Implementing a Collaborative Consultation Model To Improve Success in Mainstream Courses for Secondary Learning Disabled Students.

This practicum developed a program to improve the mainstreaming of secondary level students with learning disabilities through provision of: (1) inservice training workshops on the topic of collaborative consultation for regular and exceptional (special) educators, and (2) study skills seminars for the students. In addition to the inservice workshops and student seminars, the practicum involved development of a packet of training information for inservice participants, administration of seminar surveys, development of mechanisms for mainstream cost factor funding, and coordination of meetings for teacher course descriptions and student inventories. Evaluation indicated that collaborative consultation was a successful model for mainstreaming this population. Appendices include forms, seminar descriptions, workshop materials, student inventory, and rating scales. (Contains 35 references.) (DB)

ABSTRACT

This practicum was designed to provide a blueprint for mainstreaming learning disabled students. Inservice training workshops in collaborative consultation for regular and exceptional (special) educators were organized along with study skills seminars for learning disabled students.

The writer planned and presented inservice training for regular and special educators to assist them in understanding specific learning disabilities; prepared a packet of training information for inservice participants; taught skills-building seminars; administered seminar surveys; prepared mechanisms for mainstream cost factor funding; coordinated the meetings for teacher course descriptions and student inventories.

Analysis of the data revealed that collaborative consultation was a successful model to mainstream learning disabled students. The relationship between the exceptional educators and the mainstream teachers was enriched by the increased communication and valuable exchange of information.

CHAPTER I

INTRODUCTION

Description of Work Setting and Community

The work setting of this practicum was a secondary educational facility located in an urban area centered in a community of 200,000 in a county on the southeastern coast. The tax base in this region was generated by light industry, aerospace support industry and tourism. The school served an upper middle class population, with extensive busing to provide access for students in the surrounding areas. This secondary school was unusual in that it is also the designated learning center in its area for children identified as emotionally handicapped (E.H.), as well as for children identified as learning disabled (L.D.). In addition to day school this facility also offered evening community college credit courses as well as adult education courses.

The physical plant of the school centered around a twenty-year-old structure with three classroom and
administrative wings perpendicular to two connecting outdoor corridors. Several special purpose buildings were in close proximity to the classrooms, the auditorium, media center, physical education facilities, playing fields and music studios.

There were approximately 100 classroom teachers, three full time counselors and a department lead specializing in exceptional education (special education) placement and counseling. Additional staff included five administrators, two library and media specialists, six full time administrative support staff, one teacher assistant for exceptional education, 15 custodial and 11 cafeteria workers, to serve nearly 1450 students.

There was a cooperative, constructive relationship between the twelve exceptional education teachers and school administration. The exceptional education teachers were required to be certified to teach specific learning disabilities or emotionally handicapped students, depending on their class assignments and staffing needs. The exceptional education teachers were generally supportive of one
another and enjoyed an "open door" policy with the principal and his staff.

**Writer's Work Setting and Role**

The teaching placement of the writer at the time of this practicum was as "teacher on assignment" which included exceptional education department lead, guidance committee chairperson, exceptional education counselor, and staffing coordinator for the exceptional education department. Main employment tasks were focused on the staffing and placement of exceptional education students from local junior high schools, other counties, and other states. Responsibilities included creating the yearly master schedule for the exceptional education department, teacher class assignments, and scheduling regular diploma students into mainstream classes.

The school served both part time and full time emotionally handicapped, learning disabled and non-handicapped students in a variety of service models, including self-contained, resource tutorial classes and in-school vocational placement.
CHAPTER II

STUDY OF THE PROBLEM

Problem Description

In this school many exceptional education students were not experiencing success in the mainstream. Teachers were not making appropriate modifications for the learning disabled students in their classrooms. Over fifteen students requested schedule changes into other courses or with other teachers because they were worried they may not be successful in a particular course. Social studies and science classes appeared to be the most difficult subjects for the learning disabled students to grasp. The students’ complaints were focused on one of several concerns: the fact that the student didn’t understand any of the material, the teacher spoke too fast for the student to take notes properly, or the student could follow the course work, but could not pass a test or quiz.

