A special issue of the journal, dedicated to Henry B. Kahane, the late founder of the Department of Linguistics at the University of Illinois at Champaign, celebrates the department's first 25 years. It contains three parts. The first consists of specifically commissioned papers originally written in 1973-74 and meant for a specific project, including: an introduction (Henry Kahane, Braj B. Kachru); "Linguistics in the Midwestern Region: Beginnings to 1973" (Kachru); "History of the Department of Linguistics at the University of Illinois at Urbana-Champaign" (Kahane); "The European Emigree" (Kahane); "Tales of an Eager then Lonely then Contented Dinosaur" (Charles E. Osgood); "How To Find the Right Tree To Bark Up" (Robert B. Lees); "Three Linguistic Reincarnations of a Kashmiri Pandit" (Kachru); and "A Sense of Perspective" (Charles W. Kisseberth). The second part contains memorial tributes to Henry Kahane. Part 3 consists of abstracts of the dissertations and theses of doctoral and master's degree candidates in the department, including research in progress up to August 1992. These works are also indexed by author, language, region, area of concentration, and advisor. (MSE)
STUDIES IN THE LINGUISTIC SCIENCES

PUBLICATION OF THE DEPARTMENT OF LINGUISTICS
COLLEGE OF LIBERAL ARTS AND SCIENCES
UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

EDITOR: Hans Henrich Hock; REVIEW EDITOR: James H. Yoon

AIM: SLS is intended as a forum for the presentation of the latest original research by the faculty and especially students of the Department of Linguistics, University of Illinois, Urbana-Champaign. Invited papers by scholars not associated with the University of Illinois will also be included.

SPECIAL ISSUES: Since its inception SLS has devoted one issue each year to restricted, specialized topics. A complete list of such special issues is given on the back cover.

BOOKS FOR REVIEW: Review copies of books may be sent to the Editor, Studies in the Linguistic Sciences, Department of Linguistics, University of Illinois, 4088 Foreign Languages Building, 707 S. Mathews, Urbana, Illinois 61801.

SUBSCRIPTION: Normally, there are two issues per year. Requests for subscriptions should be addressed to SLS Subscriptions, Department of Linguistics, University of Illinois, 4088 Foreign Languages Building, 707 South Mathews, Urbana, Illinois 61801.

UPCOMING ISSUES: Vol. 22:2: Twenty-five years of Linguistic Research at the University of Illinois at Urbana-Champaign (Post-graduate research by Doctoral and Master's degree students in the Department of Linguistics). Editors: Braj B. Kachru and Frances Vavrus; Vol. 23:1: Papers in General Linguistics.

Price for this special issue: $10.00

This volume is dedicated to the memory of

Henry Kahane

November 2, 1902 - September 11, 1992
Foreword

In the academic year 1990-91, the Department of Linguistics at the University of Illinois at Urbana-Champaign celebrated the 25th anniversary of its founding. Among the commemorative events was a series of lectures presented by eight nationally and internationally prominent scholars who had received their training in the Department. These lectures have now been published as Linguistics in the Nineties: Papers from a Lecture Series in Celebration of the Department's Twenty-Fifth Anniversary, edited by Hans Henrich Hock (Studies in the Linguistic Sciences 20:2 [Fall 1990]). Other events were state-of-the-art conferences on "The Organization of Phonology: Features and Domains", and on "Linguistics and Computation: Computational Linguistics and the Foundations of Linguistic Theory", the hosting of the thirteenth national meeting of the South Asian Languages Analysis Roundtable, and an exhibition in the University Library of representative works by Department faculty members (for details of the entire program, see SLS 20:2 x-xii). This year-long celebration now reaches its culmination in the publication of the present volume outlining highlights in the history of the Department and cataloguing linguistic research at the University of Illinois at Urbana-Champaign in the form of abstracts of master's theses and doctoral dissertations by students who received degrees in the Department over the first quarter-century of its existence.

The 25th Anniversary Lecture Series was introduced by the late Henry R. Kahane with a talk entitled "The Establishment of Linguistics at Illinois", which is presented in this volume along with autobiographical vignettes by Henry R. Kahane, Charles E. Osgood, Robert B. Lees, Braj B. Kachru, and Charles W. Kisseberth, all of whom played crucial roles in establishing the Department and in determining its course over the first quarter-century. These vignettes were solicited in 1974 for a book planned by Thomas Sebeok, but for certain reasons, the book never materialized. Their inclusion here seems particularly appropriate, since they provide unusual and delightful insights into the human side of the history of a linguistics department from its conception, through the gestation period, to its birth, and on to its coming of age. While these vignettes refer specifically to the Department of Linguistics at Illinois, they cast interesting light on the personalities and thinking of some of the most prominent linguists of the second half of the twentieth century, since the founders of the Department were themselves ensconced among these or were their early colleagues or students. Of general human interest are the manner in which these five scholars were attracted to the field of linguistics and the quirks of fate that led them to their own specific destinies, whether their paths started out in Central Europe or South Asia, in Massachusetts or the Midwest. It is perhaps a pity that the book planned by Sebeok did not materialize, but it seems to me that these vignettes from almost twenty years ago now make even better
reading than they would have then, for they have taken on a certain patina with time,\(^1\) and we can now judge them with greater objectivity. In any case, they are valuable testimonies not only to the formative years of the Department, but also to a critical period in the development of the field of linguistics. We can all delight in the fact that they have at last found a fitting repository for the edification and inspiration of future generations. The Department had been looking forward to a celebration of Henry Kahane’s 90th birthday in November of 1992. Instead, his unexpected death in September led to a Memorial Tribute held in the Krannert Center for the Performing Arts on 14 November 1992. The texts of these tributes are also presented in this volume.

While Henry Kahane’s personal recollections of the events and personalities leading up to the founding of the Department in 1965 are presented here, it seems appropriate to mention a few other milestones in the Department’s history, including the fact that the actual proposal submitted to the University was worked out in 1963 by a committee chaired by Robert B. Lees (then of English and Communications Research, and Director of the Program in Linguistics) and consisting further of Joseph H. Allen (Spanish, Italian, and Portuguese), Katherine Aston (English), Frank G. Banta (German), Joseph B. Casagrande (Anthropology), Kenneth L. Hale (Anthropology), Lee S. Hultzén (Speech), Henry R. Kahane (Spanish, Italian, and Portuguese), Frederic K. Lehman (Anthropology), Rado Lenček (Russian), Howard S. Maclay (Communications Research), Charles E. Osgood (Communications Research), Angelina R. Pietrangeli (Spanish, Italian, and Portuguese), Victor Terras (Russian), and Willard R. Zemlin (Speech).

From its very inception, the Department assumed a leading role in the development of linguistics in the United States and currently ranks among the top five departments in the nation. Only three years after its founding, however, the Department was faced with a grave internal crisis when its first head, Robert B. Lees, emigrated to Israel, and two of its most prominent younger faculty members, Arnold Zwicky and Theodore Lightner, were lured away to other institutions. Compounding the difficulties was the collapse of the post-Sputnik era of national educational enlightenment. To the great good fortune of the Department, the helm was taken over by an energetic scholar of vision, Braj B. Kachru, first as Acting Head in 1968-69 and then as Head from 1969-79. Under his leadership, the Department made great strides in enhancing its position not only within the campus community, but also on the national and international scenes. He initiated the journal *Studies in the Linguistic Sciences (SLS)*, which has since attained such stature as to be included among the journals surveyed by the *Bibliographie linguistique/Linguistic Bibliography*.

---

1 The time-warp becomes particularly obvious from the now blatantly obvious absence of gender-neutral modes of expression. There is no need to point out instances, since they are so apparent. They serve as an indication of the progress that has been made over a less sensitive age.
During his headship, the annual departmental Newsletter, now in its twenty-fourth year, was initiated. He recruited promising young scholars, encouraged members of the faculty to launch a conference on African linguistics, and was himself co-organizer of a conference on South Asian linguistics and director of a summer Linguistics Institute. While significant in themselves, these conferences were the stimuli for the development of permanent national and international traditions of regular conferences attended by the leading authorities in these fields. We have recently witnessed the Twentieth Annual Conference on African Linguistics (proceedings edited by Eyamba Bokamba in SLS 19:2 [Fall 1989] and 20:1 [Spring 1990]), and the Thirteenth South Asian Languages Analysis Roundtable (meeting handbook edited by Hans Henrich Hock in SLS 20:3 [Spring 1991]).

In 1976, the Division of Applied Linguistics was established as a research unit within the Department of Linguistics with a cross-cultural and cross-linguistic focus. It coordinates and initiates research activities in the areas of bilingualism/multilingualism, language and development, literacy, and English in a global context. The Division has organized and partially supported numerous international conferences, colloquia, and seminars, and collaborates in activities related to English in the international context initiated by Larry E. Smith of the East-West Center in Honolulu. The Division has international academic contacts with scholars and institutions in such countries as India, Nigeria, Pakistan, and Singapore, which facilitates the exchange of research in various areas of applied linguistics, particularly in the study and analysis of English in non-native contexts. Among other projects, the Division of Applied Linguistics is at present taking a leading role in the establishment of a databank for various types of non-native Englishes, and with the support of other campus units, sponsored a conference on World Englishes in April 1992. Research projects initiated by the Division have been supported in the past by the Ford Foundation, the American Institute of Indian Studies, the Research Board of the University of Illinois at Urbana-Champaign, among other agencies. Professor Braj B. Kachru is Coordinator of the Division.

Under the leadership of Chin-W. Kim (Chair, 1979-1986) and Charles W. Kisseberth (Chair, 1986-1989; Acting Head, 1989-1990), the Department maintained and consolidated its position of eminence in the fields of phonology, syntax, and historical linguistics, and in the areas of applied linguistics and non-Western language teaching (particularly African and South and West Asian). It sought and eventually received a faculty position in formal semantics in conjunction with the Program in Cognitive Science/Artificial Intelligence and the Beckman Institute for Advanced Science and Technology.

A particular strength of the Department is without doubt to be found in the breadth of its programs, ranging from the most theoretical to the most practical. Because of the wide scope of its activ-
ities, the Department is intimately bound together with numerous other campus units through formally organized joint programs, e.g. in Romance linguistics with the Department of Spanish, Italian, and Portuguese, and the Department of French; in teacher education with the College of Education; in psycholinguistics with the Department of Psychology; and in applied linguistics with the Division of English as an International Language. It has both formal and less formal arrangements with units such as the Beckman Institute, the Center for African Studies, the Center for East Asian and Pacific Studies, the Center for Latin American and Caribbean Studies, the Center for Russian and East European Studies, and the programs in Cognitive Science/Artificial Intelligence, in the Study of Religion, and in South and West Asian Studies. In addition, the Department shares faculty members through joint and/or adjunct appointments with the following departments or programs: African Studies; Anthropology; the Center for Advanced Study; Classics; Communications Research; Comparative Literature; East Asian Languages and Cultures; English; English as an International Language; French; Germanic Languages and Literatures; Language Learning Laboratory; Psychology; Slavic Languages and Literatures; Spanish, Italian, and Portuguese; and Speech and Hearing Sciences. The centrality of the Department of Linguistics within the University of Illinois at Urbana-Champaign is clearly evident and accounts to some extent for the fact that an unusually large number of its faculty members have been appointed to administrative positions in campus units outside the Department: Eyamba Bokamba, Director of the Division of English as an International Language, succeeding Braj B. Kachru; C. C. Cheng, Director of the Language Learning Laboratory; Chin-W. Kim, Director of the Program in East Asian Studies (1990-91) and Director of the Program in Japan (1993-94); Jerry Morgan, Associate Director of the Beckman Institute for Advanced Science and Technology; and Ladislav Zgusta, Director of the Center for Advanced Study.

The diversity of the Department's programs was of particular importance in the recent review of the allocation of resources within the College of Liberal Arts and Sciences. The Advisory Committee on Financial Policy to the Dean wrote in its report, "LAS Resources, 1993-2000, Priorities and Principles for Allocations in the College of Liberal Arts and Sciences" (p. 13):

The Department of Linguistics is one of the College's best departments, with a consistently excellent faculty, and its quality deserves protection. The Advisory Committee recognizes intrinsic strength in our Department's tradition of combining formal and applied areas (including training in the less commonly taught languages) within a single unit. We note that in other universities, units devoted wholly to formal linguistics have not been able to maintain vitality and have been slated for closure. We congratulate our Department for using a different approach and for its success in sustaining its strength.
The excellence of the Department's faculty was recently re-affirmed through the appointment this year of Braj B. Kachru as Professor in the Center for Advanced Study, the highest recognition bestowed on a faculty member by the University of Illinois at Urbana-Champaign. Other linguists accorded this highest recognition include Ladislav Zgusta, James Marchand, and the late Henry Kahane. The Department also claims two LAS Jubilee Professors, C.C. Cheng and Braj B. Kachru, and a University Scholar, Rajeshwari Pandharipande, all-in-all an astonishing record for a department of our size.

While the number of undergraduates majoring in linguistics at the University of Illinois at Urbana-Champaign has traditionally been quite small (partly a result of the first head's firm belief that linguistic students should have a major in a particular foreign language), it is worth pointing out that this small body of students has shown an unusually high level of academic achievement: for example, of a total of eight graduating linguistics majors in 1991, two were Bronze Tablet Scholars (i.e., they ranked among the top 3% of the entire University graduating class), and four were elected to Phi Beta Kappa (i.e., in addition to other requirements, they ranked among the top 10% of graduates in the College of Liberal Arts and Sciences, by far the largest college in the University).

At the suggestion of the Advisory Committee on Financial Policy of the College, the Department is currently engaged in an intensive effort to contract the number of graduate students in its programs and to expand its undergraduate offerings that satisfy the Campus's general education requirements. Three new course proposals have already been submitted to higher administrative levels for approval, and others are in various stages of preparation. The Department is also seeking to strengthen its programs in Arabic language and Semitic linguistics, as well as in sociolinguistics.

The quality of the graduate programs in the Department of Linguistics has never been in doubt. Over the first quarter-century, the Department trained 168 Ph.D.s and 51 M.A.s, with 15 candidates for the Ph.D. whose work is still in progress. The great diversity in areas of concentration, in regions of the world, and in languages treated is apparent, not only from the abstracts themselves presented in this volume, but even more readily from the useful indices devoted to these matters. To round out the picture, there are also indices devoted to the authors of the theses as well as to the faculty members who directed them.

I had the privilege of witnessing the events of the anniversary year from the vantage point of an acting head who was neither a true insider, nor a complete outsider. I had held the titles of a faculty member 'without budgetary implications' in the Department ever since I came to the University of Illinois in 1967, just two years after the Department's founding. I have always been interested in, and have often participated in, its activities. After having committed
myself only in this past year to a permanent and intimate relationship with the Department and its excellent faculty, staff, and student body, and having served as Acting Head for a year and a half, I pondered why I had declined the kind suggestion by Henry Kahane in 1967 that I accept a joint appointment in the Department of Germanic Languages and Literatures and in the Department of Linguistics. I was no longer sure of the reason until I read the late Charles Osgood’s and, more particularly, Braj Kachru’s contributions to this volume with the vivid descriptions of their early encounters with the Department’s first head, Robert B. Lees. I realized then for the first time that it was my failure to interpret correctly Bob Lee’s straightforward mannerisms that had dampened my interest in a joint appointment, and not until after the decision had been made did I come to realize what a generous and kind colleague he really was beneath the disguising exterior.

In an era of great uncertainty in academe brought on by the unstable economic situation in the country, it is my sincere hope and conviction that the Department of Linguistics will be able to weather the external storms and continue long into the future the excellent work begun more than 25 years ago and partially chronicled in this volume.

Urbana, IL
July 1993

Elmer H. Antonsen, Head
Department of Linguistics
Preface

This volume has a fascinating biography. The plans for the project were initiated as a modest undertaking at the invitation of the Committee which was formed to plan a program for the celebration of the 25th Anniversary of the Department of Linguistics at UIUC. The original plan was to compile a volume listing the Ph.D. dissertations and Master's theses submitted to our department from its founding to 1992. This was one of several projects to celebrate the Silver Jubilee of the Department as outlined in the Foreword by Professor Elmer Antonsen. But as time passed, new ideas and suggestions substantially altered the original plan. The volume gradually became larger and larger, like the proverbial tail of the mythical monkey-god, Hanumana.

What we now have is a three-part volume. However, these three parts, I believe, directly contribute to our understanding of the founding and development of the Department as one of the major centers of linguistic studies and research in the world. The addition of parts one and two was an afterthought, and thereby hangs a tale.

The reasons that motivated the inclusion of these parts have been discussed in the introduction to each part. But, briefly, both parts have historical significance for our Department. The first part includes specifically commissioned perspectives originally written in 1973-74, over twenty years ago. These were meant for a specific project that is briefly discussed in the introduction to part one. That project, however, did not materialize; b. copies of the papers were preserved by Henry Kahane and me.

The title of the second part is self-explanatory. Henry Kahane passed away on September 11, 1992. We were planning to celebrate his ninetieth birthday on November 2, as some of us had been celebrating his birthday for several years, at his favorite restaurant, Katsinas, in Champaign, Illinois. Henry was deservedly recognized as the founder and as one of the major builders of the department. He delivered the inaugural lecture in a series of lectures organized to celebrate the Silver Jubilee. These lectures have already been published in a special issue of Studies in the Linguistic Sciences (Vol. 20:2; Fall 1990).

The third part consists of the original idea, providing information about the Ph.D. dissertations and Master's theses from the year of the Department's founding to 1992. That is actually the original tail of the monkey-god Hanumana.

I hope that this special issue of SLS will be useful to our former graduates and to new students who will join the Department in the years to come, and to linguists in the USA and elsewhere.
This volume is dedicated to the memory of the late Henry Kahane. Professor Kahane was, as stated above, as instrumental in the preparation of Part I of this volume as he was in initiating various other enterprises related to our Department since the time he joined UIUC, and until he passed away on September 11, 1992.

Urbana, IL
August 15, 1993

Braj B. Kachru
Acknowledgements

In the planning, editing, and production of this volume a number of colleagues, students and the office staff of the Department of Linguistics have contributed directly and indirectly. My appreciation and gratitude are particularly due to the following: to the late Henry Kahane who, in his usual pleasant and persuasive manner, helped in putting together Part I of this volume; to executive officers of the linguistics programs in the Midwest who provided detailed information about their units and promptly responded to my follow-up questions for writing the chapter “Linguistics in the Midwest: Beginnings to 1973” — it would not have been possible to write this chapter without their cooperation and valuable input; to Elmer Antonsen for writing a detailed and informative Foreword; to Hans Henrich Hock, editor of Studies in the Linguistic Sciences (SLS), for his invitation to include this volume as a special issue of SLS, and for his patience in spite of the delay in preparation of the final version; to Frances Vavrus, who was associated as editorial assistant from the inception of this project until 1992, and to Amy Cheatham, who took over from Frances and saw this volume through the final stages of editing, checking and production — the contribution of the two of them has been invaluable; to Sara Michael and Rosa Shim for their editorial assistance; to Cecil L. Nelson, a former Ph.D. student of our department, now a professor at Indiana State University, Terre Haute, IN, for his insightful and precise editorial comments and constructive suggestions; to Eyamba G. Bokamba for checking references related to Africa and African languages; to William F. Brewer for editing Charles E. Osgood’s paper; and to Beth Creek, Cathy Huffman, and Eileen Sutton for attending to the one-hundred-and-one chores which the production of a complex volume such as this entails.

Introduction

I

About twenty years ago, in the early seventies, when the Department of Linguistics was still in an early stage of its existence, we were asked (as were, nationwide, various other Departments of Linguistics) to contribute word portraits of our members: to indicate their development, training, scholarly aims and accomplishments. The idea, which, alas, did not materialize, was good: To characterize through collective pictures of selected departments the status of linguistics in our country.

By now, the present of then has turned into a distant past, and the plans of then into memoirs. The few pieces that follow (written in 1973-74 and appearing here without change, have to be read as a testimony of the development of linguistics at our universities in a time of restless changes, where "modern" means "old", and "post-modern" refers to last Monday.

March 1992

Henry Kahane

II

This part, as Henry Kahane has said above, has a history that goes back to 1973. These papers were specifically invited for a multi-volume series entitled, Current Trends in Language Sciences, to be published by Mouton Publishers, the Hague, the Netherlands. Thomas A. Sebeok was the Editor-in-Chief of the proposed project. One of the first volumes in the series was to be on, The University Teaching of Linguistics in the United States. The late Henry Kahane was to write a case study of linguistic studies at the University of Illinois. The plan was to include the University of Michigan and Northwestern University as other case studies from the Midwest. In January 1973, I was invited to write a chapter which would include

... a presentation and discussion ... of the principal lines of development (roughly, from World War II on) in the teaching of linguistics in linguistics departments and/or programs in those private and state universities located in the states included in your region [the Midwest].

This invitation resulted in the chapter "Linguistics in the Midwestern Region: Beginnings to 1973" which was received by the editorial office of the proposed volumes on March 21, 1974. Henry Kahane followed a different route to compile the case study of linguistics at Illinois. In a succinct note to his four departmental colleagues, dated June 6, 1973, Professor Kahane outlined his plan for
documenting the story of linguistics at Illinois. Let me quote here the relevant parts from the Kahane letter:

My idea is to tell our story arranged according to linguistic sub-disciplines and presented in the form of a few portraits of the protagonists together with one or two group pictures, rather than in terms of more or less irrelevant so-called statistical facts. The technique of the self-portrait should dominate, and again, not in the Who-is-Who style, with an enumeration of degrees, awards, and publications, but rather as an intellectual history of the portrayee: e.g., How did you come to linguistics — To which method or 'school' of linguistics — Your development before and at the U. of I. — The reception of your field among students and disciplines... and whatever else seems relevant to you. And above all: What did you do to develop your subspeciality within the U. of I. and the impact of the U. of I. on you and your groups' work.

You see what I am driving at. The value of the survey would be greatly enhanced if you could write for us such an essay, of any length that you may want, with September/October as the target date. Since the volume will be widely available, now and later on, your self-portrait is probably, something that will remain and contribute a precious contribution to the history of linguistics in our country and to the methodology of the expansion of a new (or renewed) academic field.

I myself will provide the frame and the 'embedding' of the individual contributions within our case history. I trust that you will permit me to edit and streamline whenever necessary.

Let me end with a trivial note which I feel I should add for correctness' sake rather than for its content. I have been offered $300 for my contribution. Since I am trying to have these portraits authored by others, I shall divide the amount equally among us. I apologize for the remark but you will understand why I add it.

This letter was sent to Braj B. Kachru, Charles W. Kisseberth, Robert B. Lees and Charles E. Osgood. It identified the areas on which each person was to concentrate: Kachru on Applied Linguistics and Sociolinguistics; Kisseberth on the Neo-Transformationalists; Lees on the Transformationalists, and Osgood on Psycholinguistics. In due course, the manuscripts were sent to the editor, and a note, dated March 1, 1974, confirmed, "...that University Teaching of Linguistics in the United States has this date, been sent off to Mouton Publishers, for immediate production."

However, a few months later, we received a "Dear colleague" note from the Editor-in-Chief, dated July 22, 1974, informing us that
"...owing to irreconcilable differences which have arisen between me and the new management of Mouton Publishers, I have decided to relinquish the editorship of this series effective this month."

I do not recall having heard from the publishers after that. It was the death of the projected series. This history provides a context for the papers included in this part. During the past nineteen years several changes have taken place: Robert B. Lees is now in Israel (in fact, he submitted his contribution from Israel); Charles E. Osgood passed away on September 15, 1991; and Henry Kahane passed away on September 11, 1992.

When the deliberation for this volume started, we agreed — Henry and I — that the contributors originally submitted in 1973-74, should appear in their original form, without any changes, additions, or updating. These five contributions thus represent perspectives of 1973-74, just a decade after the department was established. These should be read within that context. Professor Elmer Antonsen’s Foreword provides a brief update until the academic year 1992-1993.

Braj B. Kachru
LINGUISTICS IN THE MIDWESTERN REGION: 
BEGINNINGS TO 1973*

Braj B. Kachru

0. Introduction

This survey presents an overview of the earlier and current position of the teaching of the linguistic sciences in the Midwest of the United States; the states included are Illinois, Indiana, Iowa, Michigan, Minnesota, Ohio, and Wisconsin.

The focus and orientation of the teaching of linguistics in the Midwest, as elsewhere, are directly related to the theoretical breakthroughs which are made in this region and at other places. Therefore, there are several digressions in this paper which are not directly related to the teaching of linguistics, but are important for tracing the development of linguistics as an autonomous discipline at various institutions. I have also briefly presented the types of linguistic traditions associated with each major institution which now has a fully developed department of linguistics. I have also included information on the teaching of the applied aspects of the linguistic science. There are two areas which have developed due to serious involvement of linguists, i.e. the teaching of non-western languages and the programs in the teaching of English as a foreign (or second) language. These are discussed in sections 8.0, and 9.0. This brief report therefore is primarily about the teaching of linguistics in this geographic region with the perspective of the state of the art as seen in diachronic and synchronic terms.

1.0. Three earlier phases in the teaching of linguistics

The growth of linguistics in the midwestern states is characterized by roughly three stages. In a sense, these three stages also indicate the chronological order in which the linguistic sciences developed in these states. The first stage could be called the pre-thirties period, when linguistic studies were still a part of the comparative neo-grammarian tradition. Courses in linguistics were available in departments such as Classics or German, but most generally, in the departments of English. These courses had essentially a comparative focus such as "Comparative Indo-European," or they concentrated on the elements of language and phonetics or historical linguistics. The second stage could be termed the phase of "field linguistics." This phase is important since it slowly changed the direction of linguistics in the USA from a humanistic area of research to a research area within the social sciences. During this period linguists began to be housed in Anthropology, Sociology, and later, in Psychology departments. For example, at Indiana University, Carl F. Voegelin, who had originally come to the Department of History, moved to the Department of Anthropology. At the University of Illinois at Urbana-Champaign, Anthropology housed
the linguistics program for several years, and Kenneth Hale (now at MIT) joined that department. The result of this shift toward the social sciences was that several courses with an interdepartmental focus came into existence.

In linguistic theory this was primarily the period of Structuralism. It was during this period that the distance between language scholars and linguists started widening; this trend reached its climax in the states during the peak period of structural linguistics. The reasons for the LANGUAGE-LINGUISTICS controversy are varied, and we shall not go into those here.

The third stage began in the fifties. Gradually, but definitely, efforts were made to view linguistics as an autonomous field of study. As a result of this desire for recognition as a discipline, a few independent departments of linguistics were established. In addition, several programs or interdepartmental coordinating committees for linguistics were set up.

The development of programs in linguistics peaked in the sixties. This does not mean, however, that the loose structure of the pre-sixties inhibited linguistic activity or its development as a distinct discipline. The program at Indiana University, which had a serious impact on the development of linguistic study and research in the USA, did not become a Department of Linguistics until 1963 — but by then it had already established itself as a center for teaching and research in linguistics and had also granted several degrees in the field. This was also true at Michigan and Illinois. The sixties, however, saw the formalization of a dozen departments of linguistics in the Midwest. This was a big step forward in one decade. These new departments were: University of Chicago, Chicago, Illinois (1960's); University of Illinois at Urbana-Champaign, Illinois (1964); Indiana University, Bloomington, Indiana (1963); University of Michigan, Ann Arbor, Michigan (1963); University of Minnesota, Minneapolis, Minnesota (1966); Northwestern Illinois University, Chicago, Illinois (1961); Northwestern University, Evanston, Illinois (1966); Ohio State University, Columbus, Ohio (1967); Ohio University, Athens, Ohio (1969); Western Michigan University, Kalamazoo, Michigan (1968); and University of Wisconsin, Milwaukee, Wisconsin (1964).

This trend toward expansion continued until the end of the sixties, when a period of rethinking about the diffusion of higher education was initiated. Understandably this had an effect on the further growth of linguistics departments. However, expansion did not come to a complete stop. The following departments were set up in the early seventies: University of Illinois at Chicago Circle, Chicago, Illinois (1973); University of Iowa, Iowa City, Iowa (1970); Oakland University, Rochester, Michigan (1970); and University of Southern Illinois, Carbondale, Illinois (1970).
In addition to these formalized departments a few programs in linguistics were also set up; for example, the following, among others: Cleveland State University, Cleveland, Ohio (Ad hoc, Interdepartmental Committee in Linguistics, 1973); Indiana State University, Terre Haute, Indiana (Committee on Linguistics and Lexicography, 1973); Northern Illinois University, DeKalb, Illinois (Interdepartmental Committee, 1971); University of Toledo, Toledo, Ohio (Linguistics Committee, 1970). At present, the expansion seems to have come to a standstill. The reasons for this probably can be traced to the more-or-less stagnant condition of higher education in the USA in the past few years, at least as far as the addition of new departments or programs is concerned.

2.0. Teaching of linguistics in the 'Big Ten'

The following universities are traditionally called the 'Big Ten' of the Midwest: Chicago, Illinois, Indiana, Iowa, Michigan, Michigan State, Minnesota, Northwestern, Ohio State, Purdue, and Wisconsin. In this study, the University of Chicago has been treated as the eleventh member of the group. All of the Big Ten universities have departments of linguistics, except for Purdue. In chronological terms, the University of Wisconsin at Madison has the oldest formalized department of linguistics (1954). The University of Illinois at Chicago Circle has the youngest department, established as an independent entity in the summer of 1973; it is still primarily an undergraduate program.

The story of the pioneering universities which initiated linguistic offerings in the Midwest is of interest both in terms of the growth of linguistics as an autonomous discipline, and also from the point of view of the typical stages through which linguistics has had to pass at some of the major linguistic centers in the Midwest. The following selected excerpts give some idea of this process at these universities. At the University of Chicago, the offerings in linguistics date back to 1892. At that university, linguistics...has been an independent unit since the founding of the university, which was in 1892, under the name of the Department of Comparative Philology. It became Linguistics early in the 1960's.2

Chicago has an old tradition of teaching and research in linguistics. Carl Darling Buck was selected to join "the original faculty of the University of Chicago, as Assistant Professor of Sanskrit and Comparative Philology, when the University opened its doors on October 1, 1892...In 1930 he was named Martin D. Ryerson Distinguished Service Professor of Sanskrit and Comparative Philology, and in 1933 became Professor Emeritus."3 Leonard Bloomfield was there as Professor of Germanic Philology from 1927 to 1940.

The Department of Linguistics at Iowa was established in 1970. It began as a program in the department of English in 1962, with a
National Defense Education Act (NDEA) grant. It continued there until 1965, "...when it became an interdepartmental program directed by a committee of nine faculty members representing seven departments in the university."4

At Michigan, the Department of Linguistics
...was established in 1963, with Herbert Paper as the first chairman, John Catford as the second, and then me [William J. Gedney]. It grew out of an Interdepartmental Program in Linguistics going back to the 1930's, established originally by Professor Charles Fries, headed later by Hans Kurath and then Albert Marckwardt...5

At Michigan State University the department of linguistics has the title of Department of Linguistics and Oriental and African Languages:

[It] was established in 1964 when the formerly existing Department of Foreign Languages was broken into three — a Department of Romance and Classical Languages, a Department of German and Russian, and this Department [Department of Linguistics and Oriental and African Languages].6

The University of Minnesota established its department in 1966 under the chairmanship of Walter Leh.

At Northwestern University, the Department of Linguistics became a degree-granting unit in the 1965 academic year:

It was a direct outgrowth of a department of African Languages and Linguistics which had been created and staffed a year before. The Program in Linguistics under the direction of Professor Werner Leopold had been in operation at Northwestern University since the mid 1940's. The earlier Program of Linguistics consisted of faculty members from the Departments of Anthropology, English, German and others. The growth of the current department has been essentially an independent one and much linguistics oriented work is still offered in other departments. Much of the impetus for growth in the department involved the exploitation of established scholars in the field of African languages and linguistics.7

At Ohio State University, the tradition of linguistics dates back to the twenties when George M. Bolling (Classics) and Leonard Bloomfield (Professor of German and Linguistics from 1921 to 1927) were there. However, it was not until 1961 that a planning committee was set up for the development of linguistics. The committee included Leonard Newmark (then in the English Department) and William S-Y Wang. In 1962 a Division of Linguistics was created and Wang was appointed its chairman. It was, however,
in June, 1967 that the Department of Linguistics was established, with Ilse Lehiste as the first Chairperson.

At the University of Wisconsin at Madison, linguistics passed through several phases, beginning in the 1920's:

In the middle 1920's the Department of Comparative Philology was established, listing the (by then rather extensive) offerings of several departments in these areas. To what extent this was a purely 'paper department' I have not been able to tell; in 1936 its listed staff, Arthur Gordon Laird (Classics) and Alfred Senn (Slavic and German), were both members of other departments. In 1938 Miles Dillon was appointed as the department's first proper chairman, and its staff was considerably augmented, on paper at least... That year the department included Morris Swadesh on its staff, sharing him with Anthropology, but he left a year or two later. In 1947 the staff consisted of the following, some of whom are known figures in the field: Martin Joos, Frederic Cassidy, Joseph Russo, Miles Hanley, Einer Haugen, Roe-Merrill Heffner, J. Homer Herriott, William Ellery Leonard, Freeman Twadell, Julian Harris, Lloyd Kasten, Edmund Zawacky, and Murray Fowler (who joined the staff in that year). In 1950, the department was rechristened Comparative Philology and Linguistics...8 [his italics]

It was renamed the Department of Linguistics in 1954.

At Illinois and Indiana, autonomous linguistics departments were not formed until the sixties. At Illinois, the Program in Linguistics was a component of the Department of English. (For a detailed discussion see the chapters that follow in Part I). At Indiana, the Interdepartmental Program in Linguistics was set up in 1946 with serious input from seven members representing five departments: H. Herzog and C. F. Voegelin (Anthropology), Thomas A. Sebeok and F. Whitehall (English), Fred Householder (Classics), Harry Velten (German), and Marion Porter (French and Italian). A Department of Linguistics was formally established in 1963.

3.0. The components of the departments of linguistics

The composition of the linguistics departments in the Midwest is not uniform. The variation in the organization of the departments is as follows: First, there are those departments which focus only on offerings in the various branches of the linguistic sciences. In these departments, the core faculty concentrates on the areas of syntax, phonology, and semantics (e.g. Wisconsin, Iowa).

The second type of department has a full graduate program in linguistics with Master's and Ph.D. degrees. However, they also have the added component of non-Western language teaching. The reason for this combination varies from one institution to another. The
following departments have such components: Illinois at Urbana-Champaign (Arabic, Hindi, Modern Hebrew, Swahili and Yoruba); Southern Illinois (Vietnamese, Lao, Cambodian, Arabic, Hebrew, and Persian); Western Michigan (Mandarin Chinese, Korean, Japanese, Hindi-Urdu, Arabic, Swahili, and Hebrew); and Chicago (Malay and Japanese). At some places this integration of the non-Western language component manifests itself in the name of the department, as, for example, the Department of Linguistics and Oriental and African Languages at Michigan State University.

The third type of department has both non-western languages and English as a Second Language as added components (e.g. University of Wisconsin at Milwaukee).

In the above discussion I have included only those universities in the Midwest which have independent departments of linguistics, not what are termed 'interdepartmental programs' or 'interdepartmental committees.' (See below §3.1.)

3.1. Interdisciplinary programs and committees

Interdepartmental programs and committees continue to play an important role in teaching and research in linguistics. Universities with such interdepartmental programs also help in providing graduate students for specialized training in linguistics to those universities which have fully-developed departments of linguistics. David Lowton is right when he says, "I think the interdisciplinary programs in linguistics are worthy of mention in this survey since these programs are not generally widespread insofar as linguistics is concerned."10 The main interdepartmental programs are at the following universities, among others: Ball State University, Central Michigan, Miami University, and Youngstown State University.

4.0. Toward establishing theoretical traditions in the teaching of the linguistic sciences

This section is an historical note on the theoretical developments in linguistics in the Midwest. These developments have a direct relevance to the focus in the teaching of the linguistic sciences in this region.

4.1. The forerunners

It was in the Midwest that the initial framework for Structural linguistics was developed by Leonard Bloomfield (1887-1949). In the linguistic literature, this development within the discipline has also been called "The Bloomfield School" (see Fries, 1961). Bloomfield spent a number of years in midwestern universities. He began his career as an Instructor in German at the University of Cincinnati (1909-1910), and then moved to the University of Illinois at Urbana-Champaign, where he worked as an Instructor from 1910 to 1913; from 1913 to 1921, he was an Assistant Professor of Comparative Philology and German at the University of Illinois. In 1921, he was appointed Professor of German and Linguistics at Ohio State
University, a position which he held until 1927. His last job in the Midwest was at the University of Chicago (1927 to 1940), before he became Sterling Professor of Linguistics at Yale University.

It was at another midwestern university (Wisconsin) that Bloomfield had done his graduate work:

Here he met Edvard Prokosch, his senior by nine years, and fell at once under the spell of the older man’s personality. The meeting was an important event in Bloomfield’s life; for it marked the birth of his career as a linguist.\(^{11}\)

It was during his tenure at the University of Illinois that *An Introduction to the Study of Language* (1914) was published. In the Preface to this book Bloomfield says (Bloomfield, 1914, v):

This little book is intended, as the title implies, for the general reader and for the student who is entering upon linguistic work.

Commenting on the then available linguistic offerings in American universities, the Preface adds:

Students whose vocation demands linguistic knowledge are subject in our universities to a detached course or two on details of the phonologic or morphologic history of such languages as Old English, Gothic, or Old French — details which are meaningless and soon forgotten, if no instruction as to their concrete significance has preceded. To this method of presentation is due, I think, the dislike which so many workers in related fields bear to linguistic study (iv).

It has already been noted in the literature that the theoretical orientation of *An Introduction to the Study of Language* was somehow different from that of *Language*, which came out in 1933. This change of focus in the second book is partly responsible for the direction which our discipline took during that period.

4.2. Post-Bloomfieldian breakthroughs

The other theoretical breakthrough in descriptive linguistics came from Kenneth L. Pike, who had received the Ph.D. degree from the University of Michigan in 1942. Pike has been working at this same university since his graduation. It was here that he developed the Tagmemic model of linguistics, the preliminary version of which appeared in 1954 in *Language in Relation to A Unified Theory of the Structure of Human Behavior*. A revised edition was published in 1967. It should, however, be mentioned that the University of Michigan never became known for its Tagmemic theoretical orientation. The main center for that model continued to be the Summer Institute of Linguistics.

A recent development in linguistic theory termed “Case Grammar” initially came from Ohio State, where the seminal papers
on this theory were written by Charles Fillmore (now at the
University of California, Berkeley) during his tenure at that
university. It was originally at Chicago, Ohio State, and Illinois that
this model was presented in the courses on syntax.

The developments in three areas, i.e. syntax, phonology, and
phonetics, are presented below. These developments manifested
themselves directly in the teaching of courses and graduate student
research.

4.3. Syntax

The midwestern contribution to syntax and its teaching should
be viewed in terms of the work done under various traditions (or
models) of linguistics. In a sense, the Bloomfield 'school' (or
'tradition') was initiated in the Midwest, though Bloomfield himself,
as Fries says, never meant to establish a 'school' of linguistics (Fries,
1961:196):

He (Bloomfield) despised 'schools', insisting that the usual
attitude of the adherents of a 'school' strikes at the very
foundation of all sound science. Science, he believed, must
be cumulative and impersonal. It cannot rest on private
theories. To Bloomfield one of the most important
outcomes of the first twenty-one years of the Linguistic
Society of America was that it had "...saved us from the
blight of the odium theologicum and the postulation of
'schools'."

In the thirties and forties Bloomfield's book was the
fundamental basic text in linguistics, and it soon replaced Whitney's
Language and the Study of Language and The Life and Growth of
Language. It is still used in the classroom at several places, especially
in introductory courses. Even at those places where it is now
considered outdated, the sections on historical linguistics continue to
be used.

The Tagmemic model has been used for the analysis of the
largest number of unwritten languages, both in the Western and
non-Western parts of the world. Pike was its main architect for over
a decade, and the model was used by a large number of missionaries
in reducing unwritten languages to writing so that the Bible could be
translated into those languages.

In the sixties, the universities of Chicago, Indiana, and Illinois
were actively engaged in suggesting modifications to
Transformational theory, and in applying this extended model to a
wide variety of Western and non-Western languages. The graduates
from these universities became the radicals in the field.

At Indiana University, the Transformational model, along with
other models, was taught by Fred W. Householder, Andreas
Koutsoudas, and Thomas A. Sebeok. The University of Illinois took a
front position as one of the main centers in the USA for
Transformational linguistics, and developed an exclusive Transformational framework which has since continued.

In the period of the sixties the primary development in the area of syntax and semantics was that of Generative Semantics. In certain circles the term 'neo-Transformationalists' is also used for this development. The varied contexts in which the term 'Generative Semantics' is used is succinctly summarized in Green & Castillo (1972:123):

In the broadest sense, 'Generative Semantics' refers to the assumption that semantic representation provides the input to the transformational rules of a grammar, an idea which was unthinkably radical when Jeffrey Gruber proposed it in his 1965 MIT dissertation, but which now is taken almost for granted by many. However, only a relatively small part of the literature is concerned with elaborating and explicitly motivating this assumption. In another sense, the term 'Generative Semantics' is taken to refer to a theory in which global rules and other derivational constraints play a major role — although as G. Lakoff argued in "Global Rules", this theory is logically quite independent of the role of semantics in grammar. In still a third sense, 'Generative Semantics' is used to refer to what was for a time called 'abstract syntax', which is not so much a theory or an assumption as a way of doing things...

In some midwestern universities, a young, enthusiastic group of linguists has continued to contribute to the paradigm, both by applying it to various languages, and by bringing a rigor to the analytical techniques.

At the University of Chicago, James D. McCawley has significantly contributed in developing a focus in teaching and research in semantics as an area of linguistic study and investigation. In this he is helped by an Illinois graduate, Jerrold Sadock. The proceedings of the annual Chicago Linguistics Society meetings (CLS) are the primary source of very insightful and programmatic papers in this area. McCawley's two students, Georgia Green and Jerry Morgan, have developed a serious interest in Generative Semantics among a number of graduate students at the University of Illinois at Urbana-Champaign. At Illinois, Herbert Stahlke is using this framework for the description of some African languages, and Yamuna Kachru for the description of Hindi.

At Ohio State University, Michael Geis, Johnny Geis, and Arnold Zwicky are working primarily in this framework on English. Indiana University, through its Indiana University Linguistics Club, makes available very influential (and controversial) "underground" papers on Generative Semantics. (See §13.0.)

In teaching and research in syntax, therefore, this model has become the main thrust at these universities. On the other hand, at
places like Michigan and Wisconsin the aim is toward eclecticism. (See §10.0; for a detailed discussion see Francis, 1973.)

4.4. Phonology

The well-established departments in the Midwest have a long tradition of research and teaching in phonology in the framework of Structuralism. Detailed discussion on this can be found in Valerie Makk (1972).

In phonology after the early sixties, it was primarily the area of Generative phonology in which Chicago, Indiana, Ohio State, Illinois, and Minnesota made contributions. In recent years insightful new developments in the theory of phonology have been taking place at Chicago, Illinois, and Ohio State. At Chicago, James McCawley has given direction to this research. At Illinois, the team of Charles Kisseberth and Michael Kenstowicz (now at MIT) has attempted to reevaluate certain assumptions and bases of Generative phonology. In their research and teaching, they have not over-emphasized form to the neglect of function (see Kisseberth, 1970). They have reevaluated the assumption that the "ordering" of rules is the natural way of showing the interactions that exist among rules (see Kenstowicz & Kisseberth, 1970; Kisseberth, 1973a, 1973b). They have attempted to relate "phonological" explanations of phonetic phenomena to "morphological" explanations. Thus, an attempt is being made to relate phonetic and morphological levels to phonological processes. In their research, Kenstowicz concentrates on Balto-Slavic languages and Kisseberth on Amerindian and African languages. At Ohio State, David Stampe (now at Hawaii) and Arnold Zwicky have addressed a variety of theoretical problems in phonology (see Stampe, 1973). Contemporary phonological models have been applied to a wide variety of languages at Indiana, Michigan, and Minnesota. The following, among others, are actively involved in theoretically insightful research in phonology: Andreas Koutsoudas (Indiana), Kenneth Hill and Charles Pyle (Michigan), and Gerald Sanders (Minnesota). At Michigan State University and at the University of Illinois at Chicago Circle, paradigms other than Generative phonology are being actively discussed and taught. At these latter universities, the Stratificational model has been used for the analysis of several languages and is also discussed in detail in courses on phonology. (For detailed discussion see Wang, 1973.)

4.5. Phonetics

The attitude toward phonetics as a branch of the linguistic sciences has varied in the United States from one of "benign neglect" to outright academic hostility. In the linguistic literature there is substantial discussion on FORM vs. SUBSTANCE, and their roles in linguistic description. In the Bloomfieldian tradition the emphasis was primarily on FORM. However, in the Midwest, there has been a continuing interest in phonetics and it has become a serious
component of the teaching at several universities, especially at Illinois, Indiana, Michigan, and Ohio State.

Three books which have had a serious impact on the study and research in phonetics were written by linguists from midwestern universities. Two of these scholars were from the University of Wisconsin: Martin Joos, *Acoustic Phonetics* (1948) and R.-M. S. Heffner, *General Phonetics* (1950). Five years before Joos' book was published, Kenneth L. Pike of the University of Michigan published his *Phonetics* (1943). This book continues to be the standard work in the field. In later years, Pike also published his *Intonation of American English* (1945), and *Tone Languages* (1948). Research on phonetics has not been restricted to articulatory phonetics, since innovative research in experimental and instrumental phonetics was initiated at the following centers, among others: the University of Michigan, Ohio State University, and the University of Illinois at Urbana-Champaign. These universities developed phonetic research as a subspecialty. At Michigan, in addition to Pike, there was Gordon E. Peterson, before he finally moved to Santa Barbara, California. Peterson was the Director of the Communications Laboratory and trained two distinguished phoneticians, Ilse Lehiste and William S-Y. Wang. These two were then responsible for the early planning and development of linguistics at Ohio State University and where, under their guidance, research in experimental phonetics was conducted. In her book *Suprasegmentals*, Lehiste says (1970:vi):

For a linguist, phonetics is only a means toward an end, not a purpose in itself. The end is to provide reliable answers to linguistically relevant questions. However, for providing these answers, phonetics is indispensable. I believe firmly that true statements regarding phonological phenomena presuppose correct observation of their phonetic manifestation. A phonologist ignores phonetics at his own peril.

At the University of Illinois at Urbana-Champaign, in the Speech Research Laboratory, an active team of researchers worked under Grant Fairbanks during his tenure at Illinois from 1948 to 1962. This group included, among others, Lee Hultzén and later, Willard Zemlin. Some of the important papers by Fairbanks have been published in *Experimental Phonetics: Selected Articles* (1966). In 1967, Chin-W. Kim, a student of Peter Ladefoged, joined the active group of linguists in the Department of Linguistics. Kim helped in setting up a research and teaching laboratory for phonetics. In addition, research and teaching in experimental phonetics is being done by Kenneth Moll at the University of Iowa, and by Raymond Daniloff at Purdue University in the Department of Audiology and Speech Sciences.
5.0. Teaching of the applications of the linguistic sciences

5.1. Linguistics and language pedagogy

In 1933 Leonard Bloomfield included a chapter in *Language* entitled "Applications and Outlook" (pp. 496-509; see also Bloomfield, 1942). In that chapter the applications of the linguistic sciences are seen as being primarily in the area of language learning and language pedagogy. This tradition of restricting the application of linguistics to this one area has continued in the United States. However, it is well known that this restricted view is much narrower than how the applications of linguistics are viewed on the other side of the Atlantic.

In any case, it was the area of language pedagogy which was fostered earlier by linguists in midwestern universities. (A detailed survey of the national scene is presented in Moulton 1961.) In 1942, the Intensive Language Program was initiated with support from the US government. A large number of linguists were involved in that program. In the following year, the Army Specialized Training Program (ASTP) and Civil Affairs Training Schools (CATS) were established. Their operation naturally involved the preparation of pedagogical materials. Linguists from midwestern universities contributed to these programs, especially in the production of what is known as the "Spoken Language Series." The following linguists from the midwestern region contributed to this series: Einar Haugen, then at the University of Wisconsin (Norwegian); Carleton T. Hodge, Indiana University (Serbo-Croatian); Henry and Renée Kahane, University of Illinois at Urbana-Champaign (Greek); Norman A. McQuown, University of Chicago (Turkish); Thomas Sebeok, Indiana University (Finnish-Hungarian); and S. N. Treviño, then at the University of Chicago (Spanish).

It was in the fifties that linguistic insights were first applied to the teaching and learning of English as a foreign (or second) language. This was considered an important area of applied linguistics, and the Midwest provided the lead in this work for over two decades. (For further discussion see §9.0.) At present, at most of the universities where linguistic offerings are available, there is at least one course in linguistics and language pedagogy or language learning. Such courses are offered either in linguistics programs (i.e. Chicago, Illinois, Iowa, Michigan, Minnesota, and Northeastern), or in the TESOL or education programs. (See Table II in Appendix B.)

5.2. Linguistics and the study of literature

In the last decade courses in linguistics and literature (or what is now called "stylistics") have not only developed in linguistics programs but the language departments are also making such courses available. (See Table II in Appendix B.) The term "stylistics" is used for that area of linguistics which is concerned with the formal analysis of literary texts.
The first interdisciplinary conference on stylistics was held in the Midwest in 1958, under the auspices of the Social Sciences Research Council at Indiana University (Sebeok, 1960, v):

... to explore the possibility of finding a common basis for discussing and, hopefully, understanding, particularly among linguists, psychologists, and literary critics, the characteristics of style in language.

The proceedings of this conference were incorporated in *Style in Language* (Sebeok, 1960), which set the foundation for this now fast-growing area of the application of linguistics in the USA. (A survey of the current trends in the field of stylistics is presented in Kachru & Stahlke (1972); see also, Chatman & Levin, 1973).

5.3. Linguistics and lexicography

Recently, linguists have become involved in theoretical or applied research in lexicography and have initiated teaching of courses on lexicography in linguistics departments. It was in 1960 that "... a small group of linguists and lexicographers met at Indiana University to discuss a variety of problems related to the making of dictionaries." The proceedings of that conference, entitled *Problems in Lexicography* (1962), certainly had some impact in focusing attention on the linguistic aspects of lexicography and the then state of the art.

In the fifties and sixties, courses in lexicography were offered at a few universities such as Chicago and Michigan. Currently, one or more courses on lexicography are offered by six universities in the Midwest, i.e. Chicago, Illinois at Urbana-Champaign, Indiana, Michigan, Northeastern, and Indiana State.

Indiana State University has taken several important steps in drawing attention to lexicographical research and teaching. In 1970, an alumnus, Warren N. Cordell, gave that university some five hundred dictionaries. This collection includes rare and out-of-print dictionaries. With gifts and matching grants from the National Endowment for the Humanities, this collection is soon expected to increase to:

... four thousand dictionaries that cover the entire history of Western lexicography. Several areas are especially worthy of note. These include one hundred and fifty different editions and issues of Samuel Johnson's *A Dictionary of the English Language*; comprehensive holdings of Renaissance English-Latin Latin-English dictionaries; numerous dictionaries by American lexicographers such as Webster and Worcester; and representative classic dictionaries in several Western European languages.

At Illinois, Ladislav Zgusta, the author of the *Manual of Lexicography* (1971), is actively involved in the application of
contemporary linguistic models to lexicographical research. Fredrick G. Cassidy (Wisconsin at Madison) is compiling a *Dictionary of American Regional English* and is also involved in the teaching of courses in lexicography. (For a detailed discussion see Read, 1973.)

5.4. Linguistics and the theory of translation

There are two books which have set the tone for teaching the applications of linguistics to the theory of translation, i.e. Nida (1964) and Catford (1965). There are some institutions (e.g. Michigan) which have courses in this area. In addition, in the fifties, it seems that courses in machine translation also were offered at several places. In recent years, courses on machine translation are slowly disappearing from the scene in the Midwest (see Table II in Appendix B).

6.0. Interdisciplinary teaching and the linguistic sciences

In the United States the tradition of interdisciplinary course offerings goes back at least to the thirties. However, this interest was primarily restricted to areas such as anthropological linguistics. The focus of such courses partly depended on the departmental affiliations of the faculty interested in linguistics. In the last two decades, a considerable number of courses with an interdisciplinary focus have developed. The interdisciplinary areas are primarily the following: anthropological linguistics, bilingualism, computational linguistics, mathematical linguistics, philosophy of language, and psycholinguistics.

7.0. Teaching of linguistics and the challenge of the sixties

The late sixties presented a serious challenge to the linguists of the United States. They were called upon to show the relevance of their discipline to society in general. It was appropriate, therefore, that in 1973 the theme of the Linguistic Institute of the Linguistic Society of America at Ann Arbor, Michigan, was "Language in the Context of Time, Space, and Society." This new trend led to the development of a wide variety of courses and projects on the sociology of language, sociolinguistics, bilingualism, and bilingual education. This societal aspect also became the main focus of linguistic research at several places (see Kachru, 1972). Such courses cover a spectrum from Black English on the one hand to language and sex differences on the other. More than a dozen universities in the Midwest now offer courses in the areas of the sociology of language or sociolinguistics (see Table II in Appendix B).

8.0. Linguistics and the non-Western languages

In this subsection I shall concentrate primarily on the involvement of linguists with the languages of the non-Western parts of the world. These languages are often termed "exotic," "uncommon," or "critical." For the most part this includes the languages of the African continent, the Far East, the Middle East, and South Asia.
In a sense, the interest of linguists in non-Western languages, such as Sanskrit, is related to their interest in the Indo-European languages in general. The beginning of this interest is generally traced back to the now famous "discovery" of Sanskrit by Sir William Jones. In the early years, before the recent upsurge of interest in the study and teaching of non-western languages in America, the Oriental Institute of the University of Chicago had already earned a considerable reputation for teaching and research in the languages of the Orient.

It was not until the early fifties that linguists actually became involved with modern non-Western languages. It was during this period that non-western language teaching and organized research on these languages started in the USA, and linguists took an active role in this undertaking. The motivation for this research, and the background for the allocation of federal and other funds for this work have already been discussed in the literature by, among others, Brown (1960) and Lambert (1973). The current role of midwestern linguists and institutions in the teaching and research in this area is presented briefly below.

8.1. African languages and linguistics

The universities of Wisconsin at Madison, Northwestern, Illinois at Urbana-Champaign, Indiana, and Michigan State have a heavy emphasis on the teaching of African linguistics. A smaller, but very active center is located at Ohio University, Athens, Ohio. The five major programs have little overlap in African linguistics and have been cooperating through the Big Ten Committee on Institutional Cooperation in offering joint Summer Programs.

The distribution of work in African languages and linguistics, like that of the languages taught, shows a great deal of complementarity. Wisconsin is particularly strong in Berber linguistics (Jeanette Harries), and Bantu linguistics (Lyndon Harries, Daniel Kunene, and Patrick Bennett). The concentration at Northwestern is more in pidgins and creoles (Jack Berry), Ghanaian languages (Berry), and Mende linguistics (Richard Spears). Michigan State is strong in Bantu linguistics (Irvine Richardson), Hausa linguistics (John Eulenberg), and Efik linguistics (John Ritter). Indiana University has a strong program in Hausa and Afro-Asiatic linguistics (Carleton Hodge), and Mende linguistics and literature (Charles Bird), as well as a rich and varied program in other areas of African linguistics through the use of an exchange scholars' program. The University of Illinois, the newcomer in African languages and linguistics in the Midwest, has established a program in Swahili language and linguistics (Chin-W. Kim and Herbert Stahlke), as well as a rich program on the contribution of African linguistics to linguistic theory (Chin-W. Kim and Herbert Stahlke). The University of Illinois initiated the Annual Conference on African Linguistics in 1970.
8.2. Far Eastern languages and linguistics

Research and teaching on the linguistic aspects of the Far Eastern languages and linguistics has continued mainly at four universities. The University of Michigan has produced several dissertations on Chinese and Japanese linguistics. Indiana University has done primarily pedagogical research on these languages. Indiana, Illinois, and Michigan State are the only midwestern universities where there is a focus on the Korean language and linguistics. At Illinois there are several linguists working on Far Eastern linguistics: C-C. Cheng (Chinese), Seiichi Makino (Japanese), C-W. Kim (Korean), and Frederick Lehman (Thai and Burmese). This group of linguists and their students have worked on phonological and syntactic problems concerning these languages in the framework of contemporary linguistics. In cooperation with William S-Y. Wang at Berkeley, C-C. Cheng of Illinois has developed a computer file of Chinese dialects. The file contains phonological information on 23 dialects of Sino-xenic languages, each having about 3000 lexical items. A theory of phonological change, called lexical diffusion, has been proposed based on studies of Chinese historical phonology. (For further details see Wang & Cheng, 1970, and Cheng & Wang, 1971.) At Southern Illinois University, James H. Y. Tai has been working on constraints in Chinese syntax.

8.3. Middle Eastern languages and linguistics

The oldest center for research on the Middle Eastern languages is the University of Chicago where the Oriental Institute made available offerings in this area. At Michigan Ernest McCarus, and at Minnesota Walter Lehn, have continued to direct research and teaching on these languages, primarily Arabic. Illinois has initiated a vigorous program on the linguistic and pedagogical aspects of Modern Hebrew.

8.4. South Asian languages and linguistics

There are courses on the structure of one or more South Asian languages at several midwestern universities, e.g. Chicago, Illinois, Michigan, Minnesota, and Wisconsin. In recent years linguistically interesting and original research has been conducted primarily at Chicago, Illinois and Wisconsin. In the Midwest, Chicago was the first to enter the field of South Asian linguistics. A group of researchers there have worked on several of the languages of this area, for example K. C. Bahl (Hindi and Panjabi), Edward Dimock Jr. (Bengali), John Lindholm (Tamil), and A. K. Ramanujan (Dravidian, primarily Tamil and Kannada). The Munda Languages Project, initiated by Norman Zide, has resulted in several papers and monographs. At Illinois, the primary focus in teaching and research has been on Hindi linguistics and Yamuna Kachru and Tej Bhatia continue research on various aspects of that language. Braj Kachru continues his research on Kashmiri and South Asian English. Courses and research on Sanskrit linguistics have been initiated by Hans Henrich Hock and
Ladislav Zgusta. (For a detailed bibliography see Subbarao and Bhatia, 1973.) The University of Wisconsin at Madison has contributed to the development of teaching materials and linguistic research in several South Asian languages, primarily Hindi (M. K. Verma) and Telugu. At Minnesota, both the Departments of Linguistics and South Asian Studies have members who are continuing research on the languages of this area, e.g. R. V. Miranda (Indo-Aryan).

9.0. Linguistics and TESOL programs

The applications of the linguistic sciences to language pedagogy (see §5.1.) were naturally extended to the fast growing interdisciplinary area of the teaching of English as a foreign (or second) language. In the Midwest, the pioneer in this field has been the English Language Institute of the University of Michigan. It was founded in 1941 under the leadership of Charles C. Fries. Fries was a typical representative of the Bloomfieldian "School" and his American English Grammar (1950) and The Structure of English: An Introduction to the Construction of English Sentences (1952) have become models of the application of the structural model to a language.

In the forties, Fries published his Teaching and Learning English as a Foreign Language (1945). It became a classic in this field and continued to be used as a model for the LINGUISTIC approach to language teaching for over two decades (see Kachru, 1967). The Institute at Michigan has always had a linguist as Director and the previous directors included Charles C. Fries, Robert Lado, Albert H. Marckwardt, and J. C. Catford.

At several universities in the Midwest, TESOL programs have either developed within the linguistics departments, or linguistics has had a serious input in their development. There are some TESOL programs which are part of English departments, and they are doing linguistically insightful work, for example the program in Applied English Linguistics at the University of Wisconsin at Madison. This program has produced very significant research under the guidance of Charles T. Scott. Their publication Papers in Descriptive, Historical, and Applied English Linguistics has included many original contributions, not only to the field of TESOL but to several other areas of linguistics, such as stylistics.

At Indiana the TESOL program started as an adjunct of the Department of English and then became a small component of the Program in Linguistics. It was under the direction of Bernard Spolsky, between 1964 and 1968, that the academic foundations for a TESL program were set. In 1968 — for several reasons, both academic and administrative — this component was restructured as an independent unit and renamed the Department of Urban and Overseas English.
At Illinois, the Division of English as a Second Language also started as an adjunct of the Department of English. Several members of its faculty are contributing to linguistically oriented course offerings and research, e.g. Katherine Aston, Lawrence Bouton, Wayne Dickerson, and Yamuna Kachru. The departments of linguistics at the University of Minnesota and at Ohio University, Athens, Ohio, also offer an MA program in English as a second (or foreign) language. (For a detailed discussion see Allen, 1973.)

10.0. The theoretical focus in the teaching of linguistics

The fast-developing and constantly changing field of linguistics creates a pedagogical problem for those who have to develop a curriculum for it at various levels of instruction. The basic question they have to answer is: What constitutes the basic component of linguistic knowledge that should form the basis for a linguistic curriculum? Once this question is settled more or less to the satisfaction of all the faculty, soon another, more intriguing, question comes up: Which model (or models) of linguistics should one focus on in teaching linguistics in a particular department? If one finds even more or less agreement on this question, it is an achievement.

The broad dichotomy generally used to discuss the focus of a department in terms of its teaching is traditional vs. contemporary. As we know, there is no agreement on what these terms mean, since they can be defined in a time dimension or in terms of a particular linguistic model.

One may take the position, as some departments do, that these polemic questions are primarily of interest to an historian of ideas in linguistic thought, not to a teacher of linguistics. However, it soon becomes obvious that such a position is not necessarily correct. If the curriculum is essentially based on one model — for example, Systemic or Transformational — the pedagogical implications are that it results in a monolithic curriculum. On the other hand, if the choice is made in favor of an eclectic curriculum, the danger is of developing no clear focus in research or teaching. In any case, both these choices have their advantages and disadvantages. And, the decision made in either direction is important from the point of view of teaching.

The situation in terms of the theoretical focus in teaching linguistics in the midwestern states provides an interesting profile about the state of the art and the linguistic curricula. The responses to the question concerning the theoretical focus have been summarized in Table I (see Appendix A) under six categories.17

11.0. Current trends in the teaching of linguistics

As section 1 indicates, there have been approximately three phases in the teaching of linguistics in the Midwest. The forties and fifties were essentially a period of Structuralism. The emphasis was primarily on methodological and procedural refinement. This was
also the period when interdisciplinary course offerings were
developed mainly with Anthropology and Sociology.

The sixties initiated a period of polemics and argumentation at
the main centers of linguistics. It was during this period that a wide
variety of courses were developed and interaction was sought with
philosophy, psychology and, in certain cases, with mathematics. This
argumentation was not restricted to the scholarly journals but it was
obvious in the classrooms, too. The Linguistic Institute of the
Linguistic Society of America, as usual, presented this phase of our
discipline at Indiana (1964) and at Illinois (1968 and 1969).

This was also the period when the earlier dichotomy between
language, literature, and linguistics began to become less visible and
research was done in the area of the "linguistic" study of literature. It
was during this period that stylistics came of age. In the Midwest
now a number of linguistics departments have offerings in this area.

The late sixties and the early seventies again brought a new
dimension and a new challenge; the linguistics departments, as did
other departments, had to demonstrate their relevance. As a result, a
closer relationship developed with the departments of philosophy
and psychology. The language and linguistics departments also
rediscovered their relevance to each other. But, more visible was a
non-American was the phenomenon of midwestern linguists
discovering the role and manifestation of language in the Midwest.
There was a sudden upsurge in urban language study, Black English,
and language and sex differences. In short, language variation, which
had been pushed under the rug for over a generation, was back in
the classroom. (See also Cassidy, 1973.)

In reorienting the teaching of linguistics in the Midwest with the
new thought and new demands, several linguists played an
important role at various stages. They were, among others, Eric Hamp
(Chicago), C. C. Fries and Kenneth Pike (Michigan), Fred Householder,
Thomas Sebeok, and Carl Voegelin (Indiana), Henry Kahane, and
Robert Lees (Illinois).

In linguistically orthodox setups, room has been made for new
insights in the field, and younger scholars are now more readily
accepted.

At institutions such as Illinois at Chicago Circle and Michigan
State, attempts are being made to represent, both in teaching and
research, linguistic models such as Stratificational (A. Makkai) and
the Scale and Category (M.A.K. Halliday). The main thrust of the
seventies points toward looking at all aspects and manifestations of
language in both teaching and research (see §12.0.)

12.0. The spectrum of linguistics offerings

In Table II (see Appendix B) I have attempted to show the
range of linguistic offerings in the various linguistics departments
and programs in the Midwest. In the seventies, it seems that all the
aspects of the linguistic sciences and their applications are represented.

13.0. On teaching "underground" linguistics

In the sixties and seventies, the way in which linguistics has been taught at the main centers in the Midwest has made conventional course titles and course descriptions misleading if not irrelevant. In addition, these present only a part of the linguistic "iceberg". The main core of it is underground: By "underground" I mean that the active, innovative groups have telephonic, mimeographed, or dittoed channels of communication about their ideas on the various branches of the linguistic sciences. These convey the state of the art today. They are circulated to the initiated members of the group, who then present the material in their classes. This restricted research has developed into a large body of material in certain areas of linguistics, but especially on syntax, phonology, and semantics. The pedagogical implications of this are that evaluation of course content at various universities has become difficult. Another implication is that this material is not readily available to all the institutions and faculty members interested in a particular field.

In order to remedy this situation, several departments in the Midwest have started their own in-house publications which help in making available the current thinking of active workers in the field. A partial list of such publications is given below; it includes only publications from the Midwest.

*Contributed Papers (Speech, Hearing, Language), Purdue University; Indiana University Linguistic Club Publications, Indiana University, Bloomington; Informal Working Papers in Applied Linguistics, Ohio University; The Informant, Western Michigan University; Minnesota Working Papers in Linguistics and the Philosophy of Language, University of Minnesota at Minneapolis; Natural Language Studies, University of Michigan, Ann Arbor; Newsletter of the Department of Linguistics, University of Illinois at Urbana-Champaign; Occasional Papers of the WOLFENDEN Society on Tibeto-Burman Linguistics, University of Illinois at Urbana-Champaign; Papers in Descriptive, Historical, and Applied English Linguistics, University of Wisconsin at Madison; Studies in Generative Semantics (SIGS), University of Michigan, Ann Arbor; Studies in the Linguistic Sciences, University of Illinois at Urbana-Champaign; Working Papers in Linguistics, Ohio State University.*

The Indiana University Linguistics Club plays an important role in making such "underground" literature widely available. Chicago and Illinois also make available the research of their graduate students and faculty. The *Papers of the Chicago Linguistic Society Meetings (CLS)* has become an important trendsetter in the new thinking in linguistics. At several universities in the Midwest such
materials continue to form the basic core of the advanced courses in linguistics.

14.0. Conclusion

In the previous sections I have presented an overview of the earlier and contemporary trends in the teaching of linguistics and attempted to relate these to the breakthroughs in the theories of the linguistic sciences which were initiated in the Midwest. I have not presented details concerning the role of linguistics in the curricula of English departments or any other language departments. At present, substantial or marginal course offerings in linguistics are available in the Midwest in humanistic disciplines, in the social sciences and also in the colleges of engineering. At several places, programs in computer studies have linguistics-related courses. Therefore, it is obvious that all the manifestations and orientations in the teaching of linguistics have not been covered in this study.

The current status in the teaching of linguistics is exactly the same as the status in the development of the linguistic sciences, one of constant change and innovation. It seems to me that the direction in the near future will be toward developing theoretical foundations and methodological rigor in the teaching of applied linguistics and interdisciplinary offerings.

NOTES

*1 gratefully acknowledge the cooperation of the executive officers of the linguistics departments and programs in the midwestern region for supplying me information concerning their institutions for this survey. I owe special gratitude to Chin-Chuan Cheng, Henry Kahane, Chin-W. Kim, Seiichi Makino, Herbert Stahlke, and Ladislav Zgusta for providing me useful data in their areas of specialization. My thanks are also due to S. N. Sridhar for his assistance.

1 Communication dated 10 December 1973 from Howard I. Aronson says, "There has been no success in establishing a definite date for the origination of the Linguistics Department. I expect it has been an independent unit since the founding of the University, which was in 1892, under the name of The Department of Comparative Philology. It became Linguistics early in the 1960's."

