This annotated bibliography, which was developed as part of a series of selected bibliographies on aging for Great Britain's Centre for Policy on Ageing, contains a total of 368 entries organized under the following subject headings: risk (identification, nature, responsibilities, risk taking, security); environmental safety (hazards, design, accident data); communications (dispersed alarms, electronic monitoring, telephone support, area wardens, two-way communications); falls (causes, prevention, consequences); fire (prevention measures, fire-fighting strategies, evacuation); food and drink (nutrition, effects of alcohol, equipment); health and fitness (exercise, relationship between health and aging); hypothermia (medical factors, environmental factors, diagnosis, management, other cold-related risks, health-related risks); medication (drug administration, adverse reactions, adverse interactions, overmedication); mobility (footwear, walking aids, lifts, wheelchairs); and road safety (drivers, pedestrians, car adaptations). Each annotation contains the following information: author, title, publisher and city/year of publication, document length, and annotation summarizing the document's content and/or thesis. Concluding the bibliography is an author index. (MN)

Risk-taking, safety and older people

compiled by
Wendy Jackson

information service
Centre for Policy on Ageing

BEST COPY AVAILABLE
Since its inception in 1972, the Information Service at CPA has been putting together a variety of reading lists for students, researchers and professional people interested in ageing. By publishing the lists in booklet form, the series Selected Bibliographies on Ageing takes this process one step further, making the extensive work being carried out in the field of ageing even more accessible.

Bibliographies are published on a wide range of topics which reflect the interests of the Centre itself, and those of the many organisations and individuals with which CPA is in contact. Much of the literature referred to in the bibliographies is held in the Centre’s library, Britain’s largest collection on ageing. This major international resource is available for reference purposes by appointment.

The issue of risk-taking is central to everyone’s lives and is no less important to older people. This bibliography covers literature on the topic from the broadest perspective of self-determination and the rights of older people, to the more specific issues of safety and environmental hazards.

Successful community care policy relies on the maintenance of independence of those living in the community and this bibliography provides a valuable resource for those working on the planning and provision of services and the formulation of safety policy.

Wendy Jackson, the compiler, has worked for a number of years within the subject area of ageing and is well known for her publication Understanding the needs of older people: selected list of audio-visual items and training material. With this bibliography on risk-taking she has provided another excellent reference source for all who have an interest in the subject of older age.

Gillian Crosby
Editor, Selected Bibliographies on Ageing

CONTENTS

Numbers refer to entry numbers, not page numbers

Introduction

1. Risk: 1-17
   Identification, nature, responsibilities, risk-taking, security

2. Environmental safety: 18-72
   Hazards, design, accident data

3. Communications: 73-130
   Dispersed alarms, electronic monitoring, telephone support, area wardens, two-way communications

4. Falls: 131-178
   Causes, prevention, consequences

5. Fire: 179-215
   Prevention measures, fire-fighting strategies, evacuation

6. Food and drink: 216-240
   Nutrition, the effects of alcohol, equipment

7. Health and fitness: 241-254
   Exercise, the relationship between health and ageing

8. Hypothermia: 255-297
   Medical factors, environmental factors, diagnosis, management, other cold-related risks, heat-related risks

   Drugs administration, adverse reactions, adverse interactions, over-medication

10. Mobility: 318-325
    Footwear, walking aids, lifts, wheelchairs

11. Road safety: 326-368
    Drivers, pedestrians, car adaptations

Index of authors
INTRODUCTION

Since perceptions of risk and safety permeate all aspects of daily living, the foremost task when compiling this bibliography was to decide what limitations to place on the scope of the literature. Whatever precautions we may take, to some extent we are at risk every moment of our lives from both accident and disease; living in itself necessarily involves risk. There are, however, several areas where the consequences of inadequate attention to safety are more serious for older people than for the population as a whole; equally there are situations where the risks incurred may be considered preferable by some older people to restrictions on their independence. To take risks with one's own safety, it is necessary to have full knowledge of likely outcomes.

Since the concept of risk is so central, the first section of this bibliography, though sadly short, comes under this heading. This is followed by a section on general environmental safety, which pulls together literature on environmental hazards, design and strategies to combat those hazards and accident data. The subsequent sections, in which the topic areas are arranged alphabetically, are confined to areas of risk which particularly affect or have more serious implications for older people, and since it is concerned with risk-taking as well as safety, I have also selected literature referring to risks over which older people themselves, and those responsible for their well-being, may have some control. For this reason, although I have included a section on health and fitness, the vast body of literature which is primarily concerned with age-related degenerative disease has been omitted. Many of the sections include publications which relate specifically to institutional settings, but there is no separate section listing these as such a grouping would have been contrary to the objective of making every effort to ensure that life for those in long-term care is as much like life elsewhere as possible.

In some topic areas there is relatively little recent literature: anxiety about hypothermia seems to have had its heyday in the eighties, there were many publications about the disastrous effects of fire in the seventies, while literature reflecting concern for safe design in the public environment is still scarce in the early nineties. It is to be hoped that more publications in all these areas will be generated during the coming decade.

For relevant addresses of organisations in the field of ageing, I would like to take the opportunity of directing readers to CPA's Directory of Services for Elderly People which is regularly updated and brings together a wealth of information on both the statutory and non-statutory sectors.¹

Finally, I should like to acknowledge the contribution of Deirdre Wynne-Harley, whose report for the DTI was the starting point for this bibliography,² and to record my grateful thanks to Gillian Crosby, Assistant Director of the Centre for Policy on Ageing, for both her initial guidance and invaluable comments thereafter, and to Helen Monypenny who offered so many helpful suggestions and tirelessly provided me with publications from the Centre’s library. I should also like to thank the staff of the libraries of the Disabled Living Foundation, the Royal Society for the Prevention of Accidents and the Centre for Accessible Environments for their generous hospitality and assistance.

Wendy Jackson
Compiler

The concept of risk is central to this bibliography and yet there has been a comparative shortage of literature on the subject as compared to specific tangible issues such as fire and road safety. Both the problem of how to identify risk and conscious risk-taking have, however, generated some literature in relation to older people. Recent controversy has focused particularly on the extent to which older people have the right to take risks which may threaten their safety, in order to maintain their autonomy (Wynne-Harley 1991, Statham 1992), although self-determination was seen as an important issue as early as 1979 (Clough and Burton 1979, Harrison 1979) and continued to be so through the eighties (Midwinter 1986, Norman 1987).

1. ASSOCIATION OF DIRECTORS OF SOCIAL SERVICES (1991) *Adults at risk*, Stockport: Association of Directors of Social Services, 8pp
   Considers the nature of risk, the people at risk, policy, practice, legislation and responsibility.

   Puts the case for older people’s health clinics with provision for home assessments as a better way of identifying those who are ‘at risk’.

   Emphasises the need for social workers to assess the implications of older people being at risk.

   Looks at coping with the practical hazards of old age and management in the care of older people set within the more general context of risk.

   Discusses risk-taking policies in health care.

   Argues that residential workers should consider how they would wish to live in a home when they are older and should attempt to change residential care to give residents maximum control over their own lives.

7. FERGUSON, EJ. (1978) *Protecting the vulnerable adult: a perspective of policy and program issues in adult protective services*, Ann Arbor: Institute of Gerontology, University of Michigan-Wayne State University, 111pp
   Considers social policy and legal issues concerned with providing services for vulnerable and dependent adults.

   Considers the risks of old age and the problems of providing supportive services, as illustrated by seven older hospital patients.

   A case study of an older man, illustrating the conflict between an old person’s preference to continue living in his own home despite possible risks, and professional concern that he should be in care.

    Emphasises the right of older people to self-determination and independence in all areas of their lives.

    Demonstrates that older people’s fear of crime is not reflected by the actual figures, yet the fear itself does have a big effect on their lives. As well as considering actual crime, the report examines the role of social and environmental factors in inducing fear and calls for a ‘confident community’ to combat its impact.
ENVIRONMENTAL SAFETY

A report on compulsory care, rights in residential homes, consent to treatment, the role of the Coroner and the Court of Protection. Examines the ways in which older people's rights are eroded, often as a result of understandable concern and a desire to ensure their safety. Considers the rights of older people to take risks if they wish to do so.

13 (1989) Risk taking - a fundamental right for all, Cheshire Smile, April 18

Maintains that the right to take risks should be unqualified providing the rights of others are not infringed.

A discussion document on the uses and abuses of restraint in residential care and nursing homes for older people. Includes a discussion of the legal position of older people living in a residential setting.

Describes a study which assessed the nature and extent of risk for 11 subcategories of older people. Concludes that those most at risk are the recently moved, recently discharged, divorced/separated and the very old.

