A study assessed the readability of health education pamphlets and booklets distributed to local health department clients in North Carolina through their maternal health, child health, and family planning clinics. The materials analyzed came from various vendors, but excluded materials developed by local and state public health staff. The sample included 424 client-directed materials. Data included frequency of commonly used words, frequency of long words, variety of sentence types, overall length, target population, and content focus. The three main scores used to assess readability were reading level, "mortar" (a ratio of commonly used words to concept words); and an overall rating. Results indicated that: (1) the values for reading level, mortar, and overall rating across all three clinics were very similar; (2) more materials distributed via the maternal health clinics were in line with recommended criteria; (3) materials distributed via family planning clinics fared the best overall; but (4) only 15.4% of all of the materials supplied to local health departments by commercial and not-for-profit vendors met the recommended criteria. Recommendations for improvement include: clearly state the purpose for using the material; achieve a reading level not lower than grade 5.0 or higher than grade 7.9; vary sentence length; define specialized vocabulary; and pretest the pamphlet or booklet with a sample from the target population. (Contains 26 references and 13 tables of data. Appendixes, which constitute more than half the study, present information on all materials analyzed, a list of vendors, a description of the SMOG Readability formula, standard pretest questions, and a discussion of how to determine clients' information.) Dear Public Health Professionals:

Perhaps the most common method of informing the public about health matters in general is through the use of printed educational materials. Printed materials are cost-effective and permit us to share useful information that people may keep for future reference.

Unfortunately, most of the health education materials published by commercial and not-for-profit vendors cannot be read and understood by many of our clients. As a community of public health professionals, we need to ensure that the materials we distribute are written and presented in ways that people can understand and use.

Executive Summary

Methods

This study assessed the readability of health education pamphlets and booklets distributed to local health department clients through their maternal health, child health and family planning clinics. The materials analyzed came from various vendors, but excluded materials developed by local and state public health staff. To increase the reliability of the results and decrease human error, a computerized approach was used.

Written materials were collected from 39 local health departments: three from counties with populations greater than 250,000; eight from counties with populations between 100,000 and 250,000; 16 from counties with populations between 50,000 and 100,000; and 12 from counties with populations below 50,000. The sample included 424 client-directed materials: 195 distributed in maternal health clinics; 130 in child health clinics; and 99 in family planning clinics.

For each pamphlet and booklet, data were collected on the following variables:

- Frequency of commonly used words and simple sentences;
- Frequency of long words and complicated sentences;
- Frequency of sentences containing only short words;
- Variety of sentence types and sentence lengths;
- Average long words per sentence; and

Additional variables included:

- Overall length of the pamphlet or booklet;
- Target population;
- Primary purpose; and
- Content focus.

The three main scores used to assess readability were:

- Reading level - a reflection of sentence and word length;
- Mortar - a ratio of commonly used words to concept words; and
- Overall rating - the average of reading level, mortar, the array and use of sentence types, the frequency of long words and complicated sentences and the percentage of sentences using only short words.
Results

The values for reading level, mortar and overall rating across all three clinics were very similar. When examined separately, more materials distributed via the maternal health clinics were in line with recommended criteria for reading level, mortar and overall rating. However, materials distributed via family planning clinics fared the best when these three were combined. The most important and telling finding of this study suggested that of all of the materials supplied to local health departments by commercial and not-for-profit vendors only 15.4 percent meet all of the authors’ recommended criteria.

