The United States confronts the problem of a large and growing prison population, the majority of which is insufficiently literate. Added to the general effects of educational disability are the marginalizing factors of ethnicity, class, socioeconomic deprivation, and other handicaps. Historically, the situation in prison literacy is 150 years of reform attempts with uneven results, spotty application, and meager support. Despite increasing legal and social opinion in favor of inmates' greater rights to literacy and education, practice still lags far behind statute. Studies by U.S. and Canadian researchers reveal that the "right kind" of education in prison can reduce recidivism. The "right kind" of education is not premised on a penal mentality, but seeks to include moral education, democratic self-rule in the "just community," and instruction in the humanities, with a strong cognitive appeal, delivered by means of andragogical methods. An ideal program in prison literacy is one that educates inmates broadly, is governed for the sake of the learners, is cost effective, improves quality of life, and makes appropriate use of educational technology. Prison educators should critique current assessment and evaluation methods, undertake new and improved approaches, and establish improved standards. (Appendixes include a checklist of questions to analyze programmatic prison education, 84 endnotes, and 830 references.) (YLB)
PRISON LITERACY:
IMPLICATIONS FOR PROGRAM
AND ASSESSMENT POLICY

TECHNICAL REPORT TR93-1
SEPTEMBER 1993

CO-PUBLISHED WITH

This work was supported by funding from the National Center on Adult Literacy at the University of Pennsylvania, which is part of the Educational Research and Development Center Program (grant No. R117Q00003) as administered by the Office of Educational Research and Improvement, U.S. Department of Education, in cooperation with the Departments of Health and Human Services and Labor. The findings and opinions expressed here do not necessarily reflect the position or policies of the Office of Educational Research and Improvement or the U.S. Department of Education.
The National Center on Adult Literacy (NCAL) was established in 1990 by the U.S. Department of Education, with co-funding from the Departments of Labor and Health and Human Services. The mission of NCAL addresses three primary challenges: (1) to enhance the knowledge base about adult literacy, (2) to improve the quality of research and development in the field and (3) to ensure a strong, two-way relationship between research and practice. Through applied research and development and dissemination of the results to researchers, policymakers and practitioners, NCAL seeks to improve the quality of adult literacy programs and services on a nationwide basis. NCAL serves as a major operating unit of the Literacy Research Center at the University of Pennsylvania.

ERIC Clearinghouse on Reading and Communication Skills
2805 East 10th Street, Suite 150
Bloomington, Indiana 47408-2698

ERIC (an acronym for Educational Resources Information Center) is a national network of 16 clearinghouses, each of which is responsible for building the ERIC database by identifying and abstracting various educational resources, including research reports, curriculum guides, conference papers, journal articles, and government reports. The Clearinghouse on Reading and Communication Skills (ERIC/RCS) collects educational information specifically related to reading, English, journalism, speech, and theater at all levels. ERIC/RCS also covers interdisciplinary areas, such as media studies, reading and writing technology, mass communication, language arts, critical thinking, literature, and many aspects of literacy.

This publication was prepared with funding from the Office of Educational Research and Improvement, U.S. Department of Education, under contract no. RI88062001. Contractors undertaking such projects under government sponsorship are encouraged to express freely their judgment in professional and technical matters. Points of view or opinions, however, do not necessarily represent the official view or opinions of the Office of Educational Research and Improvement.
ACKNOWLEDGMENTS

One of the hidden benefits of the research needed for a document as demanding as this one is that you meet wonderful people all over the country who are doing their jobs competently, who provide information willingly, and who are appreciative of interest in a topic that generally inspires fear, disgust, or agony.

We found the people immensely helpful at the National Institute of Justice, U.S. Department of Justice, National Criminal Justice Reference Service, Office of Justice Programs, Rockville, Maryland. Kathy Meyers and colleagues met our every request with dispatch and cordiality. Gerald Wong, Education Specialist in the Education Division of Justice, was equally helpful.

Other people interested in education in prisons and jails from California to Virginia, from Boulder, Colorado, to Amherst, Massachusetts, were both willing and eager to contribute to what they perceived as a needed volume. We extend our heartfelt appreciation to all of the reviewers of the first versions of the manuscript, which were more than 500 pages long.

Anita Aldrich, Professor Emeritus, Indiana University; Norman Brier, Robert F. Kennedy Center, New York; Emily Herrick, Director, Literacy Services, Contact Center, Lincoln, Nebraska; Ronald Eagleye Johnny, Program Attorney, Academic Department, National Judicial College, University of Nevada, Reno, Nevada; Sylvia McCollum, Education Administrator, U.S. Department of Justice, Federal Bureau of Prisons, Washington, DC; V. Robert Payant, Dean, National Judicial College, University of Nevada, Reno, Nevada; Samuel F. Saxton, Director, The Prince Georges County Government, Department of Corrections, Upper Marlboro, Maryland; Robert Waxler, English Department, University of Massachusetts, Dartmouth, Massachusetts; and Gail Zittell, Principal, Adult Education, Elk Grove Unified School District, Elk Grove, California.

We early discovered that the research literature on prison literacy is far more abundant and available than anyone connected with this project had suspected. We thank those who persevered with us through the daunting tasks of examining more than 3,000 separate published and unpublished documents.
We extend appreciative acknowledgments also to Dan Wagner and Dick Venezky of the National Center on Adult Literacy who, patient with our early drafts, encouraged production of the slimmed-down version we now present. We thank Sheila Witherington, also of NCAL, for her editing skills in helping us to polish the finished product.

On a personal note, a word must be said about how the book was actually written. In addition to ordinary use of the library and the standard electronic information retrieval systems, including especially the database of the Educational Resources Information Center (ERIC), we made extensive use of the data bank of the National Institute of Justice (NCJRS). The NCJRS collection is more useful than any other single resource, especially for locating otherwise elusive documents.

This report has been prepared by a team of authors more expert in literacy matters than in corrections. Caroline Beverstock and I, assisted by our editor, Warren Lewis, published “Adult Literacy: Contexts and Challenges” (ERIC/RCS and IRA, 1990), and “Adult Literacies: Intersections with Elementary and Secondary Education” (Phi Delta Kappa and ERIC/RCS, 1991).

Caroline Beverstock is a learning skills expert and literacy scholar, the chair of the Adult Literacy Special Interest Group of the International Reading Association (IRA), and a member of IRA’s Commission on Family and Intergenerational Literacy. She has designed and taught in programs for out-of-school youths and automotive and electronics technicians; acted as consultant with library-based literacy programs and the Private Industry Council of San Francisco; taught study skills at the Student Academic Center at Indiana University (Bloomington), where she is also associate coordinator of the I.U. Literacy Forum. She has taught study skills and humanities at the Lady Elizabeth Campus, Martin University’s college inside Indiana Women’s Prison (Indianapolis). Beverstock provided insight and background experience, especially on the topics of assessment and evaluation.

Warren Lewis is Director of Publications at the Educational Resources Information Center, the Clearinghouse for Reading and Communication Skills (ERIC/RCS) at Indiana University (Bloomington). He also chairs the Division of Humanities at Martin University (Indianapolis), including its Lady Elizabeth campus inside Indiana Women’s Prison. He made effective use of both of those resources to gain insight into our subject. In spite of time constraints and the meager funds available for the
project, his major effort at working through and organizing the information got us started.

My major role, besides organizing the troops, has been to certify the implications of prison education as it is reported here in terms of my involvement in, and study of, the field of adult literacy. I am the two-term chair of the National Coalition for Literacy, co-designer of CONSULT-1® (an expert system that uses artificial intelligence with statistical pattern recognition to make reading strategy recommendations based on actual learner characteristics), Director of the Reading Practicum Center, and Professor of Language Education at Indiana University (Bloomington).

We thank each of the dedicated Indiana University students who have assisted in various ways with the project: Bernadette Lehman and her daughter, Katie, who pitched in when we were drowning in references; Debbie Saxon whose scholarly analysis helped us launch and sustain the project; James Chipless who assisted in the immense job of categorizing the material; Robert Leming who provided first-hand knowledge of jail codes and conditions; Kurt Messick, a wizard at the computer keyboard as well as a master of the fine art of bibliography; and Judee Reel who mastered uncooperative software to generate the original bibliography.

Like mountain climbers, we have scaled this mountain of human tragedy and despair because it is there. We hope that these results suggest to others ways of scaling back, bit by bit, the waste of human potential which now costs Americans millions of dollars more than we would have to pay to give inmates an habilitative education. “Habilitate” is used in this report in the archaic sense to refer to the process of giving or gaining more ability, to make more capable, or to qualify. This term is used—as opposed to “rehabilitate”—because the position of this study is based on the premise that prison inmates have not had the ability, capability, or qualifications needed in the first place. In other words, the use of the term “rehabilitate” infers a reclaiming of something that was lost, and such a definition does not apply in this study.

PRISON LITERACY: IMPLICATIONS FOR PROGRAM AND ASSESSMENT POLICY

ANABEL P. NEWMAN

INDIANA UNIVERSITY

Preface

America — wealthy, educated, and democratic — truly has a problem of too much illiteracy among its people and an even greater problem with illiteracy among its people in prisons and jails. Whereas the "literacy movement" is an indication that America is resolute and willing to deal with illiteracy in general, America is by and large ignoring the latter problem, which — despite valiant efforts by a few — is worsening. America's more than 1,000,000 people behind bars (more than any other nation and three times as many as the nations of the European Community, most of them illiterate drop-outs from our schools and rejects of our society, are a national cancer eating quietly away at our economic substance and our will to pledge to one another the rights of "life, liberty, and the pursuit of happiness" (Jones, 1988). Prison illiteracy is America's secret shame. It is the problem that most educators do not know about, most politicians do not acknowledge, most corrections professionals are unprepared to deal with, and most tax-payers resent having to pay for.
ABSTRACT

America, already with far more of its people behind bars than in any other other country and the prison population rising steadily, confronts a double problem: the majority of prison inmates are (by almost any definition) also insufficiently literate. A strong correlation exists between ordinary criminal behavior and educational insufficiency, so that the numbers of adjudicated persons who are inadequately literate will tend to be higher than in the rest of the population. Add to the general effects of educational disability the marginalizing factors of ethnicity, class, socio-economic deprivation, and other handicaps, and one has the formula for America's epidemic case of prison illiteracy.

Historically, the situation in prison literacy is a 150-year-old narrative of reforming energies with uneven results, spotty application, and meager support. Even so, the effort to deliver literacy to inmates of America's federal and state prisons, reformatories, and city and county jails has generated a roster of noble names—William Rogers, Jared Curtis, Galord Hubbells, Zebulon Brockway, E. C. Wines, Gideon Haynes, Homer Lane, Thomas Mott Osborne, Fred Nelles, and Austin MacCormick (among others)—leading to today's growing guild of corrections experts, teachers, librarians, researchers, literacy volunteers, and other advocates of greater literacy for inmates for many very good reasons.

The present scene is acted out before the backdrop of the social reforms during the Johnson Administration of the mid-1960s, the significant turning point for prison education in the second half of the 20th century. Despite even the ripening of legal and social opinion in favor of inmates' greater rights to literacy and education since the Great Society, practice still lags far behind statute. The federal system and a few state systems are best-organized to deliver educational services to inmates, followed by most state systems, and the local jails bring up the rear.

Because illiteracy and criminality are umbilically joined, it stands to reason that greater literacy would have a dampening effect on criminality. The result of research, on balance, seems to be that this, in fact, is the case: greater literacy is a way out of criminality, and improving literacy is a way of reducing criminal recidivism among the adjudicated. Despite a widespread perception that "nothing works," careful studies, and the review of studies by American and Canadian researchers, reveal that the
“right kind” of education in prison can statistically, though not predictably in individual cases, reduce recidivism and increase inmates' chances for staying on the outside and living a more satisfying, profitable life after they have been released.

By the “right kind” of education, one does not mean education in prison premised on the penal mentality of those far too numerous in the correctional establishment who think that punishment of the law-breaker is the purpose of prison, and that security is the most important feature of a prison. Rather, one means growth in literacies that include moral education, democratic self-rule in the “just community,” instruction in the humanities, with a strong appeal to the cognitive, delivered by means of andragogical instruction, in company with training in a variety of skills to enable the inmate to cope with the personal, sexual, familial, chemical, economic, vocational, and social problems of life, thereby to gain a realistic sense of one's individual worth as a human being.

Prison education programs in their hundreds exist; various methods have been tried, some of which were successful; researchers have tallied statistics and made reports; and periodic reviews of most aspects of prison education have been registered—enough so that one can begin to draw conclusions that some ways are better than others. One can predict, for example, that vocational education that is about meaningful, satisfying, and marketable labor, when it is accompanied by other kinds of learning as well, will prove beneficial; otherwise, it will not. One can also predict that privatized education—education run by educators rather than be correctionists—will have better effects. And one can predict that the educational program in prisons where the human factor of antagonism among corrections professionals, educators, and inmates has been alleviated, will do better.

One can, therefore, set down certain implications for a model literacy program in prisons and jails. An ideal program in prison literacy is, and ought to be, one that educates inmates broadly, is governed for the sake of the learners, that makes prison life more livable for all concerned, that is cost-effective, that improves the quality of life in the prison, that has a new-reader's library, that makes appropriate use of educational technology, and that, therefore, typifies the essential rightness in a civilized society of allowing even criminals to take advantage of the curative and regenerative process of education.
The results of study, and the review of studies, of prison education thus allows this increasingly professionalized discipline to engage in meta-critical reflection upon its own methods of self-analysis, to recognize the limits of previous research, to criticize the several means of assessment and evaluation now being employed, to undertake new and better approaches to assessment, and to erect for itself improved standards of assessment and evaluation. A final section on assessment in this study on assessment leads to a detailed checklist of questions, the most detailed protocol yet devised as a means to analysis of programmatic prison education.

The "Checklist of Questions" at the end is for policymakers and researchers as well as for literacy providers, for it is an applied and pragmatic summary of most of the critical implications raised in this report.
A READER'S GUIDE

In an effort to make this information as accessible as possible to our intended audiences—policymakers and legislators, corrections administrators, and educators in prisons and jails—we have distilled the implications of research findings into questions (See Appendix A) to consider when studying the following:

- the effectiveness of a given prison-literacy program
- the best policy to implement
- the most helpful laws to pass
- the best ways to set up and manage an effective literacy program inside
- the best ways to teach people in prison

No one institution is likely to answer "yes" to all the questions, or to be able to tackle all questions at once. However, our hope is that these distillations will help focus future directions in our correctional facilities so that they may be correctional and responsive to some of the most effective efforts in our country today. The questions are arranged topically so that readers may consider a single area at a time (technology, for example).

Perhaps a useful approach would be for prison or jail administrative and educational personnel, ideally including representative inmates, to discuss a priority ranking of the questions for consideration. In this way, broad goals might be set, with focus on a number of specific goals to be achieved in the short term and reserving others for the longer term.

Subsequent chapters provide the contexts from which the questions were derived. Although the book is essentially focused on programs and program assessment in prisons and jails, the early chapters provide background to the last two chapters which are specifically about programs and their assessment.

We hope that veterans in correctional work will find these pages as useful as newcomers and others who may be searching for information and answers. There is plenty of work for all of us.

NATIONAL CENTER ON ADULT LITERACY
A. STATEMENT OF THE PROBLEM:
PUTTING AMERICA’S ILLITERATES BEHIND BARS

This report examines the professional and research literature concerning the state of literacy instruction of adult inmates in correctional institutions in America to address the question: what are the most effective ways to deliver literacy instruction in prisons and in jails?

The literature is abundant, the history long, the issues complex, the efforts and results mixed, and the human need great. In order to answer the literacy question, a variety of themes have been explored:

- literacy, (re)habilitation, and recidivism
- social, economic, gender, and ethnic implications of the widespread illiteracy among educationally disadvantaged inmates
- the history and practice of theoretical paradigms and styles of correctional education
- the varying effects of education, or of its lack, upon the adjudicated

Much prison-related research has been conducted by Canadians, and Canadian Thomas Townsend opens the conversation regarding the establishment of education in prisons and jails as a separate and specialized field. This report is an attempt to contribute to the discovery-for-advantage to which Townsend refers. Existing research, though neither exhaustive nor perfect, can inform practice to the advantage of the habilitation of the inmates and for everyone else concerned—prison officials, educators, and tax-payers.

Correctional educators have made enormous strides by addressing the staggering problem of prison illiteracy. Beyond literacy, though, correctional education has the potential to yield positive changes in offenders’ lives. We must now move on to discover, and take advantage of, this potential through informed research and practice.

To consider prison education as only palliative is to ignore its rich potential to contribute substantively to the
correctional agenda. To be rehabilitative, correctional education must be responsive to the particular learning needs of offenders, have content that focuses specifically on changing pro-criminal values, beliefs, and attitudes, and integrate its activities with other correctional treatment initiatives.

The majority of offenders enter our correctional establishments with poor academic skills. Too little attention is given to why this is the case. In recent years, assessments of offenders have pointed to a high incidence of learning difficulties. Offenders also seem to differ markedly from non-offending populations in preferred learning styles; they favor an intense, hands-on approach rather than the more passive, visual methods practiced in our schools. These facts argue for a different teaching approach in a correctional setting than that offered in the community at large.

The curriculum of most correctional education programs emphasizes basic skills to address illiteracy. Although mastery of these skills can serve as strong motivation for the individual learner, the correlation between illiteracy and criminality cannot be considered causal. Research showing improved reintegration of offenders who have completed an Adult Basic Education program is encouraging. The challenge for researchers is to identify which aspects of the program constitute the contributing influence. However, research is unlikely to point to any existing basic curriculum as a positive influence....The development of a specific curriculum that blends basic academic skills with material that stimulates social learning must remain a critical priority.

Education in most correctional jurisdictions is a "stand alone" activity, with little interaction with other areas of corrections. This isolation is reinforced in correctional systems that contract with local school districts or private schools. Even in settings where teachers are employees, corrections-specific training is generally not provided. Because of the lack of specialized services, prison teachers are usually forced to seek professional development in the outside teaching community and are disadvantaged in dealing with prison-specific problems.

More recently, greater emphasis has been placed on co-ordinating the efforts of academic upgrading,
vocational training, and prison industries. These efforts should be encouraged. Moreover, the educational program needs to be more closely integrated with programs on social skills, substance abuse, anger management, and family violence. (Townsend, 1991, p. 2).
B. WHAT THE STATISTICS DO AND DO NOT TELL US

According to the most recent reports, the following details give some indication of the overall picture: the most up-to-date summary report in print that we were able to find confirmed the general impression that one gains from surveying previous reports, estimates, and local studies. Using a sixth-grade level as the standard for literacy, 50% of the adult inmates in U.S. prisons are illiterate. Using a 12th-grade level as the standard, 75% of inmates are illiterate, i.e., the illiteracy level of the prison population is approximately three times that of the general population (Ryan, 1990), and the numbers are even worse in some sections of the country where general educational levels are lower and class distinctions sharper (Martin, 1979a & b). Even though the home, the church, and the society—increasingly in ethnic, economic, and class breakdown—must all take their share of the blame (Davidson, 1989; cf. Thompson & Doddler, 1986; Wiley & Conciatore, 1989), among the incarcerated, the inadequacy of American public-school education and its GED-style equivalents becomes patent. Schools are scrambling to become more of the solution and less of the problem (Mauers, 1974; Phillips & Kelly, 1979).

Statistics published in 1976 are largely valid today:

- 75 to 90% of juvenile offenders have learning disabilities.
- Up to 50% of adult inmates are functionally illiterate.
- Up to 90% of adult inmates are school drop-outs (Herschler, 1976).

In 1979, the U. S. Bureau of Prisons estimated that approximately 50% of adult inmates in federal and state facilities could neither read nor write. At least 90% of all inmates had not completed high school, and the majority had less than an eighth-grade education. According to the Bureau's own 1972 policy, a sixth-grade reading level was required before inmates might be released, but the Bureau's policy was ahead of its practice. The demands of the Adult Education Act, under which most prison education programs were funded, that "functional literacy" at the ABE level should be attained by inmates, were not being met. Most inmates lacked literacy sufficient to understand a newspaper, read a
driver-instruction manual, grasp job instructions, balance a checkbook, or do tax returns (Pollack, 1979).

The U.S. Department of Justice, Bureau of Justice Statistics, reported prison populations as follows in 1986 (Bessette, 1989, p. 36):

- 95.6% were males, 4.4% were females (There are more females now than there were then.)
- 49.7% were Caucasian, 46.9% were African-American, 12.6% were Hispanic (There are more people of color now than there were then.)
- 85.4% were between the ages of 18 and 39
- 20.2% were veterans
- 60.2% had children (Because there are more women now, there are more inmates who have the care of dependent children.)
- 82.8% had been service workers, farm workers, crafts people, equipment operators, or laborers
- 57.5% had less than a 12th-grade education, with grade completion rates (as shown in Table 1).

The foregoing and subsequent statistics need to be understood in light of the three-tiered American structure of prisons. Federal prisons hold the least numbers, often provide more comfortable conditions, are harder to get into than other facilities for a narrower range of crimes, and are populated by white-collar criminals and others who are, for any number of reasons, the polar
opposites of their demographic counterparts in state institutions. Local jails fall democratically between the two extremes, and they represent a cross-section of the local population. Thus, education statistics tend to be the worst in state institutions, and the best in federal institutions, with few reliable statistics available on local jails. If one premises an opinion about prison literacy solely on federal statistics, which are the most numerous, the picture will inevitably be rosier than is the general reality.

In 1988, the Bureau published comparative figures for state prisons in 1979 and local jails in 1983 (U.S. Department of Justice, 1988). The “technical appendix” to that report concluded with the still-valid statement that “the level of education reached by jail and prison inmates was far below the national average” (U.S. Department of Justice, 1988, p. 33).
C. WHO ARE THE INCARCERATED NEEDING LITERACY INSTRUCTION?

1. THE EDUCATIONALLY DISADVANTAGED

Incarcerated learners are primarily males, primarily from socio-economically deprived backgrounds, and about equal numbers of Caucasians and non-Caucasians. The numbers of African-American males have been growing, along with their crippling school failure rate (50% to 65% generally, and as high as 90% or 95% in some schools), as have the numbers of Hispanics, whose problem with English as a second language sets them apart with a special need. Considering the close association between illiteracy and some forms of criminal behavior, it may be concluded that many inmates, had they succeeded in school, might well not be in prison.

Attitudes toward the criminal population, most of which come from the underclasses, are further contaminated by racism and genderism.

Acknowledgment of the special needs of special groups among the incarcerated and recognition of inmates as individuals with individual needs have been slow in coming, but they are the essence of literacy instruction and education inside prisons. The educationally disadvantaged, the severely learning-disabled, and the emotionally disturbed have been often lumped together in perception and programs. Throughout the 19th century and well into the 20th, prejudicial attitudes have been expressed towards educating inmates. For example, what little education was available to females in prison was aimed at their becoming wives or domestics; African-American inmates were usually denied education or else were trained as manual laborers; neither instruction in Spanish nor help with their English was available for Hispanics; and Caucasian males were trained as craftsmen or farmers. Only religious instruction was available to all (Pisciotta, 1983).

Concern for dealing with the literacy needs of juvenile offenders is obviously of tremendous concern. However, given the immense amount of literature to review and the space constraints of this manuscript, a conscious decision was made not to include juvenile corrections in the review. Nevertheless, we would most
certainly recommend that a thorough review of this body of work be undertaken. As with instruction in reading for children, adolescents, young adults, and adults, the earlier effective instruction can be given, the more likely society will be able to welcome the recipients as literate, contributing, fulfilled adult citizens.

2. AFRICAN-AMERICANS

With few, little-known exceptions [such as the work of Velma Dolphin Ashley (Revere, 1989), education of African-Americans inside prisons was the equivalent of most education for African-Americans outside, until the reforms of the civil rights movement began to take effect. The situation today is better in principle, but often not in practice (Black, 1984), as is pointed out in the title of one report: “Prison Education Programs Attempt to Pick Up Where Society Failed” (Wiley, 1989a & b).

In 1991, America achieved two punishing distinctions: it held the record for the world’s highest rate of incarceration (426 prisoners per 100,000 population), and the incarceration rate of African-American males (3,109 per 100,000) was four times that of South Africa (729 per 100,000) where Apartheid was legal.1 Studies indicate that the disequality of the races extends into the prisons after adjudication. While about 50% of inmates in 1990 were non-Caucasian, only 28.7% of the custodial staff and 25.3% of correctional personnel overall were non-Caucasian (Camp & Camp, 1990, pp. 49-50). Testing with culturally biased instruments may be another form of racism in correctional education (Besag & Greene, 1985).

Many of the studies that point to racial inequities also indicate that they need not continue (Georgia Prisons, 1976; Pass, 1988; Wright, 1989). Other studies make clear that educational programs with African-American inmates can be, and often are, both successful and cost-effective. Wiley, for example, suggests that it is cheaper to educate illiterate African-American inmates intercepted early enough in their criminal careers, and return them to society as law-abiding and tax-paying citizens, than it is to keep them as permanent residents at the public’s expense (Wiley, 1989).

Petersen’s detailed plan for African-American-oriented correctional education is now out-of-date, but it was essentially sound in theory (Petersen, 1975). Experimental programs of various kinds have demonstrated both the educability of African-American inmates and the promise for habilitation inherent in providing them educational opportunities (Martin, 1979a & b). If
habilitation is the purpose of incarceration, then education in prison is, for many African-Americans, the first opportunity to succeed at education and acquire a sense of achievement that can replace feelings of hostility and inadequacy (Black, 1984). Many studies have shown that under enriched conditions, African-American inmates' mental dispositions as well as their language abilities, both speaking and reading, improve measurably (Haber, 1983; Kanel & Ayllon, 1976; Lewis, 1985; McKee, Roy, Jenkins, Carmen, & Hart, 1970; Williams, 1978). When adjustment patterns of African-American male prison inmates were studied, researchers found that those who took part in college studies were more aggressive and more highly motivated than non-students who tended to be more insecure and had a lower self-image (Haber, 1983).

Although one study showed that the presence of African-American guards among African-American inmates did not necessarily improve a prison's atmosphere, the implication should not be drawn to suggest that African-American educators would not make a difference for African-American inmates (Jacobs & Kraft, 1983). Educators know, for many other reasons, that teachers with whom the students can identify have a positive edge in the classroom, just as a teacher towards whom students feel ethnic antipathy is liable to be an educational deficit (Karcz, 1985). Education in correctional institutions involves a highly specialized form of teaching dictated by the ethnic and age characteristics of the adult learners; therefore. special training needs to be given to prison educators to prepare them to teach in an environment that is more ethnically diverse than is the public-school classroom (Norde, 1980). African-Americans and other ethnic-minority communities, with the empowering help of the larger society, can sometimes be the best-qualified agents to solve their indigenous problems (Youth and the Justice System, 1984) and to keep the delinquents in their communities from becoming criminals (McKenna, 1974).