Outlines the nature of risk in social work, gives a Freudian analysis of anxiety and considers aspects of risk in residential care.

Argues that a balance needs to be sought between risk and safety and that, wherever possible, it is older people themselves who need to decide where that balance lies. Case studies are used to highlight particular issues and a detailed checklist included to enable individuals to assess their own risks and make informed decisions about their lifestyles.

ENVIRONMENTAL SAFETY

This section includes literature relating to environmental hazards, design, and analysis of accident data, both in the home and outside. While there is a considerable amount of literature on safety in the home and available equipment to help older and disabled people to live as independently as possible, there is a striking shortage of publications dealing with the external environment. This may be because research shows that most accidents occur in the home. However, if older people are not encouraged by the provision of public environments designed with their needs in mind, some may feel that the risk-taking involved is too great.

A guide to making decisions about housing. Includes information on warmth, safety and comfort.

Provides statistical information on fatal accidents to older people, road accidents, home accidents, falls and fractures, deaths from fire and deaths from accidental poisoning.

Discusses fatal burns of older people in residential homes.

Provides guidelines for planning outdoor spaces to accommodate the needs of older people.

Provides information, with illustrations, on a wide range of equipment to help disabled and older people to maintain their gardens. Also includes advice on garden design.

A listing which includes in its leisure section information on access, travel, holidays, outdoor activities, sports and artistic activities. The gardening section lists a wide variety of tools and aids to help disabled and older people cope with the maintenance of their gardens.

Gives detailed information, with illustrations, on equipment to help with bathing, showering, hair care, shaving, nail care and toileting.

Gives detailed information, with illustrations, on a wide variety of household equipment which will increase confidence and improve daily living for disabled and older people, including flooring, doors, ramps, electrical fittings, handrails, windows, bed accessories, chair accessories and tables.

Comprises a listing of special equipment designed to make daily life in the home easier and safer for older and disabled people, including such items as knives, scissors, graters, vegetable peelers, food processors, anti-slip aids, and holding and gripping aids. There is also a section specifically on safety, dealing with such things as plug- and hot water bottles.

Maintains that a detailed assessment of older patients and the creation of a safe environment should reduce the accident rate in mental illness hospitals.

CONSUMER SAFETY UNIT, DEPARTMENT OF TRADE (1980) Personal factors in domestic accidents: prevention through product and environmental design, London: Consumer Safety Unit, Department of Trade, 28pp

A model for accident research and prevention which attempts to deal with factors such as tiredness and stress.

Describes characteristics of home and leisure accidents. Includes sections on falls, fire safety, cooking and packaging safety.

Warns of the dangers to older housebound people with recurrent illness, especially during the winter months.

Emphasises that facilities in a house or flat should be carefully investigated before an older patient is discharged to live alone.

Concerned with safety aspects of food preparation, eating and refuse disposal, kitchen layout, space outside the kitchen, laundering, housework, leisure, sleeping and personal care, circulating, entering and leaving, electricity, gas, heating, windows and floors. Includes a checklist. Aimed at all age groups.
DEPARTMENT OF PRICES AND CONSUMER PROTECTION (1976) Collection of information on accidents in the home: proposals for an accident surveillance system, Department of Prices and Consumer Protection, 24pp

Published in connection with the Government’s consultative document on consumer safety.

Examines home accidents in the UK, home and leisure accidents of older people and provides accident data for 1988.

DISABLED LIVING FOUNDATION and SEEBOARD (1992) Information and advice for elderly or disabled persons, London: Disabled Living Foundation, 33pp

Directed at older and disabled people themselves. Gives advice on how to ensure greater safety in the home, especially with regard to electrical appliances.

Gives the results of information gathered during two months in the winter and two in the summer about all patients aged 70 years and over attending a large accident and emergency department. It was found that with increasing age more older people attended as a result of accidents in the home.

Comprises 15 chapters originating from papers presented at the conference. Topics include mechanisms and injuries, drugs and falls, and alarm systems.

FRASER, F. (1987) Assessment of bath boards and bath seats, Department of Health Disability Equipment Assessment Programme, 19pp

Provides an evaluation of available bath boards and bath seats.

Describes a study of a random sample of 145 older people aged over 75 years to assess the provision and use of aids and adaptations in their homes. Revealed that many of the aids assessed, particularly walking aids, were faulty, with possible dangerous consequences.

Describes a study which investigated the environmental factors, both reported and unreported, in home accidents amongst older people. Concludes that although incidence of home accidents in people aged over 65 years was high, few events were reported to medical services. Stresses the need for improved publicity on home safety to be targeted at older people.

Affirms that architects need to create environments that enable older people to lead safe yet active lives despite infirmities.

Provides guidance on selecting appropriate easy chairs for older and disabled people.

Provides information on home safety, including staying active, taking medicines, safety in the kitchen, the bathroom and the bedroom, and DIY safety.

(1988) Home safety checklist for the elderly, Community Safety and Health, July/August, 3-4

A checklist for living safely at home.
Emphasises the involvement of housing associations in providing options: for example, caring for home owners, needs of ethnic older people, role of wardens, alarm systems.

Includes tape/slide presentations to assist local authorities with health and safety training in sheltered housing schemes.

An evaluation of available self-rise chairs and cushions suitable for older and disabled people.

The proceedings of the Ergonomics Society's 1990 annual conference at Leeds, 3-6 April. Among other topics dealt with are design and evaluation, musculoskeletal disorders, cognitive performance, sports ergonomics, process control, biomechanics, ergonomics for older people and communications.

MORFITT, J.M. (1979) Accidents to old people in residential homes, Public Health, May, 177-184
A review of the data from the Home Accident Surveillance system, discussing the relative risk of injury in residential homes and prospects for prevention.

Discusses perceptions of security in the home as well as actual security and older people.

MTP CONSTRUCTION (1974) Housing the elderly: design bulletins, Lancaster: MTP Construction
Brings together in bound and index form publications from the Department of the Environment directly concerned with appropriate housing for older people. A compendium of information to enable architects and builders to place adequate emphasis on the design requirements of older people.

An evaluation of available self-rise chairs and cushions suitable for older and disabled people.

POYNENDORF, B. (1986) Home and leisure accident research: accidents to the elderly, London: Consumer Safety Unit, Department of Trade and Industry, 39pp
Considers gender differences in accident rates, the seriousness of home accidents to older people, the presence of personal/medical factors, falls moving about on the level, and falls while climbing to reach up. Concludes that falls constitute the greatest risk to older people and for the most part safety problems for people aged over 65 years are little different from the rest of the adult population.

This small-scale study of fatal accidents aims to discover how far the causes and processes involved differ from non-fatal accidents. The study is based on HM Coroner's files for inquests on home accidents. The report is in three parts: part 1 sets out the main findings and the principal recommendations; part 2 describes the selection of the sample and some of the problems of defining fatal home accidents; part 3 presents the classification and analysis of 450 fatal home accidents.

Discusses improvements in the design of private dwellings for older people in order for them to continue to live safely in their accustomed environment.

Investigates safe and efficient designs for cookers.

58 ROYAL NATIONAL HOSPITAL FOR RHEUMATIC DISEASES (1983) Assessment of back rests for use in car seats, Bath: Department of Health Disability Equipment Assessment Programme

An evaluation of available back rests for use in cars suitable for older and disabled people.

An evaluation of available sewing and knitting equipment suitable for use by older and disabled people.

60 ROYAL NATIONAL HOSPITAL FOR RHEUMATIC DISEASES (1988) An assessment of woodwork tools, Bath: Department of Health Disability Equipment Assessment Programme

An evaluation of available woodwork tools suitable for use by older and disabled people.

Prepared as part of a joint campaign by ROSPA and Age Concern England to promote home safety for the growing retired population.

Gives advice on how to stay active safely in various situations within the home. Concludes with a miscellaneous checklist.

Concerned with hypothermia, falls, fire, toxic hazards, scalds, contact burns and other accidents within the context of the home.

Provides advice on how to reduce the risk of accidents both in the home and outside.

65 SCRUTTON, S. (1986) Personal effects, Social Services Insight, 1 (27) 14-15

Argues that the safety, and therefore the independence and quality of life of older people is greatly affected by the design and layout of the building in which they live.

Evolved out of contributions to the International Conference on Safety in the Built Environment held in Portsmouth, 13-15 July 1988. Concerned with safety for all age groups - design codes, evacuation of public buildings, access and egress for people with mobility difficulties, escape route lighting, accidents on stairs, crime and safety.

Describes the type of accidents to which older people are prone, the predisposing factors and suggestions for prevention.

Discusses the design of various handles and controls, with a particular focus on window fastenings, electric sockets, and taps.