Mainstreaming exceptional students into regular classes continued to be an important educational trend,
this school had to deal with that reality and gave greater support for mainstreamed disabled students. Mainstreaming was the popular term for educating handicapped students in the least restrictive environment. Public Law 94-142 (The Education for All Handicapped Children Act of 1975) mandated the adaptation of curriculum, methods and materials to meet the individualized needs of handicapped students. This law protected the rights of the handicapped but also projected the idea that handicapped children need assistance regular teachers could not provide. (Zins, Curtis, Graden & Ponti, 1988). Historically, special needs students were taken from their regular classrooms to be educated in special settings, usually segregated, self-contained classrooms. Contrary to this placement, there was an educational trend toward the progressive inclusion of exceptional students back into the mainstream (Stainback & Stainback, 1985). At this secondary school more and more students were being phased into mainstream classes without a proper monitoring structure in place to allow for their success.
A major constraint in developing an integrated system of education for regular and exceptional education students was attitudinal in nature (Lipsky and Gartner, 1989). There was belief that the reintegration of exceptional students into the mainstream was not possible without changing the perception of regular teachers on the learning abilities of exceptional students (Fuchs, Fuchs, Fernstrom, & Hohn, 1989). Some regular teachers held negative positions concerning the integration of exceptional students into their classrooms and were not willing to facilitate course work to meet the needs of exceptional students.

Certainly there was a general lack of knowledge on the needs of individual disabled students in the mainstream classes. This was evident by the reports of regular teachers on the lack of success of some exceptional educational students in their classrooms and the need for assistance in modifying the curriculum. Usually this report was followed by a request to remove the child from that class to placement in an exceptional education class.
Secondary subject area teachers in basic education and vocational teachers were often frustrated teaching exceptional education students. Regular classroom teachers have not been trained on the assessment of the individualized needs of the disabled child. Typically, at this secondary school, student needs were not clearly conveyed to the regular teachers by the exceptional education staff to enable them to discern what course modifications might be appropriate. Research detailed the lack of development of effective interventions for many mainstreamed students (Zins, Curtis, Graden & Ponti, 1988). To complicate the issue, regular teacher expectations were not clearly transmitted to the students so they could attempt to adjust to particular teaching styles. Students mainstreamed for many of their classes have difficulty coping with the idiosyncrasies in the teaching styles of regular (mainstream) teachers.

Extensive multidisciplined assessment was oriented on student placement rather than instructional support. Guidance committees placed students according to assessment data, but generally didn't address specific classroom modifications needed to support the student
in mainstream classes. Regular classroom teachers lacked the necessary support to adequately teach to the needs of the exceptional child. They have not been given the responsibility to provide individualized education for the exceptional child in their classes.

Exceptional education students mainstreamed into subject area classes or vocational electives often required an additional support system to allow them to reach their potential. Skills taught in more restrictive settings were not often critical for adaptation in less restrictive environments. Students were not always prepared for transfer to a less restrictive class (Fuchs, Fuchs, Fernstrom, & Hohn, 1989). Regular classroom teachers were not receiving support regarding practical suggestions to teach exceptional students in their classrooms.

Problem Documentation

Evidence of the lack of mainstream support for exceptional students was supported by documented teacher concerns, parental conferences and student input.
Teachers in subject area courses have regularly requested student information and teaching strategies to assist them in helping particular learning disabled students in their classes. Documentation at this school provided data that none of the mainstream teachers in core subject area courses have certification in exceptional education areas that would assist them in dealing with diverse student populations. General interventions were suggested by the exceptional education counselor or teachers, such as notetaking skills or outlining techniques, but they may not be appropriate modifications for individual student needs. On an ongoing basis, parents requested educational techniques to allow their children more success in course work. After the mid-term progress reports, at least ten parents called to discuss their child's progress in certain courses. Parent-teacher conferences were often arranged to identify and manage learning problems.

Students placed in mainstream classes recurrently required resource classes and pullout programs to help them complete assignments, tests, or simplify course work in required core area classes. In several
instances, either the student or teacher had identified an academic problem and had requested additional assistance. To respond to this need, a resource class was scheduled for one period per day to provide assistance to students who were experiencing difficulty in class, and the teacher was unable or unwilling to modify the curriculum presentation to allow the students to be successful. Four learning disabled students had a pull-out resource class to assist with social studies classes. Two of these students were receiving help with World History, one with American Government, and one with Economics. Five other students were attending the resource class sporadically for assistance as needed. The option of pull-out was not the least restrictive environment for the students and disrupted the student's integration into the mainstream class.

**Causative Analysis**

There were five major causes to the problem of mainstreaming exceptional students. First: Regular education teachers were not trained on the assessment of the individualized needs of the learning disabled
student. This identification of the needs of disabled students would also increase the awareness of the individualized needs of all students. Three students had totally avoided attending particular mainstream classes because they found them too difficult. After their absences were discovered, adjustments were made to give them more mainstream support.

Second: As a general rule teachers did not use strategies for the education of exceptional learners. In discussion with several teachers, they, for the most part, did not alter their teaching techniques to suit the individual need of their students. Some teachers did not accept the responsibility for the disabled students mainstreamed into their classes. An informal review of the lesson plans of ten core area teachers did not note any adjustments or provisions for individual student needs.

