This annotated bibliography contains 119 entries related to Native American health and health care. The entries were derived from the AGRICOLA database produced by the National Agricultural Library and include journal articles, government reports, conference papers, Congressional hearings, and books. Entries cover such topics as diabetes, women and children, health education, nutrition education, health services, dental health, mental health, obesity, mortality, and prenatal education. Each entry includes title, author, publisher, publication date, language, descriptors, and the National Agriculture Library call number. Some entries contain additional bibliographic information and an abstract or annotation. Also included are indexes by author and subject and information about interlibrary loan from the National Agricultural Library. (LP)
Bibliographies in the Quick Bibliography Series of the National Agricultural Library are intended primarily for current awareness, and as the title of the series implies, are not indepth exhaustive bibliographies on any given subject. However, the citations are a substantial resource for recent investigations on a given topic. They also serve the purpose of bringing the literature of agriculture to the interested user who, in many cases, could not access it by any other means. The bibliographies are derived from computerized on-line searches of the AGRICOLA data base. Timeliness of topic and evidence of extensive interest are the selection criteria.

The author/searcher determines the purpose, length, and search strategy of the Quick Bibliography. Information regarding these is available upon request from the author/searcher.

Copies of this bibliography may be made or used for distribution without prior approval. The inclusion or omission of a particular publication or citation may not be construed as endorsement or disapproval.

To request a copy of a bibliography in this series, send the title, series number and self-addressed gummed label to:

The Rural Information Center (RIC) is a joint project of the Extension Service and the National Agricultural Library (NAL). RIC provides information and referral services to local government officials, community organizations, health professionals and organizations, cooperatives, libraries, businesses, and rural citizens working to maintain the vitality of America's rural areas. The Center combines the technical, subject-matter expertise of Extension's nationwide educational network with the information specialists and resources of the world's foremost agricultural library.

The Office of Rural Health Policy in the Department of Health and Human Services (DHHS) and the NAL jointly created a Rural Information Center Health Service (RICHS) as part of the RIC. RICHS collects and disseminates information on rural health issues, research findings related to rural health, and innovative approaches to the delivery of rural health care services.

SERVICES:

Provide customized information products to specific inquiries including assistance in economic revitalization issues; local government planning projects; rural health issues; funding sources; and other related issues for the purpose of monitoring the quality of rural life.

Process a broad array of general and funding information requests on such topics as:

- Successful strategies, models, and case studies of community development projects
- Small business attraction, retention, and expansion
- Tourism promotion and development
- Recycling programs
- Community water quality
- Technology transfer to rural areas
- Closures, restructuring and diversification of rural hospital and clinics
- Agricultural health and safety
- Health programs, services, personnel issues
- State initiatives concerning rural health delivery issues

Refer users to organizations or experts in the field who can provide additional information.

Perform brief database searches of requested topics on a complimentary basis.

Furnish bibliographies and Rural Information Center Publication Series titles.

Identify current USDA and DHHS research and Cooperative Extension Systems programs.

Document Delivery Services to Individuals

The National Agricultural Library (NAL) supplies agricultural materials not found elsewhere to other libraries.

Filling requests for materials readily available from other sources diverts NAL's resources and diminishes its ability to serve as a national source for agricultural and agriculturally related materials. Therefore, NAL is viewed as a library of last resort. Submit requests first to local or state library sources prior to sending to NAL. In the United States, possible sources are public libraries, land-grant university or other large research libraries within a state. In other countries submit requests through major university, national, or provincial institutions.

If the needed publications are not available from those sources, submit requests to NAL with a statement indicating their non-availability. Submit one request per page following the instructions for libraries below.

NAL’s Document Delivery Service Information for the Library

The following information is provided to assist your librarian in obtaining the required materials.

Loan Service — Materials in NAL's collection are loaned only to other U.S. libraries. Requests for loans are made through local public, academic, or special libraries.

The following materials are not available for loan: serials (except USDA serials); rare, reference, and reserve books; microforms; and proceedings of conferences or symposia. Photocopy or microform of non-circulating publications may be purchased as described below.

Document Delivery Service — Photocopies of articles are available for a fee. Make requests through local public, academic, or special libraries. The library will submit a separate interlibrary loan form for each article or item requested. If the citation is from an NAL database (CAIN/AGRICOLA, Bibliography of Agriculture, or the NAL Catalog) and the call number is given, put that call number in the proper block on the request form. Willingness to pay charges must be indicated on the form. Include compliance with copyright law or a statement that the article is for “research purposes only” on the interlibrary loan form or letter. Requests cannot be processed without these statements.

Charges:
- Photocopy, hard copy of microfilm and microfiche — $5.00 for the first 10 pages or fraction copied from a single article or publication. $3.00 for each additional 10 pages or fraction.
- Duplication of NAL-owned microfilm — $10.00 per reel.
- Duplication of NAL-owned microfiche — $ 5.00 for the first fiche and $.50 for each additional fiche per title.

Billing — Charges include postage and handling, and are subject to change. Invoices are issued quarterly by the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161. Establishing a deposit account with NTIS is encouraged. DO NOT SEND PREPAYMENT.

Send Requests to:

USDA, National Agricultural Library
Document Delivery Services Branch, 6th Fl.
10301 Baltimore Blvd., NAL Bldg.
Beltsville, Maryland 20705-2351

Contact the Head, Document Delivery Services Branch in writing or by calling (301) 504-5755 with questions or comments about this policy.
ELECTRONIC MAIL ACCESS FOR INTERLIBRARY LOAN (ILL) REQUESTS

The National Agricultural Library (NAL), Document Delivery Services Branch accepts ILL requests from libraries via several electronic services. All requests must comply with established routing and referral policies and procedures. The transmitting library will pay all fees incurred during the creation of requests and communication with NAL. A sample format for ILL requests is printed below along with a list of the required data/format elements.

NAL Call Number Description (sound, color, size)
1. exs sausa/user 9018

2. ss (Indian? (2w)North()America? or Native ()American? or American ()Indian? or Eskimo?) /ti,de,eng

3. ss (health or medical or disease? or mortality or alcohol? or diabetes or diabetic? or hypertension or AIDS or acquired()immune)/ti,de,eng

4. ss s1 and s2 and s3

Language: English
Descriptors: Indians of North America; Medical care surveys

Language: English
Descriptors: Arizona; Adolescents; Knowledge; Attitudes; Acquired immune deficiency syndrome; Blacks; American indians; Hispanics; Age differences; Disease prevention; Mortality; Human immunodeficiency virus

Abstract: A survey of adolescents living in rural southwestern towns demonstrated their knowledge of the basic transmission routes of Acquired Immune Deficiency Syndrome (AIDS). Nevertheless, misconceptions and attitudes, which may interfere with adopting safe behaviors, persist. Significant differences in knowledge did exist between the ethnic groups surveyed. Further, American Indian and black adolescents were more likely to express attitudinal biases against people who have AIDS. We conclude that current media efforts have been successful in communicating basic information regarding transmission, but there may exist a need for ethnically specific programs that focus on the misconceptions and attitudes surrounding AIDS.

