The discussion of Nweh, a Bantu language, focuses on a group of adjectives that can occur in positions where one would expect a noun, and which appear to enter noun classification. Specifically, the reasons that these adjectives have noun properties and that the pronominal class marker for the adjective is invariant are investigated. First, the adjective structure of the language is examined and three classes of adjectives (pure, intransitive, transitive) are distinguished. The first of these, pure adjectives, is the class in question. These differ from others in that they: cannot be modified by adverbs or take comparatives; have noun-like properties; can take number (singular/plural) morphology; can occur independently in nominal positions; take possessive pronouns; and when combined with any noun to form an attributive construction, take a possessive pronoun determined by the adjective rather than the noun. In explanation of these phenomena, it is proposed that these adjectives take these patterns because they have incorporated a null noun, and the agreement is determined by the same empty nominal. Contains 23 references. (MSE)
ON NWEH ADJECTIVES THAT SHOW UP AS NOUNS

Michael NKEMNJI

UCLA

0. Introduction.

In this paper I want to address certain interesting puzzles relating to the fact that in Nweh (Grassfield Bantu, S.W. Cameroon), certain adjectives have the property of being able to occur in positions where one would expect to find a noun and appear to enter into noun classification. In particular, I want to address two questions: One, why do such adjectives have these nominal properties? Two, why is it the case that the pronominal class marker selected by the adjective is invariant? We will provide an analysis of lexical argument structure of adjectives that provides an answer to both of these questions. Before we embark upon the enterprise we will survey the range of adjectives that Nweh has.

1. The issue.

In many languages, English, French, Nweh, ... as well as in a lot of African languages, it is not uncommon for adjectives to show up in NP positions and assume functions typical of NPs. For convenience of exposition we start with the English examples in (1).

(1) a. the poor
    b. the rich
    c. the blacks
    d. the whites
    e. the impossible

* I would like to thank Russ Schuh and Hilda Koopman for their insightful comments.
These adjectives have certain peculiarities. For instance, the English examples in (1 a-d) typically refer to animates [+human]. Despite the fact that they exhibit nominal behavior, these adjectives have properties that distinguish them from real nouns. For example, they are specified as definite; they have plural meaning even if not morphologically marked as plural; they can be modified by adverbs.

(2) a. the very poor  
b. the extremely rich  
c. the highly talented

while they can be conjoined with similar adjectives, coordination with real nouns is not possible as (3) shows.

(3) a. the rich and the poor  
b. the Blacks and the whites  
c. *the rich and the students  
d. ?* the Blacks and the Professors  
e. the Professors and the students

Adjectives in Nweh (Grassfield Bantu, S.W. Cameroon) exhibit properties somewhat similar to those outlined above for English but they also show some very unusual properties.

2. Adjectives in Nweh.

In Nweh, as in many African languages, 'pure' adjectives are very few and might even be said to form a closed class in the sense that one can easily list all of them. By pure adjectives I mean those lexical items that are specified in the lexicon as belonging to the category of adjectives, as opposed to derived adjectives. In Nweh the pure adjectives are for the most part limited to Color and Size/Dimension adjectives. This paucity of adjectives raises the question as to how the full range of adjectival meanings are expressed in these languages. Other adjectival meanings like Quality/Physical properties are expressed in the form of a predicate adjective. This is achieved through the use of a reduced-relative type construction. We will refer to these other adjectives as 'derived adjectives'. While derived adjectives have much in common with regular (stative) verbs we will show that they differ in significant ways from regular (stative) verbs. Even though derived adjectives on the surface appear to be the 'same', we will claim that they split into two types, corresponding to the verb types from which they are derived. We therefore want to claim that adjectives in Nweh pattern essentially into three classes. There appear to be semantic correlations between the different classes.
ON ADJECTIVES THAT SHOW UP AS NOUNS

Class I  (Pure Adjectives).

(4)  
  a.  fian  'black'
  b.  bαŋ  'red'
  c.  fàœ  'white'

(5)  
  a.  màia  'big/large'
  b.  sfà  'long/tall'
  c.  kêm  'short/stout'

- These are typically color adjectives (4) and some Size/Dimension adjectives (5).

Class II  ('Intransitive' Adjectives.)