A survey of 45 tenants in newly built sheltered housing revealed that kitchens contained features that created unnecessary risks. Advocates closer links between the medical and design professions over housing for older people. Recommends that community occupational therapists should be enabled to survey new sheltered housing units and make suitable recommendations before occupation.

Provides detailed design guidelines for sheltered housing complexes, bearing in mind physiological, safety, and psychological needs.

WORLD HEALTH ORGANISATION WORKING GROUP in cooperation with INTERNATIONAL CENTER OF SOCIAL GERONTOLOGY (1983) *Medical and social aspects of accidents among the elderly*, Paris: International Center of Social Gerontology, 82pp

Report of a working group at University of Bordeaux II, 29-30 June 1982. Data is presented on road traffic accidents, accidents in the home and accidents resulting from intoxication. Sections include suicide, the economic aspect of accidentology in older people, the psycho-physiological process of ageing and the role of degenerative diseases in predisposition to accidents, environmental risk factors, priorities for accident prevention and recommendations for future research.

A plea for safe design and an environment accessible to all. Includes designs for safe housing.

COMMUNICATIONS

The value of dispersed alarm systems generated a considerable amount of literature in the eighties as technological advances and the consequently more realistic costs involved made possible a wider use of these systems. The government's proposed move towards community care also served to foster further interest. During the nineties far less literature has been generated and there has been more interest in two-way communications systems, but these are obviously expensive to operate and their use may only be feasible by large bodies, such as local authorities (see Philpot 1991). When community care becomes reality, a new wave of research may take place to investigate communications systems beyond the narrow objective of merely raising alarm. It is hoped the following literature gives a balanced view of the advantages and limitations of the variety of communications systems which are presently available.

Explains how alarm systems work, how to rent or buy one and the best way to use it afterwards.

ANCHOR HOUSING TRUST (1984) *Dispersed alarm systems for the elderly: proposal for research*, Research Institute for Consumer Affairs, 98pp

A proposal for the evaluation of dispersed alarm systems, providing information about currently available systems and establishing criteria for their selection. Assesses what is required to establish an evaluation programme for maintaining an up to date source of information and advice.

Surveys the development of alarm services and identifies the users. Looks at alternatives to alarm systems and the advantages and shortcomings of both. Considers the clients' view. Dis-
discusses how to plan and monitor a system and looks at costing. Provides test results of 19 brands of home units.

Looks at the various types of central control systems available and evaluates their use. Concludes that new methods are of little benefit unless they are managed properly.

Describes an alarm system which was successfully introduced in a geriatric day hospital.

Considers the rapid development of alarm systems and the growing concern at the dependence placed on them.

80 BAZLINTON, C. (1984) We have the technology, *Voluntary Housing*, 17 (1) 25-9

Considers developments in alarm systems both for sheltered housing schemes and residents in their own homes.

Describes the use of an electronic monitoring device with elderly mentally infirm patients in hospital.

Explains how the Southwark alarm scheme relies on existing community support rather than sophisticated technology.

83 BRITISH STANDARDS INSTITUTION (1986) *Social alarm systems: code of practice*, Milton Keynes: British Standards Institution (BS 6804), 12pp

Provides recommendations for social alarm systems.

Surveys the development of community alarms.

Considers the impact of alarm systems in a sheltered housing setting and the possibility that the presence of an alarm system may actually cultivate dependence upon the warden, rather than fostering independence. From interviews with sheltered housing tenants concludes that many alarm calls made were not really for serious emergencies and in many cases there were a number of alternative courses of action available.

Reports on a four-year study on sheltered housing for older people funded by the Joseph Rowntree Memorial Trust and the National Corporation for the Care of Old People. Considers the technical and social problems of the use of alarm systems for older people and argues that although these systems are helpful they should not be regarded as a panacea.

Considers various contributions on the use and efficacy of alarm systems in housing and in the community.

Considers security and alarm systems in housing schemes and urges a closer partnership between local authorities and housing associations.

Gives detailed information, with illustrations, of equipment connected with communications. Includes sections on door entry systems, alarms.
and call systems, reading and writing equipment for those with impaired vision, and smoke alarms and doorbells for those with hearing loss.

Explains the principles on which dispersed alarm systems work and describes the difficulties of people working with older or disabled people in the community in making valid judgements about the systems on offer. Concludes with a call for an independent investigation.

91 CRINE, A. (1983) A finger on the button, Community Care, 452, March, 24-6

Description of a 24-hour mobile emergency service in Scotland.

Examines the types of alarm systems available to older and disabled people and discusses possible problems which may be encountered.

93 DAY, J.B. (1979) Rescue service for the elderly, Housing, 15 (8) 12-17

A description of a radio alarm system providing an SOS service for older people in Stockport.

94 DOWNES, S. (1988) The value of alarm systems and guidelines in their use, Geriatric Medicine, 18 (2) 71-7

Emphasises the need for better understanding in allocation of alarm systems and better user education and follow-up.

95 (1985) Emergency alarm for the elderly, Municipal Journal, 93 (50) 2025-6

Discusses personal emergency alarm devices.

96 EVANS, R.L. et al (1986) Cognitive telephone group therapy with physically disabled elderly persons, Gerontologist, 26 (1) 8-10

Describes a telephone counselling service in the United States.

A review of the telephone provision service in Dorset since the Chronically Sick and Disabled Persons' Act 1970.

Urges careful consideration of the objectives of introducing systems and offers some guidance based on an investigation by Glasgow District Council.

Describes how community alarm systems can enhance the quality of life for older and handicapped people.

Surveys the growth and development of alarm systems in sheltered housing and looks at the role of dispersed alarms in community care. Examines technical and practical issues in alarm system development and provides five case studies covering types of system and circumstances. Emphasises the need for further technological research. Aims to give guidance to agencies concerned with developing or upgrading alarm services for their clients.

Lists public sector central control facilities and manufacturers' statements. Argues that as the biggest purchasers of social alarm equipment in the UK the onus is with local authorities and housing associations to ensure that manufacturers are not allowed to lead the market in a way that may be detrimental to the equipment user.

102 FITZPATRICK, J. (1979) A pilot study to test the technical performance of an automatic emergency alarm system, Loughborough: Institute for Consumer Ergonomics, 40 pp + appendices

Report of a study which tested the overall reliability of a remote-controlled autodialling alarm system for older and disabled people.

Describes a two-way communications system via a telephone link established by Yeovil District Council Housing Department and the local WRVS.

An evaluation of a prototype radio alarm system used in sheltered housing.

Describes group work with disabled people using the telephone.

Describes a checking call system for older people living alone. Concludes that the value of a daily exchange of 30 seconds of pleasantries between individuals is greater than an efficient but silent monitor.

Emphasises the importance of a two-way call system to enable older people living in council estates the security of knowing they can rely on the encouragement and support of a sympathetic person.

Considers the wider future applications of electronic surveillance.

Describes an alarm and intercom link for older or disabled people, commissioned by Loughborough Borough Council, and planned to cover up to 10,000 homes.

110 (1987) Housing for older people, *Voluntary Housing* 19 (5) 35-50

Emphasises the involvement of housing associations in providing options: for example, caring for home owners, the needs of ethnic older people, the role of wardens, alarm systems.

A review of various emergency call systems and the designer's role in developing them.

Considers the contribution of community alarm systems and the use that older people actually make of them.

Emphasises the positive aspects of alarm systems, arguing that they give older people freedom and save local authorities money in residential care.

Gives details of Stockport’s domiciliary service which provides increased support for older people in their own homes by the use of ‘flying wardens’ who answer distress calls. Describes the provision of radio alarm systems.

A report of a conference held by Age Concern Scotland which raised various issues for investigation before the widespread installation of community alarm systems: more research into the use made of alarms; more independent assessment of the reliability and practicality of alarms; a comparison of alarm systems with alternative methods of communication; the examination of any secondary effects on the lives of older users.

Describes a Mobile Emergency Care Service (MECS) which has provided relief for carers and made possible earlier discharge from hospital.

METROPOLITAN BOROUGH OF STOCKPORT MANAGEMENT BOARD (1978) Wardens and alarm systems for the elderly, Stockport: Metropolitan Borough of Stockport, 13pp

Report of the Management Board to the social services and housing committees, reviewing the provision of wardens and alarm systems of sheltered housing in the Stockport borough.

NORTHERN CONSORTIUM OF HOUSING AUTHORITIES (1987) Operating a community alarm system, Chester le Street: Northern Consortium of Housing Authorities, 24pp

Examines the growth of dispersed alarm systems for older and handicapped people and their installation and operation by local authorities in the north of England. Considers how the service can best be developed to ensure a sense of security for users.

Describes the work of the Care Trust which monitors and cares for older people in Tower Hamlets, London.