3. HISPANICS

The U.S. prison population of Hispanics overall has fluctuated at a rate between 9.6% and 12.2% over the past few years, quite above the approximate 8% rate of Hispanics within the total U.S. population. In those states with a significantly higher proportion of Hispanic inmates—New Mexico, 54%; New York, 32.3%; and Arizona, California, Colorado, Connecticut, Texas, and the federal system each with above 20% Hispanic inmates—the problems of the ESL learner become problems to be solved by prison
educators. In states where other ethnic groups, e.g., various Asian-Americans who are not native speakers of English are statistically significant in prisons—e.g., Hawaii, 44.4%, California, 4.8%; and Colorado, Nevada, Utah, and the federal system (all above 2%)—prison educators are required who can teach effectively in a multicultural environment, even though the smaller numbers pose less of a problem than does the growing number of Hispanics (Camp & Camp, 1990, p. 5; Dillingham, 1991, p. 66).

Following the lead of New Mexico and Texas, the federal system began to address the bilingual needs of its Hispanic residents in 1973 when a study revealed that about 18.5% of the total federal inmate population had Spanish surnames, but only 2.5% of the federal staff was bicultural or bilingual (McCollum, 1978). Thereafter, California and New York initiated programs in bilingual and bicultural education (Hamilton, 1985; Castro, 1977, 1981; Hispanic Inmate Needs, 1986).

The Texas D.O.C. guide for teaching illiterate and non-English-speaking inmates provides a recommendation for an individualized approach in the use of proficiency tests for identifying an inmate's needs (Brown, 1973). In both New York and New Jersey, as is also the case with African-Americans, the failure of public-school education to help Hispanics achieve full literacy has been cited as a contributive factor to their criminal behavior (Sainz & Biggins, 1979). In a Connecticut prison where the authorities and most of the inmates all spoke English, the radio programs were all in English, and the loud-speaker invariably gave commands in English, the Spanish-speaking Puerto Riqueños viewed themselves as symbolically imprisoned by the English language (Pinton, 1978). In view of the increasing numbers and diversity of incarcerated Hispanics from all over Latin America during the 1980s, we found research and reporting on the progress of bilingual education in prison to be especially meager.

4. NATIVE-AMERICANS

Whereas bilingual education of non-native-English speakers is merely inadequate, and the prison education of African-Americans is an agony, the educational situation of Native-American inmates is a human tragedy and quite consistent with the immigrant American's historic antipathy towards the encountered native. Whereas the Native-American population at well under two million is but 0.6-to-0.7% of our total population, Native-Americans were reported to be 3.8% of the total prison inmate population in 1990 (Camp & Camp, 1990, p. 5). Proportionally speaking, Native-
Americans find themselves as inmates at nearly six times the rate that they find themselves citizens.

By the 1970s, Native-American prison inmates—at the bottom of all statistical charts registering their social, health, and educational levels—were the most neglected group, despite the constant study by researchers of Native-American programs and services. All the factors that contributed to the collective dismay of the Native-American population outside of prison complicated and made worse the plight of Native-Americans in prison. Efforts by the Bureau of Indian Affairs and other federal agencies were unavailing. A program of cultural literacy, discussion groups, cultural exchanges with fellow inmates at San Quentin (in California) in the 1960s, led to a reduction of problems for the Indian inmates who became involved in the educational program, but violence at San Quentin in 1973 caused the program to be discontinued (Nordwall, 1974).

A lawsuit in Nebraska resulted in the late-1970s in the establishment of the Cheyenne River Swift Bird Project, a Native-American rehabilitation facility, and the elaboration of two kinds of correctional programs: correctional institutions exclusively for Indians (a “correctional reservation” approach) and “prison survival schools” for Indians incarcerated within larger, non-Native populations, with the goals of developing a sense of Native-American self-worth, basic skills, and cultural literacy in both the dominant American culture and the marginalized Native culture (French, 1981). Alaska, which at 30% has the highest percentage of Native-American prison inmates (Camp & Camp, 1990, p. 4), also mounts the most thorough attempt at prison education of Native-Americans, although some notable programs exist in other states as well. We found that studies and descriptions of literacy programs for Native-Americans are even more elusive than research on incarcerated Hispanics.

5. WOMEN

Women in prison—traditionally viewed as fallen women—have in history been treated in some ways worse than men. Housed in the same buildings as the men, women thereby oftentimes became sexual prey, or they were put in the attic or in the cellar. When they did not spend their time in enforced inactivity and silence, they fulfilled domestic duties, washing and sewing for themselves and for the men, doing what they would have done in the male-dominant society had they not been in prison (Callahan, 1987).
In 1990, women constituted 7% of the federal prison population; 3.1% of the state prison population in Maine, and 9.1% in Wyoming; and 5.6% for the overall average in America’s prisons, having increased at a more rapid rate than that of males since 1981 (Camp & Camp, 1990, pp. 4-5; Bessette, 1989). Because of their minority status in prisons and jails, however, and because of traditional gender chauvinism (that women don’t need vocational training or education), educational and other services for incarcerated women have been slow to develop. In many places, programs are still wholly inadequate. For example, even though lack of jobs skills is one of the most serious problems faced by female inmates, in 1978 women’s prisons offered an average of 2.7 vocational training programs compared to 10 in male institutions (Chapman, 1978). Over the past two decades, the situation has improved in large part due to women inmates' taking it upon themselves to engage in lawsuits in order to obtain equitable treatment (U.S. Comptroller General, 1980; Kittredge, 1991). In some states, the situation is positive and hopeful. Indiana Women’s Prison, for example, the prison with which we are most familiar, already has an extensive educational program, and the potential of becoming a secure school.

Ryan’s comprehensive study of 58 prisons and other correctional facilities in which women were incarcerated yielded the following profile:

- 62% of the women were under 30 years old; 55% were 20 to 29 years old
- 38% were African-American; 50% were Caucasian (whereas in 1975, 50% had been African-American, and 38% had been Caucasian).

Educationally, the following situation prevailed:

- 58% had less than high school
- 33% had high school or the equivalent
- 7% had some post-secondary education (whereas in 1975, 16% had some post-secondary education)
- 83% of the prisons had ABE programs (up from 60% in 1973), but only 11% of the women were enrolled
- 88% of the prisons had GED programs (up from 67% in 1973), but only 9% of the women were enrolled
- 83% of the prisons had vocational education, and 18% of the women were enrolled
72% of the prisons surveyed offered post-secondary courses (up from 53% in 1975), and the percentages of women taking these courses ranged from 1% to 15%

10% of the women worked in prison industries. (Ryan, 1983)

Other studies with similar results yield the following profile of women in prison:

- under 30
- undereducated
- with undeveloped work and other functional skills
- single parents
- as often a woman of color as white
- becoming collectively less and less literate. (Sorenson, 1981; Valenta & Decostanzo, 1982)

African-American and Hispanic women are often women with the poorest educations. The low-education factor accounts for the ethnicity areas of functional incompetency reflected in APL tests (Whitson, 1977b).

Studies conducted at various institutions where educational services for women have been improved showed, among other results, that when women inmates, especially African-Americans, take advantage of self-improvement courses, their educational involvement correlates with a reduction of the length of time in jail (Rankin & Haugerud, 1976; Chapman, 1978; Valente & Decostanzo, 1982; Foster, n/d). Unfortunately, as clear as is the connection between low levels of functional competency and the great need for education, functionally incompetent women are sometimes slow to take advantage of their educational opportunities in prison (Whitson, 1977b).

Female inmates are different educationally from males. Prison educators who have educated both genders gossip that teaching in a women's prison is easier than teaching in a men's prison: the women are more civilized. At the same time, some women inmates who want to think of themselves as equal to men in every way, claim to be as tough, and those women probably are: "They can't say we don't have fights in here; us females are worse than men. It's PMS every day."—Francine Prim, 27, African-American, forger (Kittredge, 1991). Nevertheless, whereas men typically are incarcerated for intentional crimes of violence—rape, murder, and armed robbery—women typically are imprisoned for negligent manslaughter, larceny, fraud, and drug offenses (Besette, 1989, p.
37), and women frequently commit their crimes with, or on behalf of, men (Champman, 1978). Many incarcerated women demonstrate a rather romantic, sentimental side, remembering childhood as the happiest time in their lives, placing a high priority on having a happy home life, coming from actively religious backgrounds, but all of this unsupported by education to such an extent that their nostalgia for desired goals is strongly inconsistent with their near-vacuum of ideas, plans, and actions that might enable them to achieve their objectives (Mebane, 1976). Women inmates’ reading preferences for romance novels, adventure stories, and humor, but also literature about prisons and prisoners, accords with their tendencies to be romantic, passive, dependent, religious, and unrealistic about life. Economically disadvantaged on account of their gender, women need instruction in life-coping skills; in the humanities that sustain the female tradition and experience; and in independence and social responsibility, self-sufficiency, self-reliance, self-worth, and self-preservation (Chapman, 1978; Ryan, 1979; Vicinus & Kinnard, 1980).

6. THE EDUCATIONALLY DISABLED

By “educationally disabled” we refer to the educational needs of that group of people ranging from mildly to severely restricted, whom different observers designate as low I.Q., deficient, retarded, functionally retarded, learning disabled, special, handicapped, confused, slow, and who have a wide variety of impairments such as hyperactivity, impulsivity, awkwardness, destructiveness, short attention span, and specific learning problems related to motor-perceptual difficulties (Post, 1981). The national statistics available on this broad grouping leave the educator dissatisfied. No precise numbers are available, but estimates ranging from 25% to 40% have been made of the number of mentally disadvantaged individuals scattered among ordinary inmates (Fox, 1987, p. 8; Bell, R., et al., 1979, p. 1; Dennison, 1979; Illinois State Advisory Council, 1983; Gold, 1983). According to an estimate predicated on statistics about the federal prison system, 13% of the inmates are of below-average intelligence, 37% are above average, and 50% are average (Changing Times, 1976). These numbers for the elite federal system do not tell the tale for the state institutions; probably as many as 50% of juvenile offenders are educationally disabled (Garfunkel, 1986). One of the most useful descriptions of the educationally disabled within the prison system is the official guide for correctional administrators (Coffey, et al, 1989).
A most insightful study of "learning deficiencies" among inmates was conducted by Lehigh University on a sample basis in nine prisons, three each in Louisiana, Pennsylvania, and Washington. (One deficit of this selective approach was that no prison population among these nine had a high percentage of Hispanic inmates.) Some of the results of the Lehigh study, briefly stated, are as follows:

- 55% were African-American (African-Americans seemed to suffer educational disability at over twice the rate of African-American representation within the general population)
- 50% had never been employed or had been unsteadily employed
- 84% of the 50% who had been employed had been laborers or semi-skilled workers
- Almost 70% (of those for whom information was available) came from unstable childhood home environments
- 50% of the people had experienced some type of severe childhood problem
- 19% reported drug abuse, or a combination of drug and alcohol abuse, as their childhood's problem
- 43% reported themselves to have been in trouble with the law when they were juveniles; official institutional records reported a more likely figure of 60%
- 68% were incarcerated because of violent crimes, and "the level of violence tends to increase as the inmate gets older and his or her contact with the criminal justice system continues" (Bell, Conard, Gazze, Greenwood, Lutz, & Suppa, 1983, p. 67)
- An 86 I.Q. was the average, or "almost one standard deviation below national norms on the WAIS-R. There are clear indications of ethnic and state differences which are consistent with national findings. Dramatic differences (14 points or one standard deviation) exist between the learning deficient and the non-learning deficient inmates in the sample...." (Bell, Conard, Gazze, Greenwood, Lutz, & Suppa, 1983, p. 68)
- 21% of those scoring below an I.Q. of 75 scored on the Adaptive Behavior Checklist (a redesigned version of the AAMD Adaptive Behavior Scale) in a range to indicate problems with adaptive behavior

Further results of the Lehigh study in terms of educational variables were as follows:
• mean highest grade completed: 10th grade
• 6% had never gotten beyond elementary school (on 50% of the sample for whom information was available)
• 16% had been placed in “special education” programs in elementary school (33% of the “learning-deficient” inmates)
• 20% had been placed in “special education” programs in secondary school (39% of the “learning-deficient” inmates)
• 4% had been identified as “learning disabled”
• 14% had been identified as “socially and emotionally disturbed”
• 82% had been identified according to other categories, including “mentally retarded and/or brain damaged”
• 6.7% registered on the TABE (Test of Adult Basic Education) with more than three years below the average highest grade reported for the sample, with “clear indications of ethnic and state differences in the area of academic achievement.”
• 42% at or below the fifth-grade level on one or more TABE subtests
• 82% (of those who scored at or below the fifth-grade level according to the TABE)—a “startling and dramatic” finding—had disability problems (according to the Mann-Suiter Learning Disabilities Screening Tests): most commonly, visual memory, visual closure, auditory closure, auditory discrimination

The results of this study caused the researchers to conclude that there is a disproportional representation of African-Americans among educationally disabled inmates, and that “the interactive effect of socio-economic background, unstable childhood home, and the incidence of specific learning disabilities...may be the single most important determiner of anti-social behavior which results in eventual contact with the criminal justice system” (Bell, Conard, Gazze, Greenwood, Lutz, & Suppa, 1983, p. 70-74; Bell, Conard, & Suppa, 1984).

Speculating on the basis of our own limited experience, and informed by some passive figures in a statistical chart, we find ourselves knocking on a closed door (Camp & Camp, 1990, p. 40). The least able and most defenseless are crowded together with the predatory and vicious. Prisonization and criminalization result (McMahon, 1986; Keilitz & Dunivant, 1986; Grande & Koorland, 1988). Most states report the numbers of inmates enrolled in mental health and sex-offender programs, although a few states did not report their statistics for 1990 in these categories. Some states with large inmate populations (over 10,000) have relatively high
numbers of inmates enrolled in these programs. Ohio, for example, with 30,541 inmates in all institutions, reported that 3,000 of these were in mental-health programs, and 250 were in sex-offender programs. Other states, however, (Alabama, Arizona, Connecticut, District of Columbia, Florida, Indiana, Maryland, Missouri, New Jersey, New York, North Dakota, Oklahoma, Pennsylvania, South Dakota, Tennessee, and Virginia) indicated tiny enrollments in such programs. For three examples, Oklahoma, with 11,608 inmates in all institutions, reported that only 74 individuals were enrolled in mental health programs, and 29 were in sex-offender programs. New York, with 51,227 people in prison, reported that only 845 and 310 of these were enrolled in these special programs, respectively. The District of Columbia, with 12,104 inmates, reported 276 in mental programs and nobody in a sex-offender program.

We do not suggest that educationally disabled people necessarily suffer from mental-health disorders, but in the murk of non-specificity that clouds reported statistics, one can be relatively certain that these numbers involve more than a little overlap. Many educationally disabled people are mentally unhealthy and behaviorally disordered, and many mentally unhealthy and behaviorally disordered people are educationally disabled (Kazar, 1987). We may certainly conclude the likelihood that public policy on the education of the disabled—as expressed in the 1973 Rehabilitation Act, the 1975 Education of All Handicapped Children Act (P.L. 94-142), and the 1984 Carl D. Perkins Vocational Education Act (P.L. 98-524)—is being selectively obeyed from state to state, as has been noted and criticized more than once.7

Arguments (and sometimes justification) for the widespread neglect of the educationally disabled in the prisons and for non-compliance with the laws designed to protect the educationally disabled are predictable: (1) it is unreasonable to expect the corrections system to provide the expensive, individualized, highly specialized education for this large population; (2) trained staff are in short supply; (3) there is a high turnover rate among the highly mobile inmate population, making it difficult to educate them, and there is little interagency cooperation; (4) the several states' laws vary affecting education of the disabled, and, similarly, standards vary from institution to institution; (5) the educationally disabled are difficult to identify and track; (6) educational efforts in prisons typically fail to be correlated with neighboring educational programs and standards; and (7) administrative requirements for this kind of education tend to be top-heavy (Price & Vitolo, 1985; Grande & Koorland, 1988). Because of the difficulties in identifying
the learning disabled, educators in the private sector are even more so advised to accept the challenge of caring (McMahon, 1986; Leone, 1987; Grande & Koorland, 1988).

The connection between educational disability and delinquency in youths is not a simple one. Learning-disabled youths do not engage in more delinquent activity than do non-learning-disabled juveniles, although learning-disabled youths are twice as likely to run amok of the juvenile justice system. Opposite to the tendency to mainstream the learning-disabled in the public-school setting, the learning-disabled in prisons need to be sentenced to alternative education programs where they will be protected and where their habilitation can take place through individualized education (Hawkins & Wall, 1980; Rector, 1981; Haberman & Quinn, 1986; Garrison, 1987).

Educationally disabled people need literacy education (and other forms of humane help) in proportion to their greater difficulties with basic reading and writing, but they benefit more, relatively speaking, than do others when they are properly educated, and otherwise kindly treated (Devlin, et al., 1984; Larson & Gerber, 1987; Everington & Luckasson, 1989). Application of Feuerstein’s Learning Potential Assessment Device in a study of inmates’ “cognitive modifiability” demonstrated that low-achievers’ past failures to learn, even when one is a convicted criminal, is no necessary indicator of inability to learn in the present (Waksman, Silverman, Weber, 1983; Platt, Wienke, & Tunick, 1982; Ayers, 1979; ECS, 1976; Thompson, 1979; Bell, R., et al., 1979, 1983). Thoughtful educators have discussed the needs and described the characteristics of educationally disabled inmates with special attention to preparing prison educators for this special task, have elaborated procedures by which the laws could be obeyed and the educational needs of the special inmate population be met, and have devised successful programs for the educationally disabled (Program Suggestions...in Michigan, 1982; Pasternack & Lyon, 1982; Mesinger, 1984b; Wolford, 1983a & b, 1987).

Educationally disabled inmates need not only special education but also a special invitation to take advantage of prison education. Inmates with low reading levels and average-to-above-average IQ scores are statistically less likely to enroll in basic education courses than are inmates with low reading levels and low IQ scores, but both classes of inmates need encouragement to enroll in habilitative programs (Shinbaum, 1977).
D. THE BACKGROUND OF PRISON LITERACY

1. A HISTORY OF REFORM AND REHABILITATION

The first recorded instance of education that took place inside an American prison offers a parable for the present. The Rev. William Rogers announced that he would conduct services at Walnut Street Prison in Philadelphia and that he would give instruction to the inmates. The anxious prison authorities, fearful of a breach in security, moved a cannon into the jail, mounted it beside the pulpit, aimed it directly at the prisoners, and stationed beside it a guard with a lighted torch ready to ignite the piece at the first indication of prison riot.10

The history of education in prisons and jails in America continues to be a snarl of problems that have not been resolved (Bell, Conrad, Laffey, Lutz, Miller, Simon, & Stake lon, 1979; Horvath, 1982). As Lucas states, “In general, prison education has been historically loose and fragmented and essentially married to the prevailing local prison administration” (Lucas, 1985, p. 1). Nevertheless, a strong current of reform in prison education has been steadily growing in America since the beginning of the 19th century.

In 1801, elementary education was offered at New York’s Newgate Prison for the “meritorious.” The earliest extant record of prison education in New York State enshrined a testament to Bible literacy in the Session Laws of 1822: “It shall be lawful...to furnish a Bible for each prisoner confined in a solitary cell” (Laws of New York, 1822, chapter CCLXXIII, Section III). This privilege was extended to all inmates in 1829: “It shall be the duty of the agents to furnish, at the expense of the State, a Bible to each convict confined in their respective prisons, who can read” (Laws of New York, Revised Statutes, Part IV, Chapter III, Title 2, Section 58). The chaplain was the only person with a book that many inmates ever saw. By 1825, the Boston Prison Discipline Society had established Sunday schools in the houses of correction, offering both sacred and secular instruction. Following an attempt in New York State, in 1826, to ascertain how many illiterates were incarcerated, the Rev. Jared Curtis founded the Prison Sabbath School, and in 1827, he became the first resident chaplain at an American prison, in Auburn, New York. Curtis divided his school of illiterate convicts,
all of them under 25 years of age, into small groups, and he enlisted volunteer theological students to instruct them (Kangisser, 1985). In 1829, new legislation in Kentucky required prison wardens to sanctify four hours every Sunday for instruction of the inmates in reading, writing, and ciphering (Wines & Dwight, 1867). During the progressive era of the 1830s, education of inmates began to be more widespread. Maryland established the first school system for all prisoners during this decade (Tappan, 1960, p. 690). By the mid-1800s, the Latter-Day Saints in Utah were operating a school in the territorial prison where classes were held every day, including Sundays (Timmins, 1989).

In 1846, the first prison library in New York State was established at Sing Sing (Laws of New York, 1846, Chapter 324, Section 7). In 1847, the library allowance was increased, as was its use; and both vocational and correctional education were also established in New York State, the first prison system to employ full-time, paid teachers of inmates (Wallack, et al., 1939).

[The prison agent shall select, as far as practicable, such persons in appointing keepers to each prison, where manufacturing is carried on by the state, as are qualified to instruct the convicts in the trades and manufactures thus prosecuted in such prison.

Two instructors shall be appointed by the board of inspectors for each of the prisons...; it shall be the duty of such instructors with, and under the supervision of, the chaplain to give instruction in the useful branches of an English education to such convicts as, in the judgment of the warden or the chaplain, may require the same and be benefited by it; such instruction shall be given for not less than one hour and a half daily, Sunday excepted, between the hours of six and nine in the evening (Laws of New York, 1847, Chapter 460, Title II, Article I, Section 34, Subdivision 15; Paragraph 61).

The strongest influence for reform of American prisons came from Australia by way of England and Ireland. In the early 1840s in a prison in Norfolk Island, off the coast of Australia, Alexander Maconochie established a mark system, which included such correctional novelties as indeterminate sentencing, progressive housing, classification, use of peer pressure to facilitate reformation, rehabilitative programs, inmates' direct contact with the warden instead of through intermediaries, and “softening elements” (music and gardens). Inmates could earn credits or marks towards early release through honest work, good conduct,
vocational education towards post-release productivity, and study. Maconochie staffed his adult schools with educated convicts, and he rewarded prisoners with achievement prizes for reading aloud in the segregation unit, hospitals, dormitories, and larger houses. He also founded a library in the prison (Barry, 1958; Barnes & Teeters, 1959; Conrad, 1965; Gehring & Muth, 1985).

Galord Hubbells, the warden at Sing Sing, visited reformed prisons in England and Ireland in 1863, and he brought the prison reform message home to America to be incorporated into a concept that would become known as the Elmira system, because it typified the approach established in 1876, by Zebulon Brockway, used at the Elmira Reformatory in New York. Prisons began to be redefined not as places of punishment for sins committed against society, but as places in which a reformation of morals and mind might take place through industrious occupation in physical work and vocational training and demonstration of correction through specific performance (Angle, 1982; Sutton, 1983).

In the wave of progressivism that followed the War between the States, other prison systems evolved. In 1867, E. C. Wines, a leader of the Prison Association of New York, supported Gideon Haynes, warden of the Massachusetts State Prison, in sponsoring educational lectures several times monthly. In 1868, the Massachusetts Assembly approved this new departure with an allocation of $1,000 for the purchase of schoolbooks to be used in teaching illiterate inmates in twice-weekly classes.

By 1871, Zebulon Brockway, who had determined to turn the Detroit House of Detention into a school, had two-thirds of his inmates attending classes not only in basic literacy instruction but also in “formal academic, vocational, and social education” (Angle, 1982). Brockway experimented in social education, constructed separate facilities for females (the House of Shelter), and “drew a well-trained faculty from public schools, colleges, and the professions” (Gehring & Muth, 1985, p. 145). Brockway continued these policies when Elmira was founded and where he remained the superintendent until 1900 (McKelvey, 1936; Gehring & Muth, 1985).

At Elmira, Brockway implemented most of the programs he had established at the Detroit House of Corrections, and many more. He obtained private resources for an excellent library; built a big school and a separate trade school; established extensive academic, vocational, social, and postsecondary programs; constructed a large lecture/concert hall and a huge gymnasium for physical education, complete with marble hot and cold baths and
facilities for physical therapy; brought in the best artists and speakers for weekly cultural programs; experimented continuously in special school programs for handicapped learners—including individualized physician-prescribed diets and calisthenics; hired only the most qualified and best-trained, full-time teachers; started the first inmate newspaper in the U.S.; provided some post-release placement services and several well-documented follow-up studies; and generally used the entire institutional programming effort to further educational aims. Brockway was a real professional as a prison educator (Gehring & Muth, 1985, p. 145-6).

Wines, Brockway, and their growing alliance of prison reformers formed the National Prison Association (later, American Correctional Association), and they held their first congress in 1870, under the presidency of Judge Rutherford B. Hayes, in Cincinnati. There, H. S. Tarbell enunciated the first principles of education in prisons:

To give to the inmates of our prisons higher thoughts, increased acquisitions, and desires for a better life, is the object of the prison school....The most important element in the whole arrangement is a suitable teacher....He must be a painstaking, consistent, steadfast man, of so much character and scholarship as to secure the respect and confidence of the prisoners. There must be no sham, no mere assumption about him; for all shrewd observers of men and motives, of all lynx-eyed detectors of hum-bug and affectation, the inmates of our prisons are the sharpest. (Tarbell, 1870, p. 1940; cited in Wallack, 1939, pp. 7-8)

The National Prison Association (NPA) set forth two ideals: each inmate's human individuality requires specialized attention, and each inmate's potential to become a good citizen ought to be fostered. The NPA announced prison education to be a part of its "Declaration of Principles":

Education is a vital force in the reformation of fallen men and women. Its tendency is to quicken the intellect, inspire self-respect, excite to higher aims, and afford a healthful substitute for low and vicious amusements. Education is, therefore, a matter of primary importance in prisons, and should be carried to the utmost extent consistent with the other purposes of such institutions. (Tarbell, 1870)
Two years later, Brockway attended the First International Penitentiary Congress, held in London, and he addressed the gathering:

*The educational effort in prisons, if made efficient for reformation, must be well and thoroughly organized. No slate-and-pencil arrangement, with the teacher at the cell-door occasionally, but a veritable school congregated, graded, and divided into classes....The higher branches of study should be introduced, and inducements offered to young, capable men to prepare themselves for particular spheres of activity, even the learned professions.*

(Brockway, 1872, p. 648f; cited in Wallack, 1939, p. 7)

After Elmira, the tide of prison-education reform ebbed and flowed as eras of progressivism were interspersed with eras of reaction. One experiment in correctional education in a Florida state prison lasted until 1878 and the end of Reconstruction (Roberts, 1989). By the 1880s, secondary school programs, largely via correspondence courses, were being offered in some prisons (Grattan, 1959). Following 1909, Homer Lane’s Boys’ Home (now “Boys Republic”) in Farmington Hills, Michigan, exemplified the ideal educational reformatory for juvenile offenders; it was a school of self-respect, self-reliance, and self-restraint through self-government, although in the years following Lane’s administration, the original educative approach was supplanted by a therapeutic paradigm (Clatworthy, 1982). In 1915, Thomas Mott Osborne—a disciple of Brockway, reformer of Sing Sing, and founder of the Mutual Welfare League (a self-rule organization to manage inmate society)—was indicted on trumped-up charges of “going soft” on prisoners Lucas, 1985; Muth & Gehring, 1986). Between 1912 and 1920, Fred Nelles, supervisor of the Whittier State School for Boys during the enlightened governorship of Hiram Johnson of California, changed the emphasis of the prison program from institutional maintenance to academic and, especially, vocational education. The prison to Nelles was a reformatory for “providing special education for unusually needy ‘students,’ not punishing legally processed criminals” (Schlossman, 1983, p. 28).