(6)  
  a.  õfâŋ  'be big'
  b.  õseh  'be long'
  c.  δvøh  'be short'
  d.  δfìi  'be sweet'
  e.  δfroδ  'be bitter'
  f.  δbùat  'be soft'

These are typically 'quality adjectives'. We will argue they are derived from unaccusative-type verbs.

Class III  ('Transitive' Adjectives)

These are derived from transitive verbs. Thus the attributive adjectives in (7) are derived from their corresponding VP counterparts.

(7)  
  a.  ñgɔ?  ngesâŋ  -->  ngesaŋ  n-gɔ?  to grind corn  corn  Pf. ground  'ground corn'
  b.  ñkαŋ  asâ  -->  asâ  a-kâŋ  to fry fish  fish  Pf. fried  'fried fish'
  c.  ñcû  lebɔ?  -->  lebɔ?  1e-cû  to boil pumpkin  pumpkin  Pf. boiled  'boiled pumpkin'

Here the head noun corresponds to the internal argument of the verb. Below I discuss some properties of each of these three classes of adjectives such as their function within the noun phrase (attributive or predicative function); their distribution within the noun phrase (i.e. pre- or post-nominal); and their morphological properties i.e. whether or not they take a prefix. We will show that only the class I ('Pure') adjectives can occur independently without an overt head noun as well as select a pronominal class marker.
MICHAEL NKEMNJI

We discuss the derived adjectives first, and then focus our attention on the pure adjectives as these are the ones that show unusual syntactic properties.

2.1 Class III ('Transitive' adjectives)

Class III adjectives are derived from transitive (action) verbs. Thus we observe from (7) repeated below as (8) that the attributive adjectives in (b), appear to simply be stative verbal forms derived from the active transitive verbs in (a).

(8) i. a. ṣgō?  ggesāŋ
to grind  corn

b.  ggesāŋ  g-gō?
corn  Pf. ground    'ground corn'

ii. a. ṣkāŋ  a-so

to fry    fish

b.  a-so  a-kāŋ

fish  Pf. fried    'fried fish'

iii. a. ṹēn  lebō?
to boil pumpkin

b.  lebō?  le-cūū

pumpkin  Pf. boiled    'boiled pumpkin'

We notice a semantic shift in the relation between the (a) sentences in (8) and their corresponding stative forms in (b); These sentences also show a passive-like alternation. The (a) sentences designate actions, whereas the (b) sentences designate a property which is predicated of some noun. The internal (theme) argument of the transitive verbs in (a) have been " prepensed" and they now function as the first (subject) argument of the predicates in (b) and these trigger (prefixal) agreement (Pf.) on the adjective.

Transitive ('verbal') adjectives basically have an attributive function, i.e. they occur only as nominal attributes and cannot be used as inchoative predicates as the ungrammaticality of the (b) sentences in (9) indicate.

(9) i. a.  ggesāŋ  ṣ-gō?
corn  Pf. ground    'ground corn'

b.  *  ggesāŋ  e  gō?
corn  S.Agr  ground    'the corn ground'

ii. a.  akēndōŋ  a-udā

plantain  Pf. roast    'roasted plantains'
ON ADJECTIVES THAT SHOW UP AS NOUNS

b. * akéndọ́ŋ à túá
   plantain S.Agr roast  'the plantain(s) roasted'

iii. a. lebó? le-ćí̄
      pumpkin Pf. boiled         'boiled pumpkin'

b. * lebó? é cí̄
      pumpkin S.Agr boiled       'the pumpkin boiled'

Class III adjectives cannot occur independently without an overt head noun or a proform one (10) and (11), and they do not trigger noun class agreement on the possessive pronoun as 'pure' adjectives do.

(10) a. ngesaŋ ḫ-góțọ
      corn Pf. ground            'ground corn'

b. zàà ḫ-góțọ
   one Pf. ground             'the ground one'
   (speaking of corn, ...)

c. * ḫ-góțọ
   'ground'

(11) a. akéndọ́ŋ à-túá
      plantain Pf. roast         'roasted plantains'

b. zàà à-túá
   one Pf. roasted             'the roasted one'

c. * à -túá
   'ground'

2.2 Class II ('Intransitive adjectives')

Class II, the 'intransitive' adjectives typically denote qualities / physical properties. We argue these are derived from unaccusative verbs.