Describes a sheltered housing scheme with resident wardens and an intercom system where ‘help is only “a count of 15 away”’.

Describes a two-way communications system set up by Leeds Council to offer a helpline for 6,000 older people. The control room is linked to council-run sheltered housing schemes, housing associations, non-residential council properties and private houses.

A detailed listing of dispersed alarm systems which can be installed in homes of older people living in the community.

Looks at all aspects of installing dispersed alarms including managing the system and technical and legal requirements. Includes surveys of users and organisations who install systems.

Report of a seminar on telephone advice services held in London on 15 and 16 October, 1980. Includes as an appendix a directory of agencies.

Examines a variety of innovatory schemes devised by housing and social services departments to enable dependent people to remain in their own homes - communications systems, good neighbour/personal care schemes, etc.

TINKER, A. (1985) *Alarm systems: implications for home-based care*, *Voluntary Housing*, 17 (3) 16-17

Maintains that the role of alarms is as part of an overall package of care. Emphasises the importance of 24-hour coverage for answering the alarm.

FALLS

A report of an exploratory study of the special telecommunications needs of disabled and older people. Reveals consensus among those consulted that their needs were not being met. Concludes that the ordinary fixed location telephone is unlikely to meet the main need for emergencies and recommends special equipment for those with special needs. Emphasises the need to disseminate more information on costs and concessions and for more research into innovative equipment.

Gives a brief summary of the history and background of alarms and outlines possible benefits and problems connected with their use. Emphasises the importance of providing alarms as part of a whole package of community care.

130 (1985) When it's a case of taking calls to Newcastle, Municipal Journal, 93 (34) 1408-9

Describes a central-control warden call and alarm system in Newcastle-upon-Tyne.

FALLS

Falls, whether due to an underlying medical disorder or to a hazard in the environment, represent a major risk for older people, not only because of immediate injuries sustained but because of possible implications for future mobility and independence. A steady flow of literature appears to have been generated over the last decade, much of it from specific studies, and is concerned with the causes and consequences of both extrinsic and intrinsic falls.

Provides facts and figures about falls in the home and recommends preventive measures in connection with electric wires, lighting, rugs, grab bars and spectacles.

Outlines current practice in England both in accident and emergency departments and in departments of geriatric medicine. Considers innovations in clinical practice and makes recommendations for referral, assessment, treatment, rehabilitation and prevention.

A five-year study of residents of an old people's home which revealed that falls occurred as frequently at night as during the day with no significant variations by day of the week or season. Subsequent morbidity was shown to be related to the place where the fall occurred.

Reviews research undertaken on falls suffered by older people, concerned with the basic characteristics of older people who fall, medical risk factors, medication and alcohol as risk factors, housing and other environmental risk factors, social and psychological risk factors, consequences and costs of falling, treatment following a fall, and prevention. Makes recommendations for policy and practice.

135 BELFIELD, P.W. et al (1987) Deliberate falls in the elderly, Age and Ageing, 16 (2) 123-4

Reports two cases of deliberate falls in hospitalised patients who exhibited no initial sign of cognitive impairment. Demonstrates the possibility of multiple falls as a form of self-destruction in response to feelings of frustration engendered by disability.

Describes a study which investigated the causes of falls amongst a group of people aged 65 and over. Degree of handgrip strength in the domi-
nant hand and reported symptoms of arthritis, giddiness and foot difficulties were influential factors in predicting reports of recent falls.

A study of older people who fell at home.

A study of pattern falls and occasional falls amongst a sample of older people aged 65 years and over which analysed the association of physical and social variables. Results showed that women experiencing pattern falls tended to have poorer vision, while men had lower systolic blood pressure. Functional disability was shown to be the principal effective predictor of pattern falls.

Describes a study of falls suffered by older people aged 70 plus in New Zealand. An increase was observed in the rate of falling among women during the winter months but not in men. Discusses measures to decrease this seasonal increase in the rate of falls, including dietary supplementation.

Takes a sample of those aged 70 years and over from general practice records of a rural township. Each subject was assessed and followed for one year to investigate the circumstances and consequences of falls and to determine the factors which are important in causing falls.

Reports on a study of ambulatory men and women over the age of 60 established to determine how accurately older people recall recent falls. Concludes that older subjects often do not recall falls that occurred during specific periods of time over the preceding three to twelve months. Recommends that researchers and clinicians should consider using methods besides long-term recall for ascertaining and counting falls over specific periods of time.

Describes a community-based surveillance system in Miami Beach, Florida, established as part of a study to assess falls among older people. Aims both to clarify the causes of falls in older people and to identify and evaluate appropriate preventive efforts.

A report of an evaluation of the effect of impaired hearing and vision on balance in a sample of older people living in the community. Concludes that impaired vision and hearing are important risk factors for imbalance and perhaps falls and injury.

Emphasises that falls are not part of the normal ageing process but are due to underlying physical illnesses, medications and environmental hazards, often in interaction. Stresses the importance of rehabilitation to promote the early restoration of balance and mobility.

Explains why prolonged immobilisation after a fall should be avoided.

A five-year study of residents of a home for older people.

Deals with extrinsic and intrinsic causes of falls and how best to recognise these.

A brief discussion on falls with particular reference to the effect of age on the control of body 'sway'.

LUCHT, U. (1974) Prospective study of accidental falls and resulting injuries in the home among elderly people, Denmark: Acta Sociomed, 7pp

Argues that many older people tend to ignore the limitations of age and expose themselves to risk by performing tasks for which they are not suited. In addition to the possible presence of disease, the study emphasises the importance of the physical environment in relation to accidents.

Describes a study which examined dark adaptation amongst female patients in a geriatric assessment ward who were classified as 'fallers' or 'non-fallers'. Results indicated reduced retinal sensitivity and thus impaired dark adaptation in the falling group. Advocates the provision of night lights in the homes of recurrent fallers.

Considers the causes, effects and prevention of falls.

Reports on a longitudinal study of senile dementia and healthy ageing in which the occurrence of serious falls was examined in participants with senile dementia of the Alzheimer's type. The study found that higher frequency of falls in demented participants was not solely explained by greater neurological deficit nor by increased drug use. Concludes that while senile dementia of the Alzheimer's type is an important risk factor for serious falls, these increase with loss of independence and institutionalisation.

Reports on a study of patients hospitalised after a fall as compared with randomly selected patients who had not fallen. Identifies three types of falls: physiological anticipated, physiological unanticipated and accidental. Suggests appropriate preventive strategies for each type of fall.

Describes a study of patients aged 65 and over who were monitored for four months after being admitted to hospital following a fall. Concludes that the nature and significance of the post-fall syndrome remains unclear, being neither solely a pre-death syndrome nor solely a manifestation of anxiety.

Argues that as the numbers of older people employed in industry in Japan is increasing, it is estimated that the number of occupational falls will also increase. An examination of death certificates over a two-year period revealed that deaths following a fall of people aged 65 plus were more likely to be due to fracture of the femur or neck of the femur, while deaths of younger people from falls were more likely to be as a result of head injuries.

Outlines epidemiology, risk factors, pathophysiology of falls and the clinical features of faller. Concludes that older people lose their balance more frequently than younger people but are less able to correct the imbalance. Asserts that rehabilitation can be remarkably effective in some patients who have lost balance.

Report of a study in which older people, aged between 60 and 96 years, were questioned about their falls. Their sway was measured and compared with younger subjects. It was noted that sway increased with age and was higher in women at all ages. Concludes that there is a physiological decline in postural control as people age and also a decline due to disease of the central nervous system.
POYNER, B. (1986) Home and leisure accident research: accidents to the elderly, London: Consumer Safety Unit, Department of Trade and Industry, 39pp

Considers gender differences in accident rates, the seriousness of home accidents to older people, the presence of personal/medical factors, falls moving about on the level, and falls while climbing to reach up. Concludes that falls constitute the greatest risk to older people and for the most part safety problems for people aged over 65 years are little different from the rest of the adult population.

PRUDHAM, D. and GRIMLEY EVANS, J. (1981) Factors associated with falls in the elderly, Age and Ageing, 10 (3) 141-6

Reports on a survey of respondents aged 65 and over, who were asked about falls in the preceding 12 months. A comparison is made between those who reported falls and those who said they had not fallen. A history of double vision, greater contact with general practitioners, greater use of tranquillizers and the use of diuretics are all identified as being commonly present among fallers.

Provides a useful analysis of accidents which may occur as a result of using walking aids.

Provides case studies of two older persons with complex, but fairly typical, fall problems. This is followed by discussion of the epidemiology and common etiologies of falls, recommended diagnostic evaluations for patients following a fall, and detailed discussion of gait instability, muscle weakness and environmental hazards.