In 1927–28, Austin MacCormick, acting on behalf of the Committee on Education of the American Prison Association, surveyed 110 of the 114 state and federal prisons, their adult educational programs, and their libraries. MacCormick’s was the first such review of the state of the prisons to be undertaken in America. As well as state and federal prisons and male and female
reformatories, MacCormick also visited road gangs and prison farms. His published report, *The Education of Adult Prisoners*, became the first benchmark in professional correctional education and a manifesto for prison literacy. MacCormick concluded that there was "not a single complete and well-rounded educational program adequately financed and staffed" in any American prison at the beginning of the decade of the 1930s (MacCormick, 1931, pp. 11-12; Horvath, 1982).

Most significantly for prison literacy, MacCormick's and others' work led in 1946 to the founding of the Correctional Education Association (CEA). The CEA became, and remains, the professional association of prison educators and the publisher of its *Journal of Correctional Education*. By sustaining and enhancing the professional role of educators in prisons, the CEA, more than any other institution, has fostered the literacy of prison inmates (Muth & Gehring, 1986, p. 16; Osborne, 1916; Chamberlain, 1935; Evans, 1978).

As bad as the situation was in the early 1930s, MacCormick saw signs of improving conditions in prison education. He named several states in which education and libraries were being improved; he remarked that the Federal Bureau of Prisons had established a division responsible for education and libraries and that the Committee on Institutional Libraries of the American Library Association and the Committee on Education of the American Prison Association were taking the lead "vigorously to stimulate educational and library work" (MacCormick, 1931, pp. 12-13). The widely disseminated *Prison Library Handbook* (1932) was the first attempt to describe standard library practice applicable to correctional institutions.

Over the next generation, the initiatives grew, fostered by efforts like those of the Commission on Education in Correctional Institutions in the State of New York, which published its *Aims and Objectives of Education in Correctional Institutions* (Wallack, 1939; Ryan, 1977). In 1934, the Utah State Prison School was offering 22 classes under a very schoolish-sounding daily schedule (from 8:15 a.m. to 3:25 p.m.), taught by a faculty of seven. Students in the English classes had begun publication of the first-ever inmate-produced newspaper, *The Penwiper*, which continued to be published until it was interrupted by World War II (Timmins, 1989). During the time of FDR's "New Deal," the Works Progress Administration funded jobs for numerous unemployed teachers as instructors in state prisons.
By the 1960s, unevenness in prison education was the norm. Speaking favorably of some state and federal programs, but not of all, Paul Tappan summarized the situation of inmate literacy in 1960, as follows:

*Formal academic education is provided in some prisons at several levels. Illiteracy, defined as performance at less than the fourth-grade level, prevails among about 30% of those offenders admitted to prison. Remedying this condition is one of the basic and challenging tasks of correctional education. Prisoners are often pathetically pleased when they learn to read letters from home and to write them.* (Tappan, 1960, p. 690)

In the absence of adequate statistical studies, Tappan went on to estimate that another 30% of inmates had completed the seventh or eighth grades, and 10% were high-school graduates; less than 1% had graduated from college. Tappan noted the variations in prison attempts to provide supplementary training through classes and cell-study correspondence courses.

By the time of the Johnson administration's Great Society in the mid-1960s, American opinion was ripe for a massive infusion of federal energy in the expansion of prison education. A number of modern and liberal and rather optimistic ideas had come into their own: behaviorism as a theory of personality modification; vocational education and programmed instruction, and other experimental approaches to social remediation; sociology as a scientific way to explain human motivations; and therapeutic psychology and counseling as a scientific way of healing motivations gone wrong.

A glance at statistics demonstrates the changes wrought in prison education in the aftermath of the Great Society. In 1966, in 27 of 55 prison systems nationwide, post-secondary studies were still being done mostly by correspondence, the preferred style of a former era; 17 systems offered extension courses, 3 offered televised instruction, and 3 had study-release programs; none offered the possibility of a baccalaureate degree. One year later, seven state prisons offered inmates an associate's degree from junior colleges. By 1971, post-secondary programs were available in 121 prisons; by 1975, federal prisoners had completed 9,000 college-level courses, including the completion of 158 associate, 19 baccalaureate, and two master's degrees. By 1980, the number of prisons offering college programs had risen to 300 (McCollum, 1975).
At the same time, prison teachers, formerly most often chaplains or volunteers, became professionalized (Pecht, 1983). Correctional education “emerge[d] as a unique subset of the educational profession,” as seven states put education in prisons under the joint direction of the Department of Corrections (Coffey, 1982, p. 11) and the State Department of Education. Universities began to offer graduate programs to train correctional educators (Gehring & Clark, 1979).

2. PUBLIC POLICY SINCE THE GREAT SOCIETY

The aftermath of the Great Society was also an important time for judicial reform of prison education. Nevertheless, the uneven development of public and legal policy regarding the incarcerated has proceeded (in the telling phrase of the District Judge, who in *Holt v. Sarver* would like to have ruled in favor of inmates’ right to rehabilitation) on the basis of the “ripening of sociology,” a sociology which in America is still half-green.

*This court knows that a sociological theory or idea may ripen into constitutional law; many such theories have done so. But, this Court is not prepared to say that such a ripening has occurred as yet as far as rehabilitation is concerned.*

Legal theory has evolved from an extreme of judicial harshness (the court’s definition of inmates in Virginia as “slaves of the state,” [*Ruffin v. Commonwealth*, 1871]) to the theories of *natural rights*, and to the theory of *social contract*; from the notion of civil rights *entitlement*, and to the judicial reform of prison education now taking the lead. The prevalent theory now seems to be one of moral action premised on humanitarianism, which, if it can make common cause with the prevalent conservative theory of cost-effective utilitarianism, may be able to deliver education to the prisons on the promise of civilizing inmates, causing prisons to run more smoothly, and reducing recidivism (Pierce & Mason, 1976, p. ii). The emerging theory of corrections, *alternative sentencing*, will have even greater implications for education as more and more adjudicated persons are monitored by the courts outside of traditional prisons (International Conference on Penal Abolition V, 1991). The legislative and judicial impulses of the Great Society speeded up the “ripening of sociology” into the harvest of educational efforts in prisons and jails that we are now beginning to reap.

Judicial decisions have been ambiguous, and they leave us with a collection of half-ripe inmates’ rights, ranging from the promise
that “a prisoner is not stripped of his constitutional rights when he enters the prison gate” and “when a prison regulation or practice offends a fundamental constitutional guarantee, federal courts will discharge their duty to protect constitutional rights” (Proctor v. Martinez), to the far less comforting double-negative statement that “a prisoner retains only those First Amendment rights that are not inconsistent with his status as a prisoner or with legitimate penological objectives of the corrections system” (Hamilton v. Saxbe). A parallel ambiguity prevails with respect to prison education, offering with one hand that “convicts and the general public are entitled to the same rights” (Morales v. Schmidt), while taking away with the other hand: “Persons convicted of felonies do not acquire by virtue of their convictions, constitutional rights to services and benefits that are not available to persons never convicted of criminal offenses” (Four Unnamed Plaintiffs v. Hall).14

Continuing the ambiguity, some rights have been secured; others have not. As yet, the courts have not, or not quite, guaranteed a “right to (re)habilitation,”15 though that elaboration may be forthcoming by analogy to the issue of medical treatment, in which case inmates may have greater rights than do free citizens.16 Other rights with implications for literacy have, however, been secured to inmates by the courts,17 such as the right of access to legal information and the right not to remain illiterate.18

One of the hopeful signs in the reformation of prison education is the interest that sitting judges and lawyers—people in a position to know about prison conditions—are now taking, e.g. the National Judicial Conference on Literacy in 1991, co-hosted by the Special Committee on Law and Literacy of the American Bar Association and the National Judicial College. In addition, the suggestion first made by Chief Justice Warren Burger that literacy be required for inmates eventually became the mandatory adult basic education policy of the federal Bureau of Prisons, namely, as amended, 12th-grade literacy and completion of the GED.19 Contrary signs have been the cutbacks in social services in recent administrations and conservative forces in the Congress seeking to thwart the education of prison inmates at the public’s expense. More than 65% of the financial aid available to inmate-students comes in the form of PELL grants, a federal program, but a Congressional movement, led by Senator Jesse Helms, to terminate this aspect of the PELL legislation, has been growing in power.20

Correctional educational laws and policies differ in all 50 states. In 1975, Texas was debating inmates’ legal right to treatment and right to education, especially literacy education (Right to
treatment/Right to an education, 1975). Many reports have been made about state efforts to reform prison education policy and practice. Full documentation on the legislative bills, legal actions, and court decisions regarding inmates' educational rights are so numerous that even a list of these would overwhelm this brief survey.21

There are, however, a number of summary sources on contemporary legal issues in prison literacy. The Correctional Educational Association published a guide to action for prison literacy lobbyists (Correctional Education Association, 1983). Richard Crane writes a monthly “Legal Issues” column in Corrections Compendium, which also publishes updates of prison-education related legal and other matters. Pep Talk, a new “information exchange for prison education programs” now in its second year of publication at the University of Massachusetts (Amherst), also informs on legal issues requiring informed action by those concerned about prison education. A state-of-the-art report currently being prepared for the proposed new Clearinghouse on Correctional Education will undoubtedly bring us up-to-date on this matter.

Since the mid-1960s there have been vast amounts of prison literacy reports, studies, handbooks, and journals, and elaboration of more theories about, and proposals for, correctional education than ever before. This abundance of scholarship and opinion reflects the new era of heightened consciousness about prison reform and correctional education that dawned with the Great Society (Ryan, 1971; Roberts, 1971, 1973; Gaither, 1982).
E. ILLITERACY AND CRIMINALITY:
LITERACY IS A WAY OUT

Just as illiteracy and criminality are connected, so also in inverse proportion, growth in literacy and a decline in criminality are likewise connected. Among the few results of learned studies that can be considered definitive and final, the one which might well be thought of as the "first law of prison literacy" is that a pronounced and direct relationship exists between insufficient literacy and unsociable behavior (Palfrey, 1974). Studies in the United Kingdom (Dalglish, 1979, 1983), Canada (Ross, 1978), and the United States (Walton, 1987), all demonstrate the umbilical connection between the rate of functional inability to read, write, and cipher adequately, and the inability of the educationally disadvantaged to live within the legal norms of North Atlantic society (Roberts & Coffey, 1976; Ross, 1977).

The case is clear for the relationship between illiteracy and criminality in adult inmates, but it is even clearer in juveniles, with whom fewer complicating factors (such as the debilitating effects of life in prison) need to be controlled for. The inadequately literate adult inmate was himself once an illiterate and probably delinquent youth whom family, church, school, and society failed to educate for a wide range of nearly unmanageable reasons.22 Socio-economically speaking, the juvenile delinquent is merely the younger brother of his older inmate counterpart.23 When, however, juveniles' educational deficits are corrected in time, i.e., before youthful and emotionally underaged offenders are sent to prison, "enrolled in Crime College," and apprenticed to seasoned perpetrators in a graduate course on how to be a criminal, their rate of turnaround is gratifyingly high. A school for prevention is better than a prison full of correction.24

Many of the same studies that confirm the criminality/illiteracy connection also indicate a correlation between growing literacy and diminishing criminal behavior among juveniles for whom intervention to increase their literacy rate was swift and effective. Juveniles are more predictable as recidivists, and they are easier to educate and correct than are adult inmates, even in cases when the juveniles are educationally disabled.25

Not literacy alone, but the "right kind" of literacy instruction, especially where the parents become supportive, 26 is the knock-out
punch against juvenile crime. The right kind of instruction, as revealed in these studies, can be summarized as early-intervention, individualized, small-class, closely monitored, culturally responsive, success-oriented, highly motivating, self-esteem-building instruction that is delivered by caring and competent, well-trained and dedicated, street-wise and savvy teachers and counselors (Leone, 1986; van Nagel, et al., 1986; Educational services for jailed youth, 1982; Pasternack, 1988).

Programs for juvenile delinquents have needed to improve, and, where there were money and good will, they have improved over the past decade. Where these are lacking, however, temporarily incarcerated juveniles still go for weeks and months without the help in the form of education that they need the most not to become hardened criminals (Roush, 1983; Webb & Maddox, 1986; Pasternack, 1988). With nothing better to do than watch a television or look at a used magazine, a detained young person is deprived of contact with someone interested in the development of his or her mind (Rutherford & Bower, 1976; Webb & Maddox, 1986; Dell’Apa, 1973). Despite a near-universal awareness of education’s high potential for habilitative success among juvenile offenders, in very many situations—especially local jails—the laws mandating educative remediation are being ignored. The special characteristics of juvenile detention that make education difficult—especially short-term stays in detention centers, and high mobility—are offered in excuse for the waste of time that could have been spent in effective habilitation. Educationally disabled juveniles in many institutions are among our poorest served inmates (Rutherford & Bower, 1976; Webb & Maddox, 1986; Dell’Apa, 1973).

Including many of the references already cited, we found many studies of successful literacy instruction of juvenile inmates that indicated the habilitating effects of greater literacy to reduce criminal behavior (North Carolina, 1979; Cei, 1983; McCord & Sanches, 1983; Gowen, 1984; Spellacy & Brown, 1984; Greenwood & Zimring, 1985; Greenwood, 1985; Ingram, 1985; Janosik, 1985; Grenier & Roundtree, 1987). Literacy and other educational programs for juveniles are numerous enough to have evoked a number of studies that compare several programs.

A single concrete example speaks for all. In a study of 759 youths released from Wisconsin’s two juvenile correctional institutions during 1979, when school transcripts were perused and parole officers were consulted, it was discovered that only 3% of the delinquent juveniles had completed a traditional high-school program before incarceration; their reading and math test scores
indicated a range of abilities that dipped far too low. While incarcerated, 40% of them earned a GED. After release over the next three years, 19% of them (145 people) were imprisoned as adults; of these, 60% had not completed high school or earned the GED. The right kind of education helped keep many of the people in this group from recidivating (Pawasarat, et al., 1982).

1. Recidivism, Education, and the Adult Offender

Recidivism refers to released offenders’ returning to prison for having committed new crimes. When former inmates commit new crimes and return to custody, imprisonment as correction has failed because demonstrably insufficient changes were wrought while the criminal was in prison. The quest is for a means to reduce recidivism by increasing success with correction. Recidivism in relation to various correctional measures—literacy instruction and other forms of education—is perhaps the most studied aspect of correctional rehabilitation in general.

Study after study has confirmed low-level literacy among criminal recidivists. Recidivists begin their criminal careers earlier than do non-recidivists, they show greater degrees of hostility and non-conformity (apart from, and unrelated to, the effects that being in prison may have on them), and—even though they have the same general intelligence level as non-recidivists—they make lower scores in reading and arithmetic. Recidivists whose test results show exceptionally low reading scores also demonstrate a significant relationship between their illiteracy and their habitual recidivism.33

The effects of the criminality/illiteracy connection, tangled in the web of other factors, operate to send people to prison early in life; and then, after they are released, this connection continues in effect to involve them in rearrest and send them back to prison. Many other factors contributive to their criminalization include homelessness, joblessness, drug and alcohol abuse, sexual and physical abuse by family members, and psychological factors, such as low self-esteem and various forms of alienation, and prisonization (Clemmer, 1958). All these factors together become threads in the snare of functional illiteracy and its ultimate social, economic, and personal dysfunctionality. Further complicating factors, such as ethnic-minority status or learning disabilities of various kinds, only tie the knot tighter that binds together illiteracy and criminality.
2. "NOTHING WORKS"

So severe has been the problem of criminal recidivism that many analysts, in despair of finding a solution, have concluded that "nothing works." Cautioned by Austin MacCormick himself, the father of modern correctional education, we do not want to overestimate the potential of literacy instruction and education in general as a tool of correction. To be sure, a variety of techniques has worked for some offenders: punishment, torture, and fear; religion; work; moralizing; psychological therapy of the criminal mind; behavioristic tinkering with the non-soul. None of these, however, has effected an overall reduction in recidivism.

To call the roll of the others who have lamented that nothing works is to rehearse a distinguished list of acute observers of prison education. Robert Martinson concluded that "almost nothing works" because rehabilitative programs have no relationship to life outside the prison, and they are incapable of overcoming the prisonization effects of the institution itself; prison industries and vocational education programs teach skills that are obsolete on the outside; and rehabilitative efforts do not counteract the criminal's bent to criminality (Martinson, 1974).

Martinson's report rumbled through the corrections community like a thunder clap, and its echoes continue to reverberate. If nothing works, why keep trying? Corrections administrators and officers settle back to do the job society pays them to do, to keep the criminals secure and off the streets. Conscientious, hard-working corrections officials become legitimately cynical about more studies, and they tend to be disbelieving of the researchers' claims. Almost every proposal for a new grant for a new study or a new program is inevitably fueled by the hype and promise of reducing the recidivism rate. A study of grant-proposal rhetoric in the field of prison education revealed that, as realism sets in, the language of promise is lowered from something like "long-term goals of reducing recidivism" to the soberer level of "more immediate concerns, such as service delivery and educational advancement" (Ashcraft, 1979). This type of reality check has led other prison educators to stop talking about recidivism reduction altogether and to start talking about other goals (Enocksson, 1980). The optimistic conviction that increased literacy lowers recidivism (along with the notion that "employment is the ultimate aim of corrections"), D. A. Deppe called a "popular misconception" (Deppe, 1982).
Others similarly have uttered caveats against an overly optimistic regard for the positive effects of education on inmates, especially when that potential is undermined by countervailing negative effects. A leading negative factor is mismanagement of, and bad personal relations within, the prison education programs. Other negative factors include the inmates’ low levels of previous education and other achievement (especially work history). Any number of other human factors also have their effects, such as being African-American and poor or Caucasian and rich, returning to bad company, drug and alcohol dependence, a non-supportive society, or an unbearable and unwanted sense of responsibility for a family (McCollum, 1977; Knox, 1981; Locked up but not locked out, 1982; Wolford, 1982; Linden & Perry, 1982; Coffey, 1982; D.C. Government, 1990). Some studies of programs, even programs in which the educational component was strong and the literacy needs of the inmates were addressed, indicate either that recidivism was not reduced or that the statistical results proved insignificant.32

3. EDUCATION WORKS

Contrary to the negative reports mentioned above, the emergence of the educational paradigm over the decades of the 1970s and 1980s has given new hope not only for a reduction of recidivism but also for other positive effects on criminal offenders through improving their literacy and engaging them in the right kind of education. Although we cannot predict outcomes for individuals (the mad genius criminal is of an order of human being different from the majority of the ordinary offenders that we are talking about), we can say that the greater the literacy and the more extensive the education that inmates achieve, the lower will be their recidivism rate; and other benign effects will follow, also.

The studies that report a correlation between greater education and lower recidivism outnumber the studies that report negative conclusions. Indeed, the positive results are so numerous that experts in the field write reports on reports in order to marshal the evidence and ascertain what those programs that are most effective have in common. Moreover, the more sophisticated the reporting becomes, and the larger the basis of data grows, the more positive the results appear to be, rightly understood (Education and recidivism, 1991, p. 3).

For example, Marian O’Neil investigated the effect on recidivism of 129 inmates who were released in 1983 after having taken classes in the post-secondary education program of the
combined efforts of Draper Prison, Alexander City Junior College, and J. F. Ingram State Technical College in Alabama. The result was that the group who had taken post-secondary education had a recidivism rate of 3.9% as contrasted to a rate of 11.5% for the control group, much lower than the 25% recidivism rate for all those who had been released in 1983 in Alabama. O’Neil’s conclusions can stand as a manifesto of the credibility that one can place in post-secondary education’s benign influence on the recidivism rate.

Participation of the incarcerated in correctional education programs seems to result in some decrease in recidivism. Prison education also prepares the inmate psychologically for reentry into the free world. Placing the incarcerated into a collegiate atmosphere rather than an intellectually idle atmosphere provides a smoother life both within as well as outside of the walls of the institution. Education is a change-agent; incarceration is meant to change attitudes. The combination of higher education along with incarceration for the qualified inmate can not help but increase the safety of society when the offender is released (O’Neil, 1990, p. 31).

With similar results, T. A. Ryan summarized research opinion on literacy education and inmate reintegration. Several issues among programs that had supported offenders’ post-release employment and held down recidivism, included the following:

- degree of community and interagency involvement
- type of inmate offense
- type of instructional methodology used during prison education
- procedures for course development and implementation
- intake and release procedures employed by the prison
- types of support service (Ryan, 1990; Glaser, 1964; Zink, 1970; Mason & Seidler, 1978; Ingalls, 1973; Mace, 1978; Walsh, 1985; Stevens, 1986)

Based on her analysis of the programs that seemed to her had worked best, Ryan elaborated ten “common characteristics of effective literacy programs for reintegration” (Council of Chief State School Officers, 1990). These are cited in full, especially for purposes of comparison with the similar results of Ross and Fabiano (see next):
Characteristics of Effective Literacy Programs for Reintegration

1. The content reflects the diversity of human experience, is meaningful and relevant to the inmates, and addresses real-life concerns and issues such as family, sexuality, children, violence, assertiveness, and substance abuse.

2. The content provides information that inmates need for their return to society, including material on employment, unemployment, housing, transportation, welfare, social security, vocational rehabilitation, education, and health care.

3. The content of programs for young parents with custody of dependent children addresses child care, parenting, nutrition, health and hygiene, and family planning.

4. Courses for inmates with limited English proficiency recognize cultural differences and provide language instruction.

5. The programs integrate basic-skills development with life-skills development.

6. The programs are based on behavioral objectives and are open-entry open-exit, competency-based, and self-paced.

7. The progress and achievements of inmate students are monitored.

8. The learning environment is structured and supportive, providing positive reinforcement and social modeling.

9. Learning experiences and activities provide opportunities for inmate students to apply and practice skills in the context of functional, real-life settings and situations.

10. The programs use individual and group methods, a range of techniques, educational technology, and resources from community groups, business, and industry.

The most sophisticated survey, to date, of studies of the relation between various types of education, literacy instruction, and recidivism is that which appears in the numerous publications of Robert Ross and his colleagues in Canada. Setting their sails in opposition to Martinson's challenge that "almost nothing works" (Martinson, 1974), Ross and Fabiano reminded their readers that Martinson, five years later, had modified his position. They concluded that, although "success is a rare commodity in corrections," where "cognitive corrections" is used, the programs are "highly successful in rehabilitating offenders, yielding
reductions of from 30% to 80% in recidivism for follow-up periods as long as fifteen years after program completion" (Ross & Gendreau, 1980, p. 1; Ross & Fabiano, 1983; Ross, 1990).

Ross and Fabiano found that some prison education programs reduced recidivism whereas others seem actually to have increased it. Premising their work on earlier studies, they attempted to discern the difference between "programs that work" and those that do not, "on the basis of the presence or absence of specific cognitive components in the program" (Gendreau & Ross, 1983). Their highly selective criteria for inclusion were that a study had to demonstrate the following characteristics:

- conducted within an experimental or quasi-experimental design
- included follow-up assessment of delinquent or criminal behavior
- yielded a statistical evaluation of outcome data
- was judged for effectiveness on the basis of statistically significant differences between the outcomes of the groups that were enrolled in the prison education programs and control or comparison groups 35

They found reports of 15 effective cognitive programs,36 of 10 effective non-cognitive programs (7 of the 10 dealing with juveniles),37 and of 1 ineffective cognitive program and 24 ineffective non-cognitive programs.38 Their analysis of the data led them to conclude that "the effectiveness of programs was significantly associated with their use of cognitive training...[and that] how the offender thinks may be associated with his criminal behavior and with his rehabilitation."39 Keeping in mind these standards for cognitive effectiveness in a prison education program that yields success in reducing recidivism, we have read reports of a number of other efforts that seem to offer further evidence of the success of this approach.40

In the bleak world of scholarship about criminals, the news that a certain type of education can be statistically relied upon to reduce recidivism comes as a dazzling revelation. The conclusions of Ross & Co., supported by Ryan, O'Neil, and others, adds up to a new hope for inmate habilitation and an emerging new theory of education in prisons and jails.
F. THE PARADIGMS OF PRISON EDUCATION

Where one stands within the spectrum of opinion as to priorities in the prison depends upon the view of corrections that one holds. This theoretical stance or paradigm directly influences one's understanding and practice of prison education and delivery of literacy. The search for a solution of how best to handle the problems of incarceration has led up many a blind alley.

Most Department of Corrections administrators and officers and many tax payers affirm a penal paradigm: law-and-order, punishment, reformation through "teaching them a lesson," security—the secure containment of offenders in order to protect society—are the uppermost values and the prime reasons for the existence of a prison. Most inmates as well as many corrections reformers oppose this view.

Besides these two diametrically opposed points of view (Eggleston & Gehring, 1986), a broad array of other paradigms is available: the religion or spirituality paradigm, the work paradigm (vocational-educational paradigm), the therapy paradigm, and any number of holistic paradigms (Villavicencio & Gutierrez, 1978; Holistic approaches, 1982; Hipchen, 1982; Gehring, 1989). The several sub-paradigms tend to emphasize this or that individual aspect of human learning and experience: mathematics (Roundtree, et al., 1982); health and physical sports (Recreation in corrections, 1981; Thomas & Thomas, 1988); music, the plastic arts and aesthetics education (Inside/Out, 1980); the inter- and intrapersonal dimensions and social interaction (Brasel, 1982; Meussling, 1984; Semmens, 1989); sex education (Farrow & Schroeder, 1984; Gelber, 1988); chemical-dependency education (drugs and alcohol) (Price & Price, 1980); family counseling (Holder, 1978); humanistic therapy (Kendall, 1975); a "human resource development model" (Dobbs, 1984); social education (in a sense different from MacCormick's all-inclusive use of the term); criminal justice (Brodt & Hewitt, 1984); and computers. In some of these sub-paradigms, the greater use of literacy is secondary and subservient to the primary purpose, and literacy is even negated in a few cases (Kendall, 1975; Price & Price, 1980). To the contrary, H. S. Bhola, specialist in international literacy for the United Nations, asserts that literacy itself, and not so much the qualities of a given
literacy program nor the intentions of the literacy providers, is what proves liberating in the long run.44

Prison educators, whether official D.O.C. staff educators, volunteers from the local literacy effort, or professors from the near-by college, are often caught in the conflict of contending paradigms. Prison educators tend to affirm some version of a cognition paradigm or a moral-, social-, or humanistic education paradigm. While acknowledging the need for security, educators reason that when a prison functions as a school, rather than as a cage or a warehouse or a hospital or an asylum, it will achieve greater success in changing inmates for the better (Wines & Dwights, 1867; Grattan, 1959; Kerle, 1972; Roberts, 1973; Foucault, 1977; Bell, J. H., 1978; Pennsylvania, 1978; Breed, 1981; Angle, 1982; Chaneles, 1985; Callahan, 1987; McClane, 1987; Pendleton, 1988; Maryland Committee, n/d).