(12) ndìí                     'be sweet'
    ndeńó                     'be bitter'
    nbúh                      'be spoiled'
    ndet                      'be heavy'
    nduŋ                      'be hot'
    nbaŋ                      'be ripe'
    njuŋ                      'be dry'

They have verb-like morphology. Thus we notice from the examples in (12) that they all have an n- prefix which is characteristic of verbs in their citation (bare infinitival form).
As nominal attributes, class II adjectives occur post nominally (like the class III adjectives) with an agreement prefix that is determined by the prefix of the head noun. cf. (13).

\[(13) \ a. \ afù \ à - ili \ \text{medicine Pf. sweet} \quad \text{'sweet medicine'}
\]
\[\quad \ b. \ mbèzàn \ è juŋ ¹ \ \text{peanuts Agr. dry} \quad \text{'dry peanuts'}
\]

We observe from (14a) and (14b) that class II adjectives can be used predicatively, in which case the noun functioning as subject triggers subject agreement. Observe also that they can be tensed (14c).

\[(14) \ a. \ afù \ juŋ \ à \ ili \ \text{med. this S.Agr sweet} \quad \text{'this medicine is sweet'}
\]
\[\quad \ b. \ mbèzàn \ juŋ \ è \ juŋ ¹ \ \text{peanuts this S.Agr. dry} \quad \text{'these peanuts are dry'}
\]
\[\quad \ c. \ mbèzàn \ juŋ \ è \ kë? \ tè \ njùŋ ² \ \text{peanuts this S.Agr. P-1 Neg dry} \quad \text{'these peanuts were not dry'}
\]

Like the transitive adjectives (class III), the intransitive adjectives (class II) cannot occur independently without the head noun or without a proform as (15) indicates. Class II adjectives also do not govern possessive pronoun agreement.

\[(15) \ a. \ afù \ à \ ili \ \text{med. Pf. sweet} \quad \text{'sweet medicine'}
\]
\[\quad \ b. \ zàa \ à \ ili \ \text{one Pf. sweet} \quad \text{'the sweet one'} \quad \text{(speaking of med.)}
\]
\[\quad \ c. \ * \ à \ ili \ \text{Pf. sweet} \quad \text{'sweet [e]'}
\]

In terms of their internal distribution, class II adjectives can be modified by adverbs as in (16).

\[(16) \ a. \ nyém \ ndìi \quad \text{'slightly sweet'}
\]
\[\quad \ \text{nbò ndìi} \quad \text{'very sweet'}
\]

1 We believe the lengthened final nasal segment is as a result of the tone change; The final segment is therefore lengthened to bear the extra tone; it is therefore considered tonal rather than segmental.

2 The nasal prefix on the verb in (14c) is triggered by the 'recent' past tense marker (P-1) kë?.
ON ADJECTIVES THAT SHOW UP AS NOUNS

b. nyém ɲfáŋ 'slightly big'
   nbó ɲfáŋ 'very big'

Class II adjectives enter into comparatives.

(17) a. ndíi nčìà
    be sweet pass 'sweeter than...' / 'over-sweet'

b. ɲfáŋ nčìà
    be big pass 'bigger than...' / 'over-big'

There is a neat parallel between class III and class II adjectives. We have suggested that both class III and class II adjectives are derived from verbs. The difference between the two classes is based on the verb type from which they are derived. It is clear that class III adjectives are stative forms that are derived from transitive verbs. We will claim that class II adjectives are statives derived from unaccusative verbs. To show that class III and II adjectives derive from different verb-types, we will show that both verb types that we claim class III and class II adjectives are derived from behave differently. We refer to the verb classes using the same numbering that we used for the adjectives; so class II verbs will refer to the verb class from which class II adjectives are derived.

Class III verbs have just a causative usage and do not have the inchoative / causative alternants (cf. the (b) examples in (9) above); On the other hand, class II verbs have the inchoative / unaccusative usage cf. (18a) and (19a) but not the causative. cf. ungrammaticality of (18c) and (19c).