3. American Indian bibliography series.
Quick Bibliography Series

**Language:** English

**Descriptors:** Alaska; Arizona; Montana; New Mexico; North Dakota; South Dakota; American Indians; Infant mortality; Birth weight; Epidemiology; National surveys

**Abstract:** Extract: We used data from the National Infant Mortality Surveillance (NIMS) project to compare birthweights and birthweight-specific mortality risks among Native American and White infants. Because race categories in NIMS were limited to White, Black, and all, we studied six states in which greater than 85 per cent of newborns who were neither White nor Black were Native American. In these states, the infant mortality risk (IMR) among Native Americans was 1.5.3 deaths per 1,000 live births compared with 8.7 deaths among Whites, relative risk (RR) = 1.8 (95% CI = 1.5-2.0). The percentage of Native American infants with less than 2,500 g birthweights was 5.8 per cent versus 5.0 per cent for White infants. Birthweight-specific neonatal mortality risks were similar for the two race groups, but birthweight-specific postneonatal mortality risks (PNMRs) were more than three times as high among Native Americans compared with Whites for infants of greater than or equal to 2,500 g birthweight. PNMRs were elevated for most causes of death and for all categories for maternal age, educational attainment, trimester prenatal care began, and number of previous live births. Leading causes of postneonatal death among Native Americans of greater than or equal to 2,500 g birthweight were sudden infant death syndrome and infections. (author)

7 NAL Call No: 389.8 J824 Community-based exercise and weight control: diabetes risk reduction and glycemic control in Zuni Indians.  
Heath, G.W.; Wilson, R.H.; Smith, J.; Leonard, B.E.  
**Language:** English  
**Descriptors:** New Mexico; Weight control; Exercise; Diabetes mellitus; Weight losses; Body weight; Blood sugar; Community programs; Patient compliance; American Indians; Adults; Women

**Abstract:** Cardiovascular disease is a significant health problem for the Zuni Indians of southwest New Mexico, in part because of high rates of non-insulin-dependent diabetes mellitus (NIDDM). The Zuni Diabetes Project was initiated in July 1983 to reduce rates of obesity and provide primary and secondary prevention of NIDDM. Two studies of the project's activities have been carried out to date. After 2 y of follow-up, diabetic participants in an exercise program compared with diabetic nonparticipants experienced weight loss, a drop in fasting blood glucose values, and reductions in the use of hypoglycemic medications. In a weight-loss competition, 45% (122/271) of the enrollees finished and lost greater than or equal to 2.3 kg. The results of these two studies demonstrate that 1) participation in a community-based exercise program can produce significant weight loss and improvement in glycemic control in Zuni Indians with NIDDM and 2) weight-loss competitions appear to be an important public health model for health-behavior change in communities similar to that of Zuni, NM.

8 NAL Call No: 151.65 P96 Comparison of native American births in upstate New York with other race births, 1980-86.  
Buck, G.M.; Mahoney, M.C.; Michalek, A.M.; Powell, E.J.; Shelton, J.A.  
**Language:** English  
**Descriptors:** New York; Birth; American Indians; Blacks; Ethnic groups; Ethnicity; Birth weight; Pregnancy; Medical treatment; Education; Age; Mothers; Women; Infants; Epidemiological surveys

**Abstract:** The purpose of this study was to describe the neonatal characteristics of Native American (Indian) infants and the antenatal characteristics of their mothers as compared with white, black, and other race infants. The study population comprised 979,444 live births to upstate New York (exclusive of New York City) resident mothers between 1980 and 1986. Data were abstracted from vital records (birth certificates) and analyzed using a variety of descriptive statistics. Mothers of Native American and black infants had similar antenatal profiles (that is, younger, higher parity, lower ed-
ucational attainment, and delayed initiation of prenatal care), which differed from mothers of white or other race infants. Despite having at-risk mothers, Native American infants were similar to white and other race infants with respect to the percentage of births that were considered low birth weight or premature. Black infants were twice as likely as the other three groups of infants to be low birth weight or premature. These findings suggest that other factors appear to be important in determining neonatal outcome and that typical at-risk antenatal profile of mothers may not be consistent across all racial groups.

9  NAL Call No: 151.65 P96
A comprehensive local program for the prevention of fetal alcohol syndrome.
Masis, K.B.; May, P.A.
Language: English

Descriptors: Arizona; Fetal alcohol syndrome; Disease prevention; Program development; Program evaluation; American indians; Alcoholic beverages; Community health services; Family counseling; Pregnancy

Abstract: A hospital based, comprehensive approach to the prevention of Fetal Alcohol Syndrome and Fetal Alcohol Effects that combines clinical assessment, community outreach, and epidemiologic knowledge to attack alcohol-related birth defects is described. The program includes training of clinicians and members of the community, baseline screening of suspected children, and alcohol consumption screening of pregnant women in prenatal clinics. The major, although not exclusive, focus of the program is on tertiary prevention undertaken with women defined as "high risk" for producing alcohol affected children. Of the 48 women referred to the program at the Tuba City, AZ, Indian Medical Center between January 1988 and July 1989, 39 (81 percent) became participants. Complete followup was possible on 31; 17 of them reported alcohol abstinence in July 1989, 18 months into the program. Of the 29 referred women who were pregnant at the time, 21 agreed to participate, of these, 19 (65.7 percent) were abstinent by the third trimester of pregnancy, 5 voluntarily accepted offers of contraceptive measures after the birth of their child.

10  NAL Call No: GR880.P6
Coumarin-containing plants and serum albumin polymorphisms: biomedical implications for Native Americans of the Southwest.
Raichelson, R.M.
Bedford Hills, N.Y.: Redgrave.

Language: English

Descriptors: U.S.A.; Food consumption; Coumarins; Polymorphism; Albumins; American indians; Health hazards

11  NAL Call No: 500 AM33
Cross-cultural medicine: the Navajo Indians as case exemplar.
Deuschle, K.W.
Cambridge, Mass.: American Academy of Arts and Sciences.

Language: English

Descriptors: U.S.A.; American indians; Health services; Cultural integration; Cultural values; Public health

12  NAL Call No: RC660.A1D522
Cultural challenges in nutrition education among American Indians.
Jackson, M.Y.; Broussard, B.A.
Chicago, Ill.: American Association of Diabetes Educators.