1. THE PUNISHMENT PARADIGM

All of the major paradigms, one way or another, remain with us in the prison, each one affecting, for good or ill, the education program. As educators, we agree with Helen Pecht:

*Corrections is designed for custody and control. Education's purpose is freedom, growth, and self-actualization. The correctional educator must, at the minimum, maintain an island of sanity in a storm of psychosis. At the most, he must work to change the entire system.* (Pecht, 1983, p. 87)

At the first organized, national meeting of reformers in 1870, the experienced acknowledged that improvements in prison education are easier to talk about than to accomplish. The Prison Association of New York reported that the laws supportive of literacy instruction were not being obeyed by the authorities in charge. Although monies had been allocated, they had not been spent on the libraries. Although the laws called for an annual cataloging of the libraries, none had ever been made. Three years later, the association made another report and, referring to its previous “memorial to the Governor in December, 1870,” complained that “since that memorial was laid before the Legislature, about $15,000 more has been appropriated by the State for the same purpose, but no change in the system has been made.”45

The available funds in New York State went wrong in the 1870s not because of larcenous misappropriation but on account of an
unreformed attitude among the prison authorities about convicts. In the minds of the wardens and guards, convicts were criminals to be punished, not students to be coddled by giving them a free education (Roberts, 1971). The near-universal retaliatory, punitive theory of penology remained the dominant corrections paradigm throughout the 19th century and, in many places, continued on through the 20th century. The penal paradigm is, today, in whatever mild forms, the functional paradigm in the minds of many, if not most, D.O.C. personnel. Chief Justice William Howard Taft (U.S. President, 1909-13; Chief Justice of the Supreme Court, 1921-1930) summarized this view:

*The chief purpose of the prosecution of crime is to punish the criminal and to deter others tempted to do the same from doing it because of the penal consequences....It is a mistake of huge proportion to lead criminals by pampering them, and by relaxing discipline of them and the harshness of prison life, to think that they are wards of the state for their comfort, entertainment, and support.* (Quoted in Menninger, 1968, p. 194)

Complaints about prison administrations and the penal paradigm could be multiplied; they have been a permanent part of the correctional educational landscape (MacCormick, 1931, p. 43; Ohlin, 1977; Bell, et al., 1979). Prison education reports from every available point of view reveal frustration, outrage, and anger (Campbell, 1978; Cioffi, 1980). Prison educators indict their corrections colleagues as high-handed, bureaucratic, authoritarian, totalitarian, and anti-democratic (Goffman, 1961; Traverso, 1975; Foucault, 1977, 1980; Bechtel, 1977; Reynolds, 1982; Kersten & Wolffersdorf-Ehler, 1982; Jerik, et al., 1987); compulsively control-oriented, inhumane, hostile, and intrusive; undereducated (Schulman & Canak, 1976); underpaid, of low morale (DeBor, 1979; Henderson & Hardison, 1983); and personally unfulfilled (Vicinus & Kinnard, 1980; Willet, 1983; Dierkroger, 1987) penal-minded proponents of “security” who are more interested in smooth-running prisons than they are in (re)habilitated inmates (Prison Education Two, 1978; Pinton, 1982; Duguid, 1983; Gehring, 1988; Hamm, 1988b). These “panoptic” (Foucault) technicians of surveillance engage in human control as a surrogate for the punishment and torture of inmates now forbidden by our humane laws (Barnes & Teeters, 1959; Housewright & Fogel, 1977; Jones, 1977; Collins, 1988a, b; Gehring, 1988a).

Some prison officials are advocates of the penal paradigm not only by dint of culture drag and tradition but also due to the new
conservatism that has bred a cynicism in many about inmate rehabilitation; moreover, a "new generation" of prison administrators, either MBA-type generalists or political appointees, often without preparation for correctional habilitation, have reduced "offender reformation to an incidental goal of modern-day corrections."  

Some prison administrators have a "vested interest in delimiting the size, power, and perhaps even the effectiveness of correctional education programs" because they are willing to "permit the development and expansion of correctional education programs only to the degree that they serve or complement that managerial function. To go beyond that limit is to threaten the management/security function, and it is unrealistic to expect superintendents to undertake such risks." They are utilitarian in their willingness to allow the proliferation of educational programs in the basic literacies that "make an inmate more 'rational,' and job skills are always useful for the maintenance of the physical plant," but when it comes to post-secondary programs in prisons, "superintendents frequently do an about-face," and manifest a "considerable distaste" for college programs, perceiving higher education as "a haven for ideologies that are flatly contrary to the concept of control. Anti-intellectualism is alive and well among prison superintendents; college programming is frequently seen as contradictory, rather than complementary, to management goals" (Horvath, 1982, p. 9). 

A very few vocal D.O.C. personnel boast a male-dominant, macho approach to corrections. Some endeavor to argue a reasoned case for the primacy of security over every other consideration (Saxon, 1991; Herrick, 1991), and in many cases they view educators with considerable disdain as the naïve, tweedy, do-gooder, temporary intruders from outside (Jacobs & Kraft, 1978; Johnson, 1978; Braithwaite, 1980; Leone, 1986). 

Numerous suggestions have been made to foster cooperation to ameliorate this intolerable situation (Maradian, 1981; Inwald, 1982; National Forum, 1984; Groenevel & Gerrard, 1985; Bento, 1985; Gehring, 1988; Hamm, 1988b; Miller, et al., 1988), the most appealing of which is, perhaps, a paradigm of caring (Seay, 1968; Egan, 1982; Sedlak, 1975; Ross & Fabiano, 1983, pp. 69-70; Toch, 1987; Semmens, 1989). "As such, the rehabilitative ideal demands that caring about inmates be the guiding principle of the corrections process" (Hamm, 1988b, p. 149). 

However the breakdown in communication between the two groups of professionals responsible for the education of inmates
may be resolved, this human factor is a notable cause of the failure of many literacy and education programs in prisons (Harrison & Wood, 1977), and this human factor appears to be the towering problem-to-be-resolved in prison literacy today (Sebring & Duffee, 1977). Until this conundrum of conflict (Horvath, 1982, pp. 8-14) is solved, no studies, programs, or state-of-the-art reports will meet the needs in America's prisons and jails.

In contrast to the punishment paradigm of corrections, a new and old paradigm of education has been (re)affirmed over the past two decades, and its advocates are now asserting that education can be thought of as the principal change agent in the habilitation of inmates. The education paradigm may be described through five strands of education in prison: moral reasoning, the experience of democracy, a focus on the humanities, an emphasis on the cognitive, and an andragogical approach. These elements are not conceived as separate paradigms, but as a unitive theory of education in prison.

2. THE EDUCATION PARADIGM

Advocacy of the education paradigm is as old as the prison reform movement itself, and it received a great boost forward after the time of Austin MacCormick. In the past two decades, education of inmates has come to be perceived as holding more promise for the (re)habilitation of offenders than any other correctional paradigm.

MacCormick advocated what he called "Social Education": socialization of inmates both through the give and take of daily life and through formal instruction ("direct education" in literacy and other subjects) (MacCormick, 1931, pp. 204-215). Seeing that the majority of inmates was not so much anti-social as "non-social," having been "recruited in large numbers from the undereducated and underprivileged groups in the population," MacCormick reasoned in favor of a moral education "given indirectly" and "in a broad sense" that was not "narrow and pietistic," and he urged wardens to "make a moral life possible and desirable" by teaching inmates occupational skills. To socialize inmates, he proposed "direct education," by which he meant literacy instruction and other forms of adult basic education, libraries, some form of the "honor system," and socialization in community life through the self-government of inmate community organization. Praising Thomas Mott Osborne's experiments in inmate democracy at Sing Sing in 1915, and thereafter at the U.S. Naval Prison at Portsmouth, N.H., where MacCormick had worked under Osborne making
"probably the most significant contribution of this generation," MacCormick advocated a society inside in which an inmate could live as a participating citizen in a miniature community. Such a community organization would give the prisoner the opportunity to learn by doing under a system where the warden's authority is not relinquished. Supervision, ideally, would be general rather than specific in order to let the community make and corrects its own mistakes. One benefit of an inmate community organization is that it would make the way "more easy for all types of education."

*Education becomes a community enterprise. Touch is maintained with the real needs and interests of the prisoners because they are able to exercise an influence on the educational program. The educational staff encounters cooperation instead of apathy. Education goes forward because the prisoners themselves are pushing it. Self-improvement is the order of the day; it is good form to take advantage of one's opportunities. The nearest thing to an educational renaissance that the writer has ever seen in a penal institution took place at Sing Sing under Mr. Osborne and Dean Kirchwey in the early days of the Mutual Welfare League. (MacCormick, 1931, p. 215; Osborne, 1916, 1934)*

The notes that MacCormick sounded in 1930 are still, 60 and more years later, characteristic of the best aspects of the correctional educational paradigms of moral, cognitive, and humanistic education:

*The end result we hope for from all the types of education we offer the prisoner is social education: the socialization of the individual. Our hope is that the man whom we educate to better handling of the fundamental intellectual processes, to greater occupational skill, to better care of his body, to broader understanding of the world he lives in, may not only stop committing antisocial acts but may also fit into the social scheme understandingly and willingly. Much of our present system of criminal justice sets a low aim in that it is willing to have the criminal conform to the social order without understanding of it; the main point is that he conform. It is the aim of education to bring about conformity with understanding. (MacCormick, 1931, pp. 6-7)*

The several elements that we find within MacCormick's *social education* have been elaborated individually by various prison
educators, but, surely, the best theoretical and practical paradigm is one that holds the many parts together. The effects of the education paradigms in their many ramifications are exemplified in two outstanding cases in British Columbia. At Matsqui Penitentiary, a 38% lower recidivism rate was reported as the result of a “multi-facetted [sic] program which focussed [sic] on university level courses in the humanities”; and at Grandview, recidivism was reduced from 53% to 6% through training adolescent female offenders in “interpersonal problem-solving and social perspective-taking by teaching them how to assume roles as therapists for their peers” (Ross & McKay, 1979).

3. MORAL EDUCATION

Democratic versions of moral education have been tried with varying degrees of success by structuring individual life within a community in which the checks-and-balances of peer pressure along with a developing sense of individual responsibility evoked the norms of democracy through social interaction (Jacquette, 1982; Ventre, 1982; Duguid, 1981a, 1986a, 1986b, 1987a, 1988; Arbuthnot & Gordon, 1983; Wiley, 1983, 1988; Gehring, 1988a). The thought of Lawrence Kohlberg, who developed his “stages of moral development” partly in response to prison environments, yields the interpretation that, typically, inmates reason morally at “lower” stages than do control groups on the outside (Jennings, 1983; Kohlberg, 1969, 1976, 1981). The implication of this seemingly self-evident conclusion would be that educators of inmates need to address the interrupted development of the cognitive process as it relates to the interrupted moral development of perpetrators. When this is done, the studies indicate, the inmates’ level of moral reasoning, as defined according to the Kohlbergian scale, advances (Carter, 1986). Like other cognitive acts, the moral act, an act of the will informed by reason, is a question of intellectual skill, a learned ability (Michalek, 1988).

4. DEMOCRATIC SELF-RULE IN THE “JUST COMMUNITY”

A morality paradigm too narrowly conceived can be questioned. What is moral education, and whose set of relative moral values and social constructs are we talking about (Fox, 1989)? Morality conceived of democratically in a framework of inmate self-rule in a “just community” of their own devising, however, adequately approximates the larger society in accord with the norms by which inmates upon release shall live. Stephen Duguid, an experienced prison educator with a Kohlbergian perspective who fostered a mini-democracy inside the prisons of

NATIONAL CENTER ON ADULT LITERACY
British Columbia, cited the legacy of MacCormick, Osborne, and Maconochie (Osborne, 1916; Tannenbaum, 1933; Semmens, 1989; Kohlberg, 1986), as well as William George's Junior Republic (George, 1911). Duguid argued that experiential impingements of morality, role models, and environmental factors lend realism to the context of moral development:

The cognitive stage is a necessary but not sufficient condition for the parallel moral stage, just as the moral reasoning stage is a necessary but not sufficient condition for parallel moral behavior. Thus a crude determinism is avoided but an attempt made to establish causal links between intellectual growth, growth in moral reasoning, and evidence of moral behavior. (Duguid, 1981b, p. 276; see Wright, 1981)

Citing A. R. Luria (Luria, 1976), Gehring reasoned that the first theme specific to the cognitive-moral process associated with democracy is literacy. Skills basic to literacy—generalization and abstraction, deduction and inference, reasoning and problem-solving, imagination and self-analysis—are also necessary for social habilitation; they accrue when basic academic skills are learned, and they are enhanced when learned in conjunction with social responsibility (Gehring, 1988a, p. 66-67).

5. THE HUMANITIES COMPONENT

John Minahan, in essential agreement with the Kohlbergian approach, added content to morality, arguing that inmates require instruction in the humanities so as to inform them of the traditions, heritage, and norms of the society towards which they are being socialized and within which they are being habilitated. Inmates need to be humanized so that they can be moralized, so that they can map the world and their place within it (Minahan, 1990). Humanities instruction, a distinct form of instruction in literacy such as that of Stephen Duguid's "Humanities Core Curriculum" at Simon Frasier University and Matsqui Penitentiary in British Columbia (Ayers, Duguid, Montague, & Wolowidnyk, 1980), proceeds on the theory that "if people learn about their cultural roots, they will be equipped to think their way through some of life's problems" (Eggleston & Gehring, 1986, p. 90). Gehring also cited the thought and work of the Americans Brockway, George, Osborne, Kendall, MacCormick, and Kohlberg; Paolo Freire (Freire, 1970); Malcolm Knowles (see below, "andragogy"); and especially what Gehring called the Canadian CE paradigm of Robert Ross and his associates (see below).50
6. THE COGNITIVE ELEMENT

Moral reasoning, the exercise of democracy, and inquiry into the humanities are all, whatever else they may be, cognitive processes. The effort to get inmates to think about their situation is the characteristic note of the education paradigm as it has been amplified in the past two decades, and employed to unify the correctional education enterprise based on cognitive psychology as opposed to behavioral psychology, and premised on the thought of Piaget, Rey, and Feuerstein (Bertholf, 1974; Cosman, 1980; Ayers, 1981; Eggleston & Gehring, 1986; Alper, 1987; Ross, et al., 1988; Gehring, 1988a, 1989). A cognitive moral approach to correctional education involves the inmate's own effort to identify and correct his or her own criminal-thinking errors, understood as a cause of criminal behavior, according to the seminal suggestions of Samenow and Yochelson (Yochelson & Samenow, 1976; Samenow, 1984).

Thom Gehring summarized the new paradigm, especially in view of the failure of other paradigms: "Cognitive or cognitive-moral and democratic methods should be applied to prepare better citizens—[such] that prisons can be transformed into schools" (Gehring, 1988a, p. 63).

Correctional Education (CE) past practice has focused on utilitarian, marketable knowledge (vocational educational paradigm) for incarcerated students. The traditional "knowledge, skills, and attitudes" formula—in that priority order—has dominated, although it is clear that incarcerated students would be better served by a reverse order. The behaviorism which dominates CE (the diagnostic/prescriptive method) and corrections (the medical model) correspond with the old mechanistic world view. CE research is dominated by mechanistically oriented "number crunching methodologies". The institutions in which we work are managed by coercion and manipulation (penal paradigm), and the role of education is tenuous, at best...Many are working to reshape CE, consistent with the holistic, cooperative global paradigm ("global perspectives, local applications"). (Gehring, 1989, p. 166)

Both Gehring and Duguid refer to the work of Robert Ross and Elizabeth Fabiano and their colleagues, research-oriented leaders in the Federal Correctional Service of Canada, whose Time to Think approach to correctional habilitation includes strong emphasis on a "cognitive component," by which is meant
“intervention modalities” that can influence inmates' cognitive functioning, such as “modeling, negotiation-skills training, problem-solving, interpersonal skills training, role-playing, rational-emotive therapy, and cognitive behavior modification” (Ross & Fabiano, 1985, pp. 97-98).

Ross and Fabiano, having exhaustively surveyed existing correctional programs, concluded that “effective programs are truly exceptional,” but that “almost every successful program shared one characteristic in common. They included some technique which could be expected to have an impact on the offender's thinking” (Ross, 1990, p. 1; Ross & Fabiano, 1985, p. 7; Izzo & Ross, 1989; Fabiano, 1991). The conclusion that “cognition and crime are linked” persuaded Ross and friends to reject earlier non-cognitive paradigms. For four decades they searched for the empirical evidence of what works to habilitate offenders. They discovered that “many offenders have never acquired critical reasoning skills.”

Although [offenders] often are able to rationalize their anti-social behavior, the reasoning they use in doing so is frequently simplistic and illogical. Their thinking is often exceptionally shallow and narrow; they construe their world in absolute terms, failing to appreciate the subtleties and complexities of social interactions. Their thinking is concrete, rigid, uncreative and maladaptive. Many fail to consider that their thinking, their behavior, and their attitudes contribute to the problems they experience. They simply have not acquired an adequate repertoire of reasoning or problem-solving skills which would enable them to respond in alternative ways to interpersonal and economic problems. (Ross, Fabiano & Ross, 1988, p. 45)

Effective “cognitive corrections,” according to Ross and his partners, is characterized by rational self-analysis, self-control training, means-end reasoning, critical thinking, training in interpersonal cognitive problem-solving and social perspective-taking, with an emphasis on process (cognitive skills) as opposed to specific content. Ross and his colleagues affirmed the need for an all-inclusive correctional educational paradigm that would be multi-disciplinary, drawing on the fields of education, child development, cognitive psychology, clinical psychology, psychiatry, and philosophy, with appropriate non-cognitive aspects, as well (Ross & Fabiano, 1983).
In her most recent restatement of their perspective, Fabiano warned against too schoolish an interpretation of their results, as if mere literacy acquisition would be enough to achieve the desired habilitative effects:

We learned that the social-interpersonal cognitive skills required for prosocial adaptation can be taught directly and that they differ from impersonal cognitive skills....We learned...that specific and explicit training in social cognitive skills is required,...that offenders must learn social cognitive skills so they can develop social competence....The challenge for all educators, particularly correctional educators, is for us to move away from the assumption that cognitive skills will develop as a natural consequence of an individual's exposure to various parts of the school curriculum, particularly reading, writing, math, and science. In order to effectively impact on an offender's ability to adjust in a prosocial manner it may be necessary to teach thinking skills in an explicit and direct manner. (Fabiano, 1991, pp. 103-105)

7. ANDRAGOGY

Duguid took his cue from the words of Thomas Jefferson, a father of democracy and of the University of Virginia, who wanted to empower the whole people: “If we think them not enlightened enough to exercise their control with a wholesome discretion, the remedy is not to take it from them [as is usually the case in most prisons], but to inform their discretion” (Duguid, 1986b, p. 3). To appeal morally-cognitively to adult inmates in at least a somewhat democratic context and in study of their membership in the human community, is to entail the principles of andragogy (the learning of adults, as opposed to pedagogy, the teaching of children), as elaborated by Malcolm Knowles (Knowles, 1970, 1973, 1975, 1986). Among the methods of andragogy, “contracting” and “peer tutors” are especially effective with inmates (Knowles, 1970, 1973, 1975, 1986). Perhaps more than in any other professional educational guild, prison educators, whose students are very adult, have taken Knowles's instruction on adult learning to heart.51

An andragogical approach is required when educating adult inmates especially because they can be very frustrating students who often behave like children. Living in an authoritarian environment in which their keepers infantilize them, causing them to manifest the “learned helplessness syndrome,” inmates need
their teachers to treat them like adults so that they can overcome their behavioral and emotional (as well as educational) retardation and learn that they are adults (Cioffi, 1980; Miller, 1982; Seminars on Prison Education Series, 1985; Srivastava, 1986; Kiser, 1987a; Fagan, 1989).

Adult inmates in their capacity as students are described by their andragogues as follows:

- Inmates register powerfully emotional, intensely personal reactions to characters portrayed in literature and historical figures whose lives and actions they feel as affecting, eliciting from inmate students moral critiques about self, others, and life (Burton, 1980; Hedin, 1980; Hruska, 1981; McClane, 1987).

- Inmates are highly motivated, egocentric, concretist in their thinking (Seminars on Prison Education Series, 1985); interested in the existential meaning of their studies more than in the abstract or theoretical meaning (Hedin, 1980); so eager to learn that they overcome their personal problems in the attempt.

- Inmates lack the academic social graces. They are willing to interrupt one another and the teacher; have a short attention span; are nervous, withdrawn, defensive, or loud-mouthed; wander in and out of class at will; fail to report promptly to class; talk to one another instead of participating in the group effort; express arch disapproval of one another in class; and engage in power plays and disruptive behavior in the classroom to enhance their sense of freedom and importance (Kiser, 1987a).

Education for its own sake, andragogically delivered to adult inmates and for the purpose of satisfying the innate human curiosity to know, carries us away from correctional education conceived as a stick-and-carrot assistant to the penal paradigm, or in the utilitarian service of an ideology of vocational correctionism ("get smart so you can get a job when you get out"), or as a development-by-compulsion mechanism for moral reform, or redefined as a therapy, or merely so that prisoners can read their Bibles (Cosman, 1980; McCarthy, 1985; Collins, 1988b). As one of our informants, an inmate finishing his doctorate, told us, "Don't call it 'correctional education'; don't even call it 'prison education.' Call it 'education in prison'" (see Coffey, 1982).

The overall effect of the education paradigm with its many parts, as summarized by Duguid, is a massive actualization of humane literacy in its many senses:
Thus whether one opts for student councils and representative democracy, mass meetings on controversial decisions, or informal consultation networks, the involvement of prisoner-students in the educational process and in the administration of the program is essential for the leap to be made from abstract discussion to real choices. Schools do not build character; situations do. To the extent that the school provides situations that involve genuine challenge, it encourages the testing and strengthening of character....This is, in fact, what a humanities education in prison is all about, not just getting criminals jobs, filling time, or providing accreditation, but rather imparting a new vocabulary, a new literacy. And with this new vocabulary, as part of the liberal arts/humanities package, comes cultural literacy, a sense of being part of a polity rather than an outsider, and the option of a new world view, one which enables development to be a lifelong project. (Duguid, 1988, p. 180)
G. LITERACY PROGRAMS IN PRISONS AND JAILS

1. STATE-OF-THE-ART REPORTS

Beginning with Austin MacCormick and his associates in the 1930s (MacCormick, 1931; Wallack et al., 1939), the correctional educational community has been reporting its empirical and analytical, theoretical and experiential perceptions of the state of literacy in America's prisons and jails on a steady and detailed basis for over 60 years. Sylvia McCollum reported on the situation in the aftermath of the Great Society's effort to reform prison education. Two sets of program statistics from her report show how the situation had improved in the decade following 1966:

Prison-education programs in 1966:
- 27 offered post-secondary correspondence courses
- 17 offered extension courses
- 3 offered televised instruction
- 3 offered study-release programs
- 0 offered the possibility of obtaining a baccalaureate degree

Prison-education programs in 1975:
- 9,000 post-secondary courses completed by federal inmates
- 158 associate degrees awarded
- 19 baccalaureate degrees awarded
- 2 master's degrees awarded
- new styles of delivery of distance-education courses: "university without walls," closed-circuit TV, audiovisual tapes and cassettes
- new styles of study-release programs: "inside/outside" programs, special classes for inmates at nearby schools, halfway-house campus residences (McCollum, 1975).

Ten years later, in 1986, the next thorough report took the form of a directory surveying 400 literacy programs in 225 institutions in 46 states. Volume one of the two-volume summary of education in the federal and state prisons in America is a comprehensive report...
on literacy education, teaching methods, program goals, student motivation, assessment instruments, and program evaluation; volume two is the directory (Bellorado, et al., 1986, I and II). Bellorado reported that “the quality of the literacy programs described here varies greatly.” In some, she could boast of well-trained teachers and tutors for new readers, ABE offerings (though not always for the poorest readers), considerable integration of the literacy programs with vocational and/or life-skills training, some form of assessment, mostly articulated with an explicit and coherent educational philosophy, and reporting “some type of cooperative working relationship with prison administration and security staff.” Not so praiseworthy, over half of the programs had nothing for special-education students or non- or limited-English speakers, there was a lack of focus on transition to release and little or no link with outside businesses or the community in about 40% of the programs; staff development was needed throughout, especially in literacy training—at least 40% of the institutions did not report any type of educational staff development program (Bellorado, 1986, II, p. vi).

Two years later, in 1988, a report on the federal system summarized a statistically healthy, expanding situation in ABE programs (see Table 2).

(*) completion policy: 1982, grade-six; 1986, grade-eight
As of 1988:

- 12,000 inmates (29% of the 44,000 incarcerated adults 18+ years old) were enrolled in ABE programs
- 6,500 inmates completed their programs
- 3,500 inmates were enrolled in GED programs
- 2,800 inmates received diplomas

All inmates must take the ABLE (Adult Basic Level Examination) upon entering prison. Anyone who scores below 8.0 grade level on any subtest must enter ABE for 90 days, two hours per day (Littlefield & West, 1990, p. 10; Muth, 1988).

The 1990 directory of post-secondary programs is the most recent broad indicator that we have of the overall, as uneven as ever, condition of educational programs at that level in federal prisons. Eleven of the 64 institutions reporting had no programs at all; in other institutions, as many as three separate colleges or universities were delivering education to the inmates. The directory contains information on the schools, kinds of degrees they offered, major areas of study, non-degree courses, and whether inmate-students might attend courses on campus or only within the prison (Directory of Postsecondary Education Programs, 1990).

Since the Great Society re-jump-started prison education reform in the 1960s, many other reports of various kinds on literacy programs have been made, including histories of correctional education and surveys of the professional literature; status reports; bibliographies; surveys made by telephone or with a questionnaire; analytical scrutiny of selected issues; descriptions of model programs; close looks at given situations accompanied by the investigators' theories and suggestions for policy improvement; proceedings of significant conferences; assorted catalogues, overviews, directories; and policy manuals and resource and reference guides.

2. LOCAL JAILS

Local jails in towns, cities, and counties across the nation are the dark continent of unexplored territory in prison education. No adequate and up-to-date study exists that tells us about them. As recently as 15 years ago in the year of America's bicentennial celebration, Michael Reagen and Donald Stoughton had almost nothing positive to report. The jails were almost totally lacking in academic or vocational educational programs, and those that existed were unaccredited and informal; most did not have
libraries, though inmates were permitted to receive outside publications; most were lacking in physical facilities in which educational programs might be conducted; vocational training and contract programs were nonexistent; no classification processes, no tracking of inmate evaluation, no assessment of either student or program performance existed that yielded any meaningful data on achievement levels or needs of inmates; in the handful of exceptional situations, "the programs were viewed with amused indifference by most of the prison staff and the inmates were considered troublesome curiosities" (Reagen & Stoughton, 1976, pp. 63, 67-68). Two years later in 1978, 74% of jails offered neither education nor vocational training (Lewis & Shanks, 1978). By 1982, that rate had improved by an estimated one percentage point (Coffey, 1982).

Only about 7% of the incarcerated population is held in jails. The challenge of education in jails is to do something useful in the brief periods of time during short sentences and pre-conviction stays of jail inmates, typically shorter than the time served in state and federal institutions. Fifty-two percent of jail inmates are either on trial, or awaiting arraignment or trial (Kline, 1990). Study to take the GED takes longer than many inmates have time in jail, so efforts have been made to devise effective short-term programs that might take as little as two hours to complete (American Correctional Association, 1979; Walakafra-Wills, 1983).