(18) a. afû á líi
    medicine S.Agr sweet 'the medicine is sweet'

b. afû á líi
    medicine Pf. sweet 'sweet medicine'

c. * ñ díi afû
    be sweet medicine '(to) sweeten the medicine'

(19) a. mbazáŋ è júŋ
    peanuts S.Agr. dry 'the peanuts are dry'

b. mbazáŋ ñ júŋ
    peanuts Pf. dry 'dry peanuts'

c. * ñ júŋ mbazáŋ
    be dry peanuts ' (to) dry the peanuts'

Thus both classes of verbs do not undergo the causative / inchoative alternation. They are either strictly causatives (class III) or inchoatives (class II).
Generally, if a verb has both a causative and an inchoative usage, it is the case that two independent morphological forms (lexemes) exist\(^3\): one for the causative usage, and the other for the inchoative usage. Such forms involve a 'morphological blockade' as we observe from the contrast between (20) and (21) that involve njúŋ 'be dry' and nbò́ó 'to dry'.

(20) a. mbóó mbò́ó
    to dry  dry
    'to dry peanuts'

b. mbò́ó bòó
    peanuts Pf. dry
    'dried peanuts'

c. * mbò́ō bòó
    peanuts S.Agr dry
    'the peanuts dried'

(21) a. * njúŋ mbò́ō
    be dry peanuts
    'to dry peanuts'

b. mbò́ō njúŋ
    peanuts Pf. dry
    'dry peanuts'

c. mbò́ō njúŋ
    peanuts S.Agr dry
    'the peanuts are dry'

The discussion above indicates that both class III and class II adjectives are derived, and that they share a lot in common. In the rest of the discussion, except where necessary, we will simply refer to class III and class II adjectives as 'derived' adjectives.

2.3 Class I ('Pure' adjectives)

Class I ('Pure' adjectives) form a very interesting class of adjectives. Class I adjectives can be said to form what one might call a closed class in the sense that one can easily list all of them. Semantically, Class one adjectives are basically adjectives of color and size/dimension. cf. (22) and (23) respectively.

(22) a. fí́n
    'black'

b. báŋ
    'red'

c. fò́ó
    'white'

\(^3\) There appear to be a class of exception to this generalization posed by verbs like ndagé 'to melt', ǹsé 'to break' and ǹsìá 'to tear', that show the causative/inchoative alternation. A possible explanation could be to say that whereas other causative verbs obligatorily require an agent 'alternating transitive' verbs like ndagé 'to melt' only optionally require that there be an agent. Alternatively one could argue that such verbs involve two lexemes that happen to have the same morphological form.
ON ADJECTIVES THAT SHOW UP AS NOUNS

(23)  a. mía  'big/large'
b. sàa  'long/tall'
c. kèm  'short/stout'

What makes this class of adjectives so interesting is that it seems to be neither fish nor fowl, so to speak. On the one hand this class appears to be adjectives but on the other hand, they appear to be nouns. We will start with properties that class I adjectives share with other adjectives classes, and then go on to discuss properties that class I adjectives share with nouns.

Class I adjectives, unlike the derived adjectives have a Ø-prefix as we observe in (22) and (23). Class I adjectives occur prenominally within the noun phrase. Thus the word order is [Adj.-N] as in (24). As we noted above, derived adjectives invariably have a [N-Adj.] word order.

(24)  a. fin ndrò
cloth black 'black cloth'
b. bàŋ lìfi
red horse 'red horse'
c. mía abò
big bag 'big bag'

We should point out here that Nweh is a highly configurational language with a head-complement word order. How then do we explain the word order variation between the two classes of adjectives? This is one of the problems that we expect our proposal to account for.

Within the noun phrase, class I adjectives typically have an attributive function. cf. (24). However they can be used predicatively, in which case they are obligatorily reduplicated as in (25).

(25)  a. ndrò é finfin
cloth S.Agr. black 'the cloth is black'
b. ndrò é bågbåŋ
cloth S.Agr red 'the cloth is red'
c. ndrò é míamíà
cloth S.Agr big 'the cloth is big'

Reduplication in Nweh is a property of lexical adjectives. The reduplication here might be indicative of the sort of morphological blockade that exists between the different classes of adjectives. Just as we observed that there exists a neat parallel between class III and class II adjectives, we will show that there also exists a similar parallel between class III & class II adjectives on the one hand and class I adjectives on the other hand. Thus we will see that one (semantic) adjective can have two lexemes each of which belongs to a different class, and exhibits behaviors typical of the class to which it belongs. We illustrate this phenomenon in (26).
MICHAEL NKEMNJI