2 Ibid.

4 Excerpt from a communication dated 15 November 1973 from Robert Howren, Chairman, Department of Linguistics.
Excerpt from a communication dated 31 October 1973 from William J. Gedney, Chairman, Department of Linguistics.

Excerpts from a communication dated 28 November 1973 supplied by the secretary, Department of Linguistics and Oriental and African Languages.

Excerpts from a communication dated 13 November 1973 from Richard A. Spears, Chairman, Department of Linguistics.

Excerpts from a note entitled, "An Account of the Department of Linguistics, University of Wisconsin-Madison", supplied by Andrew L. Sihler, Chairman, Department of Linguistics.

Note that several of these departments also include the teaching of one or more Western languages. For example, Illinois at Urbana-Champaign, provides instruction in Modern Greek. Western Michigan, in addition to some non-Western languages, also provides instruction in Brazilian Portuguese, Serbo-Croatian, Polish, and Latvian. At Chicago, Celtic, Georgian, Albanian, and Modern Greek are taught in the Department of Linguistics.

David Lowton, Director, Interdisciplinary Major in Linguistics, Central Michigan University, in his communication dated 22 August 1973.

For a detailed discussion on the contribution of Indiana, particularly that of Andreas Koutsoudas, see Valdman's contribution which was planned to appear in this series.

Mimeographed brochure provided by the Cunningham Memorial Library, Department of Rare Books and Special Collections, Indiana State University.

Note that currently only two institutions have courses in machine translation, one of them being Chicago.

Interesting insights about the development of psycholinguistics as a distinct area of research are contained in Charles E. Osgood, "The Tale of an Eager then Lonely then Contented Dinosaur" (in this volume).

These six categories have been abstracted from the information supplied by the executive officers of the linguistics departments or programs. I found that these six categories were the crucial terms used to define the theoretical focus or orientation of a department. In certain cases, some executive officers rightly felt that my use of the term 'contemporary', for example, was not well-defined. But then who can define 'contemporary'? If a department did not fall under any of these categories, I have left all the columns
blank and presented their explanation in a footnote, for example, Northwestern.

A few universities did not provide information on this point and therefore have not been included in this table, for example, Ohio State.

18 "The primary emphasis is generative-transformational, although structural linguistics, especially phonology and morphology is taught." (Ball State)

19 "The linguistic focus is probably 'contemporary' rather than 'traditional' although I am not certain what you mean by these terms." (Bethel College)

20 "The focus is bipartite." (Central Michigan)

21 "We follow more than one method or school of linguistics." (Chicago)

22 "Our focus is contemporary, if by that you mean post-Bloomfieldian. In fact, I like to think that it is post-Chomskyite in the simple sense that we do not espouse any party line. I would call ours a highly eclectic department. Here a student learns not only about TG, but also about the views of Pike, Halliday, Lamb and even Bloomfield!" (Illinois at Chicago Circle)

23 "Although most of the linguistically oriented faculty members are interested in contemporary developments, there is no focus in the minor program on either contemporary or traditional linguistics." (Indiana State)

24 "The theoretical orientation of the department, although not monolithic, is mainly generative-transformational." (Iowa)

25 "The range of our course offerings is pretty traditional, and is intended to serve primarily although not exclusively, students with interest in English. Somewhat unfortunate, but by necessity, our courses tend toward the 'applied' aspects of linguistics often at the expense of theory. We don't call ourselves a program in applied linguistics, but this is pretty much what we are, I guess." (Miami)

26 "...we have prided ourselves both back in the days of the Interdepartmental Committee and during the last decade with a Department, on a variety of points of view represented. We are often called an eclectic department." (Michigan)

27 "Our orientation is contemporary; theoretical courses adhere essentially to the generative-transformational approach, though not in the orthodox way. Scepticism is encouraged and members of the department are, actively engaged in consideration of alternative to established theories." (Minnesota)

28 "Our program is not so extensive that we can be said to have a focus. We have tried to include structuralism, general semantics, philology, communication theory, and traditional grammar, as well as
transformational grammar and some of the later models." (Minnesota at Duluth)

29 "I would say that the department represents both traditional linguistics and contemporary linguistics, but perhaps with more of an emphasis on the latter." (Northeastern)

30 "Members of the faculty are [...] versed in contemporary linguistics of various types but one could say that most of us are resistant to and weary of what someone has described as flash-in-the-pan, provincial back-patting 'schools' of linguistics." (Northwestern)

31 "The 'focus' [...] is certainly 'contemporary' although 'traditional' linguistics constitutes a portion of the content of various courses." (Ohio University)

32 "...focus is in terms of contemporary linguistics for both theoretical and applied linguistics." (Southern Illinois)

33 "Presently, our approach is non-doctrinaire." (Toledo)

34 "The focus of the Department as a whole — its programs, courses, and philosophy — could be described as contemporary..." (Western Michigan)

35 "Currently, the Department is theoretically unfocussed, tending on all hands toward an agnosticism whose general footing is that structuralism didn't work, and currently fashionable theories endlessly fascinating though they are — don't seem to be working very well either. No one here seems to be working on either wholly novel theories, or particularly trenchant explorations of current theories. Since the Department is heavily data-oriented and empirical, I would aver that its focus is, if anything, traditional." (Wisconsin)

36 "The focus of the department is on contemporary linguistics, and its orientation is 'generative'..." (Wisconsin at Milwaukee)

37 "...the group would have to be described as eclectic." (Youngstone State)

38 The term 'area linguistics' includes course titles such as linguistic typology.

39 In 'Language Structure' I have included courses on the structure of a particular language (e.g. the structure of Hindi) and courses entitled 'language structure'.

40 By the term 'other' I mean courses which could not be classified under the categories set up in this Table, e.g. neurolinguistics. Note also that the numbers in the Table indicate the total number of courses which could be classified under each of the categories.

49
The History of the Department of Linguistics at the
University of Illinois

Henry Kahane

Introduction

In certain ways, the birth and growth of a new academic
department at a large modern University reflects changes in the
intellectual and social climate of the Nation; it thus merits a modicum
of general attention. A new discipline usually exists long before its
official recognition; it is hidden under other labels until the time
when its inherent dynamics pushes it to the fore, when, as the saying
goes, its time is ripe. The story of Linguistics at the University of
Illinois, one of those huge Midwestern state universities, is a typical
example of the process (paralleled, of course, by the history of
linguistics at various other American Universities). I shall try to tell
the story by stressing the roles and functions of the scholars,
teachers, and administrators on the local scene. The underlying
methodological credo is, obviously, my conviction that the academic
development of a new unit, particularly in its early stages, before
departmental routine has strangled the alternatives, is largely due to
the impact of individual personalities.

Bloomfieldian Prelude

An early, short-lived attempt to establish linguistics at the U. of I.
deserves interest primarily because of the one man involved.
Leonard Bloomfield (1887-1949), the central figure of the American
School of Structuralists, taught at the University from 1910 to 1921.
He was a member of the German Department, yet his bent toward
linguistic generalization was already evident in his academic title
from 1913 on, Assistant Professor of Comparative Philology and
German. It was the period in which the Urform of his influential
Language (1933) had just appeared as An Introduction to the Study
of Language (New York, 1914). The early version shows that a
mentalistic-psychological approach to language strongly influenced
by Wilhelm Wundt still dominated the curriculum which Bloomfield
had established. (After he left Illinois for Ohio, Chicago, and Yale, he
discarded the mentalistic approach for the mechanistic.) Bloomfield's
curriculum at Illinois, necessarily modest as a one-man operation,
resembled the Indo-European curricula of European universities,
which were often the domicile of linguistic theory. Bloomfield's three
courses from 1914 to 1921 bore the titles, Introduction to the Study
of Language, Comparative Philology of the Indo-European Languages,
and Sanskrit.

The Founding Fathers

The department (or group of departments) in which linguistics
surfaced varied from university to university: it could be
Anthropology or Philosophy or English or Oriental Studies or Classics
or the foreign languages. Particularly in the language departments linguistics in some form or other had traditionally been taught, intertwined with a specific language: for textual interpretation; in connection with the dreaded medieval courses, Old English, Gothic, Old Spanish; in the framework of the teacher's pedagogical preparation as French phonetics and Latin syntax. The main purpose of these courses, whether historical or descriptive, was to convey information about the target language; linguistic methods, rules, and implications came in, so to speak, by the backdoor. At Illinois, as elsewhere, Linguistics grew not so much from a single department as from a constellation of them. By the mid- and late forties, we had a group of faculty members, most of them associated with the Linguistic Society of America, who, in their respective departments and through common gatherings, tried to promote the "cause of linguistics". The most active were, in Speech, Lee Hultzen (1896-1968), oscillating between phonetics and phonemics, and Grant Fairbanks (1911-1964), an experimental phonetician and a specialist in the acoustics of speech; in Psychology and Communications, Charles Osgood, the psychologist, and his faithful collaborator, Howard MacIay, who contributed to the concept of hesitation phenomena; in Philosophy, Leonard Linsky (at the U. of I. from 1948-67), the semanticist; in Anthropology, Joseph Casagrande (with us since 1960), an ethnolinguist, with a special interest in the Amerindians, who activated the anthropologist's concern with linguistics; and in Romance (Spanish and Italian), the present chronicler, Henry Kahane, philologist. In terms of the general background, the terrible event of WW II proved to be a boon for linguistics: The Linguistic Society developed the so-called Army Method for teaching foreign languages to enlisted men, and through applied linguistics made university communities (among them Illinois) aware of the existence of linguistics itself.

We decided to launch a Department of Linguistics. The academic steps, one after another, were the usual ones: (a) A small curriculum with a director but minus a budget, using the available faculty members on released time; (b) a modest budget for the curriculum; (c) an officially established Department under a head and with members still largely from other departments; and finally (d) a regularly constituted Department. The Department's foundation was a long affair which took about eighteen years, with objections coming partly from administrators who doubted the future of linguistics, and partly from the language departments which often disliked both linguistics per se and a young, dynamic, and often aggressive competitor. We succeeded when, after many hopeful and frustrating notes, two deans of our Liberal Arts College sensed the potentialities of the newcomer: Lyle Lanier and Jack Peltason. The program of the early stage was determined, first, by the constraint, in view of our budgetary conditions, to use just the men and the courses available on the campus, and second, by our consensus to balance, within the available, the various directions of
linguistics: these were, by then, psycholinguistics, phonology and experimental phonetics, semantics, and historical linguistics. The addition of a theoretical linguist was the most urgent desideratum: we had no doubt that linguistic theory would become the core of the curriculum. By 1961, the Program in Linguistics was in existence as a graduate program; in 1965 departmental status had been reached; by 1974 we had 14 faculty members and 66 degree students, and we offered 65 theoretical courses (in addition to 40 devoted to specific languages). Linguistically oriented members of other departments cooperated generously in the teaching of many related fields. Plans were underway for an undergraduate major.

So far five men have played a preponderant role in the history of our department: Henry Kahane, a historian and comparatist linking linguistics to the humanities, the founder and first director, who put the curriculum on its feet and established the basic design for his successors to build on; Charles Osgood, who cooperated from the very beginning in the founding of the Department, the widely known creator of psycholinguistics, whose influence and prestige greatly helped to convince the skeptics, and whose field became one of the hallmarks of the linguistic offerings at the U. of I.; Robert Lees, the orthodox representative of standard transformational theory, a brilliant intellectual, the first head, who gave to the department its decisive direction and put it on the map; Braj Kachru, our sociolinguist, who with extraordinary energy and never-failing gentlemanliness steered the department from its modest beginnings to a complex and flourishing University unit; and Charles Kisseberth, a leading neo-transformationalist, who gathers about him an enthusiastic group of adepts trying to push back the known frontiers, this very moment if possible. These five men (including, I apologize, myself) have consented to portray himself and to give substance, in this way, to the image of our Department. Nationwide, the curricula, our surface, look very much alike; the real image of a department, which we were asked to present, is to be found in its deep structure, the personalities that make up the team. Therefore, the chronicler yields to the protagonists.
I was born in Berlin early in our century, an Austrian in the German world. I grew up in a milieu of literary and intellectual stimulation: my father was a man of letters and for three decades the literary adviser of the stage producer Max Reinhardt. My feeling for acculturation and comparative literature developed early. From the study of Literaturwissenschaft I turned to Romance linguistics, attracted by the magnetic personality of Ernst Gamillscheg, a trailblazing genius, who, up to his death in 1971, was inexhaustible in linguistic themes and explanations and, despite political flings, of an incorruptible professional objectivity. Two other teachers who sharpened my insight into the interrelatedness of language and history and area were Max Leopold Wagner and Gerhard Rohlfs. My classical, Romance, and German education widened, principally through my marriage with a scholar of Greek origin who became my life-long co-worker, to a preoccupation with the Mediterranean, that unique testing ground for comparative methods. These methods, within the range of my interests, were essentially historical: explanations stemmed from the similarities and differences between earlier and later stages. With the political events of the Hitler period we found a new home in Illinois. Emigration to America meant to me (among other things, to be sure) the transfer from a diachronic state of mind to a synchronic. Diachronic and synchronic interpretations of the world around us go far beyond academic disciplines; they are, in their different concern for yesterday and today, different forms of life, and I had to adjust to the new way. In linguistic matters, the school of the phonemicists, in high bloom in the forties and early fifties, was a hard and interesting training for a European, and its terse style and precise expression strongly shaped my modes of approach and presentation. In my own studies and in cooperation with my students, I experimented with structural analyses, often eliciting the pattern variants through fieldwork, sometimes without reference to meaning although usually with semantic correlates. But my wife and I returned time and again to the Mediterranean and its cultural conformity, most evident in its nautical parlance, and from the Mediterranean lexicological equations we glided to the problem of the heritage of Hellenism in the Western world. Since we came from word studies, we approached texts with an analysis of the key words; through these, as a point of departure, we tried to solve old riddles of medieval magic, science, and literature. These endeavors to exploit genetic and comparative methods for the reconstruction of medieval humanism culminated in our derivation of the Grail myth from Hermetism. We also attempted, on the basis of the sociolinguistic model of lexical borrowings, to reconstruct a complex phase of medieval history that had not been described by the work of historians: the relations between Byzantium and the West. Such studies involve an interplay of numerous techniques of historical
linguistics: the filiation and chronology of records, phonological substitution, semantic change and semantic connotation, dialectology, and linguistic geography and diffusion. The material and the methods are largely linguistic but the target lies beyond the borderline of the field: with sociolinguist lexicology, the linguist turns into a historian.

I have always loved the classroom performance. What I know about teaching I owe to two highly educational but non-academic experiences. For a few years, right after my doctorate, I became a foreign correspondent in the Balkanic area for a large and prestigious newspaper, the *Berliner Tageblatt*; both the pressure for lucid phrasing and summary and a constant awareness of the reader's level of comprehension formed a unique curriculum in Teacher Training. As teaching has always helped me to write, so writing has always helped me to teach. The second experience was furnished by the theatrical milieu in which I grew up: For me, still today, the classroom is a theatre, the teacher's desk the stage, and the teacher himself a performer — on a high level to be sure (or so we believe) — and a flop if he is not lively, stimulating, or personal, even with a subject matter as brittle as historical grammar.

In my own comparative-historical courses I drew on the classical, Romance, and Germanic languages using them as a vehicle for an introduction to the many forms of diachronic analysis. Within the Department of Linguistics we soon expanded into the area in which the techniques of reconstruction can best be developed, Indo-European linguistics, and we were fortunate in finding three co-workers who approached the problems in their personal ways: Antonio Tovar (with us from '61 to '68, when he left for Tübingen), a many-sided Spaniard, classicist, philologist, grammarian, etymologist, Celtiberianist, Euskarianist, Myceneanist, and Amerindianist; Ladislas Zgusta (who came in '71, taking over my chair), of Czech background and training, again a most versatile, most learned, most productive scholar, covering such fields as onomastics, lexicology, dialectology, and machine translation, such languages as Sanskrit, Chinese and Hittite with the other tongues of ancient Asia Minor; and finally a scholar of the younger generation, Hans Henrich Hock, who specializes in the generative analysis of historical problems, with application to a wide range of languages. Zgusta and Hock represent today's historical linguistics.

(Received December 1974.)
The Tale of an Eager then Lonely then Contented Dinosaur*

Charles E. Osgood

In his instructions to the contributor to this section on the development of psycholinguistics in the Middle West, Henry Kahane explicitly requested that "the technique of the self-portrait should dominate, not in 'Who-is-Who's style'... but rather as an intellectual history of the portrayee." Although I'm not much of a portrait artist, this should be fun, and I'll daub away at will. Since I was intermittently, and at such times, intimately, involved in the evolution of linguistics at Illinois as well, my picture will have several reflecting facets—a bit surrealistic, no doubt. The theme for psycholinguistics is marital—engagement, marriage, divorce, and reengagement—and an introspective little dinosaur (there were little dinosaurs, you know) will, of necessity, be the main character.

A Confession and an Awakening

As a baby dinosaur I was teethered on Meaning by a dentist grandfather who had always wanted to be a professor. He fed me rare words and then gave me money to buy jelly-beans when I used them correctly in sentences. Later, around the age of 10, my aunt gave me Roget's Thesaurus—perhaps to even the odds with Grampa O., a bit—and I remember having vivid dreams about multi-colored word-points distributed in clusters in an endless space. After an entirely murky spell in grammar school (spent more in reading Tarzan books and science fiction magazines than in school work), I found myself as Editor of both the weekly newspaper and the monthly magazine at Brookline High School, near Boston. I contributed several short stories to The Challenge, as the magazine was called. The Thesaurus came in very handy, and I went off to Dartmouth College convinced that I was destined to become, not a dinosaur but, a newspaper man and novelist.

But in my sophomore year at Dartmouth I took Introductory Psychology and then an advanced course in Experimental Psychology from a man who was to become both a mentor and a father figure for me—Ted Karwoski. Karwoski was a scholar-scientist with unusual sensitivity, eclecticism in research pursuits (from Purkinje after-images to visual-auditory synesthesia), and an enviable capacity to think about the same problem on several levels at once. The young dinosaur had found what he wanted: a field that offered the right balance between rigor and creativity. My undergraduate thesis (we had them then) was a combination of laboratory work on auditory-visual-verbal synesthesia (or metaphor) and cross-cultural study of parallel polarities (e.g., between white-black, up-down, good-bad, and supraordinate-subordinate) in the medical, religious and other facets of the cultures of about ten human societies (based on field reports by others, of course).
I wonder how common it is for the schema of one's scholarly life to be set in his undergraduate years; this certainly was the case for me — a focus on meaning. At Yale I got swept up in the monumental edifice of learning theory that Clark Hull was building. I believed that, with appropriate extensions, such a theory could handle Man's most complex behaviors, including language — but my focus was still on meaning. With a Ph.D. under his belt (1945: thesis title, *Meaningful Similarity and Interference in Learning*), this dinosaur-to-be began teaching at the University of Connecticut and writing drafts of chapters for what was to be the last graduate-level text in experimental psychology written by a single hand.¹

In 1949 came the bonanza that every young scholar prays for: an invitation to a major university at a tenured level and — rare in those days — with half-time explicitly for research in a newly formed Institute for Communications Research at the University of Illinois.

Confession

At Illinois I went busily to work on both the (learning theory) nature of meaning and the (semantic differential technique) measurement of meaning, and with a growing group of interested colleagues and graduate students things went along at an exciting pace. But I must confess that at this time — except for the work of Charles Morris in semiotics — I didn't have the foggiest idea of what scholars in other fields were thinking and doing about language behavior. Specifically, as to LINGUISTS, I had only a vague notion that they were strange, bearded, bird-like creatures who inhabited the remoter regions of libraries, babbling in many exotic languages and constructing dictionaries for them — hardly fit companions for a robust, rigorous and objective young dinosaur! Of course, it was true that at that time few linguists had much interest in meaning — my own focus — but there were some who did (Jakobson and Weinreich, for examples) and there was much else they were doing about language that was certainly relevant. The aliinguistic state of my awareness is evident from a perusal of the last chapter (title, "Language Behavior") of my graduate text, *Method and Theory in Experimental Psychology*: it is devoid of references to the works of linguists (the possible exception being Benjamin Lee Whorf).

Awakening

In the summer of 1951² the Social Science Research Council — sparked by Jack Carroll (attuned to linguistics via his tutelage under Whorf) and supported by John W. Gardner (a psychologist, then with the Carnegie Corporation of New York, and later to become secretary of HEW, and still later organizer of Common Cause — sponsored a summer conference of linguists and psychologists at Cornell University. The linguists were Fred Agard, Tom Sebeok and Stan Newman and the psychologists were Jack Carroll, Dick Solomon and — by a bit of a fluke — Charles Osgood.³ I say "fluke" because Bernard Riess, a psychologist who had been doing studies on semantic
generalization as a function of age, was the original invitee but had to withdraw (for reasons I can't recall). Since I had already been awarded an SSRC Research Fellowship (for support of the semantic differential studies), I was invited to be his substitute and — frankly, in part because of the attractiveness of a summer in the hills and by the lakes of Ithaca — I readily accepted. I often wonder how the course of my scientific life would have run if this "fluke," and all that followed from it, had not happened. It is at least quite certain that I wouldn't be writing this paper of remembrances for this volume. In any case, that summer was an eye-opener: not only were the linguists NOT either polyglots or lexicographers, but they WERE robust, rigorous and objective — and maybe more so than the young dinosaur!

As a result of that summer's meeting — and with the continuing push of Jack Carroll and the support of John Gardner — the SSRC established a new Committee on Linguistics and Psychology in October of 1952. The initial membership was as follows: Charles E. Osgood (psychologist and, for reasons I can't fathom, chairman); John B. Carroll (psychologist, Harvard); Floyd Lounsbury (ethnolinguist, Yale); George A. Miller (psychologist, MIT); and Thomas A. Sebeok (linguist, Indiana). Joseph B. Casagrande was officially the SSRC staff representative on this committee, but in matter of fact he served more as a regular member. George Miller resigned from the committee at the end of the first year, and Joseph H. Greenberg (ethnolinguist, Columbia) and James J. Jenkins (psychologist, Minnesota) were added in the fall of 1953. This turned out to be a very busy little committee and, as Howard Maclay (1973, p. 596) notes in his history of relations between linguistics and psycholinguistics, contributed significantly to what he calls The Formative Period of the relationship (in the 1950's). Maclay's other two stages are The Linguistic Period (in the 1960's) and The Cognitive Period (so far into the 1970's): these correspond to my Engagement, Marriage, and Re-engagement phases below.

The Engagement

One of the first steps taken by this new Committee was to plan and sponsor a research seminar on psycholinguistics, this being held during the summer of 1953 on the campus of Indiana University — when and where, not by chance, the Linguistic Institute was also having its summer session. In his foreword to the monograph that resulted from this seminar (Psycholinguistics: A Survey of Theory and Research Problems, 1954), John Gardner says, correctly, that the seminar "... set itself to the task of examining three different approaches to the language process (and their relationships): (1) the linguist's conception of language as a structure of systematically interrelated units, (2) the learning theorist's conception of language as a system of habits relating signs to behavior, and (3) the information theorist's conception of language as a means of transmitting information... (as well as) to examine a variety of
research problems in psycholinguistics with a view to developing possible experimental approaches to them (p. x)." The senior participants were Greenberg, Jenkins, Lounsbury, Osgood, and Sebeok, with Jack Carroll, Eric Lenneberg, and Joe Casagrande participating for a period of two weeks and with occasional visitors for briefer periods — Grant Fairbanks, E. M. Uhlenbeck, John Lotz, and Werner Leopold. Graduate-student participants for the whole summer were Susan Ervin, Donald Walker and Kelly Wilson (psychologists) and Leonard Newmark and Sol Saporta (linguists).

According to one impartial chronicler (A. Richard Diebold, Jr., 1965), "within a year or two of its appearance, this monograph became the charter for psycholinguistics, firmly establishing the discipline's name. It so successfully piqued the interest of linguists and other behavioral scientists that the volume itself was soon out of print, and also became notoriously difficult to obtain second-hand, or even in libraries (p. 208)." And Sol Saporta was in 1961 to edit the first "long-awaited reader, Psycholinguistics: A Book of Readings ... (which was also a testament to the fact that there was) an ever-growing number of university courses variously titled 'psychology of language,' 'psycholinguistics,' 'linguistic psychology,' etc. (p. 208)." According to another observer (Howard Maclay, 1973), "the Formative Period was characterized by extremely good relations between psychologists and linguists. This happy state of affairs had two major sources: a common commitment to an operationalist philosophy of science, and a division of labor that prevented a number of potential difficulties from becoming overt ... linguists were assigned the 'states of messages,' while psychologists assumed responsibility for the 'states of communicators' and, by default, 'the processes of encoding and decoding' (pp. 570-71)."

The thrust of the continuing SSRC Committee on Linguistics and Psychology is evident in the other projects and seminars it supported during the 1950's: (1) a "Southwest Project on Comparative Psycholinguistics" (centered at the University of New Mexico, summer, 1954); (2) a conference on Bilingualism (Columbia University, 1954); (3) another conference on Techniques of Content Analysis (University of Illinois, 1955); (4) yet another on Associative Processes in Verbal Behavior (University of Minnesota, 1955); (5) and yet another on Dimensions of Meaning — Analytic and Experimental Approaches (1956); (6) a very impressive, large-scale conference on Style in Language organized by Tom Sebeok (Indiana University, 1958); (7) a summer seminar on the Psycholinguistics of Aphasia (Boston Veterans Administration Hospital, 1958); and a conference on Language Universals (Dobbs Ferry, New York, 1961). Ah, happy eager dinosaur! Now reaching maturity, he had participated in the full kaleidoscope of these SSRC activities, and Spring was turning into what HAD to be a Golden Summer.
Psycholinguistics at Illinois in the 1950’s

Our eager dinosaur was also very busy on his home grounds at Illinois. During this decade there were a series of theoretical papers elaborating my own version of Neo-behaviorism and its relevance for understanding human perceptual, motivational and semantic processes, in general as well as in language behavior per se: "The Nature and Measurement of Meaning" (1952) — which demonstrated the abject wrong-headedness, of course, of everything psychologists had previously done in trying to measure that elusive thing called 'meaning'; "Behavior Theory and the Social Sciences" (1956) — mainly argued for the power of a two-stage mediation theory for underpinning the social sciences generally, via its incorporation of meaning, but also introduced my three-stage model with its "integration level" on both sensory and motor sides of the behavioral equation; "A Behavioristic Analysis of Perception and Meaning as Cognitive Phenomena" (1957a) and "Motivational Dynamics of Language Behavior" (1957b) — both of which further elaborated on the necessity of a three-stage (or level) model, if behavior theory was to incorporate gestalt-like perceptual and equivalent motor (cf. Lashley, 1951) skill integrations; "A Question of Sufficiency" (1958) — a highly critical review of Skinner's (1957) Verbal Behavior, mainly on the grounds of his complete failure to handle meaning; and "Cognitive Dynamics in the Conduct of Human Affairs" (1960) — which was an excursion into the dynamics of congruence and incongruence ("psycho-logic") in human thinking and sentencing.

While all this was going on in my own thinking, our little group of psycholinguists at Illinois was busily pushing the developing Semantic Differential Technique (SD for short) into various nooks and crannies of the social sciences: into the affective thinking that characterizes the "authoritarian personality" (by George Suci, 1952, my first Ph.D.); the prediction and measurement of attitude change (by Percy Tannenbaum, 1953); the nature of dream symbolism (C. Scott Moss, 1953); into the role of source credibility in mass media communications (Jean Kerrick, 1954); the semantics of passive sonar signals (Laurence Solomon, 1954); the nature and measurement of interpersonal identification (Lionel Lazowick, 1954); application of the SD to the Thematic Apperception Test (TAT) cards (Margaret Reeves, 1954); into the semantic factor structures of schizophrenics (Joan Bopp, 1955); the development of assigned meanings in the context of meaningful adjectives (Joan Dodge, 1955); the semantics of advertising (William Mindak, 1955); the semantic structure of aesthetic judgments of visual art (William Tucker, 1955). And in 1954 Zella Luria and I published our blind (SD) analysis of a case of triple personality — the case that was to become famous as "The Three Faces of Eve." Of course, our psycholinguistic interests were not limited to SD research: Kellogg Wilson's (1954) thesis was on an extension of information theory and statistics; Wilson Taylor's (1955)
thesis was an intensive evaluation of his "Cloze Procedure" in information theory terms.

In these days, when so much of research is "administered" — senior people like myself having practically nothing to do with it between original designing and terminal writing-up — it is a real pleasure to look back on those early days at Illinois when we literally lived and breathed our research from morning to night. I used to be my own first "guinea pig" (not impossible for a small dinosaur!) in every experiment, to try to get the "seat of the pants" feel for what might go on in the real subjects' heads. In the midst of doing one experiment, others were always aborning — over coffee, over sandwiches and beer, and even over cocktails and dinner, much to the amusement, but never irritation, of our spice. I am minded of an enlarged photograph on the wall of my office which caught Percy Tannenbaum and myself, glasses in hand, in animated mid-flight over something or other — and a caption had been appended, reading "BUT THERE MUST BE A MEDITATION PROCESS!" Al Heyer and I spent an hilarious weekend, practically without sleep, constructing a monstrous three-dimensional distance model with colored balls and wooden dowels to represent the meaningful similarities among 40 facial expressions of emotions. I still have that old model in my office, but ANGER and BITTERNESS have fallen off, and SURPRISE has somehow gotten attached to ADORATION — by a bemused janitor, no doubt.

In the comparatively brief period from 1950 through 1955 some 70 studies were completed, and in the summer of that year the Osgood family took off on its first sabbatical — in Tucson, Arizona. Packed into the trunk of our second-hand Buick Roadmaster (freshly painted in Dartmouth Green) was everything psychological about meaning and the measurement thereof that I could put my hands on. My sabbatical job was to put into one document all the diverse things we'd been doing on the development and application of SD technique — first with generous support from the University of Illinois Research Board and later from the Social Science Research Council. As each section was completed, I would whip it off to George Suci and Percy Tannenbaum, now on our Institute staff and my closest colleagues in this exploration of semantic space. They showed copies of some of the earlier chapters to the editor of the University of Illinois Press (Miodrag Muntyan), and he suggested making a book of it. So The Measurement of Meaning (Osgood, Suci, and Tannenbaum) was published in 1957. Because it had originally been planned as merely a research report, the first hard-cover edition didn't even have an index — so I firmly recommend the later paperback edition (which DOES have an index) to anyone interested in sampling this early work.

To the enduring amazement of Osgood, Suci, and Tannenbaum, this little book proved to be one of the best sellers on the University of Illinois Press list.
Linguistics at Illinois in the 1950's

Professors in disparate fields are often brought into contact by students they share. This is what happened between Henry Kahane and myself. I had only met Henry socially a couple of times by 1953, but when plans for the summer psycholinguistics seminar were taking form I asked for his recommendation of a linguistics graduate student at Illinois who would profit from and contribute to this enterprise — and he suggested Sol Saporta. Not only did Sol contribute most solidly, but he continued to work closely with our psycholinguistics group while completing his thesis under Kahane. It was during another large conference at Indiana in the incredibly hot and humid summer of 1955 — this one on Anthropology and Linguistics — that Kahane and I began, during our commutings back and forth between Urbana and Bloomington, to talk about getting a Ph.D. program in linguistics underway at Illinois. Although there were students specializing in this field, there was no degree-granting pathway for them to follow (for example Saporta's Ph.D. was in Spanish Linguistics).

I spent the academic year 1958-59 as a fellow in the Center for Advanced Study in the Behavioral Sciences at Palo Alto. I had proposed to spend that year doing the first-drafting of a book to be titled — after my graduate text in experimental psychology with the Oxford Press — Method and Theory in Psycholinguistics. I actually did just about everything but: finished the final drafting of Approaches to the Study of Aphasia (jointly edited by Murray Miron and myself), had long discussions with George Miller and others about Chomsky's new Syntactic Structures (1957), did research with Albert Hastorf on predicting the meanings of facial expressions fused in a stereoscope, joined Ed Dozier and Ian Waterhouse in a two-week field-trip to the Grand Canyon area to apply new psycholinguistic techniques to the study of kinship with Hopi and Hopi-Tewa Indian subjects — and MAINLY, given the example of psychiatrist Jerome Frank (who happened to have the Center "cell" next to mine), I worked on problems of applying psychological theory to international relations, ending up with what was to be acronymed GRIT (Graduated and Reciprocated Initiatives in Tension-reduction — cf. An Alternative to War or Surrender, 1962).

But by the end of the 1950's the distant mutterings of a scientific revolution were in the air — impelled by Chomsky's generative and transformational grammar (1957) — certainly in linguistics and possibly in cognitive psychology, too. In the preface to his Psycholinguistics (1961) Sol Saporta was to say: "... all attempts by psychologists to describe 'grammaticality' exclusively in terms of habit strength (etc.) ... seem inadequate ... to account for some of the most obvious facts of language (p. v)." In 1959 Chomsky wrote a carefully documented and scathing review of Skinner's Verbal Behavior (1957) — never responded to by Skinner himself — and this was to have cumulative impact on many psycholinguists. Perhaps
because our dinosaur was confidently mature, had a much more complex behavior theory, and, indeed, had written a highly critical review of Skinner himself, he was not particularly disturbed and kept right on nuzzling along and munching away at his semantic daisies.

The Marriage

While at the Center in Palo Alto in 1958-59 George Miller, Eugene Galanter and Karl Pribram were working on their Plans and the Structure of Behavior, to be published in 1960; it was heavily influenced by Chomsky and included a chapter on "Plans for Speaking." This was followed by Miller's important paper titled "Some Psychological Studies of Grammar" (1962) and soon thereafter by a small flood of papers by Miller, his students and others testing the psychological reality (in terms of effects upon processing time, memory and the like) of grammatical structures and transformations. The consummation of this intimate relation between linguistics and psychology was symbolized by two chapters in the Handbook of Mathematical Psychology (1963) written jointly by Chomsky and Miller: "Introduction to the Formal Analysis of Natural Languages" (Chomsky and Miller) and "Finitary Models of Language Users" (Miller and Chomsky).

The distant mutterings of revolution were becoming heavy rumblings of imminent paradigm clash. In concluding their debate with Martin Braine over the learning of grammatical ordering of words in sentences, Bever, Fodor, and Weksel (1965) felt themselves able to say: "As the empirical basis for assuming an abstract underlying structure in language becomes broader and the explanatory power of that assumption becomes deeper, we recommend to all psychologists that they seriously question the adequacy of any theory of learning that cannot account for the fact that such structures are acquired (p. 500, italics theirs, not mine)."

By the middle 1960's even the middle-aged dinosaur in his daisy patch was beginning to eye the ominous storm with some concern. But he was still eager and busy, and — as such things are measured — he was successful in his profession and therefore quite confident. In 1960 he received the award for distinguished scientific contribution of the American Psychological Association for his studies of meaning and in 1962 he was elected president of that Association. So early in 1963 I began to worry about what I should say to my fellow psychologists. I went through a period of intense ambivalence about this: on the one hand, since my year at the Center at Palo Alto I had been giving top priority to strategies of international relations in a nuclear age (from 1960 through 1963 I must have averaged about 20 lectures, seminars, etc. per year on GRIT as a rational strategy), and I knew that most of my potential audience expected a tough policy speech on this major social issue; on the other hand, I felt a strong urge to follow the tradition of most past presidents of APA and talk about the most crucial scientific
issues in my own specialty — even if to a much smaller audience as far as comprehension was concerned. I took the latter course, and the title of my address, "On Understanding and Creating Sentences," indicates what I thought was the most crucial issue for psycholinguistics.

I can thank Noam Chomsky (remotely) and Jerry Fodor (intimately) for not letting my "success" make me complacent. I have always been a believer in bringing the opposition up close — both to keep in touch with their ideas and to bounce my ideas off them. So when I met Fodor at Oxford University in the spring of 1961, I decided to invite him to Illinois as a Visiting Professor; he came in the fall of 1962, on a joint appointment in our Institute of Communications Research and the Department of Philosophy. He sat in on my seminar on psycholinguistics (if you could imagine Jerry just "sitting in" on anything; bouncing between floor and ceiling would be more like it!), and several of the students in the seminar told me it was the most exciting course they had ever had. In 1969 I was able to attract William F. Brewer here — from Iowa via Minnesota — and he performed the Devil's Advocate role most ably and amiably.

Oh, how the dinosaur worked on that APA address! By the middle of the summer of 1963 (and only a few weeks before the convention) he had pounded out a small book of 204 double-spaced pages that had to be pared down to about 36 deliverable pages. The full version was never published — I was not really satisfied with it — but much of it was predictive of the path our dinosaur would be following through the next decade. By 1966 the conflict between competing psycholinguistic paradigms had reached what Thomas Kuhn (1962) terms the "crisis" stage in scientific revolutions. Fodor (1965) had published a paper titled "Could Meaning Be an r m?", explicitly aimed at O. Hobart Mowrer but obviously including me, to which I replied (Osgood, 1966); it claimed to reduce neo-behaviorist two-stage mediation theories to single-stage Skinnerian theory, hence rendering them heir to all of the inadequacies claimed by Chomsky (1959). In the spring of 1966, at the University of Kentucky, there was a conference with an innocent-enough sounding topic, "Verbal Behavior and the General Behavior Theory." This was published in 1968 under the same title (Dixon and Horton, editors). Particularly in the session on Psycholinguistics, the prepared papers by "revolutionaries" Bever, Fodor, Garrett, and McNeill constituted a frontal attack on behaviorism and associationism generally. As discussant of these papers, I found myself in the unenviable and unfamiliar role of defending The Establishment. The title of my discussion, "Toward a Wedding of Insufficiencies," is indicative of my ambivalence in this role. And I was beginning to realize that I was the dinosaur!

This is not the place to go into a detailed analysis of the issue of revolutions vs. pendula swings (however, see the chapter by the title
in my forthcoming *Prolegomena to a Behavioral Theory of Cognizing and Sentencing*). But my conclusion from making such an analysis is that, although the impact of Chomsky on linguistics was certainly a revolution in Kuhnian terms, this has not been the case for his impact upon cognitive psychology (or even psycholinguistics). Why? Because it has not met the criteria which distinguish revolutions from mere pendula swings in the competition between viable paradigms: (1) there has been no attempt to incorporate solutions to problems successfully handled by the old paradigm; (2) the old paradigm has not been shown to be insufficient IN PRINCIPLE; (3) there has been no new paradigm to SHIFT TO — in the sense of a well-motivated, internally coherent alternative theory of language performance. There has been a SHIFT AWAY FROM behaviorism in any form, but in the absence of any alternative paradigm this would be better called a "revulsion" than a "revolution." Maclay (1973, p. 579) notes that the responses of "... psychologists who had a vested interest in research on language ... fell into the three familiar categories of AVOIDANCE, CONVERSION, and COMPROMISE ... their overwhelming response was conversion ... (and) the quasi-religious nature of scientific conversion required that those who had seen the light should condemn everything connected with their erroneous views they had previously held."

Maclay also points out (pp. 579-80) that in a clash between paradigms the middle ground becomes very insecure, and he kindly comments that "Osgood was the only major psychologist who continued to take linguistics seriously but who rejected some of its implications for psycholinguistics ... (particularly) the assumption of the centrality of grammar. While acknowledging the success of transformationalism as a linguistic theory and insisting that his students be trained in linguistics, he continued to argue that a revised version of behavior theory was, at least, an essential component of an adequate psycholinguistic theory." But it was a rather lonesome old dinosaur who kept offering his daisies at the shrine of a near-deserted (if still viable) paradigm in the late 1960's. What was particularly disturbing to him was that, given the prevalent liturgy — that Chomsky had demolished Skinner and Fodor had reduced Osgood to Skinner, thereby demolishing him as well — many young psycholinguists didn't even bother to read what Osgood himself had to say. The old dinosaur even sent some of his best students (after helping guide them to their Ph.D.'s) to serve at the shrine of the opposing paradigm at MIT — Merle Garrett and then, for briefer periods, Ken Forster and John Limber.

**Psycholinguistics at Illinois in the 1960's**

But this period was another busy one on the home ground, and the dinosaur didn't have much time to brood about possible paradigms lost. For one thing, the extension of the SD technique cross-culturally and cross-linguistically began in 1960, and the number of communities involved around the world increased
steadily from six to about 25 during the decade — accompanied by a steadily increasing local (some 10 staff and graduate-student assistants) and foreign (from a dozen or so colleagues to nearly 60) co-workers, increasingly long periods traveling abroad by the Principal Investigator (the friendly dinosaur), and exponentially (it seemed) increasing correspondence. Nevertheless, he kept a talon or two in psycholinguistics more generally: while the running debate with Fodor, Bever, et al. was going on, there was a study on the semantics of communication via facial expressions (Osgood, 1966) and two papers jointly with Hastorf and Ono (1966) and Ono and Hastorf (1966) on predicting the meanings of facial expressions fused in a stereoscope from the meanings of the component faces. Whose face? Why the genial dinosaur's, of course! A major thrust was toward development of a procedure for discovering semantic features other than the semantic differential; working first with Ken Forster in Hawaii (second sabbatical, 1964-65) and then with Marilyn Wilkins back at Illinois, a "semantic interaction technique" was evaluated — a technique in which the appositeness, permissibility or anomaly of word-pairs in phrases (e.g., *plead with humbly, °plead with sincerely, *plead with tolerantly) were judged by native speakers and the pattern of judgments analysed factorially to determine the features operating (cf. Osgood, 1970a, 1970b). And there was a little piece with Jerry Boucher ("The Pollyanna Hypothesis," Boucher and Osgood, 1969) that used our cross-cultural data to test certain hypotheses relating to linguistic and affective marking.

Throughout the decades from 1950 to 1970 the Institute of Communications Research was the focus of psycholinguistics at Illinois, often with joint appointments in Psychology, and the continuing grants from NIMH and NSF for the cross-cultural projects also supported both staff and graduate students specializing in this field. Osgood was Director of the Institute from 1955 through 1965, when Howard Maclay took over. And James Carey was to become Director in the 1970's. Murray Miron was Co-director of the cross-cultural project and a "resident psycholinguist" during the early 1960's; Leon Jakobovits took over the same role in the middle to late 1960's; since then William H. May, truly my right arm (as chief programmer, data analyst and budget manager), has served as Co-director since 1969. Danny Steinberg was with us for a couple of years in the mid-60's as a post doctoral student from Hawaii.

Brief citations of the topics of the doctoral theses of my students during this decade will document the gradual shift of focus from words to sentences:15 Murray Miron's thesis (1960) was a cross-cultural study of cognitive interaction among words, colors and forms; Ken Forster (1964) compared the difficulties of completing left-deleted vs. right-deleted sentences (left-deleted, of course, were harder for English speakers, but later Ken extended this study to speakers of Turkish, a left-branching language, and found the same
difference, but less in amount); Merle Garrett (1965), working then at MIT under Fodor, did one of the earliest studies on the subjective displacement of clicks in one ear as a function of the syntactic structures of sentences received in the other ear; Dogan Cuceloglu (1967) — one of the five or six young people so far who first worked as field staff on our world-wide project and then came to Illinois for advanced degrees — did a three-culture study of the communicative components of facial expressions; John Limber (1968) did a three-mode factorial study of the functions of sentence-frame, noun, and adjective features in determining the acceptability of resulting sentences; James E. Martin (1968) made a theoretical and empirical study of the determinants of prenominal adjective ordering; and Tulsi Saral (1969) returned to the domain of facial, gestural and postural communication, but now between live humans in interpersonal interactions.

Disillusion and Divorce

The marriage between linguistics and psycholinguistics in the 1960's might better be called an elopement — or perhaps even an abduction — because it was a very one-sided affair. The intuitions of generative linguists were to provide a theory of Competence, or knowledge that native speakers have of their language, and the amely psycholinguists were to cook up experiments on Performance designed to demonstrate empirically the validity of such a theory of how the mind works in sentencing. This presumed a direct Correspondence Hypothesis (Hayes, 1970) — "that the sequence of rules used in the grammatical derivation of a sentence — that is, the derivational history of the sentence — corresponds step by step to the sequence of psychological processes that are executed when a person processes the sentence (p. 5)." Learning a language was equated with the acquisition of its syntax, and semantics took a back seat. Since it seemed inconceivable that such an incredibly complex capability as a transformational grammar could be learned in the incredibly short period of three or four years, it was assumed that much of it must be innate — universal to humans and specific to language.

Although the early psycholinguistic studies of sentence processing by George Miller (1962) and his students and associates seemed to give credence to such a Correspondence Hypothesis, even by the mid-60's sufficient contrary evidence had accumulated to lead Fodor and Garrett (1966, p. 162) to say "... an acceptable theory of the relation between competence and performance models will have to represent that relation as abstract, the degree of abstractness being proportional to the failure of formal features of derivations to correspond to performance variables." In the absence of ANY characterization of this "abstract" relation, of course, all this does is to remove competence grammar from the danger of being disconfirmed by performance data.
The denouement of the Competence/Performance distinction, in my opinion, came at a symposium on *Cognition and the Development of Language* held in 1968 at Carnegie-Mellon University, the papers being subsequently published under the same title in 1970 (Hayes, editor) — particularly in the contributions of William C. Watts ("On Two Hypotheses Concerning Psycholinguistics") and Thomas G. Bever ("The Cognitive Basis for Linguistic Structures"). Watts first demolished (to his satisfaction, as well as mine) the hypothesis that a Competence Grammar, derived from the intuitions of linguists, could be isomorphic with what he terms a deeper Mental grammar — i.e., that Competence could describe how the mind works in understanding and creating sentences; he then proposed the hypothesis that what he terms an Abstract Performance Grammar must be isomorphic with the deeper Mental Grammar — and although he was rather vague about the nature of this APG, it is clear that a theory of "how the mind works in sentencing" is to come from abstracting about the performances of speakers, particularly children. The main theme of Bever's paper was that performance, at least in part, determines ultimate linguistic Competence: "many aspects of adult language derive from the interaction of grammar with the child's processes of learning and using language (1970, p. 280)," and after demonstrating this in a variety of language processing situations, he concluded that we must "... reject the claim that a linguistic grammar is in any sense internal to such linguistic performances as talking and listening (p. 344)."

Re-engagement

Needless to say, the elderly dinosaur in his daisy patch was following these developments with great interest, and even the casual observer could see the brightening gleam in his eye and the increasing vigor with which he flicked his tail. By the early 1970's he had discovered a new field of semantic daisies — ones that grew in a wondrous variety of little trees made up of chains of linked blooms — and he fed upon them with relish while he refurbished and expanded the shrine for his paradigm. The denouement of the Competence/Performance distinction had (some might say paradoxically) paved the way for a new, more balanced, and potentially very productive relation between linguists and psycholinguists in what Maclay (1973) has called The Cognitive Period of the 1970's.

And in the Midwest the old dinosaur and his companions have also been moving happily into this new relationship. He contributed a paper titled "Where Do Sentences Come From?" to the Steinberg-Jakobovits collection (*Semantics, 1971*); the main point was to demonstrate that there is an intimate interaction between non-linguistic and linguistic channels in the process of Simply Describing ordinary events, and hence that these channels must share some deeper cognitive level that cannot, in principle, be characterized by Linguistic constructs and rules. The dinosaur and one of his friends...
even invaded the heartland of the linguistic domain by publishing an article in *Language* (Osgood and Richards, 1973) titled "From Yang and Yin to *And* or *But,*" in which laws of cognitive congruence and incongruence were used to predict the discriminative use of these conjunctions in simple conjoined sentences of the form X is ADJ1 _ _____ ADJ2 (e.g., X is sweet _____ kind or X is cowardly _____ honest) — frames which, linguistically speaking, will accept either *and* or *but.* A wife-and-husband team, Sara and William Smith, demonstrated in their theses that a priori semantic features intuited on a behavior-theory basis were, indeed, predictive of the speed of completing skeleton words (Sara, 1971) when given cue words varying in feature overlap with the skeletons (e.g., completing _ X_ LO _T when given BULLY and IMPOSE ON vs. WARN, varying in feature similarity to EXPLOIT) and predictive of falsely recognizing as "old" new interpersonal verbs in long lists as a function of feature similarity (William, 1972).

In the spring of 1972, after I got back from several long trips around the world in connection with the continuing cross-cultural project — which was becoming something like a dinosaur having a bear by the tail! — what we call our Cog Group began to hold regular idea-suggesting and idea-critiquing sessions, first with a small group of my own graduate students and psycholinguist colleague, Bill Brewer, and later with an expanded group of students in several fields and two lively young linguists at Illinois, Georgia Green and Jerry Morgan. Combining my type of componential mediation theory (semantics) with liberal dashes of intuition about meanings of entities and their action and stative relations (syntax) in pre-linguistic behavior, we were trying to build a fresh conception of "where sentences come from and go to" — or, going back to Watts' notions about the characterization of the deep Mental Grammar, you could say that we were trying to build an APG (Abstract Performance Grammar) on a psychological as well as a linguistic basis.19 Oh, these Cog Group sessions have been exciting for the old dinosaur — downright rejuvenating, in fact! And they are good intellectual fun — particularly, I guess, when the old fellow tries to put on his baby booties and intuit how his pre-linguistic world was structured cognitively.

A number of recent theses and research papers were generated by these Cog Group sessions, and they pretty well portray the nature of our new thrust: Rumjahn Hoosain's thesis (1973) confirmed the prediction that cogs20 encoded from the perceptual channel (e.g., two outline facial expressions) as well as cogs across perceptual and linguistic channels (e.g., a smiling face and "I flunked the exam") will display the same processing difficulties as functions of (a) negative affect and (b) incongruence as do conjoined sentential cogs. In another study titled "The Processing of Negation," Hoosain (1974) demonstrated the same effects for simple linguistic cogs, also to be conjoined by *and* or *but,* and added a third negativity factor, the
number of explicit notes. In her thesis (1973) Gordana Opacic explored the psycholinguistics of various modes of conjoining cognitions, in terms of types (Simple Junction, Sequence, Cause, Cause and Sequence, Intention), in terms of forms (basic, centered and or but and their extensions like and so, but still then, and the like, vs. displaceable adverbials like before, because, and in order to), and in terms of displacement of adverbials and clause order — and predictions based on assumptions about "naturalness" (based on intuited pre-linguistic experiences) were confirmed. Tom Hewett (1973) tackled the problem of presuppositions, confirming the prediction that, since the theory says that presuppositions of sentences are cognized and stored at the time of comprehending them, along with the given sentence, subjects should falsely "recognize" the presuppositions but not control statements using the same words. Meridith Richards (1974) tested the hypothesis that, in both comprehending and producing triplets of prenominal adjectives in the context of displays of object-sets, both adults and children would order the adjectives according to the abstractness (frequency-of-usage) of the semantic features they tap — with generally supportive results.

And so, the old dinosaur is contented — but neither complacent nor satisfied. There will always be much to be busy about. Whence psycholinguistics at Illinois into the 1980's and maybe beyond? The cross-cultural project, particularly its Atlas of some 600 translation-equivalent concepts for some 30 language-culture communities around the world, has generated enough data on what we now call "subjective culture" to take up the energies of a dozen young scholars for several years to get it reported to social scientists — and meanwhile Oliver Tzeng, Bill May and I are working on refinements in methodology for analyses of the some 50 categories of concepts in the Atlas. I now expect that this little shrine to the neo-behavioristic paradigm will go through a period of expansion. Bill Brewer and his students are busily mining gold in the field of memory for ideas not necessarily incompatible with my views, by the way, since we are moving in on a cognitive theory of "ideas," too. But the old dinosaur knows that he will never be satisfied. Life is like the ending of his favorite symphony — Sibelius's Second, especially the Robert Kajanus rendition that I got second-hand from the music library at Dartmouth College 'way back in 1938 — always striving for fulfillment, but never quite achieving it.

NOTES

1 Not because there was no other hand capable of doing it, but because the field of psychology was literally exploding in numbers of people and numbers of research papers.

2 To keep my "confession" and "awakening" unconfused in time, it should be noted that, although my Method and Theory was published in 1953, it was already in production at the Oxford University Press by the fall of 1952 — too late to do any re-writing of whole chapters.

3 I might also note, as relevant to the development of psycholinguistics at Illinois, that Don Dulany — who some years later was to come to Illinois with the help of my prodding and become a central figure in our cognitive psychology program — participated in this Cornell meeting as a graduate student member.

4 Again for historical purposes. I should note that in 1960, when I was asked to chair a search committee for a Head for a new Department of Anthropology (separate from a department that had combined anthropology and sociology), I was fortunate to be able to talk Casagrande into leaving SSRC and coming to Illinois.

5 Appropriately enough, this monograph was published simultaneously in both the International Journal of American Linguistics and the Journal of Abnormal and Social Psychology.

6 It was mainly out of our contacts with Howard Mac lay on this project that he was invited to Illinois as an Assistant Professor in the Institute of Communications Research in 1956.

7 It was at this one that our little dinosaur first met Noam Chomsky and got the impression that he was (a) brilliant, but (b) not convinced that meaning was the central problem for students of language.

8 Many of these activities resulted in book-length publications (Trends in Content Analysis, Ithiel Pool (Ed.), 1959; Style in Language, Thomas Sebeok (Ed.), 1960; Approaches to the Study of Aphasia, Osgood and Miron (Eds.), 1963; Universals of Language, Joseph Greenberg (ed.), 1963) and others in journal publications by individual participants.

9 It is perhaps testimony to the pervasiveness of "psycho-logic" that most behavior theorists were oblivious to the existence of an Integration Level in my general theory — perhaps because it introduced S-S and R-R relations where only S-R (stimulus-response) relations "obviously" should obtain!

10 All dates in what follows refer to doctoral dissertations by students who were my advisees, available in the University of Illinois Library. Most have also been published in various journals.

11 Sol collaborated with Jim Nunnally and myself in preparing a monograph describing a procedure for analysing sentences in texts into their (paraphrastic as sets) kernel assertions — in principle, if
not in formal elaboration, like the transformational grammar that was soon to appear in Chomsky (1957) — kernel assertions that could then be coded on affective features. This monograph was published in Litera (Osgood, Saporta, and Nunnally, 1956), a journal edited in Turkey as I recall, and proved to be one of the best kept secrets in psycholinguistics!

12 Obviously, Tom Sebeok was an extraordinarily effective organizer of scholarly conferences! As the only psychologist participating, I found myself in the often embarrassing situation of trying to field questions of the form "...and what does our PSYCHOLOGIST think about X vs. Y?"

13 Considering what was to happen in psycholinguistics as a result of the impact of Chomsky, it's a good thing I didn't write my book — and I STILL haven't, but definitely plan to now.

14 The sequence between that award and election to presidency of APA, with two or three years intervening, seems to be repetitive; George Miller followed this course a few years later, as did Donald Campbell, for example.

15 See fn 10. I'm sure I must have omitted a few of those who did their dissertations under my direction, and to them I can only apologize for lack of evidence in my files and for the memory lapses of an old dinosaur.

16 In an oft-quoted (recently) footnote, Chomsky himself (1961, fn 16) early stated that this is an "utterly mistaken view."

17 It is interesting that this characterization of Competence is more prevalent among converted psycholinguists (e.g., McNeill, 1970, Palermo, 1971) than among linguists (cf. fn 16).

18 Maclay (1973, p. 583) points out that "if language is inextricably involved with ... nonlinguistic systems, the distinction between competence and performance becomes highly questionable" — 'completely untenable', I would say.

19 The final chapter of my forthcoming Prolegomena to a Behavioral Theory of Cognizing and Sentencing (Mouton Press, 1975) will be an attempt to put all of these Cog Group activities into more formal expressions.

20 "Cogs" is our shorthand for "cognitions": a simple cog can be represented as \([M_1 \rightarrow (M) \rightarrow M_2]\), where the Ms are the componential meanings of perceptual entities (or the subject and object constituents of base sentences) and the arrow is the Action or Stative relation between them.

(Received February 1974.)
How to Find the Right Tree to Bark Up

Robert B. Lees

One of the reasons I flunked the required course in Inorganic Chemistry TWICE at the University of Chicago back in 1947 was my pretentious and misguided practice of taking down all lecture notes in German, a language with which I have never had more than a studious tourist's acquaintance. But the disaster forced an already crystallizing issue, and still on the GI Bill, I walked across the campus, to sample the Geisteswissenschaften.

No doubt some covert feelings of intimidation or discontent still troubled me, and I was disposed to leave research on classified projects, for we had been rather shaken by having enjoyed the dubious privilege of appearing, as first on the list of atomic scientists in Chicago, before a government-organized tribunal investigating the extent to which I and my wife were Communist supporters of the Soviet Union. Such questions are still alive in Washington, though Sen. Joseph McCarthy is not.

With chemistry credits as minor, plus music, a sizable dose of Germanic philology, Bloomfield's and Sapir's, Pike's and Harris's structural linguistics, and several years' worth of Sanskrit, they conferred on me my first college degree, the Artium Magister and inducted me into the Phi Beta Kappa, and I went to work as an apprentice linguist for my professor, Norman A. McQuown.

Despite the efforts of my Germanic mentor, George Metcalf, of my Sanskrit guru, George V. Bobrinskoy, of the newly arrived Indo-Europeanist, Eric P. Hamp, and of course, of McQuown himself to instruct me in the ways of scholarship, the transition from my laboratory across the campus to our paradigms and phonemes has never really been completed, and in many ways my heart still lies close to mathematics, cosmology, and the stink of chemicals.

Behind lay several years of an interrupted B.S. in chemical engineering plus meteorology and forecasting in the Air Force, some work as a metallurgist, four years of research in physical chemistry at Argonne National Laboratory — Why leave all that? If occasionally you manage to discover some little thing, it's enough encouragement to go on; but if you ALMOST discover one big thing, you must leave it all to the real experts. I ALMOST discovered carbon-14 dating; but Willard Libby was the expert.

In those days linguistics was basically quite easy and more than a bit tedious — it takes little talent to find those phonemes. But all the new exotic languages were great fun — Atta unsar, pu in himinam in half a dozen archaic German languages, Aśīd rājā, Nalo nāma and the rest of that cops-and-robbers boy-meets-girl saga of classical Sanskrit, and the struggle to speak left-branched Turkish.
It was about this time that I became acquainted with the late Morris Swadesh, Sapir's most devoted student. He had just begun his study of lexico-statistics with the clever and, I believe, independent observation that the etyma in the word-stock of a language may be viewed as subject to a first-order-rate law, the same which governs the temporal decrease in mass of an element which undergoes simple radioactive decay. I had just abandoned a laboratory crammed with Geiger counters.

At an LSA meeting at Michigan some tedious paper on Stammbäume prompted me to rise and presumptuously and arrogantly announce our definitive resolution of the language family problem on the basis of a mathematical model of morpheme decay. The graybeards gently invited me to lecture on the subject one evening. Later I surveyed some languages, consulted with a real statistician, William Kruskal, and published a paper on what Swadesh insisted on calling "glottochronology". The subject seems still to be very much alive, mostly among anthropologists.

We edited an English-for-Turks bristling with Smith-Trageremics, and a year or so later I took it to Ankara for Leon Dostert (Georgetown University) and inflicted it upon the grateful natives. Our students dutifully heard out my broken-Turkish lectures on the Smith-Tragerology of English grammar, struggled manfully with our pattern-drills, plus-junctures and barred-eyes, and, mirabile dictu, survived.

Returning via a four-month stint on an old Emek Jezreel kibbutz, some months at the central Berlitz sweat shop of New York, and half a year of delightful labor as an audio-engineer at Consumers Union, I somewhat reluctantly accepted Victor Yngve's offer to return to the University — not much ivy — It was MIT. Yehoshua Bar-Hillel had breezed through and called upon the computer world to graduate from counting numbers to translating natural-language texts. (Not long afterward he was to breeze back again with a theorem purporting to prove the impossibility of machine-translation!) Yngve took his place, accepted an R-and-D grant, and looked for man power. He had chatted with me occasionally back at the University of Chicago on how to persuade the Physics Department to accept his proposal for a dissertation on Machine Translation (they remained unpersuaded). Though his offer of a position for research on the quixotic project was, in my 1956 ignorance, not entirely unpalatable, the major attraction was the possibility of a return to study and a Ph.D. As it happened, our decision to move up to Boston was a turning-point — another in a long series of accidents and minor disasters which somehow turned out each time for the good (a sense of humor is required, of course), but this time particularly auspicious.

Arriving at the Research Laboratory of Electronics for duty, I found several colleagues already at their desks. G. H. Matthews poured over his Hidatsa grammar, J. P. Applegate fussed over German with Yngve, and next door N. A. Chomsky stapled together
dittos of a chapter or two of some obscure work. I fusses over German verbs too, and uttered snide and discouraging commentary on Machine Translation (for which a year later Yngve fired me). We helped this Chomsky collate his dittos. And his mild-voiced time bombs sputtered away in our structuralist souls.

The dittos became Syntactic Structures, and I became a transformational grammarian. My review article in Language on that parvum opus was, perhaps, the first challenging polemic in our standard journals to signal the beginning of the Chomskyan Revolution in Linguistics.

We had already met once before, when at a cold winter meeting of L.S.A. in Cambridge in the early 50's, an old Chicago friend, Eric H. Lenneberg, introduced Chomsky to me. He sharply disparaged the journalistic doctrines I had brought from the previous summer I had spent in study at the Indiana Summer Institute with Louis Hjelmslev, but he granted that they might at least be "insightful".

Still another friend from the University of Chicago days was beginning to make his influence felt. Morris Halle had been engaged several years previously, ostensibly to develop a speech typewriter at the Research Laboratory of Electronics and to teach Russian in the Modern Languages Division of the Institute. He, I believe, was responsible for persuading Yngve to hire Chomsky, who might have persisted as a Wall-Street formalist in linguistics had not Halle's Jakobsonian leavening fermented so fruitfully inside an otherwise not very yeasty laboratory — a most propitious confluence of Harris's Methods and Jakobson's features, of Philadelphia logic and Riga languages.

At that time Harris was seeking legitimate help in spending a sizable grant for linguistic research, and I accepted his invitation to do a research project on his budget (which meant not doing much for Yngve, who continued to pay my salary, a contributing factor, perhaps, in his agonized decision to dismiss me after the year). I studied nominal compounding and tried to construe it as a set of transformations over sentences in order to represent more generally one's knowledge of syntactic relations such as subject, object, modifier, etc. However, to avoid the inelegant assumption that a person simply memorizes each compound he believes his language to allow, I had to idealize the notion of grammaticalness to the extent of regarding an indefinitely large set of compounds not in use to be grammatical (in a given dialect, at a given time). To relate compounds to other nominal expressions and to generalize some of the rules, I was led to study nominalization processes as well.

Chomsky and Halle immediately met the crisis of my dismissal by persuading the head of the Research Laboratory of Electronics, Professor J. Wiesner (later President Kennedy's science adviser, and now President of MIT) to grant me a fellowship; Halle then persuaded the Department of Electrical Engineering to accept me as a
student and to accept an extended version of the compounding paper as a dissertation, and in two years I was ready to be graduated. My committee consisted of Jakobson, Halle, Chomsky, Walter Rosenblith (a student of von Békésy and representative of the Research Laboratory of Electronics), and Peter Elias (representative, and subsequently head, of the Department of Electrical Engineering).

The defense was a memorable occasion. Elder Statesman Jakobson was not expected to attend — would be in Poland — but ominously appeared at the last minute. Why the omen? He was known to have been outraged at a grammatical dissertation which said almost nothing about the long, though not too glorious history of the subject. The first hour consisted entirely of a nearly uninterrupted sequence of questions put by Jakobson to the non-plussed candidate about a score or so of illustrious linguistic scholars of the past several centuries. No one else in the room, except occasionally Halle, and least of all the ignorant electrical engineering candidate masquerading as linguist, could identify any of these professional ancestors or what they had said. At the end of the hour Jakobson dropped a tiny scrap of paper on the table and departed. Halle told me later it contained the one word "Passed".

During the second hour I explained at the blackboard to Elias and Rosenblith what I thought the dissertation was about. There had been a written examination on linguistics, analytical philosophy, information theory, and audition; I offered a minor in algebra. MIT graduated me — the first and probably last linguist the Electrical Engineering Department has ever certified.

Jakobson had, of course, made a valid point, and, comfortably for me, with good humor — what we called linguistic analysis in those days was indeed crude, and some of us were, or were to become, cruel polemicizers. But Chomsky's revolution has turned linguistics back from its empiricist dead end. Some roots in the past have been found for the new ideas, and Chomsky's name is now anathema in only a few houses. And linguistic research has expanded explosively in several countries, thanks only, in my opinion, to his ideas.

The problem of employment was quickly solved, for just at the time of my graduation the expanding interest of the huge industrial R & D laboratories in language processing opened up a number of positions for linguists, and I accepted a post with IBM. We warned them that a serious linguist was not likely to expend much thought on how to make a computer translate Russian into English. Although they were sincere in their desire to hire "pure" scientists, at least in order to keep up IBM's prestigious image in their field, still the pressures to exhibit practical results were felt eventually, and the intellectual atmosphere was largely dominated by the attitudes and interests of engineers.

Having just finished a dissertation it was not difficult for me to publish a number of papers on related topics and thus help to
publicize transformational grammatical claims. I even managed to fiddle a bit with a computer program, but it never came to anything of importance.

And so, the visit of an emissary from the University of Illinois two years later was very welcome, even the offer of a position in an English department.

When I arrived at the University of Illinois in 1961, the state of linguistics was indeed a strange one, contrasted with the majority of other sciences. A large and influential body of linguists in the world, mainly older scholars, had by then managed to assimilate the basic notions advocated by the Junggrammatiker of, say, 1880 — a kind of mixture of Latinate grammar, i.e. philology, some evolutionary ideas from biology, a bit of inexpert laboratory phonetics, the glimmering of so-called "structuralism" based mainly on a strongly entrenched empiricist dogma about the nature of Science, a growing respect for exotic languages and for anthropology, an abiding disrespect for psychology and philosophy, and no inclination whatever to evaluate or reappraise their methodological doctrines.

There were also a number of "younger" (not always on the calendar, of course) linguists with an even stronger intellectual bias toward empirical science and a deep hatred for "traditional grammar," a deep suspicion of semantics and the mind, and an antipathy toward theory and abstraction — great respecters of "hard, cold facts." and often allied to ethnology and field studies; they were, or thought of themselves as the heirs of Sapir, Bloomfield, and de Saussure. Europe and America differed little except in style, slogans, and totems.

The challenge we transformationalists noisily flung down before all was an unmistakable and inescapable exposure of fallacy at the very heart of things, and it took a good long time for the gravity of this disclosure to sink in. We were not always articulate; we did not all speak with the same voice; acolytes and fellow-travelers often distorted the message. Some understood us to have advocated an alternative notation for old ideas. Some thought the structures were important only for computer fanatics. Some feared we wished to mathematicize linguistics or kill off the humanities altogether. And many a structural linguist was (and in a few cases, still is) sure that Chomsky is a modern mystic.

There was good reason for these reactions, even for the acrimony and bitter disputes, for we were experiencing a true "scientific revolution" in the now well-known sense of Kuhn. We Chomskyites were demanding not minor revisions in linguistic practice, not adoption of some new gimmicks, but nothing less than a radical reorientation of the prevailing philosophy of science, a painful, wrenching swerve from our comfortable empiricist doctrine to an unfamiliar, bewildering metaphysics of rationalism. And at the
same time, of all things, we were all to send our friendly Navajo informants back home and start boning up on mathematical logic!

Everything seemed to be turned upside down; formerly a hard problem was one which required nine months of field work in the jungle, or preparing a 900,000-entry slip-file, or a tedious search for every Welsh word in the N.E.D. Now that was all dismissed as so much data collecting, and, after all, we are swimming in data. Now, we are told a REALLY hard problem is one which requires the creation of heretofore unheard-of concepts. Concepts?! Linguistics was supposed to be about words and sounds and subordinate clauses, not about theories, the implicit knowledge of an ideal speaker, the recursiveness of nominalization processes — all philosophy, psychology, mathematics — anything but linguistics.

Yet, now that the dust has settled, we see that, except for a few recalcitrant casualties, we have all made the transition into a new world, and in a sense, linguistics has come of age. Today research flies off in all directions, and every week several bright, young men solve all the problems. The technical literature has long since outstripped any one linguist’s ability to stay au courant.