Argues that falls among older people are of major significance, both as a cause of morbidity and as an indicator of latent disease.

Argues that identification of different types of falls and fallers among older persons might aid in the targeting of preventive efforts. From a study of older subjects in the community concludes that fall-related injuries can be a serious health problem for vigorous as well as frail older persons, and injury prevention should be directed at all older persons but tailored to expected differences in fall circumstances.

Discusses normal ageing changes and the risk of falling, medical causes of falling, the assessment and correction of environmental hazards and psychosocial aspects of falls. Provides a guide to assessing and documenting fall episodes and outlines research imperatives.

Questions whether falls in older people may signal impending major illness. Emphasises the importance of preventing falls in the first instance in order to avoid loss of confidence and self-imposed immobility. Lists age-related conditions which increase the likelihood of intrinsic falls and environmental watchpoints for extrinsic falls.

Describes the Falls Efficacy Scale (FES), a means to measure fear of falling, the reliability and validity of which were assessed in two samples of older persons living in the community. Concludes that the FES may be useful in assessing the independent contribution of fear of falling to functional decline among older people.

Looks at the effects of housing conditions on falls of older people.
FIRE

A project in which a health visitor was assigned for a four-year period to a group of people aged 70 plus to educate them in healthier and safer living. The project revealed that this intervention had no significant impact on the incidence of fractures.

Explains how the findings of a study in gait and balance may help to explain the increased incidence of falls in patients with brain failure.

Argues that drug therapy is a major risk factor in repeated falls. Suggests that patients would benefit from a comprehensive medical assessment and intensive physiotherapy to regain confidence and mobility after a fall.

Gives the results of a national survey in Britain in which older people were asked about falls they had had. More of those who had fallen used non-phenothiazine tranquillizers, lived alone, had recently lost weight or were physically disabled. In addition to these influences, it was found that falls were frequently related to place of residence, lack of indoor toilet facilities being a particularly important factor. Concludes that reduced muscle strength is also strongly associated with falling and emphasises the importance of exercise for older people.

Research shows that falls are not a normal feature of ageing but usually the result of ill health.

Report of a survey giving detailed histories of 125 older people who fell at home.

A study of home backgrounds and circumstances which increase the risks of falling.

A survey which shows that falls at home in old age are often indicative of the presence of severe ill health.

Five perspectives coming from the areas of geriatric medicine, orthopaedic surgery, emergency medicine, general practice and psychiatry.

A survey of the frequency of falls and factors associated with them in five local authority homes in Southampton.

Emphasises the need to dedramatise the perception of risk experienced by older people after sustaining falls, since these may result in chronic anxiety, self-limitation, loss of self-image, and isolation. Stresses the need for research into the effects of medication with regard to falls and the need to formulate policies based on an ergonomically designed environment.

Fire is one of the most frightening hazards that people of any age are likely to encounter. For older people, who may be less able to move briskly and whose lungs are likely to be more rapidly affected by fumes, it is even more terrifying. Inevitably fire poses a serious threat in residential homes and many publications are concerned with fire prevention measures and containing the outbreak of fires within institutional settings. Much of the available literature dates from the seventies but has been included here.
because it has never adequately been replaced; other publications from that period have been listed because they provide a useful account of the origin and progress of notorious fire disasters.

179 BREARLEY, P. and COOK, K. (1984) Fire! the issue of balance, Care Concern, September/October, 24-6

A review of the 1983 Home Office Fire Department draft guide to fire precautions in existing residential care premises, which attempts to balance safety and freedom.

Discusses the problem of fire prevention and architectural preservation of historic houses used by a housing association for older people.

Discusses when and where fires occur, sources of ignition, methods of extinction, rescues, escapes and casualties.

182 CHANDLER, S.E. (1976) Fire in residential personal social services buildings, Borehamwood: Borehamwood Building Research Establishment, 11pp

Provides an analysis of fires from 1967-73. Concludes that older people are most at risk, but the report does show that older people are safer from fire in residential homes than in ordinary dwellings.

Includes proposals to reduce risks.

184 DAVIES, C. (1980) Seven minutes to flashover, Health and Social Service Journal, 90 (4717) 1418-21

Concerns fire safety in hospitals.

An inquiry into a fire which resulted in the deaths of 18 residents. Discusses the cause and spread of the fire, the provision of fire precautions in the buildings, the means of escape, alarm systems, fire-fighting equipment and the structure of the buildings.

Outlines the causes of the fire and comments on the running of the home with special reference to night staffing, the structure of the building and the apparatus available to deal with an outbreak of fire.

Refers to maintenance frequencies set down in the British Standard Code of Practice and advises consultation with manufacturers on ionising-type smoke detectors before dismantling these.

188 DEPARTMENT OF HEALTH AND SOCIAL SECURITY (1977) Fire precautions in existing residential homes, London: Department of Health and Social Security (Circular LAC(77)6), 3pp + appendices

Guidance to homes on what fire precautions should be taken.

Draws attention to a code of guidance produced by the Home Office.

Draws attention to the attached copy of a letter sent by the Home Office to Chief Fire Officers giving advice on the use of fire detectors in residential premises, including homes for older people.

**DEPARTMENT OF HEALTH AND SOCIAL SECURITY, SUPPLY DIVISION** (1976) *Fire risks associated with furniture, furnishings and textiles*, London: Department of Health and Social Security (Circular Fth1(76)80), 10pp

Considers the fire risks of solid timber furniture, upholstered chairs, bedding, curtain fabrics, carpets and clothing.

Provides guidelines on general design considerations, communication links with the fire brigade, alarms, trigger devices, control and indicating equipment, installation and commissioning, testing and routine maintenance.

Provides guidelines on fire precautions, policies, staffing and training, fire prevention, responding to a fire, use and storage of flammable substances, and fire hazards of various hospital departments with appropriate precautionary measures.

Directed primarily at the risk of fire in hospitals but also applies to voluntary organisations that provide residential care.

Sets down general principles and recommendations for guidance in the layout, design and construction of new non-nucleus hospitals and new hospital extensions to ensure effective means of escape for the occupants in the event of a fire.

**DORSET COUNTY COUNCIL** (1978) *Fire precautions in residential and day care premises: report of project council panel*, Dorchester: Dorset County Council, 82pp + appendices

Attempts to identify and assess the principal component factors to be considered in fire precaution schemes.

**FINCH, R.** (1985) *Fire: keeping the risk under control*, *Care Concern*, November/December, 24-5

Gives practical advice in designing and running residential homes and balancing fire risks and residents’ rights.

Contains sections on fire certificates, premises for which fire certificates are required, premises involving excessive risk to persons in case of fire, building and other regulations about fire precautions, consultation between fire and other authorities, enforcement, offences, penalties and legal proceedings, and amendments of other Acts.

**FIRE PROTECTION ASSOCIATION** (1976) *Lessons from the Fairfield disaster*, The Fire Protection Association, 8pp + photographs

A summary of the report of the Committee of Inquiry into the fire at Fairfield Home.

Considers the implications of the fire at Wensley Lodge Old People's Home. Calls for regular contact between residential homes and the local fire prevention officer.

FOOD AND DRINK

Contributes to the debate on the improvement of fire regulations in hospitals and social services residential premises.

Gives practical guidance on the legislation, with particular reference to hotels and other residential accommodation.

FOOD AND DRINK

The ageing process necessitates some changes of emphasis in nutritional needs and older people need to remember that they will probably require more liquid than they did when younger, while alcohol has a greater effect on the ageing liver and kidneys and is not expelled from the body so quickly. In addition to publications dealing with appropriate nutrition and the effects of alcohol, the literature in this section includes surveys of equipment to ensure the safe preparation of food, as reduced manual dexterity may pose risks for some older people.

Describes a study which analysed the use of alcohol in a group of healthy older persons between 1980 and 1987. Longitudinal analysis showed a statistically significant decline in the percentage of subjects consuming any alcohol over time and a cross-sectional analysis of the 1980 data revealed a similar decline with increasing age in the percentage of drinkers. Concludes that the decrease represents an age-related decline rather than a cohort effect.

Outlines the risks of drinking for older people and gives advice on what may be considered as safe drinking limits.

Outlines the risks of drinking for older people, with a special warning on reactions which may occur when alcohol is taken in conjunction with medication.

Outlines the risks of drinking for older people, with a special warning on reactions which may occur when alcohol is taken in conjunction with medication.

A report on the safety advantages and disadvantages of various kitchen knives and scissors when tested by rheumatoid arthritis patients who were attending the London Hospital. All manufacturers were informed that their products were to be tested.

Sixty participants were sent a questionnaire enquiry about the equipment they used and any problems they had experienced with it. The equipment they used is listed and evaluated.