(26)  
  i.  
   a.  máa  'big / large'  
   b.  n-fáŋ  'be big/large'  
  ii.  
   a.  šfá  'tall / long'  
   b.  n-seh  'be tall/long'  
  iii.  
   a.  kêm  'short / stout'  
   b.  nj-va h  'be short/stout'  

(27)  
  i.  
   a.  máa ndíा  'big house'  
   * ndíा máa  
   b.  kêm alâŋá  'short chair'  
   * alâŋá kêm  
  ii.  
   a.  ndíा é máamía  house Agr. big  'the house is big'  
   b.  alâŋá á kêmkêm  chair Agr. short  'the chair is short'  

(28)  
  a.  ndíा é fáŋ  house Agr. be big  'the house is big'  
  b.  alâŋá á vâhâ  chair Agr. be short  'the chair is short'  

While derived adjectives can be modified by adverbs like nyém 'slight', nbó 'very', class I adjectives cannot be modified by adverbs cf. (29).

(29)  
  a.  mbó / nyém n résultats  very / slightly be red  'very / slightly red/ripe'  
   ** mbó / nyém báŋ  very / slightly red  
  b.  mbó / nyém nťaŋ  very / slightly be big  'very / slightly big/large'  
   ** mbó / nyém máa  very / slightly big
ON ADJECTIVES THAT SHOW UP AS NOUNS

Also, class I adjectives unlike other adjectives cannot take comparatives.

(30)  
\begin{align*}
a. & \quad n\text{bâŋ} \quad n\text{čiā} \\
& \quad \text{be ripe pf. pass} \\
& \quad \text{'}too ripe / over-ripe' \\
* & \quad b\text{āŋ} \quad n\text{čiā} \\
b. & \quad n\text{fāŋ} \quad n\text{čiā} \\
& \quad \text{be big pf. pass} \\
& \quad \text{'}too big / bigger than' \\
* & \quad m\text{iā} \quad n\text{čiā}
\end{align*}

So far, we have seen significant evidence to suggest that pure adjectives differ in important respects from the derived adjectives. We will now turn our attention to some properties that not only set class I (pure) adjectives further apart from the other two classes of (derived) adjectives, but also makes class I adjectives very similar to nouns, syntactically class I adjectives exhibit noun-like properties. From the examples in (26a) we observe that pure adjectives, nouns, denote entities rather than a state or an attribute as is the case with derived adjectives(26b). Thus the adjectives like fin 'black', mia 'big',...can occur in isolation and would mean "the black (one)", "the big (one)" respectively.

(31)  
\begin{align*}
a. & \quad \text{fin} \quad ~ \text{bafin} \\
b. & \quad \text{bāŋ} \quad ~ \text{bafāŋ} \\
c. & \quad fāō \quad ~ \text{bofāō} \\
d. & \quad m\text{iā} \quad ~ \text{bamiā} \\
e. & \quad s\text{iā} \quad ~ \text{baśiā} \\
f. & \quad k\text{ēm} \quad ~ \text{bakēm}
\end{align*}

Here we also notice that class one adjectives can take number (singular/plural) morphology. Number typically is associated with DPs/NPs. From the [N-Adj.] attributive constructions in (9) repeated here as (32), we noted that nominal modifiers typically show agreement with the head noun, however we do not see any such agreement in the examples in (33).

(32)  
\begin{align*}
a. & \quad \text{ngēsāŋ \ p-gō?ō} \\
& \quad \text{corn Pf. ground} \\
& \quad \text{'}ground corn' \\
b. & \quad n\text{fū \ à-liī} \\
& \quad \text{med. Pf. sweet} \\
& \quad \text{'}sweet medicine' \\
c. & \quad l\text{e-bō? \ le-cūū} \\
& \quad \text{pumpkin Pf. boiled} \\
& \quad \text{'}boiled pumpkin'
\end{align*}

(33)  
\begin{align*}
a. & \quad \text{fin ndrō} \quad ~ \ast \text{ndrō fin} \\
& \quad \text{black cloth/dress}
\end{align*}
b. síà ndró ～ * ndró síà
   long dress

c. méía ndró ～ * ndró méía
   large dress

The fact that the noun does not trigger prefix agreement (Pf.) in (33) suggests one
of two things: (1) either the heads of these phrases are not nouns, or (2) that the
noun has not yet moved high enough within the DP to trigger agreement. For the
moment we leave both of these options open.