Third: Student strengths and weaknesses were not generally shared with the mainstream teachers. Processing deficits and intervention strategies were not discussed during the transition of a student into mainstream classes or at registration time. Mainstream teachers were invited to Individual Education Plan
(I.E.P.) meetings to discuss students' needs but seldom were able to attend due to scheduling conflicts. Often, after the fact, the I.E.P. goals and objectives were not shared with the mainstream teachers.

Vasquez-Chairez and McMillan (1988) emphasized the requirement for instructional staff to spend less time on assessment and more time on instructional delivery.

Fourth: Teacher requirements were not clearly transmitted to the student so they could attempt to adjust to the teacher's delivery style. Students were expected to adapt to the teacher's expectations, in some cases without adequate preparation.

Last: Support networks were not firmly established to provide assistance to both basic and vocational teachers and mainstreamed learning disabled students. Interventions were put in place as a reactive rather than proactive measure.

Relationship of the Problem to the Literature

The roles of the classroom teacher and the exceptional education teacher were changing. The needs of the students were directing this change (Grzynkowicz, Wirtz, Cation & Bullock, 1974). After the
passage of Public Law 94-142 to accommodate the specialized needs of exceptional students, they were placed in self-contained classes that were homogenous disability groupings. They were taught in isolation of mainstream students and neither student could benefit by the interaction with the other. Research was begun to analyze how the integration of exceptional and regular educators, programs and resources might best be used to present a unified, comprehensive system capable of meeting the needs of all students in regular education (Lipsky & Gartner, 1989).

The review of the literature gave evidence as to the need for interactive communication between the basic and exceptional education staff to adapt to the needs of the exceptional student in the mainstream classroom.

Educational references as well as research into rehabilitation were explored to gain a greater understanding of the problem. The current practice was to refer students with academic difficulties in school to the multidisciplinary team for a psychoeducational evaluation, with the expected result of placement in exceptional education. Research shows that three to
five percent of the school population was being referred each year (Zins, Curtis, Graden & Ponti, 1988). Referrals required an extensive, time consuming multidisciplinary psychoeducational assessment. Referrals could be inappropriate for learning problems that might be resolved in the regular classrooms. The current system led to an overidentification of students for exceptional education. Kennedy (1989) documented a 140 percent increase in the classification of students in learning disabled categories from 1976 to 1986. The reason for rapid growth included improved assessment techniques, liberal eligibility requirements, and the lack of alternatives for students experiencing problems in regular classes. The message given to teachers was that the needs of the learning disabled could not be met by the regular classroom teacher because of a lack of knowledge or skills.

Evaluation processes focused on compliance with exceptional education eligibility criteria rather than on functional performance and behavior. The negative consequences of the approach to service delivery for special children were numerous. Existing practices did not result in the development of effective intervention
services for children (Zins, Curtis, Graden & Ponti, 1988).

The Regular Education Initiative in Anchorage, Alaska Public Schools has studied the problem of the least restrictive environment for exceptional education students, and the interventions required for student success in mainstreamed classes (Kennedy, 1990).

Alternatively, exceptional educators were considered as the only available support for students who are at-risk in school. The problems presented by these students were sometimes too great for any one teacher to successfully address (L'Anse-Cruise, 1991).

Research confirmed that regular teachers assume they have little responsibility and expertise to help students with learning problems. Students with mild learning difficulties, but no handicapping condition were identified and placed in an exceptional education program in order to receive help. When exceptional students were segregated from their peers, labelling and stigmatization could have resulted. This labelling could have further isolated these students from their peers and increased negative attitudes about school and learning (L'Anse-Cruise, 1991).
Regular educators often expressed concern that they do not have the expertise to teach exceptional learners. They were troubled that teaching the learning disabled child in their classrooms would take time away from regular classroom activities (Kennedy, 1990). Research and practice illustrated the fact that the knowledge, skills and attitude required to successfully teach exceptional students were the same requirements needed to teach the "regular" students. All teachers can learn to individualize and modify their programs to suit a variety of learners in the classroom. Good teaching practices which included cooperative goal setting, appropriate instructional objectives, and grouping in ability levels in the mainstream would be appropriate interventions for students with a great range of learning abilities (Reynaud, Pfannensteil, & Hudson, 1987).
CHAPTER III

ANTICIPATED OUTCOMES AND EVALUATION INSTRUMENTS

Goals and Expectations

The goal of this writer was to meet the academic needs of learning disabled students through a needs-based student-centered consultative approach in mainstream classes.