A review of investigations into the nutritional needs of older people.

Argues that counselling on nutrition by medical and paramedical staff to men and women before they retire would encourage a healthy lifestyle.

Explains why the bodies of older people are more vulnerable to the effects of alcohol.

Warns that a proportion of older people have low dietary intake, and indications are that a higher level would give greater resistance to disease.

Outlines the reasons why drinking may become a problem, particularly in view of the fact that many older people are taking some form of long-term medication. Emphasises the importance of identifying excessive alcohol consumption and offering support where needed.

Emphasises the importance of a good diet and how this should incorporate the particular problems of ageing.

Considers the special dietary problems facing older people.

Describes a study of patients from general practice registers in London, who were interviewed to assess alcohol consumption, cognitive impairment, depression and other factors. Concludes that only a minority of older people consume alcohol above the limit designated as safe for their sex and that alcohol consumption sufficient to cause increased numbers of falls or increased use of medical services was not widespread. Neither did there appear to be any association between alcohol and depression.

Argues that older people need meaningful nutrition information to help them cope with the ageing process and nutrition related problems. Emphasises the need for further research into a nutrition education programme relevant to the physiological and psychosocial changes faced by older people.

Grapples with the everyday problems of kitchen tasks and shows how these may be adapted to permit older and handicapped people to live active, self-sufficient lives. Contains illustrations of kitchen aids.

An evaluation of equipment used by respondents attending the London Hospital during 1980 and 1981, funded by the Department of Health as part of their aids assessment programme.

An evaluation of food preparation aids used by respondents attending the London Hospital.

An evaluation of a variety of appropriate cooking utensils used by respondents attending the London Hospital.
HEALTH AND FITNESS

Considers the extent of alcohol use in old age, its physiological effects on older people, the definition of an alcohol problem among older people, the treatment of problem drinking, the effects of alcohol on health in old age, the possible benefits of alcohol use and the effects of wine on self-sufficient older people.

NORBURY, K. et al (1983) Food for thought, Warwick: Warwickshire County Council, Social Services Department, 7pp + appendices

A study of food and its relationship to good health.

ROBERTS, A. (1988) Alcohol and elderly people, Nursing Times, 84 (8) 49-52

Warns against excessive alcohol consumption amongst older people but maintains that moderate use of alcohol may, with care, be beneficial. Considers patterns of drinking in older people and why alcohol affects them particularly badly. Gives advice to carers.

Considers the effects of alcohol on older people: its toxicity in the ageing liver, its interaction with drugs, and accidents which may result from decreased agility, with particularly serious repercussions for older people.

SCOTTISH COUNCIL ON ALCOHOL and AGE CONCERN SCOTLAND (1987) Alcohol and older people: a leaflet prepared for those caring for older people, Glasgow: Scottish Council on Alcohol, 8pp

Points out the possibility of a wrong diagnosis of confusion because of alcohol consumption, outlines why older people may increase their drinking, sets out sensible levels of drinking and details the particular effects of alcohol on older people.

Describes the results of an exploratory research project. The findings suggest that older people do make changes in their food habits.

The maintenance of good health and fitness is an important factor in reducing risks in old age and older people should avoid the conclusion that ill-health is an inevitable concomitant of ageing. There is a general consensus in the following literature that while the continuation of some activities pursued in youth may not be possible, or even wise, the risks involved in sensible forms of activity far outweigh the risks accompanying inadequate exercise.

Discusses the improvement in general health which has been made possible through taking regular exercise.

A study to assess the effects of regular aerobic exercise on a group of young-old (aged 65-69 years) and old-old (aged 70-85 years) volunteers.

COPPLE, P. (1982) EXTEND: from keeping fit to Karate, New Age, 17, Spring, 17-19

Offers solutions to the problems of worsening posture and balance, and increasing stiffness and sluggishness, by a special exercise training programme to music for older and disabled people.

Argues that the harmful effects of inactivity are numerous and regular exercise is important for good health and maintaining independence.
FENTEM, P. (1985) Fitness and exercise, New Age, 29, Spring, 10-14

Explains how and why exercise is the only way to achieve joint flexibility, muscle strength and stamina.

GORE, I. (1973) Age and vitality: commonsense ways of adding life to your years, London: Allen and Unwin, 132pp

Considers ageing and longevity, the role of physical activity in physical well-being, misconceptions about physical activity in old age, and the importance of regarding life as a continuum.

Considers perspectives on exercise and ageing, the evaluation and physiology of exercise, motivation and planning, practical exercise and relaxation programmes.

Discusses myths and misconceptions about health and ageing, the relationship between health and ageing, health and ageing in a sociopsychological context and provision for long-term health care.

Examines attitudes to activity and fitness, changing activity patterns of older people in recent years, and contemporary understanding of health and good physical condition.

A guide to exercise and healthy living, particularly for frail older people.

Maintains that many health problems in older people arise from being unfit.

MUIR GRAY, J.A. (1986) Don't put it down to old age, Self Health, 10, March, 7-8

Argues that to keep healthy in old age, people should remain active both physically and mentally.

MUIR GRAY, J.A. (1988) Seven ways to prevent loss of fitness, Geriatric Medicine, 18 (2) 79-85

Explains how a family doctor is able to help older people maintain a high level of functional capacity by encouraging exercise and giving up smoking.

Emphasises the importance of encouraging older people to maintain or increase their activity levels, not only to improve their mental and physical quality of life, but also to reduce health and social services expenditure.

HYPOTHERMIA

In the UK climate, the possibility of becoming hypothermic is a regular seasonal risk for older people, particularly the very old and frail whose vulnerability to a fall in body temperature as a result of inadequate heating is frequently increased by multiple drug therapy, cold-related infection and failing homeostasis. The literature selected is weighted fairly evenly in its concern with medical factors, environmental factors and management. Also included are publications which stress the importance of other cold-related risks. Additionally, adverse reaction to high temperatures can also be a problem and one article relating to this has been included.

An illustrated booklet which explains succinctly what hypothermia is, when it is most likely to occur, what the symptoms are, what to do when it occurs and how to guard against it.

ALDERSON, M.R. (1985) Season and mortality, Health Trends, 17 (4) 87-96

Discusses the influence of the seasons on mortality.
Divides hypothermic patients into four categories. Considers various management plans but expresses personal preference for slow, external rewarming despite the fact that this means prolonging physiological abnormality for many hours.

Gives a perspective on the nature, diagnosis and management of hypothermia in older people.

Argues that while older people prefer a temperature which is higher than that chosen by those who are younger and more active, and is consistent with their lower metabolic heat production, it is difficult to assess the importance of hypothermia in the deaths of older people because it is often uncertain whether it is a cause or effect of cold-related illness.

Argues that there is a high seasonal mortality in older people associated with cold weather even though deaths directly due to hypothermia are comparatively rare.

Describes a longitudinal study of the age-related decline in thermo-regulatory capacity of older people. Concludes that people at risk of developing hypothermia also seem to have low resting peripheral blood flows, a non-constrictor pattern of vasomotor response to cold and a higher incidence of orthostatic hypotension.

Describes a study of older men and young adults of similar body build and wearing equivalent clothing insulation. Finds that the older subjects prefer the same mean comfort temperature but manipulate ambient temperature much less precisely. Concludes that both physiological and behavioural changes contribute to the increased vulnerability of old people in cold conditions.

Considers why the rate of winter mortality is higher in Britain than in other countries, including Scandinavia. Points out that excess winter mortality occurs in all social classes, although hypothermia is more prevalent where there is social deprivation. Attributes much excess winter mortality to respiratory disease and influenza.

Describes a study in which data was gathered on the home conditions of older patients with hypothermia, the circumstances in which they had been found and their recent medical history. Clinical and laboratory examinations were performed to establish accurate diagnoses of underlying illnesses present at the time of arrival in hospital and patients were monitored until completion of the study.

Describes a study which demonstrates that unfavourable social circumstances are associated with hypothermia.

Discusses the predisposing factors of hypothermia - the climatic, sociological, physiological and pharmacological factors. Gives advice on prevention and management.

Explains how a special hypothermia room facilitates management of hypothermic older patients.

</table>
MONDAL, B. et al (1987) Keeping out the cold, Nursing Times, 83 (38) 54-5
Describes a monitoring scheme designed to assess vulnerability to hypothermia.

Report of a study in which general practice patients over the age of 75, considered to be at risk, are visited early in winter to discuss how hypothermia might be prevented. Although some alterations were made in heating arrangements, some continued to live in an environment in which they were at risk of developing hypothermia.

An illustrated guide to the causes, clinical features, management and avoidance of hypothermia.

Outlines who is at risk from hypothermia, predisposing factors, clinical features and treatment. Gives advice on prevention and diet.