Local jails, however, also house state prisoners for longer terms who cannot be accommodated in state facilities because of the overcrowded conditions—as many as 26% of state inmates in Tennessee, for example, were held in equally overcrowded, local jails in 1989 (Greenfield, 1990; Kline, 1990). In jails where no educational programs are offered, the inmates have little opportunity to occupy their minds in habilitative study.

In 1992, the situation, we believe, is somewhat better in some places, thanks in part to the heightened interest in adult literacy brought about by the Literacy Decade of the 1980s, the work of the National Coalition for Adult Literacy, including the Correctional Education Association, and the efforts of hundreds and thousands of local heroes and saints—unpaid volunteers from Laubach and LVA, business people, lawyers, school teachers, and church folk (Bosma, 1987). In other places, however, the situation has not changed at all. Education for inmates in many local jails is a wasteland and a desert, a nonentity, a null, a human void.

Reports on literacy programs in jails include the highly specific programs and resources manual of the American Correctional...
Association (ACA, 1979), a handbook for establishing adult education programs in county jails, accompanied by a description of the model program in the Bell County Jail in Texas (Johnson & Baca, 1985), another report on a Texas jail in the County of Bexar (Diem & Knoll, 1981, 1982), and a description of a number of model jail programs as of 1989 (Diem & Knoll, 1981, 1982), and some others (see Jacobs & Adams, 1971; Jail Inmate Rehabilitation, 1972; Stayer, 1975; Wimer, 1985; Kurtz, et al., n/d). The Michigan County Jail Inmate Rehabilitation Program was exemplary not only for its educational offerings but also on account of its post-release follow-up, medical and drug treatment in a cooperative program involving the jail, social agencies and community participation. Citizens for Modernized Corrections worked in their community to initiate the education programs (GED courses, tailoring, vocational skills, and yoga), counseling, recreation, and referrals to social services (Kurtz, et al., 1977).

As local communities have become aware of the habilitative effects of education on inmates, enlightened self-interest and humane concern have prompted action. Educational programs can reduce the problems associated with overcrowded conditions such as boredom, stress and pain levels, violence, and generally bad living conditions.62

As in prison, so in jails, the human factor, including local politics, plays the controlling role that makes education possible or not. For the most part, programs in jails are administered by elected sheriffs who are rarely corrections professionals, and even less often educators. The sheer turnover in administrators makes program continuity and development difficult, if not impossible (Horan, et al., 1975). On the other hand, jailers skeptical of education efforts, have legitimate complaints. Funding that begins with grants for innovation is often curtailed or ended, and the local government must pay the freight. Materials for the classes often do not match the life experiences of the inmates; hence they become upset and troublesome. Technological aids installed need trained personnel to make them run, but funds to hire or train are usually in short supply, and non-functional machines are worse than no machines at all. The following letter which we received from a program coordinator for a county literacy coalition summarizes the situation well:

The [literacy] program at our local jail is on hold for several reasons. First of all, the sheriff we were working with was voted out in the May election and the new sheriff does not want to get involved at this time. Second, the present jail lacks adequate, secure space. However, a
new jail is under construction that will have educational classroom space, so we hope the sheriff will approach us next year when it will appear to be HIS idea! [Anonymous]
H. IMPLICATIONS FOR A MODEL LITERACY PROGRAM IN PRISONS AND JAILS

Our entire report is, in a sense, a discussion of model programs, for we are more interested to report on what works than on what has failed. Through our discussions of paradigms and recidivism (above), and by drawing on numerous reports about hundreds of programs, we have in effect elicited a profile of a model program. Could a single program but enjoy the perfection of having all its possible parts! In recommending this or that aspect of a model program, we hesitate to imply our approval for an entire program and its outcomes with which we ourselves are not directly acquainted. In this section, therefore, rather than offering a redundant list of model programs, we propose a roster of elements which, from a literacy instructor's perspective, would theoretically form part of a model program.

What works? is a question to be asked not only in terms of reducing recidivism but also in terms of achieving a much broader range of educational goals, and the answer, to our way of thinking, belongs to a concern for human well-being, whether the person to be educated is a short-term transient in a jail, a lifer in the pen, or an inmate about to graduate from the “school of habilitation.” A model program of literacy instruction, therefore, in addition to decreasing the recidivism rate, does the following:

- educates broadly
- is governed for the sake of the learners
- makes prison life more livable
- is cost-effective
- improves the quality of life
- provides a new reader's library
- makes appropriate use of educational technology
- is the right thing to do
1. A LITERACY PROGRAM EDUCATES BROADLY

A model educational program in prison is all-inclusive (Holder, 1978; Moore & Miller, 1979; Beto, 1990), supplying inmates with cognitive, literacy, social, and job skills that they will need when they are released. Even if one holds to the most stringent penal paradigm of prison reform, it makes no civic sense to withhold from inmates the information and training that they shall need upon release, lest they pass from being wards of the state as inmates to become wards of the state on welfare.

M. C. Hambrick defined the "ideal correctional education system" as including the following: small size, appropriate phases (orientation/assessment; academic and skills development, including social interaction and supportive use of leisure time and health awareness; release readiness and reintegration with family and community services), computer aids, fair and consistent discipline, and—an element which we heartily second—an overall climate characterized by activity, excitement, and caring (Ryan, 1977).

A model program in literacy is a program in literacies:

- **social literacies**: cultural literacy (including in some instances bilinguality both in one's native tongue and in English as a second language (Lafayette, 1987), gender literacies, civil literacy (one's legal and political rights and responsibilities, coping with IRS forms, taking a driver's-license test, getting a social security card), consumer literacy and maintaining a checking account at a bank, and social-welfare literacy. (Upon release, will a former inmate be literate enough to seek out the social-welfare agencies that will give help in coping with any remaining deficiencies in the other literacies, and can one read and write well enough to cope with the forms to be filled out?)

- **occupational literacies**: job skills (including the abilities to read technical instructions and memos, use multiple texts to complete tasks and solve problems, "read" the situation in terms of the professionalism required and other job demands, and get along with one's fellow workers and with the boss), self-image and assertiveness, interviewing savvy, and employability.

- **body literacies**: health and disease and nutritional literacies (Can one make sense of the polysyllabics on a box of prepared food so as to comprehend the roster of potentially harmful chemicals one is ingesting?); substance-abuse literacy; sexual literacy, including sexually transmitted diseases, especially AIDS;
procreative literacy (Does a woman understand her body’s workings well enough and the means available to help her so that she can avoid conceiving unwanted offspring?); parenting and family literacies.

To facilitate inmate education in many of these matters, the American Correctional Association has prepared manuals for inmates (ACA, 1979). Education in economic literacy includes consumer education. The evidence of studies is that many inmates are quite lacking in consumer awareness, and besides, an inmate who has been in prison for a number of years may consequently have lost contact with our consumer economy (Planning Consumer Education, 1978; Brooks, 1980). Many kinds of literacy instruction can support success in life and on the job: a Dutch educational program for short-term inmates incarcerated for drunk driving improved the participants’ knowledge, attitudes, and subsequent driving habits (Bovens, 1987). Greater literacy was essential during the education phase that preceded the therapy phase of a drug addiction program in the San Diego County jail (Ariessohn & Lott, 1990). The state prison system in New Hampshire published a handbook that reads like a college catalogue for student-inmates describing the various programs offered in the prison school: tutoring, basic literacy instruction, basic-skills programs, GED, high-school diploma courses, career orientation courses, and college-credit courses, with all the usual application procedures, the attendance policy, course offerings, library rules and regulations, and advice on how to use the interlibrary loan facility and the reference service (New Hampshire State Prison, 1978). The SEED Curriculum (Social, Emotional, Educational Development) seems to be a program exemplary for its all-inclusiveness (Montgomery & Rosamond, 1987).

2. A LITERACY PROGRAM IS GOVERNED FOR THE SAKE OF THE LEARNERS

A model education program in prison is set up and administered primarily to serve the needs of the learners in the most efficient ways possible, and secondarily to meet the security and other requirements of the institution; a model education program, even in prison, is educative, first, and correctional, if possible, second.

Literacy programs in prisons are governed in a variety of ways: as correctional-educational functions within the D.O.C., as part of a prison chaplaincy, as the volunteer effort of an external literacy organization or school, as an organized and semi-autonomous academic operation supplied to the institution on a cooperative basis by an external college or university, as an aspect of
vocational education within a workplace-literacy arrangement with a private corporation, as the work of an autonomous Prison School District for the state or locality.

A hot topic in correctional governance these days is "privatization," which has at least three nuances of meaning. Primarily it refers to the building and managing of prisons by private corporations for profit. Similarly, it can also refer to the control and operation of prison industries—together with associated career education and workplace literacy efforts—under the supervision of businesses from the private sector, with the intention of turning prison industries into commercially profitable enterprises and appropriate workshops for vocational education, rather than uninspiring make-work schemes. Under both of these definitions, privatization is beyond the purview of this report. Defined as reorganizing the educational dimension of the prison system under the supervision of educators, rather than of correctionists, the privatization of education in prison is a sense of the word well within the scope of our interests and a promising approach to making prison education vital and effective (Potuto, 1980; Conrad & Cavros, 1981; Kersting, 1983; Ewing, 1985; New Partnerships, 1985; Burger, 1985, 1986).

Most vocational education in prisons has been indicted for its irrelevance to the workplace and marketplace of the real world. Though no causal connection can be established between vocational education in prison and inmates' future job success, it nonetheless stands to reason that when inmates develop job savvy and technical competence within the framework of larger educational and personal achievements, and the skills necessary to cope with life, their improved on-the-job and in-society attitudes will contribute to their subsequent positive behavior and success in the community (Whiteson, C. M., 1977). To be an acceptable facet of literacy education, vocational education needs to be more than old-style training in job skills. For many, a job on the outside for which one needs merely skills would be an unacceptable style of employment and no step higher on the career ladder; therefore, broadly based and widely ranging “career education” must of necessity become an increasing part of vocational education in prisons, and that means full attention to many styles of personal and professional literacies (Texas Dept. of Corrections, 1979; Flanagan, 1982; Izzo & Drier, 1987).

Tying two definitions of privatization together in an emerging alternative to vocational education, “Correctional TIE” (Training, Industries, and Education) is one of the newest ideas for making vocational and career education in prisons more relevant and
keeping it up-to-speed with the marketplace and workshop of the real world "outside." Moreover, because the expanding effort for workplace literacy instruction has become fashionable in the world of private businesses and industries, the TIE connection seems natural: tie prison literacy together with vocational education by way of developing real-world workplace literacy (McGlone & Mayer, 1987; Correctional Training, Industries & Education, 1990). Whether the TIE concept is another idea for prison reform that, in the long run, will prove ineffective, remains to be seen. We agree with Osa Coffee that the "reading to do" emphasis of workplace literacy makes sense in prison, and with Neal Miller, "that TIE makes good sense; shouldn't we try it?" (Littlefield & West, 1990, pp. 24-26, 22).

Privatization of prison education, in the sense of establishing a "prison school district" under the supervision of a board of educators, is an idea whose time came some time ago, raising with it great expectations for overcoming the perennial problems of prison education. In 1969, Texas and Connecticut were the first to establish correctional school districts, and as many as twelve states have experimented with the concept, most of them successfully (although control of prison education in Alaska and New Jersey, on account of political squabbles and funding problems, has reverted to the Department of Correction). Virginia's correctional school district is the most independent within the Department of Correction. Independent control of prison education is opposed by many prison administrators and legislators because they see the school board as having too much autonomy. They view education as a low-priority item diverting too much of their resources, and the public's fear of crime has put the electorate into a punitive frame of mind.

Notwithstanding this opposition, one of the most successful correctional school districts, the Windham School District in Texas, has demonstrated the viability of the concept and boasts of funding for education having multiplied 10 times in 6 years (due mostly to the agency's entitlement to state and federal pass-through money on a basis equal with other education agencies). Windham increased in staff from 8 uncertified members to 172 fully certified members in the same period of time, increased in student participation by 40%, increased in the quality of the education program and full accreditation of the Windham School District by the Texas Education Agency and the Southern Association of Colleges and Schools. A lowered recidivism rate is also claimed.63
Another reason to remove education for the adjudicated population from the direct control of the D.O.C. is because the D.O.C. is not primarily interested in the fate of the inmate after the inmate is released, whereas educators share a positive and larger concern with the entire judicial system and with society at large in facilitating the success of the post-release inmate graduate. Three times as many adjudicated people are under the supervision of the courts as also are the one million-plus inmates now housed behind bars, but concentrated efforts to improve the literacy of parolees, probationers, and others, and of released, former inmates, are far fewer and less-well-developed than are in-house prison literacy programs. New energy and funds must be found to help through education those who are outside to stay outside (Riggs & True, 1981; Burstow, 1989; Wimer, 1985, 1983). Education in many instances needs to be extended to the ex-inmate’s family, as well. (Hairston & Lockett, 1987).

Study-release and other options for education outside of prison are not used at all in most places, or are used only at token levels, because prison officials and politicians are afraid of backlash in public opinion when the occasional released offender does serious harm. Nevertheless, study-release and study-furlough, when combined with contracting with inmate-students for educational achievement in conjunction with a fixed release date, has been demonstrated to increase the inmate’s level of performance (Phillips, 1974). The politicians and the public must decide whether varieties of educational release are worth the risk, or that we are going to let the bad seed ruin the opportunities for those who could make good use of them.64 One of the greatest problems in prisons is the public’s attitudes towards prisons.

“What Project PROVE” (Parolees and Probationers Realize Opportunities via Education) is one successful and improving effort in the direction of life-long learning for former inmates (Potts & Tichenor, 1989). The state of Florida has offered a select group of defendants the opportunity to escape prosecution by completing a high-school equivalency course, including being mentored by civic and business people, taking college courses in job-search skills, and improving basic literacy (Austin, 1988).

3. A LITERACY PROGRAM MAKES PRISON LIFE MORE LIVABLE

A model educational program in prison makes life behind bars more tolerable for inmates (and indirectly more tolerable for their keepers). Education in prison for many inmates has a benign and socializing effect on their personalities, resulting in a more
humane atmosphere within the prison itself. Most prison authorities realize that literate inmates are easier to govern because they can understand the many written forms one cannot escape even by going to prison—orientation interview forms, classification waiver forms, medical screening forms, inside movement passes, money and property-transfer request forms, child visit authorizations, voluntary interview statements, store chits, staff action request forms, and others (Pinton, n/d). More-literate inmates are thus more capable of reading, understanding, and complying knowledgeably with prison regulations, and communicating with prison authorities about the information needed to keep the institution running smoothly. Prisons and jails that respond to inmates' need for information become saner places for all concerned, morale is higher, and inmates and staff have the possibility of informed and rational cooperation (Curry, 1974; Vogel, 1976). The ability to relax and enjoy a good book reduces the stress level, increases tolerance for over-crowded conditions, causes the inmates to require less supervision, even cures headaches, and leads to less violence and less destructive behavior.

From the point of view of the warden in the office and the officer in the hall interested in security, all this means lower repair and operating costs for the prison, lessened tension for the line officers, and, eventually, that the well-run prison works as a public-relations tool for prison administrators. Better-educated inmates are more tractable. They break the rules less often—a high recommendation indeed for greater literacy and for prison education in general (Alston, 1981; Lawrence, 1985; Gleason, 1986; Wolford, 1986; Literacy: A Concept for All Seasons, 1989). According to Ernesta Pendleton, program analyst for the Lorton Prison College Program, “Education promotes civility, develops cognition, and encourages confidence. These three Cs should guide the thinking of our approach to criminal...habilitation” (Pendleton, 1988, p. 84, citing Breed, 1981).

Moreover, inmates whose literacy is improving, gain self-respect because they are improving themselves, and they gain the respect of others as well (Gleason, 1986). This civilizing effect of literacy makes a style of participatory democracy possible when the literate community works together to solve common problems and plan educational programs satisfactory to themselves, especially including sensitivity to otherwise divisive multicultural issues (Semmens, 1989).

The amount of academic accomplishment among inmates is positively related to self-esteem and social competence (though
not to self-efficacy, i.e., adaptive behavior in a problematic situation) (Parker, 1990). Reading achievement and reading program variability is positively correlated with self-concept and the acceptance of others among prison inmates (Reading and Study Skills, 1984). African-American inmates, especially, significantly increased their self-esteem as they increased their math competency (Roundtree, 1979). All this educated increase of self-esteem, and the like, adds up to a number of desirable effects in a prison population: as the measure of educational attainment increases, the need for social distance decreases, a factor with positive implications for race relations in prisons (Pass, 1988). As the amount of leisure time spent studying increases, the number of disciplinary problems in the prison decreases.65

The Just Community project at the Connecticut State Farm for Women in Niantic was an exemplary model of the civilizing effect of literacy for democracy in prison. The participants followed the example of the mutual welfare league experiment in controlled democracy conducted in Auburn and Sing Sing by Thomas Mott Osborne and Austin MacCormick and others from 1913 to 1916. The inmates' own democratic society within the prison included an inmate court staffed by inmate judges to rule upon inmates' crimes against one another within their democracy. Trained interviewers came to the conclusion that the effects observed on the women who took part in the experiment (75%) far exceeded those observed in a control group (33%) in the acceptance of democratic processes, political structures, and disciplinary decisions, and in relation to their improved ability to make moral decisions (Scharf, 1981; see Duguid, 1987a; Michaelak, 1988).

Part of a humanized and democratic approach to education is one-to-one tutoring and peer instruction, both strategies being especially effective with adult learners. One-to-one tutoring is a learner-centered instructional method and an intimate form of discourse during which the capable tutor can respond directly and immediately to the questions, correct the miscues, and approve the triumphs of the adult learner. It is also a form of society in which student/teacher bonding can take place most easily, a style of interaction essential in prison education. The amount of training and ongoing support that tutors receive is critical to the quality of the service they provide (Dinges, 1975).

The Linkers, a club of student ex-inmates, seems to have been a model body of organized peer teachers who formed a support system for inmate day-students at John Jay College in Illinois, thus serving the double purpose of helping fellow students who were still inmates and helping themselves by being helpful and staying
in touch with the educational program through which they had
habilitated themselves (McVey, 1977). Peer tutors were found to be
a part of the answer in a research and demonstration program in
Maryland (Hagerstown, 1982), Missouri (310 Project, 1984) and in
Louisiana (Lafayette, 1987). A reading strategy that combines well
with peer-tutoring is the neurological impress method (NIM), a
method that has demonstrated its effectiveness in prison settings

The human habit of being helpful to one another becomes a
set of specific tasks within an inmate community in which peers are
allowed to perform for one another various kinds of services that
others may provide less well. Because inmates, many of them
socially disabled people themselves, are typically targets for the
complex of human services and social services, the so-inclined
inmate may be an equally likely candidate to become a purveyor
of these services inside the prison—counseling and social work of
many kinds (psychological, family, sexual, addictions),66 paralegal
assistance (Conner, et al., 1978; O’Brien & Arbetman, 1978),
corrections (Tacardon, 1983), and peer education of many kinds
(from basic literacy to higher education).

Following an uprising in North Carolina’s Central Prison, for
example, the instigators who had thus already demonstrated their
leadership qualities were isolated as incorrigibles, but then they
enrolled in a resocialization program in which they were educated
to become corrections counselors to work with juvenile
delinquents who themselves had been labeled incorrigibles. Fifteen
men in two groups were trained academically and practically in
counseling skills and then assigned their case load of young
incorrigibles. The paraprofessional corrections counselors were
observed and tape-recorded at work, and they were assessed in
terms of their empathy, respect, and genuineness. The project was
successful, and one conclusion was that inmates make good
counselors for other inmates (Wheeler & Jones, 1977).

We are acquainted with an inmate at Indiana Women’s Prison
who has decided to become a psychological counselor. In Martin
University classes, she has undertaken voracious reading
assignments to become acquainted with the history of
psychoanalysis, alternative methods of psychological help in
traditional cultures, connections among women, women’s
incarceration for crime and institutionalization for madness, and
other relevant topics. This student knows that she will be inside for
a long time; she plans to become IWP’s best counselor of younger
women, whether officially or unofficially.
4. A LITERACY PROGRAM IS COST-EFFECTIVE

A model educational program in prison pays for itself in a variety of ways. The cost-effectiveness of the education of juveniles in custody is perhaps easier to grasp because its results are both more immediate and more evident. The results of Project Intercept in Denver were a clear and unmistakable success. Diversion of first- and second-offenders under age 14 into programs of educational and psychological habilitation and success-oriented family and school intervention, led to 53% to 58% fewer re-arrests than was the case with a control group, and, moreover, led as well to significant improvements in school attendance and performance (Project Intercept, 1974). The results of a similar program in Denver, Project New Pride, can be talked about in terms of dollars and cents. A community-based program of education, individual counseling, vocational skills training, cultural enrichment, and construction of higher esteem for the delinquents and for others, requiring a high staff-to-client ratio, and involving the efforts of 18 professionals, numerous volunteers, a psychologist, a sociologist, and an optometrist, resulted, nonetheless, in a somewhat lower recidivism rate of 27%, compared to a 32% control group during the first year. After one year, the recidivism rate for the 161 who completed the program was only 11%. Moreover, 70% of the “New Pride” participants became successfully employed, and 40% went back to school. Because it cost approximately $12,000 per year at that time to incarcerate a youth in Colorado, whereas New Pride spent approximately $4,000 per year per juvenile client, the immediate savings to the citizens of Colorado was slightly over $1.1 million. The future savings to the State of Colorado are incalculable in terms of the 89% who did not recidivate, and the earning power of those people who went on to be better educated, responsible citizens instead of functionally illiterate criminals is even greater (Blew, et al., 1977).

Other programs have similarly been studied from the perspective of their cost-effectiveness, with the same positive results. It has been said for many years that “four years in prison costs more than a Harvard education,” and as expensive as going to school at Harvard has become, going to prison has more than kept pace. Working on the principle that education is more cost-effective than is incarceration, the Indiana Correction Advisory Committee calculated that educating inmates would initially save the state $7 million per year. Were one to calculate the other savings—lower recidivism, improved morale of corrections
officers, increased productivity of habilitated inmates upon their release—the savings would be many times greater.

Because education in prison is cost-effective, a tax dollar spent on prison literacy, rather than being an economic infringement on the hard-working, law-abiding public, is an investment in law and order, a savings over and above the high cost of crime. In 1982, slightly over 22,000 inmates in state institutions were also college students, and the tax-supported Pell Grant was the indirect means of paying for about 35% of their education. Awards for that academic year ranged from $120 to $1,670, for up to half the cost of one's education—a fraction of the amount it takes to house an inmate (the costs of incarceration range anywhere from $15,000 to $80,000 per year, depending on a number of variables). Ten years later, however, Senator Jesse Helms (Rep., North Carolina)—acting consistently with the economic policies of the New Federalism—was attempting to cut off these grants that some believe reduce recidivism, result in other positive effects for prison inmates, and ultimately save the tax-payer the price of more people in prison (Williford, 1991; see O'Hayre & Coffee, 1982). At $2,500 total per year, the people of Senator Helms's state spend the least in the nation to defray the costs of their state-mandated literacy program for adult inmates, whereas the people of Texas spend the most, $23 million (Hills & Karcz, 1990).

Prison industry, done right, becomes a feature of the educational program, for workplace literacy is at the heart of the adult learner's literacy needs. Prison industry not only can be cost-effective such that it pays for itself, but it can also turn a profit. Project PRIDE (Prison Rehabilitative Industries and Diversified Enterprises), a non-profit but profitable program in Florida to reduce inmate idleness, lower corrections costs, and involve inmates in meaningful work and rehabilitation opportunities, increased inmate employment by 70%, eliminated profitless enterprises, and turned over a profit of $4,052,508 in 1987, almost double the Florida correctional industry's profits for the previous 20 years. Even so, it was estimated that PRIDE was employing only half of the available workforce.69

A well-educated, better-skilled prison workforce, trained in problem-solving and productivity, cost-effectively managed by an enlightened prison administration teamed with a self-administering prison workforce, all in the context of ever-expanding literacies, could not only pay its own way but also could turn a profit and buy its own educational services and other amenities. A properly educated prison workforce could replace idleness and boredom with productivity, decrease tax-payers'
corrections costs, increase offenders' restitution payments, and simultaneously develop inmates' real-world job skills, all of which adds up to the personal bottom line of satisfaction over a job-well-done and the attending self-esteem that so many inmates so dreadfully lack (Stewart, 1985).

5. A LITERACY PROGRAM IMPROVES THE QUALITY OF LIFE

A model prison educational program helps inmates use time on their hands constructively; builds their self-confidence; improves their morale (Curry, 1974); makes them optimistic about their future; allows them to learn new things that their natural curiosity makes them want to know about—the humanities, the sciences, math, other languages, how to fix a car; gains for them a sense of personal respect, dignity, socialization, and well-being; teaches them self-control, tolerance, and to take responsibility; and makes them happy (Educational Needs, 1973; Jacobs & Dana, 1975). Education humanizes by allowing inmates to do civil things that people like to do—read books and write letters to friends or family members. Literacy education also empowers the powerless: literate inmates can write letters to lawyers and judges (Educational Needs, 1973; Jacobs & Dana, 1975), understand the law, study their own legal cases, research the relevant jurisprudence in the massive tomes that line the walls of every prison library, and thereby help themselves secure their own rights before the law and help themselves to justice.70

Education for humanity allows inmates to overcome their incorrect self-perceptions, whether they think too little of themselves (as many typically do) or suffer from over-inflated imaginations about themselves (as many others typically do) (Sedlak, 1975; Roundtree, et al., 1982; Smith, 1987; Pendleton, 1988; Dufour, 1989; Parket, 1990). Many inmates have a higher and sometimes more unrealistic estimation of their intrinsic personal value than do the prison authorities. An outdated vocational education course in a prison auto-mechanics shop, or unrewarding labor in some low-paying, tedious prison industry using inadequate tools towards the accomplishment of some purpose that the worker him- or herself does not approve, is hardly habilitative of a person who imagines her- or himself as an accomplished professional.71 In any event, prison education, because it is education of adult human beings who are far more aware of their individuality than are school children, needs to be highly individualized education. A model educational program in prison is devised through interactive, andragogical discourse that focuses upon interests, needs, desires, frames of mind, and preferred learning styles of the
adult learners so as to achieve its maximal effect in terms of the predictability or likelihood of the individual inmate's being able to take advantage of a given educational program (Tam & Rogers, 1978; Orsagh & Marsden, 1984; Collins, 1988a, 1989).

In Idaho, prison authorities abandoned a cookie-cutter approach to education and took their inmates' negative individual characteristics into consideration: unrealistic self-esteem, unconventional value systems, self-destructive behaviors, ineffective coping mechanisms, reluctance to take appropriate risks, and unwillingness to assume responsibility for their own actions. When a curriculum was designed specifically to address the details of these particular socially disabling qualities, the recidivism rate of the 289 participants dropped to a remarkably low 8.3% (Lee, 1988). Inmates at Matsqui in British Columbia who took part in a filmed theatrical production at the prison spoke of the sense of liberty that they enjoyed in the re-creative effort. They became engrossed in the production such that it took them outside—outside of the prison routine, outside the repressions of the institution, and outside their own criminal histories (Inside/Out, 1980).