In my own view, none of the currently and often obstinately defended theories of grammatical knowledge is truly serviceable, and I for one, look forward to an early reorientation of our conceptions about what kinds of knowledge we must presume a person to control. It simply cannot be the case that all the constraints on what we can say and understand are correctly formalizable in terms of branching-diagrams of grammatical constituents plus a lexicon of taxonomized morphemes. Some as yet undelimited, and perhaps quite extensive, part of what most linguists have tried to force into such a formulation just doesn’t belong to one’s LANGUAGE per se but rather to one’s beliefs about the world, to one’s imagination (conceptualization of other worlds), to one’s knowledge of logic, to one’s feelings about social propriety or ethical behavior. It elucidates nothing to build into the syntactic or semantic organization of sentences arbitrary cases of non-linguistic constraints (our notations are so powerful that that can always be done quite easily); such linguistic imperialism merely conceals the relevant principles which govern our non-grammatical mental powers.

Thus I am hopeful for efforts, just beginning now, to formulate the relations between grammar and logic, between grammar and the perceptual mnemonic, learning, and processing constraints studied by psychology, and between grammar and the vicissitudes of social history. But such studies will have to be conducted by real professionals — philosophers, logicians, psychologists, and linguists — brighter, younger men of the coming decades.

(Received February 1974)
Three Linguistic Reincarnations of a Kashmiri Pandit

Braj B. Kachru

I shall start this note with a non-linguistic aside. It was in the winter of 1961 that I first met Robert B. Lees in the Faculty Club of Edinburgh University, Scotland, during his two-day visit to that University. In the typical Leesian manner, he left two distinct impressions on the rather tight-lipped group of British linguists: the first, of being a missionnary-at-large for the then impatient, vocal, and brisk Transformationist school, and second, his typical verbal capacity for intense shock treatment. Those who know Lees know very well that his linguistic discussions are replete with non-linguistic asides. It is these asides which either bring people close to him or convince them not to cross his path again. The first Leesian aside — for there were hundreds more to come in later years — left a distinct mark on me. It was a casual remark perhaps consciously uttered to shock the middle-aged members of his not-too-sympathetic British audience. While mentioning the work of several very young members of the transformational CLAN (for that is what it was in 1961), there was a mischievous spark in his bright eyes when he said, "You know, linguistics is the discipline of the young. When one is forty one should stop doing linguistics." If this Leesian aside is to be taken seriously then the tone of this note should be one of linguistic auto-obituary, for I was born on May 15, 1932. Thus I have already crossed the crucial year.

In deciding to use individual profiles to develop the linguistic profile of the Department of Linguistics at the University of Illinois, Henry Kahane has provided an opportunity for ego trips; psychologically this might help in a retrospective look at one's self and also at the department. This note is, therefore, mixed with nostalgia and historical tidbits. Some of these are personal and some, I think, are helpful in unfolding the linguistic spectrum at Illinois. In order to bring this personal chronicle to the foreground, some background information may be in order.

In the Indian context (I suppose as well as anywhere else), among other things, several RIGHT things should happen to a person at the time of birth. For example, the place of birth should be right, the caste should be right, and the family should be right. I don't know if all these things were right for me, but they were vital.

I was born in Srinagar, Kashmir, India, in a Kashmiri Pandit family. Being a Kashmiri Pandit is like being a Jew in several ways. Incidentally, there is a theory that claims that the Kashmirs represent the lost tribe. Whether we are the lost tribe or not, is not important. What is crucial is that the Kashmiri Pandits have the psychological, cultural and identity problems of a very small minority. The Kashmiri Pandits are not a minority in the sense in which this term is generally understood, since among over t
hundred million inhabitants of India, Kashmiri Pandits are around seventy-five thousand. It is perhaps their stamina and God's sense of humor which prevented their complete annihilation. They would then have become an interesting minor anecdote in India's three-thousand-year history. Kashmiri folklore tells us that once they came close to complete destruction; they were persecuted and reduced to eleven families. They not only survived, but they survived with a vengeance, as a constant irritant. They also developed all those characteristics which, understandably, such a minority develops. In passing I should mention that it is not accidental that in the Kashmiri language pandith (pandit) refers to one set of characteristics of this minority, and bat.ika:kh refers to another set of characteristics. Let us not disturb this can of worms any more, for thereby hangs a tale.

A typical Kashmiri Pandit family used to be something of a commune — the commune was not really a discovery of dissident western youth. My father lived with his two brothers and their families in a four-story stone house. I was never able to count the total number of rooms in this house, but neither did we ever count how many of us lived in it. It was always a festival for the children, since the family had been very productive — again the minority complex. In addition, we would be joined by a host of kids of relatives who lived on the two banks of the river Jhelum, in the City of Seven Bridges — as Srinagar used to be called. The mothers didn't know if their kids got fed, and the kids were not supposed to know who were their actual parents. The head of the family and his wife were considered the PARENTS, and often, their names were used on official documents. In fact, when our joint family broke up in 1946, the legal sorting out of parenthood took considerable time. The children were taught to show deference to age, and the eldest in the family had the honor of being considered parents. Again, this is a digression not directly relevant to a linguistic profile.

In 1952, when I graduated from Sri Pratap College with honors in English literature, it came as a shock to several people, including many members of our family. The reason was that the doctors had given me up as a patient of rheumatic heart disease and had kept me bedridden for several years. Later, in Edinburgh, I found that the diagnosis had been wrong. So my early years were spent doing what a heart patient usually does — learning to paint, doing some light reading with private tutors, or just whiling away the time. The result was that I never went to school until 1948, when I found myself in a junior college as a shy kid perspiring under the gaze of over sixty students learning English, Sanskrit, history and economics from professors who made it obvious that they didn't enjoy the experience of teaching.

In 1953, I went to Allahabad University for my Master's degree in English literature. At that time it was the place where the intellectual action was to be found. It was politically stimulating and full of anti-British intellectual (and physical) activities; it was the...
center of the so-called "Hindi movement" and it was also the center of the creative upsurge and experimentation in Hindi literature. Since my ambition was to become a creative writer in Hindi, I couldn't have made a better choice. The University of Allahabad had a reputation of being the Oxford of India. During those days we always had to have a British model! That Oxford of India is now in shambles both physically and academically. In the fifties, the English Department there had scholars such as P. E. Dustoor, Harivanshrai Bachchan, S. C. Deb and R. S. Firaq. All of them had distinct, individual characteristics, and all of them were distinguished in their fields. It was at Allahabad that I was first exposed to what may be considered an academic atmosphere. The Department of English at Allahabad exposed me to several things. First, how inadequately students are prepared for the study of literature at the MA level. Second, how the teaching of literature is done without any rigor or theoretical foundations. Third, how crucial it is to have training in language — linguistics, especially when one is teaching a foreign or second language. The real stimulation to go in the area of language and linguistics came from an outstanding teacher and scholar, P. E. Dustoor. It was due to his encouragement that I was indirectly thrown into the lap of Structuralism. (But then, it was already 1955!)

My first encounter with Structuralism was at Poona, where the Linguistic Society of India and the Deccan College Postgraduate and Research Institute had initiated linguistic institutes with funding from the Rockefeller Foundation. It was at one of these institutes that I first met senior American linguists such as Henry A. Gleason Jr., Charles F. Ferguson, Henry Hoenigswald, and Gordon Fairbanks. It was also just at this time that the United States had discovered South Asia and the social scientists were flocking to find the answers to questions such as the exact number of castes in India, or the workings of an Indian Village. The group also included several young linguists, e.g. William Bright, John J. Gumperz, John Kelley, and Norman Zide.

The enthusiasm of the Structuralists was contagious. If we found an allophone in a language it was like holding a newly born baby delivered by phonemic caesarian. The atmosphere was full of attacks on the 'traditionalists' and challenges were thrown to traditional Pandits who had spent their lives studying Sanskrit, Pali or other Indian languages. It was there that we were exposed to the academic grouping and divisions in linguistics. If we went to Sukumar Sen (the Khaira Professor of Linguistics of Calcutta University) with a problem in linguistics, his pat answer was, "Why don't you go and ask your American friends." There was the usual disgruntled group among the Hindi language scholars, who accused the whole linguistic operation and Structuralism as an attempt by the Americans for cultural domination of India.

In 1957, I was selected as a Fellow of Deccan College Research Institute for a year's training in linguistics. The American visiting
scholar for that year was Henry Gleason, Jr.; it was like getting structural linguistics from the horse's mouth.

In retrospect I can think of several things that happened at these schools. One is that for the first time I looked at my mother tongue, Kashmiri, with an entirely different language attitude. The earlier, typically Kashmiri, attitude changed to one of treating it as a human language which could be an area of serious academic and intellectual research. Second, I had an opportunity to think seriously about Indian English; its status, roles, and academic position.

In 1958, when I had just finished my tenure at Poona, I was selected by the British Council for specialization in linguistics at Edinburgh University in Scotland. The British Council tried to make our transition smooth and cushioned the culture-shocks by a one-week orientation course. The orientation had both serious and hilarious aspects. One morning a beautifully dressed, efficient-looking person gave us a talk on how to break a boiled egg for breakfast. I was fascinated by his impeccable Received Pronunciation (RP) and was unmindful of the fate of the egg. RP had been a mystical goal which all the nonnative speakers of English were persuaded to aspire to; the word received always intrigued me. Received by whom? It was much later that Ruqaiya Hasan solved this riddle for me when she said, "Received by Almighty God." We were trained how to use forks and knives with distinction. It was there I learned, for example, that a fork should not be used as a weapon to win an argument, and that a knife should not be used as if one is slicing the air to emphasize a point. In later years, I found that this same information had been elevated to an academic level internationally in the programs on the teaching of English as a foreign language, under the "cultural component." After a week's cultural (and social) orientation, the Council thought that we were ready to face British (or Scottish) culture. There was the typical British challenge — sink or swim.

Once at Edinburgh, I found that, linguistically, I had to go through two processes at the same time: the first, of learning the new paradigm, and the second, of unlearning the earlier paradigm without even leaving any 'substratum.'

There was a distinguished group of linguists at Edinurgh. J. R. Firth (1890-1960) had retired from the Chair of General Linguistics at London University in 1956. It was the first Chair of General Linguistics in Great Britain established in 1944, and he was its first occupant. During my first year at Edinburgh, Firth was there as a Visiting Professor for a term. Michael Halliday had just left Cambridge University to take a position at Edinburgh in what was then the Department of English Language and General Linguistics. He was already well-known both as a political and linguistic radical, and his study, The Language of the Chinese "Secret History of the Mongols," was being seriously discussed in linguistic circles. J. C. Catford was Director of the School of Applied Linguistics, attempting
to give new direction to APPLIED linguistics. Angus McIntosh, David Abercrombie, Peter Ladefoged and Peter Strevens were also contributing to the program.

Since Firth had spent eight years in India (1920-1928), and since, at that time, I was the only Indian student in linguistics at Edinburgh, he took a personal interest in me. In his unique way, he would talk for hours and fill me in on the personal, political and linguistic history of the members of what was then called the "Firthian" or the "London" group of linguists. I would sit in front of him (one seldom got a chance to discuss or converse with Firth) both bewildered and dazed, listening to his impressions about Indian English. It was there, listening to him, that my ideas about Indian English, and the non-native varieties of English in general, began to be structured. (I guess Indians really need gurus!)

At these sittings, I also learned that two distinct types of linguistics were developing on opposite sides of the Atlantic. In 1958-59, the Firthians were still flogging the structural horse. The transformationist (Chomsky) group was still not recognized, and Harris was considered out in the left field of linguistics. This divergence in approach would sometimes show itself in interesting ways. For example, Angus McIntosh did not like my use of the term "phoneme" in my thesis proposal. I was told that I should use the term "phonematic unit". In linguistics the term phoneme was used for a long time as a sort of caste mark — it marked you either in the "in group" or "out group."

Michael Halliday did not bring the theoretical differences to class, he merely presented HIS point of view. His seminal paper "Categories of a Theory of Grammar" (Word, 17.3. 1961) was written and discussed primarily during this period.

In the Indian tradition, we are taught to learn from a teacher by "sitting at his (lotus) feet." The sīya and gurū concept is deeply rooted in us. A Western teacher, who does not understand 'inscrutable India' is confused by the docility, unassuming humility, and blank look of an Indian student. I have heard hundreds of interpretations of this attitude of Indian students from my Western colleagues. And, I would say to myself, "here again, the mystic East confuses them." I guess I was not much different from the typical Indian student finding his way in the Scottish educational system. But there was a difference.

Firth loved to perform like an Indian guru, and Halliday had been seriously exposed to the mystic East in China. Therefore, he understood the limitations of a new oriental student in a Western classroom. Firth's personality was multifaceted. In a sense, one facet of Firth represented the typical Britisher with the raj mentality. But, on the other hand, India had played its three-thousand-year-old trick on him; it had worked the process of Indianization on him — the first step toward assimilation. But in some ways he was so British
that the Indian trick would not have completely worked on him. He had imbibed several characteristics of the typical sahib who had lived in India too long. In linguistics, as in everything else, his likes and dislikes were too strong.

In the late fifties Edinburgh had perhaps the most stimulating atmosphere for linguistic studies. During his stay, J. R. Firth gave the classes a crispness and character. Michael Halliday was both innovative and inspiring. He had the unique quality of bringing out the best in every student. David Abercrombie was a superb teacher who taught us Henry Sweet with the zeal which traditional Pandits use for the teaching of Pāṇini. His seminar could have only six students since there were only six chairs in his office!

In this stimulating atmosphere, I completed my Ph.D. thesis (in Britain it is not called a dissertation) on some linguistic aspects of Indian English under the supervision of M.A.K. Halliday and J. C. Catford. It is usual to feel a vacuum after finishing a Ph.D. thesis. I spent several months working in the Phonetics Laboratory for which every Friday (payday) I received a sealed brown envelope with my wages. These wages helped me to continue to sit in Michael Halliday's seminars in his overheated tropical room and look at the icicles in George Square. We had a small but very stimulating circle of graduate students who interacted both linguistically and socially. Among others, the group included Hanna Ulatowska, Rodney Huddleston, Ayo Bombose, Ruqaiya Hasan (now Mrs. Halliday), John Mountford and R. W. M. Dixon. Dixon's status was not quite that of a student — he used to straddle the fence between groups and read us sections of his forthcoming book, *Linguistic Science and Logic*, (Mouton 1963).

Semantics and phonetics were relevant and exciting areas of linguistics, and one didn't have to use the side door if one was a phonetician. In fact, when sociolinguistics became a popular bandwagon in America, Halliday made the apt remark, "What is now sociolinguistics in America, was always linguistics for us."

By now I had already spent three years in Edinburgh and had passed through several academic and cultural experiences. One, that of going from (pure) literature to language (1954). Second, passing through an intense period of Structural linguistics with all the leading gurus. Third, passing from Structuralism to Firthian-Hallidayan linguistics. The question was: What next?

It is here that Lees comes into the picture. In that 1961 meeting, Lees and I had a fascinating discussion. I guess for an Indian — anthropologists tell us that we are full of humility and deference — I was rather forthright and less tight-lipped than others who had dinner with him in a pseudo-Indian restaurant. But then, what other mode of communication could be used in talking with Lees during that period? If he was not abrupt, he was ironical; if he was not ironical, he was caustic. Above all, he was the typical Lees, with the
mischievous smile and kind eyes, watching and observing everything.

A few months after Lees' Edinburgh visit, Halliday received a letter from him asking if he could recommend someone for a possible opening in his linguistics program at Illinois. As a postscript, he inquired if the "Indian boy" he had met at Edinburgh would be interested in the position. Yes, I would be interested in the position, but a year later, was my reply to Lees. I had already accepted a position to initiate a program in applied linguistics at Lucknow University in India. Lees agreed to defer the offer for a year, and in 1963 I went to Urbana, right in the middle of a new culture, new linguistics, and a new phase of my life.

The process of learning and unlearning linguistics started again. It was like trying to move from one caste to another caste and being conscious of it all the time. I guess intellectual (or religious, for that matter) conversions can be painful. It was challenging to share with Lees and with a part-time assistant a small room in the Department of English where we were a Program. How we changed from a Program to a Department has already been discussed by Kahane and Osgood, and I shall not repeat it here.

The sixties were a period of youth in linguistics; a generation of linguists was being retrained and reoriented in a fast-changing discipline. In this process some survived, some became a part of the new movement, some copped out, and many either disintegrated or became bitter and cynical.

Illinois was in the forefront of the new "revolution." I was fascinated and awed by the overcharged linguistic activity here. I spent a lot of time in classes, trying to understand the fast changing paradigm. I also published several papers on my pet hobbyhorse, Indian English. The reactions to these papers varied, and a controversy was generated. In the beginning, the Indian scholars — and also some non-Indians — did not accept the identity of Indian English. You could not claim an ontological status for a foreign language. How sad that the transplanted languages never seem to grow roots! It was another manifestation of linguistic schizophrenia in India, and it took several years to attain academic acceptability for "Indian English". In my papers the processes of the INDIANIZATION of English were discussed and INDIAN English was considered a "culture-bound" language which must be studied in the Indian socio-cultural context. The Firthian (and Malinowskian) concept of "the context of situation" was considered crucial for such a study. I adopted the same position for other non-native varieties of English as the Chairman of the Committee on Regional Varieties of English at Brisbane, Australia. Later this model was adopted by several students who concentrated on various aspects of Indian English. This interest naturally led me to sociolinguistics in general. It was during this period that we also initiated linguistic projects on several Indian languages.
In teaching, my primary thrust was toward developing the applied linguistics program, using the term "applied" in a wider sense. In developing such a program, one was fighting against several problems. In America, APPLIED linguistics had been reduced to some uninteresting aspects of language pedagogy. A person interested in APPLICATION of linguistics was suspect in the new paradigm — and there were good reasons for this suspicion. Initially, Lees and I did not see eye to eye on this part of our curriculum, but then he left me alone. In this background, therefore, it was challenging to initiate and teach courses such as Introduction to Applied Linguistics, Sociolinguistics, Stylistics, and South Asian English. My other interest was the history of linguistics. Since an Indian always carries the burden of three thousand years of history on his back, the historical development of ideas fascinates him. In the sixties, however, the attitude of the linguistic radicals was that linguistics as a discipline REALLY started in 1957. It was unconventional and old-fashioned to suggest that a course on the history of linguistics be taught in a department whose focus was on new linguistics. If such courses were taught, these were labeled "bad guys" courses. On my part, therefore, it was "linguistic antiquarianism" when I first taught such a course, and I continued to teach it until Ladislav Zgusta joined the department and willingly agreed to share my antiquarian interest. Thus, during the early sixties, if you talked of applied linguistics, sociolinguistics, or history of linguistics, you were the lowest of low caste shudra on the linguistic totem pole (certainly not a desirable position for a Saraswat Brahmin!). It did not take linguistics too long to enter the phase of neo-transformationism and neo-Firthianism. The actors on the stage changed, and so did the focus of interest. We now have the PURISTS and NON-PURISTS. We have lexicalists and non-lexicalists on this side of the Atlantic, and, on the other side, we have, among others, the "Firthians" and "neo-Firthians." Membership in a group is not given without challenge, and this has added more interest to the polemic controversies. Consider the following remark of F. R. Palmer about Halliday:

Today Firth's name is linked with M.A.K. Halliday's 'neo-Firthian' or 'Scale and Category Grammar' which Halliday explicitly states in his "Categories of a theory of grammar" to have derived from Firth. But Halliday's essentially monosystemic categorization seems to me to have little in common with Firth's approach. (F. R. Palmer, ed., Selected Papers of J. R. Firth 1952-58, 8-9, 1968, Bloomington).

The main characteristic of this period is that the much maligned and ignored area of semantics came back to the forefront of linguistic investigation. In America, one heard of 'conversational postulates,' 'context,' and 'appropriateness.' It was like going back to Firth's class in 1958-59. Linguistic antiquarians started going through the literature on our discipline, and found that these concepts were very close to Bhartrhari's ḍāṅkaṣā, yogyata and sannidhi. Whitney,
Jesperson, and Henry Sweet — in short, the whole earlier linguistic tradition — were being studied with interest. And one wondered if Firth’s concept of “contextualization” was not worth revisiting. I keep bringing up these names from the past since each linguistic “reincarnation” has left its impression on me.

By 1968, the young team of linguists such as Ken Hale, Chin-W. Kim, Ted Lightner, Arnold Zwicky, and, of course, Lees, had already put Illinois on the linguistic map. Among the Ph.D’s Illinois produced during this period were LeRoy Baker, C.-C. Cheng, Austin Hale, Charles Kisseberth, Ronald Langacker, Frederick Newmeyer, and Jerry Sadock. They took the positive image of Illinois to the leading institutions where they were hired.

In 1969, Lees made the decision to move permanently to Tel Aviv University in Israel in order to initiate a program in linguistics there. This decision was again in line with Lees personality — an urge for something new and challenging. In September, 1969, I was offered the position of Head of the Department, which Lees had occupied with distinction since the beginning of the Department. The new role I accepted was both challenging and awe-inspiring. There were several questions facing us, but the primary one was: What should be the future direction of the Department? In a sense, the Department was going through a reincarnation (or, was it disintegration?). Ted Lightner and Arnold Zwicky left at the same time as Lees. Budget constraints were suffocating higher education, and Illinois was not left untouched by all this. The linguistic scene had again changed in America. And, here we were, attempting to revitalize a program!

The linguistic revolutionaries of the sixties — primarily the Transformationists — were close to their forties. If we followed Lee’s dictum, they were close to their retirement from active linguistics. A new generation of their students had emerged on the linguistic scene. At this point, in line with our earlier Illinois tradition of “radical” linguistics, we decided to invite a young team of fresh, energetic, and innovative scholars to the Department. In working out these plans, I had the cooperation and advice of three persons representing three areas: Henry Kahane, a historical linguist; Howard Maclay, a psycholinguist; and Chin-W. Kim, a phonetician and phonologist (he really does not mind being called just a phonetician!). The first thing we did was to hire one of our students, Charles Kisseberth. Then came Herb Staite, Jerry Morgan, Georgia Green, Chin-Chuan Cheng and Michael Kenstowicz. It did not take them too long to make their presence felt in the profession and infuse graduate students with new ideas. Kisseberth’s note (see Section VI) has discussed their contribution in detail. Michael Geis (who later left for Ohio State University to become Chairman of the Linguistics Department there), Yamuna Kachru, and Hans Henrich Hock were already members of the young team. In 1971 Ladislav Zgusta joined us after an adventurous escape from Czechoslovakia. He brought with him some
fresh East mean air, and his typically European scholarship. In order to announce our "renaissance," we started a house journal, *Studies in Linguistic Sciences (SLS)* and a Newsletter. *SLS* has become a highly respected journal in our profession.

Once a team was put together, the next question was: How should the linguistic spectrum unfold itself at Illinois? Again, continuing the earlier tradition, we decided to have a strong contemporary orientation. But we also agreed to present all the aspects of the spectrum of the linguistic sciences at Illinois. We initiated an area-oriented program in linguistic offerings. Herbert Stahlke was invited to offer African linguistics; C.-C. Cheng, Chin-W. Kim, Seichi Makino, and Frederic Lehman offered courses in Far Eastern linguistics; Yamuna Kachru and I added courses in South Asian linguistics. Recently, Peter Cole, a graduate of the Department, joined the faculty for Semitic linguistics. The areas of applied linguistics were strengthened and expanded; specialization is now available in historical linguistics, sociolinguistics, mathematical linguistics, computational linguistics and lexicography. Charles Osgood and Howard MacIay have further developed a strong program in psycholinguistics and language acquisition. In short, the manifestations of language — in all its aspects — are under study and, like Vāgdevī, the goddess of language, one wonders at the immense potential and infinite awe of human language.

In linguistics, usually every ten years brings new linguistic thinking. It is both healthy and fascinating, and demonstrates the vitality of our discipline. The final question now is: Can linguistics at Illinois keep up with the new paradigm that might come up in the next ten years? The answer to this question is difficult, since in the next ten years my present vocal linguistic colleagues will be in their forties and, I should guess, will be writing THEIR linguistic auto-obituaries.

(Received March 1974.)
From the time I was ten I wanted to write novels. Beginning about the age of seventeen I wanted to write richly philosophical novels about the human condition. As the years passed, I settled more and more for the academic study of literature and philosophy, drifting finally into a M.A. degree in English literature. I accepted a teaching position at the college level in Ohio, and thoughts about the great American novel were submerged in teaching freshmen how to write their weekly theme. It was during this period that I had my first exposure to linguistics: Robert Hall's*Leave Your Language Alone!* was one of the freshman English textbooks we used. In the course of casual reading I even came across a little blue book called *Syntactic Structures,* but was rather easily frightened away.

In the Fall of 1966 I entered the Ph.D. program in English at the University of Illinois, but almost immediately decided to switch into the Department of Linguistics. I enrolled in a couple of elementary linguistics courses and audited a couple of others. I began to spend long hours in the "conference room", which was the site of much animated discussion among linguistics students: I listened most of the time, said very little, and managed to learn a great deal. Almost the first student I met at that time was Michael Kenstowicz, who had entered the Department that Fall and who later was to join the Illinois faculty with me.

The enthusiasm of the linguistics students and faculty, the smallness and the intimacy of the department (in striking comparison to the gargantuan English department), the youthfulness of the field and of its leaders — all of these things appealed to me greatly. It seemed as though here was a field of study where papers and theses that students wrote were not just academic rituals, of no earthly interest to anyone at all, but rather were potentially significant documents that might well find a place in the rapidly expanding "underground literature", then so characteristic of transformational grammar. One wrote with the expectation of being read. One didn't have to be a graybeard to join the ranks of the "scholars" — for the names that recurred most often in classes (in addition to Chomsky and Halle, we heard most about Haj Ross, George Lakoff, Paul Kiparsky, Jim McCawley, Paul Postal, etc.) were largely the names of very young scholars. In many cases they were people exactly of my age. It was all very intoxicating.

In 1966-67, the transformational camp of linguistics was still in the era of good feelings. The "bad guys" had been routed and all of the "good guys" were still good guys. MIT was still mecca, Chomsky and Halle were still the voices of authority, and what now seems a quite unhealthy smugness reigned: just as the taxonomic dragons had been completely vanquished, *Language* would soon follow. The
dominant mood appeared (at least to me, as a beginning student) to be that armed as we now were with deep structure and transformations, ordered rules and cycles, etc., it was just a matter of time before each problem of language structures would be confronted and reduced to a simple set of very general principles. While mention was often made of the complexity of language, I do not think that we were yet (in 1966-67) being taught to view language with sufficient awe.

There was much about that period to be regretted: the arrogance with which we tended to ignore all but those on the inside — Chomsky and Halle, or their students; the unfortunate manner in which 'theoretical' contributions to linguistics became the end-all of doing linguistics, and 'data-collecting', even if well done, something of no significance. Nevertheless, it was a period that was tremendously exciting to a new student. The smallness of the number of active transformational grammarians at the time, and the closeness of the ties among them, meant that leading figures in the field did not remain mere names, but very often materialized on campus. For example, Ross came early in the year 1966-67 and gave a most remarkable series of non-sv^ntures on syntax, including the now famous demonstration that the sentence "Floyd broke the glass" is a deep structure containing (or is it eleven?) clauses. I recall vividly the awe with which I listened to these lectures, understanding almost nothing but feeling deeply the excitement and the brilliance of the moment.

The sense of being at the center of things, of being in at the very beginning of new developments, contributed much to the excitement. For instance, during my second year of study a letter from Ross and Lakoff to Arnold Zwicky (who, along with Ted Lightner, was primarily responsible for teaching me linguistics during my student days at Illinois) asked the then heretical question: Does deep structure exist? By Spring 1968 the controversy over a transformational versus a lexicalist account of nominalizations was one of the focal points of Zwicky's advanced syntax class. The summer brought the annual Linguistic Society of America Summer Institute to the Illinois campus, and the syntax courses were being taught by Ross, Lakoff, and McCawley. The split between the Generative Semanticists and the Interpretivists was a constant theme of that summer. A new set of bad guys had developed.

It was during that Institute that I first met two subsequent colleagues — Georgia Green and Jerry Morgan. They were students of McCawley's at Chicago, and had come south to Champaign-Urbana for the Institute. People with a really good control of syntactic argumentation, people with a flair for picking sentences out of thin air that support or contradict some hypothesis, always amaze me. The student at Illinois who most amazed me in this respect was Jerry Sadock (who himself was later to join McCawley on the Chicago faculty). Georgia Green and Jerry Morgan similarly awed me that...
summer. In fact, observing their very obvious skills made me feel sufficiently insecure about my own abilities to question whether I should attempt a thesis in the area of syntax (as I had originally been planning). I ultimately discussed the question of what I should work on for my thesis with Ross, and when he suggested I do phonology (doubtless to save me from a fiasco), I decided to follow his advice — and left syntax to those who could do it well.

The year 1968-69 I spent in the Boston area, attending classes at MIT (Halle, Ross, Chomsky), at Harvard (Lakoff), and at Brandeis (Perlmutter), and trying to write a thesis. The notion of "conspiracy" was being discussed in the area of syntax by Ross and Lakoff that year, and I felt that it had considerable relevance to phonology. It was Halle who suggested that a study of Yawelmani might be the source of evidence for the claim that diverse phonological shapes will have a specified character. The thesis that I ultimately wrote, as well as my first real paper in the area of phonology, were the direct outgrowth of Halle's suggestion.

During my stay in Boston, changes were in the works at Illinois. Lees had decided to take a position in Israel; Lightner accepted a position at Texas and Zwicky at Ohio State. Although this massive departure was viewed with alarm by many, I had selfish reasons for being not altogether displeased: I wanted to return to Illinois to teach. The mass exodus made this a possibility. As it developed, I was offered and accepted a teaching position at Illinois for the next year. One other person was hired at this time — Herb Stahlke, an Africanist from UCLA.

Although the staff had been largely decimated, Illinois still felt like home to me. Many of the students had been fellow students of mine. In particular, Michael Kenstowicz was working on his thesis at the time, and a regular interchange of ideas about phonology was quickly resumed. We had both been trained within an atmosphere where phonological analyses were highly "abstract", in the sense that proposed underlying structures deviated radically from the surface forms (and generally matched the surface forms of much earlier stages of the language) and a complex set of rules (generally recapitulating historical sound changes) related these abstract deep structures to their surface realizations. We both joined the rebellion then developing against this sort of analysis, motivated as it was almost entirely by "simplicity", the desire to capture "significant linguistic generalizations". We did not necessarily join those who assumed that phonology must necessarily be extremely "concrete" (i.e. that underlying forms did not deviate very much at all from surface forms). But we did want to explore more deeply the question of whether the "significant linguistic generalizations" that abstract phonology had found were in fact significant to speakers of languages, or whether there were other generalizations that were also of importance. For example, abstract phonology worked under the basic assumption that the "best" analysis is one where
phonological alternations are described by rules that have only phonological conditions governing their scope of application. Rules restricted to particular morphological structures are less preferred. We were interested in the validity of such assumptions. Could there not be conditions under which phonological alternations very naturally lose their phonological basis, for instance, and come to be controlled by grammatical conditioning?

During my first year of teaching, plans for developing the faculty further were being worked out. A position for Kenstowicz eventually materialized. We were also able to persuade Chin-Chuan Cheng to join the staff; he had been a student in the department earlier and had written a dissertation on Mandarin Chinese phonology. Before coming back to Illinois, he did research at Harvard and Berkeley, working with William Wang at the latter institution. With the addition of Kenstowicz and Cheng, the department was in a strong position in the areas of phonetics and phonology. In Chin-Wu Kim, who had come to Illinois during my student days, we had clearly one of the leading phoneticians in the country; but his accomplishments were even greater — he was equally well-versed in phonology, and was actively pursuing the phonological investigation of Korean. In Herbert Stahlke we had a linguist with an extensive knowledge of the phonological structure — and especially the tonal structure — of several African languages. In Hans Henrich Hock we had a man thoroughly trained in the traditional approaches to Indo-European, but with a rapidly developing interest in synchronic as well as diachronic phonological investigation of several Indo-European languages — in particular, Sanskrit and Lithuanian. In addition to these linguists within the department who were actively concerned with phonetics and phonology, there were two others outside the department with whom we had very extensive contact — Mario Saltarelli and Dieter Wanner of the Spanish, Portuguese, and Italian department. Both of these linguists are highly productive researchers in the phonological structure of Romance languages. Thus, although the teaching of the general phonology courses came to fall in the hands mainly of Kenstowicz and myself, the extent of the department’s commitment to phonology has been immensely greater.

The principle weakness at this point in the department’s program was syntax/semantics, but fortunately that weakness was instantly solved when an arrangement was worked out that brought both Georgia Green (first as a fellow in the Center for Advanced Study of the University of Illinois, later on a regular line) and Jerry Morgan to the department. With the arrival of these two, Illinois became one of the focal points of the new concern with semantics, for they were the first fruit of McCawley’s teaching, and it was McCawley who was so instrumental in bringing semantics to the forefront of research.

The faculty that was now assembled to teach the core courses in phonology and syntax/semantics all shared much in the way of a
common experience and a common reaction to that experience. We were all trained in linguistics during roughly the same period, we were all students of the first generation of transformationalists, we all gained the necessary control of the concepts and methods of transformational grammar but also learned to think critically about these concepts and methods, we all developed a healthy skepticism about formalism, we all developed an appreciation of really good data collecting. And I hope we all learned not to take ourselves or our pet theories too seriously. And at the very least we learned to stand in the proper awe of language.

Transformational grammarians have always been interested in Language. But the study of Language must be done through the study of languages. And in the beginning, it was mostly English that was the source of insights into Language (this was especially true of the study of syntax, of course). Linguists working within the transformational framework have more and more come to believe that the structure of one language cannot be properly understood unless the linguist avails himself of the knowledge provided by a study of similar phenomena in other languages. The advantages of a cross-linguistic perspective are now very generally accepted. One of the principal virtues of the Department of Linguistics at the University of Illinois is the extent of its involvement in non-Western languages. A certain international, particularly a non-Western outlook was naturally fostered by the presence of a head from the Indian sub-continent. This outlook was strengthened by the presence of a substantial number of faculty with a special interest in non-Western and rare languages — Hans Henrich Hock (Sanskrit), Yamuna Kachru (Hindi), Braj Kachru (Kashmiri and Hindi), Chin-W. Kim (Korean and Swahili), Chin-Chuan Cheng (Chinese), Herbert Stahlke (Ewe, Yoruba), Peter Cole (Hebrew), Ladislav Zgusta (Hittite), Jerry Morgan (Albanian). The teaching of these languages has made it possible to support the graduate study of a large number of linguists from abroad, which in its turn has meant that much of the linguistic research of the department's students has been directly focused on non-Western languages. If we accept that a cross-linguistic perspective is necessary to the analysis of any given language, then clearly one of the main tasks of any linguistics department is to train native speakers of a variety of languages to do careful and thorough research into these languages so that the relevant kinds of information about their structure will be available to linguists in general. There is, of course, much already known about the linguistic structure of such relatively well-known non-Western languages as Hebrew and Hindi. But the kinds of questions that linguists are seeking answers to currently are often highly articulated, requiring very specific types of information that cannot be found in existing descriptive materials. The necessary ingredient to a successful utilization of a cross-linguistic perspective is the training of linguists who can unearth the pertinent aspects of the structure of their
native language. It is such a training that we are attempting to provide.

The linguistics program at Illinois seems to me to be characterized by a high degree of cohesiveness (based on the shared experience of many of us), but at the same time an openness of spirit; an intense desire to keep from becoming shackled to familiar ways of thinking, to old questions; most of all, a sense of perspective.

Braj B. Kachru
Former Head, Department of Linguistics

Reception:
South Main Lobby, Krannert Center
Introduction

This part includes memorial tributes paid to Henry R. Kahane on November 14, 1992 at the Tryon Festival Theater, Krannert Center for the Performing Arts, University of Illinois at Urbana-Champaign. Professor Kahane peacefully passed away at his home (808 West Oregon, Urbana) on Friday, September 11, 1992. He was professionally active until almost the last day of his life working on various projects, meeting friends and engaging in intellectual discussions. He would have been ninety years old on November 2, 1993.

The secular memorial service was attended by a large number of Kahane's colleagues, friends, students, and admirers. The memorial tributes were paid by five members of the University of Illinois and, Professor Kahane's daughter, Roberta Kahane Garner, and his son, Charles Kahane.
Henry Kahane was our mentor, our colleague, and our friend for most of the days of our adult lives. He had become, or so it seemed to us, such a permanent feature in our intellectual landscape that it is difficult to grasp his absence.

In German academic circles, from which Henry ultimately sprang, the common designation for a dissertation advisor is *Doktorvater*, literally 'doctoral father'. Henry was certainly the intellectual father of many a doctor of philosophy, but he was also something no other can claim to be: he was both the father and the midwife of the Department of Linguistics at the University of Illinois. He laid all the groundwork for the Department and devoted enormous energy and a great deal of time in seeing it successfully born, but in characteristic modesty, he did not seek appointment as its first Head. Only much later did he serve a brief term as Acting Head. He brought great distinction to this University through his scholarly activities, which won him high office in academic societies, memberships in scientific academies, and honorary degrees from a number of illustrious universities. A bit of this glory rubbed off on us, who were fortunate enough to know him and to work with him. But it is not this side of Henry Kahane I want to talk about, but rather about a side not recorded in any Who's Who.

My association with Henry Kahane began in 1958, when I was a graduate student in what was then called the Department of German. Before the fall semester began, the chairman of that department, Professor Frank Banta, who was also a linguist, called me to his office to discuss my graduate appointment. To my great surprise, he recommended that instead of a half-time appointment in German, I take a 1/4-time in German and another 1/4-time as research assistant to a professor in the Department of Spanish, Italian, and Portuguese, whom I had indeed heard of, but knew very little about. My first reaction was 'No'. Why would I want to work for someone in Romance languages? Professor Banta patiently explained to me the possible advantages to a student interested in linguistics of working for Professor Kahane. I accepted reluctantly, thinking of the valuable teaching experience I would be missing.

In my interview with Professor Kahane, I immediately discovered a kind person who needed an assistant with a knowledge of German, since he and his wife and collaborator, Dr. Renée Kahane, were engaged in research seeking the source of the term *grail*, so prominent in medieval literature, and also the identity of the figure of Kyôt, mentioned by Wolfram von Eschenbach as the source of his *Parzival*. That year turned out to be a fascinating experience for me, working in the Kahanes' office, then in the rear of the Modern Language Library. I saw first-hand how scholars go about the
business of conducting research and experienced the joy and excitement that comes from making new discoveries, from finding new links, from carefully selecting exactly the right turn-of-phrase, even from the meticulous proofreading of galleys and the careful checking of quotations and their sources. It was a different world from the one I was accustomed to, but also one in which I knew I could be at home.

As it happened, during the following summer the German Department was unable to provide me with financial aid, which was a severe blow to my wife and me, since Hannelore was expecting our first child in August. Somehow, the Kahanes learned of our predicament and took immediate action. Henry secured a research assistantship for Hannelore which would keep us both busy and financially above water for the summer. I am now convinced it was as much make-work as a pressing necessity for them to have us translate hundreds of little slips of paper containing words and phrases from the dialect of Kephalonia betraying Venetian influence on the Greek of that island. But for us, this work was also a hugely educational experience. Since Hannelore was a native speaker of German and I of English, we were able to cooperate in translating the German translations of these often earthy items into English. It was another view into the world of scholarship, at the time a little shocking, which is comprehensible now only in the context of the late 1950's, when From Here to Eternity had to be printed with asterisks in place of vowels in strategic places.

During that summer we also got to know and love Henry's mother, who came to our apartment every day for lunch while Henry and Renée took their children to Wisconsin for a week's vacation. Frau Kahane, then in her eighties, not only regaled us with delightful tales of her younger years in the heady intellectual atmosphere of Vienna and Berlin, she also showed Hannelore how to bathe a newborn infant and gave her a good deal of practical advice on childcare. We were flattered to learn from Henry after her death that she had considered us to be the last new friends she had made.

Henry's interest in us did not end when we left Urbana. He and Renée continued to take an interest in my career and in our well-being and had a substantial impact on both, for which Hannelore and I are both deeply grateful.

A few days after Henry's death, Professor William M. Calder III, the William Abbott Oldfather Professor of the Classics, wrote some words to me that I would like to share with you.

I have just received your saddening note. I consider it a privilege to have known Henry R. Kahane. His life was a model for every decent scholar. He belonged to a vanishing species. He was an intellectual. Again and again I met him a nonagenarian at lectures in classics or German. His emerititude was the chance to work harder. Solon says wisely "Never call a man happy
until he has died." We can call Henry Kahane happy. He loved his work and lived for it. He made a permanent contribution to human knowledge. He gave generously to students and colleagues. He had a wonderful wife who was also his closest colleague. He lived to see two children successful. He had a famous brother who was a distinguished archaeologist. He was never bitter at the unfairness with which history treated him. He was ill for a few days. He died painlessly in his sleep. He is remembered as a friend by all who knew him.

Roberta Kahane Garner: Department of Sociology and Anthropology, DePaul University, Chicago, Illinois

Others may speak today of Henry as a warm, patient teacher and mentor, a scholar, a vigorous administrator, and a loving father ("familienmensch"). I would like to remember him as a magician and prankster, whose sense of fantasy, imagination and ironic wit constituted the core of his being.

Part One: Of masks and mirrors

Much of this playful side of Henry derived from his immersion as a youngster in the world of theater and his continuing love of the illusions of the stage. On many occasions he spoke of himself as "the old actor." Certainly many of my happiest moments with him centered on plays, and I remember very clearly the wonderful surprise on my fourth birthday when I received the Little Theater, a plywood construction with colored lights and velvet curtains for which my mother and I produced cardboard sets and characters suspended by wires, while my father and I invented exciting plays about pyramids and zeppelins. Henry and I also performed as actors for my mother and grandmother, using as our stage my grandmother's room behind the curtain that partitioned our small apartment on Coler Street; one of our best series of plays concerned the servant Ramona, shrouded in silence to hide her Indian identity from her masters. What excitement when Papa and Mama prepared a staging of Pirandello's "Man with a Flower in his Mouth" for the Spanish and Italian Department, and what a treat it was for me to go to U of I theater productions with them. Later Henry read to me many of the great works of the stage — Oedipus Rex, The Bacchae, Schiller's Robbers — that portrayed the monster or criminal as tragic hero and the gods as implacable arbiters of human fate.

In short, he keenly felt the illusoriness of social roles, the drama of history, the pleasures of shape-changing, and the peculiar interplay of the real interiors and the shimmering surfaces of life.

Part Two: Twoness and manyness.

Henry's lighthearted and playful sense of self also derived from his life story as a Jew in Europe — an outsider, an "Oriental", a wanderer — and as a European in America — an exile in Paradise,
condemned to live in the innocent Eden of a Big Ten college town. What to some might have been a double alienation, a twofold source of pain and bitterness, was to him a source of delight and mischief. He played with these twonesses in his personal life and work. The role of bilingualism and multiculturalism in his scholarly work is well known. One of his favorites was *The Krater and The Grail*, in which he and my mother found the origins of Arthurian ideals of the soul in the interplay of Greek and Egyptian culture in antiquity, their preservation in Byzantine and Islamic forms during the Dark Ages (whose Dark Ages, anyway?), and their repackaging, recycling and transmission into Western Europe by Jews and Moors. Those of you who have seen the illustrations for this book know that he quite literally put new pictures on Richard Wagner's Wall of Fame.

These ironies at the heart of "Western" culture appeared also in his personal life. In some ways he was very Central European; for instance, I never saw him sit, let alone lie, on a sofa, nor eat without a knife and fork; and he always prided himself on his "Prussian punctuality." But under his stiff, slightly formal suits he wore shirts of the softest, silkiest and most colorful fabrics, because in his own words he was "a Jewish prince," that is to say, sensuous as well as scholarly. He was also a feminist patriarch, an oxymoron I wish I had time to explain. He bequeathed these cultural complexities to his children, who grew up Jewish and Gentile, German and Mediterranean, Pagan and "People of the Book," European and American ...

I end this section with another memory of Henry's reading to me when I was a child: As for all educated Central Europeans of his generation, the world of classical antiquity — Greece and Rome — was a wellspring of intellectual life and he spoke of it constantly to me. But I suddenly realized a month after his death, that he had read only one account of Roman history to me: A book in German (I do not know the author) that told the story of the Punic Wars entirely from the viewpoint of African and Semitic Carthage. I now consider this to be one of his jokes, one that I understood only forty years after he played it on me.

**Part Three: The word, the magnifying glass and the aleph.**

The two things I removed most eagerly after his death from the office in the library were a mirror and a magnifying glass. To the mirror I have already alluded when I described his identity as an actor, playing life's roles. The magnifying glass stands for his close inspection of words, each word a microcosm of history. The word was like an aleph, that tiny magical object of Jewish mysticism that contains within itself the entire universe. For Henry and my mother, the tracing of word histories was not a work of dry, antiquarian pedantry, but the squeezing of history into a compressed form because each word contained within itself class struggle, the clash of
empires, the migration of tribes, voyages of exploration, warfare with
cannons and Greek fire, love, laughter, pleasures...

To conclude: The ironic and imaginative qualities of Henry's
close the political Freudians, the Frankfurt school, Walter
Benjamin, and Gershom Scholem; for him (as for many intellectuals
nurtured in this milieu) the sophisticated and assimilated Jewish
environment of European rationality rested on a "substratum" of
older, half-forgotten traditions of enchantment that he tried to
recapture in his writings on alchemy, his reading of secondary
sources on the Jewish mystical tradition and his continuing interest
in his own Sephardic, Judaeo-Spanish and Balkan heritage.

To this heritage must be added the fact that he saw himself as a
man who had outwitted Death, Death having appeared to him in the
form of the SS officer who interrogated him in Florence in 1938. He
was well aware that he had escaped only with the help of friends —
gentiles, including Italians and Germans, and foremost among them
my mother; but in any case, to have escaped gave him a pride,
optimism, and toughness, as well as a deep thankfulness to Fate for
the next 54 years of life. Of course, at the end he did not escape
Death a second time, but this time Death came in the gentler form of
old age, and during his last night, he spoke of traveling to Genoa
and Athens, returning in thought to his beloved Mediterranean. We
scattered his ashes in the prairie landscape, and I will never forget
the golden rays of the afternoon sun touching the greenness of the
corn plants and the cottonwoods that day, Nature shining with the
magic of his presence.

Charles Kahane: Science Advisor, National Highway Traffic
Safety Administration, Washington D.C.

Ordinary, everyday experiences can reveal a lot about a man's
character. I would like to share two happy memories of my father.

When I was 12, we visited Catalonia. We stayed at a brand-new
hotel, with a shiny new espresso machine. When my father saw it, he
said, "Charlie, have you ever seen an espresso machine?" "No." "I'm
going to order an espresso so you can watch how the machine
works." I was fascinated by the complicated preparations, mechanical
activities and hissing noises that went into producing a tiny cup of
black coffee. "Would you also like an espresso?" "No thanks, but is
there any chance the machine also makes hot chocolate?" "Please
give the young man a hot chocolate!" I watched in even greater
fascination as the waiter took a bottle of chocolate milk from the
refrigerator, poured it into a cup, opened the steam valve on the
espresso machine and played live steam on the chocolate milk until it
became hot.
With my father, every encounter became a learning experience. He always made sure that learning was not rote memorization, but discovery and fun. Just as he never stopped teaching, he never stopped his own learning. Even in his last months, he was studying a variety of new areas, looking for ways to apply his research methods.

Those last months, when his body refused to cooperate with his spirit, are imprinted in all our memories. Some of you, perhaps, never met him till this year. We should try not to remember him only that way, but how strong he was just a few years ago.

When my father was 68 and I was 21, my parents and I spent a month hiking in the Pacific Northwest. One morning, in the North Cascades, my mother felt like staying at the lodge. There was an unmarked trail that led uphill from the lodge. "We don't know where the trail goes," we told her, "so we'll walk uphill for a couple of hours, if it goes that far, and come back for lunch." We started up the hill without any food or water. After two hours, the scenery was wonderful, but we hadn't reached any place in particular. "How often do we have the opportunity to walk a trail like this?" he said, "Who knows when will be the next time? Let's keep going and see where it takes us!"

After 4 hours, when we were about 4-5,000 feet above the lodge, we reached a promontory. To the north, the peaks stretched far into Canada. Below us, Ross Lake was covered by a layer of clouds and surrounded by evergreens. We both knew: this was our destination. A few minutes later it started to snow. We ran most of the way downhill.

The way my father played that morning is how he worked all his life. When he had a new idea — when his intuition told him he was on the right track — he would pursue the idea relentlessly until he revealed its true meaning and full implications. He inspired all of us.

Morton W. Weir: Chancellor, University of Illinois at Urbana-Champaign

In a way, it is easier to memorialize a giant than it is to remember someone of lesser accomplishments. There is so much more that one can say.

But in another way, it is more difficult, because when the person's contributions are so many and they are so important, it is possible to overlook even some that would be the crowning accomplishments of an ordinary intellect.

Henry Kahane was anything but an ordinary intellect. He and Renee formed the most remarkable scholarly team that I have ever known or heard about. For 65 years, they collaborated on books and
Kahane Memorial

This remarkable record of scholarship is well known to you all, as is the fact that Renee and Henry began their careers here in 1941. Henry retired in 1971, and at the time of his death, Henry and Renee have served this campus and its students for more than 50 years.

You may not know about some other aspects of Henry's career, however. For example, he served for a short while as a foreign correspondent in Istanbul, writing for a leading Berlin daily. Of this experience, he was later to write: "... many events that my colleagues for other foreign newspapers took seriously (I remember as typical the arrival of a Zeppelin) meant little to me." He soon and wisely returned to the academic life he really loved.

He served for five years as Headmaster of a boarding school for refugee children in Florence, Italy.

In 1938, he spent a week in an Italian prison as a kind of political hostage. Referring to that experience in an interview a few years ago, Henry said: "A week in prison, I must confess, is quite an educational experience. Every morning I was shaved, with tender care, by a lifer who had murdered his entire family."

Henry was instrumental in the formation of the Department of Linguistics on this campus. He and colleagues from a number of fields could see that such a department would promote the study of linguistics, but it took them eighteen years before the Department was successfully launched in 1965.

You may not realize, either, that after his retirement in 1971 he served as acting administrator of seven different units on this campus — four departments, one division, one program, and the Center for Advanced Study.

He was, in effect, our administrative pinch-hitter. In his quiet, intelligent, perceptive way he led these units effectively — some of which were in turmoil when he was asked to preside over them.

Henry was widely recognized and honored. He was the recipient of two Guggenheim Fellowships. He was named Outstanding Educator in America in 1974. He and Renee were the recipients of the Silver Award of the Academy of Athens in 1976.

Henry was awarded honorary degrees from Humboldt University in Berlin, the Free University of Berlin, and the University of Illinois.

He was elected to the American Academy of Arts and Sciences in 1989, a marvelous and well-deserved honor. He also served as President of the Linguistics Society of America. And of course, he was a member of our Center for Advanced Study.
Whenever I spoke with Henry, he never talked about linguistics — he probably knew that was hopeless insofar as I was concerned. We always talked about the library. And he always told me we weren’t allocating enough money to it. Recently he wrote:

The extraordinary library of the University of Illinois, in which we had our ‘study’ since the day of our arrival, proved to be an unending source of support.

Henry Kahane was amazing and productive right up until the end. Just the other night I was at a dinner and the conversation turned to Henry. One faculty member with whom I was speaking said that she had run across Henry in an elevator just a couple of weeks before his death. He asked her what she was working on and when she told him he said she should take a look at some relevant work written nearly 50 years ago — and he later returned to his office and sent her the specific reference.

I end with that story because it is the essence of Henry and the essence of scholarship. A giant has indeed passed from our midst. He cannot be replaced.

Larry R. Faulkner: Dean, College of Liberal Arts and Sciences, University of Illinois at Urbana-Champaign

In Illinois, in this city, on this campus, I have learned the value of genius and of commitment.

It is not now fashionable to speak of genius, but it does exist, and it is of immeasurable importance to a university. I have encountered here members with extraordinary intellectual power, far beyond that of merely talented colleagues. Genius allows achievement and advance that diligence, no matter how great, never will. There is no substitute for its enriching power.

On this prairie, with nothing in the physical landscape to distinguish this location from countless others, has developed one of the truly exquisite locales on the globe. It has gained its merit entirely from its humanity; its distinction arises from the genius and commitment that have marked its principal figures in the 20th century. Henry Kahane was a giant here. He gathered vast ranges of the humanities into his intellect, and he invented. He saw new ways of organizing thought and scholarship, and he led. Over and over again, he led. I am sure that he was head of more departments and programs than any other individual in the history of our campus.

Chancellor Weir has already mentioned the long, persistent effort leading to the birth of the Department of Linguistics. Henry Kahane took pleasure in telling me that story not so long ago. I recall the brilliant sparkle in his eyes when he explained how he finally wore down the Dean!
Years ago, long before I learned of the magnitude of their accomplishments, I came to recognize a remarkable symbol of personal commitment in the brisk walk together of Henry and Renee Kahane. Almost every day — in the morning, at noon, and in the evening — they passed by Roger Adams Laboratory on their way to or from the Library. One did not need to know the details of their work to see that purpose filled their lives.

Chemistry is my field, so it is perhaps not surprising that I draw on a chemical vision. Among the most beautiful and useful of all physical phenomena is crystallization. A striking effect can arise if one introduces a single tiny crystal, as a seed, into a solution of molecules at saturation. One by one, new molecules seat themselves on the faces of the seed, so that it grows to become a different entity, often manyfold larger than the original. The seed organizes the surrounding universe to match its own elegant patterns. Henry Kahane was a seed crystal in this community, and a large, beautiful product has arisen from his facets.

In Illinois, in this city, on this campus, I have learned the value of genius and of commitment.

Ladislav Zgusta: Director, Center for Advanced Study, Professor of Linguistics and the Classics, University of Illinois at Urbana-Champaign

Chancellor Weir has mentioned that Henry Kahane was involved in the work of many institutions, departments, societies. Of particular importance was his membership in the Center for Advanced Study of our University. He was one of the first professors appointed to that highest academic position on the campus at the very beginning, when the Center was founded, and for some time he was the Director of the Center. In this way, Henry's participation was of decisive importance in the molding of the new institution and in the determination of the direction which its development was to take. Even when emerited, Henry frequently came to our gatherings to hear a presentation, or to take lunch with the Center community. He was as excellent a companion as he was a penetrating discussant. The Center regrets the passing away of one of its most eminent members.

One of the national organizations in which Henry played an important role was the Linguistic Society of America, by the number of its members probably the greatest professional society of linguists in the world. Henry was the Society's president and member of many committees. I cannot fail to mention that it is not only the executive officers of the Society who asked me to bring their condolences to this memorial gathering: I received a phone call from the Secretary asking me also to mention how deeply saddened the whole staff of the Secretariat's office is and what a fond memory they all have of Henry's kindness and pleasant way of reaching decisions when he was President of the Society. It seems to me that to be remembered
in such a warm way is typical for Henry's ways of dealing with people.

I frequently asked myself how one can become such a repository of human knowledge and wisdom as Henry was and it seemed to me that the answer was in the many dimensions of Henry's life. The first of those dimensions is obvious: his trajectory through time was longer than that of most people, and all those nearly ninety years were marked by constant growth and constant increase of knowledge. The second dimension, the so to say horizontal dimension of space, is not less important: Henry lived in Germany, Italy, Greece, and America. This sounds like not a big deal in today's world of easy travel, but the point is that this was not travelling around, those were changes of places where to live. There is an enormous difference between travelling somewhere and moving there for life. As anybody who went through the experience knows, the latter is infinitely more difficult and requires deep, extensive adjustments in the way how one understands and handles people and situations. A 'normal' émigré becomes an immigrant once in life: Henry went through that process three times. It must have been very difficult, but as a source of experience priceless. The third dimension of Henry's life is that of his research. Romance linguistics and philology is one of the richest fields within the Humanities, because of the number of languages, their long and well attested history and their rich social and spatial ramifications, and because of the wealth and importance of the texts preserved in all those languages. As if this were not enough, Henry combined with this overwhelming bulk of study an intensive research in the Byzantine culture. Greek is one of the few languages of the world that have an attested history stretching over several millennia. The European tradition has been that of studying in the first line Ancient Greece and its language; it was only quite recently that a modest interest in Modern Greece was developed. This caused that the Byzantine culture has not been studied with the intensity its importance would deserve. Henry's field of research comprised both these enormous areas, Romance and Byzantine; one of them would be more than enough for a lifetime, but Henry roamed through both those vast intellectual spaces, constantly accompanied by his póntia álóchos, an accomplished scholar herself, with the virtuosity of the master who knows where to find new treasures and who is not afraid to tread on untrodden paths. This par nobile maritorum (if we accept the changed quotation) developed an ability of combining knowledge from the two fields, Romance and Byzantine, that will seek its equal for generations to come.

However, there was yet another dimension in Henry's intellectual life. During one of the, alas, last lunches I had with him, we talked about Modernism and its origin; Marcel Déchamp and his memorable painting submitted to the Salon were, naturally, mentioned, but also the quotation from, I think, Rimbaud in which
we are told that 'it is absolutely necessary always to be as modern as possible'. It was most interesting to see that the nearly nonagenarian had a much more positive attitude to this piece of wisdom than I, although nearly a quarter of a century younger. That was typical Henry: always accepting something new. I think that this component of his psychology, the proclivity to things new, was the reason why he as a young man hesitated whether to choose journalism or Academia as his career. To make up his mind, he spent a year as reporter of a big German newspaper in Istanbul; but luckily for all of us, the Muses won. Henry's whole life was marked by symptoms of this proclivity, of this willingness to accept novelty. For decades, he has never taken a plane, whether crossing the Atlantic or the American continent. But then, when he was elected President of the Linguistic Society in his, I think, eighties (unless they were 'only' his late seventies), he had to get somewhere in California quickly and the only possibility how to make it was offered by the plane: without hesitation he took it and happily kept flying forever after, always accompanied, of course, by his alter (or in this case, altera) ego.

There was a saying in Rome about Cato, a man who for a long time hated Greek culture: Cato senex litteras Graecas didicit "Cato learned Greek when [= in spite of being] an old man"; with equal right we can proudly say Kahane senex caelum navigare didicit. I am sure that this attitude, this willingness to accept novelty, this constant orientation towards modern trends, points of view, ways of life, has caused that Henry during all his nearly ninety year of life always has been so very young.

Braj. B. Kachru: Professor of Linguistics, Jubilee Professor of Liberal Arts and Sciences, University of Illinois at Urbana-Champaign

I first met Henry and you, Renée, on October 17, 1963, in a cluttered room behind the present reference room of the Modern Languages and Linguistics Library. That was almost a generation ago. And now, this afternoon, I am here to celebrate with you, Renée, Roberta, Charles, and the friends, students, colleagues and admirers of Henry, the many ways in which the richness of Henry's life touched us all. In the tributes paid to Henry this afternoon we have seen many facets of his personality: his wit and the twinkle shown in his penetrating eyes, his capacity for immense friendship and concern, his contagious dynamism and energy, his astute instinct for academic administration, his integrity and equanimity, and, above all, refinement and dedication. In short, he was an ideal humanist, a renaissance man.

But that was only one part of Henry's personality. After all, Henry was an institution in more senses than one. The other aspect perhaps less often articulated and less visible, was Henry the rebel, the activist, and the catalyst for challenge and change. In fact, Henry
in his quiet way was indifferent to conventions, ignored dominant disciplinary paradigms, and ignored academic and administrative norms. He had an extraordinary skill in building bridges between the present and the challenging future. In 1962, he strongly supported the appointment of Robert B. Lees to lead the yet-unborn department of Linguistics at UIUC, for he wanted the future department to be on the cutting edge of the fast-expanding discipline. And Lees was an apostle of a new paradigm: provocative, unconventional and often devastating. Henry ignored all that, for he saw the future direction of the field. And this showed his academic vision and foresight.

His persistence in achieving an objective — academic or administrative — is legendary on this campus. Once, when asked how he had been able to convince the administration to start linguistics at the University of Illinois, he answered with typical Kahane wit: "It was very simple. It took just two things. One, I had to wait until we got a Dean who was not from the Humanities, because a humanist Dean invariably shelved the proposal for a linguistics department. We had to wait until a psychologist became the Dean. Second, I made it a point to visit the Dean every week to emphasize the importance of linguistics on this campus. He would throw me out the door and I would come back through the window." This persistence for an intellectual cause and for change, and an immense intellectual curiosity were marks of Henry the activist.

But there was a contradiction, too. Henry was progressive in ideas, in thinking, in teaching, but he did not quite accept the material progress of our times. In 1973, Henry responded firmly to an interviewer: "I don't drive. I don't fly. I don't use a typewriter and I never look at television. I am a European, and I am very afraid of machines." (Illinois Alumni News, February 1973:14) This he said in his charming, consciously preserved, European accent. However, when Henry was elected President of the Linguistic Society of America in the 1980s, the position entailed considerable travelling. He was persuaded to travel by air. And once Henry and Renée had found their wings, it was difficult to stop them.

This blend of modernism and tradition, combined with an exuberant and youthful spirit, made the Kahanes unique. And those of us who set our watches according to the schedule of the Kahanes will understand what I mean. In a sense their life revolved around room 427 in the Library Building. In their life style, the Kahanes provided "... a unique, enviable example of the perfect reconcilability, for both husband and wife, between a rich and balanced family life and the rigor and austerity of advanced research." (ibid: p.14) Who contributed what to their long academic career of joint research is difficult to answer. Once, confronted with this question, Henry's modest answer was, "my wife has the ideas and I write them." And, as one would expect, Renée protested, "I think that is not right." Henry clarified: "teamwork is a very complicated thing. As ideas
develop, one gives one thing and then the other changes it, and then
the first one again." (ibid: p.14) This was actually the secret of their
very harmonious relationship.

In celebrating Henry's life, then, we are here to celebrate a life
of unusual dedication and a life of deep scholarship, but above all, a
life of warmth and human concern. We are celebrating the life of one
who built programs, brick by brick, and person by person, and
created well-rounded students idea by idea and argument by
argument. Henry's international impact and the respect for him as a
person was evident at the International Conference on World
Englishes Today (April 1-4, 1992), organized to honor him on his
90th birthday, seven months before his actual birthday. And in his
talk at the Conference, he did not talk of the past, but presented an
agenda for the future.

I was fortunate in that I had many opportunities to watch
closely as Henry performed his roles in the classroom, in the library,
as an editor, as a collaborator and as a mentor. I almost said as a
guru, but he did not like that term. We had telephone chats at least
once a week. On T'ursday, one day before Henry passed away, he
was optimistically talking, in his usual sanguine and firm tone, of his
future plans, of one-hundred-and-one projects. We even briefly
talked of a volume which we were jointly editing to be released in
1994 to honor one of our mutual friends.

The next day, Friday, at 7:30 p.m., Renée called Yamuna to
convey the grim news. And two hours later, when Henry was taken
from 808 W. Oregon, the five of us, Renée Kahane, Mariam Ahmed,
Yamuna Kachru, Amita Kachru, and myself, who were there to say
goodbye to him represented the world's great cultural traditions: the
Judeo-Christian, the Hindu, and the Islamic. It was not planned, it
just happened that way: a convergence of major faiths and
philosophies of life and living. I believed that Henry would have
liked it that way, for in his ideas, he did not believe in the
boundaries of culture and region. All his life he crisscrossed those
boundaries in his scholarship and in his personal life. As the hearse
turned off Oregon Street on to Lincoln toward Florida, it was almost
dark; the black hearse disappeared, carrying one who has been called
a prince among teachers and a scholar's scholar, and most
importantly, a dear colleague to us all. An era seemed to end as one
wistfully watched the slow-moving hearse. We walked back to
Henry's living room, misty-eyed. And there was Renée with us,
dignified, serene, and even at that moment of loss, concerned about
the comfort of us four.

And on that evening, as Renée and the four of us sat in their
living room, I wondered: has this relationship of years with Henry
come to an end? But, soon I thought of the assurance given by the
wise, the sages, that the physical body may be destroyed, but the
Self can neither be cut, nor burnt, nor be wet or withered, for it is
eternal, all-pervading, stable, immovable, and timeless. Therefore, knowing this to be so, one should not grieve, says the Song Celestial, The Bhagavad-Gita.
PART III

Graduate Student Research 1964-1992
This part includes abstracts of 191 Ph.D. dissertations and 52 Master's theses submitted to the department from 1964 through the end of the 1991-1992 academic year. These abstracts do not include dissertations or theses submitted to other academic units at UIUC on topics related to linguistics, for example, Department of Spanish, Italian and Portuguese; Department of Germanic Languages and Literatures; Department of the Classics; Department of East Asian Languages and Cultures; interdisciplinary program in Second Language Acquisition and Teacher Education (SLATE); Division of English as an International Language; and various units in the College of Education. A number of dissertations and theses submitted to these units are directed by the faculty of our department, or they serve as members of the committees.

Research in Progress lists the dissertations and theses defended and/or deposited to the Graduate College after August 1992 and also those which have yet to be defended for award of the degree.

We have also attempted to make this section user-friendly by including the following indices:

1. Author index
2. Language index
3. Regional index
4. Areas of concentration; and
5. Index of 'sors

We hope that this part will be useful to researchers in linguistics and to our present and future students.
Ph.D. Dissertation Abstracts

The grammar of Chimwi:ni causatives

In this dissertation we have attempted to provide a detailed introduction to the morphological causative verbs in Chimwi:ni, an introduction that has included phonological, morphological, morphophonemic, syntactic, and semantic aspects. We have shown that the causative is derived either by means of suffixation or consonant change and that the causative stem may function either as simply a transitive verb or a true causative (with varying semantic implications — e.g., assistance, compulsion, persuasion, provision of means). Some evidence has been presented to show that the true causatives are appropriately described in terms of a bisentential source whereas those causatives with just a transitive function ought not be analyzed in the same way. We have examined a variety of syntactic features of sentences containing a morphological causative verb. In particular, we have considered the grammatical verb and how these NP's behave with respect to various transformational processes in the language.

The emphasis of this dissertation has been on providing a description of the behavior of Chimwi:ni causative verbs. But in order to present this description, in a coherent fashion, it has been necessary to suggest various rules (Predicate Raising, Preposition Incorporation, principle for assigning grammatical relations, etc.) and rule interactions (Relexification before Predicate Raising, Predicate Raising before Preposition Incorporation, etc.) It should be noted, however, that we have made no attempt to present a formal account of these rules or their interactions. Rather we have tried to give some data justifying these rules and interactions, leaving the details and the formalism for future research.

We hope that the basic facts about Chimwi:ni causatives presented in this dissertation can — in conjunction with similar descriptions of other Bantu languages — provide insight into the structure of the causative verb in Bantu, and that such insight into Bantu causatives will provide relevant material for a general theory of causative verbs in human languages.

On stress and Arabic phonology: A generative approach

Arabic dialects spoken in the Arab countries from Morocco in the west to Iraq in the east and from Syria in the north to the Arabian Peninsula in the south differ from each other, even within the same country, in various respects, particularly in phonological features and lexicon. Most of these dialects, however, share certain features that are different from Classical Arabic (Cl. Ar.) and Modern Standard Arabic (MSA), the latter being the form of Arabic that is taught in schools throughout the Arab countries and is used as the medium of press, formal talks, and the greatest number of radio broadcasts.

This thesis is opposed by others, e.g. Blau (1965) who maintains that "the various items, carefully collected by Ferguson to attest to the existence of the 'koine', from which, it is alleged, the modern sedentary dialects have
developed, do not in our opinion, prove that such a common language really existed. The 'koiné' stands, as we have tried to demonstrate, at the end of the linguistic process and not at its beginning. Blau attributes the features the spoken dialects share in contrast to Cl. Ar. to a general "drift", or "convergent lines of development", and to mutual influences. Blau's thesis is that the Arab conquests during the seventh century A.D. affected their language through contact with the languages of other peoples "which had lost their flexional systems."

It is not the aim of this study to deal with this problem of the origin of modern Arab dialects. Suffice it to say that the differences between these dialects and Cl. Ar. should not be exaggerated, except perhaps in the realm of the lexicon. In phonology, where the differences are most obvious, excluding the lexicon, it is striking that in most cases the underlying structures for the spoken dialects dealt with in this study and Cl. Ar. are by and large very similar, and almost identical. The phonetic differences are accountable by plausible rules, as will be seen in this study.

Although this study concentrates mainly on an Arabic dialect spoken at Jabal Al-Mukabbir south of Jerusalem, the discussion of stress and some related matters will not be restricted to this dialect, but will also touch on other dialects, particularly Egyptian Arabic (Cairo) and Iraqi Arabic (Baghdad), in addition to Cl. Ar., since similar problems are involved in most Arabic dialects, and I simply chose the ones I am most familiar with (ignoring other dialects from the Levant because they are similar to Palestinian Arabic).