Recommendations

Before using a particular health education pamphlet or booklet, the authors recommend that:

- The purpose for using the material be clearly stated;
- The reading level not be lower than grade 5.0 or higher than grade 7.9;
- Sentence lengths vary and complex sentence structures are not used;
- Specialized vocabulary (if unavoidable) is defined;
- The pamphlet or booklet be pretested with a sample from the target population; and
- The general information needs of the client or group be known and that the material specifically address these needs.
Written documents are an important source of health information and a key part of patient education in clinical settings. Primary care patients should receive complete, current information concerning their diagnoses, treatments and prognoses in terms that they can understand. The ability to read patient education materials is particularly important in patients' attempts to comply with home health management and preventive health measures. It has been shown that the more patients learn regarding their medical condition, the more likely they are to participate in their plan of care.\textsuperscript{1} In this context, materials that are distributed and not understood pose a health hazard for the patient and a liability for the health care worker.\textsuperscript{2}

Most written materials distributed to clinic patients in local health departments contain general health information or focus on preventive health information. It has been demonstrated that merely distributing these types of pamphlets and booklets does not change patient behavior.\textsuperscript{3} Thus, it is important that these materials not be used as a sole means of educating patients. Other methods of education should be incorporated. These include use of flip charts, videotapes, audiotapes, picture books and computer-assisted instruction.

This report deals with one facet of patient education -- printed materials -- and presents a readability analysis of the materials produced by commercial and not-for-profit vendors and distributed in clinics serving pregnant women, children and family planning clients.
Background

North Carolina has 100 counties, 86 of which are served by their own local health department, with the remaining counties organized into health districts. Each local health department and health district offers clinics that focus on the health problems and concerns of children, adolescents and adults. Three of these clinics are the focus of this report: (1) maternal health; (2) child health; and (3) family planning.

There were two principal reasons for studying the written materials distributed in these three clinics: (1) health education is a vital part of these clinics; and (2) a statewide computerized health information system gathers data on the clients that participate in these clinics. Of particular importance to this report are the data on highest grade completed. As a beginning point, these data contribute to our understanding and appreciation of the reading and comprehension skills of the individuals these clinics serve.

The United States has a relatively high illiteracy rate, and local health department personnel can expect their clients to include people who have limited reading skills. In North Carolina, demographic data suggest that many clients cared for in local health departments have low literacy skills. For example, data gathered via the N.C. Health Services Information System (HSIS) suggest that approximately 10 percent of local health department Maternal Health and Family Planning clients have less than a ninth grade education and less than half (41.2 percent) have graduated from high school (Table 1). Similarly, based on 1990 census information, the data in Table 2 suggest that approximately 13 percent of North Carolinians 25 and over have less than a ninth grade education.

</table>
"The presumption that individuals read at the level of their completed formal education often is inaccurate."92

Table 3 presents the average highest grade completed for local health department Maternal Health and Family Planning clients. (NOTE: Child Health clients are not included in the HSIS data). While the mean educational level for Maternal Health and Family Planning clients, as presented in Table 3, is 11.1, educational level is as a poor predictor of reading ability. Researchers suggest that the reading skills of individuals may be two to four and even five years lower than stated years of school completed.

Methods

Sample

To conduct a comprehensive evaluation, written materials were obtained from a representative sample of North Carolina’s local health departments. To do this, 39 local health departments participated. The sample included health departments from all of North Carolina’s Department of Environment, Health and Natural Resources (DEHNR) regions. The largest health departments participated as well as the smallest.

The authors analyzed 424 brochures and pamphlets. Excluded from this study are those materials developed by DEHNR personnel (the readability of these materials is closely monitored) and those developed by local health department staff for exclusive use in their agency. A list of the agencies, organizations and groups that developed the materials presented in this report is in Appendix B.

Analysis Procedures

When we speak, we can watch our listener and observe his or her reactions. This is not true when information is in print. If we want to know how readable an individual will find a particular brochure, pamphlet or booklet, we need to look at different readability values, as recommended in this report. The method of analysis was based on statistical procedures that measure word length, sentence length and percentage of commonly used words.

Naturally, many other factors affect how easily a reader can understand the intended message we are trying to get across. Developers of written materials also must consider content, typesize, format, technical accuracy, organization, reader interest and motivation. For example, the analysis carried out in this report cannot measure how familiar the reader is with the subject, or how interested he or she is in it. Nor does this analysis include syntax errors that flaw the sentence structure or unclear references within sentence.