Because education of inmates is the education of adults, literacy instruction must be andragogical, must be more than pedagogical skills training, must be adult-oriented education aimed at the needs, receptivity, and craving for meaning that these adult individuals manifest. Inmates in literature classes tend to react directly existentially, rather than critically theoretically, to the literature being read, and they sometimes identify with characters and themes that "nice people" find reprehensible. Inmates, for example, identified with the anti-hero in a short story, a successful, slick, and glamorous racketeer (Burton, 1980; Hruska, 1981). Education of adults in prison is not merely keeping school; it is grappling with the issues of life, and this affects the instructional method.

Students of reading and literacy speak of a bottom-up approach and a top-down approach. If emphasis is laid on breaking the code and adding it up—as one adds up phonetic sounds to sum a word, linguistic components to describe a verbal pattern, and patterns of words to arrive at meaning—then the bottom-up approach (in the style of the traditional Laubach and IBM PALS programs) is being taken. If emphasis is laid on "language experience" and meaning as derived from reading enjoyable and instructive literature and using complete sentences, and conceptual contexts—as one expresses ideas through the literary discourse of dictating a story and then reading it back, editing and rewriting,
until one is satisfied with the product—then the top-down approach (in the style of the Literacy Volunteers of America and Whole Language methods) is being taken (Oakley, 1988).

We assert that a bottom-up approach, to whatever extent it is premised on the mistaken belief that emergently literate adults and new readers of basic texts cannot handle anything more sophisticated, is inadequate to meet all the needs of an adult learner. Similarly, the assessment process needs to be as adult and individualized as the instruction process. A suppositional definition of adult functional competency based on the generic results of a national survey is not individualized enough (see Shelton, 1985).

Instructional methods, educational goals, and assessment instruments go hand-in-hand. The program ought to be taught with means that lead towards desired ends, and then results assessed with measures that both grow out of and were planned in advance in terms of, the previously agreed-on goals. Just as workbook pages neatly filled in and make-work assignments perfectly filled out are not authentic literary artifacts, neither are they the kinds of literary output that adults most desire to produce. Letters of many kinds—business, love, to one's family, to the editor—are authentic, as are a correctly completed job application, an autobiography, a story, and a poem. Assessment of learners' progress needs to be in terms of these high-interest products. A newly literate adult may be entirely able to pass a so-called competency test but still be hopelessly incompetent to cope with real-world situations that call for real-life literacy skills.

Education of all kinds, literacy included, does best when it arises directly from the learner's stated interests and desires. The PACE program in Chicago seems to have taken an integrated approach (Reading Program Profiles, n/d). Thomas A. Edison College in New Jersey was ahead of its time in the individualization of assessment (Thomas A. Edison College, 1976). The Martin University program at Indiana Women's Prison is expressly andragogical, as was the program at Menard Correctional Center in Illinois: totally individualized, multi-modal, adapted to the needs of the adult learners (Helgeson & Hisama, 1982; Wallace, 1992).

A further aspect of andragogy is the style of reward offered. Everyone works to gain rewards, inmates no less so. School children study to earn gold stars, and inmate-students will study better and smarter, achieving long-term goals, if short-term rewards are andragogically appropriate. In a model literacy program, valuable and desirable incentives are offered to stimulate
achievement and success. Incentives include higher pay for prison work on completion of GED, shortening the prison time of participants, more free time for study, presence of female instructors in all-male facilities, emphasizing promotion to the next higher educational level while in prison, and making the library richer and more accessible (Hard, 1976). As with many of us, money may well be the best incentive of all; inmates should be paid to perform well in their studies, just as students outside get grants and fellowships. Education in prison is a form of prison industry, and those working at learning ought to be rewarded for their productivity (Milan, et al., 1979). As with pay for other industry—which, in most prisons, is pennies a day—pay for learning needs to be at a rate that is high enough to be a real incentive and to indicate that we place high value upon it.

6. A LITERACY PROGRAM HAS A NEW-READER’S LIBRARY

A model educational program in prison is supported by a prison library that shelves, however limited its collection might otherwise be, reading matter especially for the new reader and high-interest reading matter for everyone. No prison library is likely ever to have enough funds to stock everything to meet the specialized needs of advanced readers and inmates doing research papers in post-secondary work. For these purposes, accommodative arrangements can be made with near-by libraries, especially university libraries with the good will to extend the use of their collection to distant learners off-site; CD-ROM and on-line search technology can bring a vast world of knowledge into the prison for relatively little investment; and streamlined and reliable inter-library loan services can be administered by conscientious librarians. Austin MacCormick wrote:

Prisoners read, persistently and widely. The libraries, poor as they are, are among the few bright spots in American prisons. Some prisoners take out in a month as many books as the average citizen takes out of his public library in a year....If one could choose only one of the agencies necessary for a well-rounded program of education in a penal institution, he would do well to choose an adequate library. (MacCormick, 1931, pp. 151-152)

The building of prison libraries was an essential part of the development of prison education beginning in the 19th century, and the history, administration, funding, use, censorship, standards, principles of materials selection, training of librarians, availability...
as a legal resource, use of *bibliotherapy*, and other special services have been thoroughly discussed in the literature. The American Correctional Association and the Association of Hospital and Institution Libraries conducted a survey of prison libraries 30 years ago, at which time standards for prison libraries were published (Library Services Branch, 1965). Unless we have overlooked a recent report, it is time for another survey and a new set of standards (see Williams & King, 1979, for England). Application of these standards helps the prison library to outgrow its identity as a collection of garage-sale quality, donated and outdated volumes, sharing space with a set of law books.

The situation now is patchwork: some prison libraries are well-stocked; others have as mongrel a collection as ever. Some local jails and detention centers would not even have a single book in their *library*, were it not for the Gideons' Bible. Through benign neglect, the better prison libraries came to be modeled on the public library, with the exception of the legally mandated collection of law books present in every federal and state prison. With the gradual maturation of the correctional education profession, some prison educators called for a change in prison libraries that would be, in their opinion, *change-based*—the library as a resource in support of responsible and constructive inmate change (Coyle, 1987). While not a bad idea, a *change-based* library would not necessarily serve the reading preferences, needs, and high interests of all inmate library-users.

The library interests of inmates are as wide and diverse as that of the rest of the population (travel, history, poetry, the arts, health, law, sports, romance novels, and adventure stories), but the adult-reader clientele of the prison library shows a stronger preference than do ordinary library users for informational over recreational reading, for trade and professional information, and for information about family services and family relations, in particular. Inmates who use the library tend to be interested in self-improvement, take part in literary discussion groups, and are inevitably interested in books that the library in their prison does not hold (Burt, 1977). Men tend to express interest in books about the law more than do women; women, more than men, request books about getting along with others. Male inmates like best-sellers and adventure stories on the fiction shelves and people and places in the nonfiction books, whereas women prefer romances and adventure stories in fiction and prison/prisoner literature and humor in nonfiction (Scott, 1979).

The librarian in a model prison library includes inmate library-users on the book-selection committee, and the running request
lists compiled by the library clientele are honored as much as possible, just as is done on the outside. This reading matter is available for special reading levels in identified areas of subject interest and in support of the prison's educational program.

Prisons with significant populations of Hispanic inmates need to include materials in Spanish, and prisons with significant populations of ethnic-minority inmates need to include materials that would inform those special interests, e.g., African-American studies, Native-American studies, women's studies.

Analogous to the historic ignoring of books for ethnic minorities, a censorial prejudice in the library has also been expressed about sexuality in general, and homosexuality in particular. Austin MacCormick, writing about censorship, said that the "two chief problems are books emphasizing sex and those featuring crime and mystery"; and he also said, moreover, that he had "talked frankly with a large number of prisoners on these questions and especially about their attitude towards books dealing directly or indirectly with sex." He then concluded that prison authorities worried themselves much too much about the inmates' reading of sexy books and whodunnits (MacCormick, 1931, pp. 174-175).

We agree with wise Austin. Prisons, being human institutions, are highly sexual places; and, being gender segregated, they tend to house more homosexual activity than is evident in the general population. Being cages in which aggressive and unhappy people are kept against their wills, sexuality as practiced in prisons is very often of the hostile and predatory type. Nevertheless, the connection between sex and violence in prisons is not a necessary one. The SMUTS (Something More Useful than Smut) program demonstrated remarkable success in readers' gains and growth in self-esteem by making available easy-to-read stories that included the emotion-packed language and prison jargon with which inmates are familiar (Bruce-McSwain, 1989). To censor inmate reading material out of prudery about sexuality or homophobia is a violation of the freedom of the press and of inmates' sexual and literacy rights, and is to forget that inmates are adults who know what they like, and that may include adult books.

Prison librarians need to be library marketers who realize that insufficiently literate inmates have to be sold on the use of the library, and they need to be taught how to use it (MacCormick, 1931, p. 166; Albert, 1989). The library's open hours, moreover, need to accommodate inmates' work schedules and other rhythms of life inside. The library may be more accessible than are
counselors and teachers, but not if book-reading inmates are forbidden access to it because their work hours are not coordinated with the library's hours, or if their movement to and from the library is unnecessarily restricted. A study in Maryland showed that, whereas almost all of the inmates were aware of the library and its offerings, one-third of them found it out-of-date and inadequate (even in legal materials, much less other reference materials); the staff were perceived as difficult to talk to about the library; great delays were reported concerning information requests (Vogel, 1976).

All state-prison and local-jail libraries, in view of their typical customers, need to house the most extensive collection possible of high-interest books written especially for the new reader. Experiments have demonstrated that reading materials corresponding to inmates' interests are even more important in their gains as readers than is time spent with a teacher (Grissom, 1977). Keeping a fresh supply of high-interest reading material available is a difficult chore because the publishing of high-interest, low-reading-level material is—despite the enormous market for this kind of literature—ignored by most publishers. Especially because library-users in prisons are adults, the librarian needs to make sure that the materials for new adult readers are not of the Dick and Jane variety or are only hand-me-down workbooks or texts. Children's literature of all kinds needs to be available in prison libraries for those readers who may have been deprived of its richness when they were younger, or for use when children visit.

7. A LITERACY PROGRAM MAKES APPROPRIATE USE OF EDUCATIONAL TECHNOLOGY

A model educational program in prison makes full use of available technologies, but subordinates use of the toys to the best interests and learning needs of the inmate-students. Over the years, stereopticons, gramophones, lantern slides, filmstrips, film, television, and, now, videos, computers, programmed learning, and interactive videodisks have been included in the prison toy box of technical aids (Gehring, 1990, p. 5).

Today, computer literacy is almost as essential in the marketplace and workshop as are the literacies of reading, writing, and ciphering. Students often believe that they have acquired important power in this technological society when they learn to apply computers at even the simplest levels of passive use to play games or to follow simple CAI (computer-aided instruction)
menus. They become excited about using computers to practice rather routine skills which they would balk at in paper form.

Fiscally strapped administrators would like to find that computer technology allows the reduction of salaried teaching staffs. Teachers, while often initially timid around the new machines, hope for ready-made solutions to teaching problems. Early efforts by the Federal Bureau of Prisons to use computers were, however, costly failures (McCollum, 1985). The machines were noisy, subject to frequent breakdown, and provided only limited drill and practice in mathematics and language arts. Despite a number of subsequent attempts to aid learning by machine (e.g., the Allen Teaching Machine), not until the advent of the PC (personal computer) did CAI become practicable in the prison setting. PETs from Commodore were used to teach early BASIC programming. Computer Curriculum Corporation introduced their mini-frame-based integrated computer system which met security requirements as it was a stand-alone system with no linkages outside the facility. A survey of the Bureau of Prisons Education Division in 1989 showed that a total of 872 microcomputers were in use in education and for administrative and clerical functions. The greatest percentage were IBM compatibles at 36%, followed by Apple (28%), assorted others (20%), TRS (8%), Tandy (5%), and Commodore (4%). In addition, 222 Computer Curriculum Corporation terminals were in use in 27 institutions (U.S. Bureau of the Prisons, Education Division, 1990). Even so, “if anything has been learned from the Bureau’s experience with computer-assisted instruction, it is to move slowly and judiciously and not to select any single system at this time” (McCollum, 1985, p. 39).

As the usefulness of the machines has improved, and educators have become more sophisticated in their use of them, however, computers have become as indispensable in the prison school as they are everywhere else. A CEA survey reported a 90% approval rate for the proposal of a new, technology section in the CEA Journal. Computers in use in prisons in 1990 were Apples (II, IIGS, Macintosh), 56%; IBM and compatibles, 27%; Tandy, 7%; Commodores, 5%; and miscellaneous, 5%. Prison educators were interested in learning more about integrated learning systems such as those from Prescription Learning Corporation, Computer Curriculum Corporation, and IBM (PALS), and about educational software appropriate to (in descending order of interest) basic literacy, GED, ABE, writing, applications programs (word processing, authoring, databases, spreadsheets, desktop publishing), vocational education, career awareness, assessment, and social
skills. Besides computers, interactive video and satellite television were the other technological tools mentioned (Freasier, 1990; Dobbs, 1984; Bozeman & Hierstein, 1986).

Computers have been used effectively in prisons to support the full range of instruction: data-base retrieval (Leone, 1985); labs for reading, language arts, and math (Hall, 1986); pre-GED instruction (Alessi, 1982; Low-Level and Non-Reader Program, 1985; Quick, 1990). The PLATO system, an integrated learning network developed by the Control Data Corporation, has been used more widely and for a longer time than any other system, to teach a considerable range of subjects from basic-skills instruction to post-secondary classes. Opinions of PLATO vary. Perhaps most students and teachers who learned its use thoroughly liked it, but some found it too complicated and see it now as increasingly outmoded. When measured by the TABE, no clear evidence supports the claim for greater achievement by using it (Sandman & Welch, 1978; Diem & Fairweather, 1979; Gilpin, 1982; Angle & Baldry, 1987). All in all, flesh-and-blood teachers are still preferred to electronic ones.

Advantages to learners in the use of computer-aided instruction include learner-controlled pacing, immediate feedback, quicker mastery than with conventional instruction of some content; privacy, individualization of instruction, achievement gains, cost effectiveness, learners gradually taking more and more control of their own learning, flexibility in scheduling, open entry/open exit scheduling, students feeling that they are learning the "modern way." Disadvantages include the rapid obsolescence, constant change, and therefore constant expense of the technology; lack of complete compatibility among various computers and software; high initial cost; possibility that hasty purchases may not be the best choices; requirement of technically sophisticated personnel to set up, maintain, and fix the equipment and to train teachers and others to use it. Much educational software is designed for children rather than adults. It is difficult, especially at first, to integrate what learners do on the computers with the rest of the curriculum. Also, teachers and tutors can be made uncomfortable by their changing roles, as technology seems to take center stage (Askov & Turner, 1990).

Variety and flexibility are characteristics of a fully operational CAI program. In a pre-release program in Ohio, a six-week job-readiness training program, computers were considered essential for testing, assessment, scheduling, instruction, and record keeping (Rose & Williams, 1989).
Computers can be abused in prison, just as they can be anywhere else. Some supervisors warn that inmates' access to software needs to be limited, that inmate computer experts must not be depended on for computer programming integral to running the institution, and that inmates must use only those computers designated for their use (Erlewine & Cavior, 1989). Computer expertise among the administrative staff needs to be great enough so that the prison administration need not depend upon inmate hackers who may be computer sophisticates but not trustworthy humans.

Inmate students who are likely to become computer enthusiasts will enjoy losing themselves for hours in the technology, but not all inmate students profit alike by sitting before a CRT and a keyboard. Above all, the characteristic needs of most people in prison require human interaction. It is, after all, their inability to interact appropriately with other humans that landed them behind bars in the first place. Computers, television, and other machines are inherently limited in what they can do for the lonely inmate who would rather enter into social intercourse and intellectual discourse with a mentor and friend. The right teacher is almost always a better idea than any expensive toy. Technology helps, certainly, but technology is only part of the solution to society's ills (Schon, 1983).

Thom Gehring reasoned that current technology serves education well in the dimensions of "classroom discipline" (drill, memorization, teacher-controlled lessons, skills development) and "classroom management" (teachers' assessment of students' intellectual needs). However, when the emphasis is the maturation of the whole person with priorities on affective growth, cognitive and cognitive/moral development, social/cultural learning, and the humanities and the social sciences, existing CAI is insufficient. Gehring warned against five problems in misplaced emphasis on technology in the education of inmates:

1. Goals and strategies are reversed—technology is often perceived as an end rather than a means.
2. Educators who work in prisons lack primary identification with corrections.
3. Resources for education are inadequate.
4. In slim budgets, the choice is often between technology or personnel for education.
5. Inmate students have, for the most part, failed in previous education; even though the latest technology may seem to
offer the promise of increased attention to learning, it may not prove central to learner progress.\textsuperscript{76}

Because incarcerated learners are a classic population of distance learners, prison educators have specialized in delivering instruction to them through a variety of technological means, from correspondence courses to closed-circuit TV to computers. Like the computers and the correspondence courses (still very much in use in prisons), so also education via television works for some (Paulson, 1977; McLaughlin, 1986; Maxwell, 1987; Collins, 1990), but not for others (Burnham, 1985; Langenbach, et al., 1990).

8. A LITERACY PROGRAM IS THE RIGHT THING TO DO

A model educational program in prison is a reaffirmation of the moral order within which the outside society wants the criminally adjudicated to learn to live. A literacy program is society's way of helping them to become enough like us so that we can tolerate having them live among us. From Jesus' "Golden Rule" to Kant's "Categorical Imperative," and in most other societies as well as the West, the common perception is that at least enlightened self-interest, if not divine compassion, requires that we humans ought to be decent to one another (Enocksson, 1980; Morin, 1981). America is prepared to recognize that the implication of democracy is that literacy is a right (Newman & Beverstock, 1990); and if literacy is a right, then education in prison is the act of a moral society that ought to be guaranteed to one of the least-advantaged, most vulnerable groups in our society. Society with full justice reserves the right to protect itself from the anti-social acts of criminals, but it may not act so as to deprive even criminals of the free use of the mind (Scharf, 1981). How we treat inmates is, in the words of Winston Churchill, a measure of our own morality:

\textit{The mood and temper of the public in regard to the treatment of crime and criminals is one of the most unfailing tests of any country. A calm, dispassionate recognition of the rights of the accused and even of the convicted criminal, against the state, a constant heart-searching by all charged with the duty of punishment, a desire and eagerness to rehabilitate in the world of industry those who have paid their dues in the hard coinage of punishment; tireless efforts towards the discovery of curative and regenerative processes; unfailing faith that there is a treasure, if you can only find it, in the heart of every man; these are the symbols which, in the treatment of crime and criminals, mark}
and measure the stored-up strength of a nation, and are
sign and proof of the living virtue within it (cited in
I. ASSESSMENT OF LEARNERS AND EVALUATION OF PROGRAMS

1. ASSESSMENT AND EVALUATION DEFINED

Assessment and evaluation, as used in this report, refer to closely linked, but different, aspects of the evaluation process. Assessment is the process of discovering learners' present literacies by gathering a variety of data and analyzing it in terms of long-term goals and short-term objectives. Evaluation is the examination both of learner progress in terms of these goals and objectives and of program progress to determine whether the existing structures regarding objectives, strategies, organization, and resources are valid and worthy of continuation, or should be revised. Evaluation during an ongoing program is called "formative," and it is aimed at checking and improving present practice. "Summative" evaluation measures the success of the program at an end of a formal review period.

Purposes of assessment include the following:
- placement of new learners in appropriate programs
- guidance and improvement of ongoing instruction

Purposes of evaluation include the following:
- accountability of instructors and administrators to funding and governing boards
- the evaluation of new programs
- judging of policy success

Assessment and evaluation, even in the best of worlds, are problematical. More often than not, the results do not inform the people directly engaged in the instruction, may be intimidating to the learner, and may suggest directions to the administrator that are removed from the best interests of either learner or instructor. In prisons and jails, staff and administration are often quite unwilling to have their job assessment depend on their product.
because success at learning by inmates in prison education programs is dependent on many other things in addition to the competency of the staff and administration—dependent, indeed, on factors that we do not yet understand.

Evaluation and its consequence, accountability, are not comfortable subjects for many service providers. People struggling to provide education under challenging circumstances, with antiquated equipment and inadequate funding, understandably feel threatened by reviews of the outcomes of their work. Frequently, because the administrative staff of prisons have little or no training in undertaking, monitoring, or assessing the results of evaluations, the study and reporting of these processes becomes something that is done to the prison and the people who live and work there, rather than being an integral part of the program for the mutual informing, improvement, and good of all. To overcome these obstacles, evaluation must be planned from the beginning. Stricter requirements for the inclusion of evaluation design in original proposals are needed and future education funding in corrections should depend on compliance. Most grantees do not collect, store, analyze, use, and share student achievement data either with the funding agency or with the educators on site. We agree with the results of a special Congressional initiative that "...this failure reflects a weakness in the field and/or a lack of knowledge in terms of implementing and using program evaluation. It is a need that could be met...through future training activities, technical assistance, or a demonstration project" (Lawyer, Coffey, Grieser, 1987, p. xxix).

2. LIMITS TO RESEARCH

T. A. Ryan, in the conclusion of her review of literacy training and reintegration of offenders, posted this summons to research and corrections communities:

A major challenge for the research community is the need for more conclusive research and well-designed evaluative studies, particularly for mandatory literacy training and well-conceived and designed holistic education programs for adult inmates. (Ryan, 1990, p. 32)

Assessment of inmate progress in terms of predetermined goals and overall evaluation of literacy programs, despite efforts to achieve sophistication in reporting and technical reliability, remains inconclusive. Research on corrections and habilitation continues to be plagued with problems of inaccuracy,
inconsistency, and unreliability, even as it was 20 years ago (Adams, 1974). Replication of studies, moreover, has rarely been possible in study of the correctional system (Martinson, 1974), and in the instances where it has been possible, for example Project NewGate, different researchers looking at the same data came to opposite conclusions about the effect of NewGate on lowering the recidivism rate.

Efforts have been made to set standards for correctional education in a variety of ways: through public inquiry and testimony before legally competent bodies, numerous state-of-the-art surveys on various aspects of the discipline, publication by prison-education professionals of field-tested standards (Standards, 1988; Johnson, 1978), and surveys of the tests used to place and measure inmate-students' progress in their educational programs. Perhaps the most telling assessment of a program would be the value placed on it by the students themselves. When inmate-students in Great Britain, Canada, and the U.S. were interviewed, their responses, though unsettling to some experts, were supportive of literacy and literacy-based programs.

The next needed step in this examination of correctional literacy instruction is a close and critical meta-analysis of the methodologies of the available research studies to put in perspective their strengths and weaknesses, their contributions and shortcomings, similar to that of Izzo and Ross in the narrower scope of rehabilitation programs for juvenile delinquents (Izzo & Ross, 1989). Unless this methodological introspection of the field is undertaken, statistical analysis of the effects of prison education projects must remain under a cloud of suspicion about researchers' biases and motives, inadequate grasp of the situation in prisons and jails, defective data, and the essential incapacity of the statistical-analytical approach—as least as it has been developed thus far—as an adequate means of describing this murky complexity. Until then, a unified theory of the field will not be possible.

Researchers intent upon assessment of prison education programs work within certain characteristic limits. Corrections personnel, for whom educational research is an even lower priority than education, often and understandably resist invasion by academics. The outsiders' inquiries for the sake of evaluation may cause embarrassment if the results are uncomplimentary, and their presence at least causes the bother of change in the routine of the institution—work schedules, class times, stirring up the inmates, etc. (Bell, et al., 1983, pp. 3-4). Educational staff, similarly, may view program evaluation with suspicion (Bell, Conard, Laffey, Volz, &
Wilson, 1977), and even inmates—for whose benefit ostensibly the effort is being made—may tend to be resentful of academics. Some inmates make poor informants because they do not trust the researchers; other inmates, bored and lonely, may be too willing to give answers they perceive as wanted or that they hope will hurt people whom they dislike. The researcher must likewise weigh rationally the contributions of facility personnel, who also have their own political and personal agendas, and may assume a variety of postures, from being unwilling and extremely cautious to being gossipy and self-serving informants.

As much as possible, if only temporarily, researchers need to fit into the prison's fabric of day-to-day life. The researcher who comes and goes a few times to collect the sought-for raw but crunchable data, sees the prison only when it is on good behavior, but not over time, through interpersonal exchange, and perceiving the authentic human relationships. Quantitative data alone do not tell the tale. Evaluators need to construct fair and accurate interpretive processes for learning and relating the stories.

Inmates' mental states must be considered as a potential limitation to assessment and evaluation results. At the most benign level, incarcerated people are often distracted by other aspects of their lives in the institution. Living conditions tend to be overcrowded, the noise level is high, privacy is scarce to nonexistent, sleep is easy to lose, tensions in relations with other prisoners and with prison authorities are high and electric. Worries about family outside the prison, health problems, and legal-appeal efforts all intrude upon, and can impede, the research process. Most inmates have, moreover, failed at one level or another in education outside of the prison. When confronted by a researcher with test instrument in hand, memories of failure will cloud the typical inmate's mind.

Despite having a captive audience—the inevitable prison educator's joke—lack of attendance can be a problem. Interruptions caused by prison routine, uncooperative staff members, transfer to another facility; absences due to illness; individual situations caused by prison bureaucratic processing, conflicts in scheduling work times and other responsibilities, misbehavior and its punishment, self-imposed isolation when prison life becomes overwhelming; and those instances when some inmates are released, some escape (in which case, there will be a total lockdown), and some die—all of these occasions add up to a list of obstructions to which few annoyances in institutions outside the prison can be compared. Evaluators of prison programs must
expect attrition in the population being studied, just as teachers must expect absences and drop-outs (Bell, et al., 1977, p. 8).

Constraints are imposed on the researcher from outside, also. For example, the human subjects committee at the university, in reaction to unethical research tactics which have been used to exploit vulnerable groups, will have tightened its standards on the use of human subjects, sometimes to a mindless degree that inhibits even normal interpersonal discourse, treating the subjects as though they were objects, rather than as humans with whom one may enter into meaningful conversation.

The demands of empirical social-science canons, moreover, are often difficult to meet. Experimental and control groups are frequently impossible to design in prisons and jails, as random assignment to treatment is rarely possible. When measuring the impact of education on recidivism, for example, in the absence of control groups, the overall return rate for all releasees in the same year is the only point of reference. "Adequate controls are not in place to ensure that the observed results are the result of educational programming and not due to other variables." 82

3. LIMITS TO THE TESTS

Tests used to identify inmates' personal and learning characteristics are fraught with many limitations, some of them having to do with the unusual situation in which the tests are administered. Because no norm-referenced tests have been designed for prison populations, comparisons are inherently incomplete. When inmates first arrive in an institution, they are hard-put to adjust to their new surroundings. Tests administered during this adjustment period when the incarcerated person's attention is on many other matters, do not accurately reflect how that person might score at another time and under calmer circumstances. Because inmates in general have not had good school experiences, they are unlikely to know how to perform well on tests. They may give adequate answers but lack mastery of the conventions of written language (Gentry & Escoe, 1983). Moreover, many inmates do not care whether they do well on a test that they perceive as silly and invasive. Inmates often perceive testing as just one more instance of coercion by the prison staff (Bellorado, et al., 1986).