Expected Outcomes

The following goals and outcomes were projected for this practicum:

1. Mainstream teachers and exceptional educators would participate in an interactive communication process.

2. Mainstream teachers and exceptional educators would share the responsibility of implementing collaborative consultation plans and monitoring student progress.
3. Student needs would be determined and plans would be made to accommodate those needs in the classroom.

4. A structured system of support would be established to assist in the academic success of the exceptional student.

**Measurement of Outcomes**

The success of this collaborative consultation with mainstream teachers was evaluated by the success of the modifications for the exceptional education students in their classes. This inter-teacher communication, whether written or verbal was the primary device used to notify the exceptional education consultant of any problems, complications, or successes in the mainstream classroom.

To facilitate mainstreaming, student progress was monitored regularly to determine success in the mainstream class, and allow for any adjustments and modifications in programming. Regular notations on a cooperative plan monitor form (see Appendix A) allowed the mainstream teacher and exceptional education consultant to keep a log of outcomes, comments, and
events to maintain appropriate interventions (Riegel, Mayle, & McCarthy-Henkel, 1988).

The justification and effectiveness of the collaborative consultation service model was assessed by monthly contact meetings with the teachers and students involved, discussing the classroom progress of each student.

Students also completed evaluations of each study skills seminar as to the usefulness of that particular seminar for their individual needs (see Appendix B).
CHAPTER IV

SOLUTION STRATEGY

Discussion and Evaluation Solutions

Learning disabled students were not experiencing success in the mainstream. The primary problem was that teachers were not making appropriate modifications for the disabled students in their programs.

The literature generated a great deal of interest in the collaborative consultation delivery model as a solution for the mainstream support of exceptional students (Reed, 1983, Vasquez-Chairez & MacMillan, 1988; Pugach & Johnson, 1988; Dyke & Dettman, 1989; Merrill, 1989; Reisberg & Wolf, 1986). Research confirmed the effectiveness of collaborative consultation in varied educational settings. Studies demonstrated the effectiveness of consultative models as a process for providing individualized services when exceptional students are included in regular classes. Consultation referred to the problem solving process
that involved the collaborative effort of two or more people to benefit the student for whom they were responsible (Zins, Curtis, Graden & Ponti, 1988). Collaborative consultation was a structured situation where by the exceptional education teacher and the basic education or vocational teacher worked together to plan alternatives for students having difficulty in classes.

Central to this consultative process was a strong communication base. Teachers shared the responsibility and the expertise in implementing individual plans and monitoring student progress. Teaching strategies basic to a collaborative consultation model had the potential of transfer to students not placed in exceptional education. The entire class can benefit by strategies used to teach exceptional students. Teacher input after the consultative model was in place, can describe any residual effects for the nonhandicapped classroom students. In this student centered approach, instruction was based on academic and social learning needs rather than by specific categories of exceptionality (Idol, Paolucci-Whitman & Nevin, 1986; Riegel, Mayle & McCarthy-Henkel, 1988).
There were several principles basic to collaboration (Riegal, Mayle, & McCarthy-Henkel, 1988; Luckner, Rude, Sileo, 1989; Carter, 1989). Team ownership of the problem was required. There was also a recognition of individual differences in academic progress. The use of collaborative models of instruction could then improve the skills, knowledge, and attitude for all members of the team. Instructional decisions were based on functional analysis of behaviors and academics for all students (Idol, Paolucci-Whitman & Nevin, 1986).

Vasquez-Charez and MacMillan (1988) stated evidence from meta-analysis of data. They reported that the average consultation participant was better off than 68 percent of nonparticipants considering attitudinal, behavioral and achievement variables. There was additional evidence to indicate that consultation had improved achievement among students that have disruptive behavior.

Commonalities in program delivery included professional responsibility, creative problem solving and learning strategy techniques. Aspects of collaborative consultation also included managing
resistance, establishing effective consultant-consultee relationships and discussing interpersonal variables (Posgrove & McNeil, 1989).

West (1985) examined the preferences of elementary and exceptional education teachers for four school based consultation models (collaborative, expert, medical and mental health). Results of the survey suggested a strong preference for the collaborative model of service delivery.

A Vermont Consulting Teacher Program trained consulting teachers to deliver instruction by training classroom teachers as change agents (Paolucci-Whitcomb & Nevin, 1985).

The expertise of the classroom teachers, preservice teachers, and college consultants were combined to
develop a consultative model to implement science units in an elementary curriculum (Balajthy, 1991).

In another school, a parent involvement and teacher cooperative consultation program was developed to increase secondary academic achievement levels (Basford, 1990).