With regard to their external distribution, pure adjectives can appear
independently in noun phrase positions without an accompanying head noun or
proform like English one.

(34) a. Atem à ké? n-jü5 (fin) mbó
   A. S.Agr P-1 buy (black) goat
   'Atem bought a (black) goat.'

b. Atem à ké? n-jü5 fin
   'Atem bought a black (one)' (speaking of goats)

c. Atem à ké? n-jü5 fin bó bǎŋ.
   'Atem bought a black (one) & a red (one) (speaking of goats).

The coordination test in (34c) further indicates that pure adjectives can occur
independently in nominal positions without an overt head noun or proform. In
contrast, derived adjectives cannot occur on their own in nominal positions.

(35) a. akendɔŋ à-tuá bó *(zhà) à-káŋ
   plantain pf. roasted and one Pf. fried
   'roasted plantains and fried plantains'

b. afú à-luí bó *(zhà) à-rō5
   med. pf. sweet and one pf. bitter
   'sweet medication and bitter one'

c. bǎŋ ndró bó *(zhà) fin
   red cloth and one black
   'the red cloth and the black one'

In (35a) and (35b) that both involve derived adjectives, one cannot conjoin an
NP like akendɔŋ à-tuá 'roasted plantains' with à-káŋ 'fried (one)' if there is
no proform zhà 'one' or an overt noun. But in (35c) that involve class I (pure
adjectives) we notice just the opposite effect where the presence of a proform is
not possible.

What makes (class I) pure adjectives the more unusual is the fact that they
take possessive pronouns and appear to enter into noun classification; cf. (37).
One of the hallmarks of Bantu nouns is that they subcategorize into classes
(sometimes also referred to as genders). The way linguists determine the class
membership of each noun is based on a set of (syntactic) agreements that the noun
ON ADJECTIVES THAT SHOW UP AS NOUNS

governs. Thus we observe in (36) that the possessive pronominal class marker varies depending on the class of the head noun.

(36) a. ndró jè cloth my 'my cloth'
b. asém ajé oil mill my 'my oil mill'
c. esùs gè friend my 'my friend'
d. nkè2 gè lamp my 'my lamp'
e. lebó2 lè pumpkin my 'my pumpkin'

Pure adjectives govern agreements typical of nouns. One such agreement is the possessive pronominal agreement.

(37) a. fin gè black my 'my black one' (speaking of X,...)
b. mia gè big my 'my big one'
c. síà gè long my 'my long one'
d. kem gè short my 'my short one'
e. bán gè red my 'my red one'

The behavior of the adjectives in (37) parallel that of the nouns in (36). However, we notice that whereas the possessive pronouns in (36) vary their form to indicate agreement with the noun class of the head noun, those in (37) that involve pure adjectives, are invariant. If possessive pronominal agreement is indicative of the class to which a noun belongs (as linguists commonly assume) then the lexical heads that trigger class agreement in (37) must all belong to the same class. This leaves us with another question as to what triggers the agreement in (37); Is it some null element that triggers the agreement, or is it just a case of pure coincidence that all adjectives belong to the same class and thus trigger the same agreement? While the latter alternative is less likely, we will show in the next section that it is not simply the case that the adjectives in (37) are all modifying some empty noun.
3. Adjectives as heads of NPs: A case of syntactic adoption?

One of the most puzzling phenomena concerning the behavior of pure adjectives is the fact that if we combine a pure adjective and any noun to form an [Adj.-N] attributive construction, as in (38), the possessive pronominal class marker appears to be determined by the adjective rather than by the noun that one would ordinarily construe as being the head of such a phrase.

\[(38)\]
\begin{align*}
a. & \text{fin ndrọ gé} \\
& \text{black cloth my} & \text{my black cloth} \\
* & \text{fin ndrọ jè} & \text{cf. (36a)} \\
b. & \text{mia asém gé} \\
& \text{big palmoil hut my} & \text{my big palm oil hut} \\
* & \text{mia asem (a)jé} & \text{cf. (36b)} \\
c. & \text{bàn nkè? gé} \\
& \text{red lamp my} & \text{my red lamp} \\
* & \text{bàn nkè? gé} & \text{cf. (36d)}
\end{align*}

Notice that the pronominal class marker gé 'my' in (38a), for example, is the same as that which the adjective fin 'black' independently selects; cf. (37a) and unlike that which the noun ndrọ 'cloth' independently selects cf. (36a). These same facts hold true for (38b) and (38c).