Language: English

Descriptors: U.S.A.; American indians; Nutrition education; Cultural influences; Diabetes; Health beliefs; Food beliefs

Abstract: An overview is presented of the cultural factors influencing nutrition behavior and its relevance for nutrition education and diabetes management among American Indians. Traditional and biomedical health belief systems, diabetes and traditional medicine, functions of food in American Indian culture, and Indian beliefs about body image and obesity are discussed. Techniques are suggested to improve nutrition education among American Indians.
13 NAL Call No: RC660.A1D522
Designing and evaluating diabetes education material for American Indians.
Hosey, G.M.; Freeman, W.L.; Stracqualursi, F.; Gohdes, D.
Chicago, Ill. : American Association of Diabetes Educators.
Language: English
Descriptors: Washington; Oregon; Idaho; Diabetes mellitus; Educational programs; Program development; Program evaluation; Teaching materials; Reading; Nutrition education; Knowledge level; Achievement tests; Resource materials; American Indians
Abstract: This paper describes the methods used to develop and evaluate diabetes education material for American Indians and Alaska Natives living in Washington, Oregon, and Idaho. Reading skills of individuals and readability of a sample of existing diabetic education material were measured. Using the Wide Range Achievement Test to measure reading skills, the authors found that 66% of the sample read at a 5th "grade" or higher level. Readability of a sample of available diabetic education material was found to be, on average, at the 10th "grade" level. Diabetes education booklets targeted to a 5th to 7th "grade" level were developed and assessed for acceptability and comprehension. Final evaluation, using the cloze procedure, showed that 62% of the target audience understood the messages in the booklets. A comprehensive assessment process was found to be useful in developing effective diabetes education material for Indian communities.

15 NAL Call No: RJ1.C3
Determinants of diabetes mellitus in the Pima Indians.
Koehler, W.C.; Saad, M.F.; Pettitt, D.J.; Nelson, R.G.; Bennett, P.H.
Language: English
Descriptors: U.S.A.; Child development; Minorities; American Indians; Asians; Blacks; Hispanics; Parents; Preschool children; Infants; Influences: Cultural sociology; Beliefs; Child care; Health: Health care; Family structure; Socioeconomic status; Parent child relationships; Literature reviews
Abstract: Higher than usual incidence of diabetes is reported among many American Indian tribes. To define the extent of the problem in a retrospective analysis, the health records of members of the Mandan, Arikara and Hidatsa Indians of North Dakota (the Three Affiliated Tribes) were reviewed, 3,719 usable Indian charts. Full inheritance Indians (45% of the total) age 35 or older have a diabetes prevalence rate of 22.3%. Persons with between half and full inheritance (29% of the total) have a rate of 14.9%. Those with less than half Indian inheritance (26% of the total) have a rate of 4.1%, or the same as whites living on the reservation. Below the age of 35, diabetes is uncommon among all racial subgroups.
tribes in North Dakota, South Dakota, and Nebraska.

Stahn, R.M.; Gohdes, D.; Valway, S.E.

Abstract: Objective. To determine the prevalence and incidence rates of diabetes and two specific complications for selected American-Indian tribes in North Dakota, South Dakota, and Nebraska.

Diabetes and obesity in the offspring of Pima Indian women with diabetes during pregnancy.
Pettitt, D.J.; Nelson, R.G.; Saad, M.F.; Bennett, P.H.; Knowler, W.C.

Abstract: Objective. To review the long-term effects of the diabetic pregnancy on the offspring among the Pima Indians of Arizona.

Diabetes and plasma lipoproteins in Native Americans: Studies of the Pima Indians.
Howard, B.V.

Abstract: To determine the effects of diabetes on plasma lipoproteins in Pima Indians, to identify metabolic determinants of these differences, and to examine the effects of various modes of diabetes therapy.

The ancestors of the Pima Indians have subsisted in the southern Arizona desert by irrigation farming, hunting and gathering for at least 2000 years. During the past 40 to 50 years, they have experienced marked changes in lifestyle and a progressive increase in the incidence of obesity and type 2 diabetes mellitus. The reasons for these changes, which are probably numerous, are unclear. As a group, the Pima Indians appear to have a strong genetic predisposition to diabetes, probably as a result of genetic selection. In addition, some families are more at risk than others, either as a result of a greater genetic load or from greater environmental stress. The products of pregnancies which were complicated by diabetes are at a particularly high risk of becoming obese and developing diabetes. Successive generations, because of genetic predisposition, environmental stress, and a greater number of diabetic pregnancies are at increasing risk.

Diabetes and obesity in the Pima Indians: a cross-generational vicious cycle.
Pettitt, D.J.; Knowler, W.C.

Abstract: The ancestors of the Pima Indians have subsisted in the southern Arizona desert by irrigation farming, hunting and gathering for at least 2000 years. During the past 40 to 50 years, they have experienced marked changes in lifestyle and a progressive increase in the incidence of obesity and type 2 diabetes mellitus. Successive generations, because of genetic predisposition, environmental stress, and a greater number of diabetic pregnancies are at increasing risk.

Diabetes and obesity in the Pima Indians: a cross-generational vicious cycle.
Pettitt, D.J.; Knowler, W.C.

Abstract: The ancestors of the Pima Indians have subsisted in the southern Arizona desert by irrigation farming, hunting and gathering for at least 2000 years. During the past 40 to 50 years, they have experienced marked changes in lifestyle and a progressive increase in the incidence of obesity and type 2 diabetes mellitus. The reasons for these changes, which are probably numerous, are unclear. As a group, the Pima Indians appear to have a strong genetic predisposition to diabetes, probably as a result of genetic selection. In addition, some families are more at risk than others, either as a result of a greater genetic load or from greater environmental stress. The products of pregnancies which were complicated by diabetes are at a particularly high risk of becoming obese and developing diabetes. Successive generations, because of genetic predisposition, environmental stress, and a greater number of diabetic pregnancies are at increasing risk.
overweight, family history of disease, constant hunger, fatigue, thirst, and slow wound healing. Diabetic complications include atherosclerosis, impaired blood circulation, kidney failure, nerve damage, visual changes, and increased risk of infection. The following aspects of diabetes management are described: food selection and preparation for weight control, selecting and ordering meals away from home, and controlling diabetes while on travel. Symptoms and emergency treatment measures for insulin reaction (hypoglycemia) and diabetic acidosis (hyperglycemia) are reviewed. Several recipes are provided for low-calorie salad dressings. Benefits of diet counseling and counseling services available through the local Indian Health Service are identified.

Language: English

Descriptors: Minnesota; Diabetes; Incidence; Complications; American Indians

Abstract: Objective. To determine the prevalence and incidence of diabetes, and the incidence of major diabetic complications, in a Chippewa Indian population.

Language: English

Descriptors: U.S.A.; Diabetes; Trends; American Indians

Abstract: To review the growth of diabetes as a major health problem for American Indians and Alaska Natives.