Researchers often had different titles for service delivery models, but there were parallel foundations to all programs. Intervention assistance was one method of providing services to students with learning problems. The goal of this model was to expand instructional options for the student in the least restrictive environment. In this team approach roles were specified to avoid duplication of services. Strong leaders, exceptional education staff or administrators empowered to change or modify the existing organization structure must drive this change. All teachers on the team needed to be involved in the process and operation of the alteration in delivery methods as they strived to accommodate diverse classroom populations (Pugach & Johnson, 1990).

The Regular Education Initiative (Kennedy, 1990: Lipsky & Gartner, 1989) and the Learning Support System
in Scotland, stressed the responsibility of the regular classroom teachers in educating students. The Mastery in Learning Project illucidated many of the collaborative strategies that provided support for students in the mainstream (Blythman & Warren, 1989).

Donaldson and Christianson (1990) discussed a decision-making model as a guide for selecting appropriate intervention strategies for the individual needs of exceptional education students. Garden City Public Schools (1973) and Reed (1987) elaborated on the team approach for mainstreaming exceptional students. Choice Awareness as a consultation process was outlined by Nelson and Shifron (1985).

A survey of secondary counselors revealed the consultant role of an educational counselor ranked sixth in importance. Additional data supporting the initial survey indicated that consulting is a primary counseling skill and function (Hett & Davies, 1985).

An international study from Scotland reiterates the need for the development of a "learning support system" for mainstreaming special needs students (Blythman & Warren, 1989).
Walsh (1991) continued to research the cooperative teaching service delivery model. Regular classroom teachers and exceptional teachers provided cooperative teaching in the regular classroom rather than having the exceptional student "pulled-out" of a regular class for special needs support.

Pre-referral intervention, teacher-assistance teams and building level support teams were other consultative delivery models that effectively supported regular educators with inclusion issues (Zins, Curtis, Graden & Ponti, 1988).

Other areas to be scouted included the exploration of consultative models used in other schools. Research was conducted to investigate the availability of teacher inservice training programs to assist in the establishment of a school-wide collaborative model.

Administrative and county resource teacher input into the planning stage of the collaborative consultation model ensured the foundation for implementation will be strong, and the atmosphere accepting.
Description of Selected Solution

Research detailed the importance of the development of a collaborative consultation model to assist regular classroom teachers and vocational teachers in defining alternatives to teach learning disabled students in their mainstream classes. The delivery model increased the shared responsibility of regular and exceptional educators in teaching exceptional students.

Clarification of the classroom modifications necessary to help disabled students become more successful in the mainstream classes was a focus of the consultative model. A collaborative consultation system was also instrumental in increasing the interactive communication between regular and special educators. The modifications suggested to accommodate the special needs of the exceptional student will help to decrease the stigma and labelling of the learning disabled student in the regular class and should enable them to feel a part of the class.

To provide the skills needed for regular teachers to successfully implement modifications for exceptional students in the mainstream, a structured program was
assimilated to guide the implementation of the consultation. The Hunt-Riegel Model was the collaborative consultative training and implementation model adopted. The structures defined in this system were used to facilitate implementation of this program.

To expand the knowledge of the mainstream teachers and lay the groundwork for continued success at collaborative consultation and mainstreaming, an inservice training session for the school faculty was presented focusing on the needs and classroom modifications for learning disabled students.

Report of Action Taken

As an initial step in this process, this proposal was shared with the school administration to get approval for implementation.

Collaborative consultation forms and documents were organized to facilitate the documentation and monitoring of the implementation. Parent notifications for student participation in the collaborative process were sent home. A copy of the monitoring log (see Appendix A) was included in the exceptional education
audit to document the student's participation for the purpose of mainstream cost factor funding.

An inservice training session, conducted by the county trainer for collaborative consultation, was scheduled during school hours to allow all mainstream and exceptional education teachers time to participate during their planning periods. Four separate one hour sessions permitted the maximum number of teachers (with 100 on staff) and administrators to take advantage of the inservice training. Inservice points, credited towards re-certification in any subject area, were awarded at the completion of the one hour inservice training to provide an extra incentive for teachers to attend. The meetings included information for teachers to understand the varied academic problems of learning disabled students, and internalize general aspects of the collaborative process.

Due to the current availability of state mainstream cost factor funding, this collaborative consultation approach provided the required documentation for additional resources for the school. To maximize this funding it was suggested by the administration that the number of student courses
targeted for this intervention exceed seventy. In keeping with this formula, forty students were processed and monitored for collaborative consultation. As a result of the student identification, twenty-six mainstream teachers were asked to participate in the collaborative consultation program. Permission was requested and approved to provide inservice points for mainstream teacher's participation in this semester long program.

