community directives on drinking water, water intended for human consumption, and the quality of bathing water have been incorporated into Italian law by Decrees 515/82, 236/88 and 470/82 respectively. However, no legislation has yet been adopted in conformity with EEC rules regarding water used for pisciculture, underground waters and limit values for mercury discharges from the chloro-alkali electrolysis industry.

These gaps in Italian legislation are by no means insignificant; however, the most important concerns industrial pollution, which up to now has been governed by Law 319/76, better known as the "Merli" law. In this case also we can only point to the regrettable inadequacy of the structures and institutions entrusted with the tasks of supervision and control provided for under this law.

The organizational and technical inadequacies of the local bodies concerned - especially the Local Health Units (USL) - combined with the unwillingness of industrialists to respect the limits laid down for the emission of pollutants (despite the numerous deferments granted by the legislature) has effectively shelved a law which in the 1970s had raised many hopes for the reclamation of waters polluted by industrial waste. Today, a radical revision of the "Merli" law is being planned, and the introduction of "water quality objectives" is under discussion, to replace the former prohibitions and maximum permitted values.
2. Changes in the metal and chemical industries resulting from environmental protection measures

At present, Italian industry is in a transitional phase under the influence of certain factors at both national and international level:

- the internationalization of rules and standards;
- environmental emergency situations, especially those concerning emissions and waste products;
- technological changes to plant and restrictions applying to the most dangerous;
- the changing attitude (greater vigilance) of the population, trade unions and environmental protection associations.

2.1 The chemical industry

The chemical industry is concerned with the production of basic organic and inorganic chemicals and their derivatives, organic derivatives of petrochemicals, synthetic resins and elastomers, fertilizers and plant protection products, pharmaceuticals and detergents.

The Italian chemical industry accounts for 11% of the country's total industrial production (coming third after the metal and extractive industries) and 14% of total EEC chemicals production (the fourth largest). The leading combine - Montedison - accounts for 10% of total production in the sector (its average production in the period 1980-87 was 24 million tonnes).

The environmental impact of the Italian chemical industry must be considered significant. 10-15% of the raw materials processed are discharged as waste products; if the dispersion of production sites and the efficiency of the average plant is taken into account, however, the proportion of waste products may be estimated at around 20%.

Atmospheric pollution is another particularly widespread hazard, due to processes involving combustion (gases, sulphur and nitrogen oxides and volatile organic and inorganic substances), and the production of powders such as fertilizers, detergents, etc. Another problem concerns the emission of organic halogen compounds, heavy metals and hydrocarbons, all of which are serious atmospheric pollutants, causing damage to the ozone layer and creating a source of photochemical smog. The extent of these emissions depends mainly on the existence - and efficiency - of filtering installations.

Liquid effluents mainly concern the following:

- cooling water, of which 60% is once-used seawater and 40% surface water, generally recycled;
- water used in production processes and cleaning, which amounts to 5-10% of the volume of cooling water;
- consumption: about 150-200 million m³ of cooling water require treatment before being returned to water resources.

Adding the water used in processing we arrive at a total annual consumption of 700-1 000 million m³, which corresponds to 2% of overall national water resources. However, the disposal capacity for water used in processing does not exceed 100 million m³ per annum, according to estimates relating to the major firms only.

Chemical industry waste products concern:

- special wastes: 3-5 million tonnes per annum (including 1 million tonnes of phosphorus compounds);
- toxic and injurious wastes, 300 000 - 1 million tonnes per annum;
- total: an estimated 5-10 million tonnes per annum.

Existing waste disposal capacity (including recycling, incineration and dumping) is considered to be inadequate, especially as regards toxic and injurious wastes.

In the chemical industry, which arouses the deepest anxieties and the sharpest criticism on environmental and ecological grounds, solutions are being sought primarily in three directions:

- clean technologies,
- waste minimization,
- the treatment, disposal and recycling of waste products.

At present, the greatest efforts are being concentrated on the third aspect, since it is the most directly affected by legislation regarding emission control, waste disposal, etc.

All in all, despite some notable achievements, the situation remains critical in view of the fact that a high percentage of chemical industry wastes - including toxic and injurious wastes - are still disposed of improperly.

2.2 The iron and steel industry

The iron and steel industry is concerned with the production of cast iron ingots, raw steel, ferro-alloys, rolled sections, other finished products, iron castings for various purposes, etc.
The major public sector establishments in this industry are located in Bagnoli, Cornigliano, Piombino, Taranto and Terni, while the private sector establishments are mainly concentrated in the north of the country.

The principal problems as regards pollution arise from the industry's use of considerable quantities of water: consumption varies from 5-10 m³ per tonne produced of recycled water to 100-200 m³ per tonne of once-used water. This indicates a total annual consumption of 300-600 million tonnes, taking recycled water alone; the bulk of this water (95-97%) contains toxic substances in suspension or emulsified. However, technological advances have substantially reduced effluent contamination at various stages in the production process. The following are examples:

- sintering: dust elimination, either by a dry process or using water in sealed circuit;
- pickling: the recycling of exhausted acid baths and washing water is now a widely used technique;
- steel production from pig iron, which involves the use of 5-20 m³ of water per tonne produced: concentrations of calcium carbonate, iron and iron oxides, aluminium, magnesium and manganese particulates in suspension have been reduced to an average of 15-30 kg per tonne produced; however, further reductions are possible.

On the other hand, the pollutant levels resulting from hot and cold rolling processes are still high, producing respectively 50 000-70 000 tonnes of materials in suspension in water and 0.2-0.5 kg/m³ of suspended and emulsified solids.

Smelting and blast furnace slags account for the greater part of the solid wastes produced by the iron and steel industry (120-150 kg per tonne of production, giving a total of 2.5-3 million tonnes per annum); only part of this material (20-30%) is recycled or used in the brickmaking, glass-making or road building industries. The remainder, about 2 million tonnes per annum, is disposed of as waste.

Waste in the form of dusts and sludge consists essentially of iron, carbon, silicon, calcium and magnesium, in addition to other more dangerous elements such as lead, cadmium and chrome.

These wastes originate from blast furnaces, sintering and steel production.

Apart from mineral and metallic dusts, the main atmospheric pollutants are sulphur dioxide, nitrogen oxide and mixtures containing gases such as carbon monoxide or dioxide.

Despite the efforts made, environmental problems are still acute and the iron and steel industry is still far from being able to guarantee the use of intrinsically clean technologies; on the other hand, it should be noted that while the market tendency for fine and intermediate chemical products is firm, favouring investment, the same cannot be said of the iron and steel industry, which has been in a crisis situation for the past decade, with little prospect of a brighter outlook.
It is of interest to review the principal terms of the agreement signed on 23 July between the Ministry of the Environment and the Managing Director of the ILVA (a major group which is partly State-owned), although it exclusively concerns pollution control measures.

The programme, which will run from 1990 to 1993 at a total cost of LIT 730 billion, relates to all three aspects of the ecosystem: air, water and soil. The implementation of the programme will be entrusted to the Centro Sviluppo Materiali (Materials Development Centre) of the ILVA, with the collaboration of national and foreign institutes. The cost will be borne mainly by the ILVA. However, under the terms of the contract the Government may contribute to the financing from time to time. The plants concerned by the programme are located at Taranto, Piombino and Terni; the following operations are planned:

- Atmospheric pollution: reduction of emissions by 42%, corresponding to 18,000 tonnes per annum, at a cost of LIT 110 billion over the three-year period. Sulphur dioxide emission will be reduced by 90% overall, at a cost of LIT 130 billion, while nitrogen oxide emission is to be reduced by 7% at a cost of LIT 15 billion. A further LIT 140 billion will be devoted to reducing sulphur dioxide emission from coke ovens, for which alternative fuels with a reduced carbon coke content are under study.

- Soil contamination: a drastic reduction (by 35%) in the production of foundry slags is planned, involving an expenditure of LIT 30 billion, of which half will be devoted to the reduction of the volume produced and half to recycling.

- Water pollution: LIT 25 billion will be allocated to water pollution control and a further 130 billion to research and development projects.

3. Occupations in the field of environmental protection: groups of activities

Environmental protection in industry is an area of management devoted to ensuring the protection of the environment, the workers and the population against potential hazards arising from the production processes in use at a particular plant. These hazards relate, in particular, to the following:

- raw materials: their quantities and characteristics, methods of transport and storage;

- intermediate products: their quantities and characteristics, methods of transport and storage;

- the resources used: land, water, etc.;

- solid, liquid and gaseous emissions and waste products, their treatment and/or recycling, transport and disposal;
finished products: their quantities and characteristics, methods of storage and transport to the intermediate and/or final consumer;

energy sources;

risk of injury, e.g. by exposure to noise, ionizing and other radiation, etc., generated by machinery and equipment;

danger of fire, explosion, etc. (see legislation incorporating the EEC "Seveso" Directive);

social effects.