Language: English

Descriptors: Alaska; Diabetes; Incidence; Conferences; American Indians

Abstract: Diabetes in American Indians and Alaska Natives was the focus of a conference that resulted in a unique interchange among tribal leaders, health-care providers, and medical scientists with particular interests in diabetes mellitus and its complications. The conference, which was held in Mesa, Arizona, 14-17 November 1989, was sponsored by the Indian Health Service and the National Institute of Diabetes and Digestive and Kidney Diseases, in collaboration with the Intertribal Council of Arizona.
Abstract: The two goals of the next generation of diabetes research should be to reduce the incidence of diabetes mellitus and to decrease the risk of complications from the disease. The prevention of diabetes will require a better understanding of the interaction of genetic and host-environmental factors, especially energy balance, diet and exercise, and specific nutrients. The prevention of weight gain should probably be of highest priority. The prevention of complications needs to focus on hyperinsulinemia, hyperglycemia, blood pressure, smoking, and lipoproteins. Clinical trials are needed to evaluate objectively the benefits of specific interventions. Such trials should be closely linked to community health programs to maximize the health status of the population.

Objective. To establish a registry of patients with diabetes and determine the point prevalence of diabetes in the Mississippi Choctaw Indians at the end of September 1989.

Objective. To establish a registry of diabetes patients and to determine the point prevalence of diabetes in the St. Regis Mohawk New York community at the end of August 1989.

Objective. To establish a registry of diabetes patients and to determine the point prevalence of diabetes in Alaskan Yup'ik Eskimos and Athabascan Indians after 25 yr.

Objective. To estimate the prevalence of diabetes mellitus and overweight in two populations of Alaska Natives and to compare the results with previous data.

Objective. To determine the prevalence of diabetes in Tohono O'odham pregnancies, and to assess the efficacy of early prenatal diabetes screening in populations with high rates of diabetes.

Objective. To determine the prevalence of diabetes in Tohono O'odham pregnancies, and to assess the efficacy of early prenatal diabetes screening in populations with high rates of diabetes.
Objective. To determine the diabetes-related mortality rates among New Mexico's American Indians, Hispanics, and non-Hispanic whites over a 30-yr period.

Abstract: Objective. To describe diabetes-associated mortality among Native Americans.

Abstract: Objective. To estimate the prevalence of severe diabetic complications.

Abstract: Objective. To provide descriptive epidemiological data on diabetes mellitus among Alaska Natives, including incidence, updated prevalence, and incidence rates of ESRD, LEA, MI, and stroke in the diabetic population.

Abstract: Objective. To characterize demographic, therapeutic, and complication features of patients in the Fort Totten Diabetes Project and to assess the longitudinal impact of intervention strategies.

Abstract: Objective. To determine the diabetes status of the disease among American Indians, Blacks, and Hispanics: [statement of] Eleanor Chelimsky, Assistant Comptroller General, Program Evaluation and Methodology Division, before the Select Committee on Aging, House of Representatives.
Diet and nutrition related diseases of ethnic minorities.
Groziak, S.M.; Diemand, L.M.
School foodservice journal v. 43 (6): p. 82, 84; 1989 Jun.

Language: English

Descriptors: Ethnicity; Eating habits; Risks; Nutritional assessment; Blacks; Hispanics; Asians; American indians

Abstract: This article discusses several ethnic minorities, their eating habits and how their food choices affect their health and nutritional status.

38 NAL Call No: 389.8 D14
Diet and nutrition-related concerns of blacks and other ethnic minorities.
McBean, L.D.

Language: English

Descriptors: U.S.A.; Food intake; Cultural influences; Health; Dietary factors; Nutrition; Nutrient intake; Obesity; Hypertension; Diabetes; Osteoporosis; Risks; Blacks; Hispanics; American indians

Abstract: Ethnic minorities in the U.S., specifically black, Hispanic, Asian/Pacific, and Native Americans, have higher rates of morbidity and mortality than the white (non-Hispanic) population. Both genetic and environmental factors contribute to these disparities. Among environmental factors, dietary patterns are important determinants of health. Diets of ethnic minority groups are influenced by a number of factors including the nature of the traditional diet, and the degree to which this diet has been adapted to or replaced by diets typical of the U.S. Although certain food themes and preferences such as "soul" and southern foods are emphasized in the diets of black Americans, their diets resemble those of the white population. In contrast, traditional diets of Hispanic, Asian/Pacific, and Native Americans not only differ from each other but also from those of the white population. In particular, carbohydrate-containing foods (e.g., rice, tortillas), rather than meat, are the major source of energy in the traditional diets of these ethnic minority populations. In general, complex carbohydrates and sodium are high in these diets, whereas total fat, saturated fat, calcium, iron and some vitamins are relatively low. Inadequate calcium intake of many ethnic minority populations is associated with limited use of dairy foods, either as a result of lactose intolerance or culturally-determined food avoidances. Some nutritional risks associated with ethnic minority group dietary patterns are the result of adaptation to U.S. dietary patterns. Nutrition-related diseases of high prevalence in ethnic minorities include obesity and diabetes in black, Hispanic, and Native Americans, and hypertension in black and Asian/Pacific Americans. Salt sensitivity and a low dietary intake of potassium and calcium have been identified as possible risk factors for hypertension in black Americans. Compared with whites, some minority groups, despite their overall lower calcium intakes, are

39 NAL Call No: 151.65 P96
Differences between Oklahoma Indian infant mortality and other races.
Kennedy, R.D.; Deapen, R.E.

Language: English

Descriptors: Oklahoma; Infant mortality; American Indians; Races; Classification

Abstract: Indian infant mortality rates (IMR) in the State of Oklahoma follow a downward linear trend from 13 per 1,000 live births in the 1975-76 period to 5.8 in 1987-88. Data from 7,631 death certificates matched to birth certificates, however, reveal much higher Indian IMR across the time interval than is currently documented. Matching (linking) of infant deaths to birth certificates from 1975 to 1988 indicates that infants born Indian had a 28 percent chance of being misclassified as another race (usually white) on the death certificate. Infants born white or black had less than 1 percent chance of being misclassified. Misclassification of Indian deaths strongly alters the overall IMR for the Oklahoma Indian Population from the currently reported 5.8 per 1,000 (1987-88) to an estimated actual rate of 10.4 per 1,000 for the same period.