Aspects of the phonology of Lebanese Arabic

Many studies relating to the sound system of Lebanese Arabic (LA) often times included in works on Syrian and Levantine Arabic, have been conducted within the traditional framework of Descriptive and Structural Linguistics. This study is the first major work on the phonological system of LA conducted in the framework of Generative Phonology.

Lebanese Arabic differs from other colloquial dialects in several interesting ways. One is the major subdivision of the Lebanese dialects into differential versus nondifferential dialects. The latter limit vowel syncope to short high unaccented vowels in open syllables, while the former have generalized the rule to a and thus apply it to all short vowels regardless of quality. This generalization of the syncope rule provides important confirming evidence for the cyclic analysis of stress assignment originally proposed by Michael Brame for Palestinian and Maltese Arabic. Traditional research in Levantine Arabic was puzzled by the contrast between fhim-na 'we understood' versus fihim-na 'he understood us', both deriving from [fihim-na]. Brame accounted for this contrast by proposing a cyclic assignment of stress to the underlying representations [fihim-na] versus [figim]-na. In this dissertation confirming evidence for the cyclic analysis is demonstrated on the basis of the nondifferential dialects, where [CaCaC] perfects exhibit the same contrast; drab-na 'we hit' versus darab-na 'he hit us'. We also show that the possessive suffixes induce a cyclic structure on nouns, cf. sumak-na 'our fish'.
Two different analyses for the differential versus nondifferential contrast are discussed. One simply deletes $a$ in the context CV, while the second reduces $a$ to $i$ in unstressed nonfinal syllables and then syncopates the resultant $i$ in an open syllable. Further research is needed to decide between the two alternatives.

In the course of our analysis all of the major phonological alternations appearing in the inflection of the nouns and the various verb forms — perfect, imperfect, imperative, lame — are discussed.

A reanalysis of some aspects of Arabic phonology: A metrical approach

This study attempts to reanalyze some aspects of Arabic phonology, particularly, Palestinian Arabic (PA), within the metrical framework. First, the syllable structure and syllabification rules of PA are dealt with in Chapter 2 where it is argued that the syllabification process involves not only rules to define syllable boundaries and assign structure to syllables, but also other rules, which have to apply at the time syllabification is carried out. The placement of such rules among the syllabification rules explains a number of phenomena, such as shortening of vowels carrying primary stress, that can not be accounted for by the phonological rules proper. Moreover, the internal structure of the syllable is examined and it is concluded that McCarthy's (1979a,b) analysis of superheavy syllabics is inadequate.

Second, the question of how syllables are organized into higher metrical units is considered in Chapter 3. This issue is directly related throughout this chapter to stress assignment in PA, where it is argued that the metrical approach to stress (prominence) is superior. Moreover, the metrical foot is argued to be maximally ternary rather than unbounded in PA.

Third, vowel-length alternation is dealt with in Chapter 4. Broselow's (1976) account of this phenomenon in Egyptian Arabic, whereby vowels are lengthened before clitics, is discussed and shown to be inadequate. An alternative analysis is then offered whereby this phenomenon is accounted for by a vowel-shortening rule. This rule is shown to be simpler if stated in metrical, rather than segmental, terms. Moreover, the stressed-vowel shortening phenomenon is considered and a proposal is made to account for their shortening by a syllabification rule applied at the time syllable and higher metrical structures are assigned.

Finally, in Chapter 5, various syncope and epanathesis rules are considered in an attempt to show how these rules modify metrical structures. It is argued that these rules do not alter the underlying prominence relations established by the metrical-structure assignment mechanism since they apply after the metrical structure is erected.

The interplay of phonology and morphology in Korean

The purpose of this study is to propose a more satisfactory explanation for the various morphologically constrained phonological phenomena in Korean.

Chapter 1 provides preliminary information about an inventory of underlying segments, as well as an overview of lexical phonology and CV phonology.

In Chapter 2, I examine the word-formation process in Korean and organize the model of the lexicon which consists of four ordered strata. I also provide a reanalysis of the three noun-forming suffixes, -i, -im, and -ki which is related to the Avoid Synonymy Principle of Kiparsky (1983). Finally, I reanalyze the Korean sylabification process.

In Chapter 3, I discuss several consonant-related problems. First, I argue that the controversial tensification phenomena should be regarded as several different processes. For the so-called "Bindung-s" phenomenon, I propose the underspecified e-epenthesis rule instead of the traditional t- and n-epentheses. Second, I discuss two types of palatalization phenomena in Korean; lexical t-palatalization and post-lexical palatalization processes. I also argue that phonological opacity is explained by correct morphological analysis. Third, I reanalyze the so-called irregular conjugation of the p-, t-, s-, h-, and l-predicates within the framework of CV theory. Finally, I discuss the miscellaneous aspects of aspiration, consonant cluster simplification, and coda-obstruent neutralization.

Chapter 4 deals with several vowel-related problems. First, I discuss the vowel harmony process and the reduplication in which I propose to recognize two kinds of vowel harmony in Korean, each dividing the vowel chart in its own way and being differentiated from each other in terms of the lexicality vs. post-lexicality distinction. Second, I reanalyze the i-deletion phenomena and recategorize them into two groups; lexical vs. post-lexical. I also discuss the i-analogy phenomenon which occurs in the process of children's overgeneralization of suffixation. Finally, I elaborate on the vowel shortening process.

In Chapter 5, I review the thesis and discuss some of the implications.

Learning to use Yoruba focus sentences in a multilingual setting

Focus sentences are so important in Yoruba that it is hard to picture what the language would be like without them. Their arrival in a child's language development thus marks an important point in his linguistic development.

This dissertation, based on data from adult Yoruba and child language, tries to do two things. It tries to present an adequate analysis of adult Yoruba focus sentences, and to account for how Taye and Kein (the two children studied) came to learn to use these sentence types. These two tasks are not easy to perform, and so not commonly found in language learning accounts.

After describing the children, their socio-linguistic background, and the data, the dissertation defines focus sentences, and links them with identical linguistic phenomena in English. In showing some of the characteristics of the sentence type, an attempt is made to show that one type of negation in the language is possible if and only if there is a focus sentence construction. The study shows that one form of reflexivization in the language (and incidentally
in English) does not require the clause-mate condition, but that it occurs to prevent a syntactic gap.

A proposal for analyzing focus sentences reveals that:

Ore ni o ra isu
Ore be he bought yams
‘it was Ore who bought yams’

transformationally derives from

Ore ni eni ti o ra isu
Ore be one who he bought yams
‘Ore was the one who bought yams’

which in turn derives from

eni ti o ra isu ne ore
one who he bought yams be Ore
‘the one who bought yams was Ore’

It reveals that there is no known way of transformationally deriving focus sentences of the type just seen from their traditionally related non-focus sentence:

Ore ra isu
Ore he bought yams
‘Ore bought yams’

and that an attempt at deriving them differently than as sketched in this study will leave many grammatical focus sentences unexplained and so must be judged observationally inadequate, or do so only at the cost of a very complex machinery the type not really called for.

It argues that the Extraction Theory proposed by Grosu (1972) and Akmajian (1970) for analyzing English pseudo-cleft sentences, the English counterparts of Yoruba focus sentences, cannot handle the Yoruba data, and that in fact it cannot cope with what it is intended to do. I show that my proposal can handle English focus sentences adequately, including the ones which all existing analyses have no answers for.

The second part examines the language learning data, and reveals that the rules by which adult focus sentences are derived do not help to explain how Tayc and Kein learned these sentences. On the contrary, there is reason to believe that they learned by imitation, and pattern copying, and by careful use of semantic cues. The gap between the linguistic description and the language learning data is shown to be inherent in generative grammars which say that they have nothing to offer concerning how language is perceived and produced.

Tayc and Kein are shown to have learned certain oppositions very early in life and these are used to project how they probably learned language. Semantic notions like animacy, humanness, dependency, agent, initiator, affected, action or attribution, possessor-possessed, and location or direction of objects and people are suggested as cues which the child uses in learning to speak. The dissertation suggests that an adequate theory of child language will have to integrate all of these with the use of imitation in its wide and true sense with the use of imitation in its wide and true sense, and the place of the model. This it argues, means that biologists, neurologists, speech experts,
linguists, sociologists and psychologists must have to team together to produce such a theory.

Syncope and epenthesis in Levantine Arabic: A nonlinear approach

The nonconcatenative morphology of Arabic played a prominent role in the development of CV phonology. McCarthy (1979, 1981) showed that many Arabic word formation rules can be conceived of as stipulating a CV template to which the segmental phonemes are autosegmentally mapped. In addition, he showed that the Semitic root pattern system can be reduced to the assumption that radical consonants and vowels are on separated tiers representing different morphemes. The development of underspecification theory (Arancheli 1984) made it possible for the radical consonants and the vowels to be minimally specified in the lexicon, and for the phonological rules to apply and refer to tiers rather than the whole representations. In this study, we argue that the above assumptions are essential: first, to explain an otherwise problematic set of alternations found in some Modern Levantine Arabic dialects; and second, to provide an explanation for the effects of emphatic consonants on other neighboring segments in various Arabic dialects.

The assumptions made in this study are: (1) The syncope rule deletes a mere V slot from the skeletal tier and the vowel associated with it remains floating. (2) Epenthesis rules insert an empty slot which will be (a) associated with a floating vowel if available; (b) otherwise, associated with a high stem vowel; (c) otherwise, associated with an empty matrix. Redundancy rules of different types will fill in the values of the front vowel i in the empty matrix. (3) The interaction between redundancy and phonological rules will provide the desired epenthetic vowel u in emphatic contexts and prevent the same vowel in the same contexts from getting rounded when (a) syncope feeds epenthesis within a stem or (b) the stem vowel is the high front i. Evidence and arguments for assumptions (1) and (2) are presented in Chapter 3, and those for assumption (3) are presented in Chapter 4. Chapter 1 serves as an introduction to the study, and Chapter 2 briefly discusses syncope and epenthesis rules.

Studies in the syntax and semantics of Yoruba nominalizations

This study is an attempt to characterize Yoruba nominalizations, and on that basis to enrich our understanding of the processes that a natural language can use to create new lexical items that are too large to be found in any dictionary. This investigation is imperative for several reasons. First, the processes have not been characterized in the language before, in the way we have done here, at least not to our knowledge. This does not mean that nominalizations are not important in Yoruba. In actual fact, it is our contention that the same information that speakers use in forming sentences is used in creating new words out of existing forms in the language. The creativity that makes somebody know and use the infinite number of sentences of a natural language, underlies the production and use of compound forms in the language.
Our success in describing this knowledge will depend first on substantive evidence from individual languages and what it provides for explaining language as a form of communication. Such substantive evidence will include the morphology of the language, which will tell us how new words are derived and how productive the processes are. We might then begin to understand why a speaker can tell whether a new word belongs to his language or not, just as he can tell whether a sentence is part of his language or not.

The information we have on Yoruba indicates that it is possible to dissect its complex lexical items formally, without doing it intuitively alone. That is, it is possible, given a nominal compound, to pull apart both the affix and the stem. This is our approach in this dissertation. Both the stems that the affixes take, and the affixes that the stems take are looked at in detail in order to determine what principles govern their association. What previous writers on Yoruba have done is to list the affixes and the nouns they can form. The nominal compounds were not related to sentences in the language, nor were the stems correctly identified as to whether they are verbal or ideophonic.

Kabyle Berber phonology and morphology: Outstanding issues

This thesis presents a novel account of the most important phonological and morphological processes operating in a Berber language -- Kabyle -- spoken in parts of Algeria. The study is conducted within the framework of the recent theories of syllable structure (with emphasis on the CV and Onset and Rime tiers), autosegmental phonology, and lexical phonology and morphology.

First, the syllable structure of Kabyle is investigated. This language will be seen to have a relatively simple syllable structure, compatible with universal rules. Then, I show that the puzzling problem of the schwa in Kabyle and another Berber dialect can be easily accounted for if a set of syllable-building rules specific to these languages is devised. The syllabification scheme will also be demonstrated to explain the phonological alternations associated with the "bound" state of the Kabyle noun as well as with some vowel sandhi phenomena. In addition, the problem of syllabification at the word and/or the phrase level and its implications for the linguistic theory will be discussed. Finally, in the domain of phonology, I will show that the distinction made within lexical phonology between lexical and post-lexical rules is able to account for some consonant sandhi phenomena.

In the realm of verbal morphology, two attempts are made. First, the model of autosegmental analysis which allows reference to levels of representation or tiers other than the surface segmental representation of a string (McCarthy, 1979) is made use of in order to explain the Kabyle verbal allomorphy. Second, I attempt to account for the same verbal allomorphs within the framework of Lieber (1980) who argues that the morphological alternations (allomorphs) of a verb must be listed in the lexicon, with relationships among them expressed by means of devices called morpholexical rules. Each analysis will be shown to bear at least one important consequence for the purpose of understanding Kabyle verbal roots and their derivatives.

110
This dissertation deals with morphology, syntax and semantics of Persian compound verbs from a lexicalist viewpoint. The following is a summary of the major points discussed in this study.

In Chapter 1, I show that the morphological, syntactic and semantic properties of Persian compound verbs have not received proper treatment in the past. To this end, I take the position that an adequate analysis of this phenomenon is possible within the general perspective of the "Lexicalist Hypothesis."

In Chapter 2, I discuss the phonological, morphological and syntactic characteristics of Persian simple verbs. Unlike previous proposals, I suggest that all Persian verbal stems are registered in the lexicon. However, prior to being mapped onto the underlying P-markers, I argue that such stems undergo a number of lexical rules.

In Chapter 3, a distinction is made between gerundive nominals and derived nominals. It is shown that while the former category are derived syntactically, the latter are constructed in the lexicon. Such a distinction is argued to provide an explanation for a regular tendency in all Persian gerundive nominals which do not undergo compound verb formation processes.

In Chapter 4, two major categories of simple and compound derived nominals are examined. It is argued that while a syntactic analysis of these nominals has a number of shortcomings, a lexical approach to the problem is fairly adequate.

In Chapter 5, the phenomenon of verbal compounding is discussed. Based on a number of criteria, it is argued that a large portion of Persian compound verbs are separable by various syntactic transformations. In this chapter, it is also argued that, first, the process of compound verb formation, similar to the case of derived nominals is lexical; second, unlike previous claims, such processes reveal a remarkable pattern of regularity.
The question is also broached as to whether there is justification for setting up two pharyngeal continuants /H/ and /P/ both of which are absolutely neutralized; the former as a glottal stop, the latter as a voiceless velar fricative. Evidence is brought, inter alia, from children's speech to support arguments against a /H/ phoneme, and a 'concrete' approach is adopted, i.e. historical /H/ has been replaced synchronically by /P/ plus certain exception features. Historically, some rules are applied to /H/ but not to /P/. Arguments based on children's interpretation of adult grammars, are presented to show how these exception features should be distributed in the adult's lexicon.

An underlying /H/ is, however, shown to be justified, although it is absolutely neutralized as x. One important difference between the "recognition" of /H/ but not /P/ is that the former is realized phonetically as a non-guttural, but the latter remained within this class after the change. Since about half of the twenty odd rules of Hebrew phonology refer directly or indirectly to the gutturals — this difference in realization is crucial.

As regards spirantization, the frequently held view that this can be described as a phonologically determined phenomenon is refuted. It is shown that the language is in the course of change which has, to some extent, replaced the "old" spirantization rule by increased dependence on the morphology. Differences between adult and child interpretations of spirantization are discussed and theoretical implications arising herefrom are stated. One recently added rule to the grammar involving the dissimilation of a stop to a fricative after another stop in two of the seven verb classes is examined. Arguments and evidence are presented to show that this rule was probably added by adults, and that the rule is "rejected" by children in the developing stages of their acquiring the language. The dissimilation rule actually leads to what may loosely be called "analogy", and the possibility of at least some types of analogy being caused by adults is raised.

A third chapter discusses the ordering of the rule of voicing assimilation, which has to precede a morphologically conditioned metathesis rule. It is argued that certain substantive factors have to be considered in evaluating grammars, as well as purely formal ones; both in connection with this ordering relationship and as regards the metathesis rule itself.

In the final chapter the inter-reaction between schwa-insertion and consonant lengthening is discussed, and a summary of the rules is given.

Children's development of syntactic aspects of reading comprehension: Pronoun-referent structures

This experiment was conducted to understand the development of comprehension of pronoun-referent structures involving the pronoun "it" by standard English speaking children in grades 2, 4, and 6.

In each grade, comparisons within linguistic factors were made:
1. Referent Type: Pronoun-referent structures where the referent is a noun or noun phrase (NP) vs. Pronoun-referent structures where the referent is a clause or sentence (S).
2. Reference Order: Pronoun-referent structures where the pronoun follows its antecedent (Forward Reference, FW) vs. pronoun referent structures where the pronoun precedes its referent (Backward Reference, BW).

3. Referent Distance: Pronoun-referent structures where the pronoun and referent are within the same sentence (Intra) vs. structures where the pronoun and referent are located in separate sentences (Inter).

These structures were embedded into experimental passages of eight different passage types: NP (FW, Intra), NP (BW, Intra), NP (FW, Inter), NP (BW, Inter), S (FW, Intra), S (BW, Intra), S (FW, Inter), and S (BW, inter). Four passages were constructed with each of these possible antecedents for the pronoun, one correct antecedent and two distractor items. The forward and backward versions of a story containing the same referent type and referent distance were written with the same content to control for background knowledge influences on the structure. The two versions of each story were alternately assigned to two forms of experimental booklets. Thus, each booklet had the same number of forward vs. backward structures; but no booklet had two versions of the same passage. In the experimental booklet, each of the 16 passages is followed by a question asking a child to recall the antecedent.

The three schools in which the experiment took place serve a predominantly "blue collar" or working class community in East Central Illinois. Protocols of second graders reading below grade level or having significant decoding difficulty were eliminated on the basis of standardized achievement test scores and/or teacher judgements on survey sheets. Furthermore, protocols of children of below average intelligence were not included. This was done to guarantee that all the native English speaking children had enough reading ability and intelligence to perform the task. The mean reading levels for the children whose booklets were used in the analysis were at grade level.

The children were tested within their regular class. Each child was handed one of the two forms of the experimental booklet and was asked to read each story and answer one question based on each story.

Analyses of variance were applied to the data. Along the dimension of referent type, passages containing pronoun-referent structures where the referent is a noun phrase had significantly higher scores than passages with structures where the referent is a sentence. Along the dimension of reference order, passages with forward reference order also had significantly higher scores than passages with backward reference order. There was a strong trend within passages with intra-sentential structures: forward reference had higher scores than backward reference. Yet the reference order factors had less effect on inter-sentential structures. Along the dimension of referent distance, intra-sentential pronoun-referent structures were not significantly higher than inter-sentential structures. Yet for sentence pronominal structures, intra-sentential pronominals had higher scores than inter-sentential pronominals. The opposite occurred for passages with noun phrase pronominals. Although some pronoun-referent structures are well comprehended by second grade e.g., NP (FW, Intra), the comprehension of other structures are still being developed well into the middle grades.

These findings are discussed in the light of research findings in reading, linguistics, and psycholinguistics.
Some effects of orthography on the linguistic knowledge of modern Hebrew speakers

Languages should be studied without reference to writing systems — that is one of the basic assumptions of modern linguistics. Most speakers intuitively feel, however, that the exposure to the orthographic system clearly contributes to one's knowledge of the language. The object of this study is to empirically demonstrate that the orthographic factor does play a role in the process of grammar formulation, and must therefore be regarded as linguistically significant.

Several linguistic tests were conducted with speakers of modern Hebrew. In order to isolate the crucial factor (i.e. the availability of orthographic information), the tests were presented in both oral and written versions and were run with two groups of subjects: literate and preliterate native speakers.

It is argued that unless it is assumed that orthographic information affects (maybe subconsciously) the linguistic behavior of literate adults, a plausible account for the results found in these tests cannot be provided.

The conclusions of the study are:

1) Exposure to the orthographic system might lead to the reformulation of phonological rules, as additional information which cannot be recovered from the available oral data becomes accessible.

2) Orthographic representations play an important role in identifying and distinguishing between morphemes and consequently in establishing their relatedness in other lexical items.

3) Lexical representation may be modified as a result of the availability of additional linguistic information which can be recapitulated only from the orthography.

4) Orthographic distinctions may lead to the establishing of phonemic contrasts.

Since orthographic information clearly contributes to the process of grammar formulation, and given the accessibility of written data to the average speaker in most modern societies, it is concluded that orthographic systems should be treated as linguistically significant sources of data. Unless such data are incorporated into the linguistic model, the picture one gets about speakers' competence might be partially distorted and far from characterizing adequately what they really 'know' about their language.
approaches to linguistics, which have been acknowledged as the theoretical base of the development of communicative language teaching theory and practice. However, the relationship between communicative language teaching and functional approaches to linguistics is far from clear.

This study explores the relationship of functional approaches and communicative language teaching through a consideration of the Prague and British linguistic traditions, concepts such as communicative competence, intelligibility, and model, the nature of English language use and teaching in the contexts of India, Japan, and West Germany, and the application of American and European communicative approaches to the development of English language teaching materials designed for English language learners in these three non-native contexts.

As an applied study, it does not claim to offer solutions to pedagogic problems, but to provide a means by which such problems may be solved. One of its objectives is to show how a theoretical model for linguistics can be used for classroom purposes by relating a linguistic framework to actual classroom materials and activities. It also offers a clarification of linguistic principles, drawn from the functional linguistic models of the Prague School and the British linguistic tradition, which can guide in the development and implementation of communicative language teaching models which are responsive to the needs of a growing number of learners of English in non-native contexts.

This study also addresses applied and theoretical implications for teacher training, cross-cultural communication, models in the pedagogical context, intelligibility in the classroom, and syllabus design.

A syntactic and semantic description of negation in South Asian languages

This study accounts for the syntax and semantics of negation in six South Asian languages, four belonging to the Indo-Aryan group (Hindi, Marathi, Nepali and Punjabi), one to the Dravidian group (Kannada) and one to the Dardic group (Kashmiri). In the process of characterizing the formal properties of negation, various theoretical and language-specific problems are discussed.

The dissertation is divided into seven chapters. In the first chapter, the goals, methodology, framework and scope of the dissertation are outlined. Chapter II ("The Syntax of Negation") illustrates that the syntax of the languages under discussion follows two syntactic patterns. In one group of languages, (Hindi and Punjabi) the negative particle is realized in the preverbal position, while in the other group (Kannada, Marathi, Nepali and Kashmiri) it is realized in the postverbal position. It is also shown that in these languages the surface distribution of NEG particles is semantically and not morphologically conditioned. The conditions under which these positional constraints are violated are also presented. A rank order of postverbal NEG languages is established on the basis of fixed order of negative particles. Chapter III ("Deletion and Negation") discusses various negation-sensitive deletion rules. It is shown that such deletion is subject to grammatical and pragmatic conditions. These deletion processes, together with the absence of
scope specification rules, such as NEG-incorporation, set the stage for potential massive ambiguity in the language. Chapter IV ("Quantifiers and Negation") discusses the syntax and semantics of quantifiers under negation. Chapter V ("NEG-Raising") is a pragmatically governed optional rule. The inadequacy of the concept 'optional rule' in current linguistic theory is discussed in detail. Chapter VI ("Negation and Subordination") shows that several constructions, such as causatives and consecutive-action constructions, are not permitted on the grounds of semantic incongruity caused by negation in subordinate clauses. It is also demonstrated that negation in subordinate clauses does not favor reduction processes. The final chapter provides a summary and conclusion.

The dissertation also attempts to relate the topic under discussion to the concept of India as a "linguistic area", and to investigate the strategies which these six languages adopt to resolve potential ambiguities and thus facilitate the processing of negative structures.

Comprehension and recall of figurative language by nonnative speakers of English

This study attempted to extend some of the findings in figurative language research over the past 10-15 years to a population not often tested in this area before, nonnative speakers of English. Most metaphor researchers in psycholinguistics have come to believe that nonliteral language is a vital component of language, not a "special" part that is acquired only after literal language has been acquired or that requires a different type of processing than literal language. The few studies done on nonnative speakers, on the other hand, concluded that figurative language was harder for these speakers, an aspect of the L2 that was to be avoided.

This study tested 124 international students in two intensive English programs in the spring of 1991. The study included two parts, a multiple-choice test of comprehension and a cued recall task. The three hypotheses that were tested in this study — that comprehension of literal and figurative items would be equal, that comprehension of metaphor and simile items would be equal, and that recall of literal and figurative items would be equal — were all supported, using ANOVA procedures. In the comprehension results, there was no statistically significant difference between literal and figurative items and metaphor and simile items. This held true, regardless of cultural background or English language proficiency. The third hypothesis was also supported in that figurative recall was not only as good as literal recall, but significantly better than it.

Thus, the results of this study, while supporting a decade of findings in psycholinguistic research on metaphor, make a somewhat counterclaim for second language researchers. However, it must be stressed that the handful of figurative language studies using nonnative speakers are not exactly comparable. Many of those studies used highly conventionalized figurative language, such as idioms, while this study used novel metaphors. Also, most of those studies investigated production while comprehension and recall were the subject of the present study.
1171 examples of rules especially their whole grammar should be avoided — even if "it works". Claims of this nature have been made before, but I will be trying to point out the extent to which they are true of Modern Hebrew. I wish to show that it is particularly natural for rules to be limited to the verb system due to its great productivity, especially with regard to borrowings. *i/e Alternations* (Chapter IV), two vowel deletion rules (Chapter V) and two sub-rules of stress (Chapter VI) will be given as examples of rules that are categorial, and I will argue that they should remain so. Apparent scattered manifestations of such rules beyond the category concerned should be treated separately. Chapter VII gives an illustration of a constraint that used to be general and recently has narrowed down to the verb; in other words — an actual proof that certain linguistic processes tend to be limited to a category. Chapters I, II and III are introductory in nature, and thus do not constitute an integral part of the body of this thesis: Chapter I provides the general background for Standard Modern Hebrew and for root-pattern analysis, Chapter II explores various possible treatments of the underlying representation, and Chapter III discusses the possibility of not representing gutturals underlingly and how it would affect the whole analysis.

Previous publications, the findings of which are incorporated in this thesis, are "*i/e Alternations in the Hebrew Verb and the Question of 'Vacuous Generalization'". *Hebrew Computational Linguistics* No. 5, Bar-Ilan University (Israel), February 1972.

Pro-sententialization and the *DO IT* construction in English

In his thesis, Ross (1967) suggested at one point that all sentences containing non-stative verbs originate as complement sentences embedded on instances of *do*.* That same year, Anderson (1967) also proposed a structure of this sort. His contention: that a large class of verb phrases "should be represented as embeddings, the complements of the verb *do*." Furthermore, Anderson was writing within the framework of a non-cyclic transformational theory. This thesis will set out to determine what fundamental assumptions must be made if one is to adopt the proposals of Ross and Anderson, and whether these assumptions are sound within a transformational grammar that does include a cyclic transformational component.

My intention is to test the proposal that the phrase *do it* be derived from a deep structure *do + a complement sentence object* within the framework of a transformational grammar that employs the transformational cycle. In the process, we will review some of the evidence presented by Anderson and present other evidence that bears on the question we are investigating. We
will start in chapter two by asking whether pronouns representing sentences or verb phrases need to be assumed to be derived from underlying sentences or whether they can occur as pro-forms in the deep structure itself. We shall then turn our attention to what constituents must underlie the anaphoric it of do it. In chapter three, we will compare these minimal constituents of the complement of do with those of other sentences and find them to be essentially the same. In the process, we will take issue with Anderson's claim that the identity constraints on pronominalization of sentences require that non-identical constituents in such sentences be deleted before the pronominalization rule applies to them. By tying do it so closely to other verb + complement constructions, we will have presented a situation in which considerations of simplicity will urge that the deep structure do + complement proposal be adopted. In chapter four, we will try to make the proposal work, analyzing some quite difficult problems inherent in it as it was put forth by Anderson. And finally, in chapter five, we shall draw what conclusions we must as a result of our confrontation with those problems.

Empathy and indirect quotation in Japanese

This dissertation is concerned with resolving a disagreement in the linguistic literature about indirect quotation, specifically in Japanese. On the one hand, Kuno (1972) and authors of related work (Kuno & Kaburaki (1977), Kamada (1981) have argued, partially on the basis of so-called "empathy" phenomena, that indirect quotation must be grammatically related to direct quotation, and that the mechanism of deriving the former from the latter is most appropriate. On the other hand, works such as Banfield (1973) and Gallagher (1970) have argued against such derivations. Clearly, if the position taken by this second group of authors is to retain its validity, it is necessary to reconcile the data of Kuno and others with the non-derivational position. This is the aim of this dissertation.

In order to make the argument accessible, the first chapter gives a general outline of the types of data under discussion. It discusses, first, the phenomenon of empathy in Japanese, and second, the nature of indirect quotation in Japanese. The first chapter also gives examples showing the interaction of empathy (Kuno & Kaburaki 1977) and for theories of indirect quotation. The second chapter reviews analyses of empathy and of indirect quotation, those of Kuno (1972), Kuroda (1973a), Kuno & Kaburaki (1977), Ogura (1978) and Inoue (1979).

Chapter III gives arguments, both from English and Japanese, against the analysis that derives indirect quotation from direct. Chapter IV applies Cole's (1978a) idea of propositional and quotative complements to indirect quotations containing empathy verbs, and shows how the idea of these two kinds of complements can illuminate some aspects of the data. This chapter also shows how pragmatic principles can explain exceptions in the data to a propositional/quotative analysis.

Chapter V builds on the data of Chapter IV and proposes an explicitly pragmatic analysis to patterns of empathy in indirect quotation in Japanese, by proposing a new pragmatic maxim, the Viewpoint maxim. This chapter also discusses the question of status — grammatical or cultural — of empathy phenomena in general.
diphthongs assume the difficulties posed by the diphthongs of Spanish can be dispensed with if we consider whether the theories of syllable structure.

The intricate system of Spanish diphthongs has generated much discussion in Spanish phonology as well as in the development of numerous theories of syllable structure. In this dissertation, it is my claim that many of the difficulties posed by the diphthongs of Spanish can be dispensed with if we assume that they are derived structures rather than primitive syllable types. Falling diphthongs are derived prior to initial stress assignment from two adjacent syllable nuclei, where the second nucleus is [+high]. Rising diphthongs are created subsequent to the assignment of stress from a sequence of a [+high] vowel followed by an onsetless syllable. Surface differences in the syllabicity of words like MaríaJo and María then, are encoded underlyingly in terms of stress, rather than in terms of a feature, or a structural property of high vowels. Such a proposal reduces the inventory of Spanish syllable types and allows us to minimize the feature [syllabic]. The Sonority Principle and the two-mora li:it: per syllable determine syllabic wellformedness. This makes it possible to uphold a maximally simple model of the syllable, with no inner structure.

This analysis of diphthongs also leads to a more explanatory account of the alternating diphthongs of Spanish ([ye][e] and [o][w]). It is my claim that the monophthongal forms of the diphthongs are derived from the intermediated monomoraic structures: [ye] and [wo]. These diphthongs monophthongize in unstressed environments as a result of a ban against shared feature matrices in monomoraic diphthongs that are in a metrically weak position. Overall, the analyses presented uphold a minimally marked model of Spanish syllable structure.

An autosegmental analysis of Venda tonology

This thesis is an attempt to explore the tonology of Venda, (more correctly, Tshivenda), a Bantu language spoken in the Zoutpansberg district of the Northern Transvaal in South Africa as well as in parts of Zimbabwe. It represents the first attempt to look at Venda from the perspective afforded by the autosegmental framework for phonological analysis. We also consider at times whether certain other theoretical notions could be resorted to in an attempt to get a better understanding of "Venda tone. In particular, we have considered whether the theory of underspecification could be used to account for the well-known asymmetry in Bantu languages (including Venda) between High and Low tones. And we have considered whether the theory of lexical phonology can contribute to a better understanding of problems relating to the domain of application of certain tonological rules in Venda. We conclude, however, that neither of these theories appears to contribute very significantly to the understanding of Venda tone, though some aspects of Venda are relevant for the elaboration of these particular theories.

Four chapters make up the body of the thesis. In Chapter Two, we examine the tonal alternations exhibited by Venda nominals. Chapter Three presents an analysis of a number of major affirmative verb tenses. Chapters Four and Five...
Doctoral dissertations

primarily focus on further aspects of the verbal system, but with forays into other, tonally-related matters (various "inflected" forms of the noun, adjectives).

Huanca-Quechua dialectology

This study is largely based on previous work done by the present writer, most of which appeared in the form of working papers within the Documentos de Trabajo series under the auspices of the Center for Applied Linguistics of San Marcos University (Lima). Aside from being a near native speaker of the communoloc spoken in his native district of Chongos Bajo (Huancayo), he spent more than one month on two occasions (1972 and 1975), traveling from town to town and from village to village, along most of the Quechua speaking communities of Huancayo, Concepcion and Juaja. Besides, he spent considerable time working with different informants in Lima. The material gathered in the field and during his data-eliciting sessions is largely preserved in magnetophonic tapes and in his field-work notebooks.

Spanish being the language of the dominant culture, it is normal to expect that Quechua is more influenced by it than vice versa. This influence is most noticeable in the lexicon, as usual, but as a result of the massive incorporation of Hispanisms, the phonology of the native language has become seriously altered. This is true especially for the consonantal system, which has adopted the Spanish voiced stops; the same is true for the syllable pattern, for now the language has consonant clusters, previously non-existent (except ambisyllabically). The vowel system, however, has proved to be more resistant, since the Spanish mid vowels /e,o/, incorporated in most Quechua varieties, are normally accommodated as /i,u/ within the native language. This and other aspects of the influence of Spanish upon Huanca-Quechua has been treated extensively in Cerron-Palomino (1975); see also Chapter 3, where more details are provided.

As is the case in a (unidirectional) language contact situation, however, the influence of a language upon another cannot be measured as if the two languages were discrete and homogeneous entities; rather one has to deal with a continuum. Thus if it is true that a variety x has incorporated some Spanish phonemes into its phonemic system, it is equally true that a variety y has those phonemes variably or simply does not have them yet, depending, for example, on the degree of bilingualism of the speakers. Thus the fact that a language has or has not been influenced by another, especially when this is the language of prestige, can only be determined to the extent that we take into consideration socio-economic and regional variables.

Greek word order and linguistic typology

Ancient Greek is a language which has a high degree of freedom in the placement of words/phrases within the sentence, so much so that there have been competing claims regarding the so-called 'basic' or 'unmarked' order of constituents. Short (1890) and Kieckers (1911) claim that SVO is the 'basic' order, while Ebeling (1902), Fischer (1924), Frisk (1932), and Dover (1960)
maintain that SOV is 'basic'. More recently, Friberg (1982) and Radney (1988) have put forth the claim that Greek is VSO.

In this paper I will show that a typology based on syntax is inappropriate for Ancient Greek because Greek does not behave in any way consistent with one given type, but rather exhibits behaviour which is characteristic of all three types, VSO, SVO, SOV. I will argue that the 'basic' order in Ancient Greek cannot be determined from statistical or syntactic analyses, and that a typology based on pragmatics as proposed in Payne (1987) and Dooley (1987) is more appropriate for Ancient Greek than a syntactically based typology.

A generative study of discourse with special reference to Korean and English.

This thesis is an attempt to describe in the general framework of generative semantics, some aspects of discourse in a Discourse-frame, characterized as an abstract frame consisting of speaker, hearer, time of utterance, pace of utterance and manner of utterance. In Chapter 2, these deictic elements are formally introduced, and their various functions in linguistic descriptions have been discussed in a systematic way. In Chapter 3, the deictic element of manner of speaking is described as the source of various discourse levels and honorification in Korean and discourse operator 'honorable' is introduced. In Chapter 4, another discourse operator 'information focus', originating in the discourse structure of new information in a given discourse situation is introduced, and its function in emphatic stress and clefting, its interaction in negation with proposition has been described. In Chapter 5, sentence types, declarative, interrogative, imperative and propositive are examined in terms of the modality of the speaker and hearer, with reference to Korean and English. Important notions in this approach to discourse are indices of speaker and hearer, underlying the discourse-frame.

Aspiration in Chinese

This dissertation studies aspiration in Chinese in these four areas: the temporal relationships between aspiration and the vowel of the syllable, the perception of aspiration, the correlation between pitch and aspiration, and the role of aspiration in a historical change in Chinese. Data based on 144 words with aspiration contrasts were derived from the experiments which involved production and perception by a total of 28 Chinese speakers. On the basis of the measurements of acoustical characteristics of the voice onset time and the lengths of the syllable, a constant ratio model has been proposed to describe the timing relationships among the elements within a syllable. The perceptual experiment tested the cues of aspiration by deleting the portion of the voice onset time from the syllable on the front, back, middle and both ends. The results are reported and discussed. The effects of aspiration on intrinsic tone heights in Mandarin were measured and the significance calculated. Finally some attempts are made to solve the development of aspiration from voiced obstruents under the condition of different tones from Middle Chinese to modern dialects.

Interactions between aspects of noun phrase structure and restrictions on question formation in Mandarin Chinese

This dissertation raises the question as to why it is not always the case in Mandarin Chinese that a corresponding interrogative exists for every noun phrase in a declarative sentence. Given the assumption that declaratives and interrogatives are related, and the assumption that this relationship is to be captured by some device such as a transformational rule of Question Formation or a phrase structure rule which introduces a question morpheme, it is claimed that the non-occurrence of certain corresponding interrogatives must be explained in terms of the blocking of the relating device. This blocking takes the form of constraints which state restrictions on the occurrence of question morphemes.

In order to formulate the constraints some notions connected with the properties of noun phrase structure are needed, particularly the features of definiteness/nondefiniteness and restrictiveness/nonrestrictiveness. These aspects are first defined and shown to have their independent places in the description of the language in the sense that such notions bear syntactic consequences.

The process of Relative Formation is studied in considerable detail since, in the expansion of noun phrase constructions, Relative Formation incorporates additional noun phrases which are in turn potential positions for the occurrence of a question morpheme. It is pointed out that a principle of primacy hierarchy is necessary to account for the varying acceptability of relativization in Mandarin Chinese.

Having introduced and independently justified several important aspects of noun phrase structure, a set of constraints on Question Formation which makes crucial use of these features is proposed. These constraints are that (1) no definite NP nor any element inside such a NP may be questioned, and (2) no element inside a nonrestrictive modifier may be questioned. Other factors which bear on the acceptability of an otherwise grammatical interrogative are also discussed.

The dissertation ends with some speculation on the sources of the constraints as essentially involving the notions of 'function,' 'propositional content,' and 'illocutionary act,' and a prediction that, if the speculation is indeed correct, it should be the case that no language could violate these constraints.

Mandarin phonology

A Chinese syllable is traditionally divided into three parts: the initial, the final, and the tone. The final is that part of the syllable which extends from the first non-consonantal segment to the end of the syllable. The initial, then, is anything else, possibly null, that precedes the final. The tone is superimposed over and belongs to the whole syllable. The final is further analyzed as always consisting of a main vowel or nucleus, sometimes a medial, the segment preceding the main vowel, or an ending, any segment including
century. called "rhyme" since words rhyme inspite of differences in consonants. Chinese tone, those about the reality of contour tones, overlooked neutralization, attempt first, shall support of this claim lies synchronic whole. represents the character the item group tones: lexical factors following the main vocalic segment including consonants following the main vocalic segment. The final excluding the medial can be called "rhyme" since words rhyme in spite of differences in the medial.

This traditional analysis can be traced back to as early as the sixth century. In 601 A.D, a rhyme book called Qièyùn was published. In the book lexical items are first grouped in terms of tones. At that time there were four tones: ping "even," shǎng "rising," qù "going," and rù "entering." In each group the items are then grouped in between fifty and sixty rhymes. Every item is spelled with two characters; the first character represents the initial, the second the final and the tone. More specifically, the initial of the first character represents the initial and the final of the second character represents the final and the tone.

The traditional Chinese assumption that Chinese tone belongs to the whole syllable seems correct: at least it has proved itself useful in both synchronic and diachronic description through the course of time. But the support of this claim lies in a detailed study of a type of the Chinese dialects. I shall describe Mandarin phonology in terms of this traditional understanding first, and then come back to examine this assumption and to explicitly demonstrate that other alternatives are incapable of accounting for many facts in modern Mandarin in a linguistically significant way. This thesis is an attempt to describe Mandarin tones in detail: their features, tone sandhi, tone neutralization, etc. It is also an attempt to answer questions that are often overlooked or vaguely answered, questions such as those about the nature of Chinese tone, those about the reality of contour tones, etc.

An adequate linguistic theory must be established on the basis of detailed descriptions of specific languages. At the same time, a grammar of a language must receive sufficient theoretical constraints. I shall first state the framework within which I am describing the phonology of Mandarin. The general framework that is now being shown quite promising is the one that incorporates the theory of markedness.

African varieties of English: Text in context

This is a sociolinguistic study of the characteristics of the English language used in Africa. Because English has become a world language, it is assumed in this study that non-native speakers in Africa, Asia and other parts are slowly developing new varieties of English. These varieties have already been recognized as 'Indian English', 'Nigerian English', 'Ghanaian English', 'Singaporean English' and so on.

The study shows that the English being used in Africa is slowly undergoing a process of contextualization. That is, new forms and usages are emerging which express the meanings and serve the functions of African local conditions. This process involves the use of several linguistic strategies, such as translation, semantic shifts and extension, calques, lexical hybridization, repetition and reduplication, and transfer.

In addition, the study shows that the new varieties of English also have discourse patterns, structure and strategies which deviate from native English. These are found to be in narrative types, coherence in discourses, topic-comment relations and the social significance of proverbs, indirectness and
circularity in verbal interaction. For these reasons, the analysis gives substantial attention to the influence of social markers of speaking such as age, sex, role, status, turn-taking, etc.

It is concluded that the English language in Africa is being acculturated to accommodate the context of situations in which it is used. In other words, the meaning systems which are expressed by African languages are being transferred to English, and these meanings remain either as a substratum or cause the syntax, semantics and pragmatics of native English to be modified. It is suggested that linguistic concepts such as communicative competence, meaning potential, verbal repertoire and language variation and contact should, when used in connection with English as a second language, be understood in terms of the socio-cultural settings in which English is being used.

Some interactions of grammar and pragmatics in Korean

By now it has become clear among linguists that there are various kinds of correlations between syntactic form and pragmatics. But the fact that there are interactions between grammar and pragmatics cannot be taken as prima facie evidence for the position that pragmatics is part of grammar or that grammar is part of pragmatics. This study, rather, argues for a position which keeps pragmatic features strictly out of grammar and gives functional explanations of linguistic forms in pragmatic terms. This position is referred to as a 'Modular Account of Language' in the present study.

The modular account of language assumes that (1) knowledge of language is distinct from knowledge about the use of language, and that (2) the two independent systems, grammar and pragmatics, are connected to each other.

To provide evidence for the modular account of language, I present theoretical arguments and reanalyze three areas of grammar-and-pragmatics interactional phenomena in Korean; sense adjective verb constructions, subject honorification, and periphrastic causative constructions. In each case it will be shown that both formal and functional accounts of them given under the modular account of language is superior to the accounts under the framework mixing grammar and pragmatics.

Universal Grammar and the Subset Principle in Second Language Acquisition: The Acquisition of the Governing Category Parameter by Adult Korean Learners of English

The goal of developing a theory of language acquisition is to account for how language learners construct the grammar of their target language and how such knowledge is acquired. Even though recent advances in generative grammar have made a considerable contribution to the development of first language (L1) acquisition research, no one has yet completed a full account for a single human language because of its tremendous complexity. It is apparent that research on second language (L2) acquisition is an even more complex, and therefore even more demanding, task to carry out, since in L2 acquisition, at least two languages are involved: the learner's native language
and a second language. Furthermore, in L2 acquisition research, we have to take a number of additional variables into consideration from general factors like age, the length of education, and the type of exposure to the target language, to individual factors like personality, aptitude, motivation, etc. Therefore, in this relatively undeveloped field of study, fundamental questions still remain not fully answered. How do L2 learners construct the grammar of the target language, and what kind of process is involved in such a construction of the grammar? What is the role of previous knowledge of the native language in the L2 acquisition process? In the following sections, I will briefly review traditional theories on these problems: the basic tenets, claims, and weaknesses of Contrastive Analysis and Creative Construction and also look at Universal Grammar as an alternative theory to those traditional ones.

*Textual coherence in English and Korean: An analysis of argumentative writing by American and Korean students*

This study investigated textual coherence in American and Korean students' argumentative texts in English and Korean. With the ultimate goal of exploring the relationship between (a) linguistic features and text coherence and (b) coherence and culture, it compared 76 English and 49 Korean essays written by one group of American students and three of Korean students, including Korean ESL students in America and Korean EFL students in Korea, with respect to the following features: interactive roles of linguistic units and text structure; linguistic and textual features that disturb the reader's reconstruction of the writer's message; and components significantly affecting coherence evaluation.

Three major types of linguistic features marking interactive acts (connectives, modal verbs and tense, and specific types of lexical items) were shared between the English and Korean texts. The computer analysis based on these markers showed that interactive functions were reflected relatively highly in surface linguistic forms.

Five major types of text structure were identified from the four groups of argumentative writing: claim-justification-conclusion, problem-solution-conclusion, situation-problem-solution-conclusion, introduction-elaboration-conclusion, and introduction-development-transition-conclusion. The use of the five patterns by the four groups of writers revealed that cultural context, the extent of exposure to English rhetoric, and the writing conventions in the native language affect text structure.

Nine types of coherence problems were identified by American and Korean readers: topic-structuring, cohesion, justification, conclusion, semantic/pragmatic, style, vocabulary, grammar, and mechanics. Among these variables (language, writers, and readers) the reader's ability to decode the writer's message was the key factor for the coherent interpretation of a text. American readers tended to mark textual and contextual problems, while Korean readers were more sensitive to paragraphing and sentence-level features.

American and Korean evaluators strongly agreed on the overall impression of the coherence of a text, however, a comparison of their holistic
and analytic evaluations showed that their judgements were based on somewhat different criteria.

This study suggests that native speakers of English and Korean have different notions of text coherence and that these are closely related to the writing conventions based on their cultures.

Aspects of Kejia phonology

This thesis is concerned with four aspects of Kejia phonology: initial consonants, diphthong representations and syllabification, the domain of tone sandhi, and the notion of geminate inalterability. The analysis is in line with the non-linear framework of generative phonology.

Two issues are investigated in terms of initial consonants: palatalization and onset friction. We conclude that the nasal palatal n has two URs: n and ng. Moreover, we argue that the fricatives v and j are derived from high vowel spreading. As for diphthong representations, we propose that there are two different representations: one for a rising diphthong and one for a falling diphthong. In addition, we propose that there are at most three skeletal slots for a Kejia syllable. These proposals account for two generalizations: no consonant can follow a falling diphthong, and a falling diphthong differs from a branching rime. As far as the domain of tone sandhi is concerned, we postulate that it is defined by the syntactic structure on the basis of domain-command (Kaisc 1985). The last topic is gemination and geminate inalterability. We conclude that gemination in Kejia results from spreading and that there is no inalterability effect in Kejia geminates.

A sociolinguistic study of an additional language: English in Thailand

This study seeks to provide an explicit analysis of a 'performance variety' of English as used in Thailand by the Thai people. It is an examination of the linguistic and sociolinguistic characteristics of English in the Thai context, where English serves a vital role as an additional language. The ways in which English is patterned and organized support the concept of 'Thainess', i.e., Thai English with its unique characteristics. The 'deviations' at different levels in what has been termed here 'Thai English' are explained in terms of social and cultural transfers from the native language. It is further claimed that such Thainess in English can be best understood in the Thai context of situation where English is being used. The discussion, therefore, includes shared rules of speaking and interpretations of speech performance, shared attitudes regarding language forms and uses, and shared sociocultural understandings with regard to Thai norms and values in Thai settings.

It is evident that English in Thailand has been acculturated and as a result, various innovations have taken place. These innovations can be exemplified by linguistic strategies that include translation, shifts, hybridization, reduplication, repetition, transfer, and the use of proverbs and idioms from the Thai language. Additionally, development of typical Thai strategies in discourse and style are discussed and illustrated.

Although the study does not discuss specific pedagogical concepts and approaches in detail, it does conclude with theoretical and applied implications. i.e., the notions of speech acts and pragmatics, stylistics, communicative competence, and bilingualism are discussed and it is pointed out as to how the teaching and learning of English in Thailand, will be affected as a result of studies such as this one.

*Indefiniteness and anaphoricity: The analogical extension of a semantically based constraint*

This dissertation is an examination of a facet of the general problem of the relationship between syntax and semantics. It has been proposed in a variety of works written within the framework of semantically-based grammar that the most underlying syntactic structure of a sentence and the semantic structure of a sentence are coterminous.

In the chapters which follow I trace the ontogenesis of a syntactic constraint which appears to have its inception in semantics. As the constraint has developed in English, however, it appears to have become increasingly arbitrary from the point of view of semantics. Analogical generalization has led to the extension of the constraint from a semantically coherent class of items to a morphologically coherent but semantically incoherent class.

This thesis as a whole concerns the way in which the semantic basis for a syntactic constraint may become obscured. The results of my study suggest that it is inadequate to posit semantics alone as providing naturalness conditions for syntax. Rather, as was suggested by Jespersen (1924:45-47), syntactic processes would appear to be the result of a tension between meaning and form. It is this bidirectional pressure which may explain the juxtaposition in syntax of logically and morphologically motivated properties of language.

*The aesthetic use of syntax: Studies on the syntax of the poetry of E. E. Cummings*

On the theoretical level, this dissertation develops, illustrates, and documents an 11-point typology of syntactic aesthetic effects which provides a working theoretical model for the study of the aesthetic use of syntax. Following Leech (1969, 1974) and Nowottny (1962), it is argued that these effects represent the various ways authors and speakers use syntax to "particularize" (perceptually, emotively, and conceptually) the informational content of a text or discourse — these effects being the syntactic realizations of more general aesthetic effects (i.e., iconicity, focus, emphasis, pace, tension, surprise, ambiguity, development, parallelism, transcendence, and stance) which can also be produced at other levels of linguistic structure (phonetic,
orthographic, morphological, or semantic) or by other aspects of literary form (e.g., poetic line, metrical structure, or narrative perspective).

It is argued that, by providing a direct link between linguistic structures and aesthetic functions, this theoretical model can serve as a much-needed corrective to the overly formal analyses of literary syntax in linguistic stylistics while providing a productive supplement to the overly content-oriented analyses of literary syntax in the mainstream of literary research and pedagogy. This theoretical model, it is maintained, provides a framework within which one can make statements about, not just the formal, but the aesthetic styles of speakers and authors across historical periods, literary genres, and levels/aspects of linguistic and literary structures — thus making a truly aesthetic rather than merely formal poetics possible.

On the practical level, the dissertation applies this theoretical model to the analysis of several previously unexamined aspects of E. E. Cummings' syntax — demonstrating that a broad range of Cummings' syntactic deviations produce poetically significant aesthetic effects. Chapter 2 examines how Cummings exploits the semantic constraints on English derivational morphology (un-; -ingly, -fully, -lessly, -ly, and the nominal conversion of quantifiers, pronouns, verbs, and function words) to populate his transcendental poetic "world" with dynamic, personal, self-conscious, unique objects and individuals — regardless of normal referential distinctions; Chapter 3 provides a semantic analysis of Cummings' much discussed line "he danced his did" — demonstrating that the conversion of did to a noun and dance to a transitive verb leads to complex, poetically productive ambiguity; Chapter 4 illustrates Cummings' use of fifteen types of syntactic icons (icons of existence, substance, complexity, spatial contiguity, inclusion, inversion, symmetry, disorder, fusion, occurrence, movement, temporal contiguity, simultaneity, interruption, and intrusion) through which he perceptually "presents" the thematic content of his poems; Chapter 5 explores the ways in which Cummings exploits the semantic constraints on the order of pronominal modifiers in English to convey his poetic epistemology which asserts the abnormal centrality of the subjective, unique, close, immeasurable, subjective and value-laden attributes of objects; and Chapter 6 analyzes how Cummings orchestrates the syntax in one poem ("supposing i dreamed this") to simultaneously produce five different aesthetic effects which support the thematic content of the poem. In conclusion, it is argued that, taken together, these five studies demonstrate the critical power of this aesthetically-oriented approach to the analysis of literary syntax while at the same time laying the foundation for a reevaluation of the aesthetic purpose and success of Cummings' unique syntactic style.

South Asia as a sociolinguistic area

The aim of this study is to provide a clear characterization of the concept 'sociolinguistic area' and based on this characterization to define South Asia as a sociolinguistic area.

The questions addressed in the study are:
1) What is meant by 'sociolinguistic area'?
2) What is the importance of the concept?

137
3) What are some of the features that may be seen as characteristic of a sociolinguistic area? In order to answer these questions other uses of the term 'sociolinguistic area' are examined and a working definition is formulated. The importance of the concept for an understanding of linguistic convergence is stressed and South Asia's claims to being considered a sociolinguistic area are stated. As the claims depend crucially on the existence of a common 'grammar of culture' for the region, factors which clearly illustrate the relationship between language and culture are taken up for discussion. The features studied are: diglossia, echo formation, interactional strategies, explicator compound verbs, and modernization of language. These features are studied in languages belonging to the Austro-Asiatic, Dravidian, Indo-Aryan and Tibeto-Burman language families. It is shown that they function in much the same way across language families and their use may be seen as dictated by the grammar of culture of the area. This provides clear evidence that language and society are intimately intertwined and each affects the other in very definite ways.

The study provides insights into the South Asian linguistic context. It claims that the term 'sociolinguistic area' subsumes the term 'linguistic area' because a linguistic area is the result of the prior formation of a sociolinguistic area. The study shows that South Asia has a common grammar of culture which affects linguistic diffusion and language change and provides social motivation for language change. Finally, it shows that despite surface diversity, there is an underlying unity in South Asia and this makes it a sociolinguistic area.

The study has implications for both theoretical and applied aspects of future research. It broadens the scope of research for our understanding of sociolinguistic phenomena, it provides a framework for comparison of sociolinguistic areas, and contributes to our understanding of formal innovations in functional terms. In addition, it has implications for language planning and second language teaching.

Syntax and semantics of causative constructions in Persian

The present study deals with syntax and semantics of causative constructions in Persian. The major points of focus in this study may be summarized as follows:

1. Chapter 2 describes periphrastic causatives in Persian. In particular, the categories of (a) Nominative-Subjunctive Causatives, and (b) Accusative-Subjunctive Causatives are discussed in detail. The members of the former category are further divided into (i) 'Unmarked Causatives', and (ii) 'Permissive Causatives', and it is shown that the members of the latter category constitute 'Coercive Causatives'.

2. Chapter 3 discusses lexical causatives in Persian. In this chapter, on a purely morphological basis, lexical causatives in Persian are classified into the three classes of (a) root, (b) morphological, and (c) auxiliary causatives. In this chapter, it is argued that only a lexicalist analysis can adequately account for the facts of the lexical causatives in Persian. A slightly modified version of Jackendoff's
Doctoral dissertations

Proposal (1975) is introduced to capture the morphological, grammatical, and semantic regularities between non-causal and their associated lexical causal verbs in the lexicon.

3. Chapter 4 focuses on a side by side study of the periphrastic and lexical causatives in Persian. In this chapter, the similarities, differences, and the interactions between these two levels of causation in Persian are spelled out.

4. Chapter 5 addresses the question of passive in Persian. The question of passive has been a controversial issue in the transformational treatments of Persian. While a group of scholars have postulated (with very little discussion) the existence of passive in Persian, Moyne (1974) has called this construction inchoative. In this chapter, these two approaches are discussed and a new proposal for the treatment of passive in Persian is suggested. In particular, it is claimed that a distinction should be made between unambiguous/transparent passives and ambiguous/opaque (i.e., ambiguous between an inchoative and a passive reading) passives in Persian. It is argued that the transformational rule of passive in Persian is a governed rule in the sense that it applies to a semantically definable class of verbs — i.e., verbs that express a volitional act.

The morphophonemics of the OluTsootso dialect of (Olu)Luyia: Issues and implications

This thesis is an investigation of the major morphophonemic processes of the OluTsootso dialect of (Olu)Luyia, a Bantu language of Kenya spoken in Guthries' Zone E. 32b., north and west of Lake Victoria. The morphophonemic processes involving nasal interactions, vocalic lengthening and reduction alternations, and the various processes connected with the complex verbal derivational suffixal phenomena form the major topics of this work. The issues that are raised by the analyses of these phenomena, and their theoretical implications for future research, are developed in detail after a thorough presentation of the facts. This thesis is a presentation of a previously unexplored language, and so is of importance in preserving and adding to our store of knowledge of the languages spoken today. The data alone can be used to expand and enhance phonological, historical, and general Bantu linguistics studies, and thus is useful for future research.

A second justification for the present work is the thoroughness and reliability of the research. This has been accomplished by conducting original full-time informant work extending over a period of a year and a half, working with a native speaker of the language. It has been possible, therefore, to investigate various processes quite extensively, to correct early mistakes, and to obtain accurate and spontaneous judgements and intuitions concerning both the facts and the analyses.

The last point raised leads to another reason for the work. The research has been conducted within a generative phonological framework, and relates the original and extensive data directly to current theory. Some of the data and analyses proposed here raise serious and interesting problems for certain
theoretical positions, in that in many cases, the phenomena resist uncomplicated morphophonemic rule and rule ordering solutions. Alternative analyses are presented here, and are shown to have interesting explanatory power. Now, in many cases, these phenomena have been discovered only after a very thorough investigation of the categories involved. Thus, it is here again that the importance of working with a native speaker is manifest. Without frequent checks, careful elicitations, and a painstakingly thorough investigation of a great deal of data, it is quite likely that the evidence for some of these processes would never have been obtained, and none of the more interesting analyses would have been possible. Thus, the reliability of the data is a direct function of the nature of the investigation, while the analyses which result are therefore correspondingly strengthened and supported.

An integrated approach to child bilingualism

The present study is intended as a threefold contribution: (1) to the field of language acquisition in general: (2) to the particular field of child bilingualism, and (3) to the field of general linguistics.

The focus of the work is on the description of child bilingualism, especially the phenomenon of cross-influence between L1 and L2, and more particularly the influence of L2 on L1.

The analysis is based on data collected from Brazilian children in their process of acquiring and using Portuguese as their first language and English as their second language.

The study is approached from an integrated view of human language, its analysis, acquisition and use. In this sense, a state-of-the-art summary of the main currents in the field is provided, and a new way of viewing linguistic competence is proposed. It is argued that the notion of 'integrated linguistic competence' is more adequate than the other notions of competence found in current literature because it can fit any description of human language (including analyses of child language and of bilingualism), while the other views of linguistic competence can fit only partial aspects of language description.

The cross-influence between L1 and L2 has been investigated along the first twenty-four months of the subjects' being in the USA. Three stages of cross-influence have been identified: Stage I (months 1-8), the period in which the influence of L1 on L2 is more transparent than the influence of L2 on L1, Stage II (months 9-16), when L2 dominates L1, and Stage III (months 17-24), the period in which the L1 influence on L2 is almost nil, and the L2 influence on L1 is less transparent than in Stage II.

The interaction between L1 and L2 has been examined in terms of language transfer, code-switching, and code-mixing. The phenomenon of language interference has been described in all levels of linguistic analysis, viz.: the phonetic/phonological, the morpho-syntactic, the lexical, and the semantic/pragmatic.
Some parameters in the grammar of Basque

In this study, I concentrate on some key aspects of Basque in order to lay out a basic description of this language from a GB perspective and to check relevant points of the theory against the evidence from an apparently highly marked isolate language.

The first chapter deals with ergativity, key syntactic structures which discriminate subjects from objects uniformly identify the ergative and the absolutive argument of intransitives as 'subjects'. Furthermore, building on Levin's (1983) analysis of izan (intransive) verbs as unaccusative predicates, I show Basque to belong to the 'extended ergative' type. To capture this, a case assignment system is proposed which expresses at S-structure the generalization that all and only D-subjects are marked ergative and all and only D-objects are marked absolutive.

Chapter Two deals with the configurationality parameter. Despite free word order, I present some subject/object asymmetries which can be accounted for in a natural way only by positing a configurational structure where subject NP's c-command object NP's but not vice versa. Chapter Three considers the pro-drop parameter. I claim AGR in Basque includes three distinct features matrices with case specifications for Ergative, Absolutive and Dative. Following Huang's (1984) analysis of pro identification, I claim Basque to be an extended pro-drop language with both subject and object pro's. This is directly linked to the extended agreement pattern of Basque verbs. Some deviations from the expected case marking patterns in impersonal sentences follow directly from the case marking system proposed here assuming that 0-role cannot be assigned to certain non-canonical assignees.

Finally, in Chapter Four, an alternative to Horvath's (1981) FOCUS-parameter is presented which explains the syntax of question and focus formation in Basque. Rather than the existence of a FOCUS position for wh-phrases and foci distinct from SPEC, I claim the parameter to be the level at which both move to SPEC. Wh-operators move at S-structure in Basque and English, while focus operators move at S-structure in Basque, but at LF in English. The apparent pre-verbal position of these operators is claimed to follow from general independent processes like INFL-to-C movement.

The lexicographical and lexicological procedures and methods of John Wilkins

This dissertation documents John Wilkins' contribution to the science of language analysis. I analyze his Essay towards a Real Character and a Philosophical Language (1668) concentrating on his lexicographic and lexicological achievements and the scientific apparatus that he uses to organize his classification schemes. I show how the Wilkins project must be considered a legitimate contribution to the practice of lexicography: with his friend William Lloyd he constructed a dictionary which anticipated later trends of lexicography and surpassed his contemporaries (e.g. general inclusion of ordinary words; multiple senses of single lexical items; fixed combinations — idioms, set collocations; systematic and impartial presentation of definitions). Though this dictionary has been largely ignored in the
scholarship of the history of lexicography, I demonstrate the need to reappraise the accepted tradition of English lexicography. I have compared entries from the dictionaries of Blount (1656), Kersey (1708), Bailey (1721), and Johnson (1755) with the alphabetical dictionary appended to the Essay. In the sections on the lexicological practice of Wilkins I document the semantic organization underlying the classification tables based on my analysis of the text which reveals that organization; these tables can be seen as an application of a structural analysis of the lexical items representing concepts Wilkins deemed as universal. The arrangement of the tables follows a binary and hierarchical formula. The most important aspect that I have found regarding the organization of the tables is Wilkins' use of what we would call distinctive features. In order to better appreciate the Wilkins system, I compare relevant portions of classificatory and semantic work done preceding and succeeding 1668 with the principles I have deduced from Wilkins' text. I look at works of classification (Comenius; Dornsciff; Hallig-von Wartburg; Roget), works of structural/componential analysis (Coseriu; Katz-Foder; Nida) and a design for a dictionary (Apresyan-Meleuk-Zolkovsky). I claim that Wilkins' work is organized by systematically (with lapses) applied principles. These principles, which I have deduced from my analysis of the Essay, anticipated much of what we regard as modern linguistic-semantic theory.

Some constraints of consideration on conversation: Interactions of politeness and relevance in Grice's second maxim of quantity

In his by now well-known paper 'Logic and conversation' philosopher of language, Paul Grice, establishes four maxims speakers follow in conversing: maxims of quantity, quality, relation, and manner. The maxim of quantity he divides into two parts, saying that conversational participants must give enough information to each other, but must not give too much. However, after once establishing this maxim, Grice immediately casts doubt on its validity, saying that its second part is adequately covered by the maxim of relation, which states that what one says should be relevant -- that is, that any remark that would be considered overinformative would be discounted by its being irrelevant, anyway, thus eliminating the need for the second half of the maxim of quantity.

This dissertation, employing examples from both tape-recorded 'real' conversations and conversations from short stories and novels, argues that Grice's first intuitions were correct, namely, that the second half of the maxim of quantity is both valid and necessary. Speakers refrain, at times, from conveying to one another information that could be highly relevant to the material at hand, the thesis maintains, for reasons that stem in large part from consideration for one another. A lengthy review of the literature is included, as well as a chapter distinguishing conversation from other sorts of verbal interaction, and one on the nature of consideration and precedents from the literature on human interaction for consideration as a valid form of motivation. Transcripts of four 'real' conversations follow the text.

Problems in Jita Tonology  
This thesis has two goals. First, it provides a detailed treatment of the tone system of Jita, an Eastern Bantu language spoken in Northwestern Tanzania. Secondly, it examines recent theoretical issues in Bantu tonology, especially the interaction of tone and accent.  
Since the syllable is the TBU of Jita, the syllable structure conventions of Jita are discussed first as background to a discussion of the tone system. Using a moraic framework (Hayes 1989; Ito 1989), special attention is given to accounting for compensatory lengthening in Jita, which occurs both as the result of resyllabifying onsetless monomoraic syllables and before simplified geminate nasals and pre-nasalized consonants.  
Next, the tone patterns of verbs, nouns and noun-modifier phrases are analyzed, and it is shown that much of the Jita tone system may be accounted for by non-metrical rules, i.e. rules which refer to the tonal properties of string adjacent syllables. Once it is determined which morphemes contribute a high tone to the derivation, OCP-motivated deletion rules apply to eliminate sequences of high tones on immediately adjacent syllables. Then all remaining high tones shift one syllable to the right.  
However, some tone patterns in Jita are derived from tone rules which spread, reassociate or associate tones to syllables which are not string adjacent either to the trigger of the rule or to a domain edge. Following Kenstowicz (1989) and Sietsema (1989), I argue that these tone rules provide evidence for the interaction of tone and metrical prominence (accent) in Jita, since only metrical formulations of tone rules which target non-string-adjacent elements conform to the Locality Principle (Archangeli & Pulleyblank 1986a,b; McCarthy & Prince 1986). It is further argued that in a theory in which accent is equivalent to metrical prominence, the Ordering Hypothesis (Goldsmith 1982; Sietsema 1989, etc.) may not be maintained. According to the Ordering Hypothesis, in languages in which tone and accent interact, all accentual rules apply in a block before all tonal rules. However, evidence from Zulu and Jita is presented which shows that non-metrical tone rules must precede assignment of accent in those languages.

Aspects of Mandingo grammar  
The present study attempts to provide a general description of the Grammar of Mandingo. Since the language has not been submitted to extensive linguistic investigation, the thesis will essentially be subdivided into three major parts: (1) a general background description of the morpho-tonology of the language, (2) a grammatical overview of simple sentences; and (3) an examination of the structure of complex sentences. In particular, Chapter II analyzes the morphology and the tonology of nouns, adjectives, verbs in an attempt to uncover general properties characteristic of all major Mandingo constituents. This chapter not only facilitates the reading of subsequent chapters, but it offers a description that is crucial for the understanding of the rest of the thesis.
Chapter III examines the syntax of simple sentences. In particular, three areas are covered in this chapter: (a) word order, (b) nominals such as nominal possession marking and nominalized sentences, and (c) movement transformations.

Chapter IV focuses on the syntax of complex sentences. Several questions are raised including (1) whether Mandingo conjunction fits within the Immediate Dominance/Non-immediated dominance dichotomy, proposed by Tai (1969) and Sanders & Tai (1972), (2) can a unitary account be found for Mandingo relative clause formation, that is, do the two relative clause types exhibited in this language share the same deep structure, (3) what types of complements clauses the language has, and what are their deep structures, (4) whether or not single rule can account for all Mandingo complements types, and (5) how can we account for the expletive pronoun 'it' which surfaces in some complement clauses. A tentative solution is finally proposed that permits the derivation of both relative and complement clauses by a single rule.

Chapter V concludes the thesis and discusses a number of theoretical issues raised in the previous chapters.

It is our hope that this study, although by no means exhaustive, will bring some insight into our knowledge of the structure of Mande languages, and in so doing increase our understanding of African languages and the nature of human languages in general.

*Tone and stress in Taiwanese*

This study investigates two prosodic features, tone and stress, in Taiwanese, which is a Southern Min dialect. As far as tone is concerned, in addition to establishing the possible underlying tones of the dialect examined, we present our arguments for the analysis of the three types of tone sandhi in this dialect. We also propose a hierarchy binary tone feature system derived from Clements (1981) for a phonological characterization of these Taiwanese tones. Moreover, we examine the tone sandhi domain in this dialect and discover that the domain is rate-sensitive. There is a linear relationship between tone sandhi domain and speed of speech. When the speech speed decreases, the tone sandhi domain reduces, and vice versa.