Two exceptional education teachers were chosen to assist with the implementation of a collaborative consultation model. They had the expertise to help initiate, monitor, and maintain the program. Their schedules were adjusted to allow non-teaching time for them to plan and coordinate consultative services. Information gleaned from exceptional education audit files was used to assist in the identification of student strengths and weaknesses. Processing deficits according to psychological reports, were noted on student inventories.

The appropriate student inventory forms and course descriptions were completed by the exceptional education consultants, students and the regular
teachers to initiate the collaborative consultation process.

Students were assessed according to their learning styles and academic problems on the student inventory form (see Appendix C). Disabled students were able to indicate their strengths and weaknesses in regular class settings in the areas of information output and information input.

The consultative team met with the mainstream teachers to help establish course adjustments for individual student needs as well as the continued training of the mainstream teachers on collaborative consultation. Course descriptions (see Appendix D) were completed by the mainstream teachers to identify instructional methods and the types of class assignments used on a regular basis.

According to responses on the course description forms, over fifty percent of mainstream teachers required their students to be adept at notetaking skills (see Table 1).
# Table 1

**ACADEMIC SKILLS NEEDED**

Academic skills required for success in class as indicated by mainstream subject area teachers of Science, Mathematics, English, Social Studies, and Electives.

*Sci = Science  S.S. = Social Studies  
Math = Mathematics  Elec = Electives  
Eng = English  Ttl = Total
As documented on the student inventory forms, twenty-five percent of the students recognized their weakness in notetaking skills. There seemed to be a deficiency in this area that the individual teachers might not address.

After meeting with teachers and students, there was a significant amount of agreement that many of the students were deficient in notetaking skills, outlining skills, and organizational skills. In addition to the original proposal and to offer support in these skill areas, seminars were conducted with small groups of students participating in the collaborative consultation process. To meet this need, the students were excused from class for study skills seminars, on a staggered schedule one hour per week for five consecutive weeks (see Appendix E).

To allow for realistic notetaking experiences, portions of teaching sessions in Oceanography, American Government, and Psychology were videotaped. The tapes, combined with other instructional materials, were the focal point for the five skills-building seminars. These multi-modal presentations included passages from students' texts to practice outlining and notetaking.
Motivational and organizational tips were offered from several sources. The hands-on practice and modeling of notetaking techniques along with student generated critiques were strategies used to present this skills information.

Regular consultative meetings were scheduled with participating teachers to maintain the effectiveness of the program. Logs were kept on each student to document the success of the course modifications (see Appendix A). To satisfy the requirements of the mainstream cost factor funding, monthly notations on the monitoring form were required.

An inservice training session for the school faculty gave an overview as to the definition, causes, characteristics, and suggested classroom modifications for learning disabled students. Handouts for the learning disabilities workshop included an agenda, a definition of the disability, causes, characteristics and simulation exercises (see Appendix F).
CHAPTER V

RESULTS, DISCUSSION, AND RECOMMENDATIONS

Results

In this school many exceptional education students were not experiencing academic success in mainstream classes. Teachers were not making appropriate modifications for the learning disabled students in their mainstream classes. There was a need for the increased involvement and communication between the exceptional education and regular teaching staff. This involvement helped disuade many of the teachers from negative positions concerning the abilities of the learning disabled students.

Teacher feedback confirmed that collaborative consultation was an effective tool providing the groundwork for increased communication between the exceptional and regular teaching staff. This created the foundation for future cooperative activities. Due to the necessary communication throughout this collaborative process, the mainstream teachers were
empowered to share the responsibility of monitoring student progress. Professional relationships were established, new teachers were indoctrinated and a support network was created.

Student needs were determined by documenting strengths and weaknesses on a student inventory form completed with the help of an exceptional education teacher (see Appendix C). Student needs were then compared with the course description forms completed by the classroom teacher (see Appendix D). This comparison resulted in matches or mismatches between students' abilities and teacher course expectations. As a result of the surveys, strategies were discussed with mainstream teachers to better accommodate the disabled child in the classroom. These were noted on the cooperative planning work form (see Appendix G). A structured system of support was established to assist in the academic success of the exceptional student. This system proved to be an effective means of individualizing modifications to suit the specific needs of the disabled student. An additional benefit to mainstream teachers involved in the collaborative consultation was their increased awareness and
heightened sensitivity to the needs of all students in the classroom.

Of the twenty-six (26) teachers involved in the collaborative consultation for the purpose of this program, over one-third required notetaking as a needed academic skill for success in their course. A breakdown of academic skills needed by subject area was recorded to study and compare the class requirements of each teacher (see Table 1).