Language: English

Descriptors: U.S.A.; American indians; Diseases; Genetic correlation; Risks; Environmental factors; Reviews

Abstract: A comprehensive technical review summarizes and discusses the specific diseases and disease patterns of North American Indians. Following a review and discussion of the origin and current status of American Indian populations and their health patterns, attention is given to discussions of the prevalence and predisposition of such populations to each of 18 diseases. The influence of the drastic cultural disruptions experienced by these populations on disease propensity is discussed. Their relatively high tendency towards diabetes, cholesterol gallstones, and obesity, and their relatively low incidence of duodenal ulcer and coronary heart disease is noted. (wz)

Duration of obesity increases the incidence of NIDDM.
Everhart, J.E.; Pettitt, D.J.; Bennett, P.H.; Knowler, W.C.

Language: English

Descriptors: Arizona; Obesity; Duration; Diabetes mellitus; Incidence; Body weight; American indians; Blood sugar; Blood serum; Insulin; Women; Men; Longitudinal studies

Abstract: The effect of duration of obesity on incidence of non-insulin-dependent diabetes mellitus (NIDDM) was determined among Pima Indians. Duration of obesity was defined as the time since body mass index (BMI) was first known to be at least 30 kg/m². Among 1057 participants eligible for study, there were 224 incident cases of NIDDM in 5975 person-yr of follow-up. The association of duration of obesity with incidence of diabetes adjusted for age, sex, and current BMI was highly significant (P < 0.0001). This adjusted incidence of diabetes in cases/1000 person-yr of obesity was 24.8 for people with less < 5 yr of obesity, 35.2 for people with 5-10 yr of obesity, and 59.8 for people with at least 10 yr of obesity. There was no apparent excess risk of diabetes for people who had a BMI of at least 30 kg/m² and then lost weight. They had a slightly nonsignificantly higher rate than people who had not attained a BMI of at least 30 kg/m² and a lower rate than people whose BMI remained 30-35 kg/m². The relationship of duration of obesity with serum insulin concentrations among nondiabetic people was determined controlling for sex and age, BMI, and plasma glucose concentrations at the time of a glucose tolerance test. Duration of obesity was inversely associated with fasting serum insulin concentration through most of the range of fasting plasma glucose concentrations (P < 0.001) and tended to be inversely associated with 2-h postload serum insulin concentration through the entire range of postload plasma glucose concentrations (P = 0.058).

Effects of exposure to salty drinking water in an Arizona community.
Chicago : American Medical Association.

Language: English

Descriptors: Arizona; Drinking water; Sodium; American indians; Blood pressure; Hypertension; Nutrient intake

Abstract: A survey of 342 Arizona Papago Indians and 375 non-Indians consuming drinking water containing a high Na level (440 mg/L) revealed no association between Na intake and blood pressures. Mean blood pressures in white subjects actually were lower at most age levels than in US white populations, and the hypertension incidence
was not significantly higher than the national US incidence. Data on health risk factors, Ca intakes, and urinary Na and K levels also were obtained.\(^{wz}\)

Language: English

Descriptors: U.S.A.; Food relief; United States; Indians of North America; Reservations; Nutrition; Study and teaching; Reference works; Supplemental feeding programs; Nutritional value; Nutrition education; American Indians; Food costs; Federal programs; Health promotion; Program evaluation

Abstract: A 4-month technical project addressed two important components of providing adequate nutrition to US Indian reservations: 1) the foods provided were reviewed for nutrient content, cost, and food preferences of participants, and compared the foods for satisfying the RDA's of major nutrients; and 2) an assessment was made of current nutrition education practices, available nutrition education materials, and new methods for delivering nutrition education. Following these assessments, recommendations were developed for improving the nutrient content of the foods provided and for improving the delivery of nutrition education. Background information on legislation, regulations, and organizational structure of the US Indian reservations program, the current health status of American Indians, and on the evaluation of food preferences is included. Descriptive components of the program are provided in 8 appendices. Food costs, nutritional data, and food inventories are included in the text and the appendices.

Health implications of obesity in American Indians and Alaska Natives.
Welty, T.K.

Language: English

Descriptors: Obesity; American indians; Diabetes; Cardiovascular diseases; Hypertension; Hypercholesterolemia; Kidney diseases; Pregnancy; Gall bladder diseases; Infections; Mortality; Literature reviews

Abstract: American Indians and Alaska Natives (AI/ANs) are experiencing an epidemic of diabetes, increasing rates of coronary artery disease and hypertension, and poor survival rates for breast cancer that are likely partially attributable
NATIVE AMERICAN HEALTH CARE

to the increasing prevalence of obesity over the past generation. Obesity may also contribute to the high rates of gallstones and to adverse outcomes of pregnancy in AI/ANs. Although overall mortality was not associated with obesity in Pima Indians (except in the most obese men), the relationship of obesity to longevity in other AI/AN groups is not known. Further study of the specific health effects of obesity in various groups of AI/ANs are needed. In the meantime, community-based programs to prevent obesity and its sequelae should be implemented in all AI/AN communities.

Davis, S.M.; Hunt, K.; Kitzes, J.M.

Language: English

Descriptors: New Mexico; Adolescents; Health; American Indians; Rural youth; Public services; Demonstrations; Program development

Abstract: The health status of Indian teenagers in the United States is below that of the general population. The usual barriers to the use of health care services that young people, including young Indians, encounter are compounded in rural areas by distance, isolation, and lack of appropriate services. To overcome these barriers in rural New Mexico, a public health demonstration project (a) established a single location where adolescents can receive multiple, integrated health care services free of charge; (b) set up the initial program of services at a rural school; (c) established links with existing agencies; and (d) incorporated community action toward creating change. The project began as a joint effort of three communities, the University of New Mexico (UNM), and the Albuquerque Area Indian Health Service (IHS) of the Public Health Service; a secondary level public school soon became a participant. The project is being replicated in two other communities that have formed separate partnerships with UNM and the area IHS; also the New Mexico Health and Environment Department has joined the effort in one community. Preliminary data suggest that the services are being used by a majority of the target population, with the proportions of boys and girls about equal.

Brosseau, J.D.

Language: English

Descriptors: U.S.A.; Diabetes; Incidence: American indians

Abstract: The findings from a 1988 audit of medical records of the Three Affiliated Tribes (the Mandan, Arickara, and Hidatsa) at the Fort Berthold, ND, Indian Reservation were compared with the findings from a 1975 audit. The total population served by the IHS clinic there has remained about the same. However, the number of people diagnosed as having diabetes has increased by 40%. This increase in known cases is caused largely by an increase in the number of women aged > 40 yr who have diabetes. The actual prevalence of diabetes among people aged > 40 yr has increased very little, presumably because the clinic population has aged somewhat over this period of time.

The Indian health service record of achievement.
Rhoades, E.R.; D’Angelo, A.J.; Huriburt, W.B.