Previous claims of stress in Taiwanese are based on impressionistic views. In the second part of this study, we conducted several acoustic and perceptual experiments to discern what the possible cues for the presence of stress in Taiwanese are. The results reveal that there were no identifiable acoustic cues that could be used to argue for the linguistic significance of stress in Taiwanese. Our experiments have proven that the previous impressionistic view is incorrect and there is no stress in Taiwanese as far as linguistic significance is concerned. Additionally, in the investigation of the intensity data, we establish the vowel-intrinsic amplitude difference in Taiwanese.
The phonology and morphology of modern Javanese

As its title indicates, this dissertation will deal with the phonology and the morphology of Modern Javanese. However, this very general statement of subject matter may be somewhat misleading, and, thus, it seems that a certain amount of clarification is in order.

First of all, the language to be dealt with is indeed spoken in modern-day Java; however, the general label "Modern Javanese" covers a wide area and needs some qualification. Modern Javanese speakers make use of two major speech levels: Ngoko is used for informal every-day conversation, while Krama is the level used in business or polite conversation (there are also a number of sub-classes within each of these major levels). The two major levels differ from each other mainly in their inventories of lexical items, but also to some degree, in morphology. This dissertation will deal exclusively with the Ngoko or informal speech. Furthermore, discussion will be based on data collected in the course of two year's work with a single informant, Suharto Prawirokusumo, a graduate student at the University of Illinois. He is a native speaker of Javanese who grew up in the Surakarta area, where the dialect which is generally accepted as Standard Javanese is spoken.

A second area in which clarification is necessary involves the degrees to which the areas of phonology and morphology will be treated. Chapters 2 and 3 of this dissertation form an integrated whole in which a relatively detailed generative analysis of the phonology of the language will be built up, step by step. However, the remainder of the dissertation consists of four chapters which are only loosely related. Insofar as all deal with some facet of morphology; no attempt will be made to build up a complete analysis of Javanese morphology. There are good reasons for this departure from the course followed with the phonology of the language. Not the least of these is the fact that, at this time, there is no satisfactory theoretical framework readily available for setting up any sort of complete morphological analysis: generative linguists are still at a fairly early stage in their investigation of the morphological aspects of language. At the same time, while a number of the Javanese morphological processes are so straightforward that their analysis would cause no difficulty, examination of each in turn would involve a great deal of repetition and would probably turn out to be of little value.

Finally, it should be pointed out that I do not claim to be presenting startling new data in this dissertation; nearly all Javanese constructions are to be found in the various Javanese grammars and dictionaries which are available. Nor can it be claimed that this is the first time any serious linguistic analysis of Javanese has been attempted; to make such a claim would do shameful disservice to a great deal of excellent work done in the past. Most notable, that of E. M. Uhlenbeck. What I would claim for the present work, however, is that, by approaching the analysis of Javanese from a generative point of view, I have been able to produce a more insightful and natural analysis of the phonology of the language than any which has been offered in the past. Furthermore, it is to be hoped that, in the course of discussions contained in this dissertation, particularly those dealing with morphology, some contribution has been made toward furthering linguists' knowledge of the ways in which morphological processes may function in the grammars of
natural languages, and, in addition, how such processes may interact with others contained in grammars.

The pragmatics of selected discourse markers in Swahili

The dissertation is a description of several discourse markers in Swahili in a pragmatic framework which assumes that speakers and hearers are rational agents whose behavior, including verbal behavior, is plan-based and goal-oriented. In this view, speech is coherent because the hearer can perceive the relation of utterances to the speaker's plan in the discourse. Discourse markers have a role in achieving coherent speech because their use guides the hearer in inferring how the speaker probably intends the utterances which they accompany to be part of her plan in the discourse. Each discourse marker has a basic sense which the speaker predicates of an utterance in the discourse. The hearer, believing that the speaker is cooperative, i.e. guided by the Cooperative Principle (Grice, 1975), infers what intention he must impute to the speaker in using the discourse marker that she used, when she used it, such that he may preserve the overall assumption of the speaker's cooperativeness. Thus, the speaker's use of a discourse marker requires the hearer to relate the utterance which it accompanies to his model of the speaker's plan in the discourse, thereby realizing its coherence.

Three discourse markers are discussed in detail, and several others more briefly. Chapter 2 discusses the use of sasa "now" to indicate that the speaker intends the utterance prefaced by sasa to achieve a sub-goal of a goal which she considers current in the discourse. Chapter 3 is the discussion of basi 'enough', both following and prefacing utterances. Basi indicates that the speaker intends the hearer to interpret the utterance which it follows as sufficient for the accomplishment of the speaker's super-ordinate goal. When basi is utterance-initial the speaker intends the hearer to understand that some other action is sufficient for the accomplishment of the sub-goal which she intends the basi-prefaced utterance to achieve. The use of the DM maana 'meaning', discussed in Chapter 4, indicates that the speaker intends the hearer to use the utterance which it prefaces as the basis for inferring the reason or cause for a preceding action, event or idea. Chapter 5 begins with a brief look at several other Swahili DMs (haya 'o.k.', nanikii 'whatamacallit', kumbe 'lo and behold') suggesting that they are also a means for the speaker to indicate to the hearer how the utterances of which they are a part are related to her goals and plans in the discourse. The chapter concludes with a discussion of the implications of the view of DMs developed in the dissertation for issues in pragmatics, lexicography and foreign language pedagogy.

Computational implementation of Underspecification theories: Kiswahili example

The differences between Radical Underspecification theory (RUT) and Contrastive Underspecification theory (CUT) have been discussed in the literature (for example Archangeli 1988, Mester & Itō 1989, Dikken & Hulst 1988) comparing various aspects of these theories. This dissertation presents a discussion of a computational implementation of these competing theories. The
test case of the Kiswahili phoneme set was given as an example. The computer program, PUCA (Phonological Underspecification Computationally Assisted), implemented in HyperCard 2.0 on the Macintosh computer, provides the user of the program with the opportunity to enter any language's phoneme set and then experiment with different underspecifications of that set, altering the feature set as desired.

Chapter 1 provides an introduction to the dissertation. Chapter 2 covers the literature which deals with the phonologies of Kiswahili, Underspecification theories, concentrating on Radical and Contrastive, and computationally implemented phonological rule testers. Chapter 3 provides a description of the course of following the computer program through the process of underspecifying the Kiswahili phoneme set using the feature set suggested by Archangeli and Pulleyblank (1986). Chapter 4 continues the description of PUCA, discussing the overall program design and considers complement rule formation. Chapter 5 presents the results for both RUT and CUT along with a comparison to the results obtained by Treece (1990). Chapter 6 concludes with a discussion of PUCA's current limitations and the future directions for research and the development of the program.

Palatalization and jers in Modern Russian phonology: An Underspecification approach

Every student of Russian phonology is aware of the importance of palatalization rules, and of the difficulties encountered in any attempt at describing the surfacing of jers: both structuralist and SPE-type analyses have tackled these problems in depth. In the following these topics are revisited, taking advantage of recent theoretical developments in phonology: nonlinear (syllable) theory, underspecification and lexical phonology. It is claimed: that some palatalized consonants are part of the underlying system of Russian and cannot be derived by rule, although most palatalized consonants are derived before front vowels: that there is no underlying /yl/, but only high back nonround [y], a variant of /i/: that jers (i.e., "fleeting" vowels) are not underlying vowels but are underlying segments without a syllable nucleus; and that some (but not all) of the phonological rules involving jers are syllable-based. This new approach, it is argued, describes better than former ones the Russian phonological system as a whole, a system that contains rules which represent the continuum from synchronic (productive) to historical (morphologized).

First, the widely accepted generative view that all palatalized consonants are derived by phonological rule is rejected in favor of the view that palatalized consonants are present underlyingly, but only in some contexts; contextual specification of the feature [-back] in underlying representation is used for these underlying palatalized consonants. Secondly, harkening back to structuralist analyses of Russian but using again the notion of contextual specification, high back /y/ is eliminated from the underlying vowel inventory, and [y] is considered an "allophone" of /i/.

Third, the assumption that jers are vowels is rejected, although they are certainly part of the underlying system: rather, following Levin (1985), they are equated structurally with glides in their lack of an underlying syllable nucleus. Lastly, the structural reinterpretation of jers leads to a reinterpretation of the functioning of jers in phonological rules: the previously postulated generative rules of Jer Lower and Jer Deletion are replaced by the single rule of Jer Vocalization, in which the surfacing of jers is conditioned by syllable structure. It is argued that the present approach is not merely translational (old rules are not just rewritten using a new theoretical apparatus), but makes different generalizations that allow for a better understanding of the role of jer and palatalization phenomena in the phonological system of Russian as a whole.

The interpretation of functional relations

This thesis deals with the representation of the functional relations such as agent, instrument, source and so on that are assigned to the various participants in a situation. It can be viewed as an investigation of that conceptual knowledge which defines what is and what is not a conceivable situation and how such knowledge is applied in the interpretation of natural language utterances.

The main body of the study concerns two interrelated topics. First, it contains a discussion of those functional relations that are the most likely to have universal application in the conceptual representation of situations. This discussion includes a concise definition of each of the functional relations proposed as well as a number of examples demonstrating the range of situations that it is intended to cover. Second, there is a description of the way in which this class of knowledge contributes to the interpretation of natural language utterances. The approach requires that a distinction be made between the literal interpretation of an utterance and its ultimate interpretation. Functional structure directly determines the former interpretation. However, the literal interpretation may be incomplete or ill-formed and, as a result, further processing on the basis of domain specific kinds of knowledge is required.

The general approach differs from others in that functional structure is viewed as but one of various levels or components of conceptual knowledge that affect both the form of linguistic expressions as well as the complexity of their associated conceptual representations. This enriched representation allows for directed inferencing with respect to particular domains of knowledge.
Our purpose in this thesis is to provide an explicit and formal synchronic characterization of the sound system of Modern Standard (Literary) Ukrainian (MLU). We intend to supply a large part of the phonological component of the generative grammar of MLU.

The plan of presentation usually followed by earlier Ukrainian phonologists has been the following: 1) analysis of the underlying vowel system of MLU, 2) examination of the various vowel alternations, 3) analysis of the underlying consonantal system of MLU, and 4) examination of various consonantal alternations. The procedure of discussing vowel alternations and consonantal alternations separately has evidently been successful in the respect that the reader can follow this presentation more easily than one in which vowel and consonantal alternations are mixed. Since we intend to review critically the analyses of earlier phonologists, it would aid our presentation to follow closely the plan of these works. We will therefore adopt the traditional separation of vowel from consonantal alternations in this thesis.

Therefore, in Chapter II we will examine earlier accounts of the underlying vowel system of MLU, then examine several vowel alternations in order to test the adequacy of the traditional vowel system, and finally, make any innovations in the system deemed necessary on the basis of the vowel alternations studied. In Chapter III, we will continue analysis of the vowel alternations discussed in Chapter II, offer our analysis of the vowel alternations discussed in Chapter II, offer our analyses of these alternations, and then examine other vowel alternations found in MLU. In Chapter IV, we will review the underlying consonantal systems posited for MLU and then examine consonantal alternations in the attempt to determine if any of the underlying systems posited by earlier analysts are adequate. In Chapter V, we will discuss certain alternations not discussed in earlier chapters, and make any revisions in analysis which are necessary. In Chapter VI, we will discuss problems in analysis for which we have no satisfactory explanation, or for which a better analysis than ours seems likely. In Chapter VII, we will discuss certain historical-comparative matters based upon the rules which we have motivated in the preceding chapters.

In this dissertation a number of phonological phenomena of Osmanli Turkish will be hauled over the coals, as it were. In some cases we will formulate rules for processes for which this has not been done; in others we will argue for revisions of rules that have previously been formulated. We shall see in some cases that the recent revisions in phonological theory have very desirable results in compelling us to rewrite certain rules in such a way that the insight into the workings of the language is more adequately reflected than in the old formulations. In one or two cases, on the other hand, it may turn out that the theoretical revisions have less desirable consequences. In still other cases it will be seen that no theory of phonology
seems to reflect what is going on, and, where possible, we will suggest remedies. The main drift of the thesis can be summarized here rather briefly — we will show that the first vowels of words behave rather strangely with respect to a number of different rules — rules which at first glance would not seem to have much in common with each other. We shall claim that this phenomenon cries for explanation, and we shall hypothesize that an abstract stress rule should be postulated to account for the strange behavior mentioned, and finally, shall adduce some evidence to suggest that this abstract stress rule is not just an artifact of an earlier stage of the language but has also some psychological reality for modern Turks.

_A transformational treatment of Indian English syntax_

This study will attempt to show some of the areas of syntactic deviancy in Indian English. The corpus of this study was taken from the files of the Division of English as a Second Language at the University of Illinois. The compositions of two hundred Hindi speakers who took the test in the twelve year period from September 1954 to January 1966 were analyzed for syntactically deviant sentences which, when found, were put on index cards for further analysis. Each paper had been corrected by two members of the Division at the time of the test, so the judgements about deviancy were not just the writer’s. The two hundred papers yielded almost five hundred syntactically deviant sentences for analysis. These sentences excluded obvious transfers from Hindi, such as the ordering of the adverbs of place and time, which is place-time in English and time-place in Hindi. Only those sentences whose deviancy could not be explained on the basis of obvious transfer make up the corpus.

The deviant sentences found in the corpus were analyzed following the system of transformational grammar proposed by Noam Chomsky in _Syntactic Structures_ and refined in this 1965 book, _Aspects of the Theory of Syntax_. The purpose of the analysis and, in fact, the purpose of this study is to show that syntactic deviancy in the writing and probably in the speech of second language learners occurs on the transformational level and not on the phrase structure level. Speech is included with the writing here, even though the corpus does not include the spoken language, because it is closely associated with writing and second language learners tend to write what they say.

The second chapter of this study is devoted to an analysis of selected samples sentences from the corpus in the attempt to prove that syntactic deviancy is the result of the misapplication of obligatory or optional transformations of the non-application of an obligatory transformation. It is not the purpose of this study to propose new areas of transformational analysis, or to formulate transformational rules, though this is necessary to prove the thesis of this study from time to time. When new rules are proposed, they are formulated in a tentative manner, and to account specifically for the syntactic deviancy under consideration.

The third chapter of this study is devoted to a contrastive analysis of certain selected structures to further show that the area of syntactic deviancy is on the transformational level and not on the phrase structure level. This section will necessarily be limited as the writer is not a fluent Hindi speaker.
Yamuna Kachru's *An Introduction to Hindi Syntax* will be used as the main source for Hindi syntax.

*Pragmatics and grammatical descriptions*

The goal of the dissertation is to argue for the recent position that strictly distinguishes between grammar and pragmatics and discuss its consequences. By now it is clear that "raw" linguistic data contain many pragmatic elements. Whether they are speech act properties, implicatures, beliefs and intentions of the speech participants, or what not. In analyzing such data linguists, in my view, are constantly faced with two problems: one is how to distinguish pragmatic matters from purely grammatical aspects of the data, and the other is what to do with such pragmatic elements. The second problem has to do with a proper conceptualization of the relationship between pragmatics and grammar. In particular, linguists must have a clear conception as to what the proper domain of each field is, and what the exact nature of the mode of their interaction is. This is, in my opinion, one of the outstandingly important empirical issues in current theoretical linguistics.

The first problem concerns ways of determining, in a given situation, what is pragmatic and what is grammatical. If one decides to take the position that denies the heterogeneous nature of raw linguistic data, this problem will not arise at all. I will argue, however, that such a position cannot be seriously maintained.

These are the two major issues this study addresses. The arguments in the body of the thesis will take the form of analyses or reanalyses of some problematic phenomena in Japanese and English where one's position on the above issues will have a serious effect on resulting grammatical descriptions of the phenomena. The highly controversial areas of Japanese grammar, i.e. passives and causatives, issues concerning honorifics and politeness in general, and an analysis of the English complement-taking verb *have* are some of the major descriptive issues taken up in this study. In each case, it will be shown that the position being argued for can provide solutions to the controversies and/or lead to what seems to be the optimal over-all descriptions.

*Have and the perfect in English*

The present study is a contribution to the analysis of the relationship between *have* and the copula in English. The thesis is that *have* appears on the surface as the result of a transformation. This transformation parallels passivization and operates on structures that would otherwise yield the copula. The analysis of several types of sentences containing *have* as Main Verb leads to a consideration of the periphrastic perfect. It also leads to the discovery that static and non-static uses of *have* are frequently distinguished by the presence of Tense in the deep structure in a different sentence from that containing *have* or in the same sentence. It appears that no static or Habitual is generated with Tense.
The analysis presented here is limited to reduplicating types (The table has a book on it), possessives (John has a book), and the periphrastic perfect (John has written his book). Even within these limitations, it has not been possible to avoid certain issues for which no resolutions can be proposed here.

Tonal analysis of Senufo: Sucite dialect

Sucite, a Senufo language of the Gur language group, is spoken in southwestern Burkina Faso. Its tonal system of three level tones and several contour tones exhibits a considerable number of complex alternations.

This dissertation provides a descriptive analysis of the tonal alternations in Sucite. With the help of the autosegmental approach and Clements (1981) system of tone features, we propose a double tiered approach to tonal analysis in the attempt to analyze the behaviour of the various types of Mid tone found in the language.

The dissertation consists of an introduction and six chapters. In Chapter 1, we provide a brief description of the sound system, the morphology, and syntax of Sucite. Chapter 2 describes the tone and morphology of the verb and introduces the concept of two tiers for tonal analysis. The discussion of noun tone and morphology in Chapter 3 brings to light the need to re-examine the accepted universal of associating tones to segments from left to right. Chapter 4 is a description and analysis of the tonal behaviour of verbs and verbal particles when preceded by nominal and verbal elements of various tones. In Chapter 5, we examine how the nominal elements affect each other tonally within a noun phrase. Both tonal behaviour across word boundaries and tonal alternations within complex nouns are examined and analyzed with the use of the double-tiered approach. In particular, this chapter highlights the need for several different types of underlying representations for Mid tone. Chapter 6 discusses the tonal behaviour of the adverb phrase, question formation, and the noun class clitic, the latter of which poses special analytical problems. Finally, the ordering of the tonal rules presented in the thesis is discussed.

Some aspects of verb phrase adverbials in English

This thesis will attempt to provide a syntactic analysis according to a specific model of transformational-generative grammar of a subset of the constructions which traditional grammarians have grouped together under the term "adverb" or "adverbial." Although I will actually consider only a few kinds of adverbial constructions — locatives, instantaive and frame adverbials, and durative, instrumental, and manner adverbials — it is hoped that some of the generalizations made about these adverbials will carry over to other types.

The model of transformational grammar which I will be working with considers both superficial adjectives and superficial adverbials to be represented in deep structure as predicates. in the same way that superficial verb phrases are represented. Other models of transformational grammar make claims about the deep-structure constituency of superficial adjectives and adverbials which are quite similar to the claims made about their structure by traditional grammar that adjectives and adverbials are distinct
deep-structure categories fundamentally different from those elements that are verbs in surface structure. In these models, the semantic similarities among verbs, adjectives, and adverbs must be spelled out by interpretive semantic rules; on the other hand, the model which has been adopted here, in which the deep structure assigned to sentences are far more abstract than those assigned by models utilizing semantic interpretation rules, spells out these similarities in deep structure, specifically in the initial phrase marker which is the semantic representation of the sentence.

The abstract model, which I will refer to as "generative semantics," has been developed in recent word by Ross, Lakoff, McCawley and others. My intention is to show that the facts about the semantic content and syntactic behavior of adverbials can be handled more consistently and more insightfully within the model of generative semantics, where adverbials and adjectives, as well as other "modifying" elements, such as negatives and quantifiers, are represented in the deep-structure phrase marker as verbs. In the following chapters I will give an analysis of adverbial phrases showing that it is necessary to relate place, time, manner, and instrumental adverbials to verb phrases synchronically.

Parsing and generation of Unification grammars

In this dissertation, it is shown that declarative, feature-based, unification grammars can be used for efficiently both parsing and generation. It is also shown that radically different algorithms are not needed for these two modes of processing. Given this similarity between parsing and generation, it will be easier to maintain consistency between input and output in interactive natural language interfaces. A Prolog implementation of the unification-based parser and DAG unifier is provided. The DAG unifier includes extension to handle disjunction and negation.

The parser presented in this thesis is based on Stuart Schieber's extensions of Earley's algorithm. This algorithm is further extended in order to incorporate traces and compound lexical items. Also, the algorithm is optimized by performing the subsumption test on restricted DAGs rather than on the full DAGs that are kept in the chart. Since the subsumption test can be very time consuming, this is a significant optimization, particularly for grammars with a considerable number of (nearly) left recursive rules. A grammar which handles quantifier scoping is presented as an example of such a grammar.

For generation, the algorithm is modified in order to optimize the use of both top-down and bottom-up information. Sufficient top-down information is ensured by modifying the restriction procedure so that semantic information is not lost. Sufficient bottom-up information is ensured by making the algorithm head-driven. Generation also requires that the chart be modified so that identical phrases are not generated at different string positions. It is shown how readjustments to the chart can be made whenever a duplicate phrase is predicted. The generator in this thesis does not perform equally well with all types of grammars. Grammars employing type raising may cause the generator to go into an unconstrained search. However, given the independently motivated principles of minimal type assignment and type raising only as needed, it is shown how such unconstrained searches can be avoided.
Finally, suggestions are made as to how unification grammars can be developed in order to handle difficult problems such as partially free word order, bound variables for semantic interpretation and resolving feature clashes in agreement.

Sound change in Farmer City: A sociolinguistic study based on acoustic data

This dissertation reports the findings of a survey of the dialect of Farmer City, Illinois, involving spectrographic analysis of the recorded speech of a sample of 40 individuals from two opposing teenage peer groups and two older generations. A group of 7 speakers from three generations of a family from Somerset, Kentucky, is also included in the sample in order to help determine the influence of the Kentucky dialect on the speech of Farmer City. Migration patterns suggest that such influence could be strong.

The data collected in Farmer City and Somerset were analyzed spectrographically and used to construct a representation of the phonemic system of each speaker in the two-formant acoustic space. These charts serve as a basis for comparison from a sociolinguistic point of view and for the identification of a major systemic phonological change in progress. The facts concerning this change, that of the generalization of /uw/-fronting to other back vowels, are examined in light of the predictions made by several current theories of sound change. A basic orientation to sound change theory is provided in a chapter that surveys the history of the field from the Neogrammarians in the nineteenth century to the present-day lexical diffusionists.

The detailed data analyses and sociolinguistic correlations are preceded by chapters devoted to methodological considerations. The techniques used to identify and interview the 20 members of the two teenage peer groups are outlined in the first chapter on methodology. The social polarization between these groups, as illustrated in a sociometric diagram, is based on an attitudinal difference: one group (the 'rednecks') is oriented towards academics and sports; the other (the 'burnouts') is known for a marked disinterest in most aspects of the school as well as for an alleged involvement with drugs. The unambiguous nature of this social division is supported by an appendix of interviews, in which members of both groups discuss their feelings concerning the social structure of the school. As expected, these social distinctions are reflected in differences in the speakers' phonological systems and in their participation in ongoing sound changes.

After a review of the procedures following in recording, analyzing, and charting the data, the issue of the acoustic variability of phonemic systems is considered in detail. It is concluded that the size and shape of the phonemic system in two-formant acoustic space varies from speaker to speaker as a function of fundamental frequency and social forces (both determining articulatory setting) as well as of the invariant characteristics of the vocal tract. An understanding of the causes and consequences of acoustic variability is crucial when spectrographic data are to be used for dialectological research.

Aspects of acoustic variability are reconsidered in an additional chapter in which the relationship between articulatory setting and sound change is explored. A consideration of the socially-determined articulatory setting
characteristic of each peer group proved helpful in understanding at least one aspect of their phonemic systems.

The most important ongoing sound change observed in Farmer City has provided an example of how a dialect in the path of a sound change may incorporate that change into its phonological system in novel ways. /uw/-fronting is a characteristic of many Southern and South Midland dialects, but the younger generations have generalized this feature to several other back vowels. This has given their vocalic systems a unique collapsed appearance that is found neither in the older generations of Farmer City nor in the Kentucky speakers.

Finally, it is noted that the sound changes documented in Farmer City exhibits the rule-governed behavior with respect to conditioning environments that is predicted by the variable rule theory of William Labov; no evidence for random decomposition of word classes or 'lexical diffusion' was observed.

An integrated analysis of the Hindi tense and aspect system

The genesis of this dissertation was a proposed attempt to isolate and codify the presuppositions associated with various forms in the tense and aspect system of Hindi. The articles which gave impetus to this proposal are cited briefly in Chapter II (e.g. Fillmore 1971, Lakoff 1971, etc.). Having made the decision the next step was to find a thorough analysis of the system of tense and aspect with a principled inventory of the forms contained therein. The search for such an analysis was long and, for the most part, fruitless. At the same time, dissertations and articles were appearing which questioned the nature, representation, and viability of the notion 'presupposition' (e.g. Morgan 1973, Rosenberg 1975). As a result of these influences, the analysis presented below was made to fill the vacuum.

In this dissertation certain inadequacies of both traditional and modern treatments of the Hindi tense and aspect system are cited. Several works dealing with English tense are reviewed and compared. Two descriptive models are developed to analyze the tense and aspect systems of Hindi. The first isolates elements of form and units of meaning and shows that meaning form correspondences are quite systematic. The second uses a time-line device to illustrate graphically the meanings associated with the three aspects of the Hindi verb — imperfect, perfect, and progressive.

The question of tense and aspect has generated a tremendous volume of response in linguistic literature. Only a very limited number of articles dealing with the complexities of time reference have been reviewed here. Chapter II treats several of these, ranging from a descriptive account of the chronological system of the English verb (Diver 1963) to the generative-semantic account of McCawley (1971).

The third chapter presents an overview of the tense and aspect system of Hindi. The descriptive method used by Diver (1963) is modified and applied to Hindi data in Chapter IV. In Chapter V the account of tense presented in Reichenbach (1966) is discussed. This chapter is primarily concerned with tense usage in simple sentences but deals with complex sentences in those cases where a given configuration can only be so expressed. Chapter VI
extends the notion of transcription further to account for all complex sentence tense behavior. The important claims made and their basis are presented in summary in Chapter VII. Suggestions for further research are presented here as well.

*Problems and issues in the phonology of Lebanese Arabic*

This study is both exploratory and analytic in nature. In other words, it attempts to discuss issues in the phonology of LA, which though distinct from each other, share the common factor of being rarely dealt with in the literature. The thesis is divided into four chapters.

Chapter I discusses three of the most productive rules in the language: Stress Assignment, Syncope and Epenthesis. It compares a segmental and a metrical analysis of these rules, and discusses their ordering. In addition, it deals with various related issues of general interest to the linguist. Among these is the question of "sonority", its role in the organization of the syllable, and its interaction with Epenthesis and Assimilation.

Chapter II provides the first attempt at analyzing the verbal system of a modern Arabic dialect within the framework of McCarthy's (1979) Prosodic Theory. Apart from this goal, the present chapter investigates and confirms the tri-directional affinity among vowel melody, transitivity, and the perfect-imperfect correspondences. For the purposes of this chapter, the writer has compiled a complete list of all the available strong and defective triradical verbs.

Chapter III presents the first attempt at exploring the application of rules on the phrasal level in Arabic. It is divided into three sections. Dealing with the word-level, section 3.1. gives a detailed analysis of the anomalous behavior of the feminine suffix in nouns, adjectives, and perfect verbs. Arguments are presented to show that the underlying structure of this suffix is *-/it/*. It is concluded that in order to understand the behavior of this morpheme, it is necessary to retrieve grammatical information about the stem of the word.

The same conclusion is reached in the next two sections, both of which deal with the phrasal level. In section 3.2, three types of phrases shared by most Lebanese speakers are discussed. These are feminine constructs, prepositional phrases, and definitive relative clauses. In section 3.3, data from eight Lebanese informants are analyzed, and it is shown that in spite of the variability they display, each pattern is governed by a natural and well-constructed grammar. This variability is shown not to be of the sociolinguistic type, and the proposal is made that it may be the outcome of two cognitive styles. The first is related to "tolerance of ambiguity", and the second to "field dependence-independence".

Chapter IV discusses the issue of the neutralization of contrast between */i/ and */u/* in LA. An attempt is made to study the phonetic distribution of these two vowels, and the proposal is made that all instances of */u/* are derived from */i/* by rule. This thereby reduces the phonemic inventory of the vowel system in the language into five vowels: */i/*, */u/*, */ii/*, and */uu/*.
ke-Constructions in Persian: Descriptive and theoretical aspects

In view of the last two decades of developments in linguistic theory, particularly in the United States, it might perhaps seem out of place to assert that this project assumes a generative transformational framework. But ever since its inception in 1957 (Chomsky, 1957), transformational theory has witnessed so many revisions, expansions, extensions, and bifurcations that it makes the choice of any one proposal over the other competing theories very difficult, if not impossible. This difficulty is simply due to the fact that any preference will inevitably raise a great deal of controversial issues requiring empirical justifications which go far beyond the scope of this study.

To evade the controversial issues and make the work feasible, therefore, I have arbitrarily decided to start out with Chomsky (1965) as a general frame of reference along with some other proposals for its expansion. Some of the most important concomitant assumptions of this theoretical framework which underlie this study are very briefly the following.

A. Every sentence of a language has a surface structure and a deep structure, both of which may be represented by node-labelled trees (Green, 1974).

B. Sentences with different meanings have different deep structures.

C. A grammar has four systems of rules:
   i) A system of Phrase Structure (PS) Rules, which generate possible deep structures;
   ii) A system of Lexical Insertion (LI) Rules, which map lexical materials onto the outputs of PS Rules, deriving "deep structures" of sentences;
   iii) A system of Transformational (T) Rules, which map "deep structures," through intermediate stages, onto their "surface syntactic structures;" and
   iv) A system of Phonological (P) Rules, which relate the surface syntactic structures, through intermediate stages, onto their "surface phonetic representations."

D. A grammar has a Lexicon that supplies all the idiosyncratic information regarding the lexical items in terms of their phonetic phonological, syntactic, and semantic properties.

E. In addition to PS-Rules, LI-Rules, T-Rules, and P-Rules, defining well-formedness conditions on successive stages of derivations, linguistic theory also requires constraints on deep structures (Perlmutter, 1971), constraints on derivations (Ross, 1967; Postal, 1971; G. Lakoff, 1969, 1970b, 1971; etc.), and constraints on surface structures (Ross, 1967; Perlmutter, 1971).

F. And finally linguistic theory must ultimately aim for explanatory adequacy, i.e., it must provide a principled basis, independent of any particular language, for the selection of descriptively adequate grammar of each language (Chomsky, 1964, 1965).

In light of these theoretical assumptions, I propose to investigate some descriptive and theoretical aspects of Modern Standard Persian syntax.
The problem addressed here is that of giving a well motivated, coherent, and explicit account of the syntactic capabilities of the speakers of Zürítutsch to construct and interpret sentences containing verbal complements. Verbal complements are viewed as those nonadverbal sentential structures in terms of which verbs are subcategorized. The topic approached in terms of the structure of Zürítutsch itself and not primarily as a topic in the contrastive analysis of Zürítutsch and standard German. The topic is treated in two chapters, Chapter II and Chapter III. Chapter II is concerned with the underlying structures of the base which must be posited in order to explain the relevant capabilities of Zürítutsch speakers. Chapter III is concerned with the transformations required for the mapping of these base structures onto their corresponding surface structures. The base phrase markers are required as input by the semantic component. The phrase markers of the surface structure are required as input by the phonological component. Neither of these interpretive components will be dealt with in this study.

Inasmuch as the writer is not himself a fluent speaker of Zürítutsch, all of the evidence to be presented here concerning the language was gained through work with an informant. Examples taken from written sources were checked with an informant before being presented as grammatical Zürítutsch. The principal informant was the writer’s wife, Margrit Kuster Hale.

In this thesis, I defend Noam Chomsky’s transformational account of “John is easy to please”. Then, in light of an analysis of “John is an easy man to please”, based on the infinitival relative, I propose a speculative historical hypothesis concerning the origins of “John is easy to please”. In addition, I attempt to explain the lexical government of object-shift and to account for the synchronic occurrence of such sentences as “John is too smart to fool” and “John is stupid enough to be fooled”. In general, the emphasis is placed on attempting to account for the occurrence of complex syntax, in particular, the permuted structure found in “John is easy to please”.

This thesis discusses in some detail the phonology of Sudanese Colloquial Arabic. It attempts for the first time to present a thoroughly precise descriptive analysis to the most prominent phenomena of the phonology of this language under the recently developed approaches in the field of phonological theory and shows the adequacy of these approaches in generating the phonology of this particular dialect of Arabic.

It is concluded that besides utilizing the technical devices available under the traditional approaches, the devices introduced by the recently developed approaches can be utilized in a very efficient way.
This thesis consists of an introduction and six chapters. In the introduction the main features of the study as well as its theoretical framework are set forth.

Chapter 1 is devoted to some observations on the historical development that has some significant consequences to the synchronic analysis which is the major concern of the study.

Chapter 2 deals with stress assignment in Sudanese Colloquial Arabic within two different perspectives; segmental and metrical and shows the merits of both.

Chapter 3 discusses the inflectional phonology in great detail and states a number of phonological rules to account for different processes arising from the juxtaposition of morphemes.

Chapter 4 discusses syncope as a phrasal rule and shows its operation across boundaries as well its nature as a rule sensitive to certain syntactic structures.

Chapter 5 deals with the assimilation processes within the word and across word boundaries, indicating that these processes represent one of the characteristics of Sudanese Colloquial Arabic and belong to the post-lexical portion of the grammar.

Chapter 6 discusses the morphology of the verb in Sudanese Colloquial Arabic showing the way whereby different verbal forms are derived and accounts for the morphophonological processes involved in that derivation.

Transfer of the knowledge of Chinese characters to Japanese

Unlike many European languages, Japanese orthographic system is complex, consisting of three types of scripts used to serve different functions in a text. In particular, a great deal of efforts and time are spent on teaching kanji (Chinese characters) to both native and non-native speakers of Japanese. For instance, average Japanese children spend more than ten years learning kanji to achieve functional literacy (Ishii, 1967). Since kanji are used for content words in Japanese, many researchers and educators believe that knowing more kanji entails better comprehension, and that the native speakers of Chinese should be able to read Japanese better than those whose native language do not have Chinese characters (Ezoe, 1985; Takebe, 1988).

This dissertation examined the validity of such belief and investigated the way in which knowledge of Chinese characters is transferred to processing Japanese. A series of tests of kanji, grammar and reading in Japanese which did or did not contain kanji were given to native speakers of Chinese and those of English. The results showed that Chinese speakers transferred their knowledge of kanji significantly in the tests of kanji and reading but not in the tests of grammar. Also, the influence of the native language was not a very strong factor in the reading tests. Furthermore, the results suggested that the contribution of the knowledge of kanji might vary depending on proficiency.

Linguistics and the structural analysis of literary texts

This is a programmatic study in the admittedly controversial area of the application of linguistics to the analysis of literary texts. The study is divided into two parts: Part I, the major part, consists of a review and critical evaluation of past work in this area. The aim is to explore systematically an area that is primarily noted for its lack of system, or well-defined boundaries and agreed upon goals and limitations. Part II represents an attempt to integrate and build upon this work in order to achieve an adequate means of analyzing short stories. Since prose fiction has been relatively neglected by linguists interested in literary analysis, the analytic technique proposed in Part II has certain limited claims to novelty. The technique is illustrated by being applied to William Faulkner's "A Rose for Emily."

The review in Part I is by no means an exhaustive treatment of linguistic approaches to literary analysis. This would be a monumental task since this general topic subsumes a wide range of activities. The attempt is made, however, to present a rather complete review of work in one specific, well-defined area. The essential purpose of this introductory chapter is to delimit exactly the specific topic of this study.

The technique for analyzing short stories proposed in Part II of this study involves a radical extension of linguistics in certain respects. Here linguistics is utilized as a model: extension is thus a matter of reasoning by analogy. The position taken is in essential congruence with A. A. Hill's who has written, "My position is that linguistic analysis forms a good analog for literary analysis, that many of the problems of both types of activity are similar, and that it would be as short-sighted to deny the similarities as it would to deny the inevitable differences."

Non-nominative subject constructions in the Government and Binding framework

This study is an investigation of the principles required to account for the behavior of non-nominative subjects in the Government and Binding framework, a version of the Extended Standard Theory. Non-nominative subjects are NPs which are not case marked with nominative case and which do not trigger subject verb agreement. These NPs, however, may share certain syntactic properties with nominative subjects. It is shown that in the Government and Binding framework the principles and theories which distinguish between subjects and non-subjects require an analysis in which the non-nominatives are subjects in certain components and non-subjects in others. In Imbabura Quechua, the language analyzed in greatest detail in this thesis, non-nominative desideratives are treated as subjects by the binding principles, the theory of control and the ECP. In other languages, such as Huanca Quechua, non-nominatives are treated as subjects only by the ECP, but not by the binding principles or by the theory of control.

An analysis is suggested to account for this variability. It is proposed that these nominatives be generated as D-structure objects and reanalyzed (by Move-alpha) as subjects on the right-hand side of the grammar. This analysis is
generalized to other languages, such as Kannada, Modern Hebrew and Italian. A variety of changes in the framework are proposed. The division of the right-hand side of the grammar into two components, a binding component and an LF component is motivated.

The acquisition of English restrictive relative clauses by native speakers of Arabic

Keenan and Comrie (1972) described a hierarchy of relative clause types observed in natural languages. These were: subject, direct object, indirect object, object of a preposition, possessor NP, and object of a comparative particle. If a language allows relativization at a given point on the hierarchy, it also allows relativization on all preceding positions on the hierarchy. English and Arabic allow relativization on all positions of the hierarchy.

Multiple choice tests of comprehension of English restrictive relative clauses were given to two groups from the Royal Saudi Air Force. The sentences that were tested had the matrix NP in subject and object position and the subordinated NP in the positions on the hierarchy. Fourteen sentence types were tested.

Three hypotheses examined by Sheldon (1974) were examined to determine their importance for second language learners: interruption, word order, and parallel function. The sentence types were examined to discover which types posed problems for the subjects. Errors were accounted for by the subjects' use of various strategies for processing the sentences. For relative clause sentences as a whole, interruption, word order, and parallel function were significant factors. Possessive relative sentences were significantly harder to process than non-possessives. Within the set of possessive sentences, only word order was significant.

Strategies of Adjacency. First NP Subject were observed. Other strategies and alternatives are presented to account for systemic errors.

A non-linear hierarchy of difficulty is proposed based on sentence type and what the subjects were asked to identify. The hierarchy proceeds from easy to hard:

1. Identify Matrix Object
2. Identify Subordinate Subject
   a. one NP before verb
   b. two NPs before verb
   c. more than two NPs before verb
      (1) non-possessive
      (2) possessive
3. Identify Matrix Subject
   a. non-interrupted
   b. interrupted
      (1) non-possessive
      (2) possessive
4. Identify Subordinate Object
   a. maintained word order
   b. rearranged word order
The phonology of Arabic: Bani Hassan — A Bedouin Jordanian dialect

This thesis is devoted to the study of selective phonological aspects of Arabic phonology in general and Bani Hassan dialect in particular. Basically, an analysis of the phonological rules that are most often presented in general analysis of Arabic phonology, both on the lexical level and on the phrasal level is given, while we attempt to investigate the important issues that characterize the Bedouin dialects in general and Bani Hassan Arabic in particular.

The following notes will give a general overview of the organization of this study. Chapter 1 presents the basic aspects of the language. Chapter 2 examines the lexical rules that apply inside the lexicon through the course of word formation. It has been shown that most of these rules are cyclic, structure preserving and may be sensitive to the properties of individual words. Chapter 3 deals with the relatively more complicated phonology that operates at the phrasal level. The rules that are discussed in this chapter apply across word boundaries; they may introduce new structures ad segments not found in the basic inventory of segments and finally, they should be without lexical exceptions.

Grammatical relations in Imbabura Quechua

This thesis examines certain aspects of the syntactic structure of Imbabura Quechua within the framework of relational grammar. Specifically, it examines the grammatical relations borne by nominals in the following syntactic constructions: passive, dative movement, ascensions out of sentential subjects and sentential objects, subject inversion, direct object advancement in unaccusative clauses, and causative clause union. The analysis of these constructions presented in this study provides support for the theory of relational grammar and for the more central of the universal laws of relational grammar.

The analysis of passive and ascensions out of sentential subjects and sentential objects provides support for the use of constrained variables to represent the candidate relation of relational rules. The examination of ascensions in Imbabura Quechua also provides support for the claim that certain initially intransitive clauses have direct objects but no subjects (Perlmutter 1978).

An examination of the inversion construction in Imbabura Quechua provides evidence for the inversion of subject nominals to indirect object, although an inverted subject always occurs as a direct object. The interaction of inversion and other rules shows that in Imbabura Quechua a nominal can passivize in an inversion clause. This is a counter-example to the claim in Perlmutter (1978) that inversion clauses do not allow passive and always involve the advancement of a direct object to subject in an unaccusative stratum.
The analysis of causative clause union constructions in Imbabura Quechua presented in this thesis suggests that the principles determining the syntactic structure of causative clause union constructions are not entirely understood.

Toward a theory of relationally-based grammar

This dissertation attempts to justify incorporating grammatical relations as primitives into linguistic theory and to motivate the development of a relationally-based theory, that is, a theory of grammar in which a significant number of rules and constraints are based directly on the notion of grammatical relations such as 'subject-of' and 'direct-object-of.' Theories are, as much as anything else, 'tools for investigation and communication' and hence must be judged in part by the questions they lead one to ask. To the extent that the observations and questions brought out in this study are deemed interesting and valuable, this approach will be justified in at least this one respect. At this stage of our metalinguistic knowledge, little more can be asked of any linguistic theory — after all, the major contribution of transformational grammar could well be judged in the future to be that it inspired new questions and observations — questions and observations that must be answered and explained by some totally unknown theory of language still over the horizon. This thesis, then, can be looked upon as an effort to free oneself from the conventional attitude regarding rules and grammatical relations — in the hope of uncovering new facts, raising new questions, and constructing valid generalizations that will lead, ultimately, to a deeper understanding of the nature of human language.

This basic plan of the work is as follows. Chapter II is an evaluation of the standard transformational approaches to defining grammatical relations. Chapter III develops certain definitions and notation that will prove useful throughout the rest of the study. In addition, as already mentioned, a brief outline of a possible theory of relationally-based grammar is given. The remaining two chapters are, for the most part, independent of the theory sketched in Chapter III. The focus of Chapter IV is on evidence that supports the contention that grammatical relations are central to the formulation and application or rules at other than deep-structure levels and that a universal characterization of grammatical relations is needed at relatively superficial levels of the grammar. This chapter also introduces certain complications, problems and conjectures concerning the phenomenon of 'Ergativity' — problems and complications that must be handled by any adequate linguistic theory but are not by any of the existing ones. Chapter V discusses a number of topics including the relationship of cyclicity, globality and other parameters to the property of the relation-changingness of a rule. Relation-changing rules are classified in various ways in a search for meaningful regularities. The final chapter is a brief summary and conclusion.
Studies in the Linguistic Sciences 22:2 (Fall 1992)

Wolof phonology and morphology: A non-linear approach

The object of this study is Wolof, an African language belonging to the Northern West Atlantic branch of the Niger-Congo family. Wolof is spoken primarily in Senegambia, where it has become a lingua franca. The purpose of the thesis is to provide an analysis of the phonology and morphology of the language using the non-linear framework. In Wolof, such notions as vowel length, complex segments, permissible syllable, and permissible syllable play a significant role in the description of many aspects of Wolof phonology (syllable structure, gemination and degemination, presenatalization, vowel coalescence, vowel insertion, glide insertion, vowel harmony reduplication processes, and stress assignment). Nonlinear representation of phonological structure provide a way to account in a satisfactory fashion for these processes.

The thesis is divided into six chapters. The first chapter sets the stage by giving an overall presentation of Wolof phonology and morphology and by sketching the main characteristics of the non-linear framework. Chapter 2 is devoted to syllable structure, in particular the syllabification principles of the language, the levels of assignment, and the treatment of complex segments such as long vowels, geminates, and prenasalized consonants. Chapter 3 gives an exhaustive account of vowel harmony in Wolof, emphasizing the existence of neutral and opaque vowels, and describing vowel harmony as an external sandhi rule.

Chapter 4 analyzes other phonological rules such as gemination, degemination, vowel coalescence, vowel and glide insertions, and their relationship with syllable structure. Chapter 5 accounts for reduplication in non-linear terms, positing the existence of a morpheme template and describing the relations between reduplication and other word formation processes such as suffixation and nasal prefixation. The sixth and final chapter discusses stress assignment using a metrical approach and the different parameters proposed by Hayes (1981).

Code-mixing across languages: Structure, functions, and constraints

In recent years researchers have investigated code-mixing from three perspectives: psycholinguistic, syntactic, and functional. This study is concerned mainly with the functional use and syntactic structure of code-mixing (CM) across cultures and languages. From a functional point of view, the study attempts to determine why bilingual speakers often engage in CM when they interact with other bilinguals with whom they share the same linguistic repertoire. From a syntactic point of view the study attempts to determine whether there are universal constraints on CM. And, if there are, why it is that the proposed universal constraints often prove vulnerable in light of new data.

In an attempt to address these issues the study provides first a cross-cultural and cross-linguistic typology of CM based on the three perspectives mentioned, with a focus on the functional and syntactic perspectives. Functionally, it is found that bilingual speakers mix the languages available to
them for various communicative purposes, such as marking social class identity, education, and modernization. The use of CM to achieve functions such as these is determined by the cline of bilingualism achieved by the speaker, and by the number of variables in the context of situation, e.g., the topic, the setting, and/or the participants. These conclusions are further supported by a case study of Lingala-French CM. The case study shows that like bilingual speakers in other bilingual communities, functionally Lingala-French code-mixers resort to CM in order to achieve functions such as those mentioned above. Based on these conclusions it is argued that the use of CM in bilingual communities should not be interpreted as symptomatic of linguistic incompetence in one or other of the bilingual's languages, since bilinguals are observed to resort to CM even if the message or information they convey through CM can also be expressed in one language only.

Syntactically, an attempt is made to explain why the proposed constraint on CM are often violated in light of new data. It is found that the data on which most of those constraints are based represent triggered rather than natural or self-occurring code-mixed speech. It is suggested that current methodologies that consist of triggering CM in the speech of bilingual speakers be abandoned, and that constraints be based on code-mixed data drawn from spontaneous conversation between bilinguals in natural settings. In order to determine the rules that govern CM a distinction is made between host language and guest language. It is proposed that CM is governed by a Host Code/Guest Code Principle. This principle says that in a code-mixed discourse involving languages L1 and L2, where L1 is the host code and L2 the guest code, the morphosyntactic rules of L2 must conform to the morphosyntactic rules of L1, the language of the discourse.

A moraic study of some phonological phenomena in English and Korean

The purpose of the study is to present a more satisfactory account of some phonological phenomena in English and Korean by employing the framework of moraic phonology.

In Chapter 1, I review CV phonology and present the representations and the general principles of moraic phonology. I also provide the moraic and syllabic structures in English and Korean.

Chapter 2 discusses the formal representation of ambisyllabic consonants in terms of moraic theory. I claim that the notion of ambisyllability capturing the shared feature of a consonant has a real intuitive appeal and that ambisyllability and gemination are not in complementary distribution among languages; i.e., they should be given different representations. I also show that the moraic representation of ambisyllability makes some better predictions than the CV representation of it (e.g., Clements and Keyser 1983). With the notion of ambisyllability, I reexamine English aspiration and flapping.

In Chapter 3, I deal with various syllable weight-related issues. First, I claim that there are two types of glide formation in Korean; i.e., one that is optional triggers CL, and the other that is obligatory fails to induce CL. Reanalyzing the /I/-deletion processes of Korean, I show that CL in Korean is a mirror image rule. I also provide a reanalysis of the /A/-irregular predicates
in Korean, and assert that not /l/-deletion but Intersonorant /l/-deletion ‘induces CL. The pattern here is ‘VCV \(\rightarrow\) V:C0’. I consider a case of this sort from Middle English. In addition, I discuss some other consonant deletion rules which happen to be related to CL.

Chapter 4 deals with interaction between phonological rules and conditions. First, I reanalyze the so-called CC Shortening in English, claiming that shortening here is the automatic disconnection, due to Structure Preservation, of part of the long vowel, which occurs with the incorporation of the consonant into the syllable. Second, I show that consonant cluster simplification in Korean is directly related to the moraic structure and the ‘morified’ syllabification process. Finally, I claim that no explicit orderings among some phonological rules need be specified in the grammar, for they are predictable by universal and language-particular principles.

In Chapter 5, I provide a brief overview of the thesis and discuss some of the implication for linguistic theory.

Phonology of consonant-vowel interaction: With special reference to Korean and Dependency Phonology

This dissertation is a search for a more satisfactory explanation for various consonant-vowel interaction phenomena. The theoretical framework best suited for this purpose is judged to be Dependency Phonology (Anderson & Ewen 1987.) Dependency Phonology assumes that a dependency relation holds in every module of grammar, i.e. from the internal structure of a segment to a syntactic structure. This idea is desirable by virtue of its simplicity, consistency, and versatility.

In the first chapter, two current representational systems, i.e. Underspecification and Feature Geometry, are reviewed and it is shown that these frameworks are not quite adequate in explaining the consonant-vowel interaction phenomena.

In Chapter 2, I present some basic principles and representations of DP. In order to improve the representation of phonological rules, I adopt a theory of underspecification and a convention of spreading. The former is done by removing the articulatory gesture and the latter, by spreading components instead of features. In the final section, a syllable structure of Korean in the DP framework is suggested.

In Chapter 3, four phonological processes which involve consonant-vowel interaction are explored. They are Palatalization, Labialization, Umlaut, and Consonant and Vowel Harmony. It is shown that the DP model is better than Feature Geometry in dealing with these phenomena since in DP representations, consonant and vowels share common components which are suitable for representing consonant-vowel interaction phenomena.

In Chapter 4, I deal with Korean word structure and some phonological rules which are sensitive to a dependency relation between morphemes. I examine in detail Intervocalic Voicing and Tensification. It turns out that Tensification is more specific in the sense that if a certain phonological or morphological condition is met then it applies, and if the condition is not met when voicing takes place. Tensification in relative clause is also closely...
examined and it is claimed that the seemingly same surface structure \([V+\text{LN}]\) has two different underlying structures: that of a relative clause and a sub-compound. Only in the latter case, Tensification takes place. Finally, Causative and Passive construction and allomorphy are investigated. It is claimed that it has the mutual-governed structure and \(-\text{ki}\) is the underlying form of the variant.

Finally, Chapter 5 is a concluding chapter that summarizes and discusses some theoretical implications of this study.

*Variation and change in language: A case study of Shaba Swahili*

Swahili has generally been perceived as a homogenous entity whose norms are reflected in the variety spoken on the coast of East Africa. Any deviations from these norms are perceived as trademark of colloquialism, corruption, deterioration and/or sub-standardness. In the Zairian province of Shaba, the variety of Swahili used is characterized by a multiplicity of deviations at all grammatical levels. This being the case, this variety, commonly known as Shaba Swahili (ShS), has been considered by many as a colloquial, corrupt, deteriorated, and sub-standard or pidgin variety of East African Swahili (EAS).

This dissertation provides an analysis of ShS, one of the very few non-western languages classified as pidgin/creole (P/C). It shows that although ShS fulfills some of the criteria used for the classification of P/C (i.e., structural simplification and historical origin associated with slavery, trade, etc.), it is not a P/C. It will be shown through the analysis of ShS that structural simplification is not a property of P/C only. Rather it is the property of all languages found in contact situations; namely, link languages, koinés, foreigner talk, P/C, immigrant, and institutionalized varieties. Thus, all the processes of language contact such as linguistic convergence, structural simplification, interference, interlanguage, linguistic nationalism, superstratum association, language attitudes, etc. will be evaluated to sort out a new set of criteria for language categorization in contact situations.

This study attempts to demonstrate that ShS is a "meaning system" that reflects the linguistic and socio-cultural context proper to new context of use. It shows that the multilingual context of Shaba has created new norms, which are nativized according to the linguistic, social, and cultural context of Shaba. Thus, what has generally been regarded as its own rules and norms that are distinct from those of EAS.

This dissertation also establishes that while linguistic variation is used to show the extent to which people adhere to the norms of their vernacular culture, this adherence is not automatic given the presence of members of one’s close-knit social network. It shows that although social variables such as participants, age, topic, gender, ethnicity, education, etc. can determine a speaker’s linguistic behavior, they are each subconsciously assigned hierarchical index markings of vitality. The social variables with the highest indexation marking can over-rule the constraints of linguistic behavior dictated by formality or informality during a speech event. Members of any community are aware of this indexation marking and are cognizant of the fact that this indexation varies with the context of situation. These conclusions are

164
arrived at by providing both linguistic and attitudinal studies of the speakers, their beliefs, values, and affiliations vis-à-vis the different varieties found in their linguistic repertoire.

Argumentation pragmatics, text analysis, and contrastive rhetoric

The contrastive rhetoric hypothesis (Kaplan, 1966) predicts that language users across cultures will vary in the means they use to construct coherent discourse. The problem for contrastive rhetoric research is to develop a method for reliably describing this variation. To this end, a number of methods of text analysis have been proposed that claim to describe the linguistic and discoursal features crucial to coherent interpretations of text. In this dissertation, I review these methods and then present an alternative adapted from argumentation pragmatics (Ducrot et al., 1980) and the model of discourse structure proposed by Roulet et al. (1985). Ducrot's theory rests on the observation that utterances in sequence are describable as having one of two functions — that of being an argument for some conclusion or a conclusion from some argument(s). Roulet proposes a hierarchical model of discourse having three constituent types: acts, moves, and exchanges. To test the contrastive rhetoric hypothesis, using this method of analysis, I analyzed twenty lead editorials each from The Times of India, The Singapore Straits Times, and The New York Times. These texts represent three distinct varieties of English from three different cultural settings (Kachru, 1986) and as such allow for testing the contrastive rhetoric hypothesis. The results of these analyses do not support the hypothesis that language users across cultures vary in the means they use to construct coherent discourse.

Lithuanian phonology

I have essentially two goals in this dissertation. First, I try to formulate a description of a wide variety of data about the phonology of contemporary Standard Lithuanian within the theoretical framework of generative grammar, a framework which permits a surprising amount of insight into the data. This goal is not trivial since, although there are several traditional phonemic descriptions such as Senn's Handbuch der Litauischen Sprache, Stang's Das Slavische und Baltische Verbhum, and Otrebski's Gramatyka Jezylka Litewskiego, the latter being by far the most informative, they fail, except for fairly low level and transparent phenomena, to bring any significant generalizations to bear upon the data. For this reason I do not present any new additional data in this description, but rather provide an analysis of some of the facts already given in the above works.

My second goal has been to confront the theory of generative phonology, which as been most systematically presented in Chomsky and Halle's The Sound Pattern of English, with a rather diverse set of data from still another language. In some of the cases where the theory does not, in my opinion, permit the proper insight into the data, I have attempted to extend it along lines which will allow for such insight.
It should be admitted at the outset that these goals have only partially been attained. With regard to the first, the description presented here is far from complete, there being many aspects of the language which I have omitted from consideration. Thus, derivational morphology is only touched upon sporadically, and several of the nominal declensions and verbal paradigms are not treated. In general I have concentrated on those phenomena which either would be essential to any phonological description of Lithuanian or those which are of inherent interest. However, in spite of this limitation, I believe that most of the rules I have formulated would be retained in essentially unaltered form if more data were considered. I therefore feel that the description presented here is, on the whole, a fairly faithful reflection of the phonological structure of the language. As far as the second goal of confronting the theory with a fresh set of data is concerned, here too it must be admitted that there are many features of the language which I don't think are properly illuminated in my description. In some of these cases this lack of insight can be attributed to the theoretical framework within which the description is formulated and my inability to extend it in such a way as to achieve the necessary insight.

Communicative error evaluation: A study of American native speakers' evaluations and interpretations of deviant utterances written by Arab EFL learners

This study is an attempt to investigate American native speakers' evaluations and interpretations of grammatically and semantically deviant utterances written by Arab EFL learners and to establish communicative criteria that may be utilized in selective error correction and in the writing and sequencing of teaching materials. The purpose of this study is threefold: (1) to investigate the differences between judged intelligibility and naturalness; (2) to investigate the extent to which error type (grammatical or semantic) and immediate linguistic context affect the intelligibility, naturalness, and interpretability of deviant utterances; and (3) to provide a validation measure for judgments of intelligibility.

Two types of measures were used: Evaluation and Interpretation. The former involved the evaluations of deviant utterances, presented both in and out of context, on four-point scales of intelligibility and naturalness. The latter required the selection from among four options of the best interpretation of the meaning intended by the Arab writer.

This experiment included two factorial designs: a between-subject design for naturalness and intelligibility and a within-subject design for intelligibility and interpretation.

The subjects consisted of 240 American undergraduate students enrolled at the University of Illinois at Urbana-Champaign. The results of t-tests indicated that utterances were generally judged to be more intelligible than they were natural. The ANOVA results showed that semantically deviant utterances were judged to be less intelligible and interpretable than were grammatically deviant utterances. Immediate linguistic context did not influence native speakers' ability to interpret the writer's intent. Two factors were noted that may account for this unexpected result: the limited amount of context provided and the poor rhetorical quality of this context.
Fisher's Exact Text results showed no association between the subjects' performance on the two measures of intelligibility and interpretation. This result raises questions as to the basis for judgments of intelligibility since these do not appear to reflect native speakers' actual comprehension of the meaning intended by the writer. Rather, they appear to indicate the extent to which native speakers think they understand the meaning of the deviant utterances.

The implications of these results for the methodology of communicative error evaluation and classroom teaching are discussed.

The Urdu case system

This dissertation analyses the complex Case system of Urdu within the framework of Government and Binding (GB) theory. It concentrates both on the word order and the phrase structure order of the language and on the assignment of various Case to subject NPs in Urdu.

The flexible word order of Urdu has previously been explained in terms of typological features and frequency count methods. Chapter two of this study argues for an SOV order in terms of a directionality parameter associated with the Case and Theta theories. A leftward directionality of Case and θ-role assignment in Urdu accounts for the head final character of the language. The principle of Case adjacency accounts for the obligatory occurrence of a postposition with the indirect object and explains why direct object remains adjacent to the verb.

The GB theory assumes the Verb-raising rule to be part of the Universal Grammar. However, in Urdu, such a rule will produce an incorrect surface word order due to the assumed order of the phrase structures. Chapter three demonstrates that an alternative analysis, viz. INFL-lowering, not only allows the correct word order but also explains the verb-agreement facts in Urdu.

The final chapter provides further evidence for the INFL-lowering rule and explains how nominative, ergative, dative, and instrumental Cases are assigned to subject NPs. It is argued that perfective morphology absorbs accusative Case. Similarly, dative and unaccusative verbs are incapable of assigning Case to their internal arguments. This invokes INFL-lowering which assigns nominative Case to internal argument but the external argument is consequently left Caseless. A postposition-insertion rule is, thus, required which inserts an appropriate postposition in front of the subject NP to assign it the necessary Case.

A Sesotho tonal grammar

This dissertation is an account of the tonology of Sesotho. A phonological component consisting of such subsystems as the theory of mordia tone, metrical phonology, autosegmental phonology and prosodic phonology is presupposed. Whenever relevant, I appeal to the principles and rules that govern each of these subsystems.
The main contribution of this thesis is, however, the role played by prosodic domains in the tonology of Sesotho. Four such domains are utilized to constrain the application of tones rules for the language. These are the syllable, the phonological Word (W-domain), the Clitic Group (C-domain) and the Phonological Phrase (P-domain).

Tone rules in Sesotho can classified into two groups: assimilatory and dissimilatory. Assimilatory rules involve spreading of H tones. There are two types of such H tones: lexical H tones and grammatical H tones. Lexical H tones assimilate by spreading one mora to the right whereas grammatical H tones spread all the way to heads of metrical constituents. Dissimilatory processes, on the other hand, involve various kinds of deletion and delinking of H tones. Such dissimilatory processes are shown to be responses to violations of the OCP. The responses to these violations of the OCP are different from one dialect of Sesotho to the other.

Tone rules which have been found to be constrained by these prosodic domains are: (1) Meeussen's Rule — a W-domain span rule, (2) Right Branch Delinking — a W-domain and C-domain span rule, (3) High Tone Spreading — a W-domain and a C-domain span rule, (4) Downstepping — a P-domain juncture rule, (5) Left Branch Delinking — a W-domain limit rule, (6) H Tone Insertion — a P-domain limit rule, (7) M Toning — a P-domain limit rule, and so forth.

The interaction between phonology and syntax is also discussed. It is demonstrated that heads which are C-commanded by Chomsky-adjoined constituents are at the ends of P-domains. Otherwise, the extreme right bracket of a Xmax is the end of a P-domain. Independent syntactic evidence to support the claim concerning the role played by tone in signalling Chomsky-adjoined constituents is advanced.

Tangale phonology: A descriptive analysis

Tangale, a Chadic language spoken in Nigeria, exhibits a considerable number of phonological alternations at the segmental and tonal levels.

In this dissertation, we attempt to present a descriptive account of the alternations within the theory of generative phonology (Kenstowicz & Kisselberth, 1976, 1979) enriched with the autosegmental representations introduced in works by Leben (1971), Clements (1977) and Halle & Vergnaud (1980), among others.

The dissertation is divided into four chapters: 1. An Overview, 2. Syllable Structure, 3. Assimilatory Processes and 4. Tone. In Chapter 1, we present a general survey of the Tangale dialects and dialect differences in terms of lexical items and notable phonological rules. Then, we provide a brief summary of the sound system of the language and some morphological and syntactic processes that are relevant to our study. In Chapter 2, we examine the alternations that are related to the syllable structure. These alternations are accounted for in terms of the syllable theory sketched in Halle & Vergnaud (1980) and later elaborated in Clements & Keyser (1983). Chapter 3 discusses the two assimilatory processes: obstruent voicing assimilation and vowel harmony. The vowel harmony system is described within the autosegmental framework (Clements, 1977). Finally, in Chapter 4, we present descriptions of
Studies in the Linguistic Sciences 22:2 (Fall 1992)

the tone and tonal processes in the language. Like the vowel harmony, the tone and tonal processes are described in terms of the autosegmental theory.

Voicing and tensification in Korean: A multi-face approach

The purpose of this study is to present a more satisfactory explanation for several morphologically and syntactically conditioned phonological phenomena, in particular, voicing and tensification in Korean. I will propose a multi-face model which enables these phonological phenomena to be accounted for on the basis of their interaction with morph-syntactic structures.

Chapter I provides the basic phonological background against which this study will be done, i.e., an inventory of underlying segments, the syllable structure, and a set of basic phonological rules in Korean. Apparent exceptions to rules of voicing and tensification will be noted.

Chapter II gives a critical review of the past studies done on voicing and tensification in Korean. Inadequacies in these studies gives justification for the present study.

Chapter III proposes a multi-face model as a theoretical framework for this study. This model integrates interactions between phonology and syntax, and between morphology and syntax as well as interactions between phonology and morphology for a satisfactory analysis of the phonological phenomena in question. It is argued that this model is an improvement over the framework of prosodic phonology proposed by Nesper and Vogel (1986).

Chapter IV deals with analysis and description of voicing in Korean within the multi-face model. It consists of two parts: First, I show that complex verbs ending with -i or -ha belong to the noun incorporated forms. Even though they show the same morphological structure as verbal compounds, I argue that they should be distinguished from the verb compounds on the ground that such phonological phenomena as palatalization and aspiration which apply within complex verbs do not apply within verbal compounds. Second, I show that compounds ending with -ki should be analyzed differently from those ending with -i in that compounds ending with -ki should be regarded as phrases rather than words.

Chapter V deals with analysis and description of tensification in Korean within the multi-face model. First, I argue that exceptional voicing in a noun compound can be explained by analyzing the compound as a syntactic phrase. Second, I treat tensification in the initial obstruent of the head noun in relative clauses after the prospective modifier -(a)l. Again I argue that the syntax of the relative clause explains the reason why tensification occurs in certain constructions but not in others. Third, I argue that some deverbal compounds should be dealt with differently because they have tensification which does not occur within the deverbal compounds. In order to account for these exceptional compounds I assign different morphological structures from other deverbal compounds.

Chapter VI discusses some theoretical implications of the results of this study by way of the conclusion.

Theoretical implications of Yawelmani phonology

This thesis has been written in accordance with a not unusual pattern. Namely, it provides a reanalysis of the phonological component of a particular grammar, but is interested in this particular grammar primarily for the light it sheds on general phonological theory. Thus the description is by no means exhaustive, but rather confined to those aspects of the phonological structure which are of general relevance.

In Part I, we discuss the details of the analysis of Yawelmani. We begin the details of the analysis of Yawelmani. We begin with those aspects of its structure where we have no essential quarrel with Kuroda's analysis — the rules of Vowel Harmony, Lowering, Echo, Shortening, and the nature of the underlying vowel system. We then turn to the rules of Vowel Epenthesis and Vowel Deletion, which are central to later concerns of this thesis, and the underlying structure of suffixes. In these areas we do not follow Kuroda's analysis, and will attempt to establish our motivations for not doing so. The third chapter deals with the noun paradigms in Yawelmani and focuses primarily on the "protective vowels" (to use Newman's terminology) and how they are to be treated. Like Vowel Epenthesis and Vowel Deletion, the protective vowels will figure in later discussion in Part II. The final chapter of Part I deals with a number of phenomena which either further motivate other parts of the analysis, or have some general interest of their own. In this chapter in particular we discuss data not considered in Kuroda's monograph.

Part II centers around theoretical issues. First of all, we turn to the extremely important question which Kiparsky has recently raised — namely, "how abstract is phonology?" An example of a type of analysis which we feel must be ruled out on general grounds is given. The principles which Kiparsky proposes for eliminating such analyses are then investigated, and shown to run afoul when confronted with the facts of Yawelmani. We are not able to provide an answer to the general problem, but hope that discussion in this chapter defines the range of possible answers to a certain extent. In the second chapter of Part II, the notion of the "functional unity" of phonological rules is investigated, and a wealth of evidence from Yawelmani is brought forth in favor of amending phonological theory in order to recognize functional sameness as well as structural sameness. Some very tentative suggestions about how phonological theory might be amended to accomplish this goal are made. Finally, we examine briefly the theory of markedness, and attempt to establish (on the basis of the facts of Yawelmani) whether it can be maintained in the form proposed in Chomsky and Halle's *The Sound Pattern of English* (1968). Although this discussion is largely critical in nature, we hope that it is not without a certain positive character to it.

A syntactic correlate of the semantic and pragmatic relations: The subjunctive mood in Spanish

This dissertation is an attempt to characterize the interrelation between semantic-logical aspects of the underlying representation of a sentence and their formal expressions through the subjunctive mood. This relation is
investigated through an examination of Spanish, but the nature of the semantic and pragmatic notions to be examined are not necessarily language specific. This is not to say that other languages which have a distinct subjunctive, for instance, will use that mood in exactly the same circumstances where the Spanish speaker uses it, but that the information which determines that the subjunctive be used in Spanish is the type of information which must be available to speakers of any language regardless of the syntactic mechanisms through which they express it.

This dissertation is divided into two main parts; the division is not formal but determined by the nature of the phenomena investigated. The first part (corresponding to chapter two) deals with uses of the subjunctive which are predictable from syntactic and semantic properties of abstract verbs in the semantic representation of the structures; the presence of the subjunctive is determined by the syntactic phenomenon of rule government.

The second part of this dissertation (chapters three, four, and five) deals with cases where the subjunctive alternates with the indicative as a function in the differences in the semantic representation of the sentences, and of the speaker's beliefs and attitudes when uttering the sentences.

*Topics in Chukchee phonology and morphology*

The purpose of the following dissertation is to propose a relatively complete generative description of Chukchee phonology and some of the more salient topics of the inflectional morphology. In chapter one the phonological phenomena which do not affect the syllabic structure of the language will be examined, including a complex dominant-recessive vowel harmonic system and an intricate network of consonantal assimilations and dissimilations. Chapter two will deal primarily with those phonological and morphophonemic processes which do affect the syllable structure, including numerous instances of schwa epenthesis, various consonantal deletions and vocalization, vocalic elisions, and even one example of metathesis. Chapter three will concentrate on the inflectional nominal phenomenon of reduplication and the entire complex inflectional verbal morphology.

