A study investigated adults' motivation for participating in Marshall University's off-campus credit education program in adult education. The 38 respondents (56 percent of those contacted) received their master's degrees during 1982-1992. Ninety-five percent of the respondents were white, and 5 percent were African-American. Seventy-four percent were female. More than 90 percent were employed full time as they took courses. A mailed questionnaire asked subjects to report how much each of six factors (from the Education Participation Scale) motivated them to complete their programs. The factors were social contact, social stimulation, professional advancement, community service, external expectations, and cognitive interest. Each factor could be rated either 1 for "no influence," 2 for "little influence," 3 for "moderate influence," or 4 for "much influence." The two factors rated highest as motivators were professional advancement and cognitive interest. Community service was rated next highest as a motivator. The other factors, in descending order of influence, were external expectations, social contact, and social stimulation. (11 references) (CML)
ANALYSIS OF THE MOTIVATIONAL ORIENTATIONS OF ADULT EDUCATION GRADUATES IN OFF-CAMPUS CREDIT PROGRAMS

ANALYSIS OF THE MOTIVATIONAL ORIENTATIONS OF ADULT EDUCATION

GRADUATES IN OFF-CAMPUS CREDIT PROGRAMS

ABSTRACT

The primary purpose of this study was to determine the motivation for participation in off-campus credit programs. Overall, the findings indicate that adult education graduates were more influenced to enroll due to Professional Advancement and Cognitive Interest reasons. A review of the literature and research did not reveal any studies dealing with the unique respondent group selected in this study. The data reported in this study should therefore serve as basis from which to compare similar respondents in future studies.
Introduction

A bold initiative was undertaken in the mid-sixties at Marshall University in West Virginia. A master of science degree program with a state-wide mission was conceptualized in a cooperative arrangement between the West Virginia Department of Education and Marshall University. Faculty were employed in 1969 to provide direction in the development and implementation of the new M.S. degree program in Vocational and Technical Education.

Selected specializations, certificate programs, and courses were added to supplement the original M.S. degree program. An M.S. degree in Adult Education was subsequently developed in 1973.

The off-campus credit programs were developed to serve adult education students who are unable to come to the Marshall University campus. The success and continuation of these programs is dependent upon student participation. Hone (1984) found that the common denominator for success of rural post-secondary education programs is to directly address the needs and expectations of the program participants. To promote program development, Christmas (1990) points out a need for identification of factors that motivate adults to participate in agricultural education programs.

Miller and Crawford (1990) indicated that the factor "Cognitive Interest" was the greatest motivator for participants to enroll in off-campus courses. Data from Miller and Crawford's (1990) study also revealed that the factor "Professional Advancement" was rated significantly higher by the off-campus participants when compared with the normative group in their study.

According to Boshier and Collins (1983), a persistent theme in motivational orientation research concerns the structure of "motives" for participation based on variables in the life cycle (age, sex, etc.) and socio-economic domains. Researchers have also shown a marked interest in participation and enrolling in credit classes (Johnston and Rivera, 1965; London, Wenkert, and Hagstron, 1963).
Purpose and Objectives

The purpose of this study was to determine the motivation for participation in off-campus credit programs. The specific objectives of this study were to:

a. Describe demographic characteristics regarding adult education graduates.

b. Identify the motivational orientations of adult education graduates and the level of influence to enroll in off-campus credit courses.

c. Determine the level of influence selected variables had on the motivational orientations of adult education graduates to enroll in off-campus credit courses.

Significance of the Study

A study of this nature is of primary importance to the success of programs involving non-traditional university enrollees. Knowing what motivates people to enroll and participate is central to the programs, not only in terms of obtaining initial enrollees, but also in terms of how to retain and better serve the population.

Limitations of the Study

Because of the scant research data available on motivational factors associated with enrollment in such programs, this study sought to develop important baseline data. Thus the entire population of adult education graduates were surveyed. Consequently, the data does not lend themselves to tests of statistical significance.