SALVAGE, A. (1989) Cold homes: cold comfort, Primary Health Care, 7 (10) 10, 12-13
A report of a national study on hypothermia undertaken by the Age Concern Institute of Gerontology. Asserts the right of older people as citizens to adequate levels of income and housing in order to keep the risk of hypothermia at bay.

Provides a definition of hypothermia and explains how the role of the district nurse may be developed in educating the community to help prevent the incidence of hypothermia.

SHENNAN, V. (1985) How to recognise and prevent hypothermia, New Age, 32, Winter, 16-17
Argues that most deaths from hypothermia are avoidable if the signs are recognised and the causes understood. Outlines the signs that betray hypothermia and stresses the importance both of maintaining an even room temperature of at least 70 degrees Fahrenheit, and wearing warm, loose clothing made of natural fibres.

SLATER, D.N. (1988) Death from hypothermia: are current views on causative factors well founded? British Medical Journal, 296 (6637) 1643-4
Refers to the results of a retrospective study of computerised inquest records. Concludes that although there is a high annual mortality related to cold weather, deaths due to hypothermia are rare.

Takes a look at the statistics on hypothermia and argues that hypothermia does not occur in Sweden because of efficient insulation and heating in homes.

Explains the causes of hypothermia and provides lists of the predisposing factors in older people and the signs and symptoms. Outlines what community health workers can do to help prevent unnecessary deaths from hypothermia.

Considers the policy implications of a national survey which investigated the incidence of hypothermia and considered the social, economic and environmental living conditions of older people.

Puts forward the case for a new initiative to prevent more deaths from the cold amongst older people. Suggests an action plan relating to housing and insulation, social security benefits and advice and help.
MEDICATION

No medication is without risks, particularly if mistakes are made in administration of the required dosage, and for many older people this risk is frequently compounded by the need to take a variety of drugs each day. This is an issue taken up in some of the publications listed here. Most of the literature, however, is concerned with possible adverse reactions to drugs, particularly in cases of unfavourable drug interaction, and most writers call for a greater sensitivity in prescribing medication for older people. A general picture emerges of over-medication.

297 YOUNG, P. (1983) Keeping warm in winter, Geriatric Medicine, 13 (12) 858-60
Provides advice on conserving warmth, better use of heating systems, saving heat, help with heating costs, other aids to keep warm and contacts.

MEDICATION

No medication is without risks, particularly if mistakes are made in administration of the required dosage, and for many older people this risk is frequently compounded by the need to take a variety of drugs each day. This is an issue taken up in some of the publications listed here. Most of the literature, however, is concerned with possible adverse reactions to drugs, particularly in cases of unfavourable drug interaction, and most writers call for a greater sensitivity in prescribing medication for older people. A general picture emerges of over-medication.

Papers from a conference on the problems involved with medication. Topics include: testing, use in different settings, and the consumer's perspective.

299 ARIE, T. (1980) Overdrugged old people, Geriatric Medicine, 10 (8) 24-5
Argues that over-medication may result in unwanted side effects, such as confusion.

300 ATKINSON, L. et al (1977) The difficulties of old people taking drugs, Age and Ageing, 6 (3) 144-50
The causes leading to faulty taking of prescribed drugs by older patients are identified and reviewed with suggestions for improvements.

301 BENSON, S. (1986) Chemist in the cupboard, Community Care, 606, April, 24-5
Describes safer routines for distributing medicine in residential homes.

A guide to medicines for older people and those who help to care for them.

Describes two systems of drug management implemented in residential homes.

Reveals that adverse drug reactions increase with increasing age. Calls for a better understanding of the differences in metabolism, elimination and sensitivity of drugs in older people, along with better communication with the individual patient.

305 CROME, P. (1980) Improving drug compliance, Geriatric Medicine, 10 (12) 20-4
Recommends that patients should be given more information and guidance about taking their medicines.

306 ELLIS, P. (1988) A four-pronged approach for weaning patients off tablets, Geriatric Medicine, 18 (7) 49-52
Maintains that between 10% and 30% of admissions to geriatric units are at least partly due to the tablets patients are taking. Emphasises the importance of regular drug review. Outlines four-pronged approach for weaning patients away from unnecessary medication.

Argues that a decline in visual acuity with age may lead to difficulty in discriminating between medications that are similar in appearance.

308 KNOX, J.D.E. (1980) Prescribed medicines in a residential home for the elderly, Nursing Times, 76 (44) 1934-6
Describes a system for minimising errors in the administration of drugs.

309 MATHIESON, A. (1986) Old people and drugs, Nursing Times, 82 (2) 22-5
Considers the problems involved in giving medication to older people.
MOBILITY

 Warns that changes in mobility, mental clarity and bodily functions may occur with far greater effect in older people. Provides tabulated data of adverse drug reactions resulting from a joint project of the American Association of Retired Persons and the Food and Drug Administration.

 A review of published reports on the prescribing and use of drugs and factors contributing to their optimal use.

 Deals with general pharmacological principles of drug therapy in older people and gives guidelines for rational and safer prescribing habits.

313 SIDDQUI, M.M. (1988) Project slashes patients' average tablet tally by 80%, Geriatric Medicine, 18 (7) 57-9

 Describes a project where the drug therapy of older people was gradually pared down to bare essentials. After some initial misgivings it was found that patients were enjoying a better quality of life.

 Asserts that evidence indicates that older people are no more likely to make mistakes in using drugs than any other age group, but there needs to be closer monitoring of the types prescribed.

315 SMITHARD, D.J. (1982) Drug handling in old age, Geriatric Medicine, 12 (5) 85-6, 88

 Emphasises that the prescribing of drugs must be handled carefully, reducing medication to a minimum.

 Describes a study in which the drugs prescribed for a group of older women with hip fractures were compared with those prescribed for a control group of women. Concludes that the patients with hip fracture were slightly more likely to be taking diuretics and less likely to be taking non-steroidal anti-inflammatory drugs but no differences were found with regard to other drugs.

 Argues that greater care is needed in the prescribing and supervision of drugs.

MOBILITY

Older people who are immobile or poorly mobile are at risk from the consequences of possible falls if they wish to get about, yet face reduced muscle power, increased weight and decreased stimulation if they do not take this risk. Special equipment is needed to ensure maximum safety and the following publications consider a variety of footwear, walking aids, lifts and wheelchairs to enable older people to improve their quality of life and live as independently as possible.

 Gives detailed information, with illustrations, on a wide variety of available equipment to help disabled and older people get around in safety.

 Gives information on a wide variety of available wheelchairs for the safe conveyancing of immobile and poorly mobile people.

Gives detailed information, with illustrations, on a wide variety of hoists and lifts currently available to enable disabled and older people to cope with such activities as travel by car, using the swimming pool, using their bathroom and going between floors in their own home.

Gives detailed information, with illustrations, on a wide range of walking sticks, walking frames, crutches, trolleys, rollators and rest seats.

FEUERSTEIN, P. (1990-91) Safe shoes for seniors, Family Safety and Health, 49 (4) 12-13

Stresses the importance of choosing proper footwear for the safety of older people.

A survey carried out by the Institute for Consumer Ergonomics on behalf of the Department of Health. Collects data on walking frame users and identifies problems. The survey involved interviews and observation of walking frame users in their place of residence.

A report of a two and a half year project commissioned by the Department of Health to investigate walking frames, since these had been identified as the mobility aid which presented the greatest problem. The report develops criteria for the selection and evaluation of walking frames, and, using ergonomics and technical tests, evaluates a range of walking frames in relation to the needs of the user.

AGATE, J. (1982) Ageing and driving, Update, 24 (7) 1174-8

Points out that many older people have little insight into how much their driving performance may have been affected by age or disease.

AUTOMOBILE ASSOCIATION FOUNDATION FOR ROAD SAFETY RESEARCH (1988) Motoring and the older driver, Basingstoke: Automobile Association Foundation for Road Safety Research, 40pp

Attempts to provide an insight into the problems faced by older drivers and to examine the extent to which they recognised changes in their driving capabilities. The data is divided into three age groups: 55-64, 65-74 and 75 years and over.

Argues that although the process of ageing may impair older people’s driving performance, older drivers show a wide range of capabilities so that chronological age alone cannot be the criterion of driving competence. Points out that although trends show a long-term increase in fatal accidents to older drivers, this rate of increase is not as fast as their increase in population share.