Ordinarily, one would think that the head of the noun phrase in (38a) is ndrọ 'cloth' and that the head in (38b) and (38c) is asém 'oil mill' and nkè? 'lamp' respectively. But strangely enough this does not appear to be the case. The phrases in (38) suggest that for the purposes of (external) agreement, it is the adjectives that determine the agreement and not the nouns that one would normally think of as being the heads of these phrases. It is a well known syntactic fact that heads determine agreement. The fact that the agreements in the phrases in (38) are determined by the adjectives and not by the nouns suggests that the adjectives are heads; It also suggests, though this might sound like a contradiction in terms, that these adjectives are in nominal positions or at least have nominal properties.

The facts that we have sketched above pose a fundamental descriptive dilemma. It is clear that class I (pure adjectives) show properties typical of adjectives; It is equally clear that they show properties typical of nouns. In an attempt to capture the 'intersecting' nature of such adjectives, Martin (1986) quoting the American Heritage Dictionary refers to phrases of the sort 'the poor', 'the rich', 'the Blacks'... as "adnouns", thus suggesting a blend of adjectives and nouns. The question one must address, however is how does one account for the fact that adjectives can at the same time be nouns, without violating fundamental
assumptions of syntactic theory such as the universality of the lexical categories (N, V, A, P,...) and their inherent properties?

Our proposal as to how to solve the questions posed above is to say that the behavior of pure adjectives stems from their underlying lexical properties. We will argue that pure adjectives have a complex lexical representation as in (39).

\[
\text{(39)} \quad [A_{[N^\epsilon]} A]
\]

According to (39), we claim that pure adjectives project an empty argument position in their lexical argument structure and that this empty argument position is licensed by incorporation. Since the lexical structure of pure adjectives involves an empty nominal, the noun by virtue of the Projection Principle must project a syntactic phrase. The complete lexical structure is represented in (40). Since the head of the NP is null, the only way its projection can be fully licensed is for the adjective to incorporate the null head of the NP.

\[
\text{(40)}
\]

The structure depicted in (40) indicates that pure adjectives are treated here as heads whose projections enter into the main projection line. This might seem unpopular given the fact that in most of the literature, adjectives are treated as adjuncts. However, there has been some recent work in the literature arguing that adjectives can and do enter into the main projection line. (For valuable contributions along this line of research, see Sportiche (1994)).

4.1 "Incorporation as a theory of grammatical category changing"

Given a lexical representation like (39), noun incorporation into the adjective will result in a structure like (41).

\[
\text{N-incorporation: (41)} \quad [N^\emptyset]_{[A A]}
\]
The representation in (41) raises the question as to what is the appropriate category label for a representation like (41)? We will claim here that the syntactic category label for (41) 'intersects' between an adjective and a noun and therefore is capable of playing limited functions of either an adjective or a noun. Derived constructions in natural language often have peculiar properties that are unlike the categories from which they derive or that they yield even though they may share certain properties.

In much of the discussion on incorporation people tend to be agnostic as to the resulting category label when two independent words of different syntactic categories incorporate. We here suggest that there is the possibility that such a category will show a bit of each of the categories from which it is derived. We refer to the sort of incorporation that results in a syntactic category change as syntactic adoption, and to the resulting 'intersecting' head as an adopted head, if it ends up in the head position of a different syntactic category and assumes the properties of such a category. Therefore whenever a lexical item (other than what, semantically speaking would be considered the head) functions as the head of a phrase of a different category, head adoption will be assumed to have taken place. A typical case of syntactic adoption would be when adjectives function as heads of noun phrases.

### 4.2 'pseudo' NP-head as an adjunct.

The structure depicted in (40) is going to correctly account for the cases where a bare adjective occurs in a nominal position as in (42); (see also (37)).