This management area is closely connected with another: health and safety at work.

Environmental protection is given effect through a series of specific activities involving a range of occupations and jobs in a developing field.

Within the field of environmental protection certain fundamental groups of activities may be distinguished:

coordination and planning: environmental protection strategies, preventive measures, management of resources, relations at various levels and compliance with legislative and administrative provisions;

research and development, innovation and problem-solving;

pollution control and monitoring;

checking plant safety, monitoring major hazards, fire prevention;

adjustment and maintenance;

waste management.
The emphasis given to the environment and its protection in the Italian education and training system is constantly increasing, as may be seen from the proliferation of educational experiments devoted to this subject.

Current initiatives essentially concern the following lines of action:

- environmental education in schools,
- training for specific occupations.

1. Environmental education in schools

Initiatives in the field of environmental education in schools cover a broad spectrum ranging from extra-curricular seminars to the introduction of this subject into school curricula. For example, new material known as "Scienza della Terra" (Earth Science), which concerns the relationship between man and the environment, has been introduced into the first two years of upper secondary education.

Two comments may be made on these developments:

- environmental questions are gaining an ever more pervasive influence on other disciplines, to the extent that this field is becoming a "horizontal" factor modifying the approach to the study of a whole range of subjects;
- on the other hand, current initiatives regarding environmental education in school are the fruit of efforts by a few enthusiastic teachers who often fail to find the necessary support for their activities in this area.

Taken together, therefore, these initiatives suffer from a structural weakness caused by the absence of any central coordination, making it difficult to profit from the results of the different experiments. Another problem is the lack of refresher training provision for teachers in the area of environmental education.

However, despite the difficulties noted, environmental questions are rapidly acquiring a place in school curricula because they impinge on the teaching of all other disciplines to a greater or lesser extent.

Further, this problem is international in character; many Italian schools took part in the pilot project on environmental education promoted by the EEC from 1977 onwards.

While the fragmentary and experimental character of current projects in this area in schools of every type and level makes it impossible to present a comprehensive catalogue, some examples will be given to indicate what has been achieved in environmental education, especially as regards training for specific occupations.
In the past few years certain industrial trades schools have introduced an experimental course in environmental chemistry designed to qualify students as purification plant technicians.

Other industrial trades technical schools specializing in nuclear energy have, as an experiment, introduced courses in environmental physics into their curricula; it is expected that a new branch will soon be introduced, leading to a diploma as environmental protection expert. The course content is to include natural sciences, chemistry and health physics.

The State vocational training schools, aware of the need for training for environment-related occupations, have introduced three-year basic courses in biotechnology in Rome and Venice.

During the coming school year interdisciplinary environmental material is to be introduced into the three-year courses for chemical and agricultural workers and fitters.

As regards the five-year courses run by the vocational training schools, a qualification as ecological environmental technician is shortly to be introduced in the chemistry and agricultural sectors.

In response to the challenge of the "green universities" set up by the Italian Ecological Movement (at present more than 100 of these institutions exist, attended by over 20,000 persons), the university institutions are beginning to take account of environmental problems, introducing two types of measures:

- the incorporation into degree courses of examinations connected with the study of environmental problems, for example "landscaping, parks and gardens" at the University of Bologna;

- the introduction of specialized post-graduate courses.

The following are examples of these post-graduate courses:

- landscape engineering and architecture (University of Genoa)
- landscape agronomics (University of Bologna)
- biological and integrated pest control (University of Bologna)
- forestry engineering (University of Trento)
- forestry sciences (Universities of Florence, Padova, Bari, Cosenza, Potenza, Viterbo and Turin)
- ecology (University of Padova)
- environmental biotechnology (University of Genoa)
- environmental technology and chemistry (La Sapienza University, Department of Chemical Engineering, Rome)
- environmental sciences (University of Milan).
The school system comes under the Ministry of Education and therefore has a highly centralized administration; the vocational training system, on the other hand, is run by local bodies (authority in this area is delegated by the regions to the provinces and municipalities), with the result that it has a decentralized decision-making structure able to respond more rapidly and with greater flexibility to labour market requirements and training needs at local level. As a result, a wide range of training courses for environmental occupations is on offer and is constantly being expanded; details of these courses (although not comprehensive) are given in the tables in annex. The first series of tables sets out the typology and level of the courses, the duration and target population; the second series gives an estimate of the number of courses provided, showing a breakdown by region and sector.

2. Training for specific occupations

The nature of the tasks entrusted to personnel responsible for environmental protection in the metal and chemical industries generally requires high-level qualifications (university degree or upper secondary school certificate).

It should also be noted that although a wide range of courses are offered on various aspects of environmental protection (see Annex), training is often organized directly by the firms themselves.

The requirements for occupations involving the exercise of responsibility, whether technical or managerial, include a degree in chemistry, engineering or physics combined with appropriate work experience. Self-instruction is commonly employed to acquire training and refresher training in this area.

For technical occupations (e.g., laboratory analyst or waste disposal/recycling plant operator) the upper secondary technical school leaving certificate is required, plus one year's vocational training and an appropriate period of work experience.

For operators, given the social and national importance of environmental protection, the upper (or more rarely lower) secondary school leaving certificate is generally required, plus one to three years' basic vocational training depending on the particular specialization and the qualifications held.
CHAPTER III
OCCUPATIONS IN THE METAL AND CHEMICAL INDUSTRIES:
TEN CASE STUDIES

1. Methodology

A survey was carried out to collect information directly "in the field" regarding the characteristics of occupations in the ecological and environmental protection services of the firms participating.

The firms covered by the survey belong to the metal and chemical sectors and are all located in Piemonte (Piedmont).

This choice was determined by the need for a sample of companies exhibiting significant environmental hazards and sharing a similar cultural, political and administrative context.

The survey was therefore carried out in a region with a long-standing industrial tradition and affected during the past ten years by intensive restructuring measures and technological innovations. Furthermore, Piedmont has a highly unionized workforce and well-organized public structures devoted to public health and the protection of the environment.

Finally, in this region public interest in ecological questions and the improvement of living and working conditions is particularly intense.

Information was obtained through interviews with management staff of the companies participating in the survey; in some cases the establishment's managing director was interviewed, while in others the personnel manager or director of the firm's environmental protection services was selected.

In every case, the data compiled were discussed with the trade union representatives.

In the course of the interviews, which were conducted face to face on the basis of a questionnaire, the objectives of the survey were explained by the interviewer.
Structure of the questionnaire (see Annex 2)

Part I  Data regarding the firm: location, types of product, markets, number and characteristics (sex, grade, average educational level) of staff, organization chart.

On the basis of the organization chart it was possible to situate occupations associated with environmental protection within the firm's organizational structure.

Part II  Data regarding the production process and its associated environmental hazards. On the basis of a description - and reconstruction - of one or more production processes using a flow chart (input (raw materials) - processing - output (finished product)) and other elements derived from the survey it was possible to identify potential environmental hazards (emission of contaminants into the air and water, waste products, etc.) and their effects in the area concerned.

Part III  Data on occupations associated with environmental protection. This part of the questionnaire is designed to obtain information regarding the personnel assigned full time or part time to environmental protection activities in relation to the hazards identified.

The following information was sought: the percentage of working time averagely devoted to this field of activity; any contractual provisions relating to the occupation; the tasks, skills and basic training; any refresher training provided for and the levels (1-5) of training activities in relation to the EEC standard classification.

The task of personnel assigned to environmental management activities may be divided into five areas:
- research, innovation and problem-solving,
- control and monitoring,
- adjustment and maintenance,
- treatment and processing,
- relations with outside bodies and administrative and legal matters.

2. Case studies

The case studies relate to the following companies:

Chemical industry
C.1 Production of paints and enamels (Alessandria)
C.2 Processing of copper, production of insulated cords and cables (Asti)
C.3 Manufacture of antibiotics (Turin)
C.4 Petroleum processing (Novara)
C.5 Manufacture of printed circuits (Vercelli)
C.6 Manufacture of fluorides and organic products (Alessandria)
C.7 Tyre manufacture (Turin).

Metal and iron and steel industries
M.1 Manufacture of special and stainless steels (Aosta)
M.2 Manufacture of aluminium products (Turin)
M.3 Manufacture of hot-rolled steel products (Turin).

There follows a summary, case by case, of the data obtained from an analysis of the replies to the questionnaire. Data regarding the occupations identified are set out in the tables annexed to each case study.
Case study C.1

This study concerns a company of which 65% of the capital is held by an American group and the other 35% by an important Italian group.

The company produces paints and enamels for the following industries: motor vehicles, domestic electrical appliances (e.g. refrigerators), railway equipment and electrical equipment. 85% of the production goes to the national and 15% to international markets, in particular Roumania, Bulgaria, Yugoslavia and Turkey.