</tr>
</thead>
</table>
| BROUGHTON, J. (1988) | *The variation of car drivers' accident risk with age*, Crowthorne: Transport and Road Research Laboratory, Department of Transport (TRRL research report 135), 27pp
Examines variation in accident risk by age to drivers of all ages. Concludes that the safest drivers are aged 64-68, with accident involvement and injury rates about half the average. Also that the proportion of accidents involving older drivers occurring at junctions, though still below the average rate for all ages, was high relative to the rate for other accidents.

| BULSTRODE, S.J. (1987) for ROYAL NATIONAL HOSPITAL FOR RHEUMATIC DISEASES | *Assessment of supplementary car mirrors*, Bath: Department of Health Disability Equipment Assessment Programme, 31pp
An evaluation of available supplementary car mirrors.

| BYTHEWAY, B. (1979) | *Street accidents may hasten the decline to dependence*, *Geriatric Medicine*, 9 (9) 57-8
Explains why accidents may have very serious consequences for older pedestrians.

Describes a retrospective study to test the hypothesis that the drivers among those referred to a geriatric assessment centre were operating at a higher cognitive and functional level than non-drivers.

A collection of papers presented at the conference which aimed to increase awareness of the problems of older road users.

An analysis of accidents which involved people aged 55 plus compared to the results of a questionnaire answered in person by a separate sample of older drivers in British Columbia.

Course includes advice on crossing the road, footbridges and subways, Zebra crossings, Pelican crossings, junction signals, central refuges and traffic islands, traffic signs and road markings, general safety points, and drivers' problems.

A full review of road safety policy to address the task of reducing road casualties in which the effects of age are singled out briefly.

| DEPARTMENT OF TRANSPORT (1991) | *Older road user: measures for reducing the number of casualties among older people on our roads*, London: Department of Transport, 12pp
Outlines measures which the Department of Transport, together with other bodies and organisations, is proposing to take to reduce road accident casualties among older people.

A survey of literature connected with pedestrian accidents, the road crossing task, the role of walking in the lives of older people and counter measures in the prevention of accidents.

Examines driver involvement in severe crashes, the threat drivers pose to pedestrians and the contribution of motor vehicle fatalities to overall mortality. Concludes that although some risks that drivers face may increase with age, the increases are small compared to the reductions in distance driven with increasing age.

A study which concludes that the rate of involvement of older drivers in fatal crashes after dark, although less than that of drivers under 25 years, is greater than that for drivers aged 25-64.

Report of part of a three-year research programme in which a street interview survey was conducted in four cities with a main sample of older respondents and a control sample. Questions asked included type and frequency of outings made by the respondent, the difficulties experienced at various types of crossing facilities, places in the city that pedestrians found particularly difficult and general questions about traffic speed.

Emphasises that a Pelican crossing may not be considered safe if any older person has cause to fear death or injury while using it. Highlights research which shows that many older people find the brief period when the Green Man is lit up insufficient time to cross. Calls for a publicity campaign to re-educate drivers.

INSTITUTE FOR CONSUMER ERGONOMICS, LOUGHBOROUGH UNIVERSITY OF TECHNOLOGY (1985) Problems experienced by elderly people entering and leaving cars, Crowthorne, Berkshire: Transport and Road Research Laboratory, Department of Transport, 31pp

Concerned with the difficulties encountered by older and disabled people when entering and leaving cars. Deals with the problems of reaching and manipulating items such as locks, handles and seatbelts.

LONDON ACCIDENT ANALYSIS UNIT (1990) Older road user, London: London Accident Analysis Unit (factsheet no 29), 13pp

Outlines the nature and extent of road accidents in the Greater London area which involved injury to road users over 60 years of age. Stresses that older road user casualties make up almost 11% of total casualties in Greater London.

Emphasises that driving among individuals with incapacitating dementing illness may be an unrecognised and potentially serious problem.

Covers all aspects of road safety for all age groups but calls for drivers to show more consideration to older people and for the provision of safer crossing facilities.

Explains that road accidents to older people are three times more likely to result in death than those involving younger people. Examines trends in casualties for older people and concludes that the type of casualty has changed in the last ten years.

A cross-national study of older people as car drivers and pedestrians. Makes policy recommendations in which education is seen as the key element for improving safety for older pedestrians, along with improved traffic signals, adequate lighting, the location of bus or tram stops away from corners and near to crossings. Recommends age neutral safety policies wherever possible.
ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT in cooperation with the WORLD HEALTH ORGANISATION (1985) Traffic safety of elderly road users, Paris: OECD, 183pp

Road transport research which considers socio-demographic trends, traffic patterns of older road users, the psychological and psycho-physical change in ageing road users, road accidents of ageing road users, prospects for improving the safety of the older road user, the role of education in reducing road accidents to older people and legislative measures and controls.

Describes a survey in which pedestrians aged 60 and over with no chronic disability were interviewed in homes and recreation centres in Leicester. The questionnaire included details on familiar outings, pedestrian crossing facilities, road safety education, and knowledge of road signs.

For this investigation, which was part of a larger study, the behaviour at junctions, pedestrian refuges and Pelican crossings of pedestrians aged over 60 years and that of a control group of younger pedestrians was recorded on video film and subsequently analysed. Short street interviews were also conducted to obtain opinions on specific types of crossing facility.

For this study, seven intersections with traffic signals were chosen, with varying degrees of pedestrian phases. Data was collected by interview with both older and younger pedestrians and through video recordings.

A study of comparative use of crossing facilities in which five sites were selected which provided a choice of crossing facility. Observers noted the number of older people and other adults who used each facility at various periods during one day.

A study of comparative use of crossing facilities in which five sites were selected which provided a choice of crossing facility. Observers noted the number of older people and other adults who used each facility at various periods during one day.

Reviews the medical grounds for determining competence to drive, discusses ethical implications and reports on legal regulations in America.

Highlights the design limitations of crossing structures for older and disabled users and makes suggestions for ramp grades, slip resistant walkway surface materials, rest stops and orientation cues.

Argues that road conditions, sign design and lighting do not adequately take into account the needs of older people, since reduced visual capability, particularly a reduced range of peripheral vision, slows down reactions. Suggests some
safety recommendations which, though of particular help to older drivers, would bring about a universal improvement in road safety.

Integrates statistical findings and survey data with interviews and discussions with older drivers who have been involved in a serious accident and a random sample who mostly have not. Summarises theories of ageing and research on older drivers. Makes recommendations for future traffic planning.

360 ROYAL NATIONAL HOSPITAL FOR RHEUMATIC DISEASES (1986) Assessment of car seat belt adaptations, Bath: Department of Health Disability Equipment Assessment Programme
An evaluation of available car seatbelt adaptations.

An evaluation of available car handbrake adaptations.

362 ROYAL NATIONAL HOSPITAL FOR RHEUMATIC DISEASES (1988) Assessment of car steering wheel knobs, Bath: Department of Health Disability Equipment Assessment Programme
An evaluation of available car steering wheel knobs.

363 SHEPPARD, D. and PATTINSON, M.I.M. (1986) Interviews with elderly pedestrians involved in road accidents, Crowthorne: Department of Transport (TRRL research report 98), 11pp + appendix
Relates to a survey carried out among older pedestrians who had been involved in road accidents in Sussex. Suggests that older people might benefit if they could be given advice on how best to compensate for physical handicaps, how to predict more accurately what drivers are likely to do in particular circumstances, and the safest routes to frequent local destinations, such as shopping areas.

Provides an analysis of people over 60, who were injured in the traffic environment over a one-year period. Examines the types of injuries sustained and concludes that vehicle-associated injuries account for over a third of all the injuries to older people within the traffic environment.

Details of a research and development project carried out by the Health Education Unit at Southampton University.

A plea for better facilities for disabled people to enable them to use roads and crossings safely.

A summary report of a three-year study which aimed to compare the behaviour and opinions of older pedestrians with those of younger adults, to compare the difficulties which older pedestrians said they experienced with the difficulties they actually experienced and to suggest design changes to alleviate those difficulties.

From observation of differences in accident patterns argues that older people adapt their driving strategies to compensate for their decreased capabilities.

Risk-taking, safety and older people

a selected bibliography

The issue of risk-taking and safety in relation to older people becomes ever more important as policy focuses on the maintenance of older people’s independence and provision of services in the community. This bibliography provides a range of annotated references focusing primarily on issues of safety that are of particular relevance to older people but also examining the concept of risk-taking as an element in the maintenance of independence. Areas covered are:

- risk
- environmental safety
- communications
- falls
- fire
- food and drink
- health and fitness
- hypothermia
- medication
- mobility
- road safety

Selected Bibliographies on Ageing is an occasional series bringing together annotated references on a variety of topics within the broad field of ageing. These bibliographies are intended to guide readers towards key references on the topic under review and do not aim to provide comprehensive listings. It is hoped the bibliographies will be of help to those studying or teaching ageing in universities, polytechnics and colleges, and to the many professional groups who plan or administer services for older people in central and local government and the health services. The series will also be of value to librarians.