Language: English

Descriptors: American indians; Eskimos; Community health services; Program evaluation

Abstract: Extract: The Indian Health Service (IHS) was transferred from the Department of Interior to the Public Health Service in the Department of Health, Education, and Welfare in 1955. At that time, the general health of Indian people substantially lagged behind the rest of the U.S. population. This gap was reflected in mortality rates which were several-fold higher for Indians, or reflected in time; there were decades between the dates when the U.S. population achieved certain lower death rates compared with the dates when similar reductions were achieved by Indians. As a result of preventive health programs, improvements in sanitation, and the development of a number of medical advances, substantial progress has been achieved in improving the health of American Indians and Alaska Natives. Life expectancy of Indians has increased 20 years between 1940 and 1980. From 1955 through 1982, the death rate for Indian infants dropped by 82 percent. Also, the age-adjusted death rate for tuberculosis decreased from 57.9 per 100,000 population in 1955 to 3.3 in 1983. These and other improvements are summarized in this paper. (author)

Mental health values differences between Native American and Caucasian American college students.

Tyler, J.D.; Suan, L.V.

Fresno, Calif. : California School of Professional Psychology.

Language: English

Descriptors: North Dakota; American indians; College students; Mental health; Values; Questionnaires; Demography; Ethnic groups

Abstract: Differences between Native and Caucasian American college students in the way mental health is conceptualized was investigated using the Mental Health Values Questionnaire, an eight-scale, factor analytically derived measure of dimensions used in conceptualizing the nature of good emotional adjustment. Sixty-six Native American and 93 Caucasian American undergraduate students served as subjects. The most striking ethnic group difference had to do with the tendency of Caucasian American subjects to more strongly associate unconventional experiences of reality (e.g., having visions) with poor mental health in contrast to Native students who tended to perceive a neutral to positive relationship between such experiences and healthy emotional functioning.

Chicago, Ill.: The Association.
Abstract: Extract: The nutritional and health status of American Indians and Alaska Natives has improved throughout the years. However, their health status still lags behind that of the general American population. There is incomplete information on their nutritional status and present dietary patterns, nutritive values of native foods, and nutrition education knowledge of the population. (author)

Abstract: A breastfeeding education project was designed to increase the incidence and duration of breastfeeding among women at the Papago Indian reservation in Arizona. The activities of this project, the development of new educational materials, and the overall results are presented in 3 volumes. Attitudes influencing infant feeding practices were assessed, and supporting services for pregnant women and new mothers were developed and used. All activities of the project were coordinated by staff of 7 related health agencies on the reservation site. This education project produced an increased number of women beginning breastfeeding. The educational materials are applicable for breastfeeding education for other Indian tribes. (wz)

Abstract: A set of lesson plans developed by the N.D. State Dept. of Health is presented. The lesson plans were developed to be used in the United Tribes Educational Technical Center (UTETC) to train native Americans to work as paraprofessionals in the WIC program. The lessons can also be used for self study. The first modules consist of 2 sections. The first section contains 9 lessons related to basic nutrition (i.e., food composition, major nutrients, digestion and nutrient needs). The second section contains 6 lessons that discuss nutritional assessment (clinical, anthropometry, laboratory, dietary, obesity, and diabetes). The second module discusses the WIC program (2 lessons), nutrition counseling skills, (3 lessons), and nutrition education techniques (1 lesson). The third module consists of 2 major areas that discuss nutrition and pregnancy and community resources for health care programs. Each lesson has color-coded sections (e.g., blue for objectives, yellow for the self-study section, green for the answer section). A final report on the project also is available. (kbc)

Pathogenesis of NIDDM in Pima Indians.
Bogardus, C.; Lillioja, S.; Bennett, P.H.
Diabetes care v. 14 (7); p. 685-690; 1991 Jul. Includes references.

Language: English

Descriptors: Arizona; Diabetes mellitus; Incidence; Glucose tolerance; Longitudinal studies; Insulin; Blood plasma; Metabolic studies; Liver; Pathogenesis; Pancreas; American indians

Abstract: The Pima Indians of Arizona have the highest reported prevalence and incidence of non-insulin-dependent diabetes mellitus (NIDDM) of any population in the world. A cross-sectional and longitudinal study was begun in 1982 to determine the metabolic characteristic(s) that is (are) predictive of the development of NIDDM and to document the sequence of metabolic events that occur with the transition from normal to impaired glucose tolerance and then to diabetes. Preliminary analyses suggest that insulin resistance is a primary abnormality predisposing Pima Indians to develop impaired glucose tolerance, and that the development of diabetes occurs with subsequent pancreatic failure.

Language: English

Descriptors: Nebraska; Indians of North America; Food; Diabetes; Nutritional aspects; Diabetes; Diet therapy; Diet; Handbooks, manuals, etc; Popular works; Patient education; Diabetes; American indians; Dietary guidelines; Diabetic diets

Abstract: Developed for use by the Plains Indians with diabetes, this booklet emphasizes diet as a means for controlling the disease. Introduced by a color-coded dietary guide, the basic food groups are presented to include recommended foods and serving sizes. Combination foods, foods with fat, foods to avoid, foods to freely use and those allowed in reasonable amounts are presented in the same manner. Cautions and reminders accompany each section; pictures illustrating serving sizes and other concepts addressed are included with each section.

Pregnancy and diabetes.
Gila River Indian Community (Arizona: Association)
Sacaton, Ariz.: Gila River Indian Community, Human Resources Dept./Health Branch. WIC Program, [198-?].
[6]: ill.; 22 cm. Cover title.

Language: English

Descriptors: Arizona; Popular works; Patient education; Diabetes; Pregnant women; American indians; Health care

Abstract: Designed for the pregnant American Indian woman with diabetes, this booklet presents specific steps to follow in order to keep the disease under control. Symptoms of both hypoglycemia and hyperglycemia are listed, as well as signs indicating the need for immediate medical attention. The necessity for weight control is emphasized. Drawings illustrate the concepts presented.

Preventing baby bottle tooth decay in American Indian and Alaska native communities: a model for planning.
Bruerd, B.; Kinney, M.B.; Bothwell, E.

Language: English

Abstract: Baby bottle tooth decay (BBTD) is a preventable dental disease which surveys have shown affects more than 50 percent of Native American children. An experimental program to prevent BBTD was implemented in 12 Native American communities. The project represented a cooperative effort by three Department of Health and Human Service agencies: Administration for Children, Youth, and Families; Head Start Bureau; Indian Health Service; Dental Program; and Centers for Disease Control, Dental Disease Prevention Activity. Intervention strategies included the training of parent volunteers, health professionals, and the tribal employees who counseled...
provide insight into possible variations in cardiovascular disease and its risk factors among diverse population groups. This study provides longitudinal results documenting statistically significant decreases in the prevalence of BBTD at the pilot sites. This multidisciplinary, comprehensive intervention offers a model for organizing members of minority communities to prevent health problems.