The company has 449 employees, of whom 60 are women. 238 are manual workers, of whom 80% hold lower secondary and 20% upper secondary education qualifications.

The educational levels of the 174 technicians and white collar workers are as follows: 50% lower secondary and 40% upper secondary, while 10% hold university degrees. There are 28 middle management staff, of whom half are graduates and the remainder certificate holders; the nine members of the upper management staff are almost all graduates.

The company's organization structure includes a specific service: "Health and safety at work and ecological and environmental protection", which is directly responsible to the management.

Nature of hazards. (a) In respect of its resin production (polymerization and heat treatment in pressure vessels) the company is among those covered by Table B of Decree 175188 (the Seveso Directive); (b) environmental hazards arise from the emission of solvents into the air and the company's water treatment procedures; (c) another hazard concerns the disposal of special, toxic and harmful wastes; and (d) the pigment production process presents a strong risk of fire.

Broadly, the interviewees gave the following assessment regarding the situation and the preventive and safety measures adopted: acceptable situation, dangers under control, dangerous accidents possible only in exceptional conditions.

To meet this situation, the company has a service, referred to above, to which the following personnel are attached.

<table>

4. EDUCATION AND TRAINING, LEVELS, ETC.
Case study C.2

This company forms part of an Italian group; the establishment under study is located in the province of Asti. The firm belongs to the chemical sector, and processes copper for the manufacture of insulated cords and cables. Its production is sold on both national and international markets.

The firm has 327 employees, including 143 women; 264 are manual workers, all with lower secondary school certificates, while 47 are white collar workers and technicians, most of whom also hold lower secondary certificates. There are 16 middle management staff, of whom part are holders of upper secondary school qualifications and the remainder are graduates.

No specific environmental protection service is provided for; the company can, however, call on the services of an "Environment and Ecology" Department which is directly responsible to the group's general management. This Department maintains links with the firm's personnel and maintenance departments.

Hazards. Copper processing produces waste products and scrap; used oils are collected by a waste disposal consortium, while copper and rubber scrap and rubber off-cuts are sold.

The manufacture of rubber insulated cables (for PVC cables the drawing process is used) involves the use of cooling water, which is treated before discharge; gaseous emissions from the Banbury mixer and vapours containing oils from energy production are treated before venting. Emissions to atmosphere of polymerization products are minimized.

The establishment falls within the provisions of Decree 203|88 on atmospheric pollution caused by industrial plant; the interviewees assessed the hazard situation as satisfactory, dangerous agents being under control.

As stated above, in respect of environmental questions the firm makes use of an external service directly responsible to the group's general management.

However, certain members of the firm's staff are concerned part-time with environmental questions in collaboration with the service referred to.

Case study C.3

This Company, a pharmaceuticals enterprise specializing in the production of antibiotics, is located in the province of Turin and belongs to a major Italian group. 10% of its production goes to the national market, 40% to the EEC and 50% to non-Community countries.

The Company has 630 employees, including 100 women. The 411 manual workers are all holders of the lower secondary school certificate; of the 215 white collar workers and technicians, 40 are graduates, 60 have upper secondary school diplomas, and the remaining 115 have primary school and vocational training qualifications. The 32 middle management staff all have upper secondary school diplomas, while the 4 senior managers are all graduates.

The establishment's management is responsible to the group's central management at its headquarters in Milan. The establishment has its own "Safety and Environmental Management" Service.

Hazards. The principal environmental hazards resulting from antibiotics production concern emissions of malodorous substances (sulphurous by-products, sulphur dioxide, mercaptans) and small quantities of solvents. In addition, large quantities of wastes are produced: sludge from the purification plant, which is disposed of for use in agriculture; fermentation micelles, of which the discharge into the atmosphere is authorized pending a decision by the Ministry of the Environment. The water used is treated on site before discharge.

The situation was judged to be satisfactory by interviewees, who believed the dangers to be modest or rarely arising.

The "Safety and Environmental Management" Service is responsible to the firm's managing director, who devotes about 30% of his time to environmental management activities. Two technicians are assigned full time to this Service, while other personnel from the Quality Control Department and laboratories devote 10-15% of their working time to these activities.

Case study C.4

This firm, a petroleum processing concern producing gas, bitumen and solvents from crude oil, belongs to a multinational group and is situated in the province of Novara.

The firm's products go mainly to the national market, though some are exported to Switzerland and a number of EEC countries. The company has 497 employees, including 22 women. Of the 225 manual workers, 60% hold lower secondary and 40% upper secondary certificates; of the 192 white collar workers and technicians, 60% hold upper secondary and the remaining 40% lower secondary certificates. There are 80 middle management staff, of whom 60% are graduates (primarily in chemistry and engineering), while the remainder hold upper secondary school certificates.

The group has an international advisory staff for environmental problems; the corresponding structure in Italy consists of technicians attached to the firm and outside advisers. This structure is responsible to one of the group's vice-presidents. In addition, the firm is a participant in a company specializing in the provision of advice on environmental problems.

Within the firm, the Technical Division is responsible for environmental questions, while the Personnel Department is responsible for health and safety at work.

Hazards. The firm's operations involve a number of hazards connected with the transport of the raw material (crude oil) and finished products (gas, bitumen and solvents), storage, the various processing stages and the disposal of the resulting wastes.

In particular, crude oil arrives by pipeline, which must be constantly checked both manually and using automated equipment to determine its state of wear and prevent leakages; regular police patrols are also required, in case of possible sabotage.

The storage facilities and distillation plant are located at a safe distance from dwellings and are the subject of constant monitoring and maintenance. Energy for the distillation process is obtained using 90% methane and 10% combustible oils; this reduces sulphur dioxide emission by 50%.

Waste water is collected by an internal drainage system and discharged via a treatment plant to prevent contamination by hydrocarbons. An underground conduit leading to the river Ticino is under construction.
Sludge produced by equipment cleaning operations is treated in accordance with the law; other waste products include spent catalysts, which are exported off-site for metal recovery or discharged as inert, and caustic soda, which is the most toxic.

The Company is among the high-risk firms covered by Table A of Decree 175/88 (the Seveso Directive).

The accident hazard situation was considered by the technicians interviewed to be satisfactory and under control.

All the posts concerned with environmental protection in the firm correspond to CCNL levels 8-11. The most important - and highly qualified - is the pollution adviser, who is responsible for all monitoring, checking, maintenance and waste treatment activities. He is empowered to employ the services of outside bodies or personnel from the Technical Division.

Relations with the public authorities and the group are the responsibility of the general manager and the director for outside relations.

<table>

Case study C.5

This establishment, located in the province of Vercelli, belongs to a company forming part of a leading Italian electronics group. It manufactures printed circuits for the national and international markets. For the purposes of collective agreements, the Company falls within the chemical sector.

The Company has 550 employees, including 250 women; the 370 manual workers are all holders of the lower secondary school certificate. Of the 50 technicians, 7 are graduates and the remainder hold upper secondary school certificates. Among the 16 managerial staff, 5 are graduates and the rest hold upper secondary school qualifications. There are 180 white collar workers, all of whom possess upper secondary school qualifications.

The Company's Ecology Department, responsible to the plant manager, can call on the services of group technicians and personnel from the Health and Safety, Maintenance and Quality Control Departments.

Hazards. The processes involved in the manufacture of printed circuits, described and analysed in the course of the present survey, present a variety of serious hazards. Problems in the raw materials input phase concern the storage of cupric chloride (refluents) and emissions of chlorine, methylene chloride and chlorophene. The manufacturing process involves the production of epoxy resin dust and emissions of solvents, acidic and basic vapours, and organic and photo-sensitive substances in gaseous form. Following the galvanising process, the finishing stage causes emissions of ammonia, solvents, organic substances, fluxes and pickling fluids, formic aldehyde, lead and tin.

The interviewees judged the environmental safety situation to be unsatisfactory, with many serious problems still unresolved.

To combat these hazards, the Company has an Ecology Department, to which certain specific personnel are assigned; this Department collaborates with personnel from other Departments, e.g. Health and Safety, Maintenance, the laboratories, etc.

<table>

Case study C.6

This Company, which forms part of a leading Italian chemicals group, is located in the province of Alessandria. The Company has two production lines: 1) fluorine-based products; and 2) organic products (accelerators, vulcanizing agents, and various additives for the paper industry and the chemical industry in general). These products are sold chiefly on international markets.

The Company has 820 employees, including 100 women. Of the 500 manual workers, the majority are holders of the lower secondary school certificate and the rest have upper secondary school qualifications. There are 60 managerial staff and 260 white collar workers and technicians; about half have upper secondary qualifications and the remainder are graduates.

In the Company's organization chart, environmental protection tasks are entrusted to a specific service responsible to the general management. Research work and laboratories come under the deputy plant manager, while maintenance operations come under a "Services" Department.