(42) a. 

\[
\begin{aligned}
\text{mì} & \text{ n̄- k̄'n̄ f̄̂n̄ ḡ̂} \\
& \text{I S.Agr like black this}
\end{aligned}
\]

'I like this black (one)' [speaking of X]

b. 

\[
\begin{aligned}
\text{mīa gū̂} & \text{ â b̄n̄ âḡ̂} \\
& \text{big this S.Agr please me}
\end{aligned}
\]

'This big (one) pleases me' [speaking of X]

The question arises as to the analysis of examples like (33), repeated below as (43), where an overt noun appears with a pure adjective?

(43) a. 

\[
\begin{aligned}
\text{fīn n̄dr̄̂} \\
& \text{black cloth}
\end{aligned}
\]

'(a) black cloth'

b. 

\[
\begin{aligned}
\text{b̄n̄ s̄ē̂} \\
& \text{red bird}
\end{aligned}
\]

'(a) red bird'

c. 

\[
\begin{aligned}
\text{mīa ab̄} \\
& \text{big bag}
\end{aligned}
\]

'(a) big bag'

We will argue that the nouns in constructions like (43) are actually in an adjoined position and therefore are adjuncts not heads. We assume a structure like (44)
ON ADJECTIVES THAT SHOW UP AS NOUNS

The structure in (44) is the same as that in (40) but with the DP in an adjoined position. Given a structure like (44), where the DP is in an adjoined position, it cannot interfere with the incorporation of the head noun. Thus we see that such adjoined NPs correctly do not block head movement. This apart, we see that the pronominal class marker of the phrases like (43) are determined not by the noun but by the adjective as (45) shows.

(45)  a. fīn ndṛ  gè / * jè
     black cloth my       'my black cloth'
  b. bāː z  séŋ  gè
     red bird my         'my red bird'
  c. mīa abɔ  gè / *ajè
     big bag my           'my big bag'

Recall that Nweh is a highly configurational language with a head-complement word order. By saying that the adjective is the head of phrases such as those in (38) and (43), we maintain consistency with the word order pattern as all other phrases are underlingly head initial.

An adjective always relates to some noun that can be construed as having the quality expressed by the adjective. Thus if there is no overt head noun that the adjective is predicated of, the logical tendency will be to ascribe the quality expressed by the adjective to the closest NP if such an option exists. In the case of (44), it is the adjunct NP that gets interpreted as being predicated of the adjective. Thus (43a) fīn ndṛ although translated as 'black cloth' literally means something like "the 'one' black, the cloth" i.e. the 'one' black such that (cloth, black); where, what appears to be the head of the noun phrase is actually an adjunct noun.
5. More evidence for noun adjunction.

The structure in (44), where the DP is assumed to be in an adjoined position is supported by the fact that there also exist parallel cases of NP/DP adjunction where a nominal adjunct intervenes between a head noun and a possessive pronominal class marker selected by the head noun.

\[
\begin{align*}
(46) & \quad \text{a. } \text{foto} \ gê \\
& \quad \text{picture my} \quad \text{'}my picture' \ (\text{Poss./theme}) \\
& \quad \text{b. } \text{nďa} \ jê \\
& \quad \text{house my} \quad \text{'}my house' \ (\text{Poss.}) \\
& \quad \text{c. } \text{foto} \ nďa \ gê \\
& \quad \text{picture house my} \quad \text{'}my picture of a house' \\
& \quad \quad \text{** A picture of my house.}
\end{align*}
\]

Notice that in (46a) the possessive class marker is gê while in (46b) it is jê. But in (25c) the pronominal class marker is gê -that which is selected by foto 'picture', even though nďa 'house' intervenes. This favors an analysis where nďa 'house' is an adjunct parallel to the structure in (44).

The solution we have proposed to account for the dilemma posed by pure adjectives straightforwardly explains a number of puzzles that we noted above, and others that at first sight appear to be due to mere coincidence. First the proposal gives us an explanation as to why pure adjectives appear to take possessive pronouns. The reason is that these adjectives have incorporated a (null) noun. Second the proposal not only explain why pure adjectives independently select a possessive class marker but why the class marker is invariant (cf. 37). This is due to the fact that the agreement in such cases is actually determined by the same empty nominal.
ON ADJECTIVES THAT SHOW UP AS NOUNS