Students completed the student inventory form showing specific difficulty and strength areas (see Appendix C). The skills-building seminars were tailored to meet these concerns. The student evaluations of the skills workshops were very positive (see Appendix B).

According to teacher feedback, the inservice session on learning disabilities was extremely helpful (see Appendix F). New teachers gained information to help them be more comfortable helping the learning disabled students in their classes. Seasoned veterans had a refresher course to remind them of the needs of learning disabled students.

As a result of the collaborative consultation program and documentation, a basis for the mainstream
cost factor funding of consultative services was established. As a direct offshoot of this process, there was additional funding allocated for one basic education teacher unit. In this school the unit was used to fund the collaborative consultation coordinator position.

**Discussion**

Research showed there was a need for the inclusion of disabled students in mainstream classes in order to teach them in the least restrictive environment required by law. The benefits of mainstreaming are numerous, including:

- Reduces stigma
- Enhances social status
- Provides appropriate peer models
- Provides more cognitively stimulating environment
- Resembles a "real world" environment
- Provides more flexibility for service delivery
- Serves more students, therefore reducing costs
- Decentralizes services
- Avoids isolation

(Reigel, Mayle, & McCarthy-Henkel, 1990)
There still remains the need for a continuum of services from self-contained to total inclusion in the mainstream. This is due to the various deficits and strengths of the individual students. On a hierarchy of most to least restrictive placement:

Self-contained classes would provide intensive highly individualized instruction.

Resource help to provide specific skill instruction focused on individualized needs.

Consultation support to regular teachers who have students with learning disabilities.

Accommodations and modifications in the mainstream classes to provide minor support needed for the disabled students to meet the group expectations (DLD, 1993).

In the secondary school there were a multitude of complex situations that might have affected a student's learning. Flexibility was built into this program to allow for changes and adjustments to better suit the needs of the students and teachers.
The teacher's attitude towards a handicapped student can make a difference in that student's performance. Additional research outlined aspects of programs that would aid in the appropriate placement of learning disabled students.

Vasquez-Chavez and MacMillan (1988) commented on the importance of communication and cooperation that would bring exceptional and regular educators together considering attitudinal, achievement and behavioral variables thus simplifying the mainstreaming process.

A Vermont Consulting Teacher Program used this consultative model to train their teachers to be change agents in their school, reiterating the need for professional cooperation to streamline the consultation process (Paolucci-Whitcomb, & Nevin, 1985).

Teachers seldom have the opportunity to consider their teaching styles and their classroom needs and expectations. The structured format of this collaborative consultation process offered them the occasion for this introspection.

The flexibility of the program allowed for the addition of study skills seminars to strengthen skills
the majority of the participating teachers and students felt were required.

Each participant had to take responsibility for mainstreaming exceptional students. This was a key step in successful collaboration. Since there was a need for constant interaction between mainstream and exceptional education staff, one of the most important outcomes of this report was the heightened awareness of the responsibility to work and react as a unit to better help and serve the disabled child.

Recommendations

It is important to remember the mainstream, subject area teachers have their own course requirements and it is necessary to be aware of their expectations. The same staff that is involved in mainstreaming disabled students is also involved in teaching multi-phased students. Time constraints are often imposed on the regular teachers by the structures and objectives built into their courses. Flexibility is a required aspect of the mainstreaming process.

Teacher meetings scheduled during planning times were sometimes poorly attended. Scheduled afterschool
meetings prior to teacher dismissal, were more successful. It is the responsibility of the collaborative consultant coordinator to plan these efforts with the mainstream teachers, and initiate the activity.

During the collaborative consultation process it became evident that many of the mainstream subject area teachers were not fully aware of the legal aspects, definition, characteristics, and processing deficits specific to learning disabled students. It was obvious that increasing this knowledge would facilitate the collaborative process in the coming year. This faculty-wide learning disability inservice might be suggested as the first step to a successful mainstreaming program.

Mainstreaming is a continuing process that requires the collaboration of regular and exceptional educators. The mainstreaming process should be scheduled so that the teachers have adequate lead time to attend the sessions. A standardized collaborative consultation process is a requirement for the inclusion of disabled students into the mainstream. The expectations should be clear and followed accordingly
so that all contributors can participate in the achievement, and benefit by the structure.

Collaborative consultation is a process that can take several years to be accepted and utilized to the maximum in a school. Each year more teachers should be involved in collaborative consultation. The classroom modifications and interventions for the disabled student will benefit all students.

**Dissemination**

This collaborative consultation model will be shared with the middle and junior high schools articulating students to the secondary schools to create a continuum of services for the disabled student. Further inservice training sessions on mainstreaming and handicapped awareness will provide an environment for optimum learning and teaching for the disabled student.