Hazards. The Company is among the high-risk establishments covered by Table A of Decree 175/88 (the Seveso Directive). The fluorine production line presents hazards relating to the following: the storage and utilization of hydrofluoric acid, atmospheric emissions of fluoride compounds (treated by oxidation); vapours; water neutralization and treatment (biological waste treatment plant); special solid wastes (containers, packaging materials, maintenance materials, insulation materials – resins and epoxy resins – and plastic bags).

The organic product processing line presents the following hazards: atmospheric emissions of heptane (treated by refrigeration and activated carbon systems); water contaminants (treated by chemical, physical and biological systems); sludge consisting of 95% iron and 5% organic substances (dead bacteria) collected in approved tanks and discharged at authorized disposal sites); solid wastes consisting of gypsum from the neutralization plant, carbonates, fluorides and calcium sulphate, discharged at authorized disposal sites.

The environmental hazard situation was judged by interviewees to be generally satisfactory and under control.

The personnel involved in environmental protection activities are attached to various departments and have a variety of skills and competencies.

N.B.: these posts derive from the Company's own regulations.
Case study C.7

This Company, which forms part of a leading Italian group, is a tyre manufacturer located in the province of Turin. 70% of its production goes to the national market, 23% to the EEC and the remaining 7% to non-Community countries.

The Company has 1,822 employees, including 213 women. The average age of the 1,651 manual workers, who hold primary or lower secondary school qualifications, is 45. The 106 technicians hold either lower or upper secondary school certificates. There are 34 managerial staff, the majority of whom hold upper secondary school certificates, the remainder being graduates. Of the 31 white collar workers, some have State vocational school and others upper secondary school qualifications.

Environmental protection tasks are assigned to the "Health, Safety and Ecology Office", which forms part of the "Personnel, Organizations and Systems" Department. Waste disposal, however, is the responsibility of the "Quality" Department, in conjunction with the Health, Safety and Ecology Office.

Hazards. In tyre manufacturing the raw materials (raw rubber, carbon black, plasticizing oils and other ingredients) are first processed in a banbury mixer; this stage involves emissions of particulates containing carbon black and the production of wastes from the mixer (rubber and toxic plasticizing oils). The following stages—drawing, calendering and the coating of tringles—involve emissions of vapours and particulates and the production of waste fabric and tringles. The boilers use combustible oils with a high sulphur content; the particulates are filtered; grout containing silicone is produced and heat is emitted. The Company plans to convert the heating plant to the use of methane.

The machinery is cooled by water, which is discharged to the drainage system after softening. Other waste products include used oils and vulcanized rubber (sub-standard tyres) which are disposed of in accordance with provisions in force.

The heating plant was considered to present the highest risk situation; otherwise, interviewees believed the environmental hazard situation at the plant to be under control.

Research, monitoring, maintenance and other tasks relating to environmental problems are carried out by personnel attached to a variety of departments.
The manager of the Safety, Health and Ecology Office is responsible for coordinating all research and monitoring activities concerning both the health and safety of the Company's workers and the protection of the environment. The Office cooperates with the Technical Service, which integrates its own adjustment and maintenance activities with those relating to environmental protection. Waste disposal is the responsibility of the Company's Quality Department; the Safety, Health and Ecology Office is also responsible for relations with the group's technical services, outside bodies and the public authorities.

Case study M.1

This establishment is a steelworks belonging to a major Italian group and located in Aosta; it specializes in the production of stainless and other special steels.

Its production goes both to the national market and to the EEC (in which it holds 52% of the valve market); the remainder is exported to non-Community countries.

The Company has 2 300 employees, including 30 women. The 1 845 manual workers all hold lower secondary school certificates; the 100 technicians are evenly divided between upper and lower secondary school certificate holders, as are the 317 white collar employees. There are 38 middle management staff, of whom 90% hold upper secondary school certificates, while the remainder have lower secondary qualifications. Most of the 17 top-level managers hold degrees in engineering, economics or law.

The "Safety, Environment and Ecology" Service is attached to the Personnel Department; it is responsible for monitoring and planning preventive measures both internal (for the protection and safety of the workforce) and external (for the protection of the environment). The implementation of these measures and plant maintenance are the tasks of the firm's technical department.

Hazards. The production processes present a wide range of serious hazards, both for the environment and the workforce. A salient problem is the emission of vapours, especially from the melting furnaces; treatment of these vapours gives rise to the production of about 5-6 000 tonnes of dust per year. In addition, approximately 53 000 tonnes of furnace slags result from the annual production of around 200 000 tonnes of steels. The management of these wastes is the firm's major problem; at present authorized waste disposal services are employed. Other problems, partly resolved, concern the production of scrap metal, spent liquids and oils, sludge (also exported off-site to authorized disposal sites) and gaseous emissions from the pickling tanks).

Other serious problems relate to energy production and concern the presence of oils (PCB and PCT) in the transformers and emissions of methane, propane, diesel oil and other waste oils (collected by appropriate waste disposal services).

The establishment is covered by Table B of Decree 175/88 (the Seveso Directive).
The personnel of the "Safety, Environment and Ecology" Department have the task of overseeing the application of rules and safety standards and making proposals for improvements and preventive measures; the Department is also responsible for relations with the outside bodies and public authorities involved. The search for solutions to problems is the task of the plant manager's office attached to the Technical Department. Environmental monitoring activities are carried out by outside firms. The adjustment and maintenance of pollution control equipment is the responsibility of a team made up of personnel from the plant manager's office and the Safety, Environment and Ecology Department.

Case study M.2

Case study M.2 presents an aluminium foundry specializing in the production of cylinder heads; the Company belongs to a leading Italian group and is located in the province of Turin. Its production goes to national, Community and international markets.

The Company has 2 100 employees. Of these:
- 1 700 are manual workers, holding lower secondary certificates,
- 350 are white collar workers, all holding upper secondary school certificates,
- 50 are managerial staff, of whom some are graduates and the rest hold upper secondary school qualifications.

Monitoring and preventive measures in the fields of health, safety and environmental protection are the responsibility of the Personnel Department. In particular, the plant and maintenance manager coordinates pollution control activities relating to emissions and waste disposal and collaborates with the manager of the "Safety, Accidents and Occupational Diseases" Department to frame and implement joint strategies to improve safety and combat hazards.

Hazards. The processing of aluminium for the manufacturing of cylinder heads gives rise to atmospheric emissions of vapours from smelting (only partially filtered), discharging the trolleys, and high temperature reactions due to contact between the melt and the foundry sand. Waste products include:
- foundry sand, which is almost fully recycled (unusable sands are disposed of at authorized sites);
- scrap metal and shavings, which are remelted;
- other metal wastes, which are handed over to another firm for recycling.

Water is discharged to the drainage system or to the river Po after treatment in a purification plant.

The situation, especially with regard to atmospheric emissions, was considered unsatisfactory and new solutions are being sought.

Research and development activities in relation to environmental problems are carried out by the group's research centre and outside advisory services. Maintenance and adjustment of the pollution control equipment is carried out by outside firms (cleaning of furnaces) or by the suppliers (e.g. changing of filters). The personnel manager is responsible for relations with outside bodies and the public authorities. The plant and maintenance manager, in collaboration with the manager of the Health and Safety Department, coordinates these activities, programmes measures to be taken, ensures compliance with rules and the Company's standards, etc.

The following are the personnel most closely involved in environmental activities.

<table>
<thead>
<tr>
<th>Occupation</th>
<th>% of working time devoted to environmental activities</th>
<th>Qualifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Plant and maintenance manager</td>
<td>50</td>
<td>Upper secondary school certificate</td>
</tr>
<tr>
<td>2. Health and safety officer</td>
<td>100 +</td>
<td>&quot;</td>
</tr>
</tbody>
</table>

+ Since no clear demarcation between the two areas of activity is possible, this figure includes time devoted to internal preventive measures and the protection of workers' health.

The table on the following page gives further details.

Case study M.3

This Company, located in the province of Turin, is a manufacturer of hot-rolled steel products: concrete reinforcing bars, and flat bars and squares for industry. Its production goes to national, Community and international markets.

The Company has 670 employees, including 27 women (the latter are all white collar workers). The 500 manual workers have primary or lower secondary school certificates. There are 160 white collar workers, all holders of the upper secondary school certificate. The 10 managerial staff mainly hold degrees in engineering, economics or law.

Environmental problems and ecological protection are the responsibility of the Ecology Office attached to the Personnel Department. This Office is also responsible for relations with outside bodies and the public authorities. The firm's Technical Department is responsible for maintaining the pollution control equipment; environmental monitoring is carried out by authorized outside firms.

Hazards. The principal hazards relate to vapour emissions and slag from smelting, and dust and sludge resulting from vapour treatment. Zinc and certain secondary materials are recovered by other firms. The interviewees judged the overall pollution control situation to be satisfactory.