Writers also must consider the use of illustrations to improve the understanding of educational materials. Although not analyzed here, carefully designed illustrations are extremely useful for presenting or clarifying messages. However, even the best illustrations cannot substitute for well-organized and simply written text. Indeed, when all is done, there's still no substitution for testing printed materials on small groups of clients before using them. In this light, this report can be used to guide you when selecting printed materials that you, in turn, test with clients.
Three values are presented in this report: reading level, mortar and overall rating. All of these values were calculated using the Readability Plus software package. A computerized approach was selected over manual calculations of reading estimates to increase the reliability of the results and decrease human error. Readability Plus analyzes the literacy level of word-processing text files by combining several established readability parameters:

- consecutive short words
- consecutive long words
- average sentence length
- number of commonly used words
- average number of syllables per word
- number of long words per sentence (words having more than six letters)
- sentence characteristics ranging from short and simple to long and complicated

Combined, these values provide a useful and objective measure of readability.

To analyze text, Readability Plus requires 10 sentences, so only those brochures and pamphlets containing more than 10 sentences were analyzed. As a general rule, 10 consecutive sentences near the beginning, in the middle, and near the end were used to analyze each brochure, pamphlet or booklet. The Readability Plus program defines a sentence as any string of words ending with a period, question mark, exclamation point or a colon that is followed by an upper-case letter.
**Reading level.** Several readability formulas are available to assess the reading level of printed material. Readability Plus calculates four readability indices -- the Gunning’s Fog Index, the Flesch-Kincaid Index, the Flesch Reading Ease Index and the LIX Index. In this report, the number indicating reading level was calculated using the Flesch-Kincaid Index.

The Flesch-Kincaid Index was developed in the mid 1970s and was standardized on Navy-enlisted men by first giving them a standardized reading test (the Gates-McGintie) to determine their reading levels. Then they were tested on how well they understood a set of increasingly difficult reading passages. When the results from this activity were linked to the sailors' reading levels, they were used to develop the Flesch-Kincaid Index.

Its formula is:

\[
RGL = .39ASL + 11.80S - 15.59
\]

where

- \(RGL\) = reading grade level
- \(ASL\) = average sentence length
- \(S\) = syllables per word

Maximum Flesch-Kincaid scores are now stipulated in many Department of Defense contracts. The Internal Revenue Service and the Social Security Administration have also been requiring that it be used to assess some of their documents.\(^{14}\)

STUDY RESULTS: READING LEVEL

Reading levels ranged from 1.6 to 14.7 and averaged 7.8 (Table 4). However, of the 424 written materials analyzed, less than half (172 or 40.4%) fell within the recommended range of grade 5 to 7.9 (Table 5).
Mortar. It is important to realize that nearly all readability indices measure the same two variables: average sentence length (in words) and average word length (in syllables or characters). What is different is how the results are computed and reported. While these two factors are very important for ensuring easy readability, the author of Readability Plus considers vocabulary choice to be just as important. In this regard, Readability Plus uses the concept of "Mortar and Bricks," thus comparing writing with the building of a brick wall. Bricks are the words that carry the information we wish to convey. Mortar is comprised of mostly small words (e.g., "come, that, one, as, and, if, had, an, in") that, by themselves, do not carry much information, but nonetheless lend life to language and make it easy to understand. The 450 most commonly used words in the English language are its mortar.

| TABLE 6. AVERAGE PERCENT MORTAR OF WRITTEN MATERIALS BY CLINIC |

| TABLE 7. PERCENT DISTRIBUTION OF WRITTEN MATERIALS BY PERCENT MORTAR AND CLINIC |
|------------------|------------------|------------------|------------------|------------------|
| Mortar           | Maternal Health  | Child Health     | Family Planning  | Overall Average  |
|                  | N=195            | N=130            | N=99             | N=424            |
| 59% and Less     | 57.4%            | 57.7%            | 58.6%            | 57.9%            |
| 60% and More     | 42.6             | 42.3             | 41.4             | 42.1             |

STUDY RESULTS: MORTAR

Percent mortar ranged from 36% to 74% and averaged 58.4% (Table 6) or 1.6% below the recommended value of 60%. Of the 424 written materials analyzed, more than half (246 or 57.9%) fell below the recommended value of 60% (Table 7).
Overall rating. A brochure's, pamphlet's or booklet's overall rating ranges from 0 to 5, with 5 being the easiest to read. This is a composite score based on averaging the values obtained for reading level and morbidity plus the analysis of three other variables: the array and use of sentence types, the frequency of long words and complicated sentences and the percentage of sentences using only short words.