During the explication of these various topics I shall attempt to fit them within a theoretical framework and discuss any pertinent issues which may apply, such as phonotactic conspiracies against highly complex consonantal configurations, animacy hierarchies, the concept of ergativity, and the like. Furthermore, I shall suggest alternate proposals when such theoretical guidelines are lacking in the literature, for instance a specific type of non-trivial global rule and a phonologically protective function for reduplication.

The examination of the Chukchee data was a bit unusual in some respects, since Chukchee is a Paleo-Siberian language of only several thousand extant speakers, and a native informant was therefore not available. Accordingly, this thesis was accomplished almost exclusively through the examination of the literature which has been written on the language, most notably the extensive two volume grammar by Skorik, several theoretical papers by Comrie, and the various dictionaries. Although the examination of the inflectional morphology did not suffer appreciably from this manner of investigation, certain phonological phenomena such as potentially stress
related topics did suffer (due to the scarcity of accentual marks) and must be left to future investigations.

A transformational syntax of French

The purpose of this study is twofold. On the one hand, it is offered as a modest but hopefully significant contribution towards the ultimate goal of an adequate generative description of modern French. It is hardly necessary to emphasize the very tentative character of the conclusions reached here. These generalizations that are made concerning the construction of French sentences are almost certain to yield to deeper generalizations upon subsequent investigation. On the other hand, this study is intended to provide a certain amount of empirical evidence that may be taken into account in evaluating various theoretical proposals made recently as to the nature of grammatical organization in general.

The scope of the analysis is quite limited. In general, the policy has been followed of excluding a topic from the description rather than treating it in an obviously inadequate manner. It is believed that, at this early stage in our growing understanding of language, a relatively careful examination of a few specific problems will be of more value than a relatively superficial treatment of a wide range of phenomena. Nevertheless, it is impossible to achieve a fully adequate description of certain subsystems of French syntax viewing these in complete isolation from the rest of the system. Therefore, it is necessary to consider from time to time the effect, as well as can now be conceived, of extending the analysis to cover a broader domain. In some cases, on the basis of existing evidence, we must more or less arbitrarily select one analysis where equally plausible alternatives are known. Here again we must await the results of further investigation.

The problems considered fall into three fairly closely related areas. In chapter II, sentential and infinitival complements to nouns and verbs are discussed in some detail. Chapter III centers about those prenominal expressions sometimes called "indefinites" in traditional grammars. In particular, the relative merits of a constituent structure versus a transformational source for sequences like chacun de ces livres 'each of those books' are weighed. Finally, in chapter IV, we examine various pro forms with respect to their derivation and placement.

The list of subjects excluded from the analysis is perhaps more impressive, the most notable being conjunction and adverbs. Interrogatives are not treated directly, since they have been discussed elsewhere, but they are brought into the discussion in several places where they are relevant. Other exclusions and oversimplifications are indicated throughout. At the very least, one can hope that, as a result of this study, the nature and magnitude of the problems facing the analyst of French syntax will be better appreciated.

On the interaction of morphology and phonology: The Hebrew verbal system

This study develops and defends a detailed analysis of Hebrew verbal morphology, within the framework of the prosodic theory of
nonconcatenative morphology proposed by McCarthy (1979, 1981). Both Biblical Hebrew and Modern Hebrew are covered, with occasional reference to Mishnaic Hebrew. It is shown that the distinction between Pa' al as the "base" non-derived binyan as against the "derived" binyanim is well founded at least in formal morphological terms, i.e., Pa' al's two major CV-tiers being CVCCVC and CVVC vs. the derived binyanim's CVCCVC and CVVCVC CV-tiers (namely, the same CV-tiers for all derived binyanim), and the nc-affix vs. affixing characterization of the base vs. the derived binyanim. As regards the phenomenon of medial gemination in Hebrew, and Semitic in general, it is argued that an Initial Tone Association analysis is to be preferred to the earlier proposed Erasure analysis, and a new theory on the diachronic development of medial gemination in Hebrew is proposed.

The question of the interaction of morphology and phonology is addressed and it is shown that certain phonological rules which give rise either to compensatory lengthening or assimilation strongly support the hypothesis that roots and vowel melodies are represented on autosegmental tiers independent of the CV segmental tier. It is shown that compensatory lengthening and assimilation have a simple and natural explanation within the prosodic theory, whereas these processes call for two-stage rules in a purely segmental approach.

It is argued that the Obligatory Contour Principle (OCP) holds for both Biblical and Modern Hebrew as a constraint against identical root melody elements. Apparent OCP violations, both in Biblical and Modern Hebrew, are explained as rising from a major dichotomy between the verbal and nominal systems in Hebrew. It is shown that all apparent OCP violations belong to the nominal paradigm, and owing to the different lexical representation of nouns vs. verbs, it is shown that these apparent counterexamples actually do not violate the OCP.

The existence of multiradical denominative verbs in Modern Hebrew is presented as problematic for a rigid Pi' el CVCCVC CV-tier for Modern Hebrew. These are argued to be outside the verbal system proper.

Recovery and translation of zero anaphoric subjects in Chinese

In reading a narrative, it is crucial to know who the writer is referring to. When the subject of each sentence is made explicit, this task of identifying the referent is simple. However, in a discourse-oriented language like Chinese, there is no grammatical requirement to have a subject in each sentence, and so zero subjects are the norm rather than the exception. There could be several entities present in a discourse made up of clauses with zero subjects. The reader will have to decide which entity is being referred to in each clause. The first part of this dissertation examines the cues that help readers identify the correct referent; the second part investigates how these zero subjects are translated into English where the subjects are usually made explicit.

It is proposed that the topic continuity of the relevant passage is important to recover the referents of zero anaphoric subjects. The recovery process begins at the predicate of the zero subject, then continues to the closest subtopic continuity, and then the next until the referent is found. Thus, recovery is said to be a bottom-up process. Principles that help decide whether
the most recent entity, the opening entity of the passage, or any other entity present is the referent are derived. This is done through the application of the topic continuity, discourse analysis, semantic matching and contextual knowledge.

An examination of the translation of the zero anaphoric subjects into English reveals that not only noun phrases, pronouns, and new nouns are used, but passives, cohesive devices such as coordination and subordination are used as well. The reasons that decide one usage or another can be that of specification, non-specification, or connection. The topic continuity again plays an important role, especially in the rearrangement of clauses and editing of a particular passage. In order to restructure the translated clauses, the topic continuity of these clauses has to be identified before dealing with the details of each clause. Thus, the restructuring of translation is a top-down process.

Some interaction of syntax and pragmatics in a study of pragmatic morphemes in Korean

This thesis has two goals, describing the uses of some selected Pragmatic Morphemes (PMs) in Korean and giving an account of their syntactic behaviors in the GPSG framework. First, according to the Cooperative Principle, I describe how the speaker uses a PM and how the hearer understands it. I claim that a PM has one sense and its various uses are inferred from that sense according to the Gricean CP. When the speaker uses a PM in his utterance, he assumes the hearer believes he has goals, and he expects her to be able to figure out its uses which are relevant to his goals in a way indicated by its sense because he believes she assumes he does not use it without any purpose. The hearer believes that the speaker used that PM in support of his goals, and can infer from its sense how it is relevant to his goal at the moment.

I deal with four PMs out of many in Korean. The PM com 'a little' is used to show the speaker's politeness to the hearer by implicating that he is minimizing the threat to her face, or to insult her by belittling her ability. The speaker uses the PM tul (plural marker) to indicate that an event he is describing occurred more than once, or that each referent of a subject of his utterance is involved in an event. The PMs puthe 'from' and kkaci 'to' are used to show that the speaker never expected an event/situation he is describing to occur.

Second, the morpho-syntactic behavior of PMs are analyzed within the GKPS (1985) version of GPSG. A new type of 'Near-HEAD' features is proposed for PMs, following the GPSG multi-headed approach to coordination. Near-head features are instantiated along head nodes like standard HEAD features in GKPS (1985), but they must observe an additional restriction that a node with them comes last in a local tree. The near-HEAD feature analysis predicts correctly that PMs are located on the lexical head of a phrase and that they appear on the final conjunct in coordination. However, I suggest that PMs can be treated through HEAD features, if we give up the GPSG claim that coordination is multi-headed.
Middle Korean tonology

This research deals with various aspects of tonal phenomena in Late Middle Korean (15c.-16c.) MK tonology has been studied before by several native and foreign scholars. Two things distinguish this study from previous ones. (1) Scope — previous works are not inclusive but rather fragmentary. MK tonology is systematically organized and comprehensively discussed within the overall framework of MK from tonogenesis to tonal derivation to tone decay in one place for the first time. (2) Methodology — the present study adopts the framework of explanatory and generative phonology, while most previous works were carried out in the tradition of descriptive linguistics. In particular, approaches suggested by McCawley in tone typology and Goldsmith in tone derivation are applied to illuminate the nature of MK tone system.

In tone typology, this study demonstrates that MK tone is one of McCawley's "some tonal systems that come close to being pitch accent systems but don't quite make it." In particular, it demonstrates that MK has rules assigning pitch depending on the accent locations, behaving like a pitch-accent language up to this point, but that MK then requires morphophonemic and phonetic tone rules which are characteristic of a tone language. Previous studies classified MK either as a pitch-accent language or a tone language, not an intermediate between the two. Nevertheless, a revision of McCawley's model is also suggested.

In tone derivation, the present study first establishes that there are only two underlying tonemes, High and Low, in MK, not three, High, Low, and Rising, as MK tone markings suggest. It is demonstrated that Rising is underlyingly a sequence of Low-High. It also establishes that the basic tone melody in MK is L.H., thereby naturally explaining the absence of a falling tone in MK. It next discusses the reasons why the concept of mora, rather than that of syllable, must be employed in the description of MK tone. A detailed account of generation and derivation of MK tone is then given in sequence via four types of rules:

1. Pitch assignment rules
2. Morphophonemic tone rules
3. Phonetic tone rules
4. Rhythmic rules

In several places in the course of tone derivation and in a separate chapter, the autosegmental theory of tone proposed by Goldsmith is applied to show how it contributes to a more natural explanation of MK tonal data, and to discuss some theoretical implications of MK data for the theory. In particular, the need of segmentalization before the application of rhythmic rules is demonstrated and a part of the Universal Tone Association Convention is rejected on the basis of the analysis of MK tonal phenomena. As possible origins and evolution of tone in MK, Chinese borrowing and inherent Altaic origin are considered. But it is concluded that more plausible origins are an internal development from neighboring segments as appears to have happened in Jinchon, and a contour tone development by syncope, desyllabication, and contraction as has happened in many other languages. Some suggestive MK data are given and discussed.
Finally, it is suggested that perturbation and decay of MK tone was caused by the leftward movement of ictus.

Linguistic structuring and the cinema: A study in method

This dissertation will deal with the application of various linguistic concepts to the study of the cinema and the use of linguistic methods in the analysis of the film. Currently, many film theorists are appropriating linguistic terms and concepts (seemingly haphazardly) as tools in their research — often not without some violence to the linguistic concepts. This dissertation will not attempt to rectify these errors as such, except insofar as it attempts to present a valid linguistic interpretation of the cinematic data.

This dissertation is organized as follows. The present chapter will briefly survey some of the uses of the cinema/language metaphor as encountered in writings on the film and then will be given over to the definition of basic terms used throughout the succeeding chapters.

Chapter II will present a review of previous literature using linguistic concepts in approaching the cinema. The main concentration will be on the two major periods of such research — namely, on the work of Russian linguists and film makers in the 1920's and 1930's and on the current (from about 1960 to the present) work in this area consisting of three main approaches which may be characterized as structural, semiological, or psycholinguistic, respectively, depending on their orientation.

Chapter III will discuss the uses of language within the film. This takes two forms: spoken language (as in dialogue) and written language (as in the printed titles which still sometimes appear between scenes in films). The concept of redundancy will be discussed in relation to the semantic overlap between soundtrack and image track, and a paradigm of the possible uses of language within the film will be set forth.

Chapter IV will investigate the structural parallels between language and film. It will be demonstrated how current syntagmatic attempts at structuring the sequence of a film are insufficient for the task and how a transformational generative model akin to that used to describe human language provides an adequate description of the phenomena under consideration.

Chapter V will discuss the Firthian concepts of contextualization and context of situation in relation to the cinema. It will be explained how these concepts can be used to organize all the other systems of the film, including the structural system of Chapter IV. This will then be demonstrated with two examples.

Chapter VI will provide a conclusion and a summation of the preceding chapters.

Focus constructions in Somali

The purpose of this study is to provide a syntactic analysis of focus constructions in Somali in the framework of transnational-generative
Grammar. The emphasis is on NP focus constructions with the focus marker *baa* — a very common construction in Somali.

Focus is a predominant phenomenon in Somali. One constituent in every indicative affirmative sentence must be marked by a focus marker as the focus of the sentence. The focus marker may occur in either an unconjugated form or in a conjugated form where it is coalesced with a subject clitic. The analysis proposed in this study accounts for the distribution of the various forms of the focus marker.

The main problem which the thesis addresses is that focused non-subject noun phrases are marked by a focus marker which agrees with the subject of the sentence. Thus it may appear as if Somali exhibits an unusual phenomenon of agreement between subjects and objects.

The analysis which is proposed in this study makes it unnecessary to postulate such an agreement. According to this analysis any focused NP, regardless of its grammatical relation is extracted out of its clause and moved to a position in COMP where it is marked by the invariable unconjugated form of the focus marker. The conjugated form of the focus marker is the outcome of phonological rules which coalesce the focus marker with a subject clitic and are independent of the analysis of the focus.

One important consequence of the analysis is that a logical subject which is marked as the focus by the focus marker is not the grammatical subject of the sentence. Hence sentences in which the logical subject is focused are grammatically subjectless.

An analysis of the presence and distribution of subject clitics is proposed and the role of subject clitics in various types of clauses is discussed.

*English in the Malay archipelago: Nativization and its functions in a sociolinguistic area*

This study analyzes and compares the non-native varieties of English in the countries of the Malay Archipelago — Singapore, Malaysia, and Indonesia. This region constitutes a sociolinguistic area by virtue of extensive shared sociocultural and linguistic features dating from the pre-colonial era. However, political, economic, and demographic developments during the colonial and post-colonial periods have created distinct sociolinguistic contexts for the use of English in each of these countries.

The basic theoretical premise is that realistic interpretation of non-native varieties of English requires a pragmatic and functional approach to the use and usage of language. From this perspective, a non-native variety of English is nativized to the degree that differences in its forms and functions from those in other varieties of English reflect acculturation into a specific sociocultural context and contact and interaction with other languages in multilinguals' linguistic repertoires.

Several important aspects of nativization are illustrated. First, nativization originates largely from the transfer of linguistic features from other languages and from creative innovation as an inevitable result of the use of English in non-native contexts. Second, much nativization can be linked to a number of sociolinguistic functions of language, including register, style,
and the expression of identity. Third, the degrees and types of nativization of English in a sociolinguistic setting are determined by the range of domains in which English is used and the number of speakers who use English in those domains. Fourth, changes in the sociocultural and linguistic settings of language use are generally reflected in altered patterns of nativization.

The analysis in this study is primarily textual, based on a wide range of written texts from each country rather than on close observation of verbal interaction. Implications of this research are discussed for several crucial issues in linguistic theory and its applications, including language planning and language pedagogy.

Historical rules in the development of Modern French from Latin

The analysis presented in this dissertation is a set of ordered phonological rules which represent the major sound changes that occurred during the development of the French language. These rules are part of the phonological component of a transformational grammar of the type described by N. Chomsky in Aspects of the Theory of Syntax, (Cambridge: M.I.T. Press. 1965). A brief sketch of the theory and structure of a transformational grammar is given in Chapter I of this dissertation.

There are many handbooks and articles written on the development of French phonology which have been used as sources of data for this dissertation. However, the analysis presented here differs substantially from the analyses found in the literature. These differences are discussed in detail in Chapters II and III.

The purpose of this dissertation is to determine (1) what regularities underlie the changes that occurred during the development of pronunciation in the French language, (2) what phonological rules may be formulated in order to express these developments, and (3) to what extent the descriptive order of the rules, which is determined by the simplicity criterion, reflects the apparent chronological order of the rules.

A quantitative model in dialect subgrouping: The case of Modern Wu dialects

This thesis is intended to present a new model for the comparative study of dialects with the quantitative measurements, and under this new model, the subgrouping of the Modern Wu dialects, one of the major groups of Chinese dialects, is carried out, based on the syllabic initials.

An overview is given on the previous approaches in the literature of the dialectology — namely, the traditional approach, structural approach and generative approach. Each approach has been applied to the case of the Wu dialects to accomplish the task of subgrouping. But none of them can overcome the difficulty of synthesizing the isoglosses, since they ignore the concrete processes of sound changes, and thus fails to determine the degree of associations among a number of related dialects. To study the sound change in process, based on the theory of lexical diffusion, initials a new route for quantitative study into dialect comparison.
Following the methodology in Hsieh (1977), Cheng (1972), Lu & Cheng (1985), Cheng (1986, 1988), Lu (1986a, 1987a, 1987b, 1987c, 1988, 1989, 1990), the thesis proposes a new model, namely, the systematic quantitative comparative model. Since sound change is carried out by means of lexical items, the comparison of quantity of the influenced lexical items in the course of sound change will reveal the degree and scope of sound change in process. Under this new model, the syllable initials of more than 2,700 characters pronounced in 33 localities of the Wu dialects are collected and grouped with the reference of the Ancient Chinese to provide a large database for the systematic comparison. Then, the procedure designed for dialect comparison, which includes correlational analysis, cluster analysis and principal components analysis, is followed to carry out the subgrouping of these 33 localities. The results are presented and discussed.

The effect of pronoun type on first and second language perceptual strategies in Hindi

In this thesis I will present empirical evidence that there is a general preference on the part of Hindi speakers to reassert the referent after a shift in sentence topic. While not a hard and fast rule, it can be shown that pronoun type (full or zero) also affects pronominal assignment, and may be one source of difficulty encountered by L2 learners of Hindi. Strong empirical evidence of this is presented in chapter 4.

The investigation presented here will necessarily span both syntactic theory as well as psycholinguistics. Before an understanding of how L1 and L2 speakers of Hindi process zero pronouns can be reached, a general discussion of the phenomenon will be provided. Chapter 2 will review treatments of pronominalization in general and in Hindi in particular. I will explore the distributional pattern of zero pronouns and demonstrate that this distribution cannot be explained completely by standard sentence-level processes. While syntactic deletion processes such as equi-NP-Deletion (Subbarao 1974) account for certain clear-cut examples of absent surface pronouns, there are numerous cases of zero anaphora which do not appear to be syntactically controlled, but rather, are the result of discourse-level pragmatic processes. I will then discuss the role of topic in zero pronominalization. In particular, such discourse-related notions as topic chain (adapted from Dixon 1972) appear to be useful in accounting for the distribution pattern of a large number of zero pronouns. The remainder of the chapter reviews research done on first and second language processing of pronouns, and outlines the perceptual strategies used in assigning antecedents to pronouns.

Chapter 3 provides corroboration of the role of topic flow as a predictor of zero pronouns. It contains the description and results of an experiment which tests the preferred patterns of distribution of zero pronouns at the discourse level as judged by L1 Hindi speakers. It establishes topic chain as a strong factor in the occurrence of zero anaphoric processes.

In chapter 5 I present the results of an experiment that contrasts the strategies used by L1 Hindi speakers with that of L2 students in the process of studying Hindi in secondary schools. The data indicate that such clues as verbal agreement are used by L2 learners, even at relatively low levels of proficiency in Hindi, in the assignment of reference to pronouns, and that
even such pragmatically difficult cases as the use of honorific pronouns are processed successfully by L2 learners at moderate levels of proficiency. On the other hand, discourse-level clues, while used by L1 Hindi speakers in processing anaphora, are not used by L2 learners until a very high level of proficiency is attained.

Chapter 5 contains a brief recapitulation of the results of the L2 vs. L1 experiment, and a discussion of their implications for a general theory of L2 acquisition.

*Style and meaning in African English: A sociolinguistic analysis of South African and Zimbabwean English*

This study presents an analysis of the style and 'meaning' of the variety of English used in the sociocultural context of South Africa and Zimbabwe. The focus is primarily on the African or Black English variety.

It is argued that the Blacks in this region have developed a variety of English that deviates in several ways from what is traditionally referred to as the 'standard' variety. Such deviations are essentially due to cultural and linguistic contact. The new variety thus developed has a set of functions which are not necessarily identical to those contexts in which the 'standard varieties' are used. It is also a variety developed for communication among non-native users of English. In short, the emerging Black variety has a style and meaning system appropriate for the African local situation.

It is shown that deviation in this variety is a result of many productive linguistic processes. These range from direct translation from local African languages, to various types of collocations, semantic shifts, calques, and innovations in lexicalization. These deviations are also evident at the discoursal level where they reveal a close relationship with discourse patterns in African languages.

The study provides a historical context for understanding the development of a Black English variety. It has passed through three basic stages. The first stage was when English education was restricted to very few Blacks who were expected to attain near-native fluency, and whose only other communicants in English were native speakers of English. This group's English showed an obsession with the flamboyant style of the great English literary works. The second stage was greatly influenced by missionary education, and thus echoes themes and linguistic style with a religious flavor. Even then, the goal at this stage is near-native fluency. The third stage marks a period when English education and use is no longer a privilege of a few. It is this stage that shows distinct features of Black English in this region. The feature at each stage are exemplified through literary works by Black artists such as: Plaatje, Dhlomo, Brutus, Mphahlele. Themba, Mungoshi. The study is organized in five major chapters: Chapter 1 is an overview of the study. Chapter 2 discusses various Africanization processes which make African English a distinct variety of English. Chapter 3 provides the sociolinguistic profile and gives an analysis of discourse in African English. The final chapter concludes with a summary and recommendations for further study and research. There is also an extensive bibliography.
Some aspects of Japanese nominalization

The present thesis attempts to describe Japanese nominalizations in the framework of transformational grammar. Our major concern is to describe nominalizing processes formally. We are not concerned with writing a set of elaborate base rules, nor are we concerned with writing transformational rules of other syntactical aspects than the nominalization or those aspects that are closely concerned with writing transformational rules of other syntactical aspects than the nominalizations or those aspects that are closely related to them. We, therefore, refer the reader to such Japanese transformational grammars as Inoue (1964), Isami (1964-66), Duroda (1965), Saga (1966) and Ueda (1965) for the information on the over-all grammatical structure of Japanese.

The present thesis is organized in the following way. Chapter I discusses traditional Japanese grammatical theories in contrast to our transformational theory and discusses our position within transformational theory. Chapter II deals with the problem of how to describe the basic categorical distinction of adjective, adjective-verb, and verb, in order to simplify our description in the succeeding chapters. In Chapter III we sketch our concept of nominalization which is further formalized in Chapter IV. Chapter IV, in which we discuss the problems of Japanese nominalizations in detail, is the central chapter of the thesis. In Chapter V, the final chapter, we discuss typical nominal compounds and attempt to show how to derive them in terms of the nominalizing processes discussed in the previous chapters.

A study of some auxiliary verbs in Japanese

This is a study on so-called auxiliary verbs in Japanese, including rare, sase and nine te-form verbs, which is made within the framework of the theory of generative transformational grammar.

Basic to this thesis is answering the question as to what extent the semantics of these verbs have their bases on syntactic structures. It is observed, first of all, that any instance of the auxiliary verbs investigated shows a semantic dichotomy, which we present in terms of semantic features: rare (or the passive construction) has the dichotomy of [+Affective], sase (or the causative construction), of [+Coercive], and each te-form verb (construction) of a particular contextual feature. It is found that such a semantic dichotomy is not independent of the syntactic structure, but dependent on it to a large extent. The two readings of [+Affective] of the passive construction, for instance, stem from the differences in the deep structure. In addition, the specific verb-verb sequence serves to disambiguate the two-way ambiguous readings: the sequence of rare followed by (te) sima-u allows only the reading of [+Expected] for (te) sima-u; the sequence of sase-rare permits only the reading of [+Coercive] for sase and [+Affective] for rare.

However, it is also found that in some limited number of cases the syntactic structure is not the sole basis for the semantic findings. In these cases, it is claimed that it is necessary to take into account such factors as presupposition and/or knowledge of the speaker.
Finally, various observations concerning selectional restrictions on the verb-verb sequences tell us that these restrictions are independent of the syntactic structures, and that they belong to the problems of language independent, rather than of language particular.

An approach to code elaboration and its application to Swahili

The purpose of this dissertation is to propose a theoretical model which makes it possible for languages like Swahili to acquire technical registers. A two-prong approach is suggested to build up the necessary terminology, and at the same time, cultivate the essential technical rhetoric to support the terms generated.

The first two chapters are designed to provide background information. Chapter I has, in addition to the preliminaries, an outline of the basic structure of Swahili needed in order to familiarize the reader with word formation processes, agreement patterns and sentence construction in this language. Chapter II focuses on language issues in Kenya where English is the official language and Swahili the ceremonial national language. A historical perspective of the evolution of the present Kenya language policy is presented. Also, various factors that have, in one form or another, impeded the ascendancy of Swahili as the official language of the country are examined.

Chapter III provides a framework for viewing language planning (LP) activities. Components of LP considered are: orthography, morphology, syntax and lexicology. Under each, recommendations are given that will, to a certain extent, contribute to the strengthening of Swahili as an efficient communicative tool in the domain of science and technology.

Chapter IV concentrates on the proposed approach to code elaboration. It is suggested that technical registers in languages such as Swahili can be developed in two phases. The first phase involves liberal adoption of terms (not available in the target language) from English. Arguments are given to show that this is a pragmatic way for a developing language to acquire rapidly and at a minimum cost a systematic growth of these registers. Included are discussions on issues related to nativization of the loan terms.

The objective of the second phase is indigenization (local coinage) of some of the terms relevant to primary and secondary school curricula; the main reason for this is the consideration that indigenous terms may have a pedagogical value in the basic cycle of education. For this phase, a conceptual framework is developed in order to facilitate the process of creation of a viable indigenous technical register. It is argued that it is only by starting at the concept level, not at the term level, that pitfalls and frustrations associated with "term translation" can be avoided.

Chapter V treats the technical rhetoric aspect of registers. Swahili, like any other language, has the necessary rhetoric elements (conjunctives, logical elements, special purpose verbs). But, like it is in all developing languages, these elements need to be made more rigorous and precise. For this, cluster analysis and semantic grid techniques are proposed as a method for charting the semantic field of these elements. By the use of such techniques, local lexical elements can be standardized and thus be matched precisely with
Studies in the Linguistic Sciences 22:2 (Fall 1992)

those from an international source; and in this way, translation of scientific texts from any international source will be facilitated.

Chapter VI consists of a summary and implications of the proposed model.

Mccawley, Noriko Akatsuka

1972

A study of Japanese reflexivization

This is a study in the syntax and semantics of Japanese Reflexivization. In Chapter I, it is shown that Japanese Reflexivization has two aspects, language-specific and language-independent. The former is the subject-antecedent condition and the latter is the command condition. The domain for Japanese Reflexivization is not confined to the simplex sentence as its English counterpart. It goes down into embedded sentences just like English pronominalization. Japanese has reflexive possessives, which English does not have. Despite those facts, the native speaker of Japanese somehow feels that languages like English make much more extensive use of reflexives. Chapter II is an attempt to explain why that is the case. A syntactic constraint called the Like-NP Constraint is proposed.

A grammar of a human language is a tightly organized system. In Chapter III, it is shown that the study of Reflexivization sheds light on the treatment of Japanese passives. Currently, there are two opposing hypotheses. According to the one, all instances of passives are derived from the same complex deep structure. According to the other, there are two types of passives in Japanese and one has a complex deep structure and the other has a simplex deep structure. First, it is shown that various semantic-syntactic facts including facts about reflexivization argue strongly against the uniform treatment. Then, it is argued that the current non-uniform treatment, too, is inadequate in an important way and a new analysis is proposed.

Chapter IV treats backward Reflexivization in emotive causatives in which the subject-antecedent condition appears to be violated. First, it is demonstrated that all of the current analyses of emotive causatives are wrong. Then, it is shown that backward Reflexivization in emotive causatives is actually part of a more general problem, namely, backward Reflexivization in non-agentive causative constructions. In Chapter V, it is claimed that backward Reflexivization is actually an instance of ordinary forward Reflexivization in which the true antecedent has been deleted in the course of the derivation. The subject-antecedent condition is claimed to be still operative here.

I have made the following assumptions throughout the thesis. First, case markers do not exist in the deep structure and are introduced by a transformation. The reader is referred to Kuroda (1965b) and Kuno (1972). Second, the VP node does not exist. Third, Japanese is a SOV language and English is a SVO language both on the deep and surface levels. In addition, I have ignored the topic marker wa, which occurs in many of the examples instead of the subject marker ga. The difference in meaning between sentences with ga and sentences with wa in its place is discussed with great insight in Kuno (1972).

English nominalizations and derivational morphology: A transformational analysis

This dissertation investigates the type of category change referred to by traditional grammarians as transposition, and assumes a productive, transformational approach to the relation between multimorphemic items and the stems on which they are based (e.g. writer, write; destruction, destroy). The scope of the investigation is limited to nominalizations in English, with emphasis on the generation of derived nominalizations.

Considering nominalizations in the larger framework of transposition allows the current transformational and nontransformational approaches to be seen as two intuitively valid positions which have been represented throughout the history of linguistics; this allows the question to be viewed as a continuing theoretical issue, rather than as a strictly contemporary problem resulting from the existence of two competing theories.

By investigating derived nominalizations within the framework of all nominalizations, the differences between derived and other kinds of nominalizations can be specified, and the common assumption of both generative and interpretive semantics that all nominalizations are generated by the same means is shown to be invalid. It is shown that, whereas nominalizations such as writer can be derived transformationally by the minimally powerful means of prelexical combining rules, derived nominalizations such as destruction require a more powerful means of derivation, in which target structures of the surface must play an active role.

Pattern, control, and contrast in beginning speech: A case study in the development of word form and word function

This study follows linguistic aspects of the developing communicative competence of a child named Jacob from a first observation when he was twelve months and eight days old until he was twenty months and twenty-two days old. At the time of the first observation, he babbled freely, but had only one vocalization that was recognized as a 'word'. Jacob's native language, and that of his parents and the investigator, was American English.

The study focused on the acquisition of phonology: the sound patterns of those of the child's utterances considered to be words, the way in which those patterns were related to one another, and the way in which they were related to the sound pattern of the language he was learning, English.

In defining the area of study, it was necessary to consider in detail the notion of 'word' in very early child speech. This topic proved to be of interest in its own right, and it became the subject matter for chapter 2 of this work. Chapters 3, 4, and 5 roughly follow the usual mode of description of the phonology of a non-tone language, first, phonetics and phonemic structure, then phonological rules, and last, suprasegmental phonology.

Obligatory Contour Principle (OCP) effects and violations: The case of Setswana verbal tone

This dissertation is an autosegmental analysis of the tonal patterns manifested in the verbs of Setswana, a Southern Bantu language spoken in Botswana and South Africa. Verbal tone in this language is very complex because the tonal patterns fluctuate, depending on many factors. These factors include, but are not limited to, for example, the syntactic environment in which the verb occurs, and the type of morpheme, high or toneless, that precedes the verb stem. The matter is further complicated by the fact that there are two types of verb stems in Setswana, namely, high-toned versus toneless (low-toned). All of these factors taken together result in the variability of verbal tonal patterns attested in this language.

The aim of this study, is to offer an analysis of what may be viewed in the literature on tonal studies as evidence that Setswana verbal tonal patterns violate the phonological principle termed the Obligatory Contour Principle (OCP). The OCP is assumed to be a universal principle by most authors who subscribe to its existence. According to this principle identical features cannot exist side by side. In the case of Setswana tone, the implication is that a sequence of high tones is prohibited. The very presence of these tonal sequences in Setswana presents a case that the OCP does not hold for this language. We disprove this fact by appealing to a weaker version of the OCP whereby sequences of multiply-linked high tones are allowed whereas sequences of singly-linked high tones are not allowed. The conclusion reached is that the OCP is a parametrical principle whose manifestation is dictated by any particular language.

Tense and aspect transfer errors: A new analysis of transfer errors in English compositions of Jordanian university students

This study is an attempt to provide a better understanding of the role of L1 transfer in a relatively neglected area, namely, that of tense and aspect. In particular, this thesis investigates the role of transfer from Arabic into English with regard to forms and functions of the English tenses and aspects.

The study provides a contrastive analysis of the Arabic and English tense and aspect systems. The analysis is conducted in terms of both form and function. The results of the contrastive analysis are checked against errors found in ninety-four compositions written by Jordanian university students. Ten of these error types are discussed in detail.

The study reveals that the investigation of the role of transfer in the area of tense and aspect should take into consideration both form and function. Moreover, the study supports the view that language transfer should be looked at, not as a simple mechanical process, but rather as a complicated phenomenon that interacts in intricate ways with developmental factors of L2 language learning.

The study lends support to Schachter's (1983) approach to language transfer, which acknowledges transfer as a constraint on hypothesis testing.
This thesis is an investigation of both the syntactic and semantic behavior of verb-noun sequences which convey syncategorematic meanings. In terms of their syntactic patterning, the constituent elements in each of these sequences—which are referred to as multiword lexical units—are frozen although not at the same degree. To express this syncategorematic meaning a transitive verb loses its transitivity whereas the noun loses all features which are characteristic of linguistic forms belonging to this category as well as those which are characteristic of nouns functioning as objects of their verbs. Consequently, the nouns cannot participate in any of the morphosyntactic processes they are subjected to, either as nouns or object nouns. The inactivity of the constituent elements of multiword lexical units is—it is contended—indicative of their syntactic opacity. To the extent that categorical labels such as verb, noun and adjective etc. are functional—that is to say, the linguistic forms themselves bearing them are not inherently verbs, nouns, adjectives etc.—linguistic forms which do not function as nouns as revealed in multiword lexical units cannot be treated as nouns; instead they are treated as particles.

In terms of their semantic patterning, multiword lexical units express noncompositional meanings. That is to say, one cannot derive the meaning of any one multiword lexical unit on the basis of its constituents. This points to the fact that multiword lexical units are also semantically opaque. There is, therefore, a clear correlation between syntactic and semantic opacity.

On the basis of these findings three conclusions are drawn. First, multiword lexical units are not syntagmas because they violate the principle of syntagmatic interdependences characteristic of any syntagma, in which the whole depends on the parts and the parts on the whole in terms of both form and function. Second, multiword lexical units have to be treated as lexical units in the dictionary because to the extent that they are not syntagmas, they are opaque both syntactically and semantically. In other words, instead of entering it either under the noun or the verb, a multiword lexical unit has to be treated as an entry. Treating any such unit as a subentry of either of its constituent parts makes the inevitable claim that there is a semantic relationship between the unit and the constituent parts under which it appears. That the claim is untenable is demonstrated by the noncompositional nature of the meanings multiword lexical units express. Third, to the extent that these sequences behave just like single words, their constituent parts are comparable to the syllables of a word. Consequently the internal structure of multiword lexical units is not comparable to that of sequences expressing either literal meanings or nonliteral ones which are derived from the literal ones.

A glossary of the Spanish Inquisition

The ensuing study is a contribution of the studies pursuant to the semantic notions set forth by Jost Trier. According to his theory, no word has
an independent meaning but is a representative of the sum-total of the meanings of all other words which share its same semantic field. Every word brings an influence to bear upon another word, and this influence must be reckoned with in the understanding of the meaning-content of a word. So, in the study under consideration, as is evident in Chapters III and IV, the total word-complex comprising this field plays a role in the determination of the connotations accompanying each individual word.

This, then may be viewed as an application of Trier's theory to the semantic field of the Inquisition. It is an attempt to demonstrate that the meaning of each word in the glossary must be interpreted in the context of the whole semantic field in which it occurs.

The glossary included in this work is a compilation of terms used in Spain referring to the Inquisition. It focuses mainly on expressions in currency during the sixteenth century (the earliest being 1464, the latest, 1660) with a preponderance ranging from 1550-1580. They have been culled from documents written by those involved in the Inquisition during this period (a fuller discussion of the sources used will be found in Chapter II).

In the quotations of the glossary, the spelling as well as punctuation of the original documents were retained. For this reason many apparent inconsistencies in both will be observed. It was during the sixteenth century that the Spanish language became standardized and with it came unification of spelling, but some documents still reflected the instability that had been present earlier. No attempt has been made to list these spelling variants separately in the entries. In a study whose orientation is semantic rather than phonetic this seemed irrelevant.

The main entry is presented in the written form of the standard language whether or not it actually occurs in the records. Where a variant of the word occurs in the quotation, it is listed after the main entry. Variant is to be here understood as a morphemic alternation.

The definitions have been established by means of the context in conjunction with certain contemporary and modern lexica. These are listed in Chapter II.

The words are arranged alphabetically by single word entries. Phrases are listed under the entry of the head constituent. An attempt has been made to cross reference all words with lexical meaning in each group.

Chapter III is a catalog of all expressions used in the glossary, grouped according to semantic sub-fields.

Chapter IV contains an analysis of the entire vocabulary and the role of its constituents in the total picture of the Inquisition as presented in this study.

Varieties of business English. A linguistic analysis of written texts

The spread of English as an international language has resulted in the development of several varieties of English that are used by particular groups for specific functions. Among these varieties, one that has gained considerable prominence is Business English. This prominence is evidenced
by the growing number of non-native speakers who use English on a regular basis for the conduct of business and by the increase in pedagogical materials for teaching Business English. But despite this interest in Business English there is a lack of empirical research to investigate the fundamental questions concerning the description of Business English.

This dissertation draws on research from several general areas of linguistic inquiry: Text Linguistics, Discourse Analysis, Ethnography and Sociolinguistics. The Literature Review in Chapter 2 discusses the research in these areas which pertains most directly to the questions and concerns of this study. Since the primary goal of this study is the analysis and classification of one variety of texts — Business English — the review begins by examining some of the concepts and notions that have been used to classify texts: genre, text type and register.

An analysis of written business texts is presented in Chapters 3 and 4. The analysis presented in Chapter 3 is a comparative quantitative analysis of selected linguistic features and structures in business and non-business texts. Chapter 4 presents a qualitative analysis of some salient features of business texts from selected genres.

The findings of this study have implications for issues related to the typological classification of texts and for the pedagogical purpose of teaching Business English to non-native speakers of English. The final chapter (Chapter 5) draws together the analyses presented in the preceding chapters and summarizes their contribution toward answering the central questions related to the typological classification of texts and the pedagogical concerns.

A logic feature structure and unification with disjunctive and negative values

This dissertation proposes a unification-based formalism to provide a common basis for a computational realization of different linguistic theories, GPSG, HPSG, and LFG in particular, both as a means of theory testing and for the purpose of developing natural language processing systems. A logical language, called LFD, is proposed to describe feature structures and unification as common components across different theories.

The goal of formalism is to provide an efficient computational solution to the unification problem while allowing enough expressive power for common linguistic concepts, such as disjunctive and negative values, and value sharing. The semantics of disjunctive and negative values is reevaluated as constraints on instantiation of unspecified values, and the semantics of negative values is defined in such a way that the satisfiability is monotonic with respect to the subsumption order. An intuitive correspondence between disjunctive and negative values e.g. 'first- OR second person' and 'NOT third person', is formally captured as logical equivalence, and further extended to complex values.

Underspecification, a central notion in unification-based formalisms and theories, is viewed as a property of the description of feature structures, rather than structures themselves. A special purpose atomic value, called 'unspecified value', is proposed as a primitive expression of LFD. This value plays a crucial role in stating disjunctive values in terms of logically equivalent negative values in the underspecified description of feature structures.
structures. Furthermore, this value makes it possible to express obligatory instantiation of values without specifying a particular value, a long-standing problem for which no coherent computational solution has been given.

Any formulas of LFD can be converted to a clausal form similar to Horn clauses, called negative definite clauses, whose satisfiability can be computed in polynomial time. A preprocessed form, called a prefix closure, of formulas to specify value sharing is proposed. Although the conversion of formulas into negative definite clauses could expand the size of input formulas exponentially, thus nullifying the computational efficiency of the clauses, the computational advantage of the proposed approach is shown in the context of consecutive unification operations.

Intelligibility: The case of non-native varieties of English

This study examines the concept of intelligibility from several points of view: interpretive, linguistic, and pedagogical. It is shown that intelligibility is a sociolinguistic notion; i.e., it is grounded in the structure of language, and finds its meaning and applicability in the use of language among participants in speech activity. It is shown to be the most felicitably interpretable with reference to the levels of language, from narrowest phonetic detail to broadest cultural assumptions. Two empirical investigations are reported on. The first is an examination of a non-native variety text, Kanthapura, by the Indian writer Raja Rao. The intelligibility of the text is examined, though no attempt is made to quantify its degree. This investigation contributes to the growing literature on non-native varieties of English, and speaks for the legitimacy of the "new Englishes." The second empirical study is a phonetic investigation of the timing differences between interstress intervals of zero and one unstressed syllable in the Indian and American English of twelve informants. The hypothesis, that significant deviation in timing across the varieties exists, is borne out. An attempt at verification of this difference in the perception of linguistically unsophisticated native and non-native listeners indicates that the difference is not salient enough to override other features of speech in determining overall intelligibility. Finally, implications of research in intelligibility for various linguistic enterprises are discussed.

English aspectual verbs

This work is an explication of part of the linguistic competence of every speaker of English. I feel that the theory of transformational-generative grammar, whose goals were first defined in Chomsky (1957), provides the best means of characterizing this competence and have assumed its fundamental correctness throughout. In addition, I have drawn upon the theoretical advances of Lees (1960), Katz & Postal (1964), and Chomsky (1965).

Unless stated explicitly otherwise, the specific theoretical framework will be that of Chomsky (1965). In other words, I assume that there exists a well-defined level called deep-structure which is equivalent to neither surface-structure nor semantic representation, but is intermediate between them. I assume, along with Chomsky, that there exist transformational rules, which
map deep-structures onto surface-structures, and there exist interpretive rules, which map deep-structures onto semantic representations. Furthermore, I adopt his assumption that it is at the level of deep-structure at which selectional relations between lexical items are defined, that at this level "strict subcategorial and selectional restrictions of lexical items are defined by transformational rules associated with these items." (p. 139)

I have not adopted in the main body of this work any specific proposals for alteration of the grammatical model made since Chomsky (1965). However, I did not do so only because Chomsky (1965) was the most detailed exposition of grammatical theory available, rather than because I agreed with it on all points. In the section entitled "Concluding Remarks" I will show how evidence from Chapters II through VI points toward the incorrectness of Chomsky (1965) on several basic issues.

An investigation of syntactic and semantic errors in the written composition of Arab EFL learners

This study is an attempt to investigate the syntactic and semantic errors in the writing of Arab students studying English as a foreign language and to examine the relevance of these data to L2 universals.

The study is based on 150 compositions selected from the written English of first and second-year English majors at Yarmouk University in Jordan. The compositions are analyzed and a number of deviations are identified, sorted out and classified according to their type, level of structure and source of interference inter- or intralingual. Thirteen categories of syntactic and semantic errors are found to be problematic and explained. The study reveals that mother tongue interference plays a major role in students' writing.

Unlike previous studies which have generally focused on structural errors, this research specifically shows that deviations are due to several factors: linguistic and non-linguistic. First the deviations identified here are shown to be common to all ESL/EFL learners and not particular to Arab EFL learners. Second, it is argued that the processes of foreign language learning are not any different from second language learning. Third, the study suggests that certain categories of errors can not be explained in reference to a particular language rather by allusion to universal parameters that language learners in general possess as part of their language faculty. Finally, it is argued that limiting the scope of error analysis to linguistic structure and psycholinguistic factors in an attempt to construct a theory of language learning is in itself not sufficient. One must consider other factors as well. For instance, a focus on the communicative function of the language in its sociocultural context in addition to other non-linguistic factors is equally important for a more comprehensive theory of language learning.

The theoretical and pedagogical implications of these results for foreign language learning/teaching are discussed.
The history and development of the verbal system of Early Middle Indic

Between the periods of Old Indic and Early Middle Indic (represented here by Sanskrit (Skt.) and Pali (Pa.) respectively), heavy restrictions developed on surface consonant cluster and on syllable structure in general. Although these changes caused considerable restructuring in the language as a whole, their most interesting effects can be seen in the verbal system of Pali, where extensive reinterpretation of the derivational processes, both morphological and phonological, were necessitated. The changes which took place between Sanskrit and Pali continued to have a tremendous effect throughout the entire history of the development of the Indic languages. However, it is not practical to extend the scope of this study beyond the Early Middle Indic period without sacrificing a thorough and detailed interpretation of one aspect of the language for a more superficial survey of a greater amount of data. It is thus the purpose of this study:

1. to show how the above-mentioned changes led to restructurings in the verbal system;
2. to show how certain processes involved in the derivation of verbal forms were reinterpreted to conform to this restructuring;
3. to consider the theoretical implications of the topics under discussion.

Problems in tone assignment in Shona

In this work, I provide a synchronic grammar of tonal phenomena in the Karanga dialect of Shona, a Bantu language of Zimbabwe. This investigation is taken out within the framework of autosegmental phonology. In the first chapter, I review the literature on tone in Shona, and sketch the morphological structure of the language. In the second chapter, I investigate a number of tonological phenomena which are conditioned in part by word boundaries. I argue that the Elsewhere Condition is a necessary principle of language based on an analytical problem which develops in this chapter. I also argue that rule exception features may be assigned by rule, and demonstrate that the Unordered Rule Hypothesis is falsified by the data of Shona.

In the third chapter, I consider problems which occur in accounting for the tonal rules of nominal prefixes. I argue for an autosegmental treatment of tone, based on a problem of stateability in the Associative Lowering rule. I also argue that the Elsewhere Condition is the only condition which properly assigns a disjunctive relationship between Associative Lowering and Associative Raising. In the fourth chapter, I discuss tonal problems in verbal prefixes. I motivate three central rules which account for the majority of forms, and argue that abstract contoured tones must be allowed at various stages of the grammar to account for violations of the conditions on the three core rules of prefixed tonology. I then discuss how the tone of verbal prefixes can be predicted by reference to morphosyntactic conditions.

In the fifth chapter, I discuss tonal alternations in verbal stems. I discuss the tone pattern of II toned verb stems in assertive verbal forms, and consider a number of analyses which account for this pattern. I then discuss the tone
pattern of nonassertive verbs, and argue there for an abstract tonal melody HHLB, which is associated with the verbal stem. I argue for various refinements of the mapping rule and the rule inserting this tonal melody. Finally, I consider a number of idiosyncratic tonal melodies employed in the perfective, subjunctive, and instrument nominalizations. I attempt to put these melodies in historical perspective with data from other Bantu languages.

*Roles of empathy in Japanese grammar*

The grammatical status of Japanese simplex sentences containing deictic giving verbs, *kureru* and *yaru* 'give,' and motion verbs, *kuru* 'come' and *iku* 'go,' cannot be adequately analyzed by subcategorial or selectional information alone. The speaker's empathy toward participants of events or state described by the sentences plays a crucial role in analyzing these sentences. This dissertation deals with empathy related phenomena appearing in sentences which contain giving and motion verbs.

First, the empathy related principles are formulated based on the concept of relative empathy. These principles are used in the discussions throughout the rest of the dissertation. It is then demonstrated that the choice of the giving verbs, *kureru* and *yaru*, depends solely on the rank between the giver and the receiver of the concreted object or the favor in the speaker's inner feeling empathy hierarchy. It is further demonstrated that the nature of the goal of motion is not sufficient to determine the proper motion verbs in a certain discourse. The rank of the goal in the speaker's empathy hierarchy determines the correct motion verbs when the speaker's location at time of utterance or time of reference is not relevant to the motion.

It is also shown that the choice of the proper giving verbs and motion verbs in the embedded sentences is determined by the speaker's empathy hierarchy and/or referent of the matrix subject's empathy hierarchy, depending upon the nature of the embedded clause and the matrix predicate.

Finally sentences involving double NP deletion from a single clause are observed. By looking into the process of recovering the underlying structure, two separate constraints are proposed, on recovering the underlying structures of clauses which contain empathy verbs and for clauses which do not. A comparison of these two constraints then reveals that empathy hierarchy expressed by the clause is as important as the Universal NP Accessibility Hierarchy in formulating these constraints. It is concluded that the concept of empathy, which is a semantic/pragmatic notion, is an essential element in discussing the structure of sentences.

*Tense and time in Japanese*

This study deals with questions of tense and aspect in present-day Japanese, such as whether Japanese is an aspect language or a tense language or something else, what kinds of temporal relationships there are between the times indicated in the superordinate and subordinate clauses in the complex sentence, and what factors determine the temporal relationships.
Japanese has only two tenses, or tense forms, which are the nonpast tense (a.k.a. the ru-form) and the past tense (a.k.a. the ta-form) and these two have to play a number of roles. Some analysts contend that the tense forms are aspect formatives which indicate perfective and imperfective aspects. Other researchers, who are the majority, claim that the tense forms, particularly in the subordinate clause, can be tense or aspect. Our position is closer to the latter since we retain the concepts of tense and aspect for Japanese but there is a fundamental difference between the common approach and ours. Our approach sticks to the orthodox definition of tense: whenever tense forms can designate times, they are tense. This definition is accepted by many analysts but is forgotten in their analyses of subordinate tense.

Chapter 1 introduces the two tenses and their basic characteristics.

Chapter 2 examines Kunigiro's Aspect Theory, which claims that Japanese is an aspect language and the two tense forms are aspect markers, even in the simple sentence. We will refute this theory and demonstrate that Japanese embraces both tense and aspect. Our concepts of tense and aspect are a little different from those that have been maintained by most analysts.

Chapter 3 is devoted to scrutiny of the tense forms in the complex sentence. Several works, including traditional and more recent ones, will be introduced and examined. During the course of analysis, our approach will be introduced.

Chapter 4 deals with more basic concepts of tense and aspect. This chapter also mentions major factors involved in determination of relationships between the two times in the complex sentence, such as combinations of tenses, types of conjunctions, types of constructions, and meaning.

Some problematic issues in the study of intonation and sentence stress

The two issues examined are: the assumption that there exists an intonation pattern that can be characterized as "normal" or "neutral"; and the issue of whether intonation can have any effect on the form taken by the syntactic structure of the utterance to which it is assigned.

In regard to the first issue, neutral and normal intonation are shown to be two distinctly different types of intonation patterns according to their functions. Neutral intonation is defined as the intonation that is "normally" or "regularly" applied to an utterance, without reference to sentence structure or speaker intentions. It is then shown that neutral intonation cannot exist because stress, an integral part of intonation, is always assigned in a meaningful manner and so intonation must always be meaningful, too. Normal intonation is shown to exist, but it can only be defined in such an inexact way as to render it useless as an empirical standard. In demonstrating this, it becomes clear that neutral/normal intonational form and neutral/normal function are not necessarily found in the same intonation pattern, as has been assumed by others.

In regard to the second issue, it is shown that intonation does indeed have the capacity to influence the shape of the syntactic structure chosen by the speaker in forming an utterance. The primary motivations behind such influence are style and ease of articulation. Speakers will frequently opt to
employ a noncanonical syntactic structure if by using such a structure a more easily articulated or stylistically preferable intonation pattern can also be used.

This dissertation also gives detailed reports of two studies which support the above claims. One of these studies shows that the intonation pattern identified as the "normal" pattern is actually very commonly used and is assigned to utterances of all types and all lengths with significant consistency, thus giving support to the contention that this can indeed be called the "normal" pattern. The second study gives evidence that the judgments as to the semantic equivalency of different types of utterances can be strongly affected by stress placement.

Aspects of Malay phonology and tonology

This dissertation is a descriptive study of a dialect of Malay spoken predominantly in the southern State of Johore, in Peninsular Malaysia (JM). It is concerned with synchronic aspects of Malay phonology and morphology. Its two main objectives are first, to attempt to describe some selected variety of phonological and morphological alternations found in the language and to make that description be as revealing of the processes of Malay phonology and morphology as possible, and second, to argue for a difference in status between phonological rules and morphological rules based solely on the facts of Malay. Specifically, the object in the second case is to show that the relegation of morphological rules to a set of "readjustment rules" as proposed in the standard theory of generative phonology (cf. Chomsky & Halle, 1968: 9-11 and 371-372) not only causes some important generalizations to be missed but also is inconsistent with the role played by morphological processes, such as reduplication in languages like Malay.

The discussion of the Malay data is organized into five chapters. Chapter I presents the vowel and consonant phonemes of JM. The distinctive features of the JM phonemes are presented with motivations for their selection. Chapter II discusses some general phonological processes. Of particular interest are the cases of vowel lengthening and vowel reduction, both of which present problems of rule ordering. The discussion on morphology begins in Chapter III focusing first on the morphological structure of the language; later, some general morphological processes, such as affixation, reduplication, and rhyming, are examined. Chapter IV is devoted to a discussion on dialectal variation. Attention is drawn, specifically, to variation that occurs in the process of vowel nasalization, since this presents a case of variation that leads to different ordering of rules in the dialects under consideration. Chapter V discusses the theoretical implications of rule ordering and, in particular, the claim that the application of some phonological rules may be intermixed with morphological rules, such as reduplication (cf. Anderson 1974), is examined. It is argued that in order to capture the generalizations present in the morphophonemic processes, like vowel lengthening, vowel nasalization, reduplication, etc., in a more insightful manner, the theory of generative phonology must be extended. In this regard, the analysis proposed in the present study will demonstrate that the proposals that global rules should be added to the theoretical machinery are fully motivated. Particularly in the analysis of reduplication, the decision to adopt the global rule treatment
eliminates indiscriminate use of rule ordering, and also strengthens the
theory which claims that all morphological processes apply before all

Lama phonology & morphology

Lama is a Gur language of the Oriental Subgroup spoken in the districts of
Kéran and Doufelgou (Défale') as a native language. It has received little
attention in the field of linguistics and particularly within the framework of
generative grammar.

This dissertation is a detailed description and analysis of the interaction
between phonological rules and morphological rules in Lama.

The dissertation consists of 5 chapters. The first, introductory chapter
locates the language in terms of geographical and typological affinities with
the other Gur languages of the Central Gur language family. In Chapter 2, we
provide a description and an analysis of the sound system. Of particular
interest are the sections on consonant alternation and Advanced Tongue Root
(ART) vowel harmony. Chapter 3 considers syllabification rules in the light of
CV-phonology. Chapter 4 gives a detailed account of the general tone rules in
the language (high tone spread, contour tone simplification, low tone
deletion), and concentrates on the tonal rules of noun morphology. Of
particular relevance is the interaction between the tones of noun roots and
the tones of noun-class suffixes. Chapter 5 is an analysis of the tonal system in
the verb morphology. It is shown that while Meessen's rule applies in the
language generally, its application in noun morphology differs from its
application in verb morphology. Another important section in Chapter 5 is the
section on the interface between phonology and syntax particularly in the
perfective aspect.

Syntax and semantics of the passive construction in selected South Asian
languages

The present study is intended as a contribution to the study of syntax and
semantics of the Passive construction in six South Asian languages (i.e., five
Indo-Aryan languages — Hindi, Marathi, Nepali, Kashmiri, Punjabi, and one
Dravidian language — Kannada). The major points of focus are as follows:

(1) Chapter II describes, compares, and contrasts the linguistic features of
the Passive construction in the above languages.

(2) Chapter III examines the adequacy of the definitions of Passive proposed
in Relational Grammar (i.e., Johnson 1974, Keenan 1975, Postal & Perlmutter
1974) and points out that (a) relational categories (subject, etc.) are not
discrete entities and that their properties vary from language to language
therefore, they cannot be treated as the 'foundation' of the syntactic structure
of language, and (b) neither subject-demotion nor object-demotion is complete
in Passive in the above languages.

(3) In Chapter IV the functions which are performed exclusively by Passive
sentences are determined. It is argued with evidence that syntax, semantics,
and pragmatics play a role in determining these functions in the above languages. Evidence is also provided for assuming the existence of the Passive rule in the above languages.

(4) Chapter V points out that exceptions to Passive are regular and systematic across the languages under focus, i.e., they express a volitional act, while verbs which undergo Passive typically express a volitional act. It is claimed that Passive in the above languages may be labelled as a governed rule (Green 1976) since it admits a semantic class of verbs in its structural description. It is also proposed that exceptions can be used as a parameter to define constraints on syntactic rules.

(5) Chapter VI focuses on the syntax, semantics, and pragmatics of the postpositions/suffixes which mark the agent in the Passive sentences in the above languages. The conditions which determine the choice of postpositions/suffixes are discussed.

(6) Finally, theoretical/empirical implications of the discussion of the above topics are discussed in Chapter VII.

This study is also important for the study of (a) the typology of the Passive construction and (b) the hypothesis about 'India as a linguistic area' (Emeneau 1956, Masica 1976).

Theoretical aspects of Dakota morphology and phonology

This thesis investigates some morphological and phonological processes in Dakota, an American Indian language. It attempts to show that recent revisions of and additions to the theories of morphology and phonology will more adequately account for certain problematical processes in Dakota. A recent innovation, Lexical Phonology, is shown to be an effective way to account for the high degree of interaction between the morphological and phonological processes. It is argued that inflectional and derivational morphology are carried out in the same component. Extensions in phonological theory involving the content and internal structure of segments is shown to be of significant value in the construction of certain phonological rules of Dakota. The syllabic structure of Dakota is discussed and is shown to be relevant for the characterization of certain morphological processes, specifically reduplication and infixation.

Language change and infinitival complements in Old French

This study presents an analysis of infinitival complements constructions in Old French which differ syntactically from their Modern French parallels. The analysis is formulated in the terms of the Government and Binding framework and it has the aim both of accounting for the constructions in question on the basis of the evidence available from textual sources and of providing indications as to the means of describing the subsequent evolution of the constructions.
The material evidence on which this study is based includes the results of an original study of circa 40,000 lines of material from Old French texts. Organized subsets of the data are displayed in an Appendix.

The analysis distinguishes three types of infinitival complements in Old French. The causative construction in Old French (the type: *il me l'a fait voir* ('he made me see it'), unlike its Modern French counterpart, is shown as occurring with Impersonal and Order verbs as well as with Causative and Perception verbs. Two non-causative infinitival complement constructions are analyzed and distinguished especially in terms of pronoun placement characteristics, as: *il me viendra voir* ('he will come to see me') versus *il oubliera de moi voir* ('he will forget to see me'). In the former construction, the pronoun complement in its weak form precedes the main verb and, in the latter construction, the pronoun complement in its strong form precedes the infinitive.

The analysis proposes that the construction characterized by the presence of the strong pronoun is to be described as including an S' complement, whereas the constructions with weak pronouns are to be described as including VP complements. It is further proposed that the subsequent evolution of French indicates an increase in the use of S' infinitival complements, with the remaining causative constructions appearing as relic VP infinitival complement types.

The study is divided into two parts: Part One includes a general discussion of the treatment of syntactic change in the Government and Binding framework, and Part Two consists of three chapters devoted to the analysis of the Old French infinitival complements and of comparative data from Modern Romance, especially Italian.

*Empty noun phrases and the theory of control with special reference to Thai*

This dissertation deals with theories and principles that assign referents to empty noun phrases. The major principles are: Control Theory, Binding Theory, and pragmatic principles. These principles are ranked in terms of the order in which they are applied in the attempt to assign an antecedent to an element. This hierarchical order is based on their domains of application.

The control relation is argued to be a local relation. Three types of control relations are proposed: Rigid Control, where no lexical NP can occur in place of a pro, Thematic Control, where only coreferential lexical NPs can occur in place of a pro, and Non-rigid Control, where lexical NPs can occur without restriction.

The principle of Argument Inheritance is proposed to account for the coreferentiality of the arguments in the adjunct *hau*-clauses with those in the matrix clause. The adjunct *hau*-clauses inherit the argument structures from the matrix clauses. The principle of Argument Inheritance is distinguishable from the Control Theory in several respects.

On the treatment of length in generative phonology

This thesis can be viewed as the initial step in an attempt to determine the validity, or more precisely, the initial step in an attempt to determine what the correct explanation of the dual behavior of long segments is.

The first step in this undertaking is to determine the range of ways in which long segments can manifest this dual behavior. Until recently it has been presupposed that the permutations are very simple. The usual assumption is that some languages have one representation exclusively and others have the other exclusively. In other words, in a given language long segments act uniformly either like clusters or like single segments throughout the language. This view was called into question by Michael Kenstowicz in his dissertation on Lithuanian phonology, the relevant parts of which were later published in the form of a paper entitled "On the Notation of Vowel Length in Lithuanian." (Kenstowicz, 1970). He argued that long vowels in Lithuanian act both like single segments and like clusters, which clearly invalidates the usual assumption. Once it is clear that this position must be abandoned, we must attempt to ascertain the range of possibilities which a theory of length must account for. In Chapters I and II, we pursue this issue. In Chapter I, we discuss in some detail the behavior of long vowels in West Greenlandic Eskimo (W.G.). We show that long vowels, as in Lithuanian, act both like single segments and like clusters in W.G., then we consider two relatively simple theories which one might propose to explain the behavior of length and argue that they are inadequate on the basis of data from a variety of other languages. Chapter II is devoted to establishing that long consonants also exhibit this dual behavior in a single language, namely Amharic. We argue that the two theories considered in Chapter I, are also incapable of accounting for the behaviour of long consonants. In the course of this argument, we have occasion to discuss some of the complexities of long consonants in other languages.

Having acquired in the first two chapters a general idea of the capabilities which an adequate theory must have, in Chapter III we take up several topics of relevance to determining what this theory is like. First, we propose that three types of processes naturally treat long segments like single segments which, if true, ought to be explained by the theory of length. Second, we examine three possible theories, which superficially seem to be reasonable possibilities. We argue that two of them are inadequate largely on the basis of the fact that they assume that there is one length feature, which we show to be necessary for a natural explanation of certain alternations. Third, we propose the hypothesis that all length alternations are accounted for by feature changing rules. And, finally, we suggest that the dual behavior of long segments is only one facet of a much more general phenomenon.

The grammar of Serbo-Croatian clitics: A synchronic and diachronic perspective

This dissertation represents an analysis of Serbo-Croatian clitics from both synchronic and diachronic perspectives.
Studies in the Linguistic Sciences 22:2 (Fall 1992)

Serbo-Croatian clitics are second-position clitics and include auxiliaries, pronouns, and sentential particles.

The major issues addressed in the synchronic analysis include: the definition of clitics, the origin of clitics and their underlying position, placement of clitics, the definition of 'second position', and the formulation of Clitic Ordering filter.

The most important outcome of this analysis is the treatment of clitics as a phonological phenomenon and statement of their placement in terms of the prosodic structure of the utterance. Such an analysis makes it possible (1) to distinguish clitics from other elements which appear stressless at the surface level, by defining clitics as words which lack stress at the underlying phonological level; (2) to account for the fact that clitics display characteristics of both independent words and affixes, by showing that clitics behave as independent words at the syntactic level, while the feature [-clitic] has relevance only at the phonological level; (3) to explain why words which belong to different syntactic categories exhibit identical surface behavior, by showing that their peculiar placement in the clause is a result rather than a cause of the fact that they are all clitics; (4) to define 'second position' in terms of prosodic structure.

The major goal of the diachronic analysis is to show how simple clitics (belonging to VP and enclitics on V) became special clitics (belonging to the clause and sticking up in second position). The evidence of various phases of Serbo-Croatia history suggests the following hypothesis: From V-initial structures in which sentential clitics (particles, SC) were followed by the verbal enclitics (VE) the clause second order SC-VE was generalized to all other structures. As a consequence, the category of phrasal clitics was in fact eliminated. The only remaining phrasal clitic, the possessive dative, therefore was likewise given up.

A semantic and syntactic analysis of noun complement constructions in English

In this thesis I will try to show the necessity of analyzing certain noun complement constructions in terms of 1) the meanings of the embedding predicate and 2) the modalities of the complement. It is only in this way that one can adequately describe the similarities and differences in the meanings of the constructions and in the restrictions on them. The meanings of the embedding predicate are sketched only to the extent needed for discussing certain restrictions: the distinction between performative and nonperformative, between acts and events, and states and evaluations, and between emotive and nonemotive.

The basic modalities distinguished are power, occurrence, truth and future truth. Each of these is divided into necessity or possibility.

The restrictions on the constructions have to do with the type of complement subject and predicate required, the range of complement negation, and the choice of that or infinitive complementizers.
The main thesis of this dissertation is that Sequence of Tenses (SOT) is not an actual rule of English grammar. I argue that the deep and surface structure tenses are the same in cases formerly thought to be examples of SOT. This is done on the basis of a study of the contexts in which the past and present tenses occur in both main clauses and SOT environments. Pragmatic factors, including the speaker's purpose in uttering the sentence determine tense selection. The speaker may choose the past tense over the present to avoid conveying certain implications associated with the use of the present tense, which would be misleading or superfluous to the intended communication.

I also argue that the past tense means only 'true in the past' in some possible world. The notion 'no longer' true is conversationally implicated rather than entailed. I show that the same factors condition tense selection in main clauses and SOT environments. This allows a unitary treatment of "normal" and "deviant" uses of the past tense in all types of structures, thus eliminating much of the need or desirability of a rule of SOT.

Finally, I argue against a claim that SOT is ordered after Raising in the cycle to prevent it from applying in raised structures. Such an ordering statement assumes that SOT is a rule. As part of my evidence against the rulehood of SOT, I show that tenseless/verbless structures have a different discourse function from tensed clauses. From there, I argue that infinitives (as well as other tenseless/verbless structures) are not marked for tense underlyingly. I support Smith's (1976) claim that the have which occurs in infinitives is a relational element indicating anteriority rather than a tense. It is suggested that the occurrence of have is pragmatically conditioned. Have occurs underlyingly only in those infinitives where the temporal relationship between the higher and lower verbs is not inferable. The import of these conclusions is that SOT in infinitives is ruled out on grounds other than ordering, and so there is no reason to consider it a syntactic rule of English.
to hint more frequently on the MCQ than on the DCT. These results argue against the use of elicited data, particularly in non-Western contexts.

Counterfactuals: A pragmatic analysis of presupposition

Logical properties of verbal predicates have been of interest to linguists working in the generative framework since the observation by Kiparsky and Kiparsky that complementizer factive predicates (e.g. regret, be aware) which are judged to cause their embedded complements to be presupposed to be true, and counterfactive predicates (e.g. pretend) which are judged to cause their embedded complements to be presupposed to be false, are analyzed.

Work by linguists such as the Kiparskys, Karttunen, Keenan and Morgan is discussed and two types of definitions of presupposition are analyzed: semantic or logical definitions which are based on formal language definitions by logicians such as Van Fraassen, and pragmatic definitions which view presuppositions of both types are found to be deficient in rigorously accounting for the presupposition judgments made by speakers of natural languages. No comprehensive definition is formulated. Rather, a rule of thumb is proposed.

Three classes of predicates which have been termed factive in the literature are investigated: (1) cognitive predicates which attribute mental attitudes to people and which are non-specific as to information source (e.g. know, be aware); (2) sensory verbs which report sensory events and states (e.g. see, taste, sound); (3) emotive predicates which report emotional states and reactions. The presupposition judgments associated with these three classes of predicates are explained by pragmatic principles reflecting speakers' knowledge of the conventional use of language and of the normal workings of the world. Three pragmatic principles are formulated: The Principle of Complete Knowledge (PCK), that people are expected to know certain things about themselves; The Principle of Sensory Information (PSI), that sensory input is normally taken to be accurate; The Principle of Emotional Reaction (PER), that emotional reactions occur as responses to real states and events (not imagined or hypothetical ones). These principles and Gricean maxims of conversation offer explanatory accounts of the presupposition of factives. Presupposition judgments are normal judgments but not necessary ones. Misrepresentation and knowledge based on error are possible. Lexical representations of factive lexical items which include presupposition features are shown to be inadequate. Evidence from several languages (Hidatsa, Papago, Spanish) is given in support of a conception of presupposition as part of a more universal phenomenon in language: the existence of grammatical mechanisms for providing hearers with information about a speaker's conviction to the truth of matrix and embedded propositions.

Pretend as a putative counterfactual predicate is discussed, and it is argued that a logical account of pretend as a predicative containing an incorporated negative is incorrect. Claims that speakers systematically vary in their interpretation of pretend-sentences according to parameters described logically (internal vs. external negation, entailment vs. presupposition) are shown to be incorrect based upon two informant surveys (N=64). An explanation of informant variation in terms of contexts imagined during the
judging of sentences is advanced in support of the non-homogeneous dialect classes found.