Personnel involved full-time or part-time in environmental activities are the following:

<table>
<thead>
<tr>
<th>Occupation</th>
<th>% of working time devoted to environmental activities</th>

2. KNOWLEDGE, COMPETENCES AND SKILLS
3. DENOMINATION OF OCCUPATIONS UNDER COLLECTIVE AGREEMENT OR CONTRACT
4. EDUCATION AND TRAINING, LEVELS, ETC.
CHAPTER IV
CONCLUSIONS

1. The groups of activities

The groups of activities (see Chapter I, paragraph 1.2) are identified in functional terms in relation to the classification of tasks, since in firms' organization structures environmental protection activities often overlap with the activities of other departments such as health and safety at work, procurement, marketing, production, etc.

The groups of activities listed below, although not always representative of firms' organization structures, nevertheless make it possible to draw up a catalogue of the tasks relating to the occupations in question. Since the sample under study was small (10 firms) and restricted to two sectors only (the metal and chemical industries), we cannot claim that the catalogue below is exhaustive; we believe, however, that it constitutes an adequate point of departure for further research.

The table below lists the groups of activities and tasks identified in the course of our research.

<table>
<thead>
<tr>
<th>GROUPS OF ACTIVITIES</th>

</tbody>
</table>
3. pollution control and monitoring

14. waste treatment plant management;
15. monitoring of solid, liquid and gaseous wastes to check compliance with legal requirements and company standards;
16. taking samples of pollutants, qualitative and quantitative analyses;
17. perfecting and implementing techniques and procedures for pollution control and the treatment of waste water and gaseous emissions;
18. implementation of measures aimed at improvements and pollution control;

4. plant safety, major hazards, fire prevention

19. checking plant safety;
20. adoption of safety measures in conformity with provisions on major-accident hazards (Decree 175|1988);
21. carrying out changes and modifications to plant and safety and accident prevention systems;
22. fire prevention measures;
23. checking of fire fighting systems;
24. training of volunteer fire fighters;
25. recording and evaluation of accidents;
26. stopping machinery and production lines in the event of danger;

5. adjustment and maintenance

27. maintenance of safety and pollution control equipment and systems;
28. changing filters, fluids and routine maintenance;
29. planning exceptional maintenance operations;
30. emergency measures;

6. waste management

31. collection, classification, storage, treatment, transport and disposal of wastes;
32. maintaining register of input and disposal of wastes;
33. carrying out legal and administrative procedures.
2. Analysis of occupations

The occupations identified represent a pool of resources in the form of knowledge, skills and capacities in the field of environmental protection. These occupations differ in the levels of autonomy, responsibility and complexity relating to the performance of the tasks assigned to them.

To describe and analyse these occupations we thought it necessary to refer to an analytical model designed to identify the differences between the various types of occupation and highlight their principal characteristics. For this reason, we used a model prepared by the ISFOL, based on the differentiation of three fundamental types of occupation:

A. managerial (management, coordination and control);
B. technical (maintenance, innovation, etc.);
C. operational (processing, operation of plant and equipment).

Following this model, it is possible to associate one or more fields of activity with each of these basic types of occupation. The following table sets out these activities in general terms.

<table>
<thead>
<tr>
<th>Type of occupation</th>
<th>Activities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managerial</td>
<td>Integration of specialized fields of activity Combining resources and ensuring compatibility Ensuring profitability of production.</td>
</tr>
<tr>
<td>Technical</td>
<td>Seeking innovation in technologies and processes Development and innovation as regards products Constitution and improvement of the firm's know-how Ensuring technical efficiency of solutions adopted.</td>
</tr>
<tr>
<td>Operational</td>
<td>Execution of predefined tasks Cooperation at social level Compliance with efficiency standards.</td>
</tr>
</tbody>
</table>

These activities represent the contribution required by the firm from each type of occupation.

On the basis of these elements, the occupations described in the case studies can now be classified under one of the three basic groups: managerial, technical, and operational.

Criteria for the description and classification of the occupations are set out in the following table.
<table>
<thead>
<tr>
<th>Distinguishing Factors</th>
<th>Operational</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision-making</td>
<td>Criteria regarding conformity with company rules, procedures and practice</td>
</tr>
<tr>
<td>Nature of contribution and activities</td>
<td>Activities concerning the production process or the monitoring and supervision of the latter</td>
</tr>
<tr>
<td>Results of activities</td>
<td>Technical, recurrent</td>
</tr>
<tr>
<td>Quality of results</td>
<td>Conformity with quantitative and qualitative standards laid down by company (whether formally or otherwise)</td>
</tr>
<tr>
<td>Methodology</td>
<td>Application of procedures determined by company, or company practice</td>
</tr>
<tr>
<td>Type of input</td>
<td>Preliminary data: abundant, explicit, unambiguous</td>
</tr>
</tbody>
</table>

</table>
3. Classification of occupations identified in the survey

The criteria referred to make it possible to distinguish between the various occupations and classify the respective levels and grades.

We thought it of value to review the occupations identified in the case studies, attempting to classify them on the basis of the analytical model described.

Criteria relating to the following were applied:

- Decision making
- Nature of activities
- Type and quality of results
- Methodology
- Type of input
- Type of variables involved
- Skills and experience
- Relations conducted

CASE STUDY C.1

1. Coordinator, safety and environmental protection
   a. applies criteria relating to technical efficiency to the firm's operations,
   b. his activities predominantly concern finding and applying solutions to technical problems (adapting company standards and environmental policies to production systems and ensuring application of the most restrictive rules),
   c. the results of the activities essentially concern the solving of technical problems,
   d. he defines procedures to be followed derived from the application of methods and standards (e.g., means of implementation of environmental protection projects at organizational and technological level),
   e. acts on the basis of data which require deciphering and adaptation,
   f. operates on the basis of technical and scientific variables whose interaction with other variables is not fully known,
   g. possesses technical and scientific knowledge and high-grade specialized training qualifications,
   h. post-holder must have experience relating to the technical and scientific aspects of environmental protection in industry,
   i. coordinates with bodies or departments concerned with environmental protection, whether internal or outside.

This occupation should be classified as primarily technical, although it involves certain tasks of a managerial nature: criteria regarding economic viability enter into the decision-making processes, and activities aimed at combining resources and inter-disciplinary skills.

The tasks relating to this occupation are: nos 1, 3, 4, 5, 6, 7, 10, 11 and 12.
2. Health officer and safety officer

a. the post-holders act in accordance with the firm's rules, procedures and practice and criteria relating to technical efficiency,

b. their activities mainly concern monitoring and preventive measures (including the identification and evaluation of hazards and accidents),

c. the results of the activities are technical, recurrent and in conformity with standards defined by the firm,

d. the post-holders apply procedures predetermined at technical and legislative level and approved by the firm,

e. they operate on the basis of abundant, but clearly-defined data,

f. they are concerned with combinations of technical variables,

g. the post-holders must possess a basis of knowledge both theoretical and practical; their experience must relate to technical and practical problem-solving,

h. their relations are of the cooperative type (e.g. exchanges with internal and outside bodies and departments).

Although in part technical, this occupation can be classified as predominantly operational.

This occupation relates to the following tasks: nos 6, 7, 10, 14, 15, 16, 17, 18, 19, 20 and 25.

3. Waste disposal officer

a. the post-holder acts in accordance with company standards, procedures and practice and criteria regarding technical efficiency,

b. his activities mainly concern monitoring and supervision (keeping the register of waste input and disposal, supervising the storage of wastes and ensuring homogeneity, supervising and checking methods of transport),

c. the results of the activities are therefore technical, recurrent, and in conformity with company standards,

d. the post-holder implements technical procedures pre-determined by the firm,

e. he acts on the basis of abundant data of known characteristics (e.g. the characteristics of materials for storage and disposal),

f. he acts on the basis of variables whose fluctuations are predictable (e.g., quantities to be stored, methods of transport, etc.),

g. the post-holder must possess a basis of technical and practical knowledge and a medium educational level (upper secondary school, industrial trades technical school); his experience must relate to the solving of technical and practical problems,
h. relations within the organization are of the cooperative type (links with other departments).

This occupation can be classified as operational.

The related tasks are: 31, 32 and 33.

4. Fire prevention officer

a. the post-holder acts in accordance with company standards, procedures and practice and criteria regarding technical efficiency,

b. his activities mainly concern monitoring and supervision (monitoring of plant and fire fighting equipment),

c. the activities are therefore technical, recurrent and in conformity with company standards,

d. the results of these activities are obtained through the implementation of technical procedures defined by the firm,

e. the post-holder acts on the basis of abundant data of which the significance is unambiguous (e.g., conformity of plant and fire fighting equipment),

f. he acts on the basis of technical variables,

g. the post-holder must possess a basis of technical and practical knowledge and a medium educational level (upper secondary school, industrial trades technical school); his experience must relate to the solving of technical and practical problems,

h. relations with the organization are of the cooperative type (liaison with other departments); an organizational capacity is required since he is called on to train volunteer fire-fighters.