Research Procedures

This study utilized descriptive research methodology. Gay (1981, p. 12) summarized the purpose of descriptive research as research that "determines and reports the way things are." Applied research studies are best characterized as those which concentrate on educational methodology and structure as they appear
in practice (Borg and Gall, 1983). The ultimate goal of applied research is to be of direct utility to practicing educators.

**Population** The population for this study consisted of all (N=68) Adult Education master's degree recipients, for the years 1982-1991, who participated in off-campus degree programs in adult education at Marshall University. The annual *Marshall University Commencement Program* for the academic years from 1982-1991 were used to identify the population and served as the database for the study. Names and last known addresses of graduates were obtained from the Office of the Dean of Graduate Studies, Records & Research, and the Department Chair for Adult Education.

**Instrumentation** An information sheet was developed by the researchers to collect demographic and situational data. In order to insure content validity, the information sheet was reviewed by a panel of judges selected from higher education institutions. The Education Participation Scale (EPS) (Boshier, 1982) was used to determine the motivational orientation of the participants. The (EPS) is a 40 item scale scored on a four point Likert-type basis (No Influence=1; Little Influence=2; Moderate Influence=3; Much Influence=4). The items are divided into six factors with factor reliability estimates ranging from alpha of 0.80 to alpha of 0.88. The six factors are:

a. **Social Contact**: Reflects a desire to develop or improve one's relationship with other people.

b. **Social Stimulation**: Reflects a need to find intellectual stimulation as an escape from routine or frustration situations.

c. **Professional Advancement**: Reflects a need to improve occupational status or performance.

d. **Community Service**: Reflects a selfless concern for other people. Many times reflected by a desire to participate in community affairs.
e. External Expectations: Reflects the presence of pressure to participate in educational activities from another person or circumstances.

f. Cognitive Interest: Reflects the view of learning as a way of life and the belief in the concept of learning for the sake of learning.

Appropriateness and permission of the use of this instrument for this study was discussed with the author.

Data Collection Data were collected between February 12, 1992 and April 30, 1992. All 68 graduates identified were sent a cover letter, an information sheet and an EPS instrument. After the initial mailing and two follow-up mailings, a total of 38 responses (56%) had been received. All returns received one week or later after the first follow-up mailing were classified as late respondents. A non-response bias procedure, the early/late response approach as described by (Miller and Smith, 1983), was used to determine non-response bias in their response to each question. No significant differences were found.

Analysis of Data Data were analyzed using Lotus 1-2-3 and Harvard Graphics (version 2.3). Percentages, comparison of means and standard deviations were used to describe the data.

Findings

Demographic Characteristics of Participants Findings reported in this subsection were generated from the Information Sheet of the instrument packet.

Over 30% of the participants came from communities of over 25,000 (Figure 1).

Insert Figure 1 about here
A total of 28 or 74% of the participants were female and 10 or 26% were male. The highest percentage of participants (26%) completed their M.S. degree within the age category of 35-39 years as illustrated in Figure 2.

The ethnic makeup consisted of 95% (36) whites and 5% (2) blacks.

Over 90% of the participants were employed full-time while taking off-campus classes.

**Participation Motivation**

This subsection includes findings derived from the EPS. The second objective of this study was to identify the motivational orientations of adult education graduates and the level of influence to enroll in off-campus credit courses.

The EPS contains forty questions cast with a four-point response scale. These questions were then factored in a large scale empirical test (Boshier and Collins, 1983). Six factors were identified. They are: (a) Social Contact, (b) Social Stimulation, (c) Professional Advancement, (d) Community Service, (e) External Expectations, and (f) Cognitive Interest. Scoring of the instrument was followed using the guidelines provided by the author of the EPS.