Socio-cultural biases in tests, with which educators are now familiar, mean that prison educators, who deal with a higher percentage of ethnic-minority students than do teachers outside, must make special efforts either to interpret with care or delete
from the assessments in use those elements that have been shown to be invalid for various groups of people (Besag & Greene, 1985).

Most of the tests used in learner assessment and program evaluation yield scores. While the scores may be useful for some kinds of assessments, and although they are frequently required for program evaluation, they may not offer any information descriptive of the actual processes and strategies that inmates use in their literacy activities. While a score may indicate that an inmate is not functioning well on academic tasks, it may tell nothing about why the inmate is responding in that way. Some literacy workers have experimented with an approach to assessment that resulted in a different yield of information (Rigg & Kazemek, 1987). Some of these assessment measures—e.g., a reading-and-recall protocol, the Reading Miscue Inventory, and especially initial interviews focused on the inmate's beliefs and experiences in reading and writing—might prove especially useful in the correctional setting (Goodman & Burke, 1972).

4. APPROACHES TO ASSESSMENT

Those who have reflected on the assessment of education programs in correctional facilities have suggested a variety of approaches, especially that assessment needs to be planned for from the beginning so that information can be compiled accordingly and processed along the way (Lawyer, Coffey, & Grieser, 1987, p. xxix).

For many people, assessment is often synonymous with testing. Great reliance and expectations are placed on tests to place learners accurately and reliably and chart their progress. Assessment instruments can be divided into several large categories:

- Standardized tests: norm-referenced (but usually not on prisoners), usually group-administered, low-cost, unrelated to the specific curriculum, often required by funding agencies or policy guidelines
- Criterion-referenced tests: tests for a specific set of pre-determined competencies, assuming a continuum of skills development
- Tests of intelligence/psycho-educational functioning: group and individual measures, often unreliable as a measure of individual
ability, tests of learning potential and skills required for schooling

- Informal measures: include informal reading inventories (IRIs), word-list placement tests, a wide range of teacher-developed and administered measures
- Participatory assessments: involve the learners as co-investigators gathering and interpreting information

Unfortunately, tests cannot deliver all that is expected of them.

"There is no one test nor one fixed score that indicates the true level of an individual or group. Because of the errors in these types of standardized tests [ABLE, TABE, CASAS], no major gatekeeping decisions should be based solely on a single "cut" score on a single test. There should always be multiple sources and types of information about people, including past histories of achievements, employment, informal samples of performance using basic skills, references and other types of information that can help in the decision making process. (Sticht, 1990)"

When learners are placed into programs, assessment tools are expected to make good predictions about the learners' likelihood of success in various contexts. Both intelligence and achievement testing predict most accurately a learner's academic success, but the tests are less accurate predictors of life success. The most frequently used test is the TABE, in use in 58% of institutions (Ryan, et al., 1987), but the results of a study of its predictive value for GED scores indicate its insufficiency. Littlefield and Dowling tested two groups, some in formal instruction and some not, two months before they took the GED. The coefficient of determination was .435; the TABE subtest scores explained less than half of the resulting GED scores. Thus, multiple measures, used with caution, must be applied when interpreting the results of assessments.

Ironically, even though correctional institutions contain disproportionately high populations of educationally disabled learners, there are few teachers and other personnel with the special qualifications for devising learning plans on the basis of individual testing. The standardized tests in greatest use do not provide this kind of direction, just as they also tend not to be informative about test takers' other aspects of individuality, either in terms of need, ability, or desires.

Assessment of cognitive function presents its own challenges. It can be approached either directly (by asking what the thinker is
thinking) or indirectly (by inferring from behavior or performance on a test). Informal language and cognitive functioning measures can be used to identify learning problems quickly and to facilitate prompt placement into appropriate programs (Koopman, 1983). Ross and Fabiano developed a test battery for cognitive functioning of inmates, including the following:

- for self-control, Kagan's Matching Familiar Figures Test
- for social perspective-taking, Chandler's Role-taking Task
- for concrete/abstract reasoning, Conceptual-Level, Paragraph-Completion Method
- for interpersonal, cognitive problem-solving, the Means-Ends Problem-Solving Procedure, Optional Thinking Test, Awareness of Consequences Test, or Causal Thinking Test
- for locus of control, Levinson's Internal/External Locus of Control Scale
- for conceptual rigidity, Gough's Rigidity Scale
- for critical thinking, Watson-Glaser Critical Thinking Appraisal
- for empathy/role-taking, Hogan's Empathy Scale (Ross & Fabiano, 1985)

These and informal-language and cognitive-function measures can be used to identify learning problems and to facilitate placement into appropriate programs (Koopman, 1983).

Before and after release from prison, however, the list of variables that might determine success or failure is daunting. The following collection is a list of variables within several categories—socio-cultural background, including criminal-justice considerations; physiological details; psychological aspects; and educational factors—which have been used as predictive both inside and outside of correctional facilities:

- **demographic data and family background**: age, pre-pubescent/pubescent; gender; ethnicity; place of origin/foreign-born; ESL learner; place of residence—urban, rural; father's absence during childhood; position in family; married/with children; socio-economic status; significant aspects of individuality

- **criminal justice data**: number of weeks/months/years of successful release time before recidivating; types and severity of offenses committed; number and types of prior offenses; number and types of contact with the police and courts; contact
of prison-related authorities with inmate's family; type of crime: property v. violence; age at first arrest; record of prior recidivism; number of incarcerations; amount of time incarcerated; length of most recent prior incarceration; level of most recent prior incarceration; how an inmate has been treated in prison (e.g., from incorrigible to trusted in open prisons); facing conditional release, under parole supervision; place of release from prison; type of release from prison; length of probation; degree of community and interagency involvement; intake and release procedures employed by the prison; types of support services available after release

- **educational background data**: preferred learning style; specific learning needs; number of grades completed in school; drop-out status; types of previous prison education, treatment, etc.; correlation of education completion date and release date

- **academic achievement data (while incarcerated)**: amount of, and success in, prison classes attended; drop-out from prison education; level of prison education: ABE, GED, post-secondary; increased motivation due to enriched experiences; services and styles of education received while in prison; type of instructional methodology used during prison education; procedures used for course development and implementation; post-release success at job placement and employment

- **ability/disability data**: physical disabilities; I.Q.; functional educational level; mental age; emotional age; degree of awareness; self-image; high-risk v. good-chance selectivity; psychological profile (e.g., aggressive, maladjusted, socialized, cooperative); alcohol and drug abuse; attitude towards work and work-related attitudes; learning-disabled

The foregoing list, even though it is incomplete, is enormous. No general agreement prevails on which factors ought to be accounted for, and no study known to us accounted for all, or even most, of them (Roundtree, et al., 1984). However, such a list is the first step towards building a taxonomy that could be fed into an expert system like CONSULT-I ® (Patrick & Fattu, 1986; Newman, Metz, & Patrick, 1992) to match learner characteristics with strategies most likely to produce successful habilitation. The building of a data base would take years, but results in analogous situations are promising, and a similar approach with the incarcerated would likewise inform us how best to teach literacy to people in prison.
5. APPROACHES TO EVALUATION: HOW TO ASSESS FOR SUCCESS IN A PRISON PROGRAM

From the perspective of the educator, the recidivism question is not the only measure as to whether or not educational programs in prisons work. Assessments and evaluations should match goals. The purposes of education in prison need to be defined clearly so that evaluation measures and results will be consonant with what is being measured. Evaluation requires stepping back to view the program as a whole, gathering information that will meaningfully describe the program in question and analyzing that information for the use of learners, instructors, and administrators. In their comprehensive study of program evaluation and learner assessment in adult literacy education, Lytle and Wolfe raised questions in three categories to guide those who plan evaluations.

ADULTS AS LEARNERS
- How is the program designed specifically for adult learners?
- How congruent are the teachers’ and learners’ concepts of success?
- What roles do adult learners and staff play in setting and revising program goals?

CONCEPTS OF LITERACY
- What is the program’s working definition of literacy (literacy as skills, tasks, practices, critical reflection)?
- What information about the cultures, communities, and expectations of adult learners has been used to reach this definition?

EDUCATIONAL CONTEXTS
- To what extent does the program’s design relate to adult learning in everyday life?
- Is the program individually or community oriented?
- How does the program provide opportunities for teachers to expand their instructional repertoires? (Lytle & Wolfe, 1989, p. ix)

Lytle and Wolfe further outlined these 10 critical features of program evaluation and learner assessment:

- Program evaluation in adult literacy education should be conducted both externally and internally.
- Program evaluation should be both formative and summative.
• Program evaluation and learner assessment should involve learners and staff in a participatory process.
• Questions for the design of program evaluation should be generated from theory, research, and evaluation as well as from practice.
• Program evaluation should involve critical reflection on program philosophy and goals.
• Program evaluation should give prominence to the processes of teaching and learning.
• Evaluations should be designed to capture a range of learner and program outcomes.
• Program evaluation and learner assessment require a variety of methods for collecting data over time.
• Evaluation and assessment should be integrated with program functions.
• Program evaluation should be systematic and systemic, enabling stakeholders to make comparisons within and across programs and contexts (Lytle & Wolfe, 1989, p. x-xi).

Questions to ask include the following:

• Have inmate-learners in this program made habilitative progress in literacy?
• Have they gained the reading, writing, and computational literacies that will support their other educational undertakings?
• Have they gained cognitive skills to be able to grapple responsibly with their run-away feelings and pain?
• Have they achieved a sufficient awareness of their common human condition to be able to accommodate their planetary siblings in a social and civil fashion?

A considerable range of behaviors and effects may be taken as indicative of answers to these questions. Each of the following has been used in evaluation of prison education:

• **matters directly related to instruction:** attendance in voluntary programs, enrollment figures, duration in program, grades, degree completion in academic programs, certificate completion in vocational education, scores on achievement and criterion-referenced tests, ongoing participation in education after release, accomplishment of learner-set objectives and goals.
• **inmate behavior within the facility:** incidences of violence; disruption caused by lack of understanding of written rules and regulations; general relations among inmates, between inmates and officers, and between inmates and other personnel

• **post-release effects:** employment rates, employment success (level of salary, dependence on welfare), length or stability of employment, criminal activity (rates of rearrest, conviction, return to custody)

Difficult and often impossible though post-release, longitudinal study may be, the above indicators are all data that can be counted, given time and resources. Important information can be gathered in other ways, as well, through interviews, site visits, questionnaires, and the review of official documents.

Having established a satisfactory set of working measures for evaluation of inmate performance and program effectiveness, the following eight-step assessment procedure has been recommended for use in correctional education:

1. Set the purpose of the evaluation.
2. Identify desired outcomes.
3. Formulate the questions to be answered.
4. Select methods for answering the questions.
5. Designate staff to carry out the evaluation.
6. Collect and analyze the data.
7. Report the results.
8. Incorporate the results into present policy and future planning (Halasz, 1982).

The principle that “all things are multiply determined” seems to prevail in double measure when assessing the effectiveness of education in prison. When the graduate of the prison school, now released, commits a new crime and recidivates, who failed? The bottom line is that we do not know enough in detail about that inmate-learner, that program, and that prison to know why one effort worked whereas another did not. What deforming situation arose that kept the benefits of education from having their effect? Although there will always be failures and defeats, how, now, can the program be improved to make successes and triumphs more likely? The checklist in Appendix A is a protocol designed to help answer these very questions.
APPENDIX A: CHECKLIST OF QUESTIONS FOR THOSE WHO PROVIDE LITERACY INSTRUCTION IN PRISONS AND JAILS

The following questions provide for a comprehensive examination of an individual correctional literacy program. The questions were derived from the research literature.

PARADIGMS (EXAMPLES OR MODELS) OF PRISON EDUCATION

APPENDIX B: AREAS IN NEED OF FURTHER STUDY

1. Prison statistics, surveys, studies, and reports on the educational situation in prisons and jails, and precise information on the complex educational identity of the prison population

   How many inmates can be described as follows:
   - merely illiterate, never having had the chance to learn to read and write?
   - educationally disabled?
   - learning-disabled?
   - emotionally disturbed?
   - mentally impaired?
   - other severe case individuals requiring special education?

2. A study of the possibility of a national strategic plan, investigating the following questions:
   - the equity of education in prisons and jails
   - for men and women
   - for ethnic minorities
   - for the learning-disabled and educationally disadvantaged
   - for the quality of education in prisons and jails (testing in terms of post-release, such as further education, employment, and social habilitation)

3. A national strategic plan designed to do the following:
   - establish a “National Prison School Board”
   - sustain an independent, legally competent monitoring agency to do on-site, on-demand reviews of any prison or any jail at any governance level in the country in the interests of inmate’s civil and educational rights
   - scrutinize educational programs and make recommendations
   - report in detail and on a regular basis on the state of education in prisons in America
4. A "Prison Education Coalition" with participation among the following:
   - Cabinet-level representatives of the federal government and the Federal Bureau of Prisons
   - state D.O.C.s and local sheriffs' offices
   - literacy-activist judges and lawyers
   - inmate support groups and bodies concerned with prison reform
   - colleges and universities with academic programs in Corrections and Correctional Education
   - all other interested parties
5. Lines of communication between federal, state, and local Departments of Correction; universities and colleges; and other institutions of human concern engaging administrators, officers, educators, and inmates
6. Replication of the studies by R. R. Ross and his associates, and the educational methods recommended by them as effective in reducing recidivism
7. Studies of the effectiveness of peer literacy instruction
8. Study of the long-term cost-effectiveness of the private administration of prison and jail educational programs ("privatization")
9. Official correctional policy at all three levels (federal, state, local) with reference to the demands of habilitative education
10. Determination of which is the more effective: educational programs conducted by teachers and staff paid by, and under the administration of, Departments of Correction; or programs conducted by people who are not part of the correctional establishment. This research would include analysis of the different styles of correctional educational structure, among them the following:
   - the D.O.C. as direct educational provider with its own educational organization
   - educational services purveyed to correctional facilities by non-affiliated organizations but under the control of the D.O.C.
   - semi-autonomous school districts that correspond as the educational authority to the D.O.C. in its correctional capacity
11. Determination of whether the educational benefits of the G. I Bill have been reported as they relate to correctional facilities

12. Documentation of the contributions of volunteers in the prisons and jails at all three levels

13. Research that matches local conditions and populations with jail programs

14. Research and analysis of situations in jails

15. The non-educational factors that impinge upon the post-release success of inmates who have taken part in prison education

16. The role of the African-American, Hispanic, and Native-American communities in the study and practice of corrections and prison education

17. Support by federal and state governments of African-American and Hispanic organizations in developing a correctional educational focus

18. The educational needs of the non-native-English speaker in America's prisons and of the existing programs designed to meet those needs
ENDNOTES

1 See Mauer, 1991. South Africa was second, with a rate of 333 per 100,000, the Soviet Union was third, 268 per 100,000 population.

2 For descriptions of specific bilingual programs, see Hernandez, 1978; Sainz & Biggins, 1979.

3 Hart, 1987. In an analogous situation, aboriginal Koories in Victoria, Australia, are incarcerated ca. nine times more often than non-aboriginal Australians, and they typically run afoul of the criminal-justice system at an early age and tend to have more prior terms of imprisonment than do other inmates. The first Koorie to become an Aboriginal Welfare Officer was appointed only in 1983, but with considerable success. Now, efforts in Koorie community-based corrections are underway, in recognition of Koorie family and community ties, differing perceptions of reality, and sense of social relations. Correctional staff are increasingly carrying out the recommendations of the Koorie welfare officer, and educational and cultural programs are being mounted to strengthen links among Koorie inmates and their own community and traditions. A task force has recommended the use of Koorie music and culture as a means of rehabilitation, and locating Koorie inmates in prisons convenient for their kin to visit (Barry, 1988). North American authorities might well emulate this Australian example.

4 A similar situation has prevailed in England; see Pearson, 1971.

5 Men typically prefer best-sellers, adventure stories, and books about people and places (Scott, 1979).

6 Learning difficulties in a high percentage of inmates are cases related to physical difficulties of one kind or another, and are thus remarkably easy to remedy, at least in part (McRandle & Goldstein, 1986).

7 The following discuss in various ways the unkept promise of special education in America's institutions of correction: Johnson, 1979; Special Education, 1981; Platt, Wienke, Tunick, 1982; Alexander & Caldwell, 1983; Walford, 1983; Coffey, 1983; Jensen, 1984; Davis & Dickens, 1986; Dwiggins et al., 1986; Gerry, 1986; Warboys & Shauffer, 1986; Special Education, 1987; Coffey et al., 1989, Section 3.

9 A sampler of reports on programs includes the following: the federal program at Morgantown, West Virginia (Platt, Tunick, Wienke, 1982); the Special Learning Unit in South Carolina (Conine & Maclachlan, 1982); the Planned Educational Program (Peifer & Cock, 1984); the Youth Reentry Specialist Program (Youth Reentry Specialist, 1986); the Correctional Special Education Training Project (Leone, 1984; Rutherford et al., 1986). Robert Rutherford's assessment of prison education for the disabled includes a bibliography (1966 to 1984) on the subject (Rutherford & Bigelow, 1985), a bibliographical appendix in discussion of major programs (Rutherford et al., 1986a & b), and a checklist of best practices. (Rutherford, 1988) Osa Coffey's summary report on education of the educationally disabled is the most recent to cover the field (Coffey et al., 1989).

13 See the 1962 Manpower Development and Training Acts, and the 1966 Amendment (Aller, 1968); the 1965 Prisoner Rehabilitation Act (Public Law 89-176) (Levison & Easterling, 1974); the 1965 Elementary and Secondary Education Act, Title 1 (Bartell et al., 1977; Reevaluation Needed, 1977; Pfannenstiel & Keesling, 1980); the 1966 Adult Education Act, which required that inmates achieve a minimum sixth-grade reading level prior to release (Hard, 1976); the 1967 President's Commission on Law Enforcement and Administration, first report; the 1968 Omnibus Crime Control and Safe Streets Acts, which authorized the establishment of the Law Enforcement Assistance Administration (LEAA), the administrator of the Great Society's effort to improve corrections (Roberts, 1973; Marye, 1979); the 1973 Rehabilitation Act, Section 504 (Gerry, 1986); the 1973-74 Manpower Training Act, which made possible the pre-release instruction in literacy of inmates about to be released, and provided them with some pre-vocational counseling and help with job placement (Proposal to Train, 1974); the 1975 Education for All Handicapped Children Act (P.L. 94-142), which facilitates education of juvenile inmates; the 1981 Chapter 1 of the Education Consolidation and Improvement Act (Compensatory Education, 1983); and the 1984 Carl D. Perkins Vocational Education Act (P.L. 98-524) (see Johnson, 1979; Zaremba, McCullough, Broder, 1979; Maulsford & Spears, 1981; Post, 1981; Alexander & Caldwell, 1983; Leone, 1984; Price & Vitolo, 1985; Dwiggins et al., 1986; Gerry, 1986; Wood, 1987; Grande & Koorland, 1988).

16 In analogy to Wyatt v. Stickney, quoted in Carroll (1974, pp. 480-81), which reads: "When patients are so committed for treatment purposes[,] they unquestionably have a constitutional right to receive such individual treatment as will give each of them a realistic opportunity to be cured," one could argue: "When illiterate inmates are so committed for rehabilitative purposes, they unquestionably have a constitutional right to receive such individual instruction as will give each of them a realistic opportunity to become functionally literate." Because penal adjudication obstructs the inmate's access to doctors and hospitals, but the Constitution guarantees the inmate-citizen's "right to life," the Department of Corrections is made liable for the free medical care of inmates in its keeping. Similarly, on the assumption that inmates, once they had seen the need, would avail themselves of education were they to be on the outside, one could argue that the Department of Corrections is made liable for the lifelong education of
the people whom it oversees. This would mean that inmates have a "right to education" not yet Constitutionally guaranteed even to free citizens.

17 Comment, 1973; Smith, 1987; see Watts, 1990, for a bibliography of works on inmates' legal assistance. A survey in 1986 revealed that 27 states provided law libraries alone, three others provided attorneys alone, and the remaining 20 provided both libraries and attorneys. (Parrar, J. R., 1986) Earlier law requiring access both to legal libraries and to legal counsel has been mitigated to restrict access to either legal counsel or libraries. This oxymoronic status of the law makes law books available to inmates whether they can read them or not.

18 See Arkansas Action Plan, 1988, in response to the Court's requirements in Holt v. Sarver (1970); Rutherford v. Hutto (1974); Criminal Law, 1975, pp. 793-794. In European countries, education in prisons has been spotty just as in the United States; some countries have been advanced in their thinking about literacy instruction and vocational education of inmates, and some have not. The Council of Europe, moving towards 1992 and the economic uniting of the European States, in Recommendation No. R(89) 12--suggested policy, but not yet law—recommended access to education for inmates, including classroom study, vocational education, P.E., cultural and artistic education, and social [moral] education; education should have equal status with work in the prison scheme of things; staff members are to be trained in appropriate adult education methods; special attention must be given to educationally deficient inmates; vocational education should involve the total development of the person and be correlated to the labor market; education in prison should involve the outside community as much as possible (Education in Prison, 1990).

19 Federal Register 56(84) 28 CFR Part 544; McCollum, 1990; Justice to Force Prisoners, 1990. A Congressional attempt to mandate similar literacy laws for state prisons and local jails was mitigated to an encouragement of voluntary literacy programs because federalist Senators could not find enough money to pay for the program, thus allowing states'-rights Senators successfully to oppose the legislation (Education Daily, 1991, July 8, p. 3; 1991, July 10, p. 2).

20 See Peak, 1984. The comparably conservative Thatcher administration in Great Britain manifested a similar lack of legislative support for prison education, including budgetary cutbacks and new sentencing arrangements that ran counter to education of inmates. A countervailing committee of the House of Commons proposed, among other reforms, the establishment of an educational college within the prison system (House of Commons, UK, 1982).

22 Berry, 1971; Chilton, Simpson, 1972; Wax, 1972; Gold, 1978; Mesinger, 1984a; Davidson, J., 1989. School failure is not merely an effect of socio-economic breakdown; perceptual disorders are disproportionally high among delinquent youths, and speech disorders are found among them twelve times more frequently than in the general population (Murray, 1976; Gagne, 1977; Bell et al., 1983, p. 1).

23 No sexism is to be inferred from this intentional use of gender-specific language, just as no racism is to be inferred from our reporting the statistics of ethnicity: It is important to be clear statistically about whom we are speaking. Just under 12% of the youths held in public juvenile facilities are...
female, and their numbers have declined by 8% over the past few years. Similarly, the number of White boys has been declining, while the number of Black and Hispanic boys has been increasing. By far the large majority of juvenile delinquents are boys, and most of them, persons of color. More than 88% of the juveniles held in custody in all facilities are boys (with more than a 93% rate for boys in long-term facilities), 60% are African-Americans, and 15% are Hispanic (with a higher rate of Hispanics in long-term facilities); 90.4% of these children did not make it through high school, and 58.3% are middle-school drop-outs (Beck, Kline, Greenfeld, 1988; Allen-Hagen, 1991).

24 Powell, 1975; Shinbaum, 1977; Alternative Programs, 1985; early intervention is cheaper than incarceration (Blew, McGillis, Bryant, 1977), and “it works" against recidivism (Heath, 1977; Niven & Readio, 1977; Hawkins & Wall, 1980).

25 Educational Services, 1982; Pasternack et al., 1988; Traynelis-Yurek & Giacobbe, 1988; see also Breakthrough for Disadvantaged Youth, 1969; Miller & Windhauser, 1971; Study of Reading Disorders, 1972; Project Intercept, 1974; Genesee County, 1972; Washington, 1972; California Department of the Youth Authority, 1973, 1977; Ratcliff, Taylor, Joine, 1974; Ruth, 1974; St. Louis, 1974; Shadoian, 1976; Arizona: Department of Education, Title 1, 1977; Bartell et al., 1977; Blew, McGillis, Bryant, 1977; Gagne, 1977; Bachara & Zaba, 1978; Bal & Mahon, 1978; North Carolina, 1979; Gormly & Nittoli, 1974; Griggs, 1975; Florida Youth Services, 1976 & 1977; Platt et al., 1977; Eller, 1979; Rothaizer, 1981; Geizer, 1982b; Rousch, 1983; Schlossman, 1983; Sherer, 1983; Waksman et al., 1983; Maddox et al., 1984; You and the Justice System: Can We Intervene Earlier? 1984; van Nagel et al., 1986; Grande, 1987; Roberts & Schervish, 1988; Reading Program Profiles in Correctional Institutions, n/d.

26 Studies indicate that one-shot programs in literacy alone are inadequate. (California Department of the Youth Authority, 1971, 1977; Weathers & Liberman, 1975; DeLong, 1978).

28 A number of studies on the mental ability of male juvenile delinquents indicated that they are more intelligent and capable than the students for whom the educational programs in use were designed (Harper, 1988).

29 Breakthrough for Disadvantaged Youth, 1969; Arizona Department of Education, Title 1, 1977; California Department of the Youth Authority, 1973 & 1977; Ratcliff, Taylor, Joine, 1974; Gagne, 1977; Knox, 1980; Geizer, 1982b; Current Trends, 1983; Rousch, 1983; Schlossman, 1983; Maddox et al., 1984; Programming for Institutionalized Youth, 1984; van Nagel et al., 1986; Roberts & Schervish, 1988; Reading Program Profiles, n/d.

In addition to these, among the many programs reported in the literature as designed especially for the literacy instruction of youthful offenders, the following recent or on-going programs seem to us to be exemplary for their design and/or effects: Bradfield et al., 1975; Ridgecrest in Alabama (Earnest
et al., 1975); Project Read (Project Read, 1977; To Make a Difference, 1978; Carsetti, Heiss, Pierce, 1979); Cook County, Illinois, and Jackson County, Florida (Kelley, 1978); PREP (Filipczak, Friedman, Reese, 1979); Operation IDEA in Chicago (Knox, 1980); Phoenix in Akron, Ohio (Kratcoski & Kratcoski, 1982); Shelby County, Tennessee (Bobal, 1984); Bluewater Secondary School in Ontario (Carroll, 1986); VisionQuest in Tucson, Paint Creek in Ohio, and Key Tracking in Massachusetts (Greenwood, 1988); Monteith in Ontario (McLean, 1986); Snyder-Union County in Pennsylvania (Herbst & Sontheimer, 1987); use of the neurological impress method in Virginia (Traynelis-Yurek & Yurek, 1990).

30 McGurk, Bolton, Smith, 1978. When recidivism rates first began to be studied scientifically, some failed to perceive both the connection between recidivists' low levels of literacy and their high rate of return to prison, and the connection between their illiteracy and original criminality (Tappan, 1960, pp. 58-64).

31 Austin MacCormick, the father of contemporary prison education, observed in 1931: "From the first[,] education was the backbone of the [reformatory] program. High hopes were held for the reformatories and exaggerated claims were made as to their efficacy in turning young prisoners from crime. Finally, as increasing numbers of reformatory graduates appeared in the prisons, penologists began to recognize the fact that these institutions were failing not only as educational institutions but also as reformatories." (MacCormick, 1931, pp. 272-3) Citing a study by Glueck (1930) that set the recidivism rate for the Massachusetts Reformatory at 80%, even the optimistic advocate of prison education, Austin MacCormick, and Richard Cabot, in his introduction to MacCormick's report, grieved that the reformatory system "does not work." MacCormick concluded that "...with few exceptions the reformatories have failed as educational institutions. In the greater number this is due to the fact that education has become a mass treatment process in which a stereotyped routine is followed. Individualization is almost totally lacking" (MacCormick, p. 273-4).