This occupation may be classified as operational.

The related tasks are: 22, 23 and 24.

CASE STUDY C.2

1. Personnel manager

a. the post-holder acts on the basis of economic considerations and criteria regarding the effectiveness of technical measures taken to ensure conformity with the provisions of environmental protection legislation,

b. his activities involve the coordination of all the firm's human resources,

c. the result aimed at is economic and concerns the optimization of the relationship between the effectiveness of the measures taken and conformity with the firm's objectives,
d. from the methodological viewpoint, he acts and develops a strategy in relation to a number of variables (technical, economic, legal, etc.) and agents (the company management, trade unions, public authorities, etc.),

e. he uses and deciphers heterogeneous data from a multiplicity of sources; the events to be taken into consideration are often fortuitous in character,

f. the post-holder is required to have a university education and experience relating to the operation of technical, economic and organizational systems,

g. he maintains relations with internal and outside groups and bodies (e.g., local authority environmental protection departments).

This occupation should be classified as managerial, with organizational activities and activities relating to legal questions. The related tasks are: 1, 3, 4, 5, 6, 7, 8 and 9.

2. Plant and maintenance technician

a. the post-holder acts in accordance with company standards and directives, and criteria regarding the technical efficiency of measures taken,

b. his activities concern the supervision and improvement of technical measures designed to solve problems regarding the plant and environmental protection,

c. the results aimed at concern conformity with, and improvements to, the firm's technical standards,

d. procedures determined by the company are applied, but with a margin for discretion,

e. abundant data are used, of which part is clearly defined and the remainder requires deciphering,

f. the variables relate to rules and technical matters; their interaction is not always predictable,

g. the post-holder must possess secondary technical school qualifications and experience in the field of plant maintenance and environmental protection,

h. relations within the organization are of the cooperative type and concern the achievement of technical objectives.

This occupation should be classified as operational and technical. The related tasks are: 11, 12, 14, 15, 16, 19, 20, 21, 22, 27, 28 and 29.
CASE STUDY C.3

1. Managing director

a. the post-holder acts on the basis of economic considerations and criteria regarding the effectiveness of technical measures adopted in conformity with the provisions of environmental protection legislation,

b. his activities concern the coordination of all the company's technical, technological and human resources,

c. the results aimed at are economic and concern the optimization of the relationship between the effectiveness of the measures taken and conformity with the firm's overall objectives,

d. from the methodological point of view, he acts, and develops strategies, in relation to a multiplicity of variables (production, technical, economic, legal, etc.) and agents (company management, trade unions, public authorities, etc.),

e. he uses and deciphers heterogeneous data from a multiplicity of sources; the events to be taken into consideration are often fortuitous in character,

f. the post-holder is required to possess university qualifications, inter-disciplinary skills, and management experience in relation to technical, economic and organizational systems,

g. he is responsible for relations with individuals, groups and bodies both inside and outside the firm (e.g., local authority environmental protection departments).

This occupation should be classified as managerial. The related tasks are: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 and 13.

2. Safety and environmental management technician

a. the post-holder acts in accordance with criteria regarding technical efficiency,

b. his activities concern the supervision and improvement of measures designed to solve environmental protection problems,

c. the activities are aimed at ensuring conformity with standards and improving the results obtained; the post-holder is empowered to act in the event of anomalies (e.g., he can stop the machinery and the production line),

d. he applies methods and procedures laid down by the firm,

e. the data available are abundant, recurrent and often require deciphering,

f. the variables with which he operates are technical and scientific,
the post-holder should possess good upper secondary education qualifications and some experience in the field of technical and scientific problems,

h. relations are predominantly of the cooperative type; relations with the firm's management are also involved.

This occupation should be classified as technical. The related tasks are: 14, 15, 16, 17, 18, 19, 25 and 26.

CASE STUDY C.4

1. Pollution adviser

a. the post-holder is a specialist who acts in accordance with decision-making criteria relating to technical efficiency,

b. his activities are aimed at finding solutions to safety and environmental protection problems; the post-holder seeks constantly to check the application of rules in force and improve technical standards,

c. the result aimed at is the improvement of the technical and organizational aspects of environmental protection,

d. the post-holder acts in accordance with procedures derived from the application of standardized methods, with some degree of discretion,

e. the data he uses must be constantly deciphered and updated,

f. the variables involved are technical and scientific and their interaction is fairly predictable,

g. the post-holder should possess high educational qualifications and experience in the field of technical and scientific problem-solving,

h. he carries out his activities in cooperation with the firm's management.

This occupation should be classified as technical (specialized).

The tasks involved are: 2, 3, 4, 5, 6, 7, 10, 11, 12, 14, 15, 16, 17, 18, 19, 20, 21, 22 and 27.

CASE STUDY C.5

1. Ecology Department personnel

a. the post-holders act in accordance with the firm's standards and directives and criteria regarding the technical efficiency of the measures taken,
b. their activities concern the supervision and improvement of measures designed to solve problems regarding environmental protection, the plant and the technologies used,

c. the aim is to ensure conformity with, and the improvement of, the firm's technical standards,

d. in developing these activities, procedures laid down by the firm are applied, with a margin for innovation,

e. of the abundant data input, part is explicit and the remainder requires deciphering,

f. the variables are regulatory and technical; their interaction is not fully predictable,

g. post-holders should possess good technical school qualifications and considerable experience in the fields of plant operation and environmental monitoring and protection techniques,

h. relations within the organization are of the cooperative type and concern the attainment of technical objectives. The post-holders act in close liaison with the firm's management.

This occupation is operational and technical (specialized). The related tasks are: 2, 3, 4, 5, 6, 7, 10, 11, 12, 14, 15, 16, 17, 18, 19, 20, 21, 22 and 27.

CASE STUDY C.6

1. General manager

a. the post-holder acts in accordance with criteria relating to the firm's profitability,

b. the firm's Environmental Protection Department is directly responsible to him; his activities predominantly involve decision-making, and coordinating the firm's human, technical and economic resources,

c. the activities are aimed at the maximization of the cost|effectiveness ratio,

d. he acts in accordance with strategies which take account of a wide range of variables,

e. he has available aggregate data, part of which must be constantly deciphered and updated,

f. the variables involved are technical, economic and behavioural (many different agents are involved, whether inside or outside the firm),

g. he holds university qualifications (science) and possesses inter-disciplinary skills,
2. **Deputy manager**

a. the post-holder acts in accordance with criteria relating to profitability and technical efficiency,

b. the "Research and laboratories" or "Maintenance and waste treatment plant" departments may be responsible to him as deputy manager: his activities mainly concern the coordination of human, technical and economic resources for which he is responsible,

c. the activities are aimed at the maximization of the cost\-effectiveness ratio,

d. he acts in accordance with strategies, procedures and methods which are constantly updated,

e. he has at his disposal aggregate data, part of which must be deciphered and constantly updated,

f. the variables involved are mainly regulatory, technical and economic,

g. he possesses university qualifications (science) and has interdisciplinary skills,

h. he is responsible, together with the firm's management, for relations with and between the firm's technical, economic and organizational systems and for relations with the environmental protection services of the public authorities.

This occupation is managerial, combining technical, organizational and administrative skills.
The related tasks are: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 and 13.

3. **Research and technology department personnel**

a. these personnel act in accordance with criteria relating to technical efficiency in seeking solutions making for plant safety and safe technologies,

b. their activities involve a continuing search for improvements and innovation in relation to technical problems,

c. the results contribute to the firm's know\-how,

d. the post-holders apply procedures and methods which take account of a wide range of variables,

e. the data input is limited, and requires constant deciphering and updating,
f. the variables are technical and scientific,

g. university qualifications (inter-disciplinary) are required, together with a wide range of experience in the area of technological and scientific problems,

h. the post-holders maintain relations with other internal departments, and with universities and outside research institutes.

This occupation is technical (specialized). The related tasks are: 10, 11, 12 and 13.

4. Environmental laboratory personnel

a. the post-holders are responsible for environmental monitoring, conducted in accordance with company rules and scientific procedures,

b. their activities mainly concern supervision and monitoring,

c. the activities are recurrent and are aimed at ensuring conformity with quantitative and qualitative standards laid down by the firm,

d. the post-holders apply sampling and analysis procedures based on scientific methods,

e. the data are explicit, to be obtained through the use of instruments and deciphered,

f. the variables are technical and scientific,

g. upper secondary school and/or university qualifications are required, together with knowledge and experience in the technical and scientific fields,

h. the post-holders maintain relations with other internal departments and with local authority environmental protection services.

This occupation should be classified as technical (specialized). The related tasks are: 6, 7, 14, 15, 16, 17 and 18.