The investigation of lexical counterfactivity is continued with reference to data from Toba-Batak (Sumatra) and Chinese. It is shown that putative counterfactuals in these languages are better characterized in pragmatic terms than in logical one. A paragon hypothetical counterfactual in English is discussed and it is argued that surface disparities resulting from opposite patterns of negatives for factive-containing and counter-factive containing sentences could not be tolerated by a natural language whose purpose is to permit efficient communication.

A study of Kinyarwanda complementation

The purpose of the study is to provide a detailed description of the Sentential Complement Structure of Kinyarwanda, a Lake Bantu language spoken in Rwanda, Uganda and Eastern Zaire around the shores of Lake Kivu.

In addition to providing a description of the basic complement structures of the language, the thesis deals with two theoretical problems. The first problem concerns the question of whether complementizers are to be represented in the deep structure or whether they are to be introduced by transformation. Evidence from the data we have presented suggests that, since complementizers have semantic content in this language, they must be in the deep structure.

The second problem that is investigated here concerns the effect of movement rules like Raising on complement structures. It is shown that movement rules violate Island Constraints, in the sense of Ross (1967). This apparent violation of Ross' Constraint is explained in terms of language typologies, Kinyarwanda belonging to that group of languages that violate Ross' Constraint.

Cheyenne verb agreement in GPSG

This is an analysis of the verbal agreement system of Cheyenne, a member of the Algonquian family of Amerindian languages, in terms of the Generalized Phrase Structure Grammar (GPSG). Agreement in this theory works by a mechanism of feature matching among nodes of a tree diagram which represents the structure of units of the language, either words or individual morphemes.

A necessary prerequisite for such a treatment is a reanalysis of what have previously been called directionality markers, as instead marking the person and grammatical relation of one argument of the clause. In addition, the marking function of each verbal agreement affix is formulated explicitly, in terms of features, to provide a precise mapping from the agreement features at the level of the word to lexical features which occur on the nodes of the agreement affixes themselves.

The internal structure of the word is then described by rules analogous to the rules of syntax describing the structure of sentences. In particular,
Feature Instantiation Principles license the occurrence of features on nodes of the trees of word structure just as they do for sentence structure. It is seen to be the Foot Feature Principle of GPSG that plays a crucial role in an account of verb agreement.

Also within the word, rules of Linear Precedence determine the order of the elements of the word. This is true not only in trivial ways, such as the ordering of prefixes before stems, but also in ordering morphemes according to features of person, number, animacy, and obviation. This, along with the reanalysis of directionality markers, provides a re-interpretation of the Algonquian person-animacy hierarchy, in terms of left-to-right order rather than logical precedence.

The account of verbal agreement given here thus provides evidence for rules of syntax operating within the word, with the morphological component viewed as a word-syntax.

Lexical strata in generative phonology (with illustrations from Ibero-Romance)

The purpose of this dissertation is to study the role that the different components of the lexicon play in generative phonology, and to sketch a proposal for dealing with these phenomena.

Previous treatments of this aspect of phonology are reviewed and their relevant observations are incorporated into the theory proposed here. But the present proposal is based on a large extent on data from three Ibero-Romance languages — Spanish, Portuguese, and Catalan. I have drawn most heavily from Spanish and least from Catalan. This is due in part to the existence of several studies of Spanish done in the framework of generative phonology.

Although most of the data from these Ibero-Romance languages would be the same for the majority of their dialects, the examples given here are transcribed according to the pronunciation of Standard Mexican Spanish, the Paulista dialect of Portuguese, and the Oriental dialect of Catalan.

It is assumed that the reader of this work is acquainted with the theory of generative phonology as exposed in Chomsky & Halle. The Sound Pattern of English (1968), Postal. Aspects of Phonological Theory (1968), and in Chapter I of McCawley. The Phonological Component of a Grammar of Japanese (1968). For this reason, this dissertation does not contain an Introduction that would explain the precepts of generative phonology.

Hyper sent en ces

This thesis deals with part of a model of human linguistic capability. In each of the first three sections I will present evidence which demonstrates the necessity of assuming a different sort of abstract constituent in deep structure which differs in some rather striking ways from most other underlying constituents. In the first place, each of the constituents for which I will argue is entirely abstract in that no surface structure form is ever directly traceable to any of these underlying constituents. Secondly, they are all odd in that the
relationship which they bear to the rest of the deep structure is not at all obvious. All that seems clear is that these constituents must be outside of the remaining sentential structure. Finally, they differ from other abstract grammatical entities in that they are either universally present or, at least, are universally possible. There exist arguments that they are to be postulated as occurring in the underlying representation of every sentence of every natural language. This conclusion will follow from a simplifying assumption about these three different sorts of constituents which will be presented in the fourth section. The remainder of the thesis will be concerned with providing a more detailed theory through the investigation of some of the predictions which the theory makes and subsequent modification of the theory to make it conform to the data which are available from human languages. These modifications will in general involve an increase in the specificity of the theory.

A phonology of Italian in a generative grammar

This is intended as an introduction to the study of Italian pronunciation. It covers briefly the XVI century descriptivists, the XIX century historical phonologists, the phoneuticians, phonemics and normative grammar. Although the material is intended to be comprehensive, critical attention is paid to works of insightful support to the proposal made in the dissertation. Chapter I serves as an introduction to studies on Italian pronunciation. Chapter II is designed to pave the way for the grammatical formulations proposed in Chapter III.

Chapter III provides the phonological component of a grammar of Italian. It includes most of the morphology, morphophonemics, and general phonological processes. The framework for the phonological description adopted is a distinctive feature theory as proposed by Halle in The Sound Pattern of Russian (The Hague, 1959). Since a substantial number of the rules of phonology are formulated on phrase-structure, a sketch of the syntactic bases has been developed as a separate work by the author and is assumed in this dissertation. The syntactic analysis accepts, in general, the generative-transformational view of description in the form proposed in N. Chomsky's Aspects of the Theory of Syntax (Cambridge, 1965).

Free word-order syntax: The challenge from Vedic Sanskrit to contemporary Formal Syntax Theory

Vedic Sanskrit, the early Indo-European language spoken by the Aryan invaders of India in the 2nd millennium B.C.E., is a language showing little if any evidence for levels of syntactic organization between that of lexical items and that of maximal projections of those items. But the large corpus of Vedic literature does show evidence that Vedic grammar routinely generated NPs, PPs, and VPs into which words were organized.

On the surface, however, this hierarchical organization is obscured by the ease with which Vedic grammar generated discontinuous constituents. Most of the discontinuities in the Vedic grammar generated discontinuous
constituents. Most of the discontinuities in the Vedic corpus result from phenomena common to a wide variety of languages, e.g., topicalization, pronominal fronting, particle placement, and focussing, which in Vedic are defined in such a way as to encourage discontinuity. In addition, phrases, insofar as they partook of nominal character, were defined by the grammar as 'scramblable', i.e., they could be freely discontinuous within their mothers without such discontinuity apparently needing any pragmatic justification other than the language-user's mere desire to take advantage of the options allowed by the grammar.

An attempt is made to develop consistent descriptions of Vedic discontinuity in each of two formal syntactic theoretical frameworks, the Revised Extended Standard Theory also known as Government & Binding or Principles & Parameters Approach (PPA), and Lexical-Functional Grammar (LFG). The PPA analysis is hampered by constraints built into the theory as a result of the study of languages with stricter constituent-order such as English, to the point that violence needs to be done to either the data or the theory. On the other hand, LFG proves capable of describing every attested clause with little difficulty, but appears to be no more capable than PPA of explaining why certain logically possible constituent orders occur very rarely if at all. Suggestions are offered for further research in the areas of both theory and fieldwork.

Aspects of English sentence stress  

This dissertation is organized into six chapters. The first discusses the approach to sentence stress of Chomsky & Halle (1968) and that of two of their precursors, Newman (1946) and Trager & Smith (1951). Following a review of the different approaches and the claims made by the various authors, a detailed critique of the cyclic treatment of Chomsky and Halle is presented, in which it is shown that such a treatment is unmotivated and beset with serious difficulties. Chapter II is a review and critique of more recent approaches to sentence stress by Joan Bresnan and George Lakoff and a third approach, by Dwight Bolinger, which, while not new, has only recently become widely known to generative grammarians. Chapter III is a discussion of a concept which has received little serious discussion but has been extremely important in discussions not only of stress itself but also of syntax, the concept of "normal stress". It is shown in this chapter that this notion is one which is incapable of characterization in any linguistically significant way and thus that treatments of stress (and other phenomena) which depend on it are without empirical basis. The "positive" chapters of this dissertation are Chapter IV, where the question of what items in an utterance are assigned stress is discussed, and Chapter V, which deals with relative stress levels. Chapter VI contains a summary and polemics.

It is the thesis of this work that sentence stress assignment is governed by several different principles of different natures. Some of these principles are outside the scope of any current theory. Consideration of sentence-stress phenomena indicates, then, that it is impossible to view all phonological rules as belonging to an "interpretive" component of the grammar. Their relationship between the pronunciation of a sentence and other properties is as complex, and as deserving of respect, as the relationship between the
"meaning" of a sentence and other properties, and we are still very far from having an adequate theory of linguistic competence.

The acquisition of English sentential complementation by adult speakers of Finnish

The study reported on here was an investigation into the acquisition of English sentential complementation by adult native speakers of Finnish. A written test consisting of six production tasks and a small comprehension section was administered to forty-three Finnish students studying English at the University of Jyvaskyla, Finland. The production tasks covered nineteen aspects of complementation, which were classified into thirteen subcategorization categories and six syntactic categories. There were three administrations of the test over a nine-month period.

The analysis of the data consisted of two parts. The first part was a cross-sectional analysis to determine the invariant hierarchy of difficulty for the nineteen complement categories. To determine the hierarchy of difficulty, the ordering-theoretic method developed by Bart and Krus (1973) was utilized. The cross-sectional hierarchy of difficulty determined for the Finnish speakers in this study was then compared with the cross-sectional hierarchy of difficulty determined for Puerto Rican Spanish speakers in a study by Anderson (1976).

The second part of the study looked at the students' use of complement structures over a nine-month period. Longitudinal data were compiled for twenty-three of the students. For these twenty-three students, individual rankings of the nineteen categories, based upon the percentage correct, were made for each testing. The ranking obtained on each testing for a student were then compared with each other to determine if there was much variation in a student’s ranking from one testing to the next. An analysis was also made to determine if there was much variation when one student's longitudinal ranking was compared with another student's longitudinal ranking. Finally, the individual longitudinal rankings were compared with the cross-sectionally-derived hierarchy of difficulty to determine if the individual longitudinal rankings corresponded with the cross-sectionally-derived hierarchy of difficulty.

The most important findings of this study were 1) the existence of variation in the second language acquisition process and 2) the fact that such variation was obscured by the cross-sectional group data. It was found that over time there was a great deal of variation in the individual rankings; that is, the rankings for a student changed from one testing to the next. Not only was there variation over time for individual rankings, but there was also variation when one student's individual longitudinal ranking was compared with the other students' individual longitudinal rankings. Thus, the language learning process seems to be very individualistic.

Indirect discourse and related phenomena in Xenophon

The Latin name *oratio obliqua* and its English counterpart, indirect discourse, have reference to a link between the construction so named and
some speech act. The syntactic structure, however, and the choice of lexical items for sentences embedded in either direct or indirect discourse are generated by the speaker purporting to make a report on someone's speech or thought. The extent of the adherence is entirely dependent of the capability and the desire of the reporter to produce a sentence similar in lexical items and syntax to the one he claims to reproduce. His claim, therefore, is technically a pretense, but it is acceptable, for we know the circumstances under which all such claims are made.

Certain other phenomena, formerly excluded from the range of indirect discourse, are treated by the user of the language under the same syntactic rules and thus are shown to be part of a larger category of constructions relating to indirect claims of reported speech and thought.

Rules of indirect discourse in ancient Greek produced transformations in the mood of the embedded verb, to an optative, and infinitive or a participle. Selectional restrictions of the verb of discourse determined which change, if any, took place. In some embeddings the case of the subject was also liable to change. An area of distinction between indirect and direct discourse was in the determination of person assignment. Only the former depends on identity tests with the noun phrases of the hypersentence:

Many of the transformations for embedded questions are determined by the same rules as for embedded declarative sentences. Yes-no questions are subject to a rule introducing a special conjunction, and other questions using interrogative pronouns and adverbs may find their question work made into the equivalent relative.

If the theory of a deleted hypersentence of communication at the highest node of every sentence can be accepted, including the idea that the NPs of the reporter and the hearer start out without person assignment, then the basis of direct and indirect discourse must be the embedding and reembedding of such sentences under new hypersentences.

Some sentences which are embedded in English, including most of the sentences of discourse, have in the past been theorized to have an it-S option. In the Greek of Xenophon the alternative appears to be between a demonstrative pronoun and S.

It has often been demonstrated that adjectives ought to be included with verbs, but nouns of verbal derivation are more of a problem. They function as subjects and objects in sentences, yet they can also take a direct object themselves. This dissertation illustrates their further use as verbs of discourse.

Towards a communicative theory of text

This dissertation studies the textual function of language. A theory of text is identified as one that specifies all the acceptable, usable texts of language.

The purpose of Chapter 1 is to contrast the doctrines of generative-transformational theory to the assumptions that underlie this textlinguistic study. These are identified as the act-view of language that sees language as activity of speakers/writers with a purpose and recipients as individuals that try to find out what was in their heads.
Doctoral dissertations

Chapter II starts out with a Grundlagendiskussion of observations that a comprehensive theory of text will have to account for. These observations are set in relation to several "text-models," which are shown to be in need of revision. Finally, I characterize a "rational," and non-absolute" position on textuality.

Chapter III is an analysis of the communicative function of the agentless "werden"-passive in German. This analysis is performed under the assumption that speakers/writers act "rationally" and that they choose the form that best suits their intentions. In the course of this study, several ways of exploitation are identified which are then contrasted to the exploitation of man by speakers and writers of German.

Chapter IV gives a statement of the major findings of the dissertation, as well as its shortcomings. The conclusion is that the passive is used for more than one function and that there is indeed one context that can support the claim of a substitutive relationship of passive and man.

Conjunct verbs and verbs-in-series in Thai

This dissertation deals with two general types of verb phrases in Thai: conjunct verbs and verbs-in-series. Conjunct verbs in Thai have received little attention in previous works; the classification and analysis of conjunct verbs in this study is, therefore, primary. I conclude that all conjunct verbs function like verbs and are most adequately treated at the lexical level.

In Thai, verbs-in-series appear as two different types of constructions: serial verbs and compound verbs. Serial verb sequences can have any of the following interpretations: sequential, purposive, unordered, and simultaneous. A preferred interpretation is determined by considering the semantic information and the speech context. The shared subject constraint holds in all cases of serial verbs in Thai.

I present a classification of compound verbs in Thai. Four types of these verbs — directional compound verbs, culminative compound verbs, modal compound verbs, and aspectual compound verbs — are analyzed.

Same rule in a transformational theory of syntax

This dissertation is concerned with the assessment of the significance of the notion "same rule" for syntactic theory. Several possible interpretations of and explanations for the notion "same rule" are examined, and the range of the interpretations is narrowed down, such that assuming a general framework of Transformational theory of syntax constrained by considerations of language acquisition which is assumed to be, to some degree, innately controlled, "same rule" is taken to represent a "significant generalization" in the grammar internalized by a speaker.

The intuitively-based criteria involving similarities and differences in properties of rules, used by linguistics for decisions about the sameness of two rules (within a given language) which are identical in some properties, but different in others, are examined. It is found that the various criteria can be
ordered in terms of a hierarchy of predominance relationships in determining rule "sameness", and how rules can differ from each other.

It is argued that the interpretation of "same rule" as a significant generalization in the grammar of a speaker cannot make sense across two or more languages, if one does not assume that the "same rule" is an innate universal — that is, that there exists a universal inventory of rules from which each language draws some subset, serving as a constraint on linguist generalization determining rule "sameness", and how rules can differ from each other.

The hypothesis of "innate inventory of universal rules" is assessed in the light of some cross-linguistic works reviewed in this dissertation. It is found that none of the works come up with some formulation of a universal rule that can be empirically validated against the diversity of natural languages. Also, it is found that the criteria used by linguists to determine cross-linguistic "sameness" or universal rules are arranged in a hierarchy that is the inverse of that for language-internal analysis. Other deficiencies of the hypothesis are pointed out: the substantive constraint in terms of universal inventory of rules is redundant to certain formal constraints, is unable to constrain the grammar sufficiently, and implies that there are no generalizations among the universal rules, so that it does not call for explanations for why certain rules, and not others, are possible in grammars.

In conclusion, it is suggested that the current conception of "universal rule" is a dubious notion, and that some new kind of constraint — a universal predominance hierarchy of properties in which rules can differ, if developed adequately, could restrict the power of Transformational theory in a more significant, efficient, and descriptively adequate manner than a universal inventory of rules.

The analysis of cleft and pseudo-cleft sentences in English

This work is divided into eight chapters. In Chapter II the cleft sentence construction is compared to a construction which is outwardly similar to it. This chapter is not a critique of a previously proposed analysis of the cleft sentence construction, but rather serves to demonstrate some of the unique characteristics of this construction which differentiate it from a similar looking construction. Chapter III discusses an analysis of the cleft sentence construction which was proposed in Lakoff (1965). Many of the defects of this analysis are seen to be the same ones that are found in the analysis presented in Chapter II. In Chapter IV the cleft sentence construction is compared to another outwardly similar construction. Again, the purpose of this chapter is not to criticize a previously proposed analysis of the cleft sentence construction, but rather to show some additional characteristics of this construction. In Chapter V reasons are given for believing the cleft sentence construction to be closely related to another construction — the pseudo-cleft sentence. In Chapter VI I discuss the nature of the subordinate clause of the pseudo-cleft sentence construction and present an analysis of cleft and pseudo-cleft sentences which overcomes some of the problems of previously proposed analyses. Chapter VII deals with the analysis of the cleft and pseudo-cleft sentences presented in Chapter VI. Chapter VIII points out various problems that are yet to be solved.
Word structure in Korean

The purpose of this study is to investigate the nature of morphological structure of words in Korean and to examine the interaction of morphological properties with other components of grammar. In order to provide the adequate model for word structure of Korean, I adopt a morphological model which is proposed in recent developments in morphology (e.g. Lieber 1980, Williams 1981; 1981a, Selkirk 1982, Di Scuillo & Williams 1987). In this morphological model, some syntactic notions, such as certain notions of X-bar theory, a head of a word and argument structure are extended to the theory of word structure.

Chapter 2 gives an overview of word formation models proposed within the framework of the lexicalist theory. Several word formation models of Korean are examined. This chapter also introduces some of major theoretical assumptions upon which the analyses given in this study depend.

In Chapter 3, the morphological properties of compounds in Korean are discussed. Two different sets of primary compounds are compared and the difference between them is argued to be attributed to the different word structure. The analysis of synthetic compounds is also given. It is shown how the word structure model which incorporates the Argument Linking Principle proposed by Lieber (1983) allows an adequate account of synthetic compounds. Finally, it is argued that the difference in internal word structures can make predictions on Sino-Korean tensification.

Chapter 4 discusses the morphology of passive, causative suffixes, nominalization and the negative morpheme an. An attempt is made to provide the lexical representations of passive and causative morphology using the notion of conceptual structure proposed by Jackendoff (1987). By providing the lexical representations of passive and causative morphology, it is claimed that the coincidence of affixal forms can no longer be regarded as a total accidental phenomena. The distinction between the gerundive um and ki is discussed. The morphology of negative morpheme an is also examined. It is shown that the difference in meaning between two negative types can make predictions about cooccurrence restrictions of the two negative versions.

Finally, Chapter 5 summarizes the topics discussed and examines some consequences and implications.
(2) at least the reordering rules discussed here should operate on VOS order.

In my attempt to justify (1) and (2) I would like to introduce and discuss briefly the following rules: Topicalization, Passive and Relative Clause Formation. For a better exposition of the syntactic phenomena that I am going to discuss below, I assume the correctness of (1) and (2).

Substantive evidence for morphological and phonetic regularities in phonology

In this work, I will consider whether there is any substantive evidence for the principles of unique underlying representations and phonetically-plausible rules. I will examine various examples of morphological alternation from English, French, and Finnish and show that in these cases the traditional generative phonological solutions are incorrect.

In the following chapter, I discuss the notion of substantive evidence more fully and give examples from English to show how substantive evidence can be used to determine which regularities are captured by speakers. In chapter 3, I deal with the French verb system and argue against the traditional generative phonological analyses that try to account for vowel alternations in irregular verbs by postulating unique underlying vowels and phonetically-plausible rules (which look like the original historical rules). In chapter 4, I consider three putative rules in Finnish that every generative phonologist who has worked on Finnish has postulated and show that there is no substantive evidence for these rules. In chapter 5, I consider the illative suffix in Finnish and argue that several analogical changes show that certain historical, phonetically-plausible rules are no longer captured by speakers. In each of these chapters, I will show that there is substantive evidence for rules that relate surface forms to each other. In these cases, substantive evidence indicates that speakers account for morphological alternation by means of surface patterns of alternation. In chapter 6, I consider the conditions under which speakers fail to capture phonetically-plausible regularities. And finally, in chapter 7, I discuss various attempts to limit the abstractness of generative phonological solutions on the basis of substantive evidence.

Word order in the older Germanic dialects

Throughout this study I will consider word order to be a feature of grammar which is neither completely free nor completely fixed. Complete freedom of word order would mean, among other things, that every possible order was equally meaningful for every sentence and, therefore, that order was completely non-significant. A rigidly fixed word order would mean that a given set of grammatical circumstances would require a definite word order and that no other order was possible. Neither of these situations exists in the Germanic dialects studied here. What does seem to be the case is that for every set of grammatical circumstances there is a most expected order which will be called the unmarked order. When this order is used no special emphasis or attention is called to the elements of the sentence for the same set of
grammatical circumstances there are one or several alternate orders possible, which do focus attention upon specific elements or upon the sentence itself. Such orders will be called marked orders.

One of the basic assumptions on which this thesis stands or falls is that the one crucial feature of sentential word order is the position of the verb alone. The position of the verb, then will serve as the basic determiner of word order pattern classification in this study. An examination of the documents of the ancient Germanic dialects reveals that four types of word order patterns will suffice to classify all sentences encountered. The verb may be in initial position, second position, third or later non-final position, and final position.

Noun phrase complementation in Persian

The goal of writing this dissertation is to present a syntactic as well as a semantic analysis of some major aspects of NP complementation in Persian. We begin the discussion with a brief introduction to classification of Iranian languages, approaches to Persian syntax, and a review of the earlier research on NP Complementation in Persian.

We review the earlier research conducted by Iranian and non-Iranian scholars on the phenomenon of NP Complementation in Persian. The review shows that while it is generally accepted by both traditionalists and transformationalists that a noun phrase complement forms part of the predicate, there is no consensus among the researchers as to whether it is generated underlyingly in pre-verbal or post-verbal position. Obviously, this controversy has developed as a result of adopting the transformational approach which, based on the underlying assumption of its goal of linguistic inquiry, deals with two levels of representation in the treatment of NP Complementation in Persian. This controversy is pursued in the transformational analyses of Persian Complementation presented by Moyne-Carden and Tabian. In this study, we take the position that NP complements in Persian are generated pre-verbally in the underlying representation.

A cineradiographic study of selected Korean utterances and its implications

The general purpose of this study is to reveal and quantify the physiological activities of the vocal tract during the articulation of the three types of Korean stops (tense unaspirated, lax slightly aspirated, tense aspirated) at three different points of articulation at a normal conversational speed, to see how well the various articulators serve to separate the Korean stop categories.

It may be noted that most investigators have been concerned with coarticulatory configurations of articulators such as the tongue (the most important supralaryngeal articulator) and the lips, jaw, velum, pharynx, etc., for both meaningful and meaningless phoneme sequences, but restricted in length to that of an isolated syllable. The general finding has been that there is considerable forward coarticulation between adjacent phones, with the degree of coarticulation apparently dependent upon the rate of utterance.
phonetic structure, and more tentatively, syllabic structure and the position within a word.

Specifically, this study attempts to analyze the following:

1. the phonetic nature of the Korean stop consonants;
2. the relevance of various phonological features: e.g., tense/lax, aspiration, heightened subglottal pressure, etc.;
3. the physiological correlates of the concept "word boundary";
4. utterance-initial phenomena;
5. comparison of the findings of this study with others; and
6. various aspects of the theoretical implications of the results.

Underspecification in Korean phonology

It is the purpose of this work to argue that the uniqueness of a sound is characterized by some, not all, distinctive features, departing from the SPE view of a segment as an unordered set of all the features supplied by universal grammar. By eliminating redundant features from underlying representation and specifying only unpredictable features, underspecification system constrains possible types of phonological processes in a given grammar.

A variety of arguments for feature underspecification are adduced from both vowel and consonantal phenomena of Korean phonology. The least marked vowel is completely unspecified and due to its featureless representation in the melody plane it is the highest in the hierarchies of both the eopenthesis and deletion processes. Resorting to feature underspecification, phenomena of free variation, vowel metathesis and several vowel merger processes are recognized as a single process of simply degenerating the branching structure of the nucleus. Under this generalization, the product of merger of two feature matrices automatically follows, the union of two matrices being the underspecification for a third vowel. In chapter 4 separate processes of tensification, neutralization, and nasal assimilation are also seen to be all conditioned by a single denominal adjective morpheme.

The present study addresses the issue of the structure of features in the melody plane and their relation with other planes of representation. Postulation of feature-sized morphemes for the light ideophone [+low] and the denominal adjective [+constricted glottis] strongly argues for the representation of a feature with no skeletal position. On the other hand, evidence from /s/-irregular verbs provides significant support for the asymmetrical representation of a skeletal slot with no feature specification. This study also argues that glides in Korean are not a part of the onset but a part of the nucleus node, hence providing an insight into possible and impossible diphthong structures. This gives added support for the claim that glides and vowels are nondistinct underlyingly.

As for the organization of the lexicon, the present study deploys both phonology- and morphology-based arguments against the organization of word formation processes in tandem, in favor of non-linear, simultaneous morphological processes. Within this view, phonological rule application is sensitive to the types of morphological structure in the lexicon, rather than depending on their stratum oriented domain specification.
The present study is intended as a contribution to the study of the relationship between language and thought in the area of sentence production.

The basic hypothesis of this study is that a number of crucial properties of language are determined by the structure of human perception and cognition (Osgood 1971). The structural properties investigated include: the identifying and distinguishing functions of nominal modifiers, spatial deixis, unmarked constituent and clause ordering, marked structures such as Passive, Topicalization, Right Dislocation, among others. The independent cognitive variables include: Figure/Ground and Agent/Patient relations, perceptual scanning strategies of vertical and horizontal arrays, distinction between fresh and familiar perceptions, inherent and induced perceptual salience of entities, among others.

This hypothesis, translated into a number of specific sub-hypotheses, was tested cross-linguistically, using a sentence production format. The cognitive distinctions were embodied in a color film consisting of 70 "scenes" which showed an actor and some everyday objects (blocks, balls, etc.) in various action and static relations. The composition of the scenes and their sequence was manipulated to create cognitive presuppositions — e.g., focus on the object of action was induced by zooming, or by the animacy, or by the greater relative size of the object, and so on. The film was shown in 10 communities around the world and subjects (300 native speakers of ten languages) were asked to "simply describe" each scene in a simple sentence. The ten languages are: Cantonese, English, Finnish, Hebrew, Hungarian, Japanese, Kannada, Slovenian, Spanish, and Turkish. The data (21,000 sentences) were (i) transliterated in the Roman script, (ii) translated morpheme-by-morpheme, and (iii) freely translated into idiomatic English by linguistically trained native speakers.

The analysis of data reveals several fascinating correlations between cognitive inputs and linguistic structures, including: (1) nominals denoting figures of state and agents of action precede those denoting grounds and patients, except in "presentative" contexts; (2) people prefer to express changes of state overwhelmingly more often than accompanying constant states; (3) vertical arrays are described such that the object on top is located with reference to that below, leading to the use of the unmarked "above" rather than the marked "below"; (4) in horizontal arrays, objects closest to the perceiver (ego) are located with reference to those further from ego, resulting in a preference for "in front of" over "on back of"; (5) the order of clauses expressing perceptual events corresponds to the sequence of events in perception; (6) entities rendered salient by virtue of their intrinsic meaningfulness (e.g., humanness), or perceptual focus, tend to be expressed at or near the beginning of the sentence, leading to (a) Passives or Topicalized sentences; (7) "surprise subject" contexts lead to disruption of normal word order: Verb-Subject order in SVO languages (except English) and with the subject immediately preceding the verb in SOV languages; (8) the degree of referential elaboration (measured in terms of the number of adjectival modifiers) depends on the degree to which the intended referent is presumed
to be novel to the listener; the number of adjectives decline continuously with each subsequent mention of a given entity; (9) the nature of referential expressions (including the choice of adjectives and noun phrases) depends on the nature of perceived or inferred alternative members of the same category from which the intended referent is to be distinguished; furthermore, given a choice among distinguishing features, speakers prefer inherent, perceptual features (e.g., color, size, shape) to abstract relational features (e.g., position).

This study, therefore, demonstrates the existence of performance universals which cut across differences between language. In addition, it contributes to the study of comparative syntax by demonstrating the common functional bases of different surface structures across languages. Finally, by demonstrating that various aspects of sentence structure are determined by a variety of cognitive principles (including perceptual, attentional, and pragmatic principles), it contributes to a functional, explanatory theory of language performance.

The acquisition of Black English

In this dissertation, the developing language of two children, Jackson and Marshall, will be analyzed, focusing primarily on the emergence of dialectal characteristics. The age period covered for Jackson was 20 months to 26 months, 2 weeks; for Marshall, 17 months, 2 weeks to 26 months, 1 week. The dialect spoken in their homes will be examined in Chapter Two for the characteristics of Black English (hereafter BE) that have been identified in the linguistics literature and it will be demonstrated that both children are being raised in BE speech environments. In the following three chapters, their speech will be analyzed for the emergence of these features, concentrating particularly on those involving the noun phrase, the copula and the verb phrase. The development of negation will not be discussed in this study. It will be argued that the differences between their development and that of children acquiring the Standard dialect are trivial, although in the case of the copula one structure already conforms to the adult BE pattern. However, even in this instance it cannot be argued that this is different from the pattern of acquisition in the Standard dialect because there have been no studies directed specifically to the distribution of the copula in the Standard.

On the basis of English iambic pentameter

This essay is a report on the search for a better way to describe the most common form of English metric verse: iambic pentameter, also called blank verse and, if rhymed, heroic verse. The thesis of this essay is that once an adequate theory of English rhythmic and timing characteristics has been formulated, a theory of meter can be derived from it. That is, I believe that a metric type is a particular stylized form of rhythm extant in English non-poetic utterances. The features of English rhythm are what the poet manipulates when composing his metered verse. I suggest in this essay that the principles of English rhythm as enumerated by Andre Classe (1939) and the specific characteristics of isochrony of the intervals in the speech stream as investigated by Ilse Lehiste (1971, 1973a, 1973b, 1973c) provide a sufficiently
rich and well-substantiated theory of English rhythm in non-metered discourse, so that I may motivate a theory of iambic pentameter.

The essay is organized in the following way: Chapter One discusses three suggested bases from which lines of iambic pentameter have been thought to be derived: temporal bases in the form of isochronous intervals; syllabic-stress bases in the form of a string of feet; and accentual-stress bases described as a string of two types of abstract positions, weak and strong. Chapter Two investigates a topic raised in Chapter One — the metrical status of minor category words and morphemes: auxiliaries, prepositions, pronouns, derivational suffixes, etc. Chapter Three examines a variety of iambic pentameter in which lines are said to contain an "inverted" foot — a trochee replacing an iamb; that is, in place of the expected unstressed-stressed syllabic sequence (the iamb), the poet substitutes a stressed-unstressed syllabic sequence (the trochee). Chapter Four is concerned with the motivation of a theory which will describe in a non-ad hoc manner the distribution of inversion in a line of iambic pentameter. The essay concludes with a list of prospective areas that are opened to further investigation as a result of this study.

The phonology of Latvian

The dissertation deals with the major phonological processes of Latvian. Chapter One provides a detailed description of the sound segments of Latvian and goes on to discuss those phonological processes which occur generally throughout the language and are not limited to any particular type of word. Chapter Two describes rules which apply in nouns and/or adjectives. Some of these rules also apply to verbs and are further discussed in the third chapter. The third chapter goes on to describe morphophonological rules that affect verb endings and roots. A detailed discussion of the underlying forms of personal endings and tense markers argues for a less abstract set of forms for these endings than has been posited in earlier treatments. Finally, the reflexive verbs are dealt with in detail.

The last chapter describes the tonal dialects of Latvian and gives phonetic descriptions of the tones. Data from the central tonal dialect illustrate the distribution of the tones on various types of morphemes. It is shown that, despite some claims that there are no languages with tones on unstressed syllables (made particularly by Kuryłowicz), Latvian does have unstressed syllable tones. As well, in addition to the kind of lexical tone found on roots and most derivational endings, there is a type of tone I have called 'morphological' that occurs on groups of inflectional endings which may have different phonological forms. Finally, some rules are given for placing predictable tones.

Some factors affecting the acquisition of a foreign language lexicon in the classroom

It would be useful if the foreign language pedagogue could determine which words were difficult for the language student to learn and why.
However, the literature in the field of language pedagogy deals, for the most part, with only such pedagogical issues as a) when should new words be introduced; b) what is the best method for teaching and practicing new words; and c) what are the criteria to be used when selecting items to be taught, and not with the issue of difficulty.

This dissertation considered this notion of difficulty and isolated factors associated with the physical shape of the word (i.e. pronunciation, length), grammatical characteristics (i.e. category, gender) and meaning in order to see what their effect was on the rate of acquisition and the length of retention. In addition, factors not directly intrinsic to specific items were considered: subjective feelings, native language interference, usefulness, etc.

Finally, two specific methodological approaches (audio-lingual and situational) were analyzed in light of three criteria: a) experimental evidence; b) treatment of problematic items; and c) facilitation of learning.

It was concluded that some factors had more effect on the acquisition of a foreign language lexicon in the classroom and that a tentative hierarchy could be postulated:

a) A successful methodology would have the most positive effect on acquisition. This includes such considerations as ordering, criteria for selection of items, etc.

b) Factors caused by the juxtaposition of two or more items (i.e. antonyms, similar-sounding words) have more effect (usually negative) on acquisition than those factors intrinsic to individual items (i.e. difficulty of pronunciation).

c) Non-intrinsic factors (i.e. subjective feelings) have more of an effect (positive and negative) on acquisition than intrinsic ones.

d) Intrinsic factors have the least effect on acquisition.

Methodology was considered a factor since if a method is successful, it will neutralize the effect of the negative factors and utilize the effects of the positive ones.

Word order variation in Makua: A phrase structure grammar analysis

The purposes of this dissertation are two-fold. The first is to examine one aspect of the syntax of a largely undescribed Bantu language, Makua. The aspect under consideration is the syntactic property loosely (and perhaps ill-advisedly) termed free word order. The second purpose is to provide a formal treatment of this part of Makua syntax. The analysis is cast within that version of phrase structure grammar as developed by Gerald Gazdar at the University of Sussex. This version of phrase structure grammar embodies two trends in linguistic theory: 1) a movement away from transformations and towards base-generation and 2) the incorporation of a compositional semantics of the sort advocated by Montague and others.

It is argued that even though Makua exhibits a certain degree of order freedom, it is inappropriate to analyze this order as free at the word level or free at the constituent level. Rather, certain constituents and words enjoy freedom while others do not. The analysis proposed consists of a set of rules with specific properties which depend, in part, on the existence of certain
constituents, e.g. the presence of a verb phrase in some orders but not in others. Other rules are motivated by constraints on the distribution of such constituents as sentential complements and infinitive complements (but not infinitives themselves). Additional supporting evidence for the separate rules comes from the formalization of verb agreement and from the analysis of the syntax of relative clauses. It is concluded that this multi-rule approach renders both scrambling rules or linear concatenation rules not only superfluous for an analysis of Makua syntax, but inadequate as well.

It is of no small importance to syntactic theory that a general account of order can be given in a grammar consisting entirely of phrase structure rules, because such grammars were thought (by early advocates of transformational grammars) to be not only inelegant, but inadequate on descriptive grounds. In addition, the kind of analysis provided for Makua is suggestive of a general approach to order freedom, which, unlike other formal proposals for such languages, requires the addition of no fundamentally different rule type (e.g. scrambling transformations (Ross (1967)) or linear concatenation rules (Hale (1979) and Lapointe (1980)). Because linguistic theories tend to be ephemeral in nature, the most lasting contribution may well be the presentation of data from a heretofore unstudied language. It is hoped that the thesis presents a significantly large body of data to aid in our general understanding of human language.

Noun phrase complementation in Hindi

This dissertation deals with the following aspects of noun phrase complementation in Hindi: structure of the noun phrase, the various complementizers, relevant transformational rules such as Equi-NP Deletion, Subject Raising, Extraposition and yah 'it' ~ aisa 'such' Deletion. It also considers the constituent status of the ki and the ka-na complements. In addition, some aspects of the structure of the participles in Hindi are discussed.

It is shown that the underlying word order of constituents of the noun phrase in Hindi is S NP or S N, just as in many other irrefutably verb-final languages. It is also shown that the underlying word order of the constituents subject, object and verb is independent of the direction in which the embedded S is moved. Evidence is presented to show that the claim that all rightward movement rules are upward bounded cannot be a universal because an embedded S in Hindi can be moved rightward unbounded.

Strong evidence in support of the claim that the grammar must include global rules is presented from two rules — Unbounded Extraposition and yah 'it' ~ aisa 'such' Deletion.

It is demonstrated that Hindi provides counter-evidence to Ross's claim that subjects have "primacy" over objects. Evidence is presented to show that the claim that factive complements do not permit 'raising' holds for Hindi too.

It is argued that deletion or movement of an NP from the embedded sentence in certain structures results in participialization. It is shown that the existing pruning conventions are inadequate in capturing the intuitions of the native speaker in some cases.
Significant new data concerning the postpositions in Hindi is presented and it is shown that the postpositions that occur in sentence adverbials are different from those that occur with a class of verbs called "oblique verbs." It is argued that the postpositions that occur in sentences with oblique verbs are inserted by the Postposition Insertion rule. It is also shown that the rule that deletes the ke liye with a purposive interpretation can be treated as a global rule.

Universals of Reflectives

The locality conditions on reflexives vary widely from language to language. In English, a reflexive (e.g. himself) must take a local antecedent. In contrast, in Asian languages like Chinese, a reflexive (e.g. ziji) can take an antecedent indefinitely far from its antecedent. Furthermore, in European languages, a reflexive is bound in a less restricted domain than in English, but not in an indefinite domain as in Chinese. The purpose of this dissertation is to develop a unitary analysis of locality conditions on the binding of reflexives among languages within the general framework of Government and Binding theory. The core idea explored here is that reflexives in all languages obey the same locality conditions and that apparent long distance reflexives involve local successive cyclic head movement.

Chapter 1 provides a general idea of the ways in which languages seem to be different with respect to long distance reflexives in terms of locality conditions. I suggest that long distance binding between reflexives and their antecedents is in fact local binding in much the same way that a local relation holds between wh-elements and the original and intermediate movement sites.

In chapter 2, taking Chinese as a starting point, I propose that the differences between ziji 'self' and ta ziji 'himself' in Chinese hinge on whether the reflexive form is x_0 or x_{max}. x_0 reflexives like ziji will involve head movement from INFL to INFL, thus licensing long distance binding. In contrast, x_{max} reflexives like ta ziji or himself adjoin to x_{max} projections. Therefore, x_{max} reflexives can have only local antecedents.

Chapter 3 explores the idea of proposing a simple set of principles governing feature percolation to allow a unified treatment of a number of related phenomena. I argue that four sets of data are to be accounted for by the proposed Feature Percolation Principles. The sets of data are (1) the differences in "blocking effects" of long distance reflexives in East Asian and European languages; (2) the so-called "sub-command" facts in East Asian languages; (3) the that trace effects in English and other languages; and (4) Pro-drop parameter among languages.

In Chapter 4, I first discuss a number of problems with the x_{0}/x_{max} hypothesis. I then compare the head movement analysis proposed in this thesis with a number of previous approaches to long distance reflexives. I argue that these alternative proposals are inadequate conceptually and empirically and, as a result, the head movement analysis is to be preferred.
Some deletion phenomena in Thai

This dissertation is an explication of a part of the linguistic competence of every speaker of Thai. It examines the topic of deletion in the grammar of Thai. This work will be devoted to justifying two specific types of deletion phenomena — free deletion and anaphoric deletion.

In Chapter 2 we re-examine two arguments which have appeared in the literature of Thai grammar for two free deletion transformations: UNSPECIFIED AGENT DELETION in "passive" sentences and the OBJECT DELETION in sentences containing transitive verbs. We argue that they should be treated as one rule of deletion based upon the similarity in the semantic properties of the deleted terms.

Chapter 3 to Chapter 5 are devoted to another type of deletion phenomena — anaphoric deletion. One particular phenomenon is dealt with in detail, namely, the deletion of pro-forms in a variety of sentence constructions. The purposes of this detailed investigation is to establish the nature and the properties of the deleted terms. to propose the transformational rule or rules involved in the phenomenon and the conditions under which they may operate, and lastly, to hypothesize how the antecedent of the deleted as well as the non-deleted anaphors is found.

In the last chapter, Chapter 6, we summarize the findings of our investigation of deletion phenomena in Thai grammar.

The grammar of clitics: Evidence from Pashto (Afghani) and other languages

Grammarians and linguists have long recognized the existence of a set of problematic morphemes, "clitics." With the appearance of words in the transformational mold by Browne and Perlmutter, interest in these morphemes increased. Nevertheless, the grammar of clitics has remained a poorly understood area. An extensive examination of clitics in Pashto and other languages not only offers some answers to the many questions that exist about the grammar of clitics, but also serves to clarify some central issues relative to the nature of grammars in general.

In a consideration of the general constraints on cliticization and zero pronominalization, which are commonly entirely parallel in function, it is established that for an NP to undergo cliticization or zero pronominalization it must be contextually identifiable, must be noncontrastive and nonfocused, and must be nonconjoined. In fact these three constraints derive from a single principle: An NP can undergo cliticization or zero pronominalization only when it carries "given" information — i.e. information that is provided by context.

Moreover, in Pashto and several other languages, cliticization and zero pronominalization together can account for structures that on the face of it might look like the outputs of various NP reduction processes such as Equi NP Deletion or Relativization, which in English are accounted for by separate rules.
One group of clitics in Pashto, which are placed in "second position" in simplex sentences, reveal that both stress and morphological structure have relevance for a syntactic rule, clitic placement.

In complex sentences, the placement rule for these clitics operates within each simplex clause in a manner parallel to its operation in simple sentences. Certain apparent counter-examples are explained by showing that a sentence-initial head noun plus relative clause in fact lies outside the clause where the clitics originate, presumably having undergone an "Extraction" rule.

The placement rule for these clitics interacts with a vowel coalescence rule, providing strong evidence for the interdependence of the different components of the grammar — i.e. a clitic placement rule must apply after the application of a vowel coalescence rule.

The data in hand indicates that three common views relative to clitics and clitic placement rules are not accurate. First, it is not the case that all clitics which are moved to a certain position in the clause and which occur in a fixed order relative to one another are subject to a filter-like constraint on clitic orders. Second, contrary to what the literature to date has usually implied, it is not the case that all clitics subject to clitic placement rules in a given language move to the same position in the clause. And third, contrary to Perlmutter's claim, clitic placement rules may have to refer not only to the "cliticness" of the item but also to its syntactic function.

Finally, an examination of the components of the traditional definition of clitics serves to pick out certain inadequacies or obscurities in such concepts as "phonological word," "lean on," etc., and points towards a fuller characterization of "clitic."

The learning of coreferrential NP reductions by adult Persian speakers

The main purpose of the study was to validate empirically several key hypotheses in second language learning theory, a secondary purpose being to obtain a description of what is hard and what is easy for the learner. The study first sought to validate the central hypothesis that a second language learner operates according to a coherent linguistic system, one intermediated between his native language and the target language and distinct from both. Like other studies in this line, it looked, then, for the systematicity in the learner's performance as evidence of a coherent linguistic system in use. To discover the systematicity in the apparently random student production, this study examined the operation of selected syntactic processes (the coreferrential NP reductions of pronominalization, deletion, and relativization) in as many environments and sub-environments as possible. The use of several environments, defined as narrowly as possible is the key to finding patterning in the learner's performance — performance which viewed as a whole seems random. If the environments are fine enough, the learner's errors will, it is hoped, emerge as not random after all, for it will be seen that he makes more errors in, say pronominalization in Environment A than he does in Environment C; in other words, he makes errors systematically.

Looking at difficulty orderings and by doing some analysis of the types of errors made, this study attempts (a) to discover whether there is evidence of systematicity, and thus support for the claim that the language learner...
possesses a coherent intermediate linguistic system, and, as a practical offshoot, to provide descriptive information as to what the learner's system is like; (2) through comparison of the rankings for two or more groups, to give some indication of whether there is anything approaching consistent difficulty orderings for the categories across different groups of learners, providing support for the existence of universal tendencies in second language learning; and (3) in some instances, through an examination of the patterning or the difficulty orderings and through an analysis of error types, to provide a glimpse into what processes lie behind what is happening.

Aspects of Malay phonology revisited — A non-linear approach

This dissertation re-examines the phonological system of Malay within a non-linear framework. CV-phonology and the generative theory of the syllable developed by Clements & Keyser (1983) and the hierarchical representation of phonological structure developed by Sagey (1986), are used in the analysis. This study examines the vowel system of Malay and provides syllabification rules as well as restrictions on vowel co-occurrences, vowel sequences and diphthongs in Standard Malay. The basic syllable structure of Malay is generated by an ordered series of three syllabification rules. We claim that Malay is a Type III language as classified by Clements & Keyser (1983), namely of CV(C) type in which every syllable must have an onset. This necessitates a new interpretation of the status of the glottal stop in Malay. The general rule that glottalizes /k/ to [ʔ] by removal of the point of articulation features in syllable codas is then analyzed. In Malay two vowel-initial suffixes /-an/ and /-i/ geminate a preceding consonant and begin with a homorganic glide after high vowels of the root word. Our analysis posits an empty X-slot for these suffixes which links to the preceding segment. With stems ending in a velar we incorrectly predict blockage of glottalization by geminate inalterability (Hayes 1986). We discuss the rules of glottal formation and gemination and show how phonological representation can restrict rule application and account for the phonetic facts in Malay. In analyzing Malay we found that it does not allow geminates and we offer an explanation that relies on a minimal readjustment in the autosegmental linkings to make the representation conform to the Universal Grammar and language-particular constraints. We conclude the study by surveying the Malay dialects. The phenomenon of oral depletion, i.e. obstruents /p,t,k/ → [ʔ] and /s,f/ → [h] in syllable coda in the Kelantan and Terengganu dialects is analyzed. The data from the Malay dialects are the first case reported in the literature, to the best of our knowledge, in which changes of /p,t,k/ to [ʔ] and /s,f/ to [h] co-occur in the same grammatical system.

A reconstructed history of the Chari languages -- Comparative Bono-Bagirmi-Sara segmental phonology with evidence from Arabic loanwords

A language has many aspects. In defining its relationship to other languages, many factors are involved. To say that members of a group of languages are genetically related to one another is to say they had a historically common origin. The object of this work is to reconstruct the
parent language of the present day Chari languages. In preparation for reconstructing the CHARI parent (Chapters 2, 3, and 4), I will show the characteristics common to this group of languages as a whole in terms of sound correspondences and sound changes. A language that does not share the present day sound correspondence patterns (and thus does not share the historical sound change patterns) is not a Chari language.

This work deals primarily with the sound systems of Chari languages. By mass comparison of the corresponding sound of cognate vocabulary items, I work out tables of sound correspondences (Chapter 3, Tables 1 through 10). These tables are based on natural classes of phonological segments as determined by the way in which the individual segments behave in various environments. By comparing the behavior of sound correspondences, I reconstruct the CHARI proto-language and the intermediate proto-languages, and derive the history of Chari sound changes, discussing possibly alternative historical explanations.

The following chapters will depict the common history of Chari sound changes (Chapters 3, 4, 5) and will reconstruct a number of Chari vocabulary items (Chapter 6). The Appendix adds a lengthy section on Arabic loanwords in the Chari languages. Both segmental (consonants and vowels) and supersegmental (tone, stress, length) data are taken up. But first, the long, careful, and tedious process of reconstructing the Chari language history begins in Chapter Two with a phonological description of each language.

Deverbal nominals in Kiswahili: Underspecification morphology and the lexicon

This study provides an explicit account of the lexical entries and rules required to generate five common types of Kiswahili nouns based on verbal roots and stems, as illustrated by the data below, all derived from -kata 'cut'.

a. Action Nominals in -o: mkato/mikato 'cut(s)'
b. Transitive Verbals in -a: mkata/wakata 'cutter(s)'
c. Relic Agentives in -i: mkati/wakati 'cutter(s)'
d. Productive Agentives in -aji: mkataji/wakataji 'cutter(s)'
e. Patient Nominals in -e: mkate/mikate 'lump(s), loaf/loaves'

Underspecification Theory as developed by Archangeli & Pulleyblank (1986) is adopted to aid in this descriptive task. A rigorous analysis of the Kiswahili phoneme set is provided in this framework, with underspecified and fully specified representations of all phonemes as well as explicit default and complement rules. A detailed account of various types of prefix allomorphy is included, both for inherent nouns and for derived nominals.

The apparent simplicity of the data above is deceptive, even disregarding the account provided of the stem and suffix allomorphy associated with the Relic Agentives. Issues confronted in the description include semantic drift, blocking, percolation, questions of derivational source, and archaic roots. A particular focus of the study is to streamline the lexical entries by avoiding the explicit specification of redundant features of all kinds.
An innovation in the research is the application of the principles of Underspecification Theory beyond the phonology to capture redundancies in and among the morphological, semantic, and syntactic features and representations. To develop and illustrate this approach, a set of four binary morphological features is proposed to capture the Kiswahili noun-class system. A further innovation is the use of Lexical Cross-References (LXRefs) which capture generalizations relating to morphological complexes while allowing redundant information to be filled in automatically.

Stress in Modern Greek

This study will examine the placement of primary stress in Modern Greek (hereafter MG) utterances. 'Primary stress' is not to be confused here with the notion 'Main Stress' as formulated for English in N. Chomsky and M. Halle's The Sound Pattern of English (hereafter referred to as SPE). In fact, the mechanisms for stressing MG utterances bear very little resemblance to the framework of SPE. For one thing, any connection between stress and constituent structure is confined within word boundaries: it is only word-internal syntactic intricacies that may have a bearing on the position of stress, and then only indirectly. Far more important is the reliance of stress rules on surface syllabic arrangements and the phonological nature of inflectional endings. Furthermore, each word in MG has at most one stress. Specifically, words belonging to the major parts of speech (Nouns, Verbs, Adverbs, Adjectives and Participles) have exactly one stressed syllable; pronouns, articles, and undeclined particles can have one or none, depending on their lexical classification. Any objectively detected stress gradations among various syllables of a given utterance are under the control of either performance factors or intonation contours. In other words, the notion 'degree of stress' is peripheral to the basic perception, as well as the methodological principles of generative phonology. The gap between the 'least stressed' and the 'least unstressed' syllables is a quantum one. The present analysis will not venture beyond this binary distinction, and thus for its purposes 'stress' will be synonymous to 'primary stress'.

Particle ellipses in Japanese

In this study I consider two kinds of particle ellipsis, syntactic particle ellipsis and conversational particle ellipsis. Syntactic particle ellipsis (discussed in Chapter 1) is the type of particle ellipsis caused by certain syntactic conditions. Only case particles are ellipted under these conditions. When one of these conditions is satisfied, the naturalness of case particle ellipsis (or retention) varies from "totally natural" to "totally unnatural" depending on the particle and the function it performs. To describe this phenomenon, I hypothesize that there is a hierarchical relation among case particles which perform different functions regarding their ellipsis and retention. Statistical data supports this hypothesis.

Conversational particle ellipsis (discussed in Chapters 2, 3 and 4) is another type of particle ellipsis which takes place in conversation even if none of the conditions for syntactic particle ellipsis are satisfied.
Chapter 2 discusses the ellipsis of the topic marker wa in conversation. Here, I show that the ellipsis of wa marking X is natural if the speaker and the hearer maintain close contact with the referent of X at the moment of speech.

Chapter 3 presents some general rules of case particle ellipsis in conversation. In one of these rules I claim that the ellipsis of the case particle (CP) of an NP-CP is unnatural if the NP-CP conveys the idea of exclusivity, i.e., the idea "not others but X" or "X and only X."

Chapter 4 discusses the ellipsis of the case particles ga and o in conversation. Here, I demonstrate that the ellipsis of ga in an utterance is natural if the speaker believes the utterance carries a certain kind of information. I also show that the position of an NP-ga or NP-o in a sentence affects the naturalness of the ellipsis of ga or o.

This study reveals that statements like "recoverable particles can be ellipted" cannot explain the ellipsis of particles, that the ellipsis of particles is a matter of degree of naturalness rather than naturalness versus unnaturalness, and that various aspects of language, including phonology, syntax, information and situation, have bearing on the ellipsis of particles.

Aspects of linguistic interaction and gender in South Asia

This study is a cross-cultural and cross-linguistic investigation of language use and language structure within the non-Western context of India. It especially focuses on the relationship between gender and communication in two languages: Hindi, an Indo-Aryan language of India, and Indian English.

Primarily examining the creative fiction writings of Indian authors of Hindi and Indian English, this study examines the following major points of focus.

First, this study examines how males and females are represented in the Hindi language and Indian English. Several aspects of linguistic sexism are examined: among others, linguistic gaps, symmetries, and non-parallelisms exhibited by masculine generic formations, masculine marked terms, and homogenized and universalized forms. These occurrences reveal the lexical faults of ambiguity, exclusiveness, and inequity in the languages.

Second, this study is concerned with the dynamics of gender differences in conversational style in Hindi and Indian English written and spoken cross-sex conversations. The interactional patterns which emerge reveal how discoursal work is done in continuous verbal exchanges which leads to effective or non-effective communication. The conversational strategies and patterns examined include the rates of successful initiation of discourse topic, both with question and with statement forms, the development and flow of discourse topic, and the use of various regulatory linguistic devices which coordinated verbal interaction. It is suggested that Indian authors/users of English are influenced by their native sociocultural and linguistic contexts, hence these formal characteristics of Hindi are transferred into English. Moreover the social dimension gender is being transcreated.

Third, this study questions why in previous studies on varieties of English the social dimension gender has not been included to help distinguish non-
native varieties further from standard English varieties. In order to attempt to answer this question the concepts of transference and creativity are introduced and discussed. The following claims are made. An examination of gender in Indian English helps to further explain and distinguish the non-nativeness of this variety and contributes to the creative innovations in terms of the formal characteristics, the socially-determined speech functions, and the sociocultural components involved in the transcreational process. Furthermore, to fully understand the process of transference the traditional social and cultural categories of India from which female-types are derived are discussed.

Research and descriptions of the relationship of gender and language in native as well as in non-native contexts, provide insight into a global understanding of language use across cultures, languages, and regions of the world, contribute to the understanding of the mechanisms of social differentiation across languages, further the study of male-female communication, and raise issues concerning lexicographical research, intelligibility and interpretability, the training of language specialists, the teaching of English and non-English language and literature, and the understanding and appreciation of native and non-native texts in creative writings.

Syntactically oriented phonological analysis

As indicated by its title, the topic of this thesis is subject-verb agreement. At first glance the scope of the topic appears to be extremely limited, being concerned merely with the determination of the syntactic machinery that assigns some property, or properties, of the subject noun phrase to the verb of the sentence. But even this apparently simple task requires us to examine a wide variety of phenomena which have direct bearing on agreement. In the first place, it is necessary to determine exactly what is the constituent "noun phrase" that functions as the subject with respect to agreement. Second, we must direct our attention to the "verb" in order to ascertain the structure of the verbal complex at the point in the derivation when the agreement rules apply; specifically, we must reanalyze the constituent which has been referred to as the verbal auxiliary. Third, we must pose the question of whether agreement is a "surface phenomenon," as it has been generally thought to be by traditional grammarians. Last, we should consider the relationship of the syntactically derived structure of the inflected verbal form to its internal structure which is the input to the phonological component.

The analysis of the phenomenon of subject-verb agreement and the arguments presented in support of our assumptions are based primarily on data from Czech, although occasional reference will be made to other Slavic languages whenever it is felt that consideration of related problems may shed light on the analysis. The scope of the analysis is quite limited, but it is impossible to view the grammar of subject-verb agreement entirely in isolation from the rest of the grammar of Czech. Therefore, it has been necessary to extend the analysis in certain areas to encompass relevant related areas of syntax.
This study focuses on three major issues: exploring the possibility of separating Javanese metaphors into universal and language-specific, proposing a model of understanding metaphors, and determining the domain within which metaphors are interpreted. A separation of Javanese metaphors into universal and language-specific is necessary to answer the question "Why are some metaphors readily interpretable while others are not when viewed from different cultural background?" The proposed model begins with the given utterance and is followed by three components: shared predictions, experimental gestalts, and semantic and pragmatic interpretations.

The essential premise is that understanding metaphors requires a pragmatic approach by applying principles of discourse analysis, i.e. the principle of local interpretation and the principle of analogy, and by taking into considerations context of situation, coherence, and cohesion. Two major semantic theories of metaphor (interaction theory and comparison theory) are reviewed in this study to determine whether the domain with which metaphors are interpreted is semantic or pragmatic.

Six Javanese rhetorical forms are described because these rhetorical forms contain metaphorical expressions as their basic elements. The description of these rhetorical forms include their physical forms and communicative functions.

The analysis in this study is primarily based on a wide range of written and oral texts from Central Java and the western part of East Java. Directions for future research are suggested for further study.

This study investigates certain aspects of the syntax of S-structure and the syntax of Logical Form (LF) as manifested by the behaviour of wh-questions in the grammar of Egyptian Arabic. The framework within which this thesis is written is that of Government-Binding theory, as set forth by Chomsky (1981a). Wh-operations in EA have the option of appearing under the Complementizer node or in their base position (in-situ). The fact that the grammar of EA allows movement in both the syntactic component, i.e., SS, and the interpretive component, i.e. LF, provides us with the opportunity to contrast the Syntax of SS with the syntax of LF as exhibited by the same construction, wh-questions in this case.

The first half of this thesis examines the behaviour of wh-questions at SS, where the questioned site is obligatorily marked with a coindexed resumptive pronoun. I show that the latter is syntactically bound to its antecedent via a wh-movement rule which observes Subjacency. The second part of the thesis deals with the syntax of LF as exhibited by the behaviour of wh-phrases-in-situ. The data examined provide strong support of the existence of a nonover movement rule at LF, and, hence, for the level itself. The LF movement rule affords a uniform account of several generalizations which might otherwise
be describable via a conjunction of unrelated properties. It captures the similarities that hold between movement in Syntax and movement in LF.

The interaction between SS movement and LF movement with respect to the wh-island constraint, which I show to apply at both levels, provides empirical evidence concerning two separate issues. These issues center on the nature of Subjacency as a constraint, i.e., whether it is a constraint on movement or a constraint on representation, and the successive cyclic nature of Move alpha. I argue that evidence from EA shows: (a) Subjacency is a constraint on a movement process, as opposed to a constraint on the output of a given level of representation, and (b) Move alpha applies in successive cyclic steps and not in an unbounded step. This study also provides crosst sprinkling evidence for the status of the Empty Category Principle as a principle of Universal Grammar.

Finally, another theoretical point of interest for which this study provides compelling evidence is that Subjacency applies at the LF level in EA. The fact that Subjacency applies both to syntactic as well as interpretive rules in EA provides more support of the universality of the Subjacency principle. Subjacency holds at LF in the grammar of Iraqi Arabic (Wahba, forthcoming) and in Tengale (Kidda 1983). The former has movement at the LF level only. However, LF movement in Chinese freely violates Subjacency, a situation which has been assumed to be true of all the languages with LF movement that have been studied so far, including Japanese, Turkish (Hankamer 1975), and Ancash Quechua (Cole 1982). Thus, there are some languages which observe Subjacency at LF, as well as at SS, and others which only observe Subjacency at SS. This kind of parametric variation is to be expected, as some languages may generalize a universal constraint holding at one level to another level. This means that Subjacency acts as a universal constraint at SS and a language specific constraint at LF. This assumption, in turn, explains the difference between EA, Iraqi Arabic, and Tengale, on the one hand, and Chinese, Japanese, Turkish, and Ancash Quechua, on the other.

Subjects and subjecthood in Nepali: An analysis of Nepali clause structure and its challenges to Relational Grammar and Government and Binding

Both Early and Modern Nepali use a variety of nonbasic clause structures, including dative-subject (inversion) clauses, obligational (gerundive) clauses, passive clauses, and, in Early Nepali, ergative clauses. The properties of basic clause subjects are split in these clauses between two NPs — the 'logical', nonnominative subjects and the grammatical nominative subject. This distribution can be explained by assuming that an NP which controls subject properties shares some functional or configurational feature with basic clause subjects. The acquisition of subject properties by ergative agents has affected basic clause syntax in the Nepali perfective tense.

In a Relational Grammar of Nepali, subject properties are of two types: morphological (word order, verb agreement, case assignment, nominalizations) and syntactic (reflexivization, conjunctive participle control, EQU1 control, conjunction reduction, EQU1 deletion, subject-raising, object-raising). NPs are assigned morphological properties through hierarchical processing: the highest ranking term relation in the clause controls the subject property.
Syntactic properties are controlled absolutely by a specific class of NPs. Where a complement clause contains no final 1, the complement clause itself serves as the NP controlling a syntactic property in the matrix clause. The process of morphological clause union supports this analysis. The Nepali data thus show that nonbasic clauses may be analyzed as 'subjectless', i.e., having no final 1, rather than 'impersonal' with a dummy NP as the clause final 1.

The Government and Binding framework provides interesting insights into Nepali clause structure. All nonbasic clauses can be analyzed as having an empty category in the subject position, while other NPs occur as VP complements. However, certain principles of GB may be sensitive to both configurational and functional properties of NPs. At certain levels of the grammar, two NPs differently situated and functionally distinct cannot be distinguished by certain grammatical processes. Thus the Nepali data show that modifications must be made in the GB binding theory and control theory.

Some sociolinguistic aspects of language contact in Thailand

This thesis is an attempt to study some aspects of language contact in Thailand. A portion of this dissertation will take up the study of Thai-English code mixing (CM). hoping that this aspect of the two languages in contact will be of value both in terms of its theoretical implications for language change and for its applied implications with reference to language attitude and educational considerations.

Although my main focus is the study of CM in Thai with special reference to English, I will also provide a brief sociolinguistic profile of Thailand, as this is essential to a better understanding of CM. Chapter two will take up this topic. In Chapters three and four a brief historical background of language situations in Thailand will be presented. Such discussion is crucial to an understanding of the language attitudes of Thai people towards the use of the mixed language.

It is also hoped that the study of CM will yield some important evidence concerning processes of nativization used by Thai speakers. An attempt is also made to answer the following questions: 1) To what extent are English words absorbed into the Thai structure? 2) What, if any, change has been initiated to the Thai structure as a result of such mixing? 3) To what extent does the study of English-Thai mixing support the current views of language change exemplified in Weinreich, Labov and Herzog (1968), Labov (1966, 1972), Wang (1969), and Wang and Cheng (1970), as opposed to the Neogrammarians' theory of sound change?

Some considerations in the development of a syntactic description of code-switching

This dissertation is organized around the notion that "code-mixing" and "code-changing", which together we will refer to as "code-switching", are important manifestations of language contact, and whether or not our particular formulation of the difference is theoretically workable in a broad
range of cases of bilingualism, the concept of categorizing types of code-switching date is, we feel, ultimately a sound one.

Chapter I is an outline of the essential information needed for understanding how code-switching functions as a social phenomenon. In effect, this chapter illustrates how we found code-switching was used by the children in our study for such socio-linguistic purposes as distinguishing roles, situations, and various stylistic parameters. In Chapter II one specific mode of discourse, narrative, is examined with regard to code-switching. It is determined that code-switching occurs relatively infrequently in the narrative style among these children, and that it is likely that code-changing is much more relevant to narrative than is code-mixing.

Chapter III is the heart of our philosophy of bilingualism. We attempt to accurately define and distinguish between borrowing and code-switching. Notions such as "dominance" are discussed within our theoretical framework, and the prospect of accurately defining such vague concepts in terms of the bilingual in the real world is explored.

Chapters IV and V concentrate on the theoretical implications of the central claims of this dissertation. Principally, the concepts of "code-mixing" and "code-changing" are further defined and tested. The notion of the "bicodal word constraint" is set forth, and it is concluded that many of the aspects of bilingualism are actually aspects of language in general.

Finally, Chapter VI illustrates how the study of code-switching may lead not only to positing "Monolingual Codes" as Chapter V suggests, but also to rethinking such phenomena as ellipsis and identity in monolingual repertoires. Chapter VI is in essence a step in the direction of practical application of the ideas developed in the course of the entire dissertation, and it is intended to suggest that general linguistics may be well served by considering bilingual data as extremely valuable material for furthering research on syntax.

Subjects and the clausal structure of Chinese and English

The purpose of this dissertation is to develop explanations of some syntactic differences between Chinese and English. The core idea explored is that the absence of subject-verb agreement (i.e. AGR) in Chinese and its presence in English has wide-ranging consequences, most fundamentally in the clausal structure of the two languages. Support for this idea comes primarily from the explanations which it allows for a variety of syntactic phenomena and, where possible, through testing the predictions that it entails for other languages which pattern either with Chinese or with English with respect to agreement.

The principles and parameters framework developed in Chomsky 1981 and Chomsky 1986a,b and pursued in the works of a number of other linguists provides the overall theoretical orientation. Parameterization plays a minimal role in the analyses proposed in the dissertation and relevant cross-linguistic distinctions fall largely from the interaction of principles of universal grammar (UG) with the divergent inventories of syntactic formatives in the languages considered, specifically from the availability of Agr in English as opposed to its absence in Chinese.

233
In chapter 2 some problematic differences between Chinese and English regarding constraints on the movement of subjects are examined. An account of these facts is proposed which traces the cross-linguistic variation to a difference in the clausal structure of the Chinese and English at S-structure. Specifically, subjects appear inside the VP in Chinese but outside the VP in English. This cross-linguistic difference is attributed to the demands placed on subjects in English by subject-verb agreement, demands which predictably are absent from Chinese due to the lack of agreement.

Chapter 3 is a study of a variety of problems posed by the non-gap topic (NGT) construction of Chinese. It is shown that these sentences raise problems for X-theory, Case theory, and x-bar theory as well as the ECP and notions of licensing. The analysis proposed in chapter 2 is extended to account for NGTs; it is shown how this analysis entails an explanation for the differences between Chinese and English with respect to this construction. Predictions concerning NGT constructions in a variety of other languages are also tested.

The fourth chapter gives an account of why subjects in Italian pattern with Chinese rather than English with respect to the movement phenomena examined in chapter 2. Languages like Italian pose a prima facie counter example to the analysis of chapter 2, which ties long distance extraction of subjects to the presence or absence of agreement in a language. This would seem to predict that Italian, a language with subject-verb agreement, would pattern with English rather than Chinese. It is shown that this is only apparently the prediction and that other properties of Italian account for the subject extraction facts straightforwardly in a manner consistent with my analysis of Chinese and English.

The phonology of reduplication

In the analyses of many languages, reduplicated forms are often associated with irregular behavior. It is the prime interest of this dissertation to consider how to account for this behavior. Chapter One will present background information on Reduplication which is intended to familiarize the reader with the various types of Reduplication. Chapter Two will present examples of the types of "exceptional" behavior which reduplicated forms display. Chapter Three will discuss the methods which are currently used to analyze the "exceptional" behavior of reduplicated forms. In Chapter Four, I will present what I believe is the generalization which underlies this behavior and attempts to formulate this generalization within the current framework. Chapter Five suggests some revisions which can better accommodate this generalization. I will also consider the implications of this discussion on the status of Reduplication as a morphological process in the phonological theory.