32 New Careers, 1967; California Department of the Youth Authority, 1971; Broadbent, 1973; Stowell, 1974; Maciekowich, 1976; Mace, 1978; Stevens, 1981; Orsagh & Marsden, 1984; Linden et al., 1984; Knepper, 1989; Langenbach et al., 1990; for a debate over whether the Great Society's experimental Project New Gate was successful at reducing recidivism or not, see Clendenen et al., 1979, who said it was, versus Seashore et al., 1976, p. 90, who said it was not.

34 The programs that Ryan mentioned as especially effective are as follows: the Huntington Prison Literacy Project, a Laubach Literacy International program in Pennsylvania (Correctional Education Association, 1989); the Oklahoma Prison Literacy Project, a joint effort of the Departments of Corrections, Education, and Libraries, and volunteers from 15 local literacy councils (op. cit.); the Individualized Life Skills Program in Georgia, focusing on health education, family and civic skills, and consumer education (Ryan, 1982); a technology-assisted (radio, TV, computers [PLATO]) program in the Bexar County Detention Center in San Antonio, Texas (Diem & Knoll, 1981); a Kohlbergian program of cognitive-moral development (Ventre, 1982); a mathematics instruction program in Louisiana designed to enhance inmates' self-esteem (Roundtree, Edwards, Dawson, 1982); the Educational Support Program in South Carolina designed to ease female inmates back into society through bridging their exit from prison by way of education, beginning their education in prison and then continuing their education outside in the community.
community (Ryan, 1989); the Folloup Model Program in Norway, another transition program to link education in prison with education outside of prison as a means of bridging (Select Committee of Experts, 1989).

35 Ross & Fabiano, 1985, pp. 97-98; see especially their chart of comparisons on pp. 100-113.

36 They summarized the following reports: “effective cognitive” programs as reported by Schwitzgebel, 1964; Truax et al., 1966; Sarason, 1968; Ostrom et al., 1971; Alexander & Parsons, 1973; Chandler, 1973; Phillips et al., 1973; Carkuff, 1974; Barkwell, 1976; Wade et al., 1977; Kloss, 1978; Ayers et al., 1980; Lee & Haynes, 1980; Platt et al., 1980; Seidman et al., 1980; and “effective non-cognitive” programs as reported by Baron et al., 1973; Davidson & Robinson, 1975; Wagner & Breitmeyer, 1975; Cox et al., 1977; McCord, 1977; Quay & Love, 1977; Kelley et al., 1979; O’Donnell et al., 1979; Shore & Massimo, 1979.

37 The “ineffective cognitive” program was reported by Weathers and Liberman, 1975.

39 Ross & Fabiano further supported their conclusion by appeal to an extensive meta-analysis of the effects of 111 programs on the recidivism of delinquents between 1960 and 1984, as reported by C. J. Garret. With an inter-rater reliability of .95 in the coding scheme, Garret found that among the methodologically most rigorous studies, the greatest effects were in the “cognitive-behavioral” programs (Garret, 1984).

41 Religion has proved to be the most enduring style of correctional educational paradigm and a sure avenue for literacy delivery, from the penance (from which the word penitentiary is derived), Quaker meditative silence, Bible-reading, and resident chaplains, to many new styles of prison ministry, to the neo-orientalism of the new religions. e.g., Werner Erhard & Associates’est training (now called Forum); the Hindu meditation practices of the Maharishi people—Unified Field Based Rehabilitation (Ellis D., 1979; Bleick & Abrams, 1987), and of Bo Lozoff and the Human Kindness Foundation (Lozoff, 1985); the Human Potential Seminar (McHolland, 1976; Hamm 1987b); a Buddhistic approach, the criminology of peacemaking (Quinney, 1987; Pepinsky, 1987); and various Christian efforts, such as The Living Love Way, A Course in Miracles, and the Christian Clown Ministry. Prison Fellowship, of Washington, DC, publishes a directory of organizations in the U.S. and elsewhere that work with inmates in counseling, education, employment, economic aid, prison reform, and other services for inmates. (Resource Directory, n/d) Many inmates turn to the consolation of religious groups (and self-help groups and gangs) precisely on account of the failure
of the prisons to reform or prison-education programs to habilitate (Irwin, 1980; Abdul-Mu'Min, 1985; Jacobs, 1985).

42 Jones, 1977; more studies involve conclusions indicating the failures of vocational education than indicate the failures of literacy education. Some studies indicate that vocational-technical education and cognitive/literacy education make effective partners in reducing recidivism (Broadbent, 1973; Braithwaite, 1980; Tahash, 1980; Mitchell, 1981; Mason et al., 1978; Cogburn, 1988; Schumacker et al., 1990).

In situations where vocational training and academic education are mixed, whereas some studies indicate that the latter is more effective at reducing recidivism than is the former (Beha, 1977), other studies indicate that the former is more potent than the latter (Hackett, 1988; Schumacker et al., 1990). Vocational education is neither worse nor better than group therapy in improving inmates' attitudes (Daniel, 1984). In Oklahoma, an effort with non-violent inmates called the Regimented Inmate Discipline Program appears to have done as well as vocational education or any other approach merely by emphasizing self-discipline and regimentation (Udell et al., 1989).

Some studies indicate that vocational education does not lower the recidivism rate at all (Lewis et al., 1978; Fize, 1981; Englander, 1983), and that, in fact, vocationally-technically trained inmates recidivate at a higher rate than do control group3 (Boyle, 1978; Cross-Drew, 1984; Davis & Chown, 1986). One study showed that vocational education in prison, and inmates' job placement outside of prison, were unrelated, thus demonstrating the essential uselessness of vocational education in prison, which is notoriously unrelated to the work marketplace on the outside (Pelzer, 1985).

Some studies allow one to argue for a positive effect of vocational education on recidivism in some cases (Hudson, 1971; Schaeffer & Shannon, 1983; Dollar, 1988; Hassell, 1988; Lattimore et al., 1990), whereas other studies show a mixed effect not only in terms of reducing recidivism but also in terms of making those who have been trained more employable (Gleason, 1978; Bennett & Chatman, 1979; Sadd et al., 1983; Project REAL, 1984; MacDonald & Bala, 1987). One experiment seemed to work because volunteers from labor unions helped to train probationers (Winick & Saltman, 1982).

Unlike the evidence on cognitive education, the statistical studies leave us with irreconcilably conflicting data regarding vocational education and recidivism. Like the evidence on cognitive education, vocational-technical education needs to be studied and implemented from new and better viewpoints (Correctional Information Decision System, 1979; Coffey & Carter, 1986), and when it is done right, it seems to work a lot better. (Atteberry & Tacker, 1978; Wirth, 1987; Oversight Report on PRIDE, 1988; see Khan, 1982, for a description of an even worse situation in India.) "Right" in respect to vocational-technical education—in addition to being coupled with cognitive/literacy education (Downing et al., 1987)—seems to include the following requirements:

- Vocational education needs to be meaningful and intelligent and not beneath the inmate's self-conception as a worker (Fize, 1982; Gleason, 1986; Collins, 1988; Imel, 1990). Austin MacCormick pointed out over a generation ago that one of the things that doesn't work is the mentality that prevailed then, and is still endemic now, among those vocational educators who hold a condescending bias towards inmates who tend to come from the socio-economic underclass. This classism in prison vocational education is a perception that inmates really ought to make
excellent auto mechanics and cosmetologists, rather than intellectuals and professionals (See MacCormick, 1931, pp. 272-273).

* Vocational education needs to be about some form of industry or employment that is needed and respected in the outside economy, in a field where jobs are available in the real world, and shall prove appropriately remunerative. It needs, moreover, to be under the supervision not of corrections officers (who are not necessarily trained or experienced as successful business persons or business educators). The move to reorganize vocational education in prisons as workplace literacy under supervision from the private sector, is called privatization, and it has important implications for all kinds of prison education.

* Vocational education needs to be properly completed, as those who enroll in a vocational program but do not finish are as likely to recidivate as those who never enrolled (Umer, 1976; Berckhauer & Hasenpusch, 1982).

* All the other many control factors detailed in respect to cognitive education also affect vocational education, and they are as elusive in this connection as in that (Pownall, 1971; Shuman, 1976; Lewis et al., 1978; Employment Research Project, 1980; Markley et al., 1983; Ciccone & Friedenburg, 1988).

* Human services agents, finally, need to help former inmates find work (Sedlak, 1975; Whitehead et al., 1987).

Helen Cogburn, in discussing recidivism and what has been right about the voc-tec education of inmates at J. F. Ingram State Technical College in Alabama, confirmed our perceptions about what is right in literacy programs, when she concluded as follows:

The education Ingram State provides to incarcerated individuals differs in several regards from the education provided to prisoners in other areas of the nation. It is fully accredited by the Southern Association of Colleges and Schools, operates under the Alabama Board of Education, is located outside the confines of the prison system, and maintains security only through the use of perimeter guards. The academic setting and atmosphere is the same as for institutions serving more traditional students. Ingram State is not simply a prison industry (Cogburn, 1988, p. 1).

Even with Ingram State's good record—a low, combined recidivism rate of 13.5% from 1976 to 1986, and a high, combined success rate of 86.5% for non-recidivating students—recidivism figures had been creeping up during the period from 1983 to 1986. Cogburn hoped to improve the situation by means of more careful selection of students "at an appropriate stage in their incarceration", development of job sites for inmate graduates; matching student skills with available activities and programs; and hiring a new staff person to facilitate the proper placement of students, monitor their retention and progress, and serve as their advocate after graduation (Cogburn, 1988, p. 7).

One wonders whether what had worked at Ingram State in the 1970s was no longer working with a new type of criminal in the 1980s. According to Gary Scott, Director of Education at Indiana Women's Prison for 19 years, the increased use of cocaine and crack during the 1980s was the main new element adversely affecting the recidivism rate (Scott, private communication, 1991).
Most vocational education prison programs are not like Ingram State. One of
the most recent reports on vocational education in prisons yielded generally
a negative judgment: lack of funding, too few programs, outmoded equipment
and materials, limited space, inadequate training for women (Imel, 1990). The
shelves are filled with manuals for setting up vocational education programs,
and the journals abound with expressions of opinion about the best way to
run programs; nevertheless, the negative results of a study reported in 1984,
including the judgment that research on vocational education is inaccurate,
inconsistent, and unreliable, would be the results today of another were a
similar survey of voc. ed. in U.S. prisons to be conducted. (Jengeleski, 1984;
see further negative judgments: Kershner, 1984; Rowh, 1985; Nelson et al.,
1988).

In the words of one anonymous vocational-education inmate trainee:
"Prison, where they cage you like an animal, treat you like a child, and pay
you like a slave, is not a very good place to learn to be a responsible worker."

Fascinated with the criminal mind, some ensconsed themselves in the
prisons with a concern to "treat" inmates. As medical practitioners with the
legal competence to write prescriptions, what they are unable to undo with
the nut-pick of psychology, they put at bay with prescription drugs. Some
bourgeois psychiatric fundamentalists, in frustration over the failure of the
therapy paradigm either to save or heal, are ideologically predisposed to
disregard the claims of people who are not necessarily ill but who are
irreconcilably different—as celebrated in Ken Kesey's novel One Flew over
the Cuckoo's Nest. Some clever inmates capitalize on some psychologists'
naivete by turning small-group counseling sessions into opportunities to
boast about their anti-social behavior and increase their status in prison
society. (Housewright & Fogel, 1977). Nevertheless, because many inmates are
mentally ill, disoriented, and delusional, a medical paradigm has in principle
a certain a priori efficacy.

Even so, the therapy paradigm having been capable of saving only a few, its
failure resulted in defections to other paradigms (Cosman, 1980; Daniel,
1984), among them behaviorism (B. F. Skinner) (Dominguez et al., 1976;
Ayllon et al., 1979). That theory having enjoyed its greatest popularity at
about the time of the Great Society, experiments in programmed instruction
and reinforcement theory being undertaken notably at the Draper
Correctional Institution in Alabama (McKee, 1972), it, too, has been judged
to deliver less than its theorists promised (Jeffrey, 1968; Gehring, 1988b).

43 Fascinated with the criminal mind, some ensconsed themselves in the

44 H. S. Bhola, private communication to Caroline Beverstock, Bloomington,
Indiana University, 1990.

45 Twenty-sixth Annual Report of the Executive Committee of the Prison
Association of New York, Reports 1871 to 1873, Vol. 7, pp. 187-188; cited in
Wallack et al., 1989, p. 5.

46 The penal paradigm easily coalesces with the actuarial paradigm—the tax-
payer's ticket shock at the increasing price of incarceration. Resentful tax-
payers want criminals properly punished for their misbehavior, not given a
free ride and a free education (Ross and Fabiano, 1983; see Wagner, 1976;
Bell, R. et al., 1979; Pollack, 1979; MacNeil, 1980; Pritchard, 1980).

47 Cohen & Taylor, 1972; Roberts, 1973; Curry, 1974; Lipton et al., 1975; Omark,
1976; Romig, 1978; Day, 1979; Chaka, 1980; Decker, 1980; George et al., 1980;
Kandal, 1981; Middleton, 1981; Brakel, 1982; Goldin, 1982; Millott, 1982;
Goldin & Bean, 1983; Gribben, 1983; Pecht, 1983; Thomas 1983a; Goldin &
Thomas, 1984; Collins, 1988a.
48 Hamm, 1988, p. 147; Ohlin, 1986; Owram, 1986. In the face of this hopelessness among some correctional administrators, severe complicating factors such as unprecedented violence, severe crowding, and racial conflicts (Carroll, 1982; Blumstein, 1983; Austin & Krisbert, 1985; Braswell et al., 1985; Dilulio, 1987) have led as well to disillusionment among the inmate population about the prospect of rehabilitation (American Friends Service Committee, 1971; Morris, 1974; Johnson, 1987).

49 Ragan, 1962; although public braggadocio is now passé (Brakel, 1982; Goldin & Thomas, 1984), the situation is little changed; people in uniforms tend to swagger. Some women's prisons are still under the control of males (Schweber, 1977).

52 See Kenneth Martin's brief history in Reagen & Stoughton, 1976, pp. 31-48; see Thom Gehring's writings mentioned throughout this report. He more than anyone else illuminates his understanding with an awareness of the history of education in prisons.

53 See Reading Program, 1974, the first systematic attempt to supply literacy educators with a profile of the many kinds of reading programs available for use in prisons and jails, and to give sketches of existing programs; Pollack, 1979; Gold, 1983; and especially McGrail, 1984, a report on literacy programs in general, including adult literacy programs in prisons.

54 See Prisoner Education, 1978, produced in Australia; see the annotated bibliography in Conrad & Cavros, 1981.

55 Herron et al., 1973, a survey of all superintendents, assistant superintendents, and education directors at all of the major federal and state adult correctional facilities listed by the American Correctional Association in 1972; Dell'apa, 1973; Kilty, 1977; Loeffler & Martin, 1982, on the basis of a questionnaire survey of educational directors in state D.O.C.s as recently as 10 years ago, came to the shocking conclusion that no ABE curriculum for inmates existed nationwide.

56 Peak, 1984, on the effectiveness of delivery of post-secondary education in state prisons; Imel, 1986, on adult education in prison vis-à-vis litigation by and for inmates in behalf of their educational rights, parity for female inmates, education for the handicapped and the learning disabled, and multi-agency and post-release services.

57 MESA, 1985, is a guide to model programs premised on a survey of the literature and research project on 25 vocational and academic skills programs in prisons, especially those resulting from interagency cooperation; Sawyer & Cosgrove, 1989, is a report on effective programs in three types prison settings: juvenile, local jails, and prison education. The programs mentioned are Buena Vista Correctional Facility, Garrett Heyns Education Center, Huntingdon Prison Literacy Project, Kansas State Industrial Reformatory, Lebanon Correctional Institution, Maryland Correctional...

58 Policy Institute, 1973; Linsenberg, 1975: programs in New Jersey and New York; Lewis & Fickes, 1976: programs in Pennsylvania; Tulardilok, 1977: programs in southern Michigan; Phillips & Wagner, 1977, turned in a severe policy review of the Department of Health, Education, and Welfare; Nixon and Bumbarger, 1983: programs in Canada; CUNY Tech, 1984: many programs, including prison education; Moving California, 1987: grand policy-planning in California (the results of this effort, like so many others, have been anonymously reported to be disappointing); Arkansas Action Plan, 1988: adult-literacy program plans in Arkansas, including in the prisons.

Reagen & Stoughton, 1976, p. 59, backed by the Ford Foundation, ranged in their descriptions from Dickensian nightmares to bright hopes, and concluded, as one must today: "We observed and were informed of the widest possible range and quality of imaginable prison education programs during this study. In some cases, a prison would have a reasonably full service program, while nearby, another prison would have barely any program at all."

59 Correctional Education Association annual meetings, with their published proceedings, are perhaps the best single way to take the temperature of the correctional education discipline in America, and to hear about programs considered model at the time, for example, Education—A Weapon against Crime, 1981; National Forum, 1984.

and Correctional Education Association, 1988, the published standards for correctional education programs as set forth by the CEA.

62 Teitelbaum, 1974; Lawrence, 1985. In an evaluation of jail education programs, the records from eight years of inmates enrolled in a county prison program revealed that students who were referred by other students made greater gains in reading and mathematics; progress was related to race, previous education, marital status, and gender (Rohm, 1989).

63 Coffey, O., Trends in the administration of correctional education, in Wolford et al., 1986, pp. 5-17.

64 A Projection, 1977. Home furlough and study-release programs demonstrate a low abscondence rate. Political factors obstruct the development of this approach (Smith, 1982; see also Habenstreit, 1973).

65 Boaz, 1976. Some of the evidence argues against the idea that education of inmates causes greater tractability. At Attica Correctional Facility in New York, no cause/effect relationship could be found to exist between social programs (ranging from family reunions and picnics to formal education, and including other variables such as age, ethnicity, sentence length) and a decrease in the frequency of misbehavior in terms of the number and types of infractions against prison rules. These programs were deemed to be ineffective as a means of social control or of reintegration (McCain & McNally, 1982). In this case, one would want to look carefully at the context of the study: the infamy of Attica, notorious for its ill treatment of inmates, especially of inmates of color, and the perceptions and expectations of the prison officials concerning their social programs. Education for the sake of manipulation easily backfires. The Family Reunion Program promoted tractability, and effected social control, of less-well-educated inmates much more than it did for inmate-students working at the post-secondary and continuing-education levels (Davis, 1988).

Basic education seems to be more immediately contributive to the tractability of inmates and their social control than does higher education. W. E. Reed, in a doctoral dissertation, demonstrated that inmates who enroll in college courses for self-improvement and to prepare themselves for better jobs after their release do not necessarily have fewer instances of disciplinary trouble than do non-collegian inmates. In one study, Blacks tended to enroll motivated primarily by their desire for self-improvement, whereas Whites were interested in job preparedness, but both derived self-esteem from their academic achievements. No cause/effect relation was found between motivation for enrollment and the variables of age, sex, previous education, semester hours completed, good-time classification, or number of disciplinary infractions (e.g., fighting, victimless offenses, conflicts with authority, and others). In fact, the evidence in this study suggested that the collegians may have become embroiled in more disciplinary infractions after enrolling than they had done before (Reed, 1982).

The heady feeling of being a college student may have led some of the inmates to feelings of superiority over the less-educated officers. This is an argument for staff training, not an argument against prison education.

66 Briggs, 1975; Black, 1975; Wheeler & Jones, 1977; Beckerman & Fontana, 1987. The report, New Careers, 1967, that inmate careers in mutual help does not always work well, was filed early in the experiment to allow inmates to take charge of their own social well-being.
67 St. Louis, 1974; Bachara & Zaba, 1978; Insight Incorporated, an inmate-administered, privately funded baccalaureate program in Minnesota, is exemplary for other post-secondary programs both in its cost-effectiveness and is democratic qualities (Proceedings, 1981).

68 Barnes et al., 1990, pp. 9-12: "Earned credit time" and an early release program predicated on tested and verified levels of achievement in four programs (education, literacy, substance abuse, and occupation), "tailored to an individual offender's needs and ability to progress throughout the period of imprisonment, with follow-up contact upon release to parole," would cost the State a little over $2 million in new staff costs to implement, but would save the State $9 million per year, for a savings, roughly, of $7 million per year "simply based on the number of adult inmates leaving the department" through early release. The committee used the figure $3,000 saved per year per inmate released early, and therefore probably conservatively underestimated the savings to the State, for it costs considerably more than that to keep an inmate for a year. In 1990, Indiana housed ca. 13,000 inmates, and its operating budget was ca. $216,000,000 (Camp & Camp, 1990, pp. 2, 36).

69 Oversight Report, 1988; for similar results, see Grieser, 1988; TIE, 1990; Burger, 1986. As long ago as 1976, the estimated potential productivity of the workforce in prisons and jails was $2.5 billion annually, whereas the annual productivity—due to slippage, an inadequately educated workforce, meaningless employment, outmoded equipment, and administrative ineptitude—was under $1 billion (Singer, 1976). Discussion of privatization of prison industries takes us somewhat afield, but is nevertheless related to our subject of literacy instruction because a more efficient workforce in or out of prison requires higher literacies.

T. J. Flanagan cautioned that privatization is not the panacea for all that ails prison industries, and he advised against thinking that even well-run prison industries can turn a profit, citing nonprofitable programs of academic and vocational education required to remediate inmates' deficiencies as workers. At the same time, he acknowledged that realistic criteria can be developed to determine the effectiveness of prison industry programs that would increase efficiency and the income potential of prison inmates (Flanagan, 1989).

71 The average criminal in Britain has normal intelligence, a seventh-grade education, and below-average mechanical and/or technical aptitude. Therefore, prison education that begins with training in the manual disciplines typical of vocational education is not educating the individual in terms of preferred styles of learning or individual strengths and talents (Rahn, 1979).

It may be putting too fine a point on the argument, but inmates in a New York prison food-services program who became short-order cooks recidivated at a 26.6% rate (lower than the projected rate of 33.3%), whereas inmates who attained the less exalted position of being merely waiters or kitchen helpers recidivated at a rate of 37.2 (above the projected rate of 34.8%) (Macdonald & Bala, 1987).

72 MacCormick reported in his time that in Minnesota, a state librarian had oversight of all institutional libraries, and worked closely with inmate and professional librarians in prisons; and that in Wisconsin, the state library commission extended to inmates the same library privileges that other
citizens enjoyed, lending to each small institutional library books from the main collection, on demand (MacCormick, 1931, p. 156). It is more or less supposed to work this way now, in most places, but from personal experience and from various reports, we are aware that in many situations these services work better on paper and in policy than in reality.

73 MacCormick, 1931, chp. X, "The library as an agency of education," pp. 150-179; Appendix I, "Aids for the institution librarian," prepared by John Chancellor pp. 319-354; Appendix II, "Practical suggestions for the operation of institution libraries," prepared by RolandMulhuaser, pp. 355-380. Bibliographies useful to prison librarians continue to be compiled; see Hartz et al., 1987, a select bibliography on the period from 1945 to 1985; Ryan, J. L., 1989, is an updated annotated bibliography of core resources pertinent to prison libraries for the development of literacy collections to meet the needs of adult or young adult new readers.

74 Teacher-presented instruction elicited higher scores than did the teaching machines, the results of which were, in turn, greater than the scores of those students who used text alone (Wood & Jenkins, 1971).

75 Archambeault, 1987; see two major studies addressing the issues of technology in correctional education: Roberts & Coffey, 1976; Reagen and Stroughten, 1976.

76 Gehring, 1990; educators outside of prisons raise the same questions about a hi-tech approach to instruction (Askov & Turner, 1990).

77 Seashore, Haberfeld, Irwin, Baker, 1976, p. 90, said it did not; Clendenen et al., 1979, said it did.

78 See the Illinois State Advisory Council on Adult, Vocational and Technical Education and the Illinois Employment and Training Council (Illinois State, 1983); see also the Prison Education Task Force report to the Alabama State Board of Education (Decisions 1985, 1986); see also the proposal for an international comparison of corrections programs (Caruso, 1983).

79 See T. A. Ryan's survey of tests (Ryan et al., 1987) and Bell's typical survey and categorization of types of programs (Bell, R. et al., 1977).

80 T. A. Ryan et al., 1987 found that a total of 166 different tests were in use across the country. The most frequently used tests were the TABE (Test of Adult Basic Education) used in 58% of the institutions, the WRAT (Wide Range Achievement Test) used in 45%, and the General Aptitude Test Battery in 26%. The tests can be classified as tests of achievement (TABE, WRAT), criterion-referenced (CASAS: Ricard and Stiles, 1985), intelligence (Slosson, Stanford-Binet, WISC/WAIS), and psycho-educational functioning (Woodcock-Johnston) (Ryan et al., 1987). In addition to these formal instruments, the Literacy Volunteers of America use the Read Test, an informal reading inventory that measures sight-recognition of words, word-analysis skills, reading, and listening inventory (Hills & Karcz, 1990; see further, Bellorado et al., 1986; Lyle & Wolfe, 1989). The TABE has been demonstrated to be unreliable when predicting GED scores (Littlefield & Dowling, n/d), though it continues to be used (Stewart, 1990).

81 Basic literacy, general education, humanities and social-science courses were approved by the inmates, but programmed instruction, compulsory programs, and group-counseling sessions were deemed ineffective (Ayers, 1979). Less formal, but nonetheless expert, assessments of prison programs at Folsom in California, Lorton in the District of Columbia, Rahway in New Jersey, and Attica in New York were forthcoming in the early 1970s out of the
boiling pot of prison riots at those institutions. In the Folsom Manifesto and its equivalent from the Lorton Inmate Grievance Committee, strong observations were made about the need for improving vocational training, but almost complete silence prevailed concerning academic education. In both of those institutions, however, academic courses had been relatively better developed than had vocational training been. Among the 28 Points issued at Attica, by contrast, was a demand for education, by which the inmates meant that they wanted the education system at Attica brought up to speed. Point 5 issued at Rahway was more articulate:

Educational-Vocational: Rahway Prison is a place where the educational system is truly inadequate. The programs are irrelevant to the needs of the inmate. There is no vocational training at all. General Motors has tried in the past to put a plant in the prison so that inmates could at least learn a skill that would be beneficial to them upon release, but unfortunately they were turned away by people who deemed it unnecessary, because their way was the best way to rehabilitation. (cited in Reagen & Stoughton, 1976, pp. 100-101)

82 Jenkins, 1989, p. 10; see Allemang, 1974, for a novel approach to control groups: In assessing a work/study program for delinquent women in 1974, each participant was taken to be her own control, as the researchers compared early data with completion data (Allemang, 1974). See also Bartell et al., 1977, for an attempt to arrange for control groups.

83 When educational programs are voluntary, attendance can be used as an indicator of program success (Harrison & Wood, 1977).

84 Evidence of a failed program with youthful offenders—usually relatively easy to work with—caused the researcher to call the policies and style of services in that particular program into question (Geizer, 1982a, b).