5. Plant and maintenance technician

a. the post-holder is responsible for plant maintenance, including waste treatment plant. He acts in conformity with company rules and standards,

b. activities mainly concern monitoring and adjustment,

c. the results of the activities are technical and recurrent,

d. the post-holder applies procedures determined and programmed by the firm (and also by outside advisers),
e. the data used is explicit and recurrent,
f. the post-holder monitors technical variables,
g. upper secondary school and/or university qualifications are required, in addition to knowledge and experience regarding the technical problems to be tackled,
h. he acts in liaison with the firm's management and environmental protection services.

This occupation is primarily operational and technical (specialized). The related tasks are: 19, 21, 27, 28 and 29.

6. Effluent plant technician
a. the post-holder acts in accordance with company rules and procedures,
b. his activities concern the control and monitoring of the treatment of gaseous, liquid and solid wastes,
c. the activities are technical and aimed at ensuring conformity with the quantitative and qualitative standards laid down by the firm,
d. the post-holder employs procedures based on the application of methods,
e. the data input is limited and must be regularly updated,
f. the variables are technical,
g. upper secondary school and/or university qualifications are required, together with technical and practical skills and experience,
h. the post-holder maintains relations with the research department, the laboratories and the maintenance department.

This occupation is essentially operational and technical (specialized). The related tasks are: 14, 15, 17, 31, 32 and 33.

CASE STUDY C.7

1. Manager, Health, Safety and Ecology Office
a. the post-holder seeks technical efficiency in respect of the results of the activities for which he is responsible,
b. his activities primarily involve finding and applying solutions to technical problems (implementation of organizational and technological projects for environmental protection; monitoring compliance with environmental pollution standards),
c. the results of the activities concern the solving of technical problems,
d. the post-holder determines the procedures to be followed on the basis of a method (e.g. the means used to implement organizational and technological projects for environmental protection),

e. he acts on the basis of synoptic and homogeneous data which often require deciphering,

f. the variables are technical and scientific; their integration and combination is not fully predictable,

g. upper secondary and/or university qualifications are required, plus formal technical and scientific knowledge,

h. the post-holder must possess experience in the field of technical and scientific problems relating to environmental protection,

i. he maintains relations with bodies concerned with the achievement of technical objectives.

This occupation is technical (specialized). The related tasks are: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 and 13.

2. Assistant manager, Health, Safety and Ecology Office

a. the post-holder acts in accordance with established standards and procedures,

b. his activities concern administrative procedures relating to environmental protection (relations with advisers, reports, applications for authorization, etc.),

c. the results of the activities are recurrent and relate to technical and administrative matters,

d. the post-holder follows predetermined procedures,

e. he uses explicit and recurrent data requiring constant updating,

f. the variables are homogeneous,

g. upper secondary school qualifications are required, together with technical and administrative skills in the relevant field.

This occupation should be classified as operational. The related tasks are: 1, 6 and 7.

3. Manager, Technical Department

a. the post-holder is responsible for the supervision and maintenance of plant, including pollution control equipment. He acts in accordance with company rules and standards,

b. his activities predominantly concern monitoring, adjustment and innovation,

c. the results of the activities are technical, recurrent, and - sometimes - innovative,
d. the post-holder follows procedures and implements projects defined and programmed by the company (sometimes in conjunction with group or outside advisers),

e. he uses explicit and recurrent data,

f. the variables involved are technical,

g. upper secondary school and/or university qualifications are required, in addition to knowledge and experience regarding the technical problems to be tackled,

h. the post-holder acts in liaison with the firm's management and environmental protection services.

This occupation should be classified as technical (specialized), with managerial and operational skills. The related tasks are: 19, 21, 27, 28 and 29.

4. Waste disposal technician (Quality Department)

a. the post-holder acts in accordance with company rules, procedures and practice, and criteria regarding technical efficiency,

b. his activities are predominantly supervisory (maintaining the register of waste input and disposal, supervising the storage of waste products and ensuring homogeneity, supervising and monitoring methods of transport, maintaining relations with waste disposal firms and the public authorities),

c. the results of the activities are therefore technical, recurrent, and in conformity with standards laid down by the firm,

d. the post-holder follows procedures predetermined by the company,

e. the data input is abundant but of known characteristics (e.g., characteristics of materials for storage and disposal),

f. the variables are technical in nature and predictable (e.g., the quantities to be stored, methods of transport, etc.),

g. upper secondary or upper secondary technical school qualifications are required, together with a basis of technical and practical knowledge; the post-holder must have experience in the field of technical and practical problems,

h. relations within the organization are of the cooperative type (liaison with other departments).

This occupation should be classified as essentially operational. The related tasks are: 31, 32 and 33.
CASE STUDY M.1

1. Coordinator, environmental protection activities
   (Safety, Environment and Ecology Department)
   a. the post-holder applies criteria regarding technical efficiency in his
      work of identifying, evaluating and solving environmental protection problems,
   b. his activities concern the solution of problems relating to
      environmental and other hazards and adaptation to rules and standards,
   c. the activities are aimed at improvements and innovation,
   d. the post-holder determines operational procedures following a method,
   e. he uses data which require deciphering and necessitate research
      activities and updating,
   f. the variables are regulatory, technical and scientific,
   g. a high educational level is required, together with experience relating
      to the technical and scientific problems to be tackled,
   h. relations with company and group departments are cooperative, and are
      aimed at the achievement of technical objectives.

This occupation should be classified as essentially technical (specialized).
The related tasks are: 1, 2, 3, 4, 5, 6, 10, 11, 12, 13, 21 and 25.

2. Health and Safety Officer and Ecology Officer
   a. these post-holders are responsible for environmental monitoring and
      the checking and maintenance of pollution control equipment. They act in
      accordance with the firm's rules and standards,
   b. their activities predominantly concern monitoring, adjustment and
      innovation,
   c. the results of the activities are technical and recurrent,
   d. these post-holders implement procedures and projects defined and
      programmed by the company (sometimes in conjunction with group or outside
      advisers),
   e. they use explicit and recurrent data,
   f. the variables are technical,
   g. vocational qualifications are required, together with knowledge and
      experience relating to the technical problems to be tackled,
   h. the post-holders act in liaison with the Coordinator of the Safety,
      Environment and Ecology Department.

These occupations are essentially operational.
The related tasks are: 14, 15, 16, 17, 18, 19, 21 and 27.
3. Administrative procedures officer (Safety, Environment and Ecology dept.)

a. the post-holder acts in accordance with company procedures and legal requirements,
b. his activities concern the execution of administrative procedures relating to authorizations, renewals, reports, declarations, etc.,
c. the activities are recurrent and in conformity with formal procedures,
d. the data input is explicit and recurrent,
e. the variables are technical and regulatory and are predictable,
f. technical school qualifications are required, plus experience in the field of administrative procedures relating to technical problems,
g. the post-holder orders his own work in liaison with the department Coordinator and the public authorities.

This occupation is essentially operational.
The related tasks are: 7 and 22.

CASE STUDY M.2

1. Plant and maintenance manager (waste treatment)

a. the post-holder seeks technical efficiency in maintaining pumps, filtering and other equipment for gaseous emissions and waste water, and in the storage, disposal and monitoring of waste products,
b. his activities primarily concern problem solving and the improvement (innovation) of the systems used,
c. the activities are aimed at the improvement of company standards,
d. the post-holder determines procedures on the basis of a method,
e. he uses synoptic data, which require deciphering and constant updating,
f. the variables are regulatory, technical and scientific,
g. upper secondary school qualifications are required, plus experience in the area of the technical problems to be resolved,
h. relations within the organization are primarily of the cooperative type.

This occupation is technical (specialized).
The related tasks are: 10, 11, 14, 15, 19, 27, 28, 29 and 31.
2. Health and Safety Officer

a. the post-holder applies criteria relating to technical efficiency and conformity in analysing accidents and monitoring plant, machinery, the environment and the introduction of new technologies,

b. his activities relate to monitoring and problem-solving,

c. the activities are aimed at expanding the firm's know-how,

d. he acts in accordance with established methods and participates in planning,

e. the data are synoptic and require deciphering and constant updating,

f. the variables are technical and scientific and their interaction is not fully predictable,

g. high educational qualifications are required, plus experience in the appropriate field,

h. relations within the organization are of the cooperative type.

This occupation is essentially technical (specialized).
The related tasks are: 13, 14, 15, 19 and 25.

CASE STUDY M.3

1. Maintenance technicians

a. the post-holders act jointly to maintain safety and pollution control equipment in accordance with criteria relating to technical efficiency and conformity,

b. their activities concern monitoring and adjustment,

c. the activities are aimed at ensuring conformity with quantitative and qualitative standards laid down in legal provisions and by the firm,

d. the post-holders use procedures established by the company but with some discretion to establish their own procedures based on methods,

e. the data are explicit, recurrent and require constant updating,

f. the variables are technical and regulatory,

g. upper secondary technical school qualifications are required, in addition to extensive experience in the field of the activities concerned,

h. relations within the organization are of the cooperative type.