STUDY RESULTS: OVERALL RATING

Overall ratings ranged from 1.3 to 4.8 and averaged 3.5 (Table 8). Of the 424 written materials analyzed, approximately one quarter (106 or 24.9%) fell below the recommended value of 3.0 (Table 9).
**Combined Criteria.** The materials best suited for distribution to local health department clients are those with an overall rating of 3.0 or above, a mortar value of 60% or above and a reading level ranging from grade 5 to 7.9.

**TABLE 10. PERCENT DISTRIBUTION OF "BEST PICKS" BY CLINIC**

**STUDY RESULTS: COMBINED CRITERIA**

When combining the recommended criteria of an overall rating of 3.0 or above, a mortar value of 60% or above and a reading level ranging from grade 5 to 7.9, only 65 of the 424 written materials analyzed (15.4%) met these combined criteria (Table 10).
In addition to the calculated values for reading level, mortar and overall rating, each booklet, brochure or pamphlet is described by publisher, date of publication, size, target population, primary purpose and content focus.

**Target population.** The target populations for the educational messages are designated as the general public (no specific reference to age, sex, race, etc.), adult female (18+ years), adult male (18+ years), adolescents (12 years to 18 years), children (to be read by adults), children (less than 12 years) and members of minority groups. Table 11 outlines the percentage distribution of written materials by these categories.

**STUDY RESULTS: TARGET POPULATION**

Most of the 424 written materials analyzed (223 or 52.5%) were targeted towards adult females; 24.4% were targeted to adult males; 7.4% were targeted to adolescents (12 to 18 years old); 21.9% were targeted to children (however, only two pamphlets were specifically designed to be read by children); and only one pamphlet was for a minority audience (Table 11).
Content focus. Topic areas include smoking, drugs, alcohol, exercise, parenting, nutrition, sanitation, stress, lifestyle, safety, reproduction, description of methods/procedures, description of health issues, description of disease, description of behavior, description of services, mental health and record keeping. Table 12 outlines the percentage distribution of materials by these categories.

STUDY RESULTS: CONTENT FOCUS

The content of nearly one-quarter of the 424 written materials analyzed (97 or 22.9%) referenced reproductive health issues and concerns. Parenting was the focus of 19% and nutrition information for child and mother was the focus of 10% of the materials analyzed. Many of the written materials analyzed (approximately 25%) presented general discussions or descriptions of health-related topics or procedures (Table 12).

STUDY RESULTS: PRIMARY PURPOSE

By far, most of the 424 written materials analyzed (375 or 88.5%) presented general information, and 31.3% contained instructions and guidelines for prevention (Table 13).
The following recommendations are intended as a guide when selecting printed materials to use with public clinic clients.

**Reading Level**

**Recommendation.**

- Use materials ranging from a reading level of grade 5.0 to 7.9.
- For individuals with reading skills below grade 5, use educational strategies other than written materials.

**Rationale.** Although the mean educational level in the United States is slightly more than grade 12, educational level is a poor predictor of reading ability; indeed it is well recognized that a person's reading skills may be two to four and even five years lower than stated years of school. The highest average grade completed by clients using Maternal Health or Family Planning Clinics in health departments in North Carolina ranges from 9.5 to 12.5 with an average of 11.1. Thus, when one subtracts two to five grade levels from these numbers, the grade range of 5 to 7.9, as a guideline, becomes reasonable.