Descriptors: Cardiovascular diseases; Diabetes; Risk; American indians; Diagnosis; Mortality; Morbidity; Longitudinal studies; Disease surveys; Women; Men

Abstract: The Strong Heart Study is a study of cardiovascular disease and its risk factors among diabetic and nondiabetic Native Americans. The study includes 12 tribes in Arizona, Oklahoma, and North and South Dakota. Phase I, initiated in October 1988, included a mortality survey to determine CVD death rates in individuals 35-74 yr old between 1984 and 1988, and a medical record review to determine rates of myocardial infarction and stroke for individuals ages 45-74 during the same time. In addition, a physical examination was performed on persons 45-74 yr old to measure the prevalence of cardiovascular and peripheral vascular diseases and known and suspected risk factors. In Phase II, CVD mortality and morbidity rates will be determined in the examined cohort by surveillance. CVD risk factors, changes in risk factors over time, and the relationship between risk factors and CVD incidence will be assessed longitudinally. This study provides data on the relative importance of cardiovascular risk factors in nondiabetic and diabetic Native Americans and will provide insight into possible variations in the quantitative or qualitative importance of CVD risk factors among diverse population groups.

Language: English

Descriptors: Rural health services; Hospitals, Rural; Indians of North America

Language: English

Descriptors: Washington; Obstetrics; Health care; Prenatal period; Rural areas; Urban areas; Infant mortality; Low birth weight infants; Risk; Blacks; American indians; Marriage; Age differences; Ethnic groups; Hospitals; Health centers

Abstract: It is often assumed that poor birth outcomes are more common among rural women than urban women, but there is little substantive evidence to that effect. While the effectiveness of rural provider and hospitals has been evaluated in previous studies, this study focuses on poor birth outcome in a population of rural residents, including those who leave rural areas for obstetrical care. Rural and urban differences in rates of inadequate prenatal care, neonatal death, and low birth weight were examined in the general population and in subpopulations stratified by risk and race using data from five years (1984-88) of birth and infant death certificates from Washington state. Also examined were care and outcome differences between rural women delivering in rural hospitals...
Quick Bibliography Series

and those delivering in urban facilities. Bivariate analyses were confirmed with logistic regression. Results indicate that rural residents in the general population and in various subpopulations had similar or lower rates of poor outcome than did urban residents but experienced higher rates of inadequate prenatal care than did urban residents. Rural residents delivering in urban hospitals had higher rates of poor outcomes than those delivering in rural hospitals. We conclude that rural residence is not associated with greater risk of poor birth outcome. White and nonwhite differences appear to exceed any rural and urban residence differences in rates of poor birth outcome.

105 NAL Call No: 389.8 AM34
Selected traditional and contemporary foods currently used by the Pima Indians.
Smith, C.J.; Schakel, S.F.; Nelson, R.G.
Chicago, Ill.: The Association.

Language: English

Descriptors: Arizona; Food preferences; History; Ethnic foods; Eating patterns; Diet; Food preparation; Nutrient databanks; Nutrient content; Diabetes; Risk; Dietary surveys; Obesity; American Indians

Abstract: In 1988, a large-scale dietary survey of the Pimas was begun as part of a study of the natural history of diabetic renal disease. Because of the uniqueness of this population and the specific character of their foods, it was decided to develop a new computerized nutrient database containing specific entries for the food items and mixed dishes currently used by the Pimas. In this way potential errors in approximating Piman foods with others in commonly used US nutrient databases would be avoided, and accurate dietary analysis of food records could be accomplished. In addition, more complete nutrient composition data would be obtained on Piman foods than had previously been reported.

106 NAL Call No: 151.65 P96
Serum cholesterol concentrations among Navajo Indians.
Sugarman, J.R.; Gilbert, T.J.; Percy, C.A.; Peter, D.G.

Language: English

Descriptors: Arizona; Cholesterol; Blood serum; American Indians; Anthropometric dimensions; Diabetes; Low density lipoprotein; High density lipoprotein; Triglycerides; Surveys; Age differences; Women; Men

Abstract: Navajo Indians have been reported by earlier investigators to have low concentrations of serum lipids and a low prevalence of hyperlipidemia, as well as low rates of ischemic heart disease. However, no data on serum lipid concentrations among Navajos have been reported for more than two decades. The authors conducted a study to determine the distribution of concentrations of serum total cholesterol (TC), high density lipoprotein cholesterol, low density lipoprotein cholesterol, and triglyceride among persons 25-74 years old living in a representative community on the Navajo Indian reservation. Data are reported for 255 subjects, 105 men and 150 women, ages 25-74 years. The authors compared these data to those for the general population as determined by the second National Health and Nutrition Examination Survey (NHANES II). TC concentrations...
NATIVE AMERICAN HEALTH CARE

among Navajo men were similar to those from NHANES II. TC concentrations among younger Navajo women were similar to those for women younger than 55 years from NHANES II, but were significantly lower among older Navajo women. While 27.6 percent of men ages 25-74 years studied in NHANES II had TC concentrations greater than 240 milligrams per deciliter, 33.8 percent of Navajo men had similarly elevated TC. However, the prevalence of serum TC concentrations greater than 240 milligrams per deciliter among Navajo women (17.5 percent) was about half that among women studied in NHANES II (32.9 percent). A similar pattern was found for low density lipoprotein cholesterol. The researchers concluded that Navajo Indians are no longer characterized by low serum lipid concentrations, that increased cholesterol concentrations may be a harbinger of increasing rates of atherosclerotic coronary heart disease among Navajos, and that attention should be directed to primary prevention of hyperlipidemia in Navajo Indian communities.

7 Smokeless tobacco use among native American school children.
Buerd, B.
Language: English

Descriptors: South Dakota; Montana; Nebraska; Washington; Arizona; New Mexico; Alaska; School children; Chewing tobacco; American indians; Literature reviews; Health hazards

Abstract: Seven published and two unpublished surveys of Native American school children's use of smokeless tobacco (ST) are reviewed. The surveys represent school children in the States of South Dakota, Montana, Nebraska, Washington, Arizona, New Mexico, and Alaska. This review describes and discusses the survey methods, prevalence, duration, and intensity of ST use, and ST health effects documented in these studies. Prevalence of regular ST use ranges from 18 percent in kindergartners through 6th graders to 55.9 percent among 9th and 10th graders. In two studies that surveyed kindergartners, regular use was reported at 13 percent in one study and 21 percent in the other. Comparisons to use by non-Native Americans, as reported in surveys, demonstrate the severity of the problem in Native American communities. There appear to be three significant find-

ings related to Native American ST use: (a) young age of onset of ST use, (b) similar prevalence of use among adolescent boys and girls, and (c) higher overall prevalence of ST use when compared to non-Native American populations. Acceptance of the habit, peer pressure, and addiction seem to be contributing to the high ST use in Native American communities.