This occupation is essentially operational, but partially technical (specialized).
The related tasks are: 27, 28 and 29.
2. Effluent plant operators

a. the post-holders act jointly, in accordance with criteria relating to technical efficiency and conformity in operating the safety and pollution control equipment,

b. their activities concern monitoring and adjustment,

c. the activities are aimed at ensuring conformity with quantitative and qualitative standards laid down in legislative provisions and by the company,

d. the post-holders follow procedures established by the company but have some discretion to determine their own procedures in accordance with methods,

e. the data are explicit, recurrent and require constant updating,

f. the variables are technical and regulatory,

h. upper secondary technical school qualifications are required, plus extensive experience in the field concerned,

h. the relations maintained are of the cooperative type.

This occupation is essentially operational, but partly technical (specialized). The related tasks are: 14, 15, 16, 17 and 18.

A list of the occupations identified in the ten case studies is given below. The degree to which each occupation can be assigned to one of the three groups is indicated by the following symbols: +++ (to a great extent); ++ (to some extent); + (to a lesser extent).

4. Career development

Career development is often linked to a combination of factors dependent on, or inherent in, the work organization; however, certain general trends in career development in each of the three occupational groups deriving from the methodological model used may be identified:

- Managerial personnel rise in level in accordance with the extent of their responsibilities and the degree of risk involved in their decisions, which in the present case concern the coordination and supervision of their firm's environmental protection strategies;

- For specialized technicians, career development may be seen as progress from the "micro" to the "macro" level, i.e. from the operation of micro-systems to control over more complex systems. These occupations acquire a managerial character with their gradual progress from activities concerned with technical efficiency to those concerned with the optimization of economic factors. This progress calls for accumulated experience in various sectors (broadening of the specialized field) and the acquisition of inter-disciplinary skills in the technical and economic spheres;

- Career development for operational personnel involves an increasing level of complexity in the tasks performed, the acquisition of greater autonomy in decision-making and a move closer to the sphere of the technician through contributions to the improvement of the results achieved. Advancement is obtained through coordination and supervision activities requiring a better knowledge of the company's production system and the acquisition of inter-disciplinary skills aimed at the improvement of the results - also taking profitability into account.

This sector - safety and environmental protection in industry - has developed substantially in the past few years as a result of the significance accorded to it by recent legislation. The diversity of the organizational structures adopted by the various firms under study is due to historical factors and the objectives and characteristics of the firms themselves. This raises problems in mapping career development; however, on the basis of information elicited in the course of the survey it is possible to trace certain routes to advancement, although we are aware that these are not of general application.
CAREER DEVELOPMENT

PLANT OPERATOR  INDUSTRIAL HEALTH OFFICER

MAINTENANCE TECHNICIAN

WASTE DISPOSAL TECHNICIAN

PLANT TECHNICIAN

HEALTH AND SAFETY OFFICER/ASSISTANT

COORDINATOR, SAFETY AND ENVIRONMENTAL PROTECTION

GENERAL MANAGER
SURVEY QUESTIONNAIRE

A. DETAILS OF FIRM

Registered business name .................................................................
Firm or establishment ...........................................................................
Location ...............................................................................................
Products ................................................................................................
Markets (national, Community, international) ...........................................
Total number of employees ...................................... of which women ...........
number of manual workers ............ educational level .........................
number of technicians ................. educational level ..........................
number of managerial staff .......... educational level ..........................
number of white-collar workers ...... educational level ..........................

B. ORGANIZATION CHART

Draw a chart illustrating your firm's organizational structure
C. MANUFACTURING PROCESSES OR PRODUCTS INVOLVING ENVIRONMENTAL HAZARDS

1. Give a brief description of the manufacturing process for each product, the technologies used and the work organization (with details of working hours, shift work, night work, etc.).

Complete Table 1 on next page.

Instructions for completion of Table 1

(1) In the first column, describe the manufacturing process indicating the principal stages; if necessary use a flow chart.

(2) In the second column, give a brief description of your firm's activities, the technologies and raw materials used and the work organization, giving details of working hours, shift work and night work.

(3) The hazards indicated in the third column should relate to the following:

(a) raw materials (transport, storage)
(b) manufacturing processes (emissions and waste products, solid, liquid and gaseous)
(c) semi-finished products (transport, storage)
(d) finished products (storage, transport, user or consumer)
(e) sources of energy produced and used
(f) machinery and equipment used (noise, vibration, etc.)
(g) major accident hazards (with reference to the Seveso Directive)
(h) social effects
(i) other factors (specify).

(4) A brief evaluation of the hazards identified should be given in the fourth column, using the following symbols:

- NP - non-existent problem
- PR - problem resolved
- PN - problem not resolved
- PT - problem to be tackled.

For each potential hazard give an evaluation, on a scale of from 1 to 10, of the level of danger for the environment.
<table>
<thead>
<tr>
<th>DESCRIPTION OF MANUFACTURING PROCESS (1)</th>
<th>DESCRIPTION OF ACTIVITIES, TECHNOLOGIES AND WORK ORGANIZATION (2)</th>
<th>ENVIRONMENTAL HAZARDS (3)</th>
<th>EVALUATION (4)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>Situation</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Extent of danger</td>
</tr>
</tbody>
</table>
D. OCCUPATIONS

1. In relation to each potential source of danger, indicate the occupations concerned with preventive measures and environmental protection.

Complete Table 2.

<table>
<thead>
<tr>
<th>TABLE 2</th>
<th>AREA CONCERNED</th>
</tr>
</thead>
<tbody>
<tr>
<td>HAZARD</td>
<td>RESEARCH, INNOVATION AND PROBLEM-SOLVING</td>
</tr>
<tr>
<td>---------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
2. In the occupations referred to in the table on the preceding page, what percentage of their working time do post-holders devote to the "specific field of activity"? In other words, is this a full-time or supplementary (e.g., job enrichment) activity?

+ "Specific field of activity" means activities relating specifically to one of the hazards listed.

<table>
<thead>
<tr>
<th>Occupation</th>
<th>Average % of working time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3. Are these occupations governed by specific provisions under contract or collective agreement?

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>YES</td>
<td>NO</td>
</tr>
</tbody>
</table>

If so, these provisions derive from:

- a national collective agreement:
- a firm or group-level agreement:
4. For each of the occupations referred to, list the tasks performed, the skills and knowledge required, the denomination under contract or agreement, and the type and level of education (educational levels should refer to the European classification set out in the Annex).

Complete Table 3.

<table>
<thead>
<tr>
<th>OCCUPATION</th>
<th>TASKS</th>
<th>SKILLS AND COMPETENCES</th>
<th>DENOMINATION UNDER AGREEMENT OR CONTRACT</th>
<th>EDUCATION AND TRAINING LEVEL (WITH REF. TO EEC CLASSIFICATION)</th>
</tr>
</thead>
</table>
5. Indicate the source and type of vocational training provision:

- educational level required (indicate the minimum required)

- in-firm or outside vocational training (indicate source of training)

- type of training (on-the-job, theoretical, practical, etc.)

- average duration of course

- indicate whether training is occasional or recurrent

- level of training (1, 2, 3, 4, 5) with reference to the EEC classification (see Annex)
TRAINING LEVELS (WITH REFERENCE TO EEC CLASSIFICATION)

LEVEL 1: compulsory schooling + vocational preparation.

Vocational preparation may be obtained within the school system or outside, or in firms. At this level, theoretical knowledge and practical skills are very limited, enabling the execution of relatively simple tasks which may be mastered rapidly.

LEVEL 2: compulsory education + vocational training (including, in particular, apprenticeship).

At this level, the trainee is fully qualified to exercise a well-defined activity and possesses the skills necessary to operate the equipment involved and employ the techniques necessary. This training level relates primarily to operational jobs which may entail a degree of autonomy within the limits of the techniques involved.

LEVEL 3: compulsory education and/or supplementary technical training or technical or other training at secondary school level.

At this level, trainees' theoretical knowledge is more advanced than at level 2. The related activities are primarily technical and may entail a degree of autonomy and/or other responsibilities such as planning and coordination.

LEVEL 4: secondary school and upper secondary school technical qualifications.

The specialized technical training required can be obtained inside or outside the school system. The trainee acquires knowledge and perspectives corresponding to an advanced level, although a mastery of the scientific principles underlying the various subjects is not required. These qualifications enable the holder to assume the tasks and responsibilities involving a conceptual activity (planning and/or administration and/or management).

LEVEL 5: upper secondary or upper secondary technical + higher education qualifications.

These qualifications enable the holder to exercise an occupation, whether as an employee or in a self-employed capacity, and entail the mastery of the fundamental principles involved. The qualifications required to exercise an occupation may be identified with other levels.