Table 1 provides the mean factor ratings and standard deviations of the off-campus program participants. "Professional Advancement" was given the highest rating by participants with a mean score of 2.99 (standard deviation=0.48). "Cognitive Interest" was of next greatest importance with a mean score of 2.57 (standard deviation=0.79). The other factor which was rated as having "little influence" was "Community Service" with a mean score of 2.08 (standard deviation=0.67). "Social Contact", "Social Stimulation", and "External Expectations" had mean ratings of 1.60, 1.54 and 1.76, respectively. These factors were rated "No Influence".
Influence of Selected Variables on Participation Motivation

This subsection also includes findings derived from the EPS. The third objective of this study was to determine the level of influence that selected variables had on the motivational orientations of adult education graduates to enroll in off-campus credit courses.

Table 2 shows mean comparisons of factors by gender. The mean ratings of factors for female participants were higher for "Professional Advancement" (3.04) and "Cognitive Interest" (2.63) than their male counterparts. However, male participants had a higher mean rating (2.27) for "Community Service". "Social Contact", "Social Stimulation", and "External Expectations" were rated as "No Influence" by male and female participants.

Table 3 reflects the means comparisons of factors in relationship to the age at which participants completed their M.S. degree.

"Professional Advancement" was given the highest rating with a mean score of 3.18 (standard deviation = 0.33). This rating came from respondents who completed their degree at 25-29 years old. Respondents who completed their degree at 40-44 years, had mean ratings of 3.10, 2.00, 2.10, and 2.89 respectively for the following factors: "Professional Advancement", "Community Service", External Expectations", and "Cognitive Interest". "Social Contact" and "Social Stimulation" were rated as "No Influence" by respondents.
Discussion and Conclusions

Off-campus courses were available to graduates who resided in most counties in the state of West Virginia while pursuing their M.S. degree in adult education. This is an indication that Marshall University offered courses throughout the state in an effort to meet its state-wide mission. Participants in the program were quite homogeneous in that most were women from a community of over 25,000 individuals. The highest percentage of participants completed their M.S. degree within the age category of 35-39 years. Over 90% of the participants in the study were employed while taking off-campus courses. The ethnic makeup of respondents consisted of over 95% whites.

The 38 participants were more influenced to be enrolled for Professional Advancement and Cognitive Interest reasons. According to Miller and Crawford (1990), courses must be of direct utility in providing for improved job performance. This is concordant with Polson (1989) in that "ADULTS WANT education to be relevant--dislike wasting time". Participants were not influenced to enroll for "Social Contact" and "Social Stimulation" reasons. Women were more influenced than men to be enrolled for Professional Advancement and Cognitive Interest reasons. It is the opinion of the researchers that this could be attributed to futurists' predictions about the changing make-up of the labor force, which indicate, that more women will be working full-time in a wider range of occupations. This finding may also reflect the gender equity issue which is taken seriously by education leaders in West Virginia.
Respondents who completed their degree between 30-44 years old indicated that the "Community Service" factor had "Little Influence" for them to enroll in off-campus credit courses. It is likely to assume that respondents between 30-44 years old had some selfless concerns for other people. Many times this is reflected by a desire to participate in community affairs. "External Expectations" had "Little Influence" on respondents who had completed their degree between 40-49 years old. One can therefore assume that some of these participants were encouraged or pressured to participate in educational activities from another person or circumstances.

Recommendations

Based on findings and conclusions of this study, the following recommendations are suggested:

a. Nonwhite graduates were underrepresented in this study. It is therefore recommended that strategies be implemented to encourage nonwhite enrollment and participation in off-campus credit programs.

b. Social Contact between participants, and between participants and professors should be encouraged. Courses should be developed which allow for a high degree of interaction/intellectual stimulation.

c. Program planners should be aware of the importance of professional development as it impacts upon motivation for participation.

d. This study should be used by faculty and administrators as they examine the effectiveness of off-campus credit programs within the department.

e. The results of similar studies in other states could be useful as a program evaluation tool for guiding, modifying and changing adult education programs where necessary.

f. The data reported in this study should serve as a basis from which to compare similar respondents in future studies.