Sentence types and complement types in English

In this dissertation I will concern myself with the relationship between complement types and declarative sentences. I hope to present a unified and insightful account of the syntactic and semantic relationships between initial
S and S introduced by various recursive embedding phrase structure rules, specifically the initial S which is the deep structure for declarative sentences. Explication of and justification for these ideas and claims of course constitute the content of the remaining chapters of this dissertation.

Chapters II and III will be devoted to developing a formalism for handling independent declaratives and the complements in question in a unified way in the grammar. For the most part, the data on which this formalism is initially based is semantic in nature. Chapter IV sets forth the reasons for which the deep structure head noun fact analysis impedes a uniform analysis of independent declarative sentences and all the complement types which can be shown to be syntactically and semantically related to declaratives. After this the first argument against the adequacy of the deep structure head noun fact analysis as an explanation for semantic factivity is presented. A possible alternative analysis in terms of head noun act is introduced. In chapter VI it is shown that this "act" analysis will not save the general deep structure head noun analysis of factivity. The remainder of chapter VI is devoted to further refutation of such deep structure head noun analyses. Finally, in chapter VI we have a resume of the arguments of the two preceding chapters with a discussion of how the theory presented and exemplified in the first part of the dissertation can handle the problems brought up in them. A concluding summary and statement of the results of the dissertation and their significance is included.

The alternation of so-called learned/popular vocabulary in a phonological description of Latin American Spanish

This thesis consists of a phonological description of a portion of a dialect of modern Latin American Spanish. It is conducted within the framework of generative grammar. The description presented will incorporate abstract underlying representations and a number of phonological rules which account for various alternations in Spanish. The primary goal of this thesis is to show the relationship which exists between traditionally termed 'learned' vocabulary and 'popular' vocabulary. Traditional 'learned' vocabulary is generally not discussed in any detail in descriptions of Spanish because of its relatively uninteresting phonological development, but these forms can be accounted for historically and also synchronically. This thesis will present an analysis which covers a large portion of the vocabulary in which we find so-called 'learned' forms alternating with the 'popular' forms in related words. The aim of the thesis is to explain the synchronous relationship which exists between this learned and popular vocabulary without resorting to an ad hoc listing of the categories in which the morphological alternations occur. I shall propose a system in which roots and formatives will carry certain morphological features and certain phonological rules will be sensitive to the combinations of these formatives and roots. A second purpose of this investigation is to present a large body of data to test our phonological theory. It is hoped that detailed analyses of languages other than English will shed light on the adequacies and possible inadequacies of the universal theory. Problems will arise within this work and some solutions may be proposed.
Levels of unity in production of long utterances in Laura

This dissertation focuses on unities in production of long utterances in a 22-month old, Laura, at other levels than the usual linguistic levels. The unities are partially modelled in real-time, using the Witz-Easley neo-Piagetian cognitive paradigm. Approximately 1,000 hours were involved in videotape analysis of the utterances.

The content of major chapters is as follows:

- IV establishes that Laura’s language functioning is variable and complex.

- V discusses prosodic production, utterances in which many words in Laura’s phrases exist in “embryonic form,” as “whiffs” in the ongoing prosody, and utterances which are phrases often heard in adult speech. Prosodic production is a significant level of emergence for words, and, suggests a conceptualization of long term memory of phrases as holistic entities.

- VI enlarges the picture of development of prosodic production by adopting a holistic-organismic perspective of the child. Developments in language functioning, such as prosodic production, are seen as a direct expression of expansions in Laura’s “total effort” behind every utterance, her organismic-body-total.

- VII delineates four other levels of unity in Laura’s production of long utterances. These are: Unifying motor flows, integrated complexes of motor activities in which one feels a single flow of energy at the 5-10 second level; pitch holding and intonational pushing, continuously re-emerging pitch heights across a phrase, and energy tension in the intonation contour to proceed forward over time throughout the phrase; carrying of meaning throughout the phrase, meaning processes held over periods of 5-10 seconds; and still-motor imaginal activity, a complex of thought processes and motor behavior preceding and leading directly into Laura’s verbal production.

In essence, the dissertation seeks to understand and conceptualize some of Laura’s language production processes in real-time.

Tone change in Cantonese

The phenomenon known as bianyin, or ‘tone change’, in Cantonese as spoken in Hong Kong and Guangzhou, China involves an alternation between any of the six non-high tones and the high rising tone — or, for a very limited number of morphemes, the high level tone. This study gives an analytical account of the various types of tone change from both the synchronic and diachronic perspectives. After a description of the tone alternations, the Cantonese syllable and tone in Chapter 1, Chapter 2 works out an analysis of the regular cases and proposes an assimilation rule and a deletion rule in the synchronic grammar of Cantonese. Chapter 3 discusses the irregular cases of tone change and the various general tendencies, semantic and morphological.
Doctoral dissertations

that favor the occurrence of the changed tone. Chapter 4, bringing in comparative evidence from Taishan, Bobai, Mandarin and other dialects, presents the hypothesis that the changed tone historically derived from [ji55] — and [tsi35] — suffixation, and the diachronic changes involved are similar to the synchronic rules that account for the regular cases. Chapter 5 presents a quantitative analysis of all Cantonese morphemes that can undergo tone change. With the aid of the Dictionary on Computer (compiled by William S-Y. Wang and his associates), it is found that there are phonetic tendencies that favor tone change — namely, low tones favor tone change more than the mid tone, and low rising tone favors tone change (to a high rising tone) more than the other two low tones; and possibly also, long vowels favor tone change more than short vowels, and non-high vowels favor tone change more than high vowels. Chapter 6, based on William Labov's sociolinguistic studies of synchronic variations within a speech community, presents a quantitative analysis of data elicited under different stylistic contexts. The results show that the optional changed tone occurs more frequently in informal styles than in formal styles, and its occurrence is governed by a hierarchy of constraints similar to the phonetic tendencies found in the implementation of the diachronic change across the lexicon. Chapter 7 concludes the study with a discussion of the implications of the findings on theories of linguistic change.

On movement transformations in Thai

This dissertation is an investigation of the class of movement transformations in Thai. The main objective is to find out whether or not there are any limitations on this class of transformations, and in case there are, to see how the class is limited. The next objective is to explain why the class of movement transformations in Thai is limited in such a way.

The first objective is carried out by considering four constructions: the passive construction, the topic-comment construction, the quantifier-final construction, and the noun complement-final construction. I argue that the last two of these constructions have undergone movement transformations, Quantifier Floating and Noun Complement Extraposition, respectively. The other two are argued to be essentially base-generated instead of being derived by movement transformations, as claimed by some previous Thai linguists (Chaiyaratana 1961, Bandhumedha 1976, for instance). In particular, I argue that the passive sentence in Thai is generated in the base with thäuk (or dön) 'to be affected by' as a main verb and with a clause embedded under thäuk (or dön). I also argue that the topic-comment sentence in Thai is generated in the base with the topic in the initial position.

In the last chapter, other movement transformations that are likely to exist in Thai grammar are taken into consideration. It is found that none of these transformations involves movement of a whole NP. To achieve the second objective of this study, an explanation for such a limitation on the class of movement transformations in Thai is offered, with reference to the major characteristics of the language, namely, lack of the overt morphological marking on verbs and very little on noun phrases, and the pervasive use of zero anaphora. It is suggested for future research that other major characteristics of Thai, such as verb serialization, be considered in relation to limitation on movement transformations in the language.
This dissertation investigates the domain and mode of application of Mandarin third tone sandhi (TS henceforth), in terms of which it is intended to explore the characteristics of the interface between phonology and syntax.

The general result is that TS applies cyclically both in the lexicon and at the phrase level. In the lexicon, it follows the model of lexical phonology. At the phrase level, its domain is partially constrained by the left end of a \( X^{\text{max-b}} \) (branching maximal projection), but finally defined by its unique condition: two by two subgrouping convention and its interaction with other phrasal phonological rules such as sentential stress assignment, secondary stress deletion, last cycle formation, 'marked' stress rules, rate of utterance, and so on.

The significance of the study is that it exemplifies the similarities between phrasal phonology and lexical phonology. On one hand, cyclic application is the characteristic of both phrasal TS and lexical TS. The rule (of TS) applies from right to left cycle by cycle both in the lexicon and at the phrasal level. On the other hand, phrasal TS operates in the same mode as lexical TS does. That is, after the application of TS in a cycle, the cycle boundary is deleted and the output of the cycle joins the next cycle as its input to create a new context for next TS (hence exactly the same model proposed by lexical phonology). This implies that the prosodic structure of a sentence is organized in the same way as that lexical structure does: namely, either with the right cycle (s) embedded in the left ones (such as Mandarin TS) on a par with the word composed of prefix + base ([prefix base]), or with the left cycle (s) embedded in the right ones (such as tone sandhi in Cantonese) on a par with the word formed by base + suffix ( [base] suffix)). The discovery of these similarities has significant impact on linguistic theory.
properties of the null subject parameter in Spanish. Two different judgment tasks were administered to Spanish speakers learning English and English speakers learning Spanish. The results of the first task, a written grammaticality judgment task administered to classroom learners, confirmed the directionality prediction. The scores on judging sentences in the target language by Spanish speakers learning English were higher than the scores by English speakers learning Spanish. The results of a second task, a coreferential judgment task administered to highly proficient L2 speakers of Spanish and English, did not confirm the results of the written grammaticality judgment task. Both groups of advanced L2 speakers appeared to transfer interpretations from L1 sentences to equivalent L2 sentences.

Although these results raise questions about the status of the null parameter in L2 acquisition, they provide evidence that the L1 does influence the acquisition of a second language.

Studies in the phonological history of Amoy Chinese

As the title of this dissertation would indicate, the main portion of the present study concerns the reconstruction of the phonological history of Amoy Chinese — more specifically, a reconstruction of Old Amoy, the phonological changes that have taken place in its history, and the chronological order of these changes. The period covered by our studies is from circa 700 A.D. down to the present time. The materials utilized for our reconstruction are mainly lexical items borrowed from a certain identifiable dialect at a certain identifiable date.

First, we shall concern ourselves with the problem of the date at which the words that now constitute the superstratum, 'literary layer,' of Modern Amoy were introduced into this language from Ancient Chinese. In Chapters II and III we shall discuss, first, the phonemes of Modern Amoy and its morpheme structure rules; then, the problem of how to represent tones of this language in our phonological representations; and finally we shall discuss various types of phonological boundaries and sketch syntactic rules that introduce these boundaries into our phonological representations of Amoy utterances. In Chapters IV and V we present the phonetic correspondence between Ancient Chinese and Modern Amoy. Ancient Chinese forms are cited in the orthography proposed for this language in Chapter III. In Chapter IV we shall present a set of (partially) ordered phonological rules, by means of which one can derive Superstratum words from their respective etymons in Ancient Chinese in the maximally economical way. Finally, in Chapter VII, we attempt a reconstruction of Amoy Chinese of c. 706 A.D. — i.e. around the time when there was a large-scale borrowing of Ancient Chinese words into Amoy. Our reconstruction is based on the systematic phonetic differences that we have found between Substratum initials and finals and their corresponding initials and finals in Superstratum when compared through the medium of Ancient Chinese or, in a few cases, Archaic Chinese initials and finals. With the help of various rules that we have formulated in the preceding chapter — which are, with some exceptions that we have noted, phonological changes that occurred within the history of Amoy Chinese, and hence must have affected both words from Old Amoy and those from Ancient Chinese — we should be able to project the phonetic differences that now exist between
Substratum and Superstratum of Modern Amoy back on Ancient Chinese of c. 700 A.D., and reconstruct Old Amoy of approximately the same period.

Interaction of rules in Bahasa Malaysia

In this dissertation I will investigate interaction of rules, such as, Object-creating rule (i.e. Transitivization, Objectivization, or Dative Movement) with Passivization and also Passivization with Relativization, which can systematically advance an NP, for example, an Instrumental, from an inaccessible to an accessible position, that is, to Subject position whence it can be relativized. On account of the fact that, in Bahasa Malaysia, Object-creating rule is regarded as essential to making an inaccessible NP, such as, Oblique Object, accessible to Passivization; and Passivization is seen as absolutely necessary to making an inaccessible Direct Object accessible to Relativization, interaction of rules such as these which confirm Johnson, Keenan and Comrie's hypotheses will be fully discussed.

This thesis is organized as follows: In Chapter I, inadequacies of the description of some aspects of Bahasa Malaysia syntax are pointed out. Chapter II concerns the simple sentences in Bahasa Malaysia. Various types of simple sentences such as equative, ascriptive, locative, intransitive, stative and transitive are examined and discussed. The claim that it is optional to prefix the active marker /mengi-/ to a transitive verb of an active sentence is falsified.

In Chapter III, five types of Passives in Bahasa Malaysia are critically examined and discussed. Inadequacies of the past treatments of some passive constructions, especially the 1st and 2nd Person Passive, are pointed out; and syntactic similarities found among the various types of Passives are clearly illustrated. Since Indirect Object and Oblique Objects such as Benefactive, Locative and Instrumental are not passivizable, interaction of rules, such as Object-creating rule with Passivization, is extensively discussed. It is shown that Bahasa Malaysia is in harmony with the Relational Constraint proposed in Johnson (1974), that is, if an Oblique Object can be systematically advanced to Subject position, Indirect Object and Direct Object can also be systematically promoted to Subject position.

The last chapter illustrates that, as far as Keenan and Comrie's Accessibility Hierarchy (AH) is concerned, only two NP positions in Bahasa Malaysia, that is those of Subject NP and Poss-NP, can be relativized directly. The other NPs lying in the hierarchy gaps between the Subject NP and the Poss-NP are relativizable only after they have been systematically advanced to an accessible position by interaction of rules. Since only the Subject NP and the Poss-NP can be relativized directly, it is concluded that Bahasa Malaysia not only poses a problem but also presents a good counterexample to Keenan and Comrie's AH as far as direct relativizability of an NP is concerned. This is simply because direct relativizability of a low NP position, in this case, does not entail direct relativizability of all higher NP positions on the AH.

The tonal grammar of Bari

This thesis presents a comprehensive description of the tonal system of Bari, an Eastern Nilotic language spoken around Juba in the Sudan. In particular, the thesis attempts to thoroughly describe both the tonal structure of the Bari word as well as the tonal interactions that result from the juxtaposition of words in sentences.

The tone of verbal roots as well as the tonal properties of the extensive system of verbal derivation in Bari is presented in detail. Bari verb roots are shown to display "melodic" tone: there are just two (underlying) tonal patterns — H and LHL — regardless of the syllabic length of the root. Some verbal suffixes are "toneless" whereas other suffixes contribute a tone to the tonal tier of the word. Bari noun roots are "non-melodic": each syllable of the noun root selects from the underlying inventory of tones independently of the other syllables. The tonal properties of noun suffixes are complex and straightforward rules governing the tone of derived nouns are not possible.

The bulk of the thesis details the effect that the tone of one word has on an adjacent word. Two principal rules operate across word boundaries: High Tone Spread and High Tone Lowering. A rule of Contour Simplification applies to the output of these two rules. It is shown that the rule of High Tone Lowering must apply iteratively across the sentence in a left-to-right manner. Evidence in favor of iterative rather than (syntactically) cyclic rule application is presented in detail.

A restrictive theory of morphosyntactic interaction and its consequences

In this dissertation, I develop a theory of morphosyntactic interaction based on a principled distinction between Rule Systems and Grammatical Components. It is argued that while morphological and phrasal rules belong to distinct rule systems, they do not define distinct components. In contrast to the proponents of Strong Lexicalism, I develop a theory in which the components of syntax and lexicon are freed from inherent association with either phrasal or morphological rules. Rather, the lexicon and syntax stand in a "level-ordered" relationship with the objects defined by rules of the lexicon acting as atoms of the syntactic rule system.

The assignment of rules, morphological or phrasal, to either component, is made on the basis of the properties exhibited by rules, such as interactivity with other rules of the component and the X0 vs. XP status of objects defined by rules. In contrast to much recent work, the decision to treat a certain type of morphology as syntactic is not made on the basis of an a priori methodological guideline.

The criteria I employ to assign a certain piece of morphology to syntax are more stringent than those countenanced in alternative approaches. It is argued, however, that this restrictive approach reveals a truer picture of how morphology and syntax interact. This is because morphology determined to be syntactic by the restrictive criteria always evince independent signs of being syntactic.
A comparative study of the morphosyntax of nominalizations and antipassives in different languages bears out the significant conceptual and theoretical advantages of the restrictive view of morphosyntactic interaction proposed in this work.

Theoretical aspects of noun classes in Lama

Lama is a Gur language spoken in the districts of Keran and Doufelgou of Togo. Other than earlier research by A. Prost (1964b), the field of linguistics has not given much attention to Lama. More recently, though, dissertations by Ourso (1989) and Aritiba (1989) have contributed significantly.

This dissertation provides an analysis of the noun class system and agreement phenomena in Lama (Kante variant). Furthermore, the incorporation process for borrowed nouns and the agreement phenomena for left-dislocated coordinate NP structures support the analysis that Lama noun classes, for the most part, are not semantically or phonologically based.

The dissertation contains six chapters. The introductory chapter classifies Lama with respect to geographical and typological categories and discusses relevant research and methodology. Chapter 2 presents the reanalysis of the noun class system and Chapter 3 summarizes the agreement phenomena of nouns and their constituents. The fourth chapter contains an analysis of the borrowing process for nouns and Chapter 5 discusses agreement in left-dislocated coordinate NP structures. The final chapter summarizes the findings of this research and proposes further research areas.

Variation in Standard Persian: A sociolinguistic study

This research aims to investigate variation in Tehrani Persian (Standard) in relation to its socio-cultural dimensions. The primary objective is to investigate stratification of glottals and glides and the general tendencies of these features towards linguistic change, as well as the social mobility of speakers. The secondary objective is to investigate the sociolinguistic properties of two social dialects of Persian in Tehran, which until now have gone virtually undescribed: Jaheli and Armenian Persian.

The analysis is based on quantitative measurements of the data collected from seventy-eight native speakers with consideration to age, education, sex, religion, and ethnic membership.

To account for variabilities, four variable rules were advanced: (y)-insertion, (7)-insertion, change of glottal to glide, and (7)-deletion rules. Style and religion most strongly co-vary with the linguistic variables; education and age also closely correlate. In comparison, sex shows a lesser degree of correlation with the variables.

This inquiry further offers a number of interpretations for certain previously unresolved issues in Persian linguistics: (a) Two types of glides — "underlying" and "derived" — are distinguished. (b) A distinction is also advanced for "underlying" and "derived" glottals. Derived glottals can change to glides; the underlying cannot (c) The two rules of (y)-insertion and (7)-
insertion appear to reflect a functional unity of P-rules and provide a case example of a "conspiracy of phonological rules" (Kisseberth, 1979). (d) The change of glottal to glide is a new innovation and still is "in progress."

The social dialect of Jaheli is shown to make use of an elaborate speech of give-and-take with overt phonological characteristics. Some features of Jaheli are emulated by other members of the community also to express certain values and chauvinistic sentiments.

Armenian Persian appears to provide a rather "marked" sociolinguistic case study. Unlike that of all other subsequent generations of dialect speakers in Tehran who yield to the prestigious dialect of Tehran, this variety has remained unbending.

Finally, the results here could be used for the preparation of teaching materials and bilingual lexicographical works.

Aspects of Chinese syntax: Ergativity and phrase structure

This thesis is a study of various aspects of Chinese syntax from a government-and-binding perspective. The purpose of this work is to argue that a range of grammatical problems of Chinese syntax such as the variable position of subject, word order variation, locative inversion, definiteness effects, quantification and scope effects of inverted subjects can be explained if it is recognized that Chinese has both unergative (accusative) and ergative-type structures. In the unergative (accusative) structure, the subject NP bears the role of an internal argument of the verb and as such occupies the object position at D-structure and is either moved or unmoved to the spec (IP) position at S-structure in accordance with a set of well-formedness principles of the grammar.

Chapter One introduces some basic notions of Government-Binding theory and the theories of ergativity in general, and argues for a unified theory of grammatical mapping between the argument structure and syntactic structure, which accounts for a comprehensive range of ergative phenomena across languages.

Chapter Two provides arguments for taking contrastive word order in Chinese as the primary syntactic diagnostics for ergativity in this language and explores the unergative-ergative alternations with regard to word order variations. It proposes a theta-theoretic condition, the 0-polarity condition which regulates the distribution of arguments and adjuncts in this language. A scrutiny is devoted to the difference in categorial projection with respect to functional categories and lexical categories.

Chapter Three explores the range of ergativity in Chinese in phrasal syntax, with emphasis on the displaced subject and locative inversion construction. It argues for a type-oriented approach to ergativity across languages. Alternative analyses are provided for some syntactic problems related to the Chinese ergative constructions, ranging from the syntactic nature of postverbal agentive subject to the scope and extraction effects in presentational construction.

Chapter Four examines the syntactic nature of complex predicates in Mandarin and the ergative phenomena on the word level, focusing on the
headness condition of causative verb compound predicates as well as the thematic structure of such predicates.

On the communicative effect of relative clause extraposition in English

In this dissertation I will investigate some possible correlations between the form of sentences and the communicative purposes which these sentences may serve. For such a study to offer interesting and significant results it would have to involve a large variety of sentences differing from each other in several aspects related to form, and it would have to focus on various communicative functions that these different sentences may fulfill. General observations concerning the nature of the relationship between the form of a sentence and the way it may function in linguistic communication may be arrived at only on the basis of an extensive investigation of this kind. Such a study, however, although desirable, is presently beyond my capacity. Therefore, I decided to examine only an arbitrary sub-set of syntactically related constructions — sentences related by Right Movement Rules — with respect to their various communicative functions. However, after studying in detail sentences related by only one such rule — relative clause extraposition — I realized that it would not do justice to the other constructions involving Right Movement Rules to include them in this thesis without examining them equally carefully. The scope of the present study will, therefore, be restricted to an investigation of only two types of constructions related by the syntactic process of relative clause extraposition. I will be most concerned with the purposes for which speakers may use sentences with restrictive relative clauses (extraposed and unextraposed) in communication with each other; more specifically, I will deal with the differences between the appropriateness of such sentences with regard to conveying particular communicative intentions of speakers.

As will become evident during the course of this thesis, the communicative effects of the syntactic process of relative clause extraposition are closely related to the principles of word order in a given language. Hence, languages which differ in word order are likely to manifest different characteristics with respect to relative clause extraposition. I will, therefore, restrict myself here to an examination of sentences with restrictive relative clauses in English. (But cf. Ziv and Cole (1974) and Ziv (forthcoming) where Modern Hebrew is investigated with respect to relative clause extraposition and other related phenomena.) The present thesis should be considered exploratory; it does not aim at offering definitive conclusions, but rather at encouraging inquiry in the area of form-function correlation. Hopefully, the results of this investigation may serve as a starting point for a more comprehensive study of this kind.

The thesis is organized as follows: In Chapter I, I delineate the scope of the structures under investigation, discuss the theoretical framework within which this research is conducted and present the kinds of questions with which I will be most concerned. Chapter II deals with various communicative functions of sentences with restrictive relative clauses that modify generic head noun phrases. In this context the differences between sentences with extraposed and sentences with non-extraposed restrictive relative clauses are examined. Chapter III serves as a continuation of Chapter II; it takes up the
question of the relation between conditional if sentences and sentences with restrictive relative clauses on generic heads. It is shown that an account of the relation between these structures in derivational terms is ad-hoc in several respects and consequently a new account for the affinity between these sentences is called for.

Chapter IV is on par with Chapter II. In Chapter II the communicative functions of sentences with restrictive relatives on generic heads are investigated, whereas in Chapter IV some communicative functions of restrictive relative clauses on indefinite no-generic heads are examined. In this context it is shown that in order to characterize some form-function correlations adequately, the pragmatic correlates of the relevant propositional content must be taken into consideration.

Chapter V consists of a brief summary of the conclusions from the previous chapters, a discussion of the overall communicative effect of relative clause extraposition and a discussion of some unresolved problems and suggested topics for further research.

On primary stress in Modern Literary Arabic

In this paper I shall deal with the primary stress of words in Modern Literary Arabic (henceforth MLA). I shall first mention briefly some attempts to account for the primary stress of words in MLA and show in what way they fail. Then I will try to give some rules to account for this stress correctly.

NP Movement and some related syntactic phenomena in Japanese

Ross's quite insightful and stimulating Ph. D. dissertation Constraints on Variables in Syntax motivated this paper. His dissertation is a search for universal constraints on syntactic variables. The complex NP Constraint and the Conjoint Structure Constraint are proposed as putatively universal, and the Sentential Structure Constraint as language-specific. Also, the type of syntactic rules affected by those constraints are said to be reordering transformations which chop the specified NP and permute it around a variable. I would like to investigate whether or not Ross's claims are justified in Japanese.

First, I would like to discuss "NP scrambling" in Japanese, which does not exist in the grammar of English. Second, I will touch on three Japanese reordering transformations which make crucial use of variables: NP Shift, Topicalization, and Cleft-Sentence. Their behavior with regard to Ross's constraints will be investigated. Third, I would like to analyze the Japanese rule of Reflexivization.

[194] Awóyálé, Yiwólá

Gerundive structures in Yorùbá and the notion of "target structures"

The hypothesis of target structures is that each language has a relatively small set of "target structures" — a set of constraints which apply at some relatively superficial level, as a sort of filter on derivations. The correctness of such a hypothesis may explain why in natural language diverse underlying structures are mapped onto the same or similar superficial structures. Whether such structures are similar in all languages, or each language has its own unique set, is not quite clear at the moment until comparative studies are conducted. It is a fact that the underlying structures may be the reason why we have so few superficial word order patterns in natural languages. The possibilities are so few that one would expect diverse structures to converge on the surface. Yet the convergence is not random; it has to be systematic, otherwise there would be no possible explanation for such a phenomenon. This further implies that the rules that create such structures would be expected to share some properties too. And finally, the correctness of the notion of target structures should throw some light on the phenomena of opacity and transparency in grammar.

These structures are the type which assume the same configuration at the surface but which derive from very different logical or semantic structures. There are at least four ways to deal with this phenomenon. Each of the
prevailing approaches will be looked at here in relation to the Yoruba data after the data itself has been presented.

Definiteness and indefiniteness in English

My purpose in this paper is to give a formal characterization of the notions of definiteness and indefiniteness which are found in virtually all traditional English grammars. My aim is to develop a system of rules which will predict the correct English articles on some other basis than simply that of freely choosing between, say, and the. Many transformational grammars have dealt with articles by means of rules such as

1) DET → {a, an, the} or 2) DET → [+def].

These grammars are then forced to include a set of context-restricted rules in their phrase structure which prevent occurrences of definite noun phrases in sentences where only indefinites can occur, and vice versa. The viewpoint I have adopted as a working hypothesis is precisely the reverse, namely, that articles in English are highly predictable on the basis of other, more fundamental, grammatical relations expressed in the phrase structure, and hence need not be specified independently in the phrase structure at all.

As a result of this kind of work, I have arrived at a rough analysis for English in which nouns need not be distinguished as between definite and indefinite in the phrase structure rules. The following is a brief summary of the generalizations which I will eventually draw in the course of this paper.

I. All indefinite noun phrases arise from underlying existential sentences.
II. There is a large and well-defined set of occurrences of definite article plus noun in which the definite article can be analyzed as the overt marker for the presence, in the same or in a previous tree, of an existential containing the same noun.
III. The difference between those indefinites which are given a specific interpretation and those which are given a non-specific interpretation is explained by a mechanism associated with certain embedding rules which delete previously existing reference markers.

Muong Clause Structure

The purpose of this paper is to describe the internal structure of clauses in Muong. Muong is a language spoken by a minority group of approximately 400,000 people in North Vietnam, mainly in Hoa Binh province. The analysis presented in this paper is based on the author’s knowledge of the Muong language gained while residing in the Muong refugee village of Hoa Binh, near Baumethuot, South Vietnam, from 1961-1963 and 1966-1969. Examples given are drawn from recorded text material.

Applying machine learning algorithms to phonology

Consider the problem of discovering a rule characterizing a given sequence of events (objects) and being able to predict a plausible continuation of the sequence. This prediction is nondeterministic because the rule doesn't necessarily tell exactly which events must appear next in the sequence but rather determines a set of plausible next events. It is assumed that the individual events in the sequence are characterized by a set of attributes and that the next event depends solely on the values of the attributes for the previous events in the sequence. The attributes are either initially given or derived from the initial ones through a chain of inferences.

This paper describes briefly an inductive incremental learning program AQ 15 that learns attributional descriptions from examples, and the representation models used to describe syllable structures and the results of applying AQ 15 in this domain.

The evaluation will be done from the viewpoint of classification accuracy of the induced rules on new forms and complexity of the rules. Examples will be taken from the major phonemic groups with known syllabification. The induced rules will be tested for accuracy against the known data.

The data is represented utilizing the encoded concepts of the sonority hierarchy and syllable structure (onset, nucleus, and coda). The program would then be able to induce the appropriate syllable parsing rules given a handful of examples.

[198] Carlsen, Joanne

Notes on adverbials in Greek and English

The complex and subtle nature of adverbials has long presented problems to any linguist attempting to deal with them. In his thesis (1969) Mike Geis proposed that most adverbial clauses fall into the larger and better defined categories of relative clauses and complement clauses. The merit of such a proposal rests not only on the validity of the arguments which support it, but also on the usefulness of the ideas which motivate it. In this case, the motivation is to place adverbials into a category which we know something about and which, therefore, gives us some sort of basis for judging the various and odd ways adverbials act.

I am not interested here in whether Geis' proposal and thesis are successful or not. That I subscribe to his general approach will be obvious from my own. What I intend to do in this paper is to explore in Greek and English the reactions of two classes of verbs which I have isolated because of their distinct reaction to certain features of adverbial clauses. In so doing, I also will explore the nature of why and because-clauses. Lastly, I shall explore Greek there-where clauses. This is not a paper on Greek adverbials, or on English adverbials, but rather a paper on whatever I can find out about adverbials in the fields I explore. I expected Greek to extend or verify, where it differed from English, our description of the behavior of adverbial facts — and this is in fact what happened. In the case of there-where clauses, however, which occur frequently in Greek, but only rarely in English, I concentrate on describing the Greek data.
Something to add to Chinese conditions box

This paper is written in response to Ross’s dissertation in which he proposes that there should be constraints on syntactic rules which make crucial use of variables. These constraints could either be language universal or language particular. He further suggests that the present theory of grammar should be so revised as to incorporate a condition box for each language so that a generalization could be made about the language-particular conditions on the rules of the language.

The necessity of using variables in syntactic rules and the necessity of restrictions on the variables so that the rules will drive correct results are well-stated in Ross’s work. What I want to add is that the kind of language-particular constraints somehow classifies the type of language as a “rigid-word-ordering” language as in the case of Chinese.

I limit the scope of this paper to those rules which involve reordering transformation and feature-changing rules. The paper is organized in the following way. In section II, I will discuss some reordering rules, which lead to the conclusion that certain constraints on them are necessary to be included in the Chinese condition box. In section III, I will discuss some feature-changing rules and try to state the constraints which seem to be operating on them. In this section Pronominalization will be discussed in greater length and the condition on “backward” Pronominalization will also be explored. Section IV is a brief conclusion.

Movement rules and negation

In many proposed derivations, various operations seem to have moved negatives and/or sentential elements containing negatives out of their original positions in deep or logical structure. In the first two substantive sections of this paper, rule ordering provides technically correct explanations of the pattern of sentence acceptability. In the third, rule ordering is inadequate. Since the solution in the third case also suffices in the first two, it is preferred over rule order. The remainder of the paper takes up other cases involving negatives that show similarities to the first three.

Subject pronouns in direct address: Judeo-Spanish

This study will examine pronominal phenomena in Spanish along two basic lines. One is the dialect study, since its starting point in empirical data is a series of Judeo-Spanish texts consisting mainly of folk-tales told by Sephardic Jews in Istanbul to M. L. Wagner and transcribed by the latter in the early twentieth century. Pronominal usage will be compared with standard Spanish, specifically with the results found by T. A. Wilson in his M.A. thesis investigating choice and non-choice of the explicit pronoun in Spanish-American Spanish as found in three plays and the conversational parts of a novel. His data differ from ours in three obvious respects: a) time — mid-twentieth century, ., nature of materials — written rather than oral, c) dialect
— Spanish-American. For this reason we will also consider briefly Spanish usage of the time of the exile of the Jews from Spain, and we will choose a text which is informal and colloquial, in so far as such is available from that period. However we will not attempt an extensive dialect comparison between the Spanish-American materials and the Judeo-Spanish. We will assume that the Spanish-American data represent standard Spanish in all relevant aspects.

Secondly, we will try to account for the results where appropriate, with such rules as would form part of a grammar purporting to properly generate Spanish. In the process of arguing for these rules we hope to show how and why previous analyses are adequate or inadequate.

[202] Donaldson, Susan Kay

Movement in restrictive relative clauses in Hindi

The particular research with which this paper is concerned has to do with the matter of what roles rules of movement may play in determining the surface shape of restrictive relative clauses in Hindi. While much remains inconclusive about generalizations to be gained from this study, I think we can say that word order in Hindi is more restricted than in a thoroughly inflective language, but at the same time more free than in a language which determines syntactic relationships solely from word order. This greater freedom is exercised by the speaker in his choice of position with the S for the relative clause, and in his choice within the clause for the relative pronoun. It appears that the grammar contains the necessary mechanism for moving the clause containing the presupposition to either sentence-initial or post-main clause position from wherever it arises, and that this movement can be vacuous in case the underlying order is that of the surface manifestation.

[203] English, James B.

French: How to predict the stress

The purpose of this paper is to show that French can adequately be described by positing only seven vowels instead of fourteen (seven tense and seven lax). I will discuss vowel alternation and then propose another interpretation of French stress without attempting to analyze the former problem. The paper concludes that stress is always ultimate in French due to the existence of a stress rule much like that of Spanish (Harris 1969) and the rule PSVD, which deletes all vowels after the stress.

Over Konyunktiv in AR talk: About subjunctiveness in Germanized Ozark English

The purposes of this paper are threefold: a) to present data about the uses of the so-called konyunktiv verb forms of the Germanized Ozark dialect of American English, b) to give a reasonable description of this data in the context of a transformational generative grammar, and c) to point out and discuss as yet unsolved problems in accounting for the data in a descriptively and/or explanatorily adequate way. I have used myself as an informant where possible, as I speak this dialect quasi-natively. With my honored father I have also consulted as this is his native dialect. My final authority has been the Lady Peter Schärmer, Sr., of near Scranton, Arkansas, who was born and
reared in the district and who has never been out of it for more than a few days at a time — unlike my father and me — both of whom have travelled considerably in other areas.

*A partial grammar of English superlatives*

There are two primary goals of an optimal grammar of superlatives in English: to account for the phenomena of superlativization in a maximally simple, productive set of ordered rules, and to relate those rules to more general phenomena in the grammar. Specifically, if we can find a grammatical basis for the native speaker’s intuition that the comparative and superlative are related in some way, justifying in some sense the traditional paradigm tall, taller, tallest/beautiful, more beautiful, most beautiful, the resulting grammar will be so much the closer to achieving the second goal of linguistic theory. It is clear upon the most cursory examination, however, that such a relationship is not a simple or obvious one. This paper will attempt to show that deep similarities do exist, and to point out where they may be found.

[206] Hammerschlag, Doris  
1967

*On the notions subject, predicate, and universals*

It seems that some linguists may be overlooking the need for observational and descriptive adequacy in their grammars. A quick look at the past studies of Malayo-Polynesian languages shows that there is a tendency either to try to make the languages look exactly like English or to neglect the possibility that they might have anything at all in common with English. We cannot attack languages with the view that they are identical or that they are completely different.

The similarities we do find by working on the languages individually will be more substantial for the support of universals than those found by basing analyses on English. And, of course, we wish to describe the differences between languages as well as the similarities among them. Basing new grammatical descriptions on English is just as sinful as basing description of English on those of Greek and Latin.

*Classical Greek phonology: Vowel contractions*

The purpose of this paper is to lay a foundation for the diachronic study of Ancient Greek phonology from a transformational generative grammar approach. It was felt that before we should launch into the broader area of diachronics we ought first to get a fair idea of the phonological system of one dialect in one period. For this purpose we chose what is, perhaps, the best studied dialect, Classical Attic.

It may be in place at this point also that we should explain why we have chosen to approach Ancient Greek phonology through transformational grammar. It might be concluded by some that such a well studied language as Ancient Greek could serve as little more than a practice board for scholars in transformational grammar. In actual fact I believe that this relatively new
Masters theses

approach can contribute a great deal to our better understanding of language in general.

The nature of wa and its relation to Japanese negation

The postposition wa has long been supposed to be simply a topicalizer of a sentence. The purpose of this paper is to show that wa has a function of bringing "contrast" into a sentence and that the contrastive function of wa can most adequately be described by assuming a "shadow sentence" in the underlying structure. We will argue that the introduction of a shadow sentence in the underlying structure will provide adequate description of such postpositions as ma 'also' and dake 'only' and the occurrence of wa in negative sentences.

A phonological cycle in Siane

The purpose of this paper is to show the value of ordered rules and the need for a cyclical application of a subset of those rules in the phonological component of a transformational-generative grammar of Siane, a language of the New Guinea Highlands. Motivation for each rule and its specific ordering is given in sections two and four, and motivations for a phonological cycle is shown in section three. In the appendix the ordered rules are listed together followed by the full derivation of every example not fully derived in the body of the paper.

The PIE consonant shift in Armenian dialects

The consonant shift from Proto-Indo-European in Classical Armenian is similar to the consonant shift that independently took place from PIE in Germanic. As in the Germanic languages, secondary and tertiary shifts took place in the various dialects of Armenian. Some scholars including Gharibian and his followers postulated that some of the Modern Armenian dialects evolved through sister dialects of Classical Armenian rather than directly from it. In doing so, they rejected the consonant shift phenomenon.

In earlier versions of this paper I tended to agree with Gharibian's view. However, I have come to realize that Classical Armenian is the older dialect that underwent the first consonant shift. Because of the absence of earlier written documents in Armenian it is impossible to follow the various stages of the development of Armenian consonantism extending from the PIE period to the first translation of the Bible in the fifth-century AD. Gharibian's view can best be refuted by considering the historical background of Armenia and the nature of the internal and the external influences to which the speakers of Armenian became exposed. Following this a brief discussion of the consonantal outcome in Classical Armenian will be given and then the problem will be discussed in more detail.
Shan or Thai Yai is a language (or group of dialects) spoken in the Shan States of Burma and Yunnan, with some speakers in the Mac Hong Son area of northwest Thailand. It is usually grouped together with Thai and Laotian into the Kadai or (Kam-Thai) family. The number of speakers of Shan is estimated to be around 1,350,000.

This paper is an attempt to give a grammatical characterization of the comparative construction(s) in Shan within the framework of a transformational-generative grammar. Much of what is to be presented here will be of a purely observational nature, either because any deeper a treatment of it would be well beyond the scope of this paper or because the writer knows just too little about it to say anything of interest or significance. However, it can only be hoped that the many problems hinted at or left unsolved in the course of what follows will provide starting points and motivations for others beginning work on the Shan language.

Most previous studies of Latin word order have taken the view that, although Latin word order is "freer" than most languages, certain patterns or regularities can be noticed which would allow one to formulate what I would call nothing more than "rules of thumb." Since Latin grammars have neglected to discuss word order in anything other than generalities, this is the one area in which the grammars can be supplemented and it is also the topic to which I direct this paper.

I have chosen the comedies of Plautus as the basis of my study. With Plautus we can establish structural description of a spoken Latin idiolect at a fixed period of time. The general scope of this paper will be to present the predominant patterns observed in the noun phrase and to indicate various problems involved in the structural description.

There are two ways to describe an object. One can speak of an object actively, as in "A dog is running toward us", or statively, as in "That dog is ferocious." In this thesis I compare active and stative expressions in English and Japanese. In particular, I offer examples to show that determining whether a phrase is active or stative depends on context. I will focus on the stative verbs used in English and in Japanese, and the relationship between ASPECT and STATE.

This thesis consists of five chapters including a conclusion. In chapter one I discuss the claims of six linguists, namely Lakoff, Kuno, Alfonso, Martin, Teramura and King. This leads to twenty-three questions for discussion. I divide these questions into five categories, and in chapter two I discuss the first three of these. In chapter three I address three questions concerning
stative and nonstative verbals. This requires making some additional definitions. In chapter four I analyze the remaining question concerning the relationship between stative transitive verbs and the Japanese nominative case-marker GA. I tie these results together in the concluding chapter.

Acquisition of English as a Second Language for Korean children in declarative and interrogative sentences

This research will investigate the second language acquisition processes of two Korean children in their performance of declarative and interrogative utterances in English. In declarative utterances, the acquisition order of grammatical morphemes will be studied, based on Brown's (1973) framework that represents the semantic relationships of Fillmore's (1968) case grammar. In interrogative utterances, inversion of yes/no questions, WH-questions, and do-support including models are to be investigated.

This research on second language acquisition was based on the hypothesis that (1) high frequency of input would not play an important role; (2) semantics would be a significant consideration but not imitation; (3) development of intelligence or perception would be one of the most important factors; and (4) ego-centrism or nearness would influence second language acquisition for pre-school children.

Coordinating conjunctions in Hindi

In An Introduction to Hindi Syntax Y. Kachru devotes a brief section to the discussion of conjunctions in Hindi. While making some remarks on the coordinate conjunction structures in Hindi, she refers to the "general rule" that the strings conjoined by conjunctions must have 'like' structures.

The nature of deep structure constraints on coordinately conjoined sentences in Hindi has not been studied in any work so far. Both transformational and deep structural constraints must be formulated to apply to all conjuncts of a coordinate structure in Hindi. It is equally important to study different types of coordinately conjoined structures for determining the deep structure of sentences or parts of sentences which can be conjoined by the coordinate conjunction morpheme or. Here I intend to make some remarks on the different types of coordinated conjoined structures, and to point out some deep structural and transformational constraints on such structures which can be conjoined coordinately with or.

[216] Langacker, Ronald W. 1964
Some embeddings and interrogatives of French

The purpose of this paper is to propose a theory accounting for selected portions of the grammatical structure of French. These include a large but by no means inclusive body of interrogative expressions, a number of related generalized transformations projecting the output of the rules comprising this theory into an infinite set, and a fairly elaborated though admittedly rough constituent structure component describing a finite set of strings together.
with their structural descriptions, constituting the domain over which the transformational rules are defined.

As with any theory, its claims are only tentative and approximate. There are no complete descriptions, and there is always some artificiality and oversimplification involved in dissecting out some part of the body of data in order to describe fully that part. Therefore the rules presented here do not constitute a closed system. They are obviously inadequate in many respects, and an attempt has been made to point out some of these inadequacies as well as to indicate possible ways of extending this theory to account for a fuller body of data. The noun expansion rules, for example, clearly will not survive deeper analysis as they stand, although it is hoped that they will have contributed something towards a satisfactory treatment. The scheme of verb classification is proposed more seriously. Although naturally incomplete, the main outlines of it are probably valid.

[217] Leich, Harold M. 1971

Patterns of verbal accentuation in Slovene

The aim of this paper is to investigate the basic pattern and broad outlines of the accentual system of the standard Slovene conjugation, particularly in light of the hypothesis of M. Halle, who has claimed (1971) that accentual phenomena on the surface level of Slavic languages are the result of two distinct components or levels in the grammar — the morphology and the phonology. More specifically, Halle claims that information associated with individual lexical elements determines where stress will be marked in the underlying phonological representations of words: the phonological rules, in turn, determine the pitch or stress contour of the phonetic representation of the word, on the basis of the morphological marking or stress-assignment. Halle, in his paper, discusses largely accentual alternations of the nominal paradigms of the Slavic dialects; he also deals primarily with the phonological rules involved in producing these phenomena, largely leaving aside the question of the morphological rules which determine the input to the phonological component proper, and the problem of how the lexicon is to be marked by features which determine the original accenting of underlying representations. The purpose of this paper is, in part, to discover whether Halle's theory, and the rules he proposes, can account for the accentual patterns found in the Slovene verbal system, and also to see what morphological rules, of the type Halle mentions, must be posited in the grammar of Slovene to explain the certain accent-classes found in verbal conjugation.

Intensive reflexes

While reflexive pronouns have been analyzed and found to have important implications for transformational grammar study, the closely related phenomenon of the intensive reflexive has been ignored, perhaps on the assumption that in itself it is uninteresting or that it at least has nothing to contribute beyond the insights garnered from the study of the other reflexive pronouns. This paper will examine some of the facts of intensive reflexives, relate these to other facets of the grammar, and raise some other questions without providing any answers to them.
On some Chinese syntactic rules

This paper is divided into two sections: Section I is to show whether the Chinese Topicalization Rule is subject to the constraints which Ross proposes in his dissertation. Section II is to present some data in order to get a clearer idea about the Chinese Relative Clause Formation by applying the Constraints. The four constraints are: the Complex NP Constraint, the Coordinate Structure Constraint, the Sentential Subject Constraint and the Left Branch Condition. Ross claims that the first two of these are universal. He made a further survey to find out the differences between the rules which are subject to the Constraints and the rules which are not subject to the Constraints.

In this paper I will test two Chinese rules to see if the Constraints operate in Chinese and to see whether or not we have to add some other constraints to the language-particular grammar. I have chosen two Chinese rules. They are: A. Topicalization Rule, B. Relative Formation Rule. The reasons I have chosen these two rules are because 1) topicalization is a chopping rule, 2) the Chinese Relative Formation Rule is still a mystery. If the Constraints also apply to it, it is very strong evidence to support that it involves movement; otherwise it does not.

The oral narrative ability of children in grades one, four, and seven

This is a study of the development of elementary school children's ability in oral narration at three-year intervals. My purpose in this study is to examine stories told by children on three grade levels, with a view to improving their training in this area. Teachers of language arts often find the teaching of composition, oral or written, the most difficult part of their program. It calls for creativity, which is the result of hard work. I believe that if we know what grasp of the structures of language and of narrative discourse a child has acquired at various levels of schooling, we can help him to make the best use of the former to improve his performance in the latter. And so, I undertook this project to see how I might work with others to achieve such a goal.

Some unsolved problems in Korean phonology

The purposes of this paper are: 1) to describe the synchronic phonology of Korean in such a way as to be optimally efficient both in descriptive and explanatory adequacy — aiming to illustrate the basic symmetry of the phonological system and the inter-relatedness of phonological rules; 2) to describe the historical sound changes that have led to present forms; 3) to relate Korean to its ancestral (and "sister") language; and 4) to evaluate and describe all the above in terms relevant to our understanding of universals in language. The task of the generative-transformational linguist extends beyond the already difficult tasks to which taxonomic linguists have always devoted themselves — observation and description: what happens in language and how. Now linguists are beginning to try to find out why things happen in language (the realm of interpretation) as witnessed particularly by recent concern to
describe "function" and "motivation" in linguistic patterning and change. I personally feel strongly that it is important to keep on looking for the what, how, and why even when simple answers are far from immediately apparent. For this reason I present in this paper not mainly solutions but problems. I feel that even though satisfactory answers have not been found for these phonological enigmas in Korean, a look at some possible or partial solutions can be beneficial — perhaps even illuminating to others who will continue the search for solutions.

A linguistic study of sound and meaning in poetry

My central thesis is that if literary analysts, critics, critical readers, readers for simply enjoyment, etc., can make a statement about "musicality" of verse, i.e., "the hissing of the striking snake," "rapid flowing rhythms and sounds," "the babbling of the brook," "a general feeling of soft whispering sounds," etc., the sound-meaning connections can, much of the time, be taken as evidence of a very real linguistic phenomenon which is little understood, and upon which much elaboration is needed. I would like to provide several descriptive techniques by which one can, in part, account for sonority of English verse. My study will not necessarily lead to a rigid proceduralist approach toward sound in poetry, but hopefully will offer insights in the understanding of sonority and sound analysis. I believe that such a view toward poetic analysis, appreciation, and perhaps criticism will help lift the awesome, mysterious authority from one of a poet's chief tools — sound.

My paper is divided into three parts. The first is a collection of misconceived or only partly appropriate statements that literary specialists have claimed in reference to sound and sound effects. The second chapter deals with phonemic selectivity and phonemic distribution, as seen by Yeats's "Leda," and how this sonnet deviates from the prosaic norm. Chapter three presents a sketch of how syllabification can effectively be used by the poet to set up patterns of sonority.

Minow, Martin

Random generation of sentences from context free and context sensitive phrase structure grammars

This paper describes a set of computer programs which generate sentences from context-free (CF) and context-sensitive (CS) phrase-structure grammars. The paper is divided into three main sections: introductory comments on the linguistic assumptions reflected in the CS programs, descriptions of the overall structure of the programs and their use, and a series of appendices giving more detailed information. Future publication of flow diagrams, program listings, and sample output is planned.

The discussion which follows deals only with the CS and transformation programs. The CF program will be dealt with separately as it is completely independent of the CS programs and models a different type of grammar.

*Notes on transitivity and subcategorization of verb-verb compounds in Japanese*

In this paper, first I would like to show how the transitivity-intransitivity of verb-verb compounds in Japanese should be treated. Then, following Newmeyer, how these verb-verb compounds can be subcategorized in Japanese.

One of the big differences between English and Japanese is that some action takes two separate verbs in English but one compounded form in Japanese. Since the surface forms are distinctive in transitivity, we are interested in the transitivity when two verbs are compounded. Japanese sentences which have verb-verb compounds will be tested in this paper.

*Pronouns and constraints on coreference*

The occurrence of pronouns and the determination of what antecedents they refer to is one of the most difficult questions in linguistics. Vast amounts of pulp and pen-ink have been spent on discussion of the phenomena, yet no firm conclusions have been reached. In addition to the intricacy of the relation of anaphora to other grammatical phenomena, there is enormous difficulty in making judgments of relative grammaticality, as well as substantial cross-dialect variation. All statements made at this time must therefore be highly tentative. In this paper I wish to take one approach to the representation of anaphora in a grammar and explore some of the consequences. It should be recognized that the approach here is no more firmly supported than any other discussion of the topic, and probably a good deal less so than many.

*Tonal characteristics of Kyongsang dialect of Korean*

The Kyongsang dialect in the Southeastern province of Korea has been regarded as a tone language by many Korean linguists. Although some argue whether the Kyongsang dialect is a 'registered tone language with contour overlap' or 'registered tone language without contour overlap', most Korean linguists presupposed that the Kyongsang dialect is a tone language since the dialect meets the traditional definition of a tone language as it has 'lexically contrastive pitch'.

Will the Kyongsang dialect still be a tone language in the light of a new concept of a tone language by McCawley? In this paper I will give some supporting evidence that indicate that the Kyongsang dialect is more a 'pitch-accent' language than a 'true tone' language.

*Explanation of the tonal change from Middle Chinese to the modern dialects*

Several recent papers have discussed the tonal changes in the evolution of Middle Chinese (MC) into Modern Chinese dialects. Cheng and Wang (1971a)
discussing the Chao-zhou dialect and Cheung (1971) the Chang-sha dialect, dealt with the internal causes of these phonological changes. In this paper I will, in the same way, discuss the internal causes for the change of Middle Chinese tone III with unvoiced aspirated initials into tone II in the modern Nan-chang dialect.

_Tone in some Kikuyu verb forms_

This paper deals first and mainly with some processes of tone assimilation governing the tonal configuration of affirmative verb forms in Kikuyu. The first part of the paper deals with tonal assimilations triggered by high and low tone verb stems, pronouns, prefixes and suffixes respectively. With the support of evidence from verb-noun constructions, it is suggested that the assimilation processes in question are most naturally viewed as cyclic and that a linear approach leads eventually to false claims about the nature of the assimilations. Subsequently it is shown that the assimilation rules fall into two classes according to their behaviour in forms where vowel coalescence is operative. More light is shed on this dichotomy by the presentation of a rule of dissimilation operative under rather special circumstances. Various means of expressing the dichotomy are discussed and all found wanting.

The data for this paper has been taken from L. E. Armstrong’s _Phonetic and Tonal Structure of Kikuyu_ and from the _Kikuyu-English Dictionary_ edited by T. G. Benson, the latter serving mainly as a source for verifying the former. All the examples given here are attested in Armstrong or Benson. In a few cases, mostly involving the tone of initial pronouns, the isolation examples cited by Armstrong differ unpredictably from the identical forms quoted later in the book in verb-noun constructions. When in doubt, I have adopted the forms given in the verb-noun examples.

_On the syntax of Hona in Hindi_  

This paper deals with the syntactic analysis of the verb _hona_ in Hindi, which is translated as ‘to be’, ‘to become’, ‘to have’, etc. in English. The main body of the text has been divided into four sections. The first section is a brief survey of previous work done on _hona_, along with some comments about deficiencies. The second section attempts to give motivations for establishing different _hona_'s. The third section, following the current transformational-generative grammatical model, formulates deep structures underlying the several surface _hona_'s established in the second section. The fourth section comprises some concluding remarks.

[230] Shih, Celia Mou-Pin  

_Question words in Chinese_  

This paper discusses two important points concerning the transformation theory on interrogations. One is that the so-called 'question formation rule' is the process of transforming the questioned elements from the underlying level to an intermediate stage which is the replacement of lexicon entries without involving the movement of those questioned elements. The 'question
formation rule', apart from the 'question movement rule' is an obligatory transformational process in all languages. With this analysis, we can account for the derivational history of interrogations in a more general way.

Another point is that the question formation rule can actually apply in sentences to almost anything, as far as the different grammatical categories are concerned. The questioned elements on the underlying level will be represented by a dummy element with a list of features from which all the WH-words in the language can be derived. The analysis here of using a dummy element as the questioned strings in the underlying structure of interrogation has a more general insight into some linguistic facts on language structure than the theory of WH-marker many linguists have proposed. It provides more consideration on the aspects from phonological, semantic, and syntactic viewpoints.

Phonetic nature of even-tone split in Chinese

Tone plays a very significant role in Chinese. In this paper, I will concentrate my attention on one phenomenon in tone change, which is called tone split. There are four tones in Mandarin Chinese: Tone I, Tone II, Tone III, and Tone IV, which are also called Ying Ping (Yin Even), Yang Ping (Yang Even), Shang (Rising) and Qu (Going), respectively. Certainly this is not the only tone system in Modern Chinese dialects, nor in that of the ancient Chinese. However, in comparison with MC tone categories — which are Ping (Even), Shang (Rising), Qu (Going) and Ru (Entering) — we find that the Even tone in Middle Chinese is split into two tones: Yin Even and Yang Even in Mandarin. This paper is focused on the tone split in Even tone. I shall discuss the correspondences between Middle Chinese and Mandarin Chinese and try to give some credible explanations.

Some classes of noun modifiers in Japanese

The aim of the present study is to examine the syntactic structure of noun modifiers in Japanese in terms of generative grammar, the basic theory of which was systematically and successfully developed by N. Chomsky, and to attempt to formulate the rules to generate them.

In the past ten years, study of the theory of a language has developed remarkably and many attempts have been made to apply the theory of generative grammar to languages other than English. The application to Japanese is by no means new. In the present study, however, we would like to consider the generation of noun modifiers in terms of the assumption that they are mainly generated by the process called relativization.

Topics in Finnish phonology

In closed syllables most consonant clusters ending in a stop will be altered. Any liquid or nasal before a double consonant will not affect gradation of the geminate consonant cluster. In addition, gradation cannot apply to an initial consonant cluster. In general terms, it appears that liquids and glides do
not affect gradation: p→v, t→d, and k→φ. We could write three separate rules for this gradation process, one for each stop. If k is preceded by either a liquid l or r, or h and followed by a front unrounded vowel, then k→j.

The problem is that we need a natural explanation for these and other rules in Finnish. This paper will consider several natural solutions to problems in Finnish phonology.

Su, Maria Shu-Hsiang 1971

*Chinese classifiers*

A long time ago people had noticed the difference between classifiers and nouns; however, classifiers were usually put into the category of nouns. Li Jing Syi called them "measures" because they denote the quality of nouns. Now, "measures" are widely adopted by grammarians. Some grammarians called them "adnouns" or "auxiliary nouns." Whatever they called them, one thing they wanted to make clear was that they are not nouns but they are used with nouns. We call them "classifiers" in this paper because we emphasize the fact that they separate nouns into different categories according to their semantic regularities. Also, we are not concerned with so-called "measures for verbs" since they are quite different from those of nouns. Furthermore, we put emphasis on what Chao called "Individual measures."

*Some aspects of underlying syllable structure in Thai*

Word games are interesting to phonologists in general for the reason that they are a phenomenon of language which may reveal phonological rules operative in the language and thus may be helpful to phonologists in working with the language. To others, namely anthropologists, sociologists and psycholinguists, this kind of verbal play is meaningful for its deviation from common linguistic usage. This deviation sometimes expresses the characteristics of the society and its culture: it is a particular manner in which society, due to conventional regulations or cultural taboos, chooses to express its experience.

In this paper, we wish to investigate some phonological aspects of Thai through this word game. We hope that the evidence from the game will help us to gain a clearer understanding of the nature of the underlying structure of Thai syllables going beyond what has been proposed in the literature. Our tentative proposals concerning the phonological constraints on syllable structure will involve aspects of tone in Thai. Additionally, we will try to postulate some phonological rules to account for the neutralization of tone as noted by Haas (1956).

We are unable to determine independently on phonological grounds which of the words or syllables in the sentence string will be exchanged in the word game. Semantics surely plays a crucial role in Thai puns as well as in English. But what we will try to show is how this exchange is done. Our study is based on data collected from a group of Thai students at the University of Illinois.
According to the generative theory of language, the phonological component of a grammar consists of a set of partially ordered rules that relate surface structures (i.e. the final outputs of the syntactic component) to phonetic interpretation. These rules are divided into redundancy, transformational and phonetic, applied in this order. The first group fills in for each segment the features that were left unspecified in the lexicon by virtue of their non-phonemic character. The third group transforms binary features into multi-valued ones, thus yielding a phonetic transcription.

In this paper we will be mainly concerned with rules of the second type. More specifically, we will discuss a set of cyclical rules whose application entails the following procedure:

Rules apply first, in their marked order, within the innermost pair of labeled brackets. When the end of the cyclical rules is reached, (i.e. at the end of a cycle), the aforementioned brackets are erased and the same set of rules applies over again within the presently innermost pair. Where no more brackets are left in the utterance, we pass to the post-cyclical rules.

The appearance in certain Spanish verbs of an unexpected -g- in the first person singular present indicative and throughout the present subjunctive poses a vexing problem for the historical investigator. The occurrences of this intrusive velar element can be grouped into three categories — those of the types tengo, salgo, and caigo.

In this paper we observe the very similar development of tened, valed, cadeô, etc. in other Romance languages. After a cursory examination of the Spanish dialects, we describe the situation in Castilian. Each of the major problem areas will be examined, with pertinent data from the various Romance languages playing an important role.

Kanuri is an East-Saharan language spoken by the Kanuri of Bornu Province just west of Lake Chad in northeast Africa. Most of the nearly two million speakers of this language live in Yerwa and Dikwa and the country surrounding these cities. Since most of the data under analysis have been taken from Lukas’ grammar, our discussion will center around the Yerwa dialect which he studied. Although much would be gained no doubt from an in-depth crosslinguistic study comparing the various dialects of Kanuri, our primary concern in this paper is for the synchronic phonology of Kanuri alone. In particular, we will limit discussion mainly to the verbal morphology and the rules needed to generate the various verb forms in Kanuri.

Disjunctive conjunction in English: An outline

This paper consists of a basic study of the syntax of conjunction with BUT, and a brief examination of the semantic necessities involved. The problem of conjunction appears, at first glance, to be quite simple syntactically, and quite complex semantically. Although I believed this to be the case when I began developing this paper, the gradual evolution of the content considerably altered my opinion. I feel that when all of the syntactic complexity of conjunction is resolved, the semantics will be extremely simple.

The discussion of some "counterexamples" to this thesis will serve both to introduce its content and to illustrate the "semantic" difficulties involved in conjunction in general, though conjunction with BUT is the only kind about which this paper makes claims of reasonable accuracy.

Contextualized language teaching: English texts for military school in Thailand

This paper is an attempt to use sociolinguistic insight to design appropriate courses and texts for the military school in Thailand. The research is based on the Royal Thai Armed Forces Preparatory Academy, which is considered the gateway to the higher level of other military schools such as: The Air Force Academy, The Royal Thai Army School, The Naval School, and The Police Academy.

This research will focus only on the teaching of English in a special area, namely, English for military purposes. In the case of English for military purposes, the designed program will permit the Precadets and Cadets to read textbooks in their specific field of study. Moreover, as officers-to-be, they are also to be trained to perform their jobs properly in English when needed.

A portion of this study will look at the sociolinguistic background of the people involved, namely, the Precadets and the English language instructors in the Royal Thai Armed Forces Preparatory Academy. In addition, teaching materials used in this institute, including textbooks and supplementary activities designed for the Precadets will be discussed in detail.

An attempt is also made to answer the following questions:

(1) What will be the appropriate texts for the Precadets?
(2) What will be the appropriate approach for teaching ESP to the Precadets?
(3) What implication can be found in the Precadets' achievement and failure in relation to Bernstein's theory of the varieties of language?
(4) What can be done in order to prevent such a failure in learning the language of the Precadets?

Phonological rules in Korean

The purpose of this paper is to describe the phonological behavior of Korean within the framework of generative phonology. Only the obligatory
phonological rules of Modern Korean will be discussed; thus, no optional rules will be introduced. The conclusion includes a list of the phonological rules which have been discussed in the paper. The dialect used in this study is my native dialect of Seoul. Neither dialectal nor ideolect differences will be considered.

A contrastive analysis of sentential noun phrases in English and French

Contrastive analysis has long figured as a pedagogical tool in the foreign language classroom. Yet the nature of its contribution remains a subject of controversy. On the one hand its value is seen to lie entirely in its explanatory power: problems areas identified through error analysis and shrewd classroom observation are traced to their source via an investigation of the contrasts that exist between the target and native languages. A more powerful claim is that contrastive studies are themselves capable of predicting which errors will occur through a careful comparison of the structure and rules of the two languages. This claim has been criticized for numerous reasons: e.g., areas of greatest contrast are not necessarily those of greatest difficulty to the learner; and vice versa, while it may be claimed that similarities between L1 and L2 will facilitate learning, experience shows that when the two languages share a great many features, interference is frequently maximized and confusion on the learner's part increased.

This paper deals with the current controversy. I assume that a great number of errors made by American students of French are absolutely unavoidable. These include mistakes regarding the grammatical gender of French nouns, agreement between noun and adjective, the proper shape of verb stems and endings, and to a certain extent correct word order, e.g., ADJ + N in English versus both ADJ + N and N + ADJ in French. These errors are the result of imperfect memorization of a vast amount of information idiosyncratic to French. There are errors, however, which from the generative standpoint are the result of differing transformational histories of roughly equivalent sentences in the native and target languages. It is with the prediction of this kind of error that I am concerned. To that end a discussion of sentential subjects and complements in French and English is presented. The results of this comparison will indicate that beyond some initial similarities, the treatment of sentential elements in the two languages differ markedly.

[243] Ziv, Yael 1973

Relative clause extraposition: Some observations

In this paper I have attempted to investigate some aspects of extraposition of relative clauses. In the first part I have attempted to show that extraposition of relative clauses applies only to restrictive relative clauses. I have also tried to explain why this should be the case. The second part of this paper is devoted to the analysis of some sentences with extraposed relative clauses. It is claimed that some such sentences are more acceptable than others, and there are attempts at discovering the factors which play a crucial role in determining the acceptability of such sentences. The third and last part of this paper deals with the relations between restrictive relative clauses that modify generic NP's and the matrix sentences.

FACULTY MEMBERS
DEPARTMENT OF LINGUISTICS
University of Illinois at Urbana-Champaign
1993-94

ANTONSEN, ELMER H.: Professor & Head (historical, comparative, and synchronic Germanic linguistics: runic inscriptions; phonology, morphology, and orthographies).

BENMAMOUN, ELABBAS: Visiting Assistant Professor (Arabic and Semitic linguistics).

CHAO, RUTH: Visiting Assistant Professor (phonetics).

CHENG, CHIN-CHUAN: LAS Jubilee Professor (computational linguistics, quantifying dialect affinity, and Chinese discourse analysis).

COLE, JENNIFER: Assistant Professor (phonology and computational linguistics).

DONCHIN, RINA: Lecturer (Hebrew language and literature, teaching methodology).

DOWNING, LAURA: Visiting Assistant Professor (phonology, historical linguistics).

GREEN, GEORGIA M.: Professor (syntactic theory, pragmatics, discourse understanding).

HOCK, HANS HENRICH: Professor (general historical linguistics, Indo-European, historical and synchronic Sanskrit studies, Old English syntax).

KACHRU, BRAJ B.: Center for Advanced Study and LAS Jubilee Professor (sociolinguistics. World Englishes, multilingualism, and language and ideology).

KACHRU, YAMUNA: Professor (applied linguistics, discourse analysis, pedagogical grammar, and Hindi).

KIM, CHIN-WOO: Professor (phonetics, phonology, morphology, Korean linguistics, and stylistics).

KISSEBERTH, CHARLES W.: Professor (phonology and tonology).

MACLAY, HOWARD S.: Professor (psycholinguistics and applied linguistics).

MORGAN, JERRY L.: Professor (syntax, pragmatics, morphology, computational linguistics, natural language processing, and Albanian).

PANDHIARIPANDE, RAJESHWARI: Associate Professor (Hindi language and literature, language of religion, syntax and semantics of Sanskrit, Hindi and Marathi, sociolinguistics, Asian mythology, Hinduism).

YOOON, JAMES: Assistant Professor (syntax, morphology, Korean and Japanese linguistics).

ZGUSTA, LADISLAV: Center for Advanced Study Professor (lexicography and Indo-European linguistics).

ZUCCCHI, ALESSANDRO: Assistant Professor (semantics, syntax interface, and Romance linguistics)
The annual *Newsletter* of the Department of Linguistics at the University of Illinois at Urbana-Champaign appears each summer and contains information on the preceding academic year, including Departmental Personnel, Honors and Recognitions, Instructional Programs, Research and Service, Public Events, Individual Recognition and Projects, and Departmental Publications.

Beginning with the 1994 issue, we would like to feature a new section, *News from Alumni*. We encourage (actually, beg) all former students, faculty, or staff members of the Department to drop a note with any information they would like to share with us and with other former members of the Department to:

The Editor, Annual Newsletter  
Department of Linguistics, 4088 FLB  
University of Illinois  
707 S. Mathews Avenue  
Urbana, IL 61801  

e-mail: huffman@ux1.cso.uiuc.edu  
fax: (217) 333-3466

If you have not received a free copy of this year’s *Newsletter* and would like one, or would like to have your name placed on the mailing list for next year’s edition, send your name, current mailing address, telephone number, and e-mail address (if any) to the above address. It would be helpful to us if you would also indicate your degree(s) and the year(s) of conferral, or the years of your affiliation with the Department.

It is always a pleasure to hear from former students, colleagues, and friends, so do not be bashful, write us today!
| Vol. 17:1 | Spring 1987 | Papers from the 1986 South Asian Languages Analysis Roundtable (Editor: Hans Henrich Hock) | $6.00 |
| Vol. 17:2 | Fall 1987 | Papers in General Linguistics | $6.00 |
| Vol. 18:1 | Spring 1988 | Papers in General Linguistics | $6.00 |
| Vol. 18:2 | Fall 1988 | Papers in General Linguistics | $6.00 |
| Vol. 19:1 | Spring 1989 | Papers in General Linguistics | $7.50 |
| Vol. 20:2 | Fall 1990 | Linguistics for the Nineties: Papers from a Lecture Series in Celebration of the Department's Twenty-Fifth Anniversary (Editor: Hans Henrich Hock) | $7.50 |
| Vol. 21:1 | Spring 1991 | Papers in General Linguistics | $7.50 |
| Vol. 21:2 | Fall 1991 | Illinois Studies in Korean Linguistics, 2 (Editor: Chin-W. Kim) | $7.50 |
| Vol. 22:1 | Spring 1992 | Papers in General Linguistics | $7.50 |
| IN PREPARATION: | | | |
| Vol. 23:1 | Spring 1993 | Papers in General Linguistics | $8.00 |

For earlier issues and order information see inside cover.
All checks and money orders must be in U.S. Dollars, drawn on a U.S. Bank, and made payable to University of Illinois. Sales Tax must be included as follows (except tax exempt organizations: IL 7 1/4%, IN 5%, MI 4%, MN 6%, OH 5%, WI 5%).

While quantities last, Volumes 7:2 through 16:2 are being offered at half-price.