8 Spacing of babies.
Gipp, Bertha
Native American Maternal and Child Health Project (N.D.)

Language: English

Descriptors: North Dakota; Popular works; Family planning; Birth control; American indians; Health care

Abstract: To assist the American Indian in family planning, this pamphlet provides basic information on birth control methods. Pills, intra-uterine devices, diaphragms, condoms, vaginal medications and natural family planning are the methods explained thoroughly and accompanied by a drawing of each. A short summary of Native American family planning, both past and present, is included. A checklist of good health practices that accompany participation in spacing of babies is also presented.

9 Standing Rock Sioux Reservation a case study of food security among native Americans : hearing before the Select Committee on Hunger, House of Representatives, One Hundred First Congress, second session, hearing held in Fort Yates, ND, February 26, 1990.
United States. Congress. House. Select Committee on Hunger
iv, 208 p. ; ill., maps ; 24 cm. Distributed to some depository libraries in microfiche. Serial no. 101-15. Includes bibliographical references (p. 45).

Language: English
Abstract: This hearing of the House Selection Committee on Hunger contains testimony, statements and supplemental materials presented by members of the Rock Sioux Tribal Council, members of Congress and other government officials. The topics discussed are problems of poverty and malnutrition among Native Americans, especially those at The Standing Rock Sioux Reservation.

110 NAL Call No: 151.65 P96
A study of dog bites on the Navajo Reservation.
Daniels, T.J.
Language: English

Descriptors: Arizona; Utah; New Mexico; American indians; Statistical data; Bites; Dog control; Public health

Abstract: Reservation-wide dog-bite statistics indicate a bite rate on the Navajo Reservation that is comparable to that of a large city. Detailed analysis of 772 bite reports was made to determine the characteristics of biters and their victims. This included an assessment of the behavioral antecedents leading up to the bite incident; 98.4 percent of all cases for which a possible cause could be ascertained were provoked in some way. Both dog control and public education measures need to be taken to reduce the frequency of dog bites.

Thermic effect of glucose in obese subjects with non-insulin-dependent diabetes mellitus.
Ravussin, E.; Zawadzki, J.K.
Language: English

Descriptors: Arizona; Obesity; Diabetes; Glucose; Heat production; Energy metabolism; American indians

Abstract: Extract: A reduced thermic effect of glucose in non-insulin-dependent diabetes mellitus (NIDDM) has been previously reported. To investigate whether this defect is related to 1) a decreased rate of glucose storage, 2) a reduced energy cost of glucose storage, or 3) a defect in the sympathetically mediated component of thermogenesis, we studied the thermic effect of ingested and infused glucose in nine NIDDM obese Pima Indians [90.5 +/- 3.9 kg, 39 +/- 2% fat, fasting plasma glucose (FPG) 130 +/- 10 mg/dl] and in nine nondiabetic obese Pima Indians (99.3 +/- 7.2 kg, 38 +/- 2% fat, FPG 103 +/- 2 mg/dl). Energy expenditure and glucose storage were derived from indirect calorimetry measurements. The thermic effect of 100 g of glucose was found to be similar in both groups (4.0 +/- 0.9 vs 5.0 +/- 1.3% of energy ingested in diabetic and non-
diabetic subjects, respectively) but lower than that previously reported in nonobese subjects. The cost of glucose storage calculated after stimulating storage by constant glucose infusion (0.46 g/min) and variable insulin infusion (19.5 +/− 3.8 vs. 2.9 +/− 0.6 mU.kg−1.min−1 in diabetic and non-diabetic subjects, respectively; P less than .01) was similar in both groups (approximately 0.35 kcal/g glucose stored) and not different from that reported in lean subjects. As opposed to lean and obese Caucasian subjects, energy expenditure failed to markedly decrease during propranolol infusion in both nondiabetic and diabetic Pima Indians. We postulate that the decreased rate of tissue glucose uptake and storage associated with insulin resistance is the major cause of the lower thermic effect of ingested glucose in NIDDM. It is unlikely that a reduced thermic effect of glucose causes or perpetuates obesity in NIDDM, because a low thermic response is the consequence of the increased insulin resistance and is opposed by greater increases in resting metabolic rate.(author)

The traditional Pima Indian diet: Composition and adaptation for use in a dietary intervention study.
Boyce, V.L.; Swinburn, B.A.

Language: English

Descriptors: Arizona; Diet; Diabetes mellitus; American Indians

Abstract: Objective. To examine changes in the Pima Indian diet composition that may have played a role in the dramatic rise in the incidence of NIDDM among Pima Indians over the last century.

Use of secondary data: extrapolating to the community.
Stewart, B.; Kozoll, R.; Rhyne, R.l.

Language: English

Descriptors: New Mexico; American Indians; Communities; Community health services; Vital statistics; Data collection; Information services

Workshop report: Prevention and early treatment of NIDDM.
Wilson, R.; Horton, E.

Language: English

Descriptors: Diabetes mellitus; Health programs; American Indians

Abstract: Critical scientific and practical questions are whether it is possible to prevent NIDDM and
whether early treatment of diabetes is effective. There are three potential strategies that may retard the development of prevention of NIDDM and which are also of importance in the early treatment of NIDDM, control of obesity, preservation of insulin action, and preservation of insulin secretion. The panel stressed the impact of exercise both on the control of obesity and the preservation of insulin action. A structured exercise program such as that conducted in the Zuni community can be made available to an entire community. The importance of community involvement in establishing and sustaining such programs, and the importance of using sound principles of effective behavior modification were recognized.

Years of potential life lost among a Native American population.
Mahoney, M.C.; Michalek, A.M.; Cummings, K.M.; Hanley, J.; Snyder, R.L.

Language: English
Descriptors: New York; American Indians; Mortality; Risks; Health

Abstract: The determination of years of potential life lost (YPLL) can aid in monitoring changes in premature mortality among various population groups. While premature mortality has been shown to differ among blacks and whites, patterns of YPLL have not been well established among other racial groups. The Seneca Nation of Indians (SNI) is a Native American group residing primarily in western New York State (NYS). A review of SNI necrology records revealed that 55 percent (510 of 924) of the deaths between 1953 and 1984 occurred before 65 years of age. The proportion of premature deaths among males exceeded the proportion in females. SNI males demonstrated an increased risk of premature death (odds ratio = 1.43) relative to SNI females. Both the percentage of premature deaths and the number of YPLL per death were greater among SNI members compared with NYS residents. Almost one-half of all YPLL among the SNI were attributable to accidents and injuries. Heart disease, digestive diseases, and malignant neoplasms also represented important contributors to YPLL for both SNI males and females. This investigation identifies important causes of premature death among a Native Ameri-