Studies conducted with clients of public clinics, also support this recommended guideline. In a study conducted on a clinic population of mainly indigent minority patients, R.H. Jackson assessed reading level via the reading comprehension section of the PIAT-R. Here, individuals read an average of 4.6 grade levels below their last grade completed in school, and the mean reading level of these clients was grade 5.4. Again using the PIAT, T.C. Davis carried out a study in public clinics, one a university clinic and the other a community clinic, and assessed reading comprehension at 6.8 and 5.4, respectively. He determined the gap between stated education and comprehension to be 3.7 and 4.8 grades, respectively.

Another study carried out on clients of a primary care clinic in a public hospital found that the mean difference between educational grade level and WRAT score was 3.8 grades. In this study, reading ability as measured by WRAT scores ranged from less than grade 3 to above grade 12 with a median level of grade 6. Although word recognition, as measured by the WRAT is an important literacy skill, understanding words in context, as measured by the comprehension section of the PIAT, is a better indicator of literacy.
Mortar

**Recommendation.** Use 60 percent as the bottom cut off point for mortar.

**Rationale.** To assure easy readability, the authors of Readability Plus recommend taking at least 60 percent of the words in a text from the list of 450 commonly used words. Thus, the more the mortar value falls below 60 percent, the harder the text is to read.

Overall Rating

**Recommendation.** Use materials with an overall rating of 3.0 or above.

**Rationale.** Overall rating ranges from 0 to 5 with 0 indicating that a brochure, pamphlet or booklet is extremely difficult to read and 5 indicating that it is very easy to read. A rating of 1 on this scale equals "very hard," 2 equals "hard," 3 equals "average" and 4 equals "easy." Materials with an overall rating below 3.0 typically bring together a combination of factors, for example a reading level score above grade 8 and a mortar score below 60 percent, which make them difficult to read.
RECOMMENDATIONS

To be effective, written materials must be used for specific reasons and be tailored to the information needs of the client or client group. Beyond having objectives, the concern centers on the client’s ability to read and comprehend the materials. Though ideal, it would be difficult to test each client’s reading and comprehension skills. In the authors’ opinion following these recommendations will compensate for the lack of such testing and best assure the effectiveness of written materials.

Recommendations for Using Client Health Education Materials

Before using a pamphlet or booklet:

- Answer YES to at least one of the following statements:
  1. This (pamphlet or booklet) reiterates what I will say to the client and thus serves as a record of our communication.
  2. This (pamphlet or booklet) aids my teaching process. Because of this (pamphlet or booklet), I feel more confident that the client will understand and appreciate what I say.
  3. This (pamphlet or booklet) will reinforce what I will say to the client. It is something the client can take home and use to recall what we have talked about.

- Know its reading level. The recommended criteria for judging reading level is that it not be lower than grade 5.0 or higher than grade 7.9. If you do not have software to calculate reading level, see Appendix C for instructions to hand calculate a SMOG Index.

- Review it for the following characteristics:
  1. Sentence lengths vary and complex sentence structures are not used; and;
  2. Specialized vocabulary is defined.

- Pretest it with a sample from the target audience. See Appendix D for a list of core questions.

- Assess its information level. See Appendix E for a guideline on assessing its information level.

The SMOG
Readability Formula

To calculate the SMOG reading grade level, begin with the entire written work being assessed, and follow these four steps:

1. Count off 10 consecutive sentences near the beginning, in the middle and near the end of the text.

2. From this sample of 30 sentences, circle the words with three or more syllables, including repetitions of the same word. Total the number of words circled.

3. Estimate the square root of the total number of polysyllabic words counted. This is done by finding the nearest perfect square, and taking its square root.

4. Finally, add a constant of three to the square root. This number gives the SMOG grade, or the reading grade level that a person must have reached if he or she is to fully understand the text being assessed.