AGENDA OF SKILLS-BUILDING SEMINARS
AGENDA
SKILLS-BUILDING SEMINARS

Collaborative Consultation

After meeting with teachers and students, there was a significant amount of agreement that many of the students identified were deficient in the following three areas:

Notetaking skills

Outlining

Organizational Skills
   i.e. completing assignments
   being prepared for class

To this end, it was decided that these students would be pulled out of class one time per week for five consecutive weeks.

   Week 1  Instruction on Organization
   Week 2  Instruction on Notetaking Skills
   Week 3  Video Notetaking Experience
   Week 4  Instruction on Outlining
   Week 5  Outlining Exercises
AGENDA

LEARNING DISABILITIES INSERVICE WORKSHOP

1. Definition of Learning Disabilities

2. Causes of Learning Disabilities

3. Characteristics of Learning Disabled

5. Reading Comprehension Exercise (Video F.A.T. City, 1990-begin VCR at count 1595)

6. Modification Strategies
LEARNING DISABILITIES WORKSHOP

Definition:

1. The learning disabled have difficulties with academic achievement and progress. Discrepancies exist between a person's potential for learning and what he or she actually learns.
2. The learning disabled show an uneven pattern of development (language development, physical development, academic development).
3. Learning problems are not due to environmental disadvantage.
4. Learning problems are not due to mental retardation or emotional disturbance.

The definition accepted by the Association for Adults and Children with Learning Disabilities in 1984 states learning disabilities are a chronic condition of presumed neurological origin which selectively interferes with the development, integration, or demonstration of verbal or nonverbal abilities.

Some famous learning disabled people include: Albert Einstein, Thomas Edison, Greg Loganis, Cher, Tom Cruise and Bruce Jenner.

Example of a letter from nineteen year-old Thomas Alva Edison. He was considered slow and had to be taught by his mother at home.

Dear Mother- Started the store several weeks. I have grewed considerably don't lik much lik a Boy now- Hows all the folk did you recive a Box of books from memphis that he promised to send them- languages. Your son Al (Lavoie, 1990).
CHARACTERISTICS

The primary characteristics of a learning disability is a significant difference between a child's achievement in some area and his or her overall intelligence. Learning disabilities typically affect five general areas:

1. Spoken language: delays, disorders and deviations in listening and speaking.
2. Written language: difficulties with reading, writing and decoding.
3. Mathematics: problems with arithmetic operations or in understanding concepts.
4. Reasoning: difficulty in integrating and organizing thoughts.
5. Memory: problems in remembering information and instructions.

(Lavoie, 1990)

Specific Learning Disabilities

1. Visual perception problems (dyslexia) frequently confuse letters that look alike, omit and add words or jumble spaces between words. Ex. No wisthe ti fo alpoobmen t com toth aib of the rcountry. (Now is the time for all good men to come to the aid of their country).

2. Auditory perception problems. Difficulty differentiating between sounds, or acutely sensitive to background noises. Auditory perception problems can make it hard to catch the implications of different tones of voice.

3. Spacial perception problems- affects a person's ability to judge distance, differentiate between right and left, and follow directions.
WHAT CAUSES LEARNING DISABILITIES?

The causes are unknown, but some general observations are:

Some children develop and mature at a slower rate than others in the same group—"maturational lag".

An unexplained disorder of the nervous system.

Injuries before birth or in early childhood may cause a learning problem later.

Learning disabilities tend to run in families and may be inherited. Experts estimate approximately ten percent of the school population is learning disabled.

Some learning disabilities appear to be linked to the irregular pronunciation and structure of the English language. The incidence of learning disabilities is lower in Spanish or Italian speaking countries.

The following inconsistencies that exist in English spelling are illustrated in the following limericks: (Learner, 1985).

A king, on assuming his reign,
Exclaimed with a feeling of peign:
"Tho I'm legally heir
No one here seems to ceir
That I havn't been born with a breign"

A young lady crossing the ocean
Grew ill from the ship's dizzy mocean,
She called with a sigh
And a tear in her eigh,
For the doctor to give her a pocean.

(Lavoie, 1990 taken from the video F.A.T. City. This simulation was projected across the screen)
"Come on", said Betsy. "We have to pick up this corn. We don't have another can of popcorn."

"Are we going to eat popcorn that's been on the floor?"

"We can wash it," Betsy answered. "That's a good idea", said Susan.

"We can wash it. Come on all of you. Help me pick it up."

The children went to work. It took them a long time to do it.

Betsy put the corn in two big pans to put into the oven.