Example

Readability Test Calculations

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Number of Polysyllabic Words</td>
<td>38</td>
</tr>
<tr>
<td>Nearest Perfect Square</td>
<td>36</td>
</tr>
<tr>
<td>Square Root</td>
<td>6</td>
</tr>
<tr>
<td>Constant</td>
<td>3</td>
</tr>
<tr>
<td>SMOG Reading Grade Level</td>
<td>9</td>
</tr>

</table>
Appendix D

Standard Pretest Questions

NOTE: Change the words in parentheses to fit the particular item being pretested.

1. Main Idea Communication/Comprehension

- What was the main idea this (message) was trying to get across to you?
- What does this (message) ask you to do?
- What action(s), if any, is the (message) recommending that people take?
- In your opinion, was there anything in the (message) that was confusing?
- Which of these phrases best describes the (message)?
  - Easy to understand
  - Hard to understand
- Did you learn anything new (about the health subject) from this (message)? If yes, what?
- In your opinion, was there anything in particular that was worth remembering about the (message)?

Source: These questions were adapted from:

Appendix D

2. Believability

- In your opinion, was there anything in the (message) that was hard to believe? If yes, what?
- Which of these words or phrases best describes how you feel about the (message)?
  Believable
  Not believable

3. Personal Relevance/Interest/Acceptance

- In your opinion, what type of person was this (message) talking to?
  Was it talking to . . .
  Someone like me
  Someone else, not me
  Was it talking to . . .
  All people
  All people, but especially (the target audience)
  Only (the target audience)
- Which of these words or phrases best describes how you feel about the (message)?
  Interesting
  Not interesting
  Informative
  Not informative
  Well done
  Poorly done
  Comforting
  Alarming
- What, if anything, did you particularly like about the (message)?
- Was there anything in the (message) that you particularly disliked or that bothered you? If yes, what?
Appendix D

4. Artwork

• By just looking at this (graphic, drawing, picture), what do you think it says?

• Is there anything in this (graphic, drawing, picture) that bothers or offends you?
Appendix E

INFORMATION NEEDS

The pathway to action and change in a health behavior can involve a variety of steps. Typically, people need to:

- Know a problem exists;
- Learn facts in relation to the problem;
- Learn how their behavior and feelings relate to the problem;
- Believe there are benefits to correcting the problem;
- Learn the array of actions they can take;
- Decide on which action is possible for them;
- Believe that they can carry out the action;
- Accept and trust those helping them; and
- Control the situations and other causes that trigger the problem.

As a person proceeds through these steps, and possibly repeats some of them, their needs for information change. That is, the information in the pamphlet or booklet we would give a person just learning about a problem would differ from the information given a person already involved in solving a problem. Thus, the above list of steps could be arranged into the following information categories:

- **Why? What’s the Problem?**
  
  Behavior Example: does not exercise and does not intend to start exercising

- **What’s in It For Me?**
  
  Behavior Example: does not exercise but intends to start exercising

- **Ready for Action**
  
  Behavior Example: exercises some but not regularly

- **Keeping It Going**
  
  Behavior Example: exercises regularly but just started do so recently

- **Staying Put - Never to Return**
  
  Behavior Example: has been exercising regularly for a long time
Appendix E

Most of the time you will know what type or level of information a person needs. If not, discovering a person's information needs is easy and only takes a minute.

ASK THE FOLLOWING QUESTIONS:

1. Do you intend to (___________) in the next six months?

   If negative, STOP. This individual is in the "Why? What's the Problem?" category and needs general or overview information about the problem.

   If positive, ask question #2 and possibly question #3.

2. Do you intend to (___________) in the next month, or have you (___________) in the past month?

   If the answer is "intending to in the next month," the person is in the "What's in It For Me?" category and needs information on the benefits of pursuing action and information that can help displace doubts, such as facts and figures.

   If the answer is "have in the past month," the individual is in the "Ready for Action" or possibly the "Keeping It Going" category and needs "how-to" information on where to go (resources) for help and tips on troubleshooting situations.

3. Have you been (___________) for the past six months?

   If the answer is "yes," the individual is in the "Staying Put - Never to Return" and could use information or advice on "staying the course."
